5. MIT shall design and construct at its own expense a storm water infiltration facility, drainage line, and relocation of the existing chain-link fence on City property (Parcel 2021059019) just to the south of the southern MIT property line separating MIT (Parcel 2021059001) and City properties. The system shall intercept storm water drainage located near

the northeast corner of the City's property, be linked to a MIT storm infiltration system by means of a raised berm and connection pipe(s) and shall divert overflow stormwater through a new pipe to an existing City storm line in Howard Road SE. MIT shall access the site and secure it when they or their agents leave the site. MIT shall complete the work and upon completion of all work leave the site in a condition acceptable to the City.

6. Provide the City with an electronic AutoCAD file of the proposed subdivision and access road that references city survey monuments to facilitate plotting the proposed easement and associated setbacks on the existing city water property.

7. MIT shall complete the necessary legal descriptions and drawings in paper, mylar and electronic formats for the City's use in creating the short plat on Tax Parcel 2021059019.

C. INSURANCE

1. Throughout the period of performance of this Agreement for all construction related activities, the Parties or their respective Contractors shall carry and maintain commercial general liability insurance with limits of not less than one million dollars ($1,000,000.00) per occurrence for bodily injury, including death, and one million dollars ($1,000,000.00) per occurrence for property damage or, alternatively, one million dollars ($1,000,000.00) per occurrence combined single limit for bodily injury and property damage combined, and two million dollars ($2,000,000.00) general aggregate.

2. This insurance shall be in a form and with an insurer acceptable to the City's insurance carrier and shall contain coverage for all premises and operation, broad form property damage, contractual liability (including without limitation that specifically mentioned in the Agreement, and products and contemplated operations insurance. In addition, the insurance for construction work performed by the City or its Contractor shall be in the form acceptable to MIT and consistent with the City's requirements.

3. This insurance shall provide coverage for explosion, collapse, underground excavation, and lateral support.

4. Any policy or policies that provide the insurance required in this Agreement shall name the other Party as an additional insured on a separate endorsement, to the extent of the contractual obligations set forth here. If the Contractor, as the Agent of MIT, provides the required insurance, then such insurance shall name both the MIT and the City as additional insured.

5. Before the beginning of any construction work required under this Agreement, each Party shall provide the other Party for review and approval, a certificate of insurance reflecting

full compliance with the requirements set forth in this Agreement. The certificate shall be kept current and in compliance throughout the construction work until final acceptance by the other Party and for two years thereafter for products and contemplated operations liability, and shall provide for 30 days advance written notice to the City if cancellation or material change adversely affect the interests of the other Party.

6. Throughout the period of performance of the Agreement, MIT shall cover or maintain insurance in compliance with the applicable worker's compensation laws, with respect to all of its respective employees working on or about the facility site, regardless of whether such coverage or insurance is mandatory or merely elective under the law.

7. For the purposes hereof, the period of performance of this Agreement includes and refers to the time during which any party hereto is obligated to perform tasks required herein.

D. INDEMNIFICATION

1. MIT shall indemnify and hold the City and its agents, employees, and/or officers, harmless from and shall process and defend at its own expense any and all claims, demands, suits, at law or equity, actions, penalties, losses, damages, or costs, of whatsoever kind or nature, brought against the City arising out of, in connection with, or incident to the execution of this Agreement and/or the MIT's performance or failure to perform any aspect of this Agreement; provided, however, that if such claims are caused by or result from the concurrent negligence of the City, its agents, employees, and/or officers, this indemnity provision shall be valid and enforceable only to the extent of the negligence of the MIT; and provided further, that nothing herein shall require the MIT to hold harmless or defend the City, its agents, employees and/or officers from any claims arising from the sole negligence of the City, its agents, employees, and/or officers. No liability shall attach to the City by reason of entering into this Agreement except as expressly provided herein.

2. The City shall indemnify and hold MIT and its agents, employees, and/or officers, harmless from and shall process and defend at its own expense any and all claims, demands, suits, at law or equity, actions, penalties, losses, damages, or costs, of whatsoever kind or nature, brought against MIT arising out of, in connection with, or incident to the execution of this Agreement and/or the City's performance or failure to perform any aspect of this Agreement; provided, however, that if such claims are caused by or result from the concurrent negligence of MIT, its agents, employees, and/or officers, this indemnity provision shall be valid and enforceable only to the extent of the negligence of the City; and provided further, that nothing herein shall require the City to hold harmless or defend MIT, its agents, employees and/or officers from any claims arising from the sole negligence of MIT, its agents, employees, and/or officers. No liability shall attach to MIT by reason of entering into this Agreement except as expressly provided herein.

E. WAIVER OF SUBROGATION

1. MIT and the City hereby mutually release each other from liability and waive all right of recovery against each other for any loss caused by fire or other perils which can be insured against under fire insurance contracts including any extended coverage endorsements thereto which are customarily available from time to time in the State of Washington, provided, that this paragraph shall be inapplicable to the extent that it would have the effect of invalidating any insurance coverage of MIT or the City.

F. WAIVER OF SOVEREIGN IMMUNITY

1. MIT agrees to a limited waiver of sovereign immunity. MIT does hereby expressly waive its right to sovereign immunity and its right to assert sovereign immunity defense in the courts of the State of Washington for the limited purpose of any legal claim or complaint for the interpretation and/or enforcement of this Agreement, and/or for any complaints or counterclaims for monetary damages or equitable relief for any breach of this Agreement, and/or for the enforcement of any final judgment by any court of the State of Washington regarding such matters. This limited waiver of immunity is solely for the benefit of the City of Auburn for the purposes stated herein, and the Tribe does not waive its sovereign immunity as to any party other than the City. The Tribe agrees not to invoke sovereign immunity as a defense up to the limits of the insurance policy in connection with the enforcement of the rights of the City.

2. MIT consents to the jurisdiction of the Washington State Superior Court in the event that either Party deems it necessary to institute legal action or proceedings to enforce any right or obligation under this Agreement; the Parties further agree that any such action or proceedings shall be brought in the superior court situated in King County, Washington.

G. COMPLIANCE WITH REGULATIONS AND LAWS

1. The parties shall comply with all applicable rules and regulations pertaining to them in connection with the matters covered herein.

H. ASSIGNMENT

1. The parties shall not assign this Agreement or any interest, obligation or duty therein without the express written consent of the other party.

I. ATTORNEYS' FEES

1. If either party shall be required to bring any action to enforce any provision of this Agreement, or shall be required to defend any action brought by the other party with respect to this Agreement, and in the further event that one party shall substantially prevail in such action, the losing party shall, in addition to all other payments required therein, pay all of the prevailing party's reasonable costs in connection with such action, including such sums as the court or courts may adjudge reasonable as attorney's fees in the trial court and in any appellate courts.

J. NOTICES

1. All notices and payments hereunder may be delivered or mailed. If mailed, they shall be sent to the following respective addresses:

To MIT (Notice):

To the City:
City of Auburn
25 West Main
Auburn, WA 98001-4998
Attn: Ingrid Gaub, City Engineer
Phone:(253) 931-3010
FAX (253) 931-3053

or to such other respective addresses as either party hereto may hereafter from time to time designate in writing. All notices and payments mailed by regular post (including first class) shall be deemed to have been given on the second business day following the date of mailing, if properly mailed and addressed. Notices and payments sent by certified or registered mail shall be deemed to have been given on the day next following the date of mailing, if properly mailed and addressed.

For all types of mail, the postmark affixed by the United States Postal Service shall be conclusive evidence of the date of mailing.

K. MISCELLANEOUS

1. All of the covenants, conditions and agreements in this Agreement shall extend to and bind the legal successors and assigns of the parties hereto.

2. The captions in this Agreement are for convenience only and do not in any way limit or amplify the provisions of this Agreement.

3. The duration of this Agreement shall be perpetual.

4. No separate legal entity is created by this Agreement.

5. The funding of the respective obligations of the parties shall be out of the respective general funds/current expenses of the parties, except as otherwise specifically provided.

6. The performances of the duties of the parties provided hereby shall be done in accordance with standard operating procedures and customary practices of the parties.

7. The oversight and administration of the Agreement shall be by the respective named representatives identified in Paragraph J hereof, or their designees.

8. If any term or provision of this Agreement or the application thereof to any person or circumstance shall, to any extent, be held to be invalid or unenforceable by a final decision of any court having jurisdiction on the matter, the remainder of this Agreement or the application of such term or provision to persons or circumstances other than those as to which it is held invalid or unenforceable shall not be affected thereby and shall continue in full force and effect, unless such court determines that such invalidity or unenforceability materially interferes with or defeats the purposes hereof, at which time the City shall have the right to terminate the Agreement.

9. This Agreement constitutes the entire agreement between the parties. There are no terms, obligations, covenants or conditions other than those contained herein. No modifications or amendments of this Agreement shall be valid or effective unless evidenced by an agreement in writing signed by both parties.

10. Copies of this Agreement shall be filed with the King County Recorder's Office; the Secretary of State of the State of Washington; and the respective Clerks of the parties hereto.

IN WITNESS WHEREOF the parties hereto have executed this Agreement as of the day and year first above written.

For and in consideration of One Dollar ($1 00) and other valuable consideration, the receipt of which is hereby acknowledged, THE MUCKLESHOOT INDIAN TRIBE ("Grantor" herein), hereby grants and conveys to the CITY OF AUBURN, a Washington municipality ("Grantee" herein), for the purposes hereinafter set forth a water or sanitary sewer line right-of-way over, across and under the following described real property (the "Property" herein) in KING COUNTY, Washington

Exhibit "A" attached hereto and by this reference made a part heteof

Except as may be otherwise set forth herein Grantee's rights shall be exercised upon that portion of the Property (the "Right-of-Way" herein) described as follows

A Right-of-Way fifteen (15) feet in width having seven and one-half (7 5) feet of such width on each side of a centerline described as follows

The Centerline of Grantee's facilities as constructed or to be constructed extended or relocated, lying within the above described Property as more particularly depicted on the document marked as Exhibit"B" attached hereto and by this reference made a part hereof

1 **Purpose.** Grantee shall have the right to access, inspect, construct, operate, maintain, repair, replace and enlarge one or more water distribution lines or sanitary sewer lines over

and/or under the Right-of-Way together with all necessary or convenient appurtenances thereto, which may include but are not limited to the following

For water distribution lines Backflow assemblies, water mains, hydrants, meters and meter boxes, blowoff assemblies and appurtenances

For sanitary sewers manholes, cleanouts and sewer mains

Following the initial construction of its facilities, Grantee may from time to time construct such additional lines and other facilities as it may require Grantee shall have the right to place any type of driving surface within said Right-of-Way not inconsistent with Grantor's use of the Property

Grantor additionally grants to Grantee the use of such additional area immediately adjacent to the Right-of-Way area as shall be required for the construction, reconstruction, maintenance and operation of said water or sewer facilities The use of such additional area shall be held to a reasonable minimum and in the case of any damage or disruption of the premises, the Grantee shall return the Property to a condition as reasonably comparable to its condition as it existed immediately before entry and/or work was made thereon by the Grantee or its agents

2 **Access.** Grantee shall have the right of access to the Right-of-Way over and across the Property to enable Grantee to exercise its rights hereunder, provided, that Grantee shall compensate Grantor for any damage to the Property caused by the exercise of the rights granted herein Grantor shall not in any way block, restrict or impede access and egress to or from said Right-of-Way, and/or in any way block, restrict or impede full use of the real property within the above-described Right-of-Way by the Grantee for the above-described purposes

3 **Grantor's Use of Right-of-Way.** Grantor reserves the right to use the Right-of-Way for any purpose not inconsistent with the rights herein granted, provided, that Grantor shall not take actions that may adversely affect the integrity of the water facilities located within the Right-of-Way, such as excavation or filling, without first notifying Grantee of the proposed activity Grantee shall have the right to inspect any activities of Grantor that may adversely affect the water facilities, and take appropriate action to protect the water facilities

4 **Indemnity.** By accepting and recording this service line agreement, Grantee agrees to indemnify and hold harmless Grantor from any and all claims for injuries and/or damages suffered by any person, which may be caused by the Grantee's exercise of the rights herein granted, provided, that Grantee shall not be responsible to Grantor for any injuries and/or damages to any person caused by acts or omission of Grantor

5. **Abandonment or Termination.** The rights herein granted shall continue until such time as Grantee ceases to use the Right-of-Way In the event that Grantor desires to terminate this service line agreement, the Grantor shall provide Grantee with funds sufficient to install any necessary backflow preventor or preventors on Grantee's waterlines located outside the subject property that connect to the subject property

6. **Cooperation and Coordination.** Grantor and Grantee agree to cooperate in the implementation of this service line agreement and to coordinate their respective duties and activities relating to this service line agreement with each other.

RESOLUTION NO. 5182

A RESOLUTION OF THE CITY COUNCIL OF THE CITY OF AUBURN, WASHINGTON, AUTHORIZING THE MAYOR TO EXECUTE A SERVICE AREA AGREEMENT BETWEEN THE CITY OF AUBURN AND PIERCE COUNTY, ESTABLISHING WATER UTILITY SERVICE AREA BOUNDARIES

WHEREAS, the City of Auburn is a water purveyor located partly within Pierce County, Washington; and

WHEREAS, service area agreements are required by WAC 246-293-250 to help assure that water reserved for public water supply purposes will be utilized in the future in an efficient and planned manner; and

WHEREAS, in conformity with the requirements of WAC 246-293-250, the City of Auburn and Pierce County, Washington, have developed a water utility service area agreement establishing water utility service area boundaries, with terms acceptable to both entities.

NOW THEREFORE, THE CITY COUNCIL OF THE CITY OF AUBURN, WASHINGTON, HEREBY RESOLVES as follows:

Section 1. The Mayor is hereby authorized to execute a Service Agreement between the City of Auburn and Pierce County, which agreement shall be in substantial conformity with the agreement a copy of which is attached hereto, denominated as Exhibit A, incorporated herein by this reference.

Section 2. The Mayor is hereby authorized to implement such administrative procedures as may be necessary to carry out the directives of this legislation.

Section 3. This Resolution shall be in full force and effect upon passage and signatures hereon.

DATED and SIGNED this 16th day of November 2015.

CITY OF AUBURN

Nancy Backus
NANCY BACKUS, Mayor

RESOLUTION No. 5182

EXHIBIT A

STANDARD SERVICE AGREEMENT ESTABLISHING WATER UTILITY SERVICE AREA BOUNDARIES

City of Auburn
STANDARD SERVICE AGREEMENT ESTABLISHING WATER UTILITY SERVICE AREA BOUNDARIES

PREAMBLE

THIS AGREEMENT establishing water utility service area boundaries is entered into this day for purposes of identifying the external boundaries of the service area for which this water purveyor has assumed water service responsibility.

WHEREAS, service area agreements are required by WAC 246-293-250 to help assure that water reserved for public water supply purposes within Pierce county will be utilize din the future in an efficient and planned manner; and

WHEREAS, the designation of retail water service area and future service planning areas, together with the cooperation of other utilities, will help assure efficient planning to accommodate growth, avoid duplication f service, and facilitate the best use of resources; and

WHEREAS, the responsibilities applicable to water purveyors are outlined in the Pierce County Coordinated Water System Plan (CWSP) and by the adopted rules and regulations of the Washington State Department of Health (DOH); and

Whereas, IT IS NOT THE INTENT OF THIS Agreement to give new authority or responsibilities to the water purveyor or to the County or State regulatory agencies, in addition to those requirements imposed by law; and

NOW, THEREFORE, the undersigned party, having entered into this Agreement by its signature, concurs with and will abide by the following provisions:

Section 1. The terms used within the contract shall be as defined in the implementing regulations of Chapter 70.116 RCW, except as identified below.

A. Lead Agency shall mean the department or organization within Pierce County that has been designated by the Pierce County Executive as being administratively responsible for the coordination and filing of the Pierce County Water Service Area map, Standard Service Agreement Establishing Water Utility Service Area Boundaries, Agreements for Retail Service Areas, Utility Service Policies, and other administrative documents necessary for the implementation of the Pierce County CWSP.

B. Pierce County Coordinated Water System Plan (CWSP) shall mean the plan adopted by the Pierce County Council for public water systems within critical water supply service areas within Pierce County which identifies the present and future needs of the systems and sets forth means for meeting those needs in the most efficient manner possible.

C. Pierce County Water Service Area Map shall mean the map reference din this Agreement for the retail service area signed by the water purveyor, except as amended in accordance with the CWSP procedures and with the concurrence of the affected water purveyors.

AUBURN COPY

D. Retail Service Area shall mean the designated geographical area within Pierce County in which the undersigned water purveyor assumes full responsibility for providing water service to individual customers.

E. Utility Service Policies shall mean those policies and conditions of service that area attached to the provision of water service for individual customers. The identified policies and conditions of service are those conditions incorporated within the water purveyor's water system improvement and expansion plans required under the provisions of the Public Water Systems Coordination Act and DOH.

Section 2. Lead Agency. The lead agency for administering the Pierce county Water Utility service area agreements shall be the Pierce County Department of Planning and Land Services unless otherwise established by the Pierce County Executive. The lead agency shall function only as a coordination center. The lead agency will maintain the original documents and will be responsible for updating the water system map and agreements as provided for in the CWSP.

Section 3. Authority. The authority for this Agreement is granted by the Public Water Systems Coordination Act of 1977, Chapter 70.116 RCW.

Section 4. Service Area Boundaries. The undersigned Water Purveyor acknowledges that the Pierce County Water Service Area Maps identifying its retail service area boundaries, dated July 28, 2015 and included as Attachment A to this Agreement, identify the water purveyor's present and future service area. The undersigned further acknowledges that there are no service area conflicts with an adjacent water utility or purveyor, or, if such a conflict exists, agrees that no new water service will be extended within disputed areas except as stipulate din an adjudication by DOH.

This Agreement shall apply to service areas existing as of August 1994, and to the service area boundaries identified in the above referenced maps, or as shown on current revisions thereof, provided that no revisions of service areas shown on these maps shall be made without prior written concurrence of the water utilities/purveyors involved and such written concurrence is filled with the Lead Agency. Revisions may also require an amendment to the purveyor's or utility's service plans.

Section 5. Boundary Adjustments. If, at some time in the future, it is in the best interest of the undersigned parties to make service area boundary adjustments, such modifications must be by written concurrence of all involved utilities and the proper legislative authority(ies), and must be noted an filed with the designated Pierce County lead agency and DOH. It is understood by the undersigned utility that it may decline to provide service within its designated service area boundary, but in that case, an applicant may be referred to other adjacent purveyors or utilities or a new utility may be created and the original service area boundary will be adjusted accordingly.

Section 6. System Extension Policies. The undersigned utility agrees that in order to expand its existing water service area, (other than by addition of retail customers to existing water mains), or to serve in the capacity of a pre-qualified satellite system management agency (SSMA), it shall have adopted design standards and Utility Service extension policies. The design standards shall meet or exceed the pierce County Water System Minimum Standards and Specifications.

A water utility anticipating expansion of retail service in unincorporated areas of Pierce County, or intending to operate as an SSMA, shall identify utility service policies in its updated water system plan. The undersigned utility agrees to identify, for information, its utility service policies or provide a copy of the updated water system plan to the Lead Agency prior to application for extension of its existing water system into new service areas within the unincorporated areas of Pierce County.

Municipalities further agree that if they identify a service area outside of their existing municipal corporate boundaries, the municipality will assume full responsibility for providing water service equivalent to the level of service provided for their customers inside the city limits with similar service requirements, and must also meet or exceed Pierce County's minimum design standards.

Section 7. Special Working Agreements. Special working agreements, if they exist and are relevant, between this water purveyor and any adjacent water purveyor shall be attached to this Agreement as Attachment B and incorporated herein by this reference.

Section 8. Compliance with the CWSP. Nothing in this Agreement shall waive any requirement of the state, federal, or local government regarding the provision of water service. This Agreement shall comply with the interlocal agreement requirement of the CWSP.

IN WITNESS WHEREOF, the undersigned party has executed this Agreement as of

Interlocal Agreement Among the Cities of Auburn and Bonney Lake for Revision of Water District Boundaries
Agreement Between the Cities of Pacific and Auburn Relating to Urban Service Area Designation
Agreement Between the Cities of Sumner and Auburn Relating to Potential Annexation Area Designation

INTERLOCAL AGREEMENT AMONG THE CITIES OF AUBURN AND BONNEY LAKE FOR REVISION OF WATER DISTRICT BOUNDARIES

THIS INTERLOCAL AGREEMENT is made and entered into, pursuant to the Interlocal Cooperation Act, Chapter 39.34 of the Revised Code of Washington, on the 14th day of April, 2015, by and among the CITY OF AUBURN ("COA")and the CITY OF BONNEY LAKE, municipal corporations of the State of Washington (collectively, the "Cities").

RECITALS:

1. **WHEREAS,** the Cities each own and operate public water systems pursuant to Chapter 70.119_RCW, are purveyors of potable water, and provide water services within the boundaries of the Cities' respective water service areas; and,

2. **WHEREAS,** the City of Auburn is presently revising and updating its six-year comprehensive water plan, as required by the state Department of Health pursuant to RCW 70.116 and WAC 246-290-100; and

3. **WHEREAS,** the Cities' respective water services areas adjoin and abut one another in the "Lakeland Hills South" area of Pierce County, where the Cities' water service areas are demarcated by an border or boundary line identified and described in service area agreement dated December 10, 1998 (approved by and appended to COA Res. No. 3018) ("Service Area Agreement"); and

4. **WHEREAS,** Cities' respective water rights and obligations had been the subject of litigation which was resolved amicably pursuant to settlement agreement between the Cities dated March 5, 1998 (approved by and appended to COA Res. No. 2925) (the "March 1998 Settlement Agreement"), the terms and conditions of which continue to apply to the Cities and shall be interpreted consistently with the change in boundary lines agreed upon herein; and

5. **WHEREAS,** on February 14, 2005, the Cities executed an addendum to the March 1998 Settlement Agreement, to revise the boundary relating to one tax parcel, which does not otherwise affect the March 1998 Settlement Agreement; and

6. **WHEREAS,** the Cities mutually desire to revise and adjust the border line separating their respective water service areas, presently described in Service Area Agreement, as amended by the February 14, 2005 addendum to the March 1998 Settlement Agreement.

NOW THEREFORE in consideration of their mutual covenants, conditions and promises, **THE CITIES DO HEREBY AGREE** as follows:

1. The boundary line between and separating the Cities' respective water service areas, previously established and described in Service Area Agreement, as amended by the

February 14, 2005 addendum to the March 1998 Settlement Agreement, is hereby revised and adjusted pursuant to the legal descriptions and surveyor's map attached hereto as Exhibit "A" and Exhibit "B", respectively; and

2. This revision of water service area boundary lines shall be effective immediately.

IN WITNESS WHEREOF the parties hereto have executed this Agreement as of the day and year first above written.

Thence northeasterly 16.98 feet along said curve and said southeasterly margin through a central angle of 00°56'40" to the most northerly northwest corner of Lot 22 of said plat of Lakeland Division 1, Phase 2, and the north line of Section 6, Township 20 North, Range 5 East, W.M.;

Thence along last said north line S 88°34'43"E a distance of 808.02 feet to the northeast corner of Said Section 6 and the terminus of this line description.

The basis of bearings for this description is Record of Survey for Segregation prepared by Apex Engineering dated February 26, 2001 and recorded under Auditors File Number 200102265002, records of Pierce County, Washington.

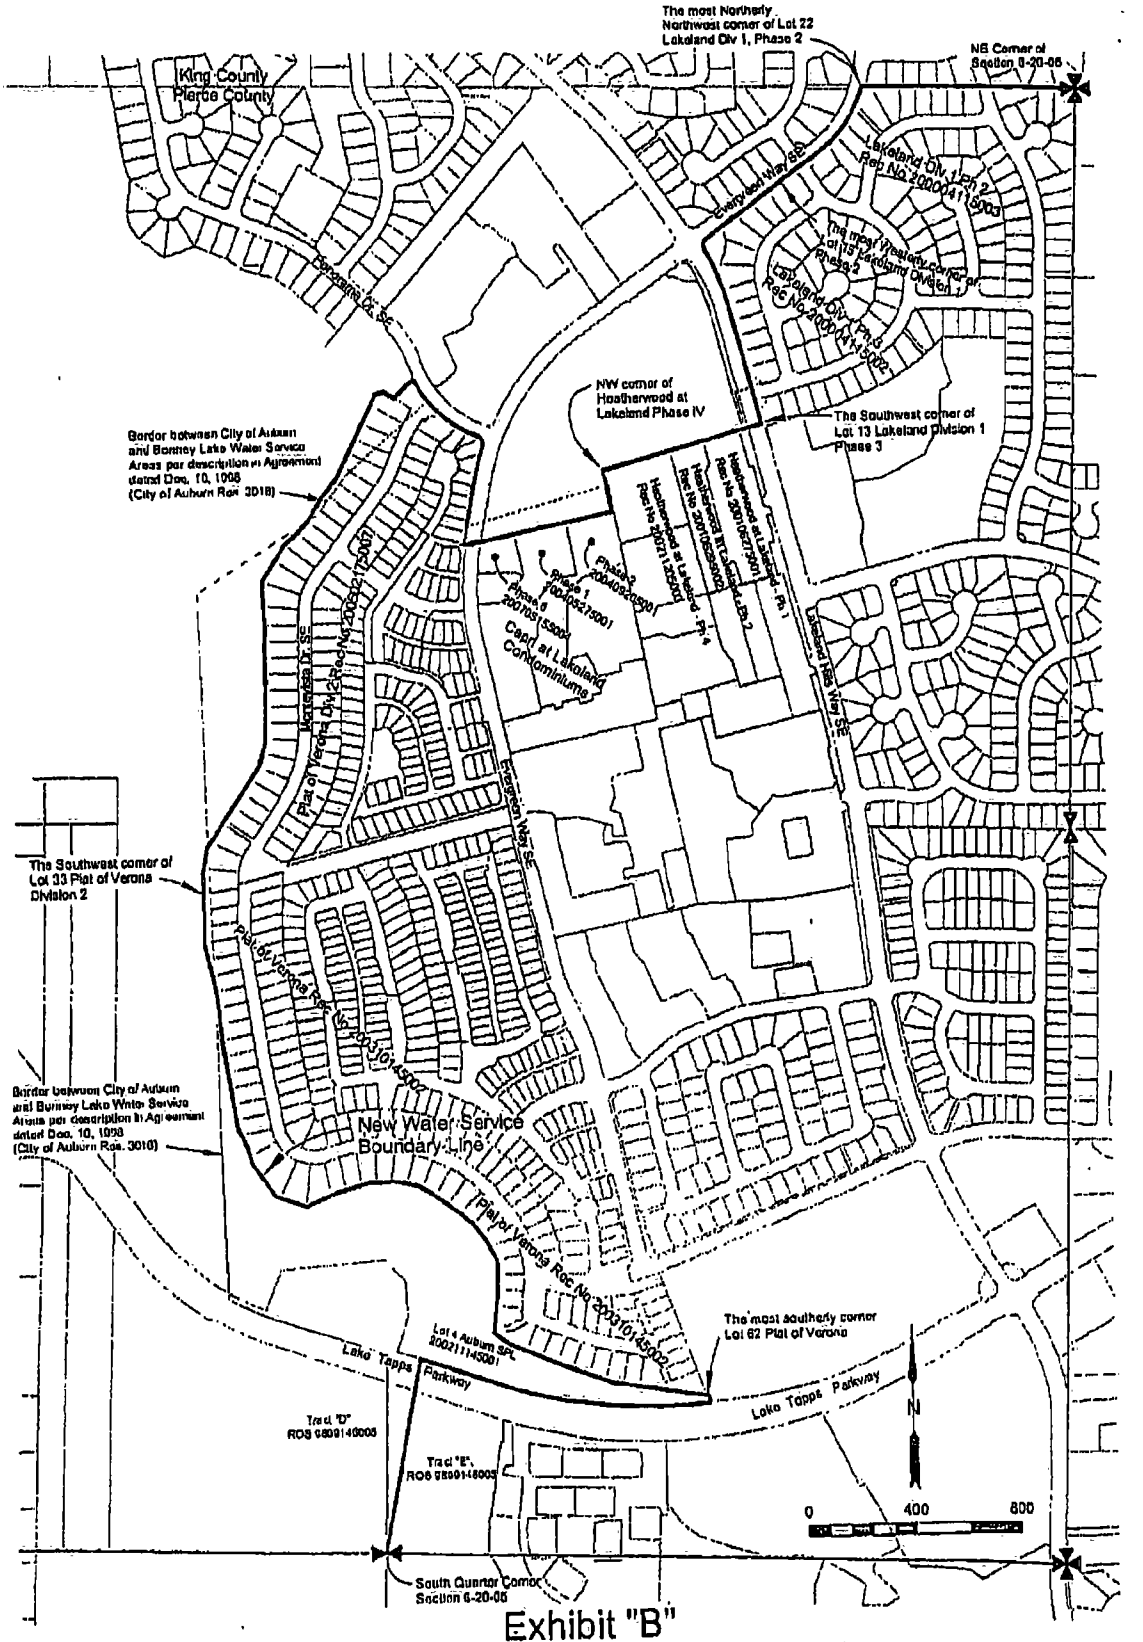

Exhibit "B"

Auburn-Bonney Lake Water Service Boundary

Map updated 01-13-2016

ORIGINAL

AN AGREEMENT BETWEEN THE CITIES OF PACIFIC AND AUBURN RELATING TO URBAN SERVICE AREA DESIGNATION

THIS IS AN AGREEMENT between the Cities of Pacific, a municipal corporation of the State of Washington ("Pacific"), and Auburn, a municipal corporation of the State of Washington ("Auburn"), hereinafter collectively referred to as the "Cities."

RECITALS

A. Pursuant to RCW 36.70A.110(2), the Washington State Growth Management Act of 1990 as amended requires each City within the County to propose the location of an urban growth area, and

B. The Pierce County Countywide Planning Policies adopted and approved by Resolution R92-86 on June 30, 1992 by the County Council and ratified by Cities within the County, establishes rules for designating City urban growth areas within the countywide urban growth boundary, and

C. The Pierce County Comprehensive Plan adopted and approved by Ordinance 94-82S by the County Council identifies an urban growth area overlap between the Cities of Auburn and Pacific.

D. It is in the public interest that the jurisdictions cooperate to designate logical and achievable urban growth area boundaries,

NOW THEREFORE, the Cities hereby agree:

1. PURPOSE.

The purpose of this agreement is to resolve the boundary overlap between the Cities of Auburn and Pacific.

2. DEFINITIONS.

Urban Service Area (USA): The incorporated urban area adjacent to a City, within which urban growth shall be encouraged and phased, and which is expected to annex to the city. Annexation is expected to occur sometime during the next 20 years at which time the city will provide services and utilities. Urban Service Area is another term for a City's Urban Growth Area.

Urban Growth Areas (UGA): Areas designated by the County within which urban growth shall be encouraged and phased and outside of which growth can occur only if it is not urban in nature. A City's Urban Growth Area is another term for its Urban Service Area.

Comprehensive Urban Growth Area Boundary (CUGA Boundary): The boundary marking the limit between the urban growth areas and other areas such as rural and resource area where urban growth is not permitted. The boundary shall be designated by the County in

REF: Resolution No. 2873
September 15, 1997

Exhibit "A" Resolution No. 2763
Adopted 12/2/96

consultation with the appropriate Cities, under the requirement of the Growth Management Act, as amended.

3. PUBLIC PROCESS.

The designation of USAs in Exhibit A (map) are of interest to a variety of affected parties, including property owners, area residents, the general public, special service districts and the municipalities.

4. RELATIONSHIP TO EXISTING LAWS AND STATUTES.

This Agreement in no way modifies nor supersedes existing laws and statues and is consistent with existing laws and statues. In meeting the commitments encompassed in this Agreement, all parties will comply with the requirements of the annexation statutes, Open Meetings Act, State Environmental Policy Act, Growth Management Act and the Pierce County Countywide Planning Policies.

5. RESPONSIBILITIES.

A. The Cities acknowledge the USA boundary as shown in Exhibit A. The City of Pacific urban service area boundary will not include any area shown in exhibit A.

B. The Cities will only annex territory within their designated USAs.

C. The Cities shall conduct a public involvement process that includes, but is not limited to workshops, surveys, or hearings in areas within the USA, prior to the inclusion of any additional areas within the USA.

6. AMENDMENTS.

A. A city which desires to modify the USA shall contact the other party to this Agreement to begin discussions regarding urban service area boundary amendments. The Cities agree to participate in such discussions when called. Either Party is authorized to call a meeting upon 30 days written notice.

B. The proposed modifications shall be supported by written evidence of a significant change in one of the criteria listed in paragraph 6D. Below. The Cities shall concur that the substantial change warrants an amendment to the original designated urban service area.

C. A public process shall be conducted regarding an amendment to an urban service area.

D. *Criteria for Designation of Potential Annexation Areas*

- Recognition of resident community identification.
- Financial and technical ability to provide municipal services.
- Creation of logical service areas (vehicular accessibility and utility construction).
- Recognition of physical boundaries.

E. The proposed amended USA agreement shall be submitted to the respective legislative authorities for approval.

7. DURATION AND TERMINATION.

This Agreement is effective upon signature of both parties and shall continue in effect from year to year unless terminated by a six month written notice by one party to the others.

8. SEVERABILITY CLAUSE.

Any provision of this Agreement which is declared invalid or illegal shall in no way affect or invalidate any other provision hereof and such other provisions shall remain in full force and effect.

9. INDEMNIFICATION.

A. The City of Pacific shall indemnify and hold harmless the City of Auburn and its officers, agents and employees, or any of them from any and all claims, actions, suits, liability, loss, costs, expenses and damages of any nature whatsoever, by reason of or arising out of any negligent act or omission of the City of Pacific, its officers, agents and employees, or any of them, in the performance of this Agreement. In the event that any such suit based upon such a claim, action, loss or damage is brought against the City of Auburn, the City of Pacific shall defend the same at its sole cost and expense; provided, that that the City of Auburn reserves the right to participate in such suit if any principle of governmental or public law is involved. If final judgment be rendered against the City of Auburn and its officers, agents and employees, or any of them, the City of Pacific shall satisfy the same, including all chargeable costs and attorney's fees.

B. In executing this Agreement, the City of Pacific does not assume liability or responsibility for, or in any way release, the City of Auburn from any liability or responsibility which arises in whole or in part from the existence or affect City of Auburn ordinances, rules or regulations. If any cause, claim, suit, action or administrative proceedings is commenced in which the enforceability and/or validity of any such City of Auburn ordinance, rule or regulation is at issue, the City of Auburn shall defend the same at its sole expense and if judgment is entered or damages are

awarded against the City of Pacific, the City of Auburn shall satisfy the same. including all chargeable costs and attorney's fees.

C. The City of Auburn shall indemnify and hold harmless the City of Pacific and its officers, agents and employees, or any of them, from any and all claims, actions, suits. liability, loss, costs, expenses and damages of any nature whatsoever, by reason of our arising out of any negligent act or omission of the City of Auburn, its officers, agents or employees or any of them, relating to or arising out of the performance of this Agreement. In the event that any suit based on such a claim, action, loss or damage is brought against the City of Pacific, the City of Auburn shall defend the same at its sole costs and expense; provided by the City of Auburn retains the right to participate in and suit of any principle of government law is involved; and if final judgment be rendered against the City of Pacific, and its officers, agents and employees, or any of them, the City of Auburn shall satisfy the same, including all chargeable costs and attorney's fees.

D. In executing this Agreement, the City of Auburn does not assume liability or responsibility for or in any way release the City of Pacific from any liability or responsibility which arises in whole or in part from the existence or affect City of Pacific ordinances, rules or regulations. If any cause, claim, suit, action or administrative proceedings is commenced in which the enforceability and/or validity of any such City of Pacific ordinance, rule or regulation is at issue, the City of Pacific shall defend the same at its sole expense and if judgment is entered or damages are awarded against the City of Auburn, the City of Pacific shall satisfy the same. including all chargeable costs and attorney's fees.

10. ADMINISTRATION.

This Agreement shall be administered by:

A. The Mayor of Pacific or the Mayor's designee, and

B. The Mayor of Auburn or the Mayor's designee.

ORIGINAL

AN AGREEMENT BETWEEN THE CITIES OF SUMNER AND AUBURN RELATING TO POTENTIAL ANNEXATION AREA DESIGNATION

THIS AGREEMENT is entered into on this 16th day of JULY, 1996, by and between the City of Sumner, a municipal corporation of the State of Washington (hereinafter referred to as "Sumner") and the City of Auburn, a municipal corporation of the State of Washington (hereinafter referred to as "Auburn").

WHEREAS, pursuant to RCW 36.70A.110(2), the Washington State Growth Management Act of 1990 as amended, requires each city within Pierce County to propose the location of an urban growth area; and

WHEREAS, the King Countywide Planning Policies adopted and approved by Ordinance 10450 on July 6, 1992, by the King County Council and amended by Ordinance 11446 on July 19, 1994 and ratified by cities within King County, establish rules for designating potential annexation areas for cities within the countywide urban growth boundary; and

WHEREAS, King Countywide Planning Policy LU-31 states that each city shall designate a Potential Annexation Area (PAA) in collaboration with adjacent counties and cities and King County, and in consultation with residential groups in affected areas; and

WHEREAS, Pierce Countywide Planning Policies adopted and approved by Resolution No. R92-86 on June 30, 1992 by the Pierce County Council reestablish rules for designating urban growth areas for cities within Pierce County; and

WHEREAS, Pierce Countywide Planning Policy No. 1 on Urban Growth areas states "The County shall designate urban growth areas for the County and each municipality in the County based on consultations between the County and each municipality"; and

WHEREAS, the Pierce County Comprehensive Plan approved November 29, 1994 by the Pierce County Council establishes procedures for the adoption of Urban Service Areas (USA's) as a part of a Comprehensive Urban Growth Area (CUGA). The plan also adopts Urban Service Areas for the jurisdictions within Pierce County. The plan indicates an overlap of the USA's for the Cities of Auburn and Sumner in the general vicinity of an approved private development called Lakeland; and

WHEREAS, it is of mutual interest to Sumner and Auburn to resolve the overlaps between the Potential Annexation Areas in order to allow for continued land use and capital facility planning without threat of litigation or appeals; and

WHEREAS, in the spirit of cooperation and mutual understanding, Sumner and Auburn desire to address mutual interests, work together on issues of mutual benefit, and enter into agreements to work constructively on issues of concern; **NOW THEREFORE,**

Exhibit A Resolution No. 2762
August 5, 1996

In consideration of the mutual benefits, Sumner and Auburn hereby agree to the terms and conditions as set forth below:

SECTION 1. PURPOSE.

The purpose of this agreement is to confirm the decision made between Sumner and Auburn for the identification of Potential Annexation Area boundaries and Urban Service Areas.

SECTION 2. DEFINITIONS.

A. Potential Annexation Area (PAA): is a term used in the King Countywide Planning Polices meaning the incorporated urban area adjacent to a city, within which urban growth shall be encouraged and phased, and which is expected to annex to the city. Annexation is expected to occur sometime during the next twenty (20) years at which time the city will provide services and utilities. For purposes of this agreement, the term Potential Annexation Area is the same as Urban Service Area (USA) as applied in the Pierce County Comprehensive Plan.

B. Urban Growth Areas: means areas proposed by the Sumner and Auburn and designated by the county within which urban growth shall be encouraged and passed and outside of which growth can occur only if it is not urban in nature.

C. Urban Growth Boundary: means the boundary marking the limit between the urban growth areas and other areas such as rural and resource area where urban growth is not permitted. The boundary shall be designated by the county in consultation with Sumner and Auburn, under the requirements of the Growth Management Act.

SECTION 3. PUBLIC PROCESS.

The designation of PAAs in Exhibit A (map) attached hereto and by this reference made a part of this agreement are of interest to a variety of affected parties, including property owners, area residents, the general public, special service districts and the municipalities.

SECTION 4. RELATIONSHIP TO EXISTING LAWS AND STATUES.

This Agreement shall in no way modify nor supersede existing laws and statutes and is consistent with existing laws and statutes. In meeting the commitments encompassed in this Agreement, all parties shall comply with the requirements of the annexation statutes, Open Public Meetings Act, State Environmental Policy Act, Growth Management Act and Countywide Planning Policies for King and Pierce Counties.

SECTION 5. RESPONSIBILITIES.

A. Sumner and Auburn acknowledge the PAA boundary described in Exhibit A.

B. Sumner and Auburn shall only annex territory within their designated PAAs.

C. Sumner and Auburn shall conduct a public involvement process that includes, but is not limited to, workshops, surveys, or hearings in areas within the PAA prior to the inclusion of any additional areas within the PAA.

SECTION 6. JOINT PLANNING

Sumner and Auburn shall work cooperatively together in the planning and delivery of services to the respective PAA to the extent feasible as described below:

A. Sumner and Auburn shall initiate discussions between staff to review the feasibility of sharing the costs associated with the construction and operation of a water storage facility. Both cities shall also explore the possibility of shared water resources.

B. Sumner and Auburn shall work cooperatively on other issues of mutual concern which may arise including:
   1. Design, funding, and construction of the 8th Street Corridor from Lake Tapps to SR 167;
   2. Railroad traffic and the mitigation of increased rail activity on transportation;
   3. Mitigation of stormwater impacts to the valley;
   4. Modifications to the Mud Mountain Dam to reduce base flood levels;
   5. Joint fire services and operations such as training, hazardous spill response, mutual aide, and special operations;
   6. Bicycle and pedestrian trails connecting the Sumner and Auburn;
   7. Watershed planning and management related to the Stuck (White) River and its tributaries; and
   8. Joint planning and participation with Pierce County.

SECTION 7. AMENDMENTS.

A. A city which desires to modify the Potential Annexation Area shall contact the other party to this Agreement to begin discussions regarding potential annexation or boundary amendments. Sumner and Auburn agree to participate in such discussions when called. Either city is authorized to call a meeting upon providing the other city has at least a thirty (30) day written notice.

B. The proposed amendments shall be supported by written evidence of a significant change in one of the criteria listed in paragraph 7D below. Sumner and Auburn shall concur that the substantial change warrants an amendment to the original designated PAA.

C. A public process shall be conducted regarding an amendment to a potential annexation area as described in 5(c) above.

D. Criteria for Designation of Potential Annexation Areas

1. Recognition of resident community identification.
2. Financial and technical ability to provide municipal services.
3. Creation of logical service areas (vehicular accessibility and availability of utility service).
4. Recognition of physical boundaries.
   -bodies of water
   -topographical features
   -watersheds
   -freeways
5. Protection of critical/resource areas significant to a particular jurisdiction.
   -protection of critical areas
   -opportunities for urban separators
6. Logical boundaries.
   -elimination of unincorporated islands
   -no overlapping potential annexation areas

E. The proposed amended PAA agreement shall be submitted to the respective legislative authorities for approval.

SECTION 8. DURATION AND TERMINATION.

This Agreement shall be in effect upon signature of both parties and shall continue in effect from year to year unless terminated by a six month written notice by one party to the others.

SECTION 9. SEVERABILITY CLAUSE.

Any provision of this Agreement which is declared invalid or illegal shall in no way affect or invalidate any other provision hereof and such other provisions shall remain in full force and effect.

Exhibit A Resolution No. 2762
August 5, 1996

SECTION 10 ADMINISTRATION.

This Agreement shall be administered by the Mayor of the City of Sumner and the City of Auburn, or their designees.

ORDINANCE NO. 6624

AN ORDINANCE OF THE CITY COUNCIL OF THE CITY OF AUBURN, WASHINGTON, RATIFYING THE FRANCHISE AGREEMENT WITH LAKEHAVEN UTILITY DISTRICT ADOPTED BY RESOLUTION NO. 3650

WHEREAS, the Lakehaven Utility District currently owns, operates, and maintains a water system within the City of Auburn's public rights-of-way within the City of Auburn corporate boundary; and

WHEREAS, in 2004, the City and Lakehaven Utility District negotiated a franchise agreement that was approved by the City Council through Resolution Number 3650; and

WHEREAS, Revised Code of Washington 35A.47.040 includes certain procedural requirements not typically followed when adopting a resolution; and

WHEREAS, the City wishes to ensure that the benefits and obligations inured to Lakehaven Utility District through Resolution Number 3650 are not invalidated by any procedural deficiency; and

WHEREAS, ratification of Resolution Number 3650 by this Ordinance will resolve any omission in the procedural requirements of RCW 35A.47.040 and conform to the City's standard practice of franchise adoption by ordinance; and

WHEREAS, following proper notice, the City Council held a public hearing on ratification of Resolution Number 3650; at which time interested citizens were heard in a full public proceeding affording opportunity for comment by any and all persons desiring to be heard; and

WHEREAS, from information presented at such public hearing, and from facts and circumstances developed or discovered through independent study and investigation, the City Council now deems it appropriate and in the best interest of the City and its inhabitants that Resolution Number 3650 be ratified.

NOW, THEREFORE, THE CITY COUNCIL OF THE CITY OF AUBURN, WASHINGTON, DO ORDAIN as follows:

Section 1. Grant of Franchise The provisions of Resolution Number 3650, attached hereto as Exhibit A and incorporated herein by this reference, are hereby adopted as if fully set forth herein.

Section 2. Implementation. The Mayor is hereby authorized to implement such administrative procedures as may be necessary to carry out the directions of this legislation.

Section 3. Severability. The provisions of this ordinance are declared to be separate and severable. The invalidity of any clause, sentence, paragraph, subdivision, section or portion of this ordinance, or the invalidity of the application thereof to any person or circumstance shall not affect the validity of the remainder of this ordinance, or the validity of its application to other persons or circumstances.

Section 4. Effective date. This Ordinance shall take effect and be in force five days from and after its passage, approval and publication as provided by law.

RESOLUTION NO. **3650**

A RESOLUTION OF THE CITY COUNCIL OF THE CITY OF AUBURN, WASHINGTON, AUTHORIZING THE MAYOR TO EXECUTE A FRANCHISE AGREEMENT BETWEEN THE LAKEHAVEN UTILITY DISTRICT AND THE CITY OF AUBURN, ALLOWING THE LAKEHAVEN UTILITY DISTRICT TO CONNECT, INSTALL, OPERATE, MAINTAIN AND REPAIR WATER SYSTEM, FACILITIES, AND APPURTENANCES IN, OVER, ALONG, ACROSS AND UNDER THE FRANCHISE AREA FOR THE PURPOSE OF PROVIDING WATER SERVICE

WHEREAS, the Lakehaven Utility District currently owns, operates, and maintains a water system within Auburn's public right of way located in the franchise area; and

WHEREAS, the Lakehaven Utility District is seeking a new comprehensive franchise with Auburn for public water facilities installed within Auburn's current and future public right of way; and

WHEREAS, in order to maintain control over the use of City of Auburn right-of-ways by utilities operating within the City of Auburn, it is appropriate to enter into franchise agreements with such utilities; and

WHEREAS, Lakehaven Utility District is such a utility, and has negotiated this franchise agreement with the City of Auburn acceptable to both parties; and

WHEREAS, the City of Auburn has determined that it is in the best interests of the public to grant the Lakehaven Utility District a water franchise on the terms and conditions set for in this Agreement.

NOW, THEREFORE, THE CITY COUNCIL OF THE CITY OF AUBURN, WASHINGTON, HEREBY RESOLVES as follows:

Section 1. The Mayor of the City of Auburn is herewith authorized to execute a Franchise Agreement between the Lakehaven Utility District and the City of Auburn in substantial conformity with the Agreement attached hereto, marked as Exhibit "A" and incorporated herein by this reference.

Section 2. The Mayor is hereby authorized to implement such administrative procedures as may be necessary to carry out the directives of this legislation.

Section 3. This resolution shall be in full force and effect upon passage and signatures hereon.

DATED this 2nd day of February, 2004.

CITY OF AUBURN, WASHINGTON
WATER FRANCHISE AGREEMENT
WITH THE LAKEHAVEN UTILITY DISTRICT

THIS FRANCHISE AGREEMENT, made and entered into this 23rd day of September, 2004, by and between the CITY OF AUBURN, Washington and the LAKEHAVEN UTILITY DISTRICT:

WITNESSETH:

WHEREAS, the Lakehaven Utility District currently owns, operates, and maintains a water system within Auburn's public right-of-way located in the franchise area; and

WHEREAS the Lakehaven Utility District is seeking to establish a comprehensive franchise with the City of Auburn for water system lines within Auburn's current and future public right-of-way; and

WHEREAS, in order to maintain control over the use of City of Auburn rights-of-way by utilities operating within the City of Auburn, it is appropriate to enter into franchise agreements with such utilities; and

WHEREAS, Lakehaven Utility District is such a utility, and has negotiated this franchise agreement with the City of Auburn acceptable to both parties; and

WHEREAS, the City of Auburn has determined that it is in the best interests of the public to grant the Lakehaven Utility District a franchise on the terms and conditions set forth in this franchise agreement.

NOW, THEREFORE THE CITY OF AUBURN AND THE LAKEHAVEN UTILITY DISTRICT AGREE AS FOLLOWS:

SECTION 1 DEFINITIONS

Where used in this franchise agreement ("Franchise"), the following definitions shall apply:

1.1 "Franchisee" means the Lakehaven Utility District, a Washington municipal corporation, and its respective successors and assigns.

1.2 "City" means the City of Auburn, a Washington municipal corporation.

1.3 "Franchise Area" means all of the public roads, streets, avenues, alleys, highways, and other rights-of-way of the City as now laid out, platted, dedicated or improved; and any and all public City roads, streets, avenues, alleys, highways, and other rights-of-way that may hereafter be laid out, platted, dedicated or improved within the area in which the City has jurisdiction, as described in Attachment 1 and as depicted in

Attachment 2, both attachments attached hereto, which is by this reference incorporated as if fully set forth herein; provided, that the Franchise Area shall not include or convey any right to the Franchisee to install facilities on, or to otherwise use, City owned or leased properties; and provided that the terms of this franchise (i.e., permitting and enforcement) shall not apply to those public roads, streets, avenues, alleys, highways, and other rights-of-way that may hereafter be laid out, platted, dedicated or improved within the area as described in Attachment 1 and depicted in Attachment 2 until such time that the City has assumed jurisdiction thereof.

1.4 "Facilities" means the Franchisee's water system, lines, mains, pump stations, appurtenances, and all other necessary or convenient appurtenances for the purpose of providing water service.

SECTION 2 FRANCHISE GRANT

Subject to the terms and conditions set forth in this Franchise, the City grants to the Franchisee the right to construct, own and maintain its Facilities, including, but not limited to, water pipelines, pump stations, and appurtenances within the City's public right-of-way and the Franchisee's water service area. In exercising authority to construct and install its Facilities and to excavate trenches in City roads for the purposes of constructing, installing, operating, maintaining, removing, and replacing its Facilities, and making connections between the same to the dwellings and other buildings of the consumers, the Franchisee shall be governed by and conform to the general rules adopted by the Public Works Department of the City, and the Franchisee, at no expense to the City, shall complete all work and shall replace and restore the City roads to the condition of the City roads existing immediately prior to such disturbance; PROVIDED, HOWEVER, that no such work shall be done prior to the obtaining of a permit therefor issued by the City's Public Works Director (hereinafter "Director"), which permit shall set forth conditions pertaining to the work to be done and specifications for the restoration of the roads to the same condition as they were immediately prior to such work. If the Franchisee does not repair the City roads to the satisfaction of the Director, the City may, at its sole discretion, repair such City roads, or cause them to be repaired, and the Franchisee hereby agrees to reimburse the City for the cost of such work, including reasonable overhead costs.

SECTION 3 FRANCHISE TERM

This Franchise shall take full force and effect five calendar days after being approved by the City, and shall be valid for a period of 25 years, expiring in 2029; provided, that this Franchise shall not take effect and the Franchisee shall have no rights under this Franchise unless the Franchisee files a written acceptance of this Franchise with the City pursuant to Section 4 of this Franchise.

SECTION 4 ACCEPTANCE BY FRANCHISEE OF TERMS AND CONDITIONS

The full acceptance of this Franchise and all of its terms and conditions shall be filed with the City Clerk within forty-five (45) days from the date of the resolution approving this Franchise by the Franchisee's duly elected Board of Commissioners. Full acceptance of this Franchise is a condition precedent to its taking effect, and unless this Franchise is

accepted within the time specified, this grant will be null and void and have no force or effect.

SECTION 5 NON-EXCLUSIVE FRANCHISE

This Franchise is not exclusive. It does not prohibit the City from granting franchises for other public or private utilities in, over, along, across, and under any City property, including the Franchise Area. This Franchise does not prevent or prohibit the City from constructing, altering, maintaining or using any of the Franchise Area. The City retains full power to make all changes, relocations; repair, maintenance or other work to or in the Franchise Area as the City deems fit.

SECTION 6 JURISDICTION

This Franchise is intended to convey limited rights and interest only as to those roads and rights-of-way in which the City has an actual interest within the Franchise Area. It is not a warranty of title or of interest in City road rights-of-way. None of the rights granted to the Franchisee shall affect the jurisdiction of the City over City road rights-of-way or the City's power to perform work upon its roadways, rights-of-way or appurtenant drainage facilities including by constructing, altering, renewing, paving, widening, grading, blasting or excavating. The parties shall comply with all applicable rules and regulations pertaining to them in connection with the matters covered herein.

SECTION 7 REGULATION OF USE AND CONTROL

This Franchise does not deprive the City of any powers, rights, or privileges it now has or may later acquire in the future to regulate the use of and to control the City road rights-of-way covered by this Franchise. The City reserves the right and power at all times to exercise its police powers with respect to the time, manner and location of the placement of the Franchisee's Facilities.

SECTION 8 EMINENT DOMAIN

This Franchise and the limited rights and interests granted by this Franchise are subject to the exercise of eminent domain. In the event of an exercise of eminent domain by the City, the value to be attributed to all the rights and interests granted under this Franchise shall not exceed the actual amount the Franchisee paid to the City in obtaining this Franchise.

SECTION 9 VACATION

If at any time the City vacates any City rights-of-way covered by this Franchise, the City will not be held liable for any damages or loss to the Franchisee by reason of such vacation. The City may, after giving thirty (30) days written notice to the Franchisee, terminate this Franchise with respect to any City road or rights-of-way vacated. However, should Franchisee notify the City that an easement is required for existing or proposed facilities within the proposed vacation area, the City shall withhold approval of such vacation until the Franchisee has notified the City that the necessary easement(s) have been secured, or provisions otherwise made to maintain the viability and use of existing Facilities.

SECTION 10 ENFORCEMENT

The City's failure to enforce any provision of this Franchise does not constitute a waiver of its right to enforce that provision or any other provision of this Franchise.

SECTION 11 INDEMNITY AND HOLD HARMLESS

11.1 The Franchisee shall defend, indemnify and hold harmless the City, its appointed and elected officials, and its employees and agents from and against liability for all claims, actions, injuries, demands, liabilities, losses, costs, damages and judgments, including costs of defense thereof, (collectively referred to as "damages") for injury to persons, death or property damage caused by, arising out of, or incidental to the Franchisee's exercise of the rights and privileges granted by this Franchise, except for damages caused by or arising out of the City's sole negligence. In the event that any such claim or demand for damages is presented to or filed with the City, or if any suit or action is initiated against the City based on such claims or demands for damages, the City shall promptly notify the Franchisee of the claim, demand, suit or action and the Franchisee shall have the right, at its election and its sole cost and expense, to settle and compromise such claim, demand, suit or action, or defend the same at the Franchisee's sole cost and expense.

11.2 If it is determined that RCW 4.24.115 applies to this Franchise, the Franchisee agrees to defend, hold harmless and indemnify the City to the maximum extent permitted under that statute, and specifically for the Franchisee's negligence concurrent with that of the City to the full extent of the Franchisee's negligence.

SECTION 12 INSURANCE

12.1 The Franchisee shall keep a policy of insurance in force with a minimum limit of five million dollars ($5,000,000.00). Verification of insurance coverage is a condition precedent to the effectiveness of this Franchise.

12.2 The insurance shall be maintained in full force and effect at the Franchisee's sole expense throughout the term of the Franchise, and, should such insurance be terminated, this Franchise shall terminate as of the date of the termination of insurance coverage.

12.3 The coverage provided by the Franchisee's insurance policies shall be primary to any insurance maintained by the City, except as to losses or damages attributable to the sole negligence of the City. Any insurance maintained by the City that might relate to this Franchise shall be in excess to the Franchisee's insurance and shall not contribute with or to it. The City has no obligation to report occurrences to the insurance companies unless a claim is filed with the City's City Council; and the City has no obligations to pay the Franchisee's premiums.

12.4 The Franchisee shall be solely and completely responsible to perform all work related to this Franchise in compliance with all applicable federal, state, county and city statutes, rules, regulations, ordinances, orders and codes. The Franchisee's attention is directed to the requirements of the Washington Industrial Safety and Health Act, Chapter 49.17 RCW. The Franchisee shall be solely and completely responsible for

safety and safety conditions on its job sites and for its work within the Franchise Area, including the safety of all persons and property during performance of any works therein. The services of the City or City's consultant personnel in conducting construction review of the Franchisee's work relating to the Franchise is not intended to include review of the adequacy of the Franchisee's work methods, equipment, scaffolding, or trenching, or safety measures in, on or near such Franchise Area or job site. The Franchisee shall provide safe access for the City and its inspectors to adequately inspect the work and its conformance with applicable statutes, ordinances, rules, regulations, and the Franchise.

SECTION 13 INSTALLATION, REPAIR, REMOVAL OR RELOCATION

13.1 The Franchisee shall, at no expense to the City, expeditiously repair all existing Facilities that it owns within the Franchise Area, including any damage caused directly or indirectly by its Facilities, all appurtenant Facilities and service lines connecting its system to users, if the City requires such repair for any reasonable purpose.

13.2 The Franchisee shall, at no expense to the City, adjust, remove or relocate existing Facilities within the Franchise Area, including all appurtenant Facilities and service lines connecting its system to users, if the City determines such adjustment, removal or relocation is reasonably necessary to allow for an improvement or alteration planned by the City. The City shall give the Franchisee written notice of such requirement as soon as practicable. The written notice shall include all available information, such as plans and specifications, as is reasonably necessary for the Franchisee to plan for such adjustment, removal or relocation.

13.3 Franchisee's Facilities shall be constructed, installed, maintained and repaired within the Franchise Area so as to provide safety of persons and property, and not interfere with the free passage of traffic, all in accordance with the laws of the State of Washington, and the ordinances, resolutions, rules and regulations of the City.

13.4 For projects that are a part of the City's capital improvement program, in addition to any other notice given to the Franchisee, the City shall provide a copy of the capital improvement plan and six (6) year transportation improvement plan when requested. Further, the City shall provide a horizontal plan and vertical profile of the roadway and drainage facilities within it, both existing and as proposed by the City, and the proposed construction schedule. The initial design information shall be given at least one hundred and eighty (180) days before construction is scheduled to begin, except in cases of urgent construction or emergencies. The Franchisee shall respond to this notice, and to any later notices of revised designs, within twenty (20) days of the date of the notice, by providing to the City the Franchisee's best available information as to the location of all the Franchisee's Facilities, including all appurtenant Facilities and service lines connecting its system to users, and all Facilities that it has abandoned, within the area proposed for the project.

13.5 The City shall offer the Franchisee the opportunity to participate in the preparation of bid documents for the selection of a contractor to perform the public works project as well as all required adjustments, removals or relocations of the Franchisee's Facilities. The City shall have sole authority to choose the contractor to perform such

work. Such bid documents shall provide for an appropriate cost allocation between the parties. In addition to the Franchisee's allocation of contractor costs, the Franchisee shall reimburse the City for all costs, to include but not be limited to legal, engineering, inspections, administration and/or soils testing, related to the Franchisee's work and reasonably incurred by the City in the administration of such joint construction contracts. Such costs shall include the direct salary cost of the time of City professional and technical personnel, including the City's consultants, spent productively engaged in such work, plus overhead costs at the standard rate charged by the City on other similar projects. The specific terms of the joint participation on any public work shall be as set forth in a written agreement between the parties.

13.6 It is understood that emergency situations may arise that could threaten public health and/or continued operation of the Franchisee's utility system and the Franchisee may be unable to notify the City in the manner prescribed in Section 14 of this Franchise. In such a situation the Franchisee shall immediately correct the hazardous situation and continue to use best efforts to contact the City staff. The Emergency Phone Number for the City of Auburn is (253) 931-3048, and that for the Lakehaven Utility District is (253) 941-1516. Dialing 911 is advised for emergency situations that may result in imminent threats to life and/or property.

SECTION 14 REQUIREMENT OF CONSTRUCTION PERMITS

14.1 The Franchisee has the right, privilege and authority to enter the City road rights-of-way for the purpose of constructing, installing, operating, maintaining, replacing or repairing its Facilities on the condition that it obtains construction, excavation, and right-of-way use permits issued by the City. Any work performed, whether by Franchisee, its contractors, or third parties, shall include necessary paving, patching, grading and any other reasonably necessary repair or restoration to the City rights-of-way. All work shall be done to the City's satisfaction.

14.2 All equipment, pipelines and appurtenances which are used in the construction, installation, operation, maintenance or repair of the Franchisee's Facilities and which are located within the City road rights-of-way and owned by the Franchisee shall be considered to be part of the Franchisee's system and shall be the responsibility of the Franchisee. All permits for the construction, installation, operation, maintenance or repair of the Franchisee's system shall be applied for and given in the name of the Franchisee, who will be responsible for all work done under the permit. The Franchisee remains responsible whether the work is performed by the Franchisee, its contractors, or by third parties.

14.3 When required by the City's Public Works Director, the Franchisee shall post a bond to the City in the amount sufficient for any road repair or restoration. The amount of the bond shall be set by the City and must be filed with the City before a permit will be issued.

SECTION 15 PERFORMANCE OF WORK

15.1 Any work performed by the Franchisee in the Franchise Area shall conform to all City ordinances and requirements including, but not limited to, Auburn City Code and the City's Design and Construction Standards in force when the work is performed. All traffic control shall conform to the current edition of the Manual of Uniform Traffic Control Devices in force when the work is performed.

15.2 If work performed under this Franchise makes it necessary to turn off or diminish water pressure or potential flow to any fire hydrant, the Franchisee shall notify the City's Fire Department by telephone and by written notice, that water pressure or fire flow conditions have been affected. Except in the case of an emergency, the notice shall be provided at least 48 hours prior to the water pressure or potential flow being suspended or diminished. If more than one fire hydrant will be affected, the Franchisee shall provide a map of the affected area to the Fire Department. Out-of-service fire hydrants must be identified as not operational by covering with a properly secured burlap or plastic bag. Fire hydrants should be returned to full service as soon as reasonably possible or no longer than two working days from the date service was suspended or diminished. The Franchisee shall notify the City's Fire Department when the hydrant(s) is/are returned to full service.

SECTION 16 RESTORATION OF CITY RIGHTS-OF-WAY

After performing work on, under or adjacent to City road rights-of-way, the Franchisee is responsible for and shall leave all City road rights-of-way in the condition of the City road rights-of-way existing immediately prior to such disturbance. If the Franchisee, its contractors, or third parties working under permit should fail to diligently restore City road rights-of-way to the satisfaction of the City, the City may make such repairs or restorations as are necessary to return the City road rights-of-way to a condition reasonably comparable to the condition of the City road rights-of-way existing immediately prior to such disturbance. Upon presentation of an itemized invoice for repairs or restorations, including all applicable costs, both direct and indirect, to include, but not be limited to, the cost of labor, tools, materials and equipment, the Franchisee shall pay the invoice within sixty-five (65) days of its receipt and approval.

SECTION 17 INFORMATION ON LOCATION OF FACILITIES

The Franchisee shall provide the City with all information requested by the City regarding the location of the Franchisee's current Facilities, including, but not limited to, copies of all record drawings for such Facilities. If the Franchisee performs any work to install, repair, reconstruct, or replace Facilities in the Franchise Area after this Franchise's effective date, the Franchisee shall provide the City with all information requested by the City regarding the location of those Facilities, including, but not limited to, copies of record drawings.

SECTION 18 COORDINATION OF WORK IN FRANCHISE AREA

To facilitate the coordination of work in City rights-of-way, if either the Franchisee or the City plans to make excavations in the Franchise Area, the party planning such excavation shall provide written notice to the other of the planned excavation, affording the other party the opportunity to share in the excavation; provided, that (1) such joint use shall not unreasonably delay the work of the party causing the excavation to be made, (2) such joint use shall be arranged and accomplished on terms and conditions satisfactory to both parties, and (3) either party may deny such request for safety reasons.

SECTION 19 BLASTING REQUIREMENTS

The Franchisee's right to construct, install, operate, maintain and repair Facilities does not preclude the City, its agents or contractors from blasting, grading, or doing other road work contiguous to the Franchisee's Facilities. When practical, the City shall give the Franchisee forty-eight (48) hours notice of blasting or excavating.

SECTION 20 SURVEY MARKERS AND MONUMENTS

Before any work is performed under this Franchise, the Franchisee shall establish two or more reference marks to all monuments and markers of every nature relating to subdivisions, plats, rights-of-way, and all other surveys. The reference points shall be located so that they will not be disturbed during any of Franchisee's operations under this Franchise. The method of referencing monuments or other markers or points shall be approved by the City before placement. The replacement of all markers or monuments disturbed during any construction of the Franchisee shall be made as promptly as conditions permit. The cost of monuments or markers lost, destroyed, or disturbed and the expense or replacement with approved markers or monuments shall be borne by the Franchisee.

SECTION 21 RESERVATION OF RIGHTS

21.1 The City reserves the right to impose, to the extent authorized by law, a utility tax on the Franchisee and/or to charge the Franchisee a reasonable fee for services provided or rights granted under this Franchise.

21.2 The Franchisee agrees that it shall be subject to all authority now or later possessed by the City or any other governing body having competent jurisdiction to fix just, reasonable and compensatory rates for services under this Franchise.

21.3 The City reserves the right, upon thirty (30) days written notice to the Franchisee, to amend or modify the provisions or conditions of this Franchise to conform to any state, county, federal, or City statute, ordinance, rule or regulation. The City may terminate this Franchise upon thirty (30) days written notice to the Franchisee if the Franchisee fails or refuses to comply with such amendment or modification.

SECTION 22 ASSIGNMENT

The Franchisee shall not have the right to assign this Franchise without the written consent of the City. No assignment shall be effective unless an acceptance by the assignee of all rights, conditions, terms, provisions and responsibilities contained within the Franchise, as well as surety bonds which the City deems necessary to be posted, are received as allowed by law. The City's approval of the assignment may be made subject to the assignee's acceptance of new or modified terms of the Franchise.

SECTION 23 PENALTY FOR VIOLATION OF CONDITIONS

If the Franchisee fails to comply with any material term, condition or responsibility under this Franchise, the City may provide the Franchisee with written notice of the City's intent to revoke the Franchise if the Franchisee's failure is not cured within thirty (30) days of the date of the notice. During the thirty (30) days following the date of the notice, the Franchisee shall have the opportunity to remedy the failure to comply. A public hearing shall be scheduled before the Auburn City Council at least thirty (30) days following the notification on the issue of the revocation. If at the hearing, the City Council finds that grounds exist to revoke the Franchise under this paragraph and that the revocation is in the public interest, the City Council may by resolution revoke the Franchise. The revocation shall be effective ninety (90) days after the public hearing.

SECTION 24 EXPIRATION AND RENEWAL

24.1 If the Franchisee requests a renewal of this Franchise prior to its expiration date, which renewal shall be granted, on terms reasonable to the parties, unless the City can demonstrate, in good faith, that such renewal would be contrary to its operation of the right of way, the City may, at the City's sole discretion, extend the term of this Franchise for up to one year beyond the expiration date to allow for processing of the renewal. If the City elects to extend the term of this Franchise, written notice of the extension shall be provided to the Franchisee prior to the Franchise expiration date.

24.2 If the Franchisee has not requested a renewal of this Franchise prior to its expiration date, the City has the right, upon thirty (30) day's prior notice to the Franchisee, to remove or relocate any of the Franchisee's Facilities as is reasonably necessary for the public's health, welfare or safety, or for the construction, alteration, or improvement of the Franchise Area, or for the construction or installation of lines or facilities of other franchise holders. The Franchisee shall be liable for costs incurred in any removal or relocation of the Franchisee's Facilities under this section.

24.3 Upon the expiration of this Franchise, the Franchisee shall continue to be responsible for the operation and maintenance of the Franchisee's existing facilities in the Franchise Area, but shall not have the right to provide additional services. This Section and Sections 11, 13, 14, 15, 16, 18, and 20 of this Franchise shall continue in force until such time as the Franchisee's Facilities are abandoned to the City's satisfaction.

SECTION 25 COMPLIANCE WITH LAWS
The Franchisee shall conform to all applicable federal, state and local laws and regulations including, but not limited to, the State Environmental Policy Act and the City's Environmental Standards and Ordinances.

SECTION 26 NON-DISCRIMINATION CLAUSE
In all hiring or employment made possible or resulting from this Franchise, there shall be no discrimination against any employee or applicant for employment because of sex, sexual orientation, age, race, color, national origin, marital status or the presence of any sensory, mental, or physical handicap, unless based upon a bona fide occupation qualification. No person shall be denied or subjected to discrimination in receipt of the benefit of any services or activities made possible by or resulting from this Franchise on the grounds of sex, sexual orientation, race, color, national origin, age, except minimum age and retirement provisions, marital status, or the presence of any sensory, mental or physical handicap.

SECTION 27 NOTICE
All notices between the two agencies hereunder may be delivered or mailed. If mailed, they shall be sent to the following respective addresses:

City of Auburn:
City Engineer
25 West Main Street
Auburn, WA 98001-4998
Tel: 253-931-3010

Lakehaven Utility District:
General Manager
31627 1st Ave South
PO Box 4249
Federal Way, WA 98063-4249
Tel: 253-941-1516

or to such other representative addresses as either party may hereafter from time to time designate in writing. All notices and payments mailed by regular post (including first class) shall be deemed to have been given on the second business day following the date of mailing, if properly mailed and addressed. Notices and payments sent by certified or registered mail shall be deemed to have been given on the day next following the date of mailing, if properly mailed and addressed. For all types of mail, the postmark affixed by the United States Postal Service shall be conclusive evidence of the date of mailing.
If an emergency situation develops, it is recommended that the City or the Franchisee call 911 to solicit an emergency response.

SECTION 28 ATTORNEYS' FEES
If either party shall be required to bring any action to enforce any provision of this Franchise, or shall be required to defend any action brought by the other party with respect to this Franchise, and in the further event that one party shall substantially prevail in such action, the losing party shall, in addition to all other payments required therein, pay all of the prevailing party's reasonable costs in connection with such action, including such sums as the court or courts may adjudge reasonable as attorney's fees in trial court and in appellate courts.

SECTION 29 SEVERANCE
If any term, provision, condition or portion of this Franchise is held to be invalid, such invalidity shall not affect the validity of the remaining portions of this Franchise which shall continue in full force and effect, unless the dominant purpose of the Franchise would be prevented or the public interest would no longer be served, as determined by the City.

SECTION 30 EFFECTIVE DATE
The resolution approving the Franchise, having been introduced at least five days prior to its date of passage and submitted to the city attorney, and being approved by at least a majority of the entire city council at a regular city council meeting, shall take effect and be in force five calendar days after its passage and approval by both parties to this Franchise.

SECTION 31 EXISTING UTILITIES
This Franchise shall govern existing and future water system facilities currently owned, operated and maintained by Lakehaven Utility District within the City of Auburn.

SECTION 32 DISPUTE RESOLUTION
In the event that a dispute arises with regard to the terms of this Franchise Agreement, either party may request that the dispute be submitted to non-binding mediation or arbitration prior to court action. Such request for non-binding mediation or arbitration shall be made in writing and mailed by first class, U.S. Mail to the other party. The mediator or arbitrator shall be chosen by agreement of the parties. Either party may refuse to submit to the dispute resolution process. Refusal to engage in the dispute resolution process shall not prejudice the refusing party in any way.

IN WITNESS WHEREOF the parties hereto have executed this Franchise Agreement as of the day and year first above written.

RESOLUTION NO. 5 3 3 2

A RESOLUTION OF THE CITY COUNCIL OF THE CITY OF AUBURN, WASHINGTON, AUTHORIZING THE MAYOR TO EXECUTE A FIRST AMENDMENT TO INTERLOCAL AGREEMENT 2 FOR THE LEA HILL INTERTIE PROJECT BETWEEN COVINGTON WATER DISTRICT, KING COUNTY WATER DISTRICT NO. 111 AND THE CITY OF AUBURN

WHEREAS, in 1996, the City of Auburn, Covington Water District and King County Water District No. 111, entered into an Interlocal Agreement (IA2) for the Lea Hill Intertie Project, which provided, in part, for the construction and operation of certain water facilities to be jointly funded by the parties and owned and operated by the City; and

WHEREAS, IA2 also provided for the City to make water supply available to the Districts in an interruptible basis, until and unless the City were to acquire additional firm water rights, in which case, the City's supply of water to its IA2 partners would have increased; and

WHEREAS, the City was not yet successful in acquiring additional water rights; and

WHEREAS, in accordance with changes since IA2 was negotiated, the Parties recognize that some changes in circumstances require the clarification of the terms and conditions of the Interlocal Agreement, including that Covington no longer desires to be a party to the Agreement; and

WHEREAS, King County Water District No. 111 and the City would like to make certain clarifications and modifications, including further definition of the duration of the Agreement.

NOW, THEREFORE, THE CITY COUNCIL OF THE CITY OF AUBURN, WASHINGTON, HEREBY RESOLVES as follows:

Section 1. That the Mayor is hereby authorized to execute the First Amendment to IA2 for the Lea Hill Intertie Project Between Covington Water District, King County Water District No. 111 and the City of Auburn, which amendment shall be in substantial conformity with the amendment attached hereto as Exhibit A and incorporated herein by this reference.

Section 2. That the Mayor is authorized to implement such administrative procedures as may be necessary to carry out the directives of this legislation.

Section 3. That this Resolution shall take effect and be in full force upon passage and signatures hereon.

Dated and Signed this 4th day of December, 2017.

FIRST AMENDMENT TO INTERLOCAL AGREEMENT 2 FOR THE LEA HILL INTERTIE PROJECT BETWEEN COVINGTON WATER DISTRICT, KING COUNTY WATER DISTRICT NO. 111, AND THE CITY OF AUBURN

THIS FIRST AMENDMENT TO INTERLOCAL AGREEMENT 2 ("**First Amendment**"), is made and entered into by and between Covington Water District, a Washington municipal corporation ("Covington"), King County Water District No. 111, a Washington municipal corporation ("WD 111") (Covington and WD 111 are referred to collectively as the "Districts"), and the City of Auburn, a Washington municipal corporation ("City"), (individually a "Party" and collectively the "Parties") for the purposes set forth below.

1. RECITALS.

1.1. The Parties entered into Interlocal Agreement 2 for the Lea Hill Project ("IA2") in 1996 providing, in part, for the construction and operation of certain water facilities to be jointly funded by the Parties and owned and operated by the City ("Project"). IA2 provided for the City to make water supply available to the Districts.

1.2. The Parties recognize that some changes in circumstances require the clarification of the terms and conditions of IA2, including that Covington no longer desires to be a party to IA2 and therefore desires to terminate any rights and obligations it may have with respect to IA2. WD 111 and the City also desire to make certain clarifications and modifications to IA2, including the further definition of the duration of IA2.

1.3. The Parties are authorized by chapter 39.34 RCW, the Interlocal Cooperation Act, to enter into interlocal agreements for joint action.

Now, therefore, in consideration of the following terms and conditions, the Parties agree as follows:

2. AGREEMENT.

2.1. The recitals set forth above are incorporated herein in full by this reference.

2.2 As of the Effective Date of this First Amendment, Covington shall no longer be a party to IA2 and shall have no further rights or obligations with respect to IA2 or this First Amendment.

2.3 Section IX. "Term of Duration of Agreement" of IA2 is hereby modified and amended to read as follows:

> IX. Term of Duration of Agreement: Unless terminated sooner by mutual agreement of the Parties, this IA2 shall have a term of sixty (60) years commencing from the Effective Date of this First Amendment.

2.4 Section VIII.A. "Conditions of Service" of IA2 is hereby modified and amended to read as follows:

VIII.A. Auburn will continue to honor the provisions of IA2 with respect to providing water supply to WD 111 on an interruptible basis upon request from WD 111 for such service, subject to the availability of Auburn's water supply to provide water service as reasonably determined by Auburn. Auburn does not presently have the necessary capacity (i.e., water supply and/or water rights) to guarantee delivery of firm uninterruptible water. It is acknowledged and agreed that in the event Auburn experiences any failure or decreased capacity for any reason or increased demand within its retail service area as it currently exists or may exist in the future, the supply to WD 111 may be immediately reduced or stopped under such conditions at the reasonable discretion of Auburn. WD 111 agrees that Auburn may take such action irrespective of any costs, investment in capacity, or other reliance which may have been placed upon the intertie facilities and interruptible water supply referenced in this IA2.

2.5 Section VI.A. "Service Charges" 2.8.1 of the Agreement is hereby modified and amended to read as follows:

VI.A. Auburn retail water customers and wholesale water customers are treated differently. Retail customers for Auburn include all citizens and properties within Auburn's retail service area as it currently exists or may exist in the future. Auburn has created a customer classification for wholesale customers, and rates for service charges for wholesale customers shall be based on a rate study for the wholesale customer classification. Auburn will charge WD 111 a wholesale rate based on a rate study regularly done in Auburn's normal course of business and as approved and adopted by the City of Auburn's City Council. Wholesale water rates shall be based on costs of providing the service.

2.6 A new subsection F. is added to Section III. "Description of Project" as follows:

III.F. Auburn agrees to continue to operate and configure its water system to make wholesale water service available to WD 111 through the present WD 111 connection to Auburn's water system on 132nd Avenue NE south of SE 299th Street (referred to as the "DuBerry Intertie") or through such other connection point(s) as may be mutually agreed to by Auburn and WD 111.

2.7 Except as expressly set forth in this First Amendment, all other provisions of IA2 shall remain unchanged, and in full force and effect. Each reference in IA2 to itself shall be deemed also to refer to this First Amendment.

2.8 Auburn will work with WD 111 to further review the language of IA2 to determine whether other updates or amendments are appropriate.

2.9 This First Amendment to IA2 is contingent on final approval by the Auburn City Council, the WD 111 Board of Commissioners, and the Covington Board of Commissioners. Staff and counsel of the Parties recommend the approval of this First Amendment to their respective City Council and Board of Commissioners.

2.10 All capitalized terms used but not defined in this First Amendment shall have the same meanings as defined in IA2.

2.11 This First Amendment shall be effective on the date whereby it has been executed by all of the Parties ("Effective Date").

2.12 Pursuant to RCW 39.34.040, this First Amendment shall be filed with the King County Auditor upon full execution or listed on the City's and WD 111's respective web sites listed by subject matter.

FIRST AMENDMENT TO INTERLOCAL AGREEMENT 2 FOR THE LEA HILL INTERTIE PROJECT BETWEEN COVINGTON WATER DISTRICT, KING COUNTY WATER DISTRICT NO. 111, AND THE CITY OF AUBURN

THIS FIRST AMENDMENT TO INTERLOCAL AGREEMENT 2 ("**First Amendment**"), is made and entered into by and between Covington Water District, a Washington municipal corporation ("Covington"), King County Water District No. 111, a Washington municipal corporation ("WD 111") (Covington and WD 111 are referred to collectively as the "Districts"), and the City of Auburn, a Washington municipal corporation ("City"), (individually a "Party" and collectively the "Parties") for the purposes set forth below.

1. RECITALS.

1.1. The Parties entered into Interlocal Agreement 2 for the Lea Hill Project ("IA2") in 1996 providing, in part, for the construction and operation of certain water facilities to be jointly funded by the Parties and owned and operated by the City ("Project"). IA2 provided for the City to make water supply available to the Districts.

1.2. The Parties recognize that some changes in circumstances require the clarification of the terms and conditions of IA2, including that Covington no longer desires to be a party to IA2 and therefore desires to terminate any rights and obligations it may have with respect to IA2. WD 111 and the City also desire to make certain clarifications and modifications to IA2, including the further definition of the duration of IA2.

1.3. The Parties are authorized by chapter 39.34 RCW, the Interlocal Cooperation Act, to enter into interlocal agreements for joint action.

Now, therefore, in consideration of the following terms and conditions, the Parties agree as follows:

2. AGREEMENT.

2.1. The recitals set forth above are incorporated herein in full by this reference.

2.2 As of the Effective Date of this First Amendment, Covington shall no longer be a party to IA2 and shall have no further rights or obligations with respect to IA2 or this First Amendment.

2.3 Section IX. "Term of Duration of Agreement" of IA2 is hereby modified and amended to read as follows:

> IX. Term of Duration of Agreement: Unless terminated sooner by mutual agreement of the Parties, this IA2 shall have a term of sixty (60) years commencing from the Effective Date of this First Amendment.

2.4 Section VIII.A. "Conditions of Service" of IA2 is hereby modified and amended to read as follows:

VIII.A. Auburn will continue to honor the provisions of IA2 with respect to providing water supply to WD 111 on an interruptible basis upon request from WD 111 for such service, subject to the availability of Auburn's water supply to provide water service as reasonably determined by Auburn. Auburn does not presently have the necessary capacity (i.e., water supply and/or water rights) to guarantee delivery of firm uninterruptible water. It is acknowledged and agreed that in the event Auburn experiences any failure or decreased capacity for any reason or increased demand within its retail service area as it currently exists or may exist in the future, the supply to WD 111 may be immediately reduced or stopped under such conditions at the reasonable discretion of Auburn. WD 111 agrees that Auburn may take such action irrespective of any costs, investment in capacity, or other reliance which may have been placed upon the intertie facilities and interruptible water supply referenced in this IA2.

2.5 Section VI.A. "Service Charges" 2.8.1 of the Agreement is hereby modified and amended to read as follows:

VI.A. Auburn retail water customers and wholesale water customers are treated differently. Retail customers for Auburn include all citizens and properties within Auburn's retail service area as it currently exists or may exist in the future. Auburn has created a customer classification for wholesale customers, and rates for service charges for wholesale customers shall be based on a rate study for the wholesale customer classification. Auburn will charge WD 111 a wholesale rate based on a rate study regularly done in Auburn's normal course of business and as approved and adopted by the City of Auburn's City Council. Wholesale water rates shall be based on costs of providing the service.

2.6 A new subsection F. is added to Section III. "Description of Project" as follows:

III.F. Auburn agrees to continue to operate and configure its water system to make wholesale water service available to WD 111 through the present WD 111 connection to Auburn's water system on 132nd Avenue NE south of SE 299th Street (referred to as the "DuBerry Intertie") or through such other connection point(s) as may be mutually agreed to by Auburn and WD 111.

2.7 Except as expressly set forth in this First Amendment, all other provisions of IA2 shall remain unchanged, and in full force and effect. Each reference in IA2 to itself shall be deemed also to refer to this First Amendment.

2.8 Auburn will work with WD 111 to further review the language of IA2 to determine whether other updates or amendments are appropriate.

2.9 This First Amendment to IA2 is contingent on final approval by the Auburn City Council, the WD 111 Board of Commissioners, and the Covington Board of Commissioners. Staff and counsel of the Parties recommend the approval of this First Amendment to their respective City Council and Board of Commissioners.

2.10 All capitalized terms used but not defined in this First Amendment shall have the same meanings as defined in IA2.

2.11 This First Amendment shall be effective on the date whereby it has been executed by all of the Parties ("Effective Date").

2.12 Pursuant to RCW 39.34.040, this First Amendment shall be filed with the King County Auditor upon full execution or listed on the City's, Covington's and WD 111's respective web sites listed by subject matter.

RESOLUTION NO. 5357

A RESOLUTION OF THE CITY COUNCIL OF THE CITY OF AUBURN, WASHINGTON, AUTHORIZING THE MAYOR TO SIGN AN INTERLOCAL AGREEMENT WITH OTHER WASHINGTON AGENCIES FOR THE PURPOSE OF RECEIVING AND PROVIDING WATER/WASTEWATER MUTUAL AID IN THE EVENT OF AN EMERGENCY

WHEREAS, pursuant to RCW 35.A.11.040, Auburn has the legal authority to exercise its powers and perform any of its functions as set forth in RCW 39.34; and

WHEREAS, local governments throughout the State of Washington have signed on to an interlocal agreement for the provision of water/wastewater mutual aid in the event of an emergency, identified as the Water/Wastewater Agency Response Network (WARN); and

WHEREAS, mutual aid agreements improve City response to emergencies and disasters; and

WHEREAS, the City Council finds that joining WARN will benefit public health safety and welfare.

NOW, THEREFORE, THE COUNCIL OF THE CITY OF AUBURN, WASHINGTON, RESOLVES as follows:

Section 1. The Mayor is hereby authorized to sign on to the interlocal agreement for the Water/Wastewater Agency Response Network, in substantial conformity with the agreement attached hereto, marked as Exhibit A and incorporated herein by this reference.

Section 2. The Mayor is hereby authorized to implement such administrative procedures as may be necessary to carry out the directions of this legislation.

Section 3. This Resolution shall take effect and be in force upon passage and signatures thereon.

DATED and SIGNED on this 2nd day of April, 2018.

CITY OF AUBURN

Nancy Backus

NANCY BACKUS, MAYOR

ATTEST:

Danielle E. Daskam, City Clerk

APPROVED AS TO FORM:

Daniel B. Heid, City Attorney

Mutual Aid and Assistance Agreement for Washington State for Intrastate Water/Wastewater Agency Response Network (WARN)
As of: 04/13/09

This Agreement ("Agreement") is made and entered into by public water and wastewater utilities that have executed this Agreement.

ARTICLE I
PURPOSE

Recognizing that emergencies may require aid or assistance in the form of personnel, equipment, and supplies from outside the area of impact, the signatories hereby establish an Intrastate Network for Mutual Aid and Assistance (the "Network"). Through the Network, Members (as further defined in this Agreement) may coordinate response activities and share resources during emergencies.

ARTICLE II
DEFINITIONS

A. Authorized Official – An employee or officer of a Member agency that is authorized to:

1. Request assistance;
2. Offer assistance;
3. Decline to offer assistance;
4. Decline to accept offers of assistance, and
5. Withdraw assistance under this Agreement.

B. Emergency – A natural or human-caused event or circumstance causing, or imminently threatening to cause, loss of life, injury to person or property, human suffering, significant financial loss, or damage to environment. For example, Emergencies may include fire, explosion, flood, severe weather, drought, earthquake, volcanic activity, spills or releases of oil or hazardous material, contamination, utility or transportation emergencies, disease, blight, infestation, civil disturbance, riot, intentional acts, sabotage and war that are, or could reasonably be beyond the capability of the services, personnel, equipment, and facilities of a Member to fully manage and mitigate by itself.

C. Member – Any public agency which provides supply, transmission or distribution of water; or collection, conveyance or treatment services of storm water or waste water that executes this Agreement (individually a "Member" and collectively the "Members"). The Members are further classified as follows:

1. Requesting Member – A Member who requests aid or assistance under the Network.
2. Responding Member – A Member that responds to a request for aid or assistance under the Network.

D. Period of Assistance – The period of time when a Responding Member

assists a Requesting Member in response to a Request for Assistance. The Period of Assistance commences when personnel, equipment, or supplies depart from Responding Member's facility and ends when all of the resources return to the Responding Member's facility (*i.e.*, portal to portal).

E. National Incident Management System (NIMS): The national, standardized system for incident management and response that sets uniform processes and procedures for emergency response operations.

F. Associate – Any non-utility participant approved by the Statewide Committee that provides a support role for the Network (such as the State Department of Health). An Associate does not execute this Agreement.

ARTICLE III
ADMINISTRATION

The Network is administered through Regional Committees and a Statewide Committee.

A. Regional Committees. The State is divided into regions that are geographically the same as the existing Department of Health Office of Drinking Water regions of the state, with the exception that the eastern region is divided to create a central region. Each region has a Regional Committee. Each Member within a region may appoint one person to be a member of its Regional Committee. Only those Regional Committee members appointed by Members are entitled to vote on matters before the Regional Committee. An Associate may be a non-voting member of a Regional Committee. Each Regional Committee shall elect a Chair by majority vote of the voting members of that Regional Committee and shall meet annually to review the operations and procedures of the Network.

B. Statewide Committee. The Chairs of the Regional Committees are the voting members of the Statewide Committee. An Associate may be a non-voting member of the Statewide Committee. Further, the Statewide Committee also may include as non-voting members representatives from the Washington State Department of Health Office of Drinking Water, Washington State Department of Ecology, Washington State Emergency Management Division, Rural Community Assistance Corporation, Evergreen Rural Water of Washington, Washington State Public Health Laboratory, EPA Region 10, Washington Association of Sewer and Water Districts, and the Washington PUD Association. Under the leadership of a Statewide Committee Chair elected by majority vote of the voting members of the Statewide Committee, the Statewide Committee shall plan and coordinate emergency planning and response activities for the Network.

C. Members' administrative activities shall be voluntary and members shall not be required to finance the administration of the Network, nor shall the Network hold real or personal property.

ARTICLE IV
PROCEDURES

In coordination with the Regional Committees, and emergency management and public health systems of the State, the Statewide Committee shall develop and adopt operational and planning procedures for the Network that are consistent with this Agreement. The Statewide Committee shall review these procedures at least annually and shall update them as needed.

ARTICLE V
REQUESTS FOR ASSISTANCE

A. Member Information: Promptly after executing this Agreement, the signatory Member shall deliver the following to the Statewide Committee: (1) a certified copy of the action of Member's governing body that authorized the signing of this Agreement and (2) an original signed Agreement. Each Member shall identify an Authorized Official and one alternate Authorized Official. Each Member shall provide current 24-hour contact information for its Authorized Officials to the Statewide Committee, which shall maintain a current list of all Members and the contact information for their Authorized Officials. The Statewide Committee shall provide to all Members an updated version of this list annually and whenever there is an addition or withdrawal of a Member and whenever there is a change of Authorized Officials' contact information.

B. Request for Assistance. In the event of an Emergency, a Member's Authorized Official may request mutual aid and assistance from Members ("Request for Assistance"). Requests for Assistance may be made orally or in writing, provided that when a Request for Assistance is made orally, the Requesting Member shall, as soon as practicable, identify and transmit in writing the personnel, equipment and supplies requested. Requesting Members shall direct Requests for Assistance to Authorized Officials. The Statewide Committee shall provide specific protocols for Requests for Assistance as part of the procedures created pursuant to Article IV of this Agreement.

C. Response to a Request for Assistance – Members are not obligated to respond to a Request for Assistance. After a Member receives a Request for Assistance, the receiving Member's Authorized Official shall evaluate whether to respond to the Request for Assistance, whether resources are available to respond, or if other circumstances would hinder response. Following the evaluation, the Authorized Official shall inform, as soon as possible, the Requesting Member whether the Member will respond to the Request for Assistance. If the Member is willing and able to provide assistance, the Member shall inform the Requesting Member of the type of available resources and the approximate arrival time of such assistance.

D. Discretion of Responding Member's Authorized Official – No Member has any duty to respond to a Request for Assistance. When a Member receives a Request for Assistance, the Authorized Official shall have sole and absolute discretion

as to whether or not to respond to the Request for Assistance, and if responding in the affirmative, to determine the availability of resources to be made available to the Requesting Member. The response of a Member's Authorized Official regarding the availability of resources to a Requesting Member shall be final.

E. No Liability for Failure to Respond – No Member will be liable to any other Member for deciding not to respond to a Request for Assistance or otherwise failing to respond to a Request for Assistance. All Members hereby waive all claims against all other Members arising from or relating to any Member's decision to not respond to a Request for Assistance or to any Member's failure to respond to a Request for Assistance.

ARTICLE VI
RESPONDING MEMBER PERSONNEL

A. National Incident Management System-When providing assistance under this Agreement, the Requesting Member and Responding Member are encouraged (but are not obligated) to be organized and function under NIMS.

B. Coordination and Records – Employees of the Responding Member will remain under the direction and control of the Responding Member to the fullest extent possible. The Responding Member is an independent contractor at all times. The Requesting Member's Authorized Official shall coordinate response activities with the designated supervisor(s) of the Responding Member(s). The Responding Member's designated supervisor(s) shall keep accurate records of work performed by personnel during the Period of Assistance and for the equipment and supplies provided during work.

C. Food and Shelter – Whenever practical, Responding Member personnel must be self sufficient for up to seventy-two (72) hours. Whenever practical, the Requesting Member shall supply adequate food and shelter for Responding Member personnel. If the Requesting Member is unable to provide food and shelter for Responding Member personnel, the Responding Member's designated supervisor is authorized to secure the food and shelter necessary to meet the needs of its personnel.

D. Communication – The Requesting Member shall provide Responding Member personnel with communications equipment as available, radio frequency information to program existing radios if appropriate, or telephone contact numbers, in order to facilitate communications with local responders and utility personnel. Each Requesting Member shall provide contact information for an individual with whom Responding Member's personnel may coordinate while en-route for access, staging instructions and other logistical requirements.

E. Status - Unless otherwise provided by law, the Responding Member's officers and employees shall have the same powers, duties, rights, privileges, and immunities as if they were performing their duties in the jurisdiction in which they are

normally employed.

F. Licenses and Permits – To the extent permitted by law, Responding Member personnel that hold licenses, certificates, or permits evidencing professional, mechanical, or other skills shall be allowed to carry out activities and tasks relevant and related to their respective credentials during a Period of Assistance.

ARTICLE VII
RIGHT TO WITHDRAW RESOURCES

A. Right to Withdraw - A Responding Member may withdraw some or all of its resources at any time for any reason, as determined in the Responding Member's sole and absolute discretion. The Responding Member shall communicate written or oral notice of intention to withdraw all or some of a Responding Member's resources to the Requesting Member's Authorized Official as soon as practicable under the circumstances. To the greatest extent possible, but without limiting in any way a Responding Member's sole and absolute discretion, a Responding Member's determination to withdraw some or all of its resources provided to a Requesting Member should consider the status of the incident and incident stability, to minimize any adverse impacts from the withdrawal of resources by a Responding Member.

B. No Liability for Withdrawal - No Member will be liable to any other Member for first responding to a Request for Assistance by providing resources (such as personnel, materials, and equipment) and later withdrawing or refusing to continue to provide some or all of those resources. All Members hereby waive all claims against all Members arising from or relating to such a withdrawal or refusal.

ARTICLE VIII
COST- REIMBURSEMENT

The Requesting Member shall reimburse the Responding Member for all costs incurred by the Responding Member during a Period of Assistance, unless otherwise agreed in writing by both Members.

A. Personnel – The Requesting Member shall reimburse the Responding Member for personnel costs incurred for work performed during a Period of Assistance. Responding Member personnel costs will be calculated according to the terms provided in their employment contracts, hourly rate schedules or other conditions of employment. The Responding Member's designated supervisor(s) shall keep accurate records of work performed by personnel during a Period of Assistance. The Requesting Member shall include in its reimbursement of the Responding Member all personnel costs, including salaries or hourly wages, costs for fringe benefits, and indirect costs.

Unless otherwise agreed in writing, the Requesting Member shall reimburse the Responding Member for all reasonable and necessary costs associated with providing food and shelter for the Responding Member's personnel, if the food and shelter are

not provided by the Requesting Member. The Requesting Member is not required to reimburse the Responding Member for food and shelter costs in excess of State per diem rates unless the Responding Member demonstrates in writing that the excess costs were reasonable and necessary under the circumstances.

B. Equipment – The Requesting Member shall reimburse the Responding Member for the use of equipment during a Period of Assistance, including, but not limited to, reasonable rental rates, all fuel, lubrication, maintenance, transportation, and loading/unloading of loaned equipment. The Requesting Member shall return all equipment to the Responding Member in good working order as soon as is practicable and reasonable under the circumstances. If equipment cannot be returned in good working order, then Requesting Member shall either provide in-kind replacement equipment to Responding Member at no cost to Responding Member or pay to Responding Member the actual replacement cost of the equipment. Reimbursement rates for equipment use will be no less than the Federal Emergency Management Agency's (FEMA) Schedule of Equipment Rates. If a Responding Member uses rates different from those in the FEMA Schedule of Equipment Rates, the Responding Member shall provide such rates orally or in writing to the Requesting Member prior to supplying the equipment. If reimbursement rates are to be different than those in the FEMA Schedule of Equipment rates, Responding Member and Requesting Member shall agree in writing on which rates will be used prior to dispatch of the equipment to the Requesting Member. Requesting Member shall reimburse for equipment not referenced on the FEMA Schedule of Equipment Rates based on actual recovery of costs. If a Responding Member is required to lease equipment while its equipment is being repaired because of damage due to use during a Period of Assistance, Requesting Member shall reimburse Responding Member for such rental costs.

C. Materials and Supplies – The Requesting Member shall reimburse the Responding Member in kind or at actual replacement cost, plus handling charges, for use of expendable or non-returnable supplies by the Responding Member during a Period of Assistance. The Responding Member shall not charge direct fees or rental charges to the Requesting Member for other supplies and reusable items that are returned to the Responding Member in a clean, damage-free condition. Reusable supplies that are returned to the Responding Member with damage will be treated as expendable supplies for purposes of cost reimbursement.

D. Payment Period – In order to be reimbursed, the Responding Member shall provide an itemized bill to the Requesting Member no later than ninety (90) days following the end of the Period of Assistance for all expenses incurred by the Responding Member while providing assistance to a Requesting Member under this Agreement. The Responding Member may request additional time to submit the itemized bill, and Requesting Member shall not unreasonably withhold consent to such a request. The Requesting Member shall pay the itemized bill in full on or before the forty-fifth (45^{th}) day following the billing date. The Requesting Member may request additional time to pay the itemized bill, and Responding Member shall not unreasonably withhold consent to such a request, but in no event will payment in full occur later than one year after the date a final itemized bill is submitted to the

Requesting Member. If a Responding Member disputes a portion of an itemized bill, the Requesting Member shall promptly pay those portions of the bill not under dispute, pending the resolution of the payment of the disputed portion of the bill.

E. Records - Where a Responding Member provides assistance to a Requesting Member under this Agreement, both Members shall provide the other Member access to the books, documents, notes, reports, papers and other records relevant to this Agreement for the purposes of reviewing the accuracy of a cost bill or making or undergoing a financial, maintenance or regulatory audit. Both Members shall maintain these records for at least three (3) years or longer where required by law.

ARTICLE IX
DISPUTES
NEGOTIATION

Members shall first attempt to resolve any controversy, claim or other dispute arising out of or relating to this Agreement by direct negotiation.

MEDIATION

To the extent not resolved by direct negotiation, Members shall mediate any controversy, claim or other dispute arising out of or relating to this Agreement. Mediation is a condition precedent to arbitration. Unless the disputing Members agree otherwise, the mediation will be administered by the American Arbitration Association (AAA) under its Construction Industry Mediation Procedures. The disputing Members shall pay in equal shares the mediator's fee and any filing fees. Unless otherwise agreed by the disputing Members, the disputing Members shall (1) hold the mediation no later than thirty (30) days after a disputing Member delivers a request for mediation to the other disputing Members and (2) hold the mediation at the location of the Requesting Member. Agreements reached in mediation will be enforceable as settlement agreements.

ARBITRATION

To the extent not resolved by mediation, Members shall arbitrate all controversies, claims and other disputes arising out of or relating to this Agreement. Unless the disputing Members agree otherwise, the arbitration will be administered by the AAA in accordance with its Construction Industry Arbitration Rules in effect on the date a disputing Member makes a demand for arbitration. A disputing Member may make a demand for arbitration before negotiation or mediation if it appears that a claim might be barred by a statute of limitations if the demand were made after the negotiation or mediation. However, in such a case the arbitration will be stayed until the conclusion of negotiation and mediation. The decision and award rendered by the arbitrator(s) shall be final, and judgment may be entered upon it in accordance with applicable law in any court having jurisdiction thereof.

ARTICLE X
DUTY TO INDEMNIFY

To the extent of its fault, a Member shall defend, indemnify, and hold harmless all other Members, their elected officials, Authorized Officials, officers, employees and agents from any and all costs, claims, judgments, losses, awards of damage, injury, death and liability of every kind, nature and description, including the reasonable cost of defense and attorneys' fees, directly or indirectly arising from or relating to this Agreement (collectively, "Indemnified Claims"). This indemnity obligation extends to all Indemnified Claims against a Member by an employee or former employee of another Member, and for this purpose, by mutual negotiation, each Member hereby expressly waives, with respect to each other Member only, all immunity and limitation under any applicable industrial insurance act, including Title 51 of the Revised Code of Washington, other worker compensation acts, disability benefit acts or other employee benefit act of any jurisdiction which would otherwise be applicable in the case of Indemnified Claims.

ARTICLE XI
WORKER'S COMPENSATION AND SITE CONDITIONS

The Responding Member is responsible for providing worker's compensation benefits and administering worker's compensation for its employees. The Requesting Member is responsible for providing worker's compensation benefits and administering worker's compensation for its employees.

Each Member shall promptly identify to the other Members concerns about site safety, environmental concerns, and other working conditions. The Safety Officer appointed within the Incident Command System during the Period of Assistance shall address specific safety conditions and mitigations.

ARTICLE XII
NOTICE

Unless otherwise provided in this Agreement, all notices must be in writing. Notice to a Member must be delivered to the Member's Authorized Official.

ARTICLE XIII
EFFECTIVE DATE

This Agreement shall be effective with respect to each Member when that Member's authorized representative executes the Agreement. The Statewide Committee shall maintain a master list of all Members.

ARTICLE XIV
WITHDRAWAL

A Member may withdraw from this Agreement at any time by providing to the Statewide Committee Chair written notice of withdrawal signed by the withdrawing Member's Authorized Official or other person authorized by the withdrawing Member's governing body. Any withdrawal will be effective upon receipt by the Statewide Committee Chair of the notice of intent to withdraw. If there is no Statewide Committee Chair, the withdrawing Member shall provide written notice to each Member in its region, and the withdrawal will be effective upon delivery of those notices. Once withdrawal from this Agreement is effective, the withdrawing Member will have no further obligations under this Agreement, except that withdrawal from this Agreement will not affect any indemnification or reimbursement obligation under this Agreement that arises prior to the effective date of the withdrawal.

ARTICLE XV
TERMINATION

This Agreement shall terminate in its entirety when there are less than two Members. Termination of this Agreement will not affect any indemnification or reimbursement obligation under this Agreement arising prior to the termination. The Statewide Committee Chair shall provide written notice of termination to all remaining Members of the Agreement.

ARTICLE XVI
AMENDMENT

This Agreement may be amended if, after written notice of a proposed amendment to all Members, the proposed amendment is approved by a majority of Members in each region. The Statewide Committee Chair shall provide written notice to all Members of approved amendments. Approved amendments will take effect sixty (60) days after the date the notice is sent to the Members.

ARTICLE XVII
SEVERABILITY

The parties agree that if any term or provision of this Agreement is declared by a court of competent jurisdiction to be illegal or in conflict with any law, the validity of the remaining terms and provisions shall not be affected, and the rights and obligations of the parties shall be construed and enforced as if the Agreement did not contain the particular term or provision held to be invalid.

ARTICLE XVIII
PROHIBITION ON THIRD PARTIES AND ASSIGNMENT OF RIGHTS/DUTIES

Notwithstanding rights of subrogation asserted by a Member's insurance provider, this Agreement is for the sole benefit of the Members and no other person or entity shall have any rights under this Agreement as a third party beneficiary nor shall any Member owe duty to a third party not a signatory of this Agreement by virtue of this Agreement. Assignments of benefits and delegations of duties created by this

Agreement are prohibited and of no effect.

ARTICLE XIX
GOVERNING LAW

This Agreement is governed by the law of the State of Washington, specifically RCW 39.34, Interlocal Cooperation Act.

ARTICLE XX
EXECUTION IN COUNTERPARTS

This Agreement may be executed in any number of counterparts and by different parties in separate counterparts. Each counterpart when so executed shall be deemed to be an original and all of which together shall constitute one and the same Agreement.

Water Right Self-Assessment Form for Water System Plans

331-372 • 1/13/2017

All water right permits, claims, and certificates must be evaluated in a water right self-assessment for all sources used to supply the water system. The self-assessment compares the parameters and other limitations of existing water rights against current and forecasted water production, as described in your water system plan, to determine whether the rights are adequate to serve your system's current and future water needs.

You must account for all sources of supply and total quantities of water withdrawn from the source. If you purchase water from another purveyor through a non-emergency intertie, you must complete the INTERTIES section of the self-assessment.

A Note on Exempt Wells

If you're seeking DOH approval of a new Group A or Group B water system using an exempt well, you must complete the self-assessment, although certain fields will not apply. Talk to your DOH regional planner about using the Water Right Self-Assessment form for a Small Water System Management Program instead of this version.

Local governments must ensure that an adequate potable water supply is available from the exempt well before issuing a building permit. Before developing a permit exempt well, check with your local authorities on their criteria for establishing an adequate potable water supply for your planned public water system.

Water Right Parameters

Below is a brief description of the parameters associated with a typical water right. For the self-assessment, you only need to describe the last two bulleted items if they apply to your water rights.

Source Type – this refers to whether the source is surface water, groundwater or a spring.

Source Location – this refers to the location of points of groundwater withdrawal or surface water diversion for each right.

Purpose of Use – this refers to the type of use, such as municipal water supply, community domestic, industrial or agricultural purposes.

Place of Use – this describes where water can be put to beneficial use under the right. Under the 2003 Municipal Water Law, RCW 90.03.386, the place of use for a water right held for municipal water supply purposes may be the system's service area as identified in an approved water system plan or small water system management program. See Ecology Policy 2030 for information on how Ecology administers the Municipal Water Law.

Washington State Department of Health

If you need this publication in an alternative format, call 800.525.0127 (TDD/TTY call 711). This and other publications are available at www.doh.wa.gov/drinkingwater.

Period of Use – this refers to time-of-year limitations in which the water right may be put to use. If any water right has a time-of-year limitation, please include this information in the INTERRUPTIBLE WATER RIGHTS section.

Provisions or Limiting Conditions – this refers to any provisions or conditions placed on the water right. If a water right has a limiting condition or other provision, such as a collection and reporting requirement, other than a time-of year limitation, include this information in the ADDITIONAL COMMENTS section at the bottom of the self-assessment and in the water system plan narrative.

See Ecology Policy 1040 for more information on water right terminology. If you have questions about your water rights, please contact the Ecology regional office in your area.

Completing the Water Right Self-Assessment Form

The self-assessment is a Word document to allow users to make changes or to expand the document. You may use another format, if preferred, as long as all required information is included. Below is a description of all fields and how to complete them. This form is divided into four different sections. Each section is described in the headings below.

See the column identifiers (A, B, C, etc) at the bottom of each column for guidance in completing the necessary calculations.

Water Right Permit, Certificate, or Claim Number: This number is assigned by Ecology when a permit application is filed. It's listed at the top of the permit or certificate. For water right claims, this is the registration number stamped in the lower left hand corner of the claim form.

WFI Source #: Identify the individual sources (e.g. well #1, well #2) as defined on the DOH Water Facilities Inventory form. If a water right is associated with multiple sources, list all sources in the same row in this column. If a source is associated with multiple water rights, identify each water right on a separate row.

If you have any source(s) that is not currently being used (categorized as standby, back-up, or emergency), and the source has an associated water right that is not listed in column #1, please include the source and water right information in the ADDITIONAL COMMENTS section. This will identify that the source is still intended for a beneficial use under RCW 90.03.015(4). See Ecology Policy 1040.

EXISTING WATER RIGHTS SECTION *(olive green color, top section)*

This section refers to existing water rights. It does not include any water right applications that have been submitted to Ecology.

Primary Qi (Instantaneous Quantity): This is also known as instantaneous flow rate. It's the amount of water allowed to be taken under the right from the source during a period of peak operation. For surface water, this is generally expressed in terms of cubic feet per

second (cfs). For groundwater, this is generally expressed in terms of gallons per minute (gpm). One cfs equals 448.8 gpm. Please indicate the units of measurement you are using for each source. If there are situations where the flow rate will be limited (e.g. limitations established on the source when other sources are utilized), please note them in the ADDITIONAL COMMENTS section in the form and in the WSP narrative.

Non-Additive Qi: This term was formally known as "supplemental." Your water rights may use the old terminology. See Ecology Policy 1040 for more information. Not all water rights have non-additive quantities. If a water right has non-additive Qi quantities, include the non-additive quantity in this field. This is generally listed in the "quantity, type of use, period of use" section on both permits and certificates. *Non-additive quantities should not be included in the primary Qi totals.*

Primary Qa (Annual Quantity): This is the amount of water that can be taken from the source under the right on an annual basis. It's usually expressed in terms of acre-feet. An acre-foot is the amount of water necessary to submerge an acre of land to a depth of one foot. One acre-foot equals 43,560 cubic feet or 325,851 gallons of water.

Non-Additive Qa: This term was formerly known as "supplemental." Your water rights may use the old terminology. See Ecology Policy 1040 for more information. Not all water rights have non-additive quantities. If a water right has non-additive Qa quantities, include the non-additive quantity in this field. This is generally listed in the "quantity, type of use, period of use" section on both permits and certificates. *Non-additive quantities should not be included in the primary Qa totals.*

CURRENT SOURCE PRODUCTION SECTION *(light green color, top section)*

This section refers to how much water is withdrawn from the source under each water right for the most recent full calendar year. You will need to determine any excess or deficiency for each water right after calculating how much water was withdrawn compared to how much water is allowed under each water right. If demand has decreased over past years, you may wish to include historic maximum production information in the ADDITIONAL COMMENTS section. This will provide a more complete picture of the use of your water rights.

Use the water use data and demand projections from your water system plan to define current and projected water needs. You can determine if you'll need additional water rights based on the comparison of existing water rights, current water production, and projected 10- and 20-year needs.

Total Qi (Instantaneous Quantity): This refers to the total maximum instantaneous flow rate withdrawn from the source under each water right during the most recent calendar year. For surface water, this is expressed in terms of cubic feet per second (cfs). For groundwater, this is expressed in terms of gallons per minute (gpm). One cfs equals 448.8 gpm.

Current Excess or Deficiency (Qi): Please calculate the excess or deficiency for each water right after comparing the total amount withdrawn against each water right. Please use parentheses for deficient amounts.

Total Qa (Annual Quantity): This refers to the total volume of water withdrawn from each source under each water right during the most recent calendar year. It's usually expressed in acre-feet.

Current Excess or Deficiency (Qa): Please calculate the excess or deficiency for each water right after comparing the total amount withdrawn against each water right. Please use parentheses for deficient amounts.

10-YEAR FORECASTED SOURCE PRODUCTION SECTION *(light blue color, top section)*

This section refers to how much water you project to withdraw from each source in ten years as determined in your water system plan. Please complete this section in the same manner (using the same units of measurement) as the current source production section using your 10-year forecasted amounts.

20-YEAR FORECASTED SOURCE PRODUCTION SECTION *(darker blue color, top section)*

This section refers to how much water you project to withdraw from each source in twenty years as determined in your water system plan. Please complete this section in the same manner (using the same units of measurement) as the current source production section using your 20-year forecasted amounts. If you are unable to provide 20-year forecasts for each source, you may choose to include the combined 20-year total at the bottom.

PENDING WATER RIGHTS SECTION *(second section of form)*

Please complete this section for any water right applications that have been submitted to Ecology. Please include the application number, whether it's a new or a change application, the date submitted, and the total quantities requested.

INTERTIES SECTION *(third section of form)*

This section must be completed by purveyors who purchase any amount of wholesale water. If your system sells water to another public water system, include the quantity sold in the CURRENT SOURCE PRODUCTION section.

Purchasers of wholesale water must account for all water obtained through the intertie for non-emergency supply purposes. This is to ensure that all sources of supply are considered when evaluating whether new water rights are needed within 20 years.

Please identify the maximum quantity of water, expressed in the same manner as the above sections, allowed under each intertie contract. If there are limiting conditions or temporary

agreements that effect the long-term use of the intertie, you must account for such limiting conditions when evaluating the current and forecasted water supply needs in your water system plan.

Finally, purchasers of wholesale water are responsible for ensuring that the underlying water right (held by the purveyor selling water) are adequate for such use. You should confirm that the selling system has accounted for the wholesale area in their water system plan to ensure that the water right authorizes the distribution of water through the intertie.

INTERRUPTIBLE WATER RIGHTS SECTION *(bottom section of form)*

This section refers to water rights that have an annual time-of-year interruption. Please complete this section for any water right listed in the above fields that has a time-of-year interruption. Please include the water right number, describe the limitation, and the time period of interruption. Purveyors with interruptible rights should develop a water shortage response plan as part of their water system plan to describe how demand will be met during periods of interruption through aggressive demand-side conservation, fixing leaks or other means.

ADDITIONAL COMMENTS SECTION *(bottom section of form)*

If the system has any source that is not currently being used on a regular basis (such a source may be categorized as stand-by, back-up, emergency), you should identify the source in this section if the source has an associated water right that is not listed in the above sections. The purpose is to identify that such water rights are still intended for a future beneficial use as required under RCW 90.03.015(4). See Page 2, Item 9 (b) in ECY Policy 2030. For these water rights, please briefly describe the future intended use of the source and when you expect to utilize the water right. This does not refer to sources categorized as seasonal sources.

You should also include any other comments in this section that will explain aspects of your water right portfolio that are not identified above.

ADDITIONAL COMMENTS:

Current and proposed Qi and Qa quantities for Well 5A (G1-25518) are included with G1-23633C.
Current Well 6 Qa = 1,435 AF which was distributed between G1*04731C, G1-00277C, and G1-20391C.
Current Well 7 Qa = 0 AF.
10-year and 20-year forecasted Qi and Qa includes providing an annual average of 2.5 MGD from Coal Creek Springs to the Muckleshoot Indian Tribe (MIT) for a hatchery.
G1-25173C is a non-municipal water right issued to serve the Braunwood satellite system, so is not listed.
S1-049354CL (West Hill Springs) is a claim filed under RCW 90.14.061; quantities can only be validated per RCW 90.14.081.

LEGAL DESCRIPTION FOR LOCATION OF DIVERSION/WITHDRAWAL

256 feet north and 2548 feet west of the SE corner of Section 28.

LEGAL DESCRIPTION FOR PROPERTY ON WHICH WATER IS TO BE USED

Area served by the City of Auburn as identified in their latest approved water system plan and periodic updates consistant with coordinated water supply plans, including interties for wholesale water delivery to the service areas of any water purveyors that have approved interlocal agreements with the City of Auburn.

PROVISIONS

All conditions and requirements contained in reports of examination or permits previously issued apply to this certificate unless specifically noted below.

Issuance of this water right may be subject to implementation of the minimum requirements established in the Conservation Planning Requirements, Guidelines and Requirements for Public Water Systems Regarding Water Use Reporting, Demand Forecasting Methodology, and Conservation Programs, July 1994, and as revised.

Under RCW 90.03.005 and 90.54.020(6), conservation and improved water use efficiency must be emphasized in the management of the State's water resources, and must be considered as a potential new source of water. Accordingly, as part of the terms of this water right, the applicant may be required to prepare and implement a water conservation plan approved by Department of Health. The standards for such a plan may be obtained from either the Department of Health or the Department of Ecology.

9709260277

The right to use of the water aforesaid hereby confirmed is restricted to the lands or place of use herein described, except as provided in RCW 90.03.380, 90.03.390, and 90.44.020.

This certificate of water right is specifically subject to relinquishment for non-use of water as provided in RCW 90.14.180.

Given under my hand and the seal of this office at Bellevue, Washington, this 16th day of Sept., 1997.

PROVISIONS

9709260281

All conditions and requirements contained in reports of examination or permits previously issued apply to this certificate unless specifically noted below.

All water wells constructed within the State shall meet the minimum standards for well construction and maintenance as provided under RCW 18.104, Washington Water Well Construction Act of 1972, and Chapter 173-160 WAC, Minimum Standards for Construction and Maintenance of Wells.

An approved metering device shall be installed and maintained in accordance with RCW 90.03.360, WAC 508-64-020 through -040. Meter readings shall be recorded at least monthly.

The well or wells under this appropriation right shall not be screened, perforated or open to water bearing materials shallower than 180 feet below ground surface at the well site.

Issuance of this water right is subject to the implementation of the minimum requirements established in the Conservation Planning Requirements, Guideline and Requirements for Public Water Systems Regarding Water Use Reporting, Demand Forecasting Methodology, and Conservation Programs, July 1994, and as revised.

Under RCW 90.03.005 and 90.54.020(6), conservation and improved water use efficiency must be emphasized in the management of the states water resources, and must be considered as a potential new source of water. Accordingly, as part of the terms of this water right, the applicant shall prepare and implement a water conservation plan approved by Department of Health. The standards for such a plan may be obtained from either the Department of Health or the Department of Ecology.

In order to monitor the resource, static water level (SWL) shall be measured at least once each month. Measurements shall be taken after the pump has been shut off and the water level in the well has been stablilized. The data shall be maintained and made available to Ecology upon request. However, Ecology's Water Resources Section (NWRO) shall be notified if the SWL is determined to be below the level normally recorded at that time of year.

The right to use of the water aforesaid hereby confirmed is restricted to the lands or place of use herein described, except as provided in RCW 90.03.380, 90.03.390, and 90.44.020.

This certificate of water right is specifically subject to relinquishment for non-use of water as provided in RCW 90.14.180.

PROVISIONS

All water wells constructed within the state shall meet the minimum standards for construction and maintenance as provided under RCW 18.104 (Washington Water Well Construction Act of 1971) and Chapter 173-160 WAC (Minimum Standards for Construction and Maintenance of Water Wells).

An approved measuring device shall be installed and maintained in accordance with RCW 90.03.360, WAC 508-64-020 through WAC 508-64-040 (Installation, operation and maintenance requirements attached hereto).

8809190660

The well or wells under this appropriation right shall not be screened, perforated or open to water bearing materials shallower thant 180' below ground surface at the well site.

The right to the use of the water aforesaid hereby confirmed is restricted to the lands or place of use herein described, except as provided in RCW 90.03.380, 90.03.390, and 90.44.020.

This certificate of water right is specifically subject to relinquishment for nonuse of water as provided in RCW 90.14.180.

LEGAL DESCRIPTION FOR PROPERTY ON WHICH WATER IS TO BE USED

Area served by City of Auburn as identified in their latest approved water system plan and periodic updates consistent with coordinated water supply plans, including interties for wholesale water delivery to the service areas of any water purveyors that have approved interlocal agreements with the City of Auburn.

PROVISIONS

9709260280

All conditions and requirements contained in reports of examination or permits previously issued apply to this certificate unless specifically noted below.

The well or wells under this appropriation right shall not be screened, perforated or open to water bearing materials shallower than 180 feet below ground surface at the well site.

All water wells constructed within the State shall meet the minimum standards for well construction and maintenance as provided under RCW 18.104, Washington Water Well Construction Act of 1972, and Chapter 173-160 WAC, Minimum Standards for Construction and Maintenance of Wells.

An approved metering device shall be installed and maintained in accordance with RCW 90.03.360, WAC 508-64-020 through -040. Meter readings shall be recorded at least monthly.

Issuance of this water right is subject to the implementation of the minimum requirements established in the Conservation Planning Requirements, Guideline and Requirements for Public Water Systems Regarding Water Use Reporting, Demand Forecasting Methodology, and Conservation Programs, July 1994, and as revised.

Under RCW 90.03.005 and 90.54.020(6), conservation and improved water use efficiency must be emphasized in the management of the states water resources, and must be considered as a potential new source of water. Accordingly, as part of the terms of this water right, the applicant shall prepare and implement a water conservation plan approved by Department of Health. The standards for such a plan may be obtained from either the Department of Health or the Department of Ecology.

In order to monitor the resource, static water level (SWL) shall be measured at least once each month. Measurements shall be taken after the pump has been shut off and the water level in the well has been stabilized. The data shall be maintained and made available to Ecology upon request. However, Ecology's Water Resources Section (NWRO) shall be notified if the SWL is determined to be below the level normally recorded at that time of year.

The right to use of the water aforesaid hereby confirmed is restricted to the lands or place of use herein described, except as provided in RCW 90.03.380, 90.03.390, and 90.44.020.

This certificate of water right is specifically subject to relinquishment for non-use of water as provided in RCW 90.14.180.

Given under my hand and the seal of this office at Bellevue, Washington, this 16th *day of* Sept., *1997.*

Well 5C: SW¼ NE¼ of Section 6, T. 20 N , R. 5 E.W.M., located approximately 1525 feet West and 2400 feet South of the Northeast corner of Section 6, Pierce County.

LEGAL DESCRIPTION OF PROPERTY ON WHICH WATER IS TO BE USED

The area served by the City of Auburn as identified in their latest approved water system plan and periodic updates consistent with coordinated water supply plans, including interties for wholesale water delivery to the service areas of any water purveyors that have approved inter local agreements with the City of Auburn

PROVISIONS

"The total instantaneous withdrawal rate for Well 5, Well 5A, Well 5B, and Well 5C authorized by this certificate shall not exceed 1,000 gpm The total annual withdrawal rate for Well 5, Well 5A, Well 5B, and Well 5C shall not exceed 720 acre-feet per year "

An approved measuring device shall be installed and maintained for each of the sources identified by this water right in accordance with the rule "Requirements for Measuring and Reporting Water Use," Chapter 173-173 WAC

Water use data shall be recorded monthly The maximum rate of diversion/withdrawal and the annual total volume shall be submitted to Ecology by January 31 of each calendar year

The following information shall be included with each submittal of water use data owner, contact name if different, mailing address, daytime phone number, WRIA, Permit/Certificate/Claim No , source name, annual quantity used including units, maximum rate of diversion including units,

1 monthly meter readings including units,
2 peak monthly flow including units,
3 Department of Health WFI water system number and source number(s),

and period of use In the future, Ecology may require additional parameters to be reported or more frequent reporting Ecology prefers web based data entry, but does accept hard copies Ecology will provide forms and electronic data entry information

Chapter 173-173 WAC describes the requirements for data accuracy, device installation and operation, and information reporting It also allows a water user to petition Ecology for modifications to some of the requirements Installation, operation and maintenance requirements are contained in the document entitled "Water Measurement Device Installation and Operation Requirements "

Department of Ecology personnel, upon presentation of proper credentials, shall have access at reasonable times, to the records of water use that are kept to meet the above conditions, and to inspect at reasonable times any measuring device used to meet the above conditions

Issuance of this water right is subject to the implementation of the minimum requirements established in the Conservation Planning Requirements, Guideline and Requirements for Public Water Systems Regarding Water Use Reporting, Demand Forecasting Methodology, and Conservation Programs, July 1994 and as revised

Under RCW 90 03 005 and 90 54 020(6), conservation and improved water use efficiency must be emphasized in the management of the State's water resources, and must be considered as a potential new source of water Accordingly, as part of the terms of this water right, the applicant shall prepare and implement a water conservation plan approved by Department of Health The standards for such a plan may be obtained from either the Department of Health or the Department of Ecology

Water Resources Act of 1971 specifies certain criteria regarding utilization and management of the waters of the state in the best public interest Use of water may be subject to regulation at certain times, based on the necessity to maintain water quantities sufficient for preservation of the natural environment

The right to use of the waters aforesaid hereby confirmed is restricted to the lands or place of use herein described, except as provided in RCW 90 03 380, 90 03 390, and 90 44 020

This certificate of water right is specifically subject to relinquishment for non-use of water as provided in RCW 90.14.180.

Given under my hand and the seal of this office at Bellevue, Washington,
this 19th *day of* FEBRUARY, *2004*

July 20, 1995

City of Auburn
25 West Main Street
Auburn, Washington 98001-4998

Dear Sir or Madam:

Re: Change Application for Ground Water Certificates 3560-A, G1-00277C, G1-20391C, and G1-23629C

Your change application has been approved. However, superseding certificates for 3560-A, G1-00277C, G1-20391C, and G1-23629C will not be issued until the authorized change has been accomplished. If the 30 day appeal period expires with no appeal, this letter and the accompanying Report of Examination (ROE) would become the legal instruments authorizing the change.

When wells 6 and 7 have been drilled and connected to Auburn's delivery system, notify this office in writing that the change as authorized in the ROE is completed. The notice shall include water well reports documenting well development in the same aquifer and statutory recording fees for issuing superseding certificates as indicated below.

$20.00 payable to the Department of Ecology and
$32.00 payable to the County Auditor.

This letter and the enclosed Report of Examination constitute our determination and order. Any person wishing to appeal this action may obtain review by submitting a written request, within thirty (30) days of receipt of this order, to the Washington Pollution Control Hearings Board, 4224 - 6th Avenue S.E., Bldg. #2, Lacey, WA 98504-0903. Concurrently send to the Director of the Department of Ecology, Mail Stop 7600, P.O. Box 47600, Olympia, Washington 98504-7600, a copy of the request for review. These procedures are consistent with the provisions of Chapter 43.21B RCW and the rules and regulations adopted thereunder.

Sincerely,

R. K. Hellwig

Raymond K. Hellwig

Enclosures

STATE OF WASHINGTON
DEPARTMENT OF ECOLOGY
REPORT OF EXAMINATION
FOR CHANGE OF WATER RIGHTS

Request: The City of Auburn wants to change existing ground water certificates 3560-A, G1-00277C, G1-20391C, and G1-23629C by adding two supplemental wells (#6 and #7) to each of the four certificates.

Recommend: That two supplemental wells (well 6 and well 7) be added to certificates 3560-A, G1-00277C, G1-20391C, and G1-23629C. All other conditions and terms pertaining to the certificates remain unchanged.

Superseding certificates will be issued when the following conditions are met.

Both wells (#6 and #7) are drilled, completed, and connected to Auburn's water delivery system.

Water well reports for wells (#6 and #7) are filed with Ecology documenting development in the same aquifer as wells under certificates 3560-A, G1-00277C, G1-20391C, and G1-23629C.

SUPPORT DATA

Background

Application of Change for: Ground Water Certificates 3560-A, G1-00277C, G1-20391C, and G1-23629C.

Name: City of Auburn

Date submitted: May 19, 1995

Request: Add two supplemental wells (#6 and #7) to each of the referenced certificates which share a common ground water source.

Use: Municipal water supply

Legal notice: Published in the Valley Daily News on June 9 and 16, 1995. No protests filed.

Investigation

Location: City of Auburn in southeast King County

Water supply sources: Auburn has seven wells plus West Hill Springs, and Coal Creek Springs.

Service area: The City of Auburn and surrounding areas including interties as described in their current water system plan.

Water rights: Auburn currently holds a combined total of 12,520 Acre Feet per year (AF/yr) in certificated water rights. The certificates pertaining to this application for change were issued as follows:

Cert. 3560-A (well 1), 2200 gallons per minute (gpm), 1120 AF/yr.

Cert. G1-00277C (well 2), 2400 gpm, 3840 AF/yr.

Cert. G1-20391C (well 4), 2800 gpm, 3600 AF/yr.

Cert. G1-23629C (wells 3A & 3B), 2800 gpm, 3600 AF/yr.

The proposed change would add wells (#6 and #7) as yet to be drilled to each of the four certificates to provide system flexibility and operational reliability. The instantaneous and annual quantities authorized by each certificate would remain unchanged.

Valley aquifer: According to a hydrogeologic study and report prepared by the consulting firm of Hart Crowser for Auburn, wells 1,2,3A,3B, and 4 are all developed in the same aquifer known as the Auburn Valley Aquifer.

Well 1 is in the NE1/4NE1/4, Sec. 19, T. 21N, R. 5E

Well 2 is in the NE1/4, Sec. 18, T. 21N, R. 5E

Wells 3A & 3B are in the NE1/4SW1/4, Sec. 30, T. 21N, R. 5E

Well 4 is in the NW1/4NE1/4, Sec. 30, T. 21N, R. 5E

The proposed supplemental wells are to be located as follows:

Well 6 in the NE1/4, Sec. 18, T. 21N, R. 5E

Well 7 in the NW1/4, Sec. 18, T. 21N, R. 5E

Staff hydrogeologist reviewed data on existing wells and the Hart Crowser report and confirms that all existing wells are developed in the same aquifer and are hydraulically connected to each other; therefore, it can be considered as being part of a very large well field. The aquifer covers an area of approximately four miles by one and one half miles. The proposed wells will be located between the other existing wells and within the area covered by the Auburn Valley Aquifer.

Well development: Auburn plans to drill well 6 by December 1996 and drill well 7 by October 1997. Both wells will be connected to Auburn's water delivery system by December 1997.

Prior to issuing any superseding certificates, copies of the water well reports must be filed with Ecology to document completion and document that the wells are developed in the same aquifer as the certificated wells.

Conclusion:

In accordance with RCW Chapters 90.03 and 90.44, I find that Auburn has water rights to approve the request for change to add supplemental wells, that the change is for a beneficial use and will not impair existing rights or be detrimental to the public welfare.

EXHIBIT F. Algona Well Facility and Water Right Conveyance

WARRANTY DEED

The GRANTOR, THE CITY OF ALGONA, on this 4th day of October, 1996, for and in consideration of the sum of $1.00, receipt of which is hereby acknowledged, and for benefits to be derived by the GRANTOR herein, hereby conveys and warrants to the CITY OF AUBURN, GRANTEE, the following well facility and Certificated Ground Water G1-227769C situated in the County of King, State of Washington:

Well Facility. The well, piping, and appurtenances generally consist of 10 inch casing to approximately 65 feet below ground surface.

Ground Water Certificated Right: G1-22769C. This Ground Water Right is certificated to provide water on a continuous basis for municipal purposes pursuant to RCW 90.03.290. Further, this water right is certificated to provide an instantaneous rate of withdrawal (Qi) of 500 gpm, and an annual quantity/rate of withdrawal (Qa) of 175 acre feet per year. As a water right applied to municipal purposes, the instantaneous (Qi) and annual (Qa) amounts authorized for withdrawal within GW Certificate G1-22769C are not subject to relinquishment pursuant to RCW 90.14.140(2)(d).

Dated this 4th day of October, 1996.

Glenn Wilson
GRANTOR - CITY OF ALGONA

STATE OF WASHINGTON)
) ss
COUNTY OF KING)

On this 4th day of October, 1996, before me, the undersigned, a Notary Public in and for the State of Washington, duly commissioned and sworn, personally appeared Glenn Wilson, to me known as the Mayor, for the City of Algona, the municipal jurisdiction that executed the above and foregoing instrument and acknowledged that he signed the same as the legally authorized representative of the City of Algona as his free and voluntary act and deed, for the uses and purposes therein mentioned.

IN WITNESS WHEREOF, I have hereunto set my hand and affixed my official seal on the date hereinabove set forth.

Diane M Jenka
NOTARY PUBLIC in and for the STATE of WASHINGTON, residing at Puyallup
My Commission expires May 10, 1997

EXHIBIT G

Well and Ingress / Egress Easement

For and in consideration of the sum of one dollar ($1.00) and other good and valuable consideration, receipt of which is hereby acknowledged, and for benefits to be derived by the Grantor herein, Grantor, City of Algona, a Municipal Corporation of the State of Washington, hereby conveys and warrants to the City of Auburn, Grantee herein, a Municipal Corporation of the State of Washington, its successors and assigns, a perpetual Nonexclusive Easement under, over, through and across the following described real property for the purpose of laying, maintaining, and/or installing groundwater well facilities and appurtenances thereof, said real property being described as follows:

> Well and Protection Zone. A circle of land consisting of a 100 foot radius, centered on and surrounding the existing well facilities located on Lots 25-30 inclusive, Block 4, Woods Algona Addition, Division 1, according to the Plat thereof, as recorded in Volume 19 of Plats, page 36, in the records of King County, Washington.

Said Grantee shall have the absolute right, at times as may be necessary, for immediate ingress / egress over the regularly traveled portion of said Lots 25-30 inclusive, Block 4, for the purpose of maintenance, inspection, construction, operation, repair or reconstruction of the well facilities without incurring any legal obligation or liability therefore.

Said Grantor shall not in any way block, restrict or impede access and ingress / egress to or from said Easement, and/or in any way block, restrict or impede full use of the real property within the above-described Easement by said Grantee for the above-described purposes. Said Grantor may fence across said Easement and/or along the boundaries of said Easement provided that a gate is constructed in said fence. Said gate shall be of sufficient length and location to allow the Grantee full use of, and access and ingress / egress to and from the real property within the above-described Easement. If said gate is to be locked, keys shall be provided to the Grantee.

This Easement shall be a covenant running with the above-described real property and burden said real estate, and shall be binding on the successors, heirs and assigns of all parties hereto.

In the event of future well abandonment by Grantee, this easement shall be vacated by Grantee, and Grantor shall no longer be bound hereby.

IN WITNESS WHEREOF, said corporation has caused this instrument to be executed by its property officers this 4TH day of October, 1996.

HYDRAULIC MODEL CALIBRATION AND HYDRANT TESTING PLAN

Technical Memorandum

Date: May 6, 2022

Project: 22-3425

To: Susan Fenhaus, City of Auburn

From: Stephanie Ard, PE
Murraysmith

Re: Hydraulic Model Calibration

Background

The City of Auburn (City) has retained Murraysmith to update their Comprehensive Water System Plan. As part of this scope, Murraysmith will utilize the City's hydraulic model to analyze the system's capacity to meet existing and projected future demands. To ensure the model as accurate as possible, hydrant flow and pressure field data will be used to calibrate model parameters.

The process for hydrant testing is described in this memo.

Task Goals

The goal of this model calibration is to match model and field pressures and flows. During the calibration, system field data will be compared to model simulation results and the model will be updated to better reflect the existing system conditions. The calibration process ensures that the model accurately represents real-world conditions. Common model adjustments include pipeline friction coefficients adjustments (within standard ranges based on pipe age and material) and operational settings adjustments to match the actual system operations.

Field Testing Process

Flow and pressure testing in the field is a critical step for calibrating the City's existing hydraulic model. It provides the real-world data that will be used to ensure the model replicates existing system conditions.

Testing Locations

A total of thirty (30) test locations have been identified for calibration testing, as shown in Attachment 1. If field conditions make a test location impossible or impractical, a new location will

be selected that is close to the original location. Any new locations should be as similar as possible to the original location considering pressure zone, pipe size, and dead ends. Any changes in test location should be documented (marked on a map and written in the data collection log) to ensure that test results are accurately represented in the model during the calibration process.

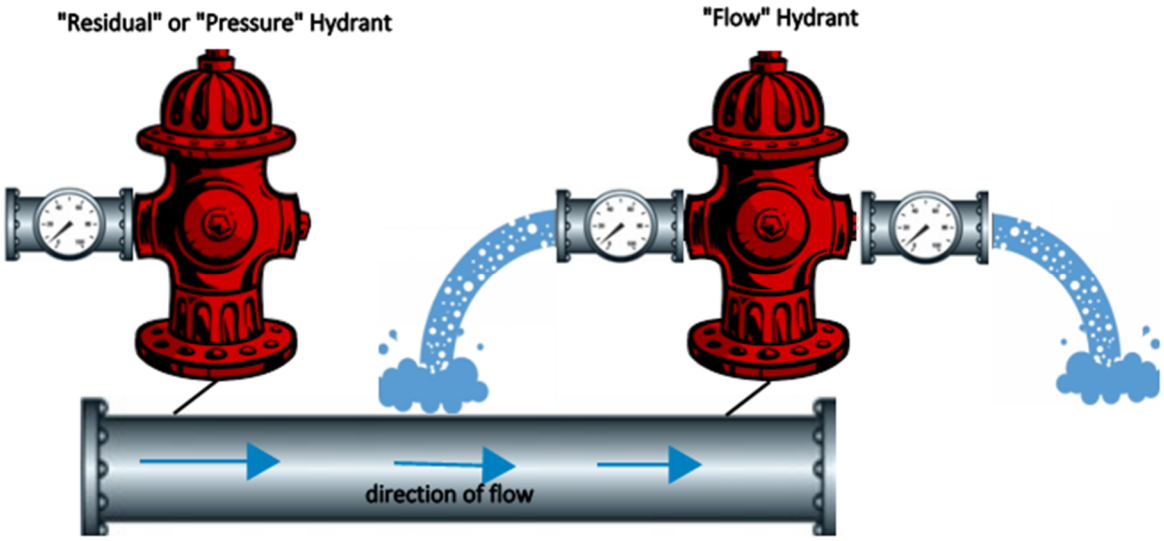
Procedure

Flow and pressure tests will be conducted using at least two adjacent hydrants. One hydrant is used to measure pressure and at least one other hydrant is opened to create a pressure drop in the system (see Figure 1, below). Record results from the tests on the Data Collection sheet, provided in Attachment 2. The recommended testing process is as follows:

1. Locate the flow and pressure hydrants indicated on Attachment 1 in the field. It is advisable for City staff to review or visit each proposed flow location prior to field testing to evaluate the risks of flooding and mark the hydrants involved in testing. If time does not permit review of the locations in advance, flow test locations may need to be changed in the field and any changes should be indicated. It is important to keep the pressure and flow hydrant adjacent, if possible.

2. Flush the "pressure hydrant" to remove sediment, and then install the pressure gauge. Open hydrant, confirm no leakage, and then measure the static pressure. Recorded "static pressure" on the Data Collection sheet.

3. Install pitot pressure measurement gauge on the "flow hydrant." If possible, the gauge should be directly connected to the hydrant, without the use of a hose. Open hydrant, confirm no leakage, and then measure the static pressure. Recorded "flow static pressure" on the Data Collection sheet.



4. As the "flow hydrant" discharges, monitor the pressure at the "pressure hydrant" until it drops at least 10 psi and stabilizes. This process can take up to five minutes. Record "residual pressure" and "pitot pressure" on the Data Collection sheet.

    a. If the 10-psi pressure drop cannot be realized with a single flow hydrant, select a second flow hydrant near the pressure and first flow hydrant. Flow measurements will need to be recorded at all flow hydrants. If the test is near a facility, the 10 psi may not be realized. If this is the case, add a note on the Data Collection sheet.

    b. If the pressure does not stabilize after 5 minutes, record a couple of values.

5. Close both hydrants. Remove equipment. Clean up site, as necessary.

Figure 1 | Example Test Configuration

Additional Testing Notes

- Field testing should be completed in less than one week of field time by City crews.
- Open and close the hydrants slowly to prevent water hammer and potential system damage.
- Estimate discharge path prior start of flow test to ensure the flowed water does not cause erosion or flooding. If necessary, use sand bags or a diffuser to divert water to appropriate drainages.
- Measure and note the size of the orifice a flow hydrant. These measurements are used to translate the pressure measurement from the pitot gauge into a flow rate. Note any non-typical outlet geometry or signs of excessive corrosion or damage that could affect the accuracy of the measurement.

Boundary Conditions

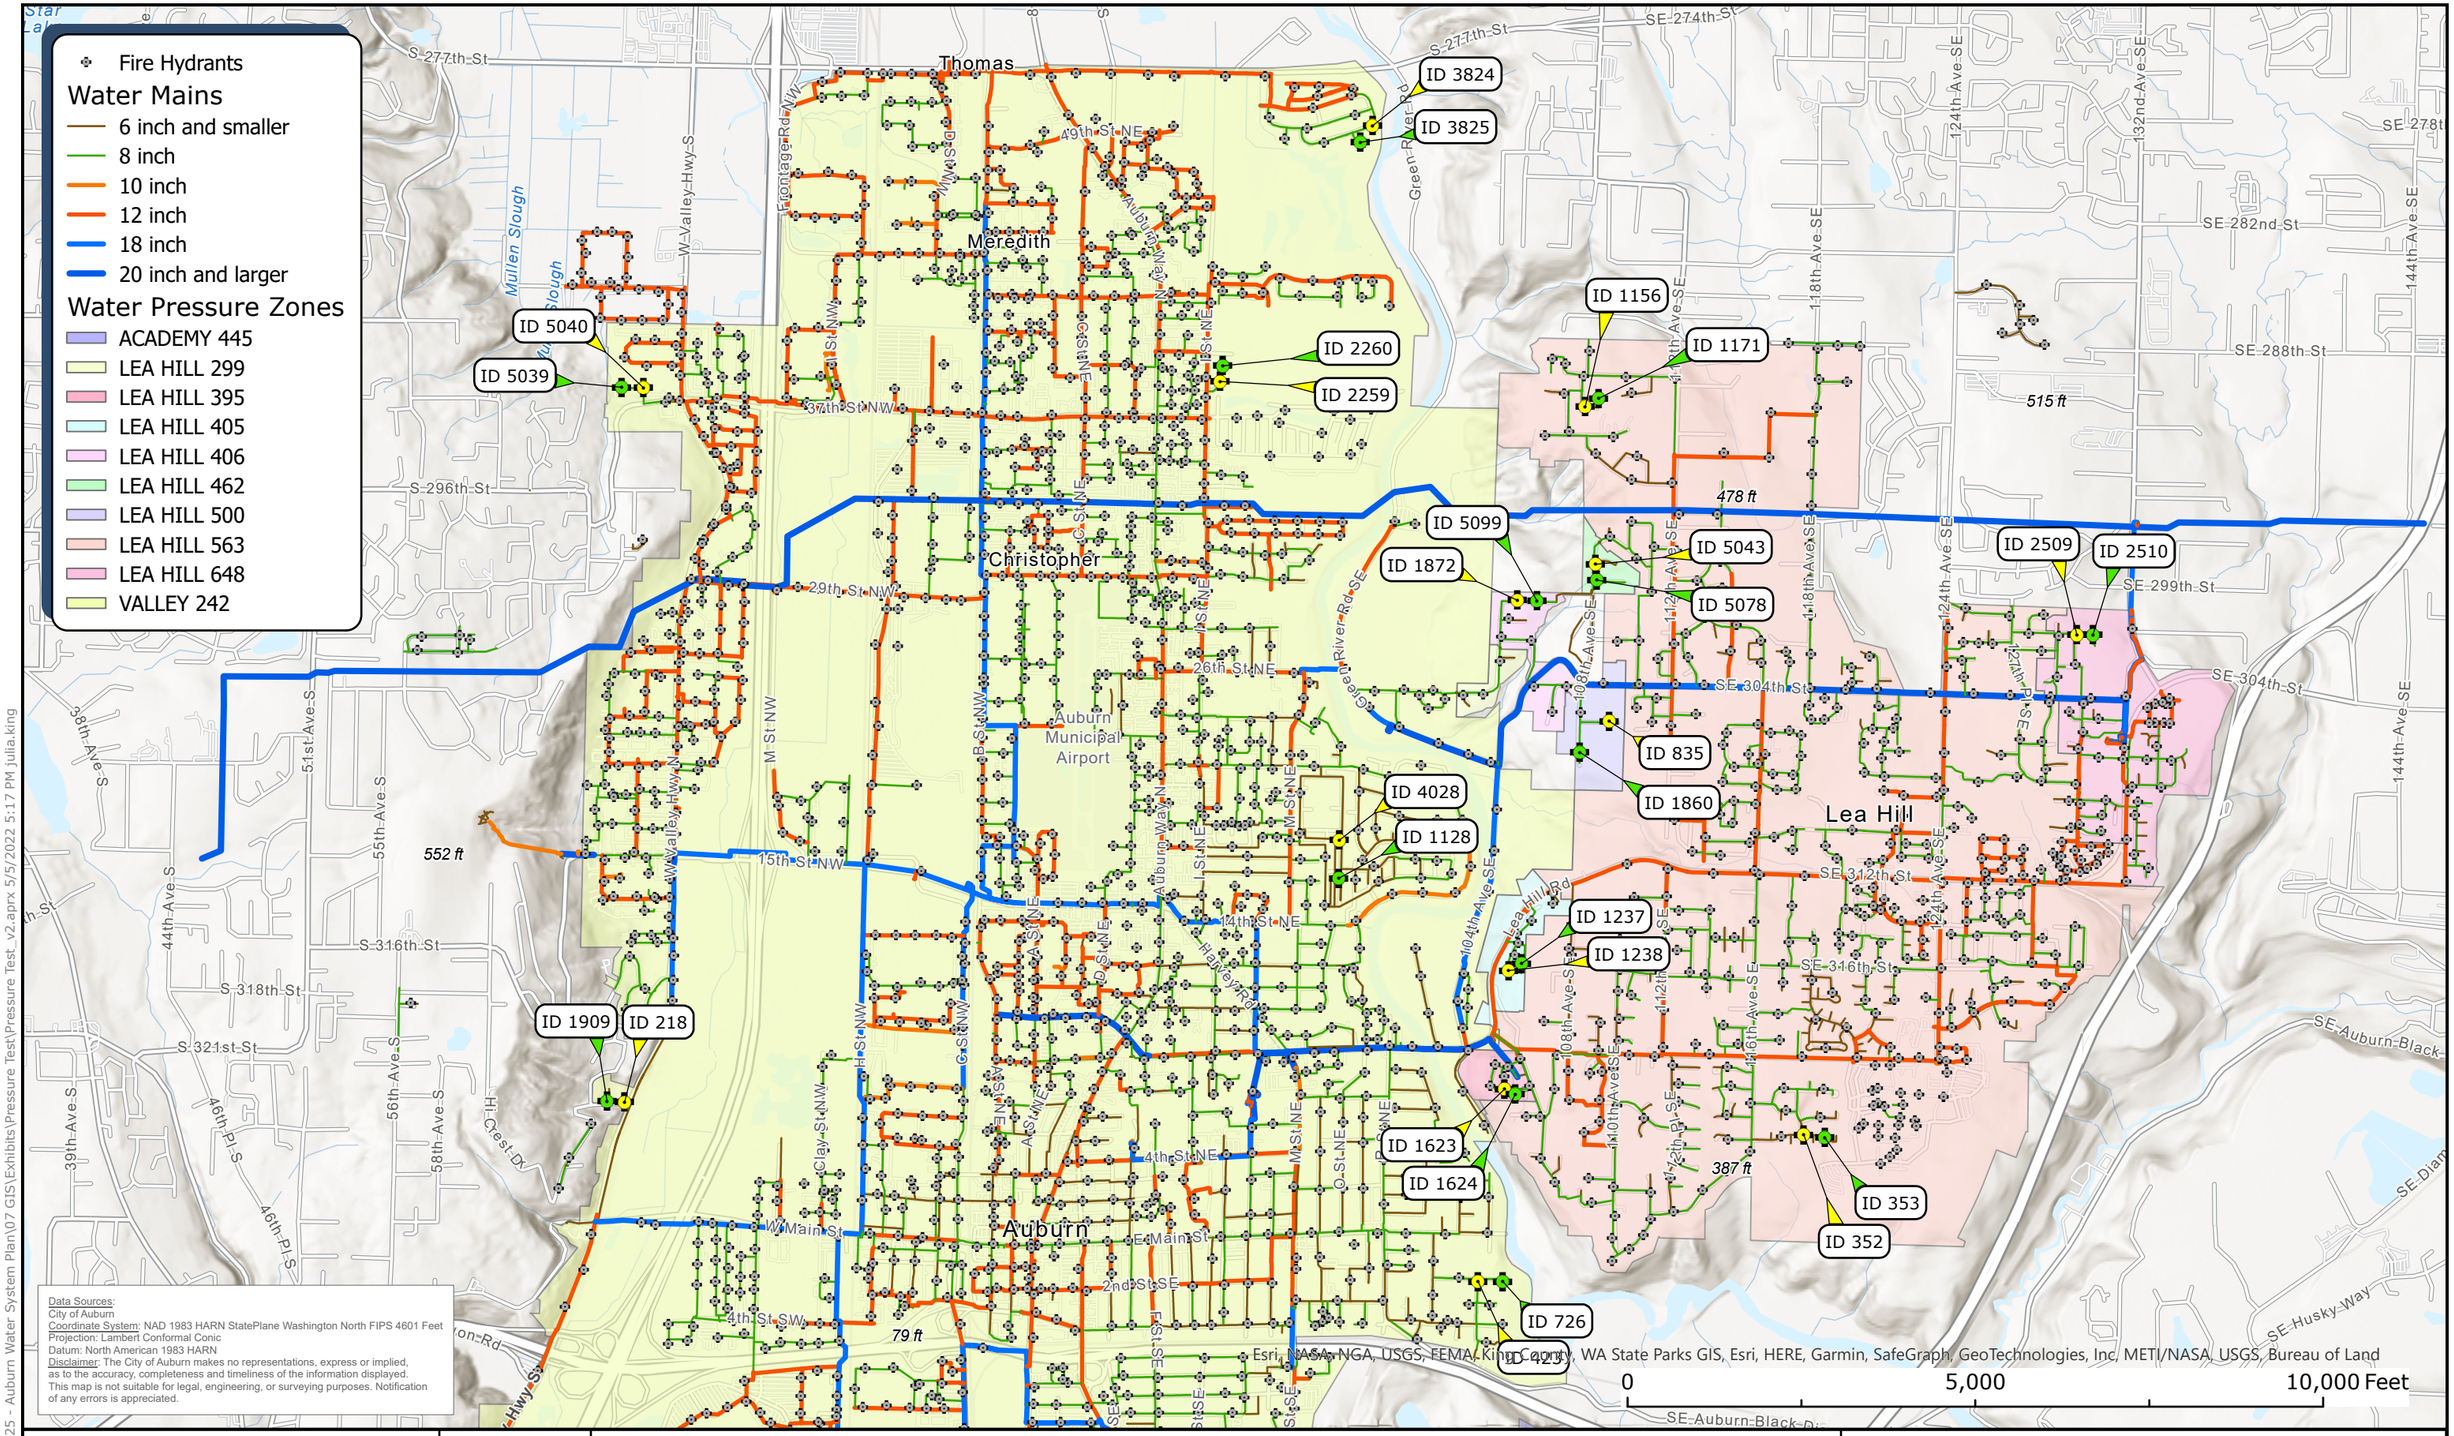
In addition to flow and pressure data collected at the hydrants, system boundary conditions are required to calibrate the model. To accurately represent system conditions during flow testing, supervisory control and data acquisition (SCADA) information for all facilities will be used in the model to represent system conditions during testing including the following.

- Water levels in reservoirs.
- Well and booster pump status and flow rates.
- Intertie flow rates (as applicable).
- Valve status and flow rates (as available).

The SCADA information should be recorded and provided at time intervals small enough to show the testing, preferably one-minute increments. If SCADA is not available at the facilities, a person should be at the station to manually record information for the facilities that are anticipated to contribute flow during the testing period.

Equipment

One crew of 2-4 City staff (if possible, the same people for the duration of testing) with the appropriate vehicle and equipment will be required to conduct the pressure and flow tests. All fire flow test equipment should be calibrated before field use to confirm measurement accuracy. This can be done by calibrating to manufacturer recommendations or comparing with other pressure reading instruments. Flowed hydrants make considerable noise, and the two hydrants may not be in direct line of sight of one another, so radios or phones are a good idea for communicating between the operator at the pressure hydrant and the operators at the flowed hydrants. A list of field equipment includes:



Equipment List

- Two manually read pressure gauges
- Two pitot gauges or pitot diffusers
- Radios/phones for communication between pressure and flow hydrant
- Spray paint for marking pressure and flow hydrants (optional)
- Hydrant Testing Plan map (Provided by Murraysmith)
- Data Collection sheet to record pressure and flow measurements (Provided by Murraysmith)
- Sandbags for flow tests (as needed)
- Safety equipment including cones for traffic control
- Equipment necessary for accessing and opening all hydrants/valve vaults

Next Steps

Once testing is complete, the City shall submit the completed Data Collection sheet, marked-up Hydrant Testing Plan map, and the requested boundary conditions data to Murraysmith. Please also provide any additional notes or information that may be helpful to understanding how the system was operating at the time of these tests. This information will be compared to model simulation results to calibrate the hydraulic model. Based on the results of this calibration process, additional questions may arise.

King County

Water Reclamation Evaluation Checklist
For Systems with 1,000 or more Connections

The County and State recognize that changing conditions could initiate a need to respond in new ways to future water quality standards, wastewater discharge requirements, take advantage of advances in treatment technologies and/or allow our region to be positioned to respond to changes associated with climate change and population growth.

In 2003, Chapter 90.46 of the Revised Code of Washington (RCW) was amended to require public water systems serving 1,000 or more connections to evaluate opportunities for reclaimed water when completing their water system plans. Please use this checklist to meet King County consistency requirements in responding to this legislation.

Please use this checklist, including the inventory template, to ensure that your water system plan includes sufficient information about opportunities for reclaimed water and your system's efforts to develop those opportunities. If a question is not applicable or the information is unavailable, then answer, "unknown" or "n/a." King County will consider the checklist completed if each answer is filled in with the best available information, even if the utility states that it is not aware of any reclaimed water opportunities within its service area.

Water System Name: City of Auburn
Date: 03/11/2024

1. **Identifying Potential Future Demand for Reclaimed Water:** King County maintains a database and map of potential reclaimed water users for evaluating future projects. Please use the template below, or similar table, to provide information to assist King County in further researching these potential uses.
   - **Large Utility Water Users** (choose one):
     - ☐ Attached is an inventory of twenty large (above 20,000 gallons/month on average), non single-family residential, water users served by our utility that have a potential for reclaimed water use, or
     - ☑ Attached is an inventory of our utility's top twenty water users, or
     - ☐ The information requested is unknown or not available.
       Additional Comments: _____
   - **Large Self Suppliers** (choose one):
     - ☐ Attached is an inventory of large, self-supplied water users within our water utility's service boundaries - especially those near wastewater treatment plants, mainlines, outfalls, and pump stations or similar reclaimed water facilities), or
     - ☑ The information requested is unknown or not available.
       Additional Comments: _____
   - **Other** (choose one):
     - ☐ Attached is an inventory of other water users (such as those that are clustered near one another and could be served by a single system) that may be likely candidates for reclaimed water use, or
     - ☑ The information requested is unknown or not available.
       Additional Comments: _____

2. **Environmental Commitment**: Are you a city/town, or providing water service to a city/town, that has made commitments within resource management plans, salmon recovery plans, or other environmental initiatives for which there is a potential opportunity for using reclaimed water to assist in meeting commitments? (choose one)

☐ Yes, here are plans that have potential for reclaimed water use in our service area to meet the above commitments:

_____

_____

☑ The information requested is unknown, not available.
Additional Comments: _____

3. **Identifying Areas of Potential Use of Reclaimed Water for Environmental Benefit:**
Below are ***examples*** of uses of reclaimed water ***that comply with State, Federal and other reclaimed water environmental, health and safety standards***. All of these uses are currently in effect somewhere in Washington State. To the best of your knowledge, are any of these potential uses for reclaimed water applicable to your area?

River Augmentation (choose one):

☐ Yes, our water rights are limited by instream flows. For more information, King County may contact:

_____

_____

☑ The information requested is unknown, or not available.
Additional Comments: _____

Groundwater Recharge (choose one):

☐ Yes, we withdraw water from an aquifer that is in a groundwater management area, or from a declining aquifer, where water levels may need to be replenished or to maintain aquifer storage. For more information, King County may contact:

_____

☑ The information requested is unknown, or not available.
Additional Comments: _____

Water Rights Mitigation (choose one):

☑ Yes, our area is pursuing, or planning to pursue, new or additional water rights, and there may be an opportunity to use reclaimed water for mitigation of those new water rights. For more information, King County may contact:
Application G1-28404. Contact Ingrid Gaub, 253-804-3113

☐ The information requested is unknown, or not available.
Additional Comments: _____

Potential Areas of Environmental Need (choose one):

☐ Yes, parts of our service area include potential environmental enhancement locations, such as wetlands enhancement, aquifer recharge, stream flow augmentation, that might be candidates for reclaimed water use. For more information, King County may contact:

_____

☑ The information requested is unknown, or not available.
Additional Comments: _____

4. **Local Reclaimed Water Legislation**: If water reclamation is mandated for this water system through local government agreement, contract, local regulations, ordinances, or other mechanisms, please provide a copy of the governing mechanism (choose one).

   ☐ Yes, local legislation exists in our area in support of reclaimed water use. The following relevant legislation is attached (please list titles of documents):

   _____

   _____

   ☑ No water reclamation legislation exists, or is known to exist, at a local level in our service area.

5. **Coordination with Local Wastewater Utility:** Include a brief description of your interactions with any wastewater or reclaimed water utility (King County or other) adjacent to your service area to evaluate any potential opportunities to develop reclaimed water (choose one).

   ☑ Describe if applicable:
   The City of Auburn's policy is to coordinate with King County to explore potential opportunities for water reclamation.

   ☐ None. Additional Comments: _____

Water Use Efficiency
Annual Performance Report - 2020

WS Name: Auburn City of

Water System ID# : 03350 WS County: KING

Report submitted by: *Susan Fenhaus*

Meter Installation Information:

Estimate the percentage of metered connections: *100%*

If not 100% metered – Did you submit a meter installation plan to DOH? No

Within your meter installation plan, what date did you commit to completing meter installation?

Current status of meter installation:

Production, Authorized Consumption, and Distribution System Leakage Information:

12-Month WUE Reporting Period _____ To _____

Incomplete or missing data for the year? *No*

If yes, explain:

Total Water Produced & Purchased (TP) – Annual volume gallons	*2,312,559,400*	gallons	
Authorized Consumption (AC) – Annual Volume in gallons	*2,165,043,100*	gallons	
Distribution System Leakage – Annual Volume TP – AC	*147,516,300*	gallons	
Distribution System Leakage – DSL = [(TP – AC) / TP] x 100 %	*6.4 %*		
3-year annual average - %	*4.5 %*		*2018, 2019, 2020*

Goal-Setting Information:

Enter the date of most recent public forum to establish WUE goal: *10/25/2014*

Has goal been changed since last performance report? *No*

Note: Customer goal must be re-established every 6 years through a public process.

Customer WUE Goal (Demand Side):

1 percent reduction per year in equivalent residential unit values over 6-year planning period (2015-2020).

Customer (Demand Side) Goal Progress:

In 2020, due to Covid-19, no low flow shower heads were given and no applications for WaterSense® toilet rebates were processed.

The goal of 1 percent reduction per year in equivalent residential unit (ERU) values over the 6-year planning period was adopted on 10/25/2014. The change of ERU values from year 2019 to 2020 was 168 to 179, a 6.5% increase, the value of 168 for year 2019 is the lowest value achieved so far.

The City continued to implement WUE program measures such as bills showing consumption history, water saving device kits and conservation pricing.

Additional Information Regarding Supply and Demand Side WUE Efforts

In 2020, the City continued efforts to reduce unaccounted-for water, performing leak detection and repair, metering hydrant use and repairing breaks. As a result, the Distribution System Leakage for year 2020 was 6.4%, below the 10% target. The rolling 3-year average was 4.5%, meeting the WUE rule of at or below 10%.

In 2020, the City continued to implement the WaterSense® toilet rebate program, providing customers a $100 rebate per toilet for the replacement of up to two old toilets with new high efficiency toilets with the WaterSense® label.

The City continued to implement the low flow shower head giveaway program, providing free low flow shower heads so that customers could replace their higher flow ones.

The City continued to perform large meter consumption and meter register checking and calibration.

The City continued to educate customers about water use efficiency practices.

The City continued to encourage the use of water conserving plants in landscaping for both public and private projects.

The City continued to use an inclining block rate for the quantity of water consumed to promote water conservation and customer notification of any high or abnormal water consumption.

The City continued to utilize the AMI (Advanced Metering Infrastructure) system to better understand usage, proactively and more efficiently and effectively manage the water resources and respond better to customers. The City completed the replacement of all small and large water meters in 2017 as part of the AMI implementation.

Describe Progress in Reaching Goals:

- Estimate how much water you saved.
- Report progress toward meeting goals within your established timeframe.
- Identify any WUE measures you are currently implementing.
- If you established a goal to maintain a historic level (such as maintaining daily consumption at 65 gallons per person per day for the next two years) you must explain why you are unable to reduce water use below that level.

The following questions will help DOH better understand water usage, water resources management and drought response. The data will be used to provide technical assistance, not for regulatory purposes.

All questions are voluntary

Month	Date of Measurement	Static Water Level (feet below measuring point)	Dynamic Water Level (feet below measuring point)
January	01/07/2020	43.3	51.6
February	02/18/2020	43.2	49.1
March	03/10/2020	43.3	50.0
April	04/16/2020	42.6	51.7
May	05/06/2020	42.7	51.3
June	06/05/2020	42.6	51.7
July	07/20/2020	43.1	53.1
August	08/01/2020	44.6	53.5
September	09/01/2020	45.3	54.0
October	10/19/2020	45.1	53.2
November	11/20/2020	44.8	52.5
December	12/02/2020	44.1	53.2

Water level data:

Please provide the following information (if known) to help us better utilize the water level data.

Well tag Id number:

Well depth: 339.0

Water level accuracy (within 0.01 ft < 1 ft ~ 1 ft) 0.1'

Completion type (e.g., cased open interval, cased open-ended, cased open-ended with perforations, etc…)

Location coordinates (latitude, longitude) and accuracy of the coordinates (< 1ft, ~1ft, >1000ft) 47.28582N, 122.21645W

Water level parameter name (e.g. depth below measuring point, depth below top of casing, depth below ground surface) depth below top of casing

Elevation of top of casing OR elevation of measuring point if different than top of casing (as specified in question 7) 120.8'

Monthly/Seasonal Water Usage:

What was your maximum daily water demand for the previous year (in gallons per day)? 13,616,000

Month	Volume of Water Produced in gallons
January	153,656,000
February	146,249,000
March	161,764,000
April	162,137,000
May	187,153,000
June	197,198,000
July	263,820,000
August	293,885,000
September	237,212,000
October	171,856,000
November	155,010,000
December	159,250,000

Water shortage response:

Did you activate any level of water shortage response plan the previous year?

☐ Yes ☑ No ☐ There was no need to

If you activated a water shortage response plan the previous year, what level did you activate? (Check all that apply)

☐ Advisory Conservation ☐ Voluntary Conservation

☐ Mandatory Conservation ☐ Rationing ☐ Other

What factors caused your water shortage the previous year?

☐ Drought ☐ Fire ☐ Landslides ☐ Earthquakes

☐ Flooding ☐ Water Supply Limitations ☐ Other

Water Use Efficiency
Annual Performance Report - 2021

WS Name: Auburn City of

Water System ID# : 03350 WS County: KING

Report submitted by: *Susan Fenhaus*

Meter Installation Information:

Estimate the percentage of metered connections: *100%*

If not 100% metered – Did you submit a meter installation plan to DOH? No

Within your meter installation plan, what date did you commit to completing meter installation?

Current status of meter installation:

Production, Authorized Consumption, and Distribution System Leakage Information:

12-Month WUE Reporting Period *01/01/2021* To *12/31/2021*

Incomplete or missing data for the year? *No*

If yes, explain:

Total Water Produced & Purchased (TP) – Annual volume gallons	*2,453,684,600*	gallons	
Authorized Consumption (AC) – Annual Volume in gallons	*2,251,573,400*	gallons	
Distribution System Leakage – Annual Volume TP – AC	*202,111,200*	gallons	
Distribution System Leakage – DSL = [(TP – AC) / TP] x 100 %	*8.2 %*		
3-year annual average - %	*7.0 %*		*2019, 2020, 2021*

Goal-Setting Information:

Enter the date of most recent public forum to establish WUE goal: *08/02/2021*

Has goal been changed since last performance report? *Yes*

Note: Customer goal must be re-established every 6 years through a public process.

Customer WUE Goal (Demand Side):

Decrease the planning ERU value (gpd/ERU) 1 percent annually from the current planning ERU value of 179 gpd/ERU, which is the 75th percentile of the 7 years of historical data (2014-2020). Revaluate goal when the planning ERU value reaches less than 172 gpd/ERU.

Customer (Demand Side) Goal Progress:

In 2021, the City processed 5 applications for WaterSense® toilet rebates for an estimated consumption savings (reduction) of 40,920 gallons per year.

Decreasing the planning ERU value (gpd/ERU) 1 percent annually from the current planning ERU value of 179 gpd/ERU was adopted on 8/2/2021. The change of ERU values from year 2020 to 2021 was 179 to 182, a 1.7% increase, the value of 168 for year 2019 is the lowest value achieved so far.

The City continued to implement WUE program measures such as bills showing consumption history, water saving device kits and conservation pricing.

Additional Information Regarding Supply and Demand Side WUE Efforts

In 2021, the City continued efforts to reduce unaccounted-for water, performing leak detection and repair, metering hydrant use and repairing breaks. As a result, the Distribution System Leakage for year 2021 was 8.2%, below the 10% target. The rolling 3-year average was 7.0%, meeting the WUE rule of at or below 10%.

In 2021, the City continued to implement the WaterSense® toilet rebate program, providing customers a $100 rebate per toilet for the replacement of up to two old toilets with new high efficiency toilets with the WaterSense® label.

The City continued to implement the low flow shower head giveaway program, providing free low flow shower heads so that customers could replace their higher flow ones.

The City continued to perform large meter consumption and meter register checking and calibration.

The City continued to educate customers about water use efficiency practices.

The City continued to encourage the use of water conserving plants in landscaping for both public and private projects.

The City continued to use an inclining block rate for the quantity of water consumed to promote water conservation and customer notification of any high or abnormal water consumption.

The City continued to utilize the AMI (Advanced Metering Infrastructure) system to better understand usage, proactively and more efficiently and effectively manage the water resources and respond better to customers. The City completed the replacement of all small and large water meters in 2017 as part of the AMI implementation.

Describe Progress in Reaching Goals:

- Estimate how much water you saved.
- Report progress toward meeting goals within your established timeframe.
- Identify any WUE measures you are currently implementing.
- If you established a goal to maintain a historic level (such as maintaining daily consumption at 65 gallons per person per day for the next two years) you must explain why you are unable to reduce water use below that level.

The following questions will help DOH better understand water usage, water resources management and drought response. The data will be used to provide technical assistance, not for regulatory purposes.

All questions are voluntary

Month	Date of Measurement	Static Water Level (feet below measuring point)	Dynamic Water Level (feet below measuring point)
January	01/11/2021	35.1	21.5
February	02/02/2021	41.9	22.7
March	03/11/2021	48.1	
April	04/12/2021	46.2	25.3
May	05/11/2021	45.1	24.0
June	06/01/2021	44.7	23.4
July	07/02/2021	43.1	22.1
August	08/01/2021	41.4	20.6
September	09/11/2021	40.4	20.2
October	10/22/2021	40.7	21.2
November	11/30/2021	46.9	
December	12/08/2021	47.4	26.8

Water level data:

Please provide the following information (if known) to help us better utilize the water level data.

Well tag Id number:

Well depth: 298.0

Water level accuracy (within 0.01 ft < 1 ft ~ 1 ft) 0.1

Completion type (e.g., cased open interval, cased open-ended, cased open-ended with perforations, etc…)

Location coordinates (latitude, longitude) and accuracy of the coordinates (< 1ft, ~1ft, >1000ft) 47.29780N, 122.21294W

Water level parameter name (e.g. depth below measuring point, depth below top of casing, depth below ground surface) depth above the probe

Elevation of top of casing OR elevation of measuring point if different than top of casing (as specified in question 7) 27.7'

Monthly/Seasonal Water Usage:

What was your maximum daily water demand for the previous year (in gallons per day)? 13,080,000

Month	Volume of Water Produced in gallons
January	162,246,000
February	145,212,000
March	169,190,000
April	179,441,000
May	204,398,000
June	252,258,000
July	304,515,000
August	299,897,000
September	229,711,000
October	177,834,000
November	165,938,000
December	173,023,000

Water shortage response:

Did you activate any level of water shortage response plan the previous year?

☐ Yes ☑ No ☐ There was no need to

If you activated a water shortage response plan the previous year, what level did you activate? (Check all that apply)

☐ Advisory Conservation ☐ Voluntary Conservation

☐ Mandatory Conservation ☐ Rationing ☐ Other

What factors caused your water shortage the previous year?

☐ Drought ☐ Fire ☐ Landslides ☐ Earthquakes

☐ Flooding ☐ Water Supply Limitations ☐ Other

Water Use Efficiency
Annual Performance Report - 2022

WS Name: Auburn City of

Water System ID# : 03350 WS County: KING

Report submitted by: *Senait Gebreeyesus*

Meter Installation Information:

Estimate the percentage of metered connections: *100%*

If not 100% metered – Did you submit a meter installation plan to DOH? No

Within your meter installation plan, what date did you commit to completing meter installation?

Current status of meter installation:

Production, Authorized Consumption, and Distribution System Leakage Information:

12-Month WUE Reporting Period _____ To _____

Incomplete or missing data for the year? *No*

If yes, explain:

Total Water Produced & Purchased (TP) – Annual volume gallons	*2,425,214,900*	gallons	
Authorized Consumption (AC) – Annual Volume in gallons	*2,215,863,800*	gallons	
Distribution System Leakage – Annual Volume TP – AC	*209,351,100*	gallons	
Distribution System Leakage – DSL = [(TP – AC) / TP] x 100 %	*8.6 %*		
3-year annual average - %	*7.7 %*		*2020, 2021, 2022*

Goal-Setting Information:

Enter the date of most recent public forum to establish WUE goal: *08/02/2021*

Has goal been changed since last performance report? *No*

Note: Customer goal must be re-established every 6 years through a public process.

Customer WUE Goal (Demand Side):

Decrease the planning ERU value (gpd/ERU) 1 percent annually from the current planning ERU value of 179 gpd/ERU, which is the 75th percentile of the 7 years of historical data (2014-2020). Revaluate goal when the planning ERU value reaches less than 172 gpd/ERU.

Customer (Demand Side) Goal Progress:

In 2022, the City processed 6 applications for WaterSense® toilet rebates for an estimated consumption savings (reduction) of 81,840 gallons per year.

Decreasing the planning ERU value (gpd/ERU) 1 percent annually from the current planning ERU value of 179 gpd/ERU was adopted on 8/2/2021. The change of ERU value from year 2021 to 2022 was 182 to 173, a 4.9% decrease, the value of 168 for year 2019 is the lowest value achieved so far.

The City continued to implement WUE program measures such as bills showing consumption history, consumer web portal to check consumption, customer possible leak alert, water saving device kits and conservation pricing.

Additional Information Regarding Supply and Demand Side WUE Efforts

In 2022, the City continued efforts to reduce unaccounted-for water, performing leak detection and repair, metering hydrant use and repairing breaks. The Distribution System Leakage for year 2022 was 8.6%, below the 10% target. The rolling 3-year average was 7.7%, meeting the WUE rule of at or below 10%.

In 2022, the City continued to implement the WaterSense® toilet rebate program, providing customers a $100 rebate per toilet for the replacement of up to two old toilets with new high efficiency toilets with the WaterSense® label.

The City continued to implement the low flow shower head giveaway program, providing free low flow shower heads so that customers could replace their higher flow ones.

The City continued to perform large meter consumption and meter register checking and calibration.

The City continued to educate customers about water use efficiency practices.

The City continued to encourage the use of water conserving plants in landscaping for both public and private projects.

The City continued to use an inclining block rate for the quantity of water consumed to promote water conservation and customer notification of any high or abnormal water consumption.

The City continued to utilize the AMI (Advanced Metering Infrastructure) system to better understand usage, proactively and more efficiently and effectively manage the water resources and better response to customers. The City completed the replacement of all small and large water meters in 2017 as part of the AMI implementation.

Describe Progress in Reaching Goals:

- Estimate how much water you saved.
- Report progress toward meeting goals within your established timeframe.
- Identify any WUE measures you are currently implementing.
- If you established a goal to maintain a historic level (such as maintaining daily consumption at 65 gallons per person per day for the next two years) you must explain why you are unable to reduce water use below that level.

The following questions will help DOH better understand water usage, water resources management and drought response. The data will be used to provide technical assistance, not for regulatory purposes.

Customer (Demand Side) Goal Progress:

Decreasing the planning ERU value (gpd/ERU) 1 percent annually from the current planning ERU value of 179 gpd/ERU was adopted on 8/2/2021. The change of ERU value from year 2021 to 2022 was 429 to 251, a 41.5% decrease, the value of 251 for this year is the lowest value achieved so far.

The City continued to implement WUE program measures such as bills showing consumption history, consumer web portal to check consumption, customer possible leak alert, water saving device kits and conservation pricing.

Additional Information Regarding Supply and Demand Side WUE Efforts

All meters in the Braunwood system have been replaced in 2017 as part of the Advanced Metering Infrastructure (AMI) project. The Distribution System Leakage for year 2022 was 6.6%, below the 10% target. The rolling 3-year average was 5.1%, meeting the WUE rule of at or below 10%.

In 2022, the City continued to implement the WaterSense® toilet rebate program, providing customers a $100 rebate per toilet for the replacement of up to two old toilets with new high efficiency toilets with the WaterSense® label.

The City continued to implement the low flow shower head giveaway program, providing free low flow shower heads so that customers could replace their higher flow ones.

CITY OF AUBURN WASHINGTON	**Public Works Committee** **October 20, 2014 - 3:30 PM** **Annex Conference Room 2** **MINUTES**

I. CALL TO ORDER

Chairman Wayne Osborne called the meeting to order at 3:30 p.m. in Conference Room #2, located on the second floor of Auburn City Hall, One East Main Street, Auburn, Washington.

A. Roll Call

Chairman Wayne Osborne, Vice-Chair Bill Peloza, and Member Claude DaCorsi were present. Also present during the meeting were: Mayor Nancy Backus, Community Development & Public Works Director Kevin Snyder, Assistant Director of Engineering/City Engineer Ingrid Gaub, Assistant City Engineer Jacob Sweeting, Utility Engineering Manager Lisa Tobin, Transportation Manager Pablo Para, Water Utility Engineer Susan Fenhaus, Planning & Design Services Manager Elizabeth Chamberlain, Financial Planning Manager Bob Brooks, Water Manager Allen Hunter and Public Works Secretary Molly Mendez.

B. Announcements

1. Announcements
   Public comment will be accepted on Discussion Item E.

C. Agenda Modifications

There was one agenda modification, removing Action Item A, Public Works Project No. C512A, from the agenda.

II. CONSENT AGENDA

A. Approval of Minutes
Public Works Committee to approve the minutes of the October 6, 2014 Public Works Committee meeting

It was moved by Vice-Chair Peloza, seconded by Member DaCorsi, that the Committee approve the Public Works Committee Meeting minutes for date, October 6, 2014.

Motion carried 3-0.

III. ACTION

A. Public Works Project No. C512A (Wickstrom)
Award Contract No. 13-12, to Gary Harper Construction, Inc. on their Low Bid of $870,696.00 plus Washington State Sales Tax of $82,716.12 for a Total Contract Price of $953,412.12 for Project No. C512A, Well 4 Emergency Power Improvements

Action Item A was removed from the agenda.

B. Resolution No. 5108 (Tobin)
A Resolution of the City Council of the City of Auburn, Washington, Authorizing the Public Works Committee to Appoint the City of Auburn Representatives to the King County Metropolitan Water Pollution Abatement Advisory Committee

Utility Engineering Manager Tobin provided a brief background summary of Resolution No. 5108 and reviewed the draft letter identifying the City's representative and alternates. There were no questions from the Committee.

It was moved by Vice-Chair Peloza, seconded by Member DaCorsi, that the Committee adopt Resolution No. 5108.

Motion carried 3-0.

IV. DISCUSSION ITEMS

A. Ordinance No. 6534 (Chamberlain)
An Ordinance of the City Council of the City of Auburn, Washington, amending Section 18.29.060 of the Auburn City Code related to floor area ratio in the Downtown Urban Center Zone.

For the purpose of these minutes, this item was discussed after Discussion Item C.

Planning & Design Services Manager Chamberlain provided a brief background summary of Ordinance No. 6534. Chamberlain stated Ordinance No. 6534 already went before the Planning Commission which held a public hearing on October 7, 2014. There was no public testimony. The Planning Commission recommended approval of the code change. Ordinance No. 6534 also went to the Planning and Community Development Committee on October 13, 2014 and the Committee concurred with Planning Commission's recommendation.

Planning & Design Services Manager Chamberlain responded to a question asked by Chairman Osborne regarding the building height limit of 75 feet and that this could be reviewed in the City's Comprehensive Planning effort.

In response to a question asked by Chairman Osborne, Planning & Design Services Manager Chamberlain provided definition of "life of the project" as mentioned on page 29 of the packet.

B. Ordinance No. 6537 (Chamberlain)
An Ordinance of the City Council of the City of Auburn, Washington, amending Section 17.09.010 of the Auburn City Code related to short plat thresholds.

Planning & Design Services Manager Chamberlain provided a brief background summary of Ordinance No. 6537. There were no questions from the Committee.

C. System Development Charges (Tobin/Fenhaus)

For the purpose of these minutes, this item was discussed before Discussion Item A.

Utility Engineering Manager Tobin invited Financial Planning Manager Brooks and Water Utility Engineer Fenhaus to join her at the table as this has been a collaborative effort.

Using a slideshow presentation, Utilities Engineering Manager Tobin briefed the Committee on the System Development Charges.

This was followed by a group discussion.

The Committee reached consensus on Option 1 – Full Water and Sewer SDC increase to be effective in January 2015, with annual updates to the Water, Sewer, and Storm SDCs in subsequent years based on the Construction Cost Index (CCI), but not to be an annual change less than zero.

Staff will provide a similar briefing for the full council before the proposed fee schedule is brought to the council for action.

D. Cross Connection Control Program (Fenhaus)

For the purpose of these minutes, this item was discussed after Discussion Item B.

Water Utility Engineer Fenhaus provided informational materials which explained the Cross Connection Control Program. Fenhaus briefly reviewed the presentation materials with the Committee.

Water Utility Engineer Fenhaus introduced Allen Hunter, the Water Manager at Maintenance and Operations, to the Committee. Water Utility Engineer Fenhaus mentioned that Water Manager Hunter has extensive knowledge with cross connection as he used to be the Cross Connection Specialist.

Water Manager Hunter further explained that Washington Administrative Code requires Public Water Systems to address "Table 9 Facilities" which are facilities that could pose a health concern because of the risk of death, spread of disease or illness. The Department of Health has mandated water systems to concentrate on medical facilities. The City program has identified 65 facilities within that category, and to date, 55 of them have the required premise isolation with the approved backflow device. The staff continue to work with the remaining 10. The Washington Administrative Code also requires Public Water Systems to track backflow assemblies used to protect the water system. The City currently tracks 2600 assemblies, all of which require annual testing by the owner.

Following a question asked by Member DaCorsi, Water Utility Engineer Fenhaus explained the City process for existing facilities.

E. Water Use Efficiency Program (Fenhaus)

Water Utility Engineer Fenhaus indicated this is Chapter 8 of the Water System Comprehensive Plan. Fenhaus noted that a requirement for putting together a Water Use Efficiency Program is to hold a public meeting where public comments are accepted. There were no public comments received.

Water Utility Engineer Fenhaus pointed out some highlights as seen in the memorandum on page 48 of the packet.

There was a group discussion regarding Distribution System Leakage following a question asked by Chairman Osborne.

Water Utility Engineer Fenhaus will investigate the numbers in the chart on page 70 of the packet, specifically the "Schools" column as pointed out by Vice-Chair Peloza.

Water Utility Engineer Fenhaus responded to a question asked by Chairman Osborne regarding the average consumption per account (single family) on the chart on page 72 of the packet.

F. Capital Project Status Report (Sweeting)

Item 6 – CP1024 – AWS and M Street SE Intersection Improvements:
Assistant City Engineer Sweeting provided the Committee with a project status update in response to a question asked by Member DaCorsi.

Item 10 – CP1308 – BNSF Utility Crossings Project:
Chairman Osborne requested staff keep the Committee updated on this project as this contractor has not been used by the City before.

Assistant City Engineer Sweeting indicated staff will keep the Committee informed.

Item 28 – CP1406 – West Main Street Traffic Signal Upgrades:
Assistant City Engineer Sweeting replied to a question asked by Vice-Chair Peloza regarding the completion date of this project.

G. Significant Infrastructure Projects by Others - Public Works Status Report (Gaub)

There were no questions from the Committee.

H. Action Tracking Matrix (Gaub)

Assistant Director of Engineering/City Engineer Gaub reviewed the previous discussion on the 105th Place SE at 107th with committee; staff indicated they would investigate the site to see whether additional signage could be installed in the interim until the repair work could be done next year. Staff is completing this investigation.

Assistant City Engineer Sweeting noted this section of the road is scheduled with the capital projects to go out early next year. Sweeting advised the Committee that this is Item 17 on the Capital Project Status Report.

V. ADJOURNMENT

There being no further business to come before the Public Works Committee, the meeting was adjourned at 5:03 p.m.

Approved this 3rd day of November, 2014.

_____	_____
Wayne Osborne	Molly Mendez
Chairman	Public Works Department Secretary

Report Form

Consumer Confidence Report Certification Form

331-203 • Updated 3/6/2023

Consumer Confidence Reports are due before July 1, 2023

You need to complete the following.

1. **Before July 1, 2023**, mail or otherwise directly deliver a copy of your 2021 Consumer Confidence Report (CCR) to your water system customers. Keep a copy for your records.

2. **Before July 1, 2023**, mail or email a copy of your CCR to the regional office for your county (information on back)**.**

3. **By October 1, 2023*** complete and send this certification form to the regional office with your CCR.

***Note**: We are better able to properly credit your water system when we receive both documents, together, before the July 1 deadline.*

Certification for

Water System Name City of Auburn

Water System ID Number 03350 Water System County King and Pierce

Date delivered Mail and electronically delivered in June, 2023

URL (if delivered electronically) auburnwa.gov/water

In compliance with the CCR requirements in WAC 246-290-72001 through -72012, I confirm that:

- The CCR has been appropriately delivered to customers who use this water system.
- All information contained in this report is correct.
- The monitoring data stated in the CCR matches information submitted to Washington State Department of Health, Office of Drinking Water.

Certified by

Signature

Date delivered Mail delivered in June, 2023

URL (if delivered electronically) _____

In compliance with the CCR requirements in WAC 246-290-72001 through -72012, I confirm that:

- The CCR has been appropriately delivered to customers who use this water system.
- All information contained in this report is correct.
- The monitoring data stated in the CCR matches information submitted to Washington State Department of Health, Office of Drinking Water.

RESIDENTIAL LEAD AND COPPER MONITORING

Residential lead and copper sampling was conducted in Summer 2021 to determine the concentrations of lead and copper that leach from residential water pipes and fixtures. Lead results ranged from <1 ppb to 6.6 ppb. Copper results ranged from <0.02 ppm to 0.294 ppm. The 90th percentile results for lead and copper were 1.3 ppb and 0.056 ppm respectively, which are below the Action Level for lead (15 ppb) and for copper (1.3 ppm). If present, elevated levels of lead can cause serious health problems, especially for pregnant women and young children. Lead in drinking water is primarily from materials and components associated with service lines and home plumbing.

The Auburn Water Utility is responsible for providing high quality drinking water, but cannot control the variety of materials used in its customers' plumbing components. When your water has been sitting for several hours, you can minimize the potential for lead exposure by flushing your tap for thirty seconds to two minutes before using water for drinking or cooking. If you are concerned about lead in your water, you may wish to have your water tested. Information on lead in drinking water, testing methods, and steps you can take to minimize exposure is available from the Safe Drinking Water Hotline at **800-426-4791** or at **epa.gov/lead**.

WATER USE EFFICIENCY

The main components of the City of Auburn Water Use Efficiency(WUE) program are managing the water distribution system to minimize water loss, and encouraging responsible use of water by our customers.

Water loss is the difference between the total water produced and the water used by our customers, presented here as a percentage of water produced. The City of Auburn Water Utility goal since 1999 has been to maintain water loss at or below 10 percent. In accordance with the Water Use Efficiency reporting requirements, the water loss for year 2022 is **8.6%**. The three year average for the years up to and including 2022 was **7.7%**. In an effort to limit water loss, the Utility performs annual system leak detection and repair; tests production and service meters, calibrating or replacing them as required; and issues permits for water withdrawal from hydrants.

Responsible water use by our customers is promoted by the Utility through educational programs for school children and homeowners. Quantifying the benefit of educational programs and corresponding behavioral changes is difficult, but reductions in water use and/or waste can have a significant impact on the amount of water used as a whole. The City of Auburn is committed to efficiently managing the water distribution system and encourages you to use water wisely.

The City's Water Use Efficiency Annual Performance Report and other information regarding Auburn's Water Use Efficiency program are available on the City of Auburn's website at visit **auburnwa.gov/water**.

FLUORIDE

The City of Auburn does not add fluoride to your drinking water. In 2022, Fluoride levels present in Auburn's water range from 0.0-0.2 ppm. If you have questions about fluoride for dental use, please consult with your doctor or dentist. For more information on fluoride in drinking water, visit the Environmental Protection Agency (EPA) website at **epa.gov/ground-water-and-drinking-water**.

CROSS CONNECTION PROGRAM

Protecting Our Water System From Contamination

A cross connection is a connection between a water pipe and a source of contamination. Examples of cross connections within the home include hose ends submerged in pools, hot tubs or buckets, irrigation systems and most hose-end spray applicators. Cross connections are extremely dangerous because they provide opportunities for contaminated fluids to be pulled back into the water system.

To protect our water supply, avoid using hose-end sprayers and maintain an air gap by keeping the hose end above the water surface when filling containers. Irrigation systems are required to have a backflow assembly. Backflow assemblies require a plumbing permit, must be inspected by a cross connection specialist, and must be tested by a certified tester when installed, and yearly thereafter. For more information or a list of certified testers, call the Water Division at **253-931-3048** or visit **auburnwa.gov/water**.

PARAMETER	STANDARDS		SAMPLE RESULTS		ADDITIONAL INFORMATION
	MCLG	MCL	Average	Range	Typical Source/Comments
INORGANIC SUBSTANCE					
Arsenic (ppb)	0	10		ND - 1.8	Erosions of natural deposits. Most recent sampling date and data are from the most recent testing done in accordance with the regulations.
Nitrate (ppm)	10	10		0.30 - 3.25	Natural deposits, fertilizer, septic tanks
VOLATILE ORGANIC SUBSTANCE					
Haloacetic Acids (ppb)	NA	60		ND	By-product of drinking water disinfection
Total Trihalomethanes (ppb)	NA	80		9.03 - 10.41	By-product of drinking water disinfection
OTHER MONITORED SUBSTANCE					
Chlorine Residual (ppm)	4 (MRDL)	4 (MRDLG)	0.59	0.40 - 0.77	Measure of disinfectant added to water
Manganese (ppb)		50 (SMCL)		ND	Black to brown color, black staining; Bitter metallic taste
UNIT DESCRIPTION					

NA: Not applicable
ND: Not detected
ppm: parts per million, or milligrams per liter (mg/l)
ppb: parts per billion, or micrograms per liter (µg/l)

DEFINITIONS

MCL | Maximum Contaminant Level
The highest level of a contaminant that is allowed in drinking water. MCLs are set as close to the MCLGs as feasible using the best available treatment technology.

MCLG | Maximum Contaminant Level Goal
The level of a contaminant in drinking water below which there is no known or expected risk to health. MCLGs allow for a margin of safety.

MRDL | Maximum Residual Disinfectant Level
The highest level of a disinfectant allowed in drinking water.

MRDLG | Maximum Residual Disinfectant Level Goal
The level of a drinking water disinfectant below which there is no known or expected risk to health.

SMCL | Secondary Maximum Contaminant Level
The secondary standards are set to give public water systems some guidance on removing those chemicals to levels that are below what most people will find to be noticeable. They are non-mandatory and non-enforceable.

REQUIRED HEALTH INFORMATION FROM THE EPA

HEALTH ISSUES

Some people may be more vulnerable to contaminants in drinking water than the general population. Immuno-compromised persons such as persons with cancer undergoing chemotherapy, persons who have undergone organ transplants, people with HIV/AIDS or other immune system disorders, some elderly, and infants can be particularly at risk from infections. These people should seek advice about drinking water from their health care providers. Environmental Protection Agency (EPA)/Centers for Disease Control (CDC) guidelines on appropriate means to lessen the risk of infection by Cryptosporidium and other microbial contaminants are available from the EPA's Safe Water Drinking Hotline at **800-426-4791**.

CONTAMINANTS AND REGULATIONS

Drinking water, including bottled water, may reasonably be expected to contain at least small amounts of some contaminants. The presence of contaminants does not necessarily indicate that water poses a health risk. More information about contaminants and potential health effects can be obtained by calling the EPA Safe Drinking Water Hotline at **800-426-4791**. The sources of drinking water (both tap water and bottled water) include rivers, lakes, streams, ponds, reservoirs, springs and wells. As water travels over the surface of the land or through the ground, it dissolves naturally occurring minerals and, in some cases, radioactive material, and can pick up substances resulting from the presence of animals or from human activity. Microbial contaminants, such as viruses and bacteria, may come from septic systems, livestock and wildlife. Inorganic contaminants, such as salts and metals, can be naturally occurring or result from urban stormwater run-off, septic systems or fertilizer use. Pesticides and herbicides may come from a variety of sources such as agriculture, urban stormwater run-off and residential uses. Organic chemical contaminants, including synthetic and volatile organic chemicals, are by-products of industrial processes and petroleum production, and can also come from gas stations, urban stormwater run-off, and septic systems. Radioactive contaminants can be naturally occurring or be the result of oil and gas production and mining activities. In order to ensure that tap water is safe to drink, EPA prescribes regulations that limit the amount of certain contaminants in water provided by public water systems. Food and Drug Administration regulations set limits for contaminants in bottled water that are intended to provide similar protection for public health.

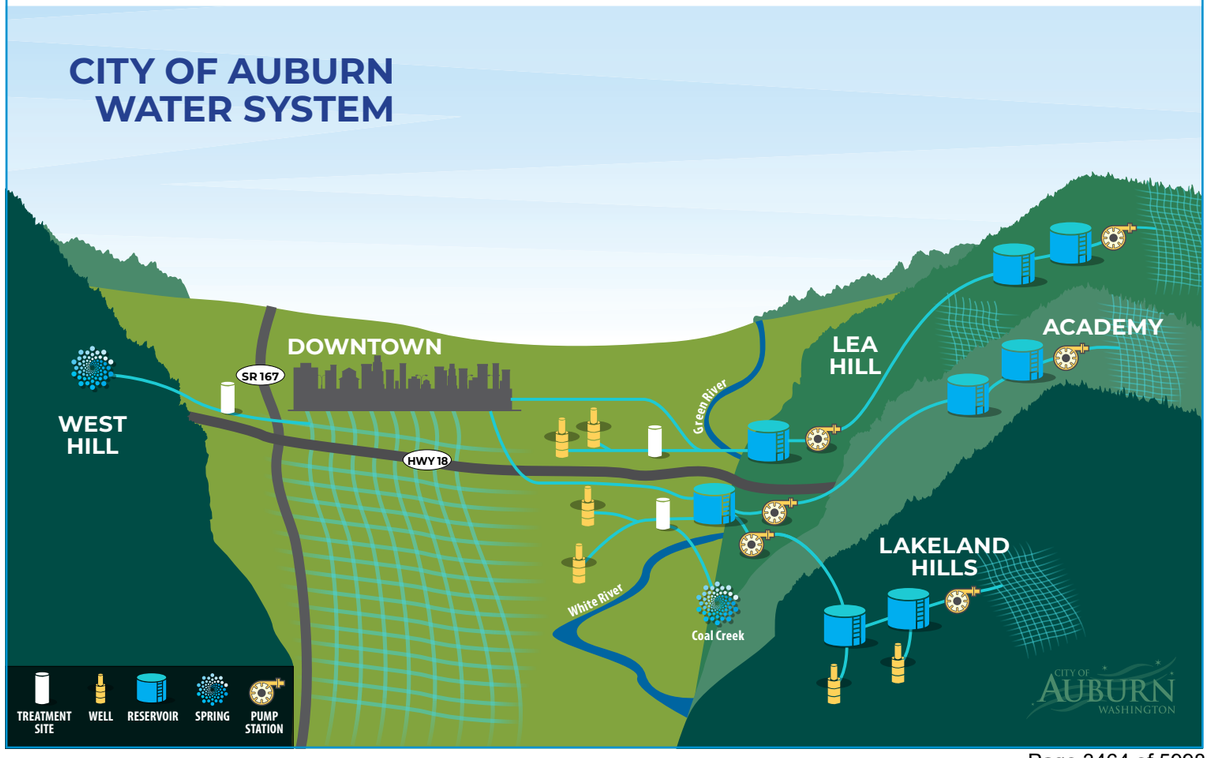
AUBURN WATER UTILITY
2022 WATER QUALITY REPORT

THE AUBURN WATER UTILITY IS PROUD TO PRESENT YOU WITH OUR 2022 WATER QUALITY REPORT.

This report is a snapshot of 2022 water quality. The test results in this report show that Auburn's water meets or surpasses all federal and state standards for public drinking water. Auburn's water comes from a combination of wells drawing water from deep below the city, and springs located near the walls of the valley. Water from the valley wells and springs is distributed to the entire Auburn service area. Additional wells are located in Lakeland Hills and serve Auburn customers in that neighborhood.



AUBURN WATER UTILITY
2022 WATER QUALITY REPORT

Auburn provides water to its customers from 4 active wells and 2 springs located in the Valley. Auburn customers in Lakeland Hills get their water from 2 active wells in that area. The wells are 290 to 750 feet deep and produce from 180 to 3,500 gallons per minute (gpm) of water. The Springs produce from 600 to 3,800 gpm of water. To supplement the demand in Lakeland Hills, water from the Valley is also provided from the Terrace View Pump Station located at Alexander Place and Terrace View Drive SE.

Water quality is generally very good and requires minimal treatment and the water is soft to moderately hard. Water from wells and springs is aerated for pH adjustment through two corrosion control facilities, and chlorine is added for disinfection. Auburn does not add fluoride to its water. Fluoride is a naturally-occurring element in groundwater, and is detected at levels up to 0.2 parts per million (ppm) in Auburn's sources. For the latest map showing fluoride levels throughout the City, please visit **auburnwa.gov/water**.

Although most wells and springs are in the Valley, water storage tanks/reservoirs are generally located at the highest elevation in the hills so that water from these tanks can flow by gravity to our customers. Auburn has 8 reservoirs with a total storage capacity of 15.8 million gallons.

Auburn has 6 active pump stations that pump water from the Valley up to the hills to the reservoirs, and boost it to higher elevations and pressure on the hills. Auburn also has 36 Pressure Reducing Valve (PRV) stations to keep the pressure in the water mains at acceptable levels. These PRVs are located at various elevations in the hills.

AUBURN WATER UTILITY
2022 WATER QUALITY REPORT

HIDDEN VALLEY ACRES

THE AUBURN WATER UTILITY IS PROUD TO PRESENT YOU WITH OUR 2022 WATER QUALITY REPORT.

The water which we provide to your home comes from a deep well located in your neighborhood. This report is a snapshot of 2022 water quality.

REQUIRED HEALTH INFORMATION FROM THE EPA

HEALTH ISSUES

Some people may be more vulnerable to contaminants in drinking water than the general population. Immuno-compromised persons such as persons with cancer undergoing chemotherapy, persons who have undergone organ transplants, people with HIV/AIDS or other immune system disorders, some elderly, and infants can be particularly at risk from infections. These people should seek advice about drinking water from their health care providers. Environmental Protection Agency (EPA)/Centers for Disease Control (CDC) guidelines on appropriate means to lessen the risk of infection by Cryptosporidium and other microbial contaminants are available from the EPA's Safe Drinking Water Hotline at **800-426-4791**.

CONTAMINANTS AND REGULATIONS

Drinking water, including bottled water, may reasonably be expected to contain at least small amounts of some contaminants. The presence of contaminants does not necessarily indicate that water poses a health risk. More information about contaminants and potential health effects can be obtained by calling the EPA Safe Drinking Water Hotline at **800-426-4791**. The sources of drinking water (both tap water and bottled water) include rivers, lakes, streams, ponds, reservoirs, springs and wells. As water travels over the surface of the land or through the ground, it dissolves naturally occurring minerals and, in some cases, radioactive material, and can pick up substances resulting from the presence of animals or from human activity. Microbial contaminants, such as viruses and bacteria, may come from septic systems, livestock and wildlife. Inorganic contaminants, such as salts and metals, can be naturally occurring or result from urban stormwater run-off, septic systems or fertilizer use. Pesticides and herbicides may come from a variety of sources such as agriculture, urban stormwater run-off and residential uses. Organic chemical contaminants, including synthetic and volatile organic chemicals, are by-products of industrial processes and petroleum production, and can also come from gas stations, urban stormwater run-off, and septic systems. Radioactive contaminants can be naturally occurring or be the result of oil and gas production and mining activities. Perfluorooctanoic acid (PFOA), Perfluorooctanesulfonic acid (PFOS), Perfluorohexanesulfonic acid (PFHxS), Perfluorononanoic acid (PFNA) and Perfluorobutanesulfonic acid (PFBS), belong to a larger group of chemicals called per- and polyfluoroalkyl substances (PFAS), which have been extensively utilized in both industrial and consumer products. PFAS have been found to persist in the environment and have the ability to accumulate in the human body over an extended period and may have potential health effects. In order to ensure that tap water is safe to drink, EPA prescribes regulations that limit the amount of certain contaminants in water provided by public water systems. Food and Drug Administration regulations set limits for contaminants in bottled water that are intended to provide similar protection for public health.

FLUORIDE

The City of Auburn does not add fluoride to your drinking water at Hidden Valley Acres. If you have questions about fluoride for dental use, please consult with your doctor or dentist. For more information on fluoride in drinking water, visit the Environmental Protection Agency (EPA) website at **epa.gov**.

WATER USE EFFICIENCY

The main components of the City of Auburn Water Use Efficiency (WUE) program are managing the water distribution system to minimize water loss, and encouraging responsible use of water by our customers.

Water loss is the difference between the total water produced and the water used by our customers, presented here as a percentage of water produced. The City of Auburn Water Utility goal since 1999 has been to maintain water loss at or below 10%. In 2022, the Hidden Valley Acres water loss was approximately **6.6%**, below the 10% target. The rolling 3-year average was **5.1%**, meeting the WUE rule of at-or-below 10%.

Responsible water use by our customers is promoted by the Utility through educational programs for school children and homeowners. Quantifying the benefit of educational programs and corresponding behavioral changes is difficult, but reductions in water use and/or waste can have a significant impact on the amount of water use as a whole. The City of Auburn is committed to efficiently managing the water distribution system and encourages you to use water wisely.

CROSS CONNECTION

CROSS CONNECTION CONTROL PROGRAM: PROTECTING OUR WATER SYSTEM FROM CONTAMINATION

A cross connection is a connection between a water pipe and a source of contamination. Examples of cross connections within the home include hose ends submerged in pools, hot tubs or buckets, irrigation systems and most hose-end spray applicators. Cross connections are extremely dangerous because they provide opportunities for contaminated fluids to be pulled back into the water system.

To protect our water supply, avoid using hose-end sprayers and maintain an air gap by keeping the hose end above the water surface when filling containers. Irrigation systems are required to have a backflow assembly. Backflow assemblies require a plumbing permit, must be inspected by a cross connection specialist, and must be tested by a certified tester when installed, and yearly thereafter.
For more information or a list of certified testers, see **auburnwa.gov/water** or call the Water Division at **253-931-3048**.

LEAD AND COPPER

RESIDENTIAL LEAD AND COPPER MONITORING:

Residential lead and copper sampling was conducted in Summer 2021 to determine the concentrations of lead and copper that leach from residential water pipes and fixtures. Lead results ranged from <1 ppb to 1 ppb. Copper from 0.035 ppm to 0.16 ppm. The 90th percentile results for lead and copper were 1 ppb and 0.16 ppm respectively. The Action Level for lead is 15 ppb and for copper is 1.3 ppm. If present, elevated levels of lead can cause serious health problems, especially for pregnant women and young children. Lead in drinking water is primarily from materials and components associated with service lines and home plumbing. The Auburn Water Utility is responsible for providing high quality drinking water, but cannot control the variety of materials used in plumbing components. When your water has been sitting for several hours, you can minimize the potential for lead exposure by flushing your tap for thirty seconds to two minutes before using water for drinking or cooking.

If you are concerned about lead in your water, you may wish to have your water tested. Information on lead in drinking water, testing methods, and steps you can take to minimize exposure is available from the Safe Drinking Water Hotline at **800-426-4791** or at **epa.gov**.

HIDDEN VALLEY ACRES' WATER SOURCE

Hidden Valley Acres gets its water from a well 6 inches in diameter and 352 feet in depth located in the neighborhood. The City of Auburn refers to this separate source and its distribution system as Braunwood Water System. The well which was drilled in 1989 has a capacity of 20 gallons per minute. The pump house building consists of a well, pumps, pipes, controls and other mechanical and electrical equipment. The site is also equipped with a generator for emergency power.

A 33,000-gallon concrete storage tank 20 feet in diameter and 15 feet in depth is located adjacent to the pump house. Sensors control when the well pump turns on to fill the reservoir. High level and low level alarms are tied into the City's Supervisory Control and Data Acquisition (SCADA) system.

Water from the reservoir is pumped to 3 pressure vessels by 3 booster pumps (1 for emergency) where domestic pressure is maintained at around 60 pounds per square inch (psi) and then distributed to the customers in the neighborhood through 4 inch diameter underground ductile iron pipes.

Water quality is generally very good and requires minimal treatment and the water is soft. Inside the pump house, chlorine is added for disinfection. No fluoride is added to this water.

The annual water supply is limited by the water right certificate limit that was issued by the Department of Ecology and the system is not connected to the City's main water system and does not benefit from any other water sources. Therefore, water usage monitoring and conservation efforts are critical in the Hidden Valley Acres area to avoid emergency water restrictions, penalties, and potential shut-downs.

Braunwood Pump House

Braunwood Reservoir

Important Notes for Sample Collector:

1. Collect samples early in the month and early in the week.
2. Do not collect sample(s) in a week when there is a holiday or when a key staff member is on vacation.
3. If a sample site is no longer a good sample site, substitute an acceptable site in the same area. If the condition change cannot be resolved, choose a permanent new sample site and update this CMP.
4. Always review the lab results for your coliform samples.

E. Reduced Triggered Source Monitoring Justification

Auburn is not requesting reduced triggered source monitoring approval. When Auburn is notified of a routine distribution sample that is total coliform positive in Auburn's distribution system or in one of Auburn's wholesale customers systems (and the sample is not invalidated under WAC 246-290-320 (d)), triggered source water monitoring is required within 24 hours of said notification. **Triggered source water monitoring requires collecting one sample at each groundwater source that was in use at the time the total coliform positive sample was collected.** The source samples are to be collected prior to treatment (i.e. raw water samples), and are to be analyzed for E. coli.

F. Routine Sample Rotation Schedule

Week	Routine Site(s)
1	C-1 through C-18 and C-36 through C-42
2	C-19 through C-35 and C-54 through C-61
3	C-36 through C-53 and C-1 through C-7
4	C-54 through C-70 and C-19 through C26

G. Routine Sample Locations - Month Following Unsatisfactory Samples

Location/Address for Routine Sample Site(s) Unsatisfactory the Previous Month	Location/Address for the five Routine Sample Sites
The month after a coliform positive sample, one hundred (100) routine samples will be submitted in accordance with Section A of this plan.	

H. *E. coli*-present response plans

Distribution System *E. coli* Response Checklist					
Background Information	**Yes**	**No**	**N/A**	**To Do List**	**To Do**
We inform staff members about activities within the distribution system that could affect water quality.	☒	☐	☐	☐	
We document all water main breaks, construction & repair activities, and low pressure and outage	☒	☐	☐	☐	

Distribution System *E. coli* Response Checklist					
incidents.					
We can easily access and review documentation on water main breaks, construction & repair activities, low pressure and outage incidents.	☒	☐	☐	☐	
Our Cross-Connection Control Program is up-to-date.	☒	☐	☐	☐	
We test all cross-connection control devices annually as required, with easy access to the proper documentation.	☒	☐	☐	☐	
We routinely inspect all treatment facilities for proper operation.	☒	☐	☐	☐	
We have procedures in place for disinfecting and flushing the water system if it becomes necessary.	☒	☐	☐	☐	
We can activate an emergency intertie with an adjacent water system in an emergency.	☒	☐	☐	☐	
We have a map of our service area boundaries.	☒	☐	☐	☐	
We have consumers who may not have access to bottled or boiled water.	☐	☒	☐	☐	
There is a sufficient supply of bottled water immediately available to our customers who are unable to boil their water.	☒	☐	☐	☐	
We have identified the contact person at each day care, school, medical facility, food service, and other customers who may have difficulty responding to a Health Advisory.	☐	☒	☐	☐	
We have messages prepared and translated into different languages to ensure our consumers will understand them.	☐	☒	☐	☒	Update
We have the capacity to print and distribute the required number of notices in a short time period.	☒	☐	☐	☐	
Policy Direction	**Yes**	**No**	**N/A**	**To Do List**	
We have discussed the issue of *E. coli*-present sample results with our policy makers.	☒	☐	☐	☒	Inform new members
If we find *E. coli* in a routine distribution sample, the policy makers want to wait until repeat test results are available before issuing advice to water system customers.	☒	☐	☐	☐	

Potential Public Notice Delivery Methods	**Yes**	**No**	**N/A**	**To Do List**	

It is feasible to deliver a notice going door-to-door.	☐	☒	☐	☐	
We have a list of all of our customers' addresses.	☒	☐	☐	☐	
We have a list of customer telephone numbers or access to a Reverse 9-1-1 system.	☒	☐	☐	☐	
We have a list of customer email addresses.	☒	☐	☐	☐	
We encourage our customers to remain in contact with us using social media.	☒	☐	☐	☐	
We have an active website we can quickly update to include important messages.	☒	☐	☐	☐	
Our customers drive by a single location where we could post an advisory and expect everyone to see it.	☐	☒	☐	☐	
We need a news release to supplement our public notification process.	☒	☐	☐	☐	

E. coli-Present Triggered Source Sample Response Checklist – All Sources

Background Information	Yes	No	N/A	To Do List	To Do
We review our sanitary survey results and respond to any recommendations affecting the microbial quality of our water supply.	☒	☐	☐	☐	
We address any significant deficiencies identified during a sanitary survey.	☒	☐	☐	☐	
There are contaminant sources within our Wellhead Protection Area that could affect the microbial quality of our source water, and If yes, we can eliminate them.	☐ ☐	☒ ☐	☐ ☒	☐ ☐	
We routinely inspect our well site(s).	☒	☐	☐	☐	
We have a good raw water sample tap installed at each source.	☒	☐	☐	☐	
After we complete work on a source, we disinfect the source, flush, and collect an investigative sample.	☒	☐	☐	☐	

Public Notice	Yes	No	N/A	To Do List	
We discussed the requirement for immediate public notice of an *E. coli*-present source sample result with our water system's governing body (board of directors or commissioners) and received direction from them on our response plan.	☒	☐	☐	☐	

We discussed the requirement for immediate public notice of an *E. coli*-present source sample result with our wholesale customers and encouraged them to develop a response plan.	☒	☐	☐	☒	Update
We have prepared templates and a communications plan that will help us quickly distribute our messages.	☒	☐	☐	☒	Update

E. coli-Present Triggered Source Sample Response Checklist–Source S01 Coal Creek Springs

Alternate Sources	**Yes**	**No**	**N/A**	**To Do List**	**To Do**
We can stop using this source and still provide reliable water service to our customers.	☐	☒	☐	☐	
We have an emergency intertie with a neighboring water system that we can use until corrective action is complete (perhaps for several months).	☒ for Valley	☒ for Academy	☐	☐	
We can provide bottled water to all or part of the distribution system for an indefinite period.	☒	☐	☐	☐	
We can quickly replace our existing source of supply with a more protected new source.	☐	☒	☐	☐	
Temporary Treatment	**Yes**	**No**	**N/A**	**To Do List**	
This source is continuously chlorinated, and our existing facilities can provide 4-log virus treatment (CT = 6) before the first customer. If yes, at what concentration? _0.8____ mg/L	☒	☐	☐	☐	
We can quickly introduce chlorine into the water system and take advantage of the existing contact time to provide 4-log virus treatment to a large portion of the distribution system.	☒	☐	☐	☐	
We can reduce the production capacity of our pumps or alter the configuration of our storage quantities (operational storage) to increase the amount of time the water stays in the system before the first customer to achieve CT = 6.	☐	☒	☐	☐	
We can alter the demand for drinking water (maximum day or peak hour) through conservation messages to increase the time the water is in the system prior to the first customer in order to achieve 4-log virus treatment with chlorine.	☐	☒	☐	☐

Distribution System *E. coli* Response Plan

If we have E. coli in our distribution system we will immediately:

1. Call DOH.
2. Collect repeat and triggered source samples per Part D. Collect additional investigative samples as necessary.
3. Inspect our water system facilities, including wholesale interties, for proper operation.
4. Interview staff to determine whether anything unusual was happening in the water system service area, especially since the previous month's sample(s).
5. Review new construction activities, water main breaks, and pressure outages that may have occurred during the previous month.
6. Review Cross-Connection Control Program status.
7. Discuss with DOH whether to issue a Health Advisory based on the findings of steps 3-6.

E. coli–Present Triggered Source Sample Response Plan – Source S01 Coal Creek Springs

If we have E. coli in Source S01 Coal Creek Springs water we will immediately:

1. Call DOH.
2. Distribute required notice, including to City of Algona and KC WD#111.
3. Interview staff. Inspect spring facilities for signs of contamination source.
4. Ask DOH to review our Contact Time analysis and acknowledge that we provide 4-log virus treatment before the first customer.

E. coli–Present Triggered Source Sample Response Plan – Source S02 West Hill Springs

If we have E. coli in Source S02 West Hill Springs water we will immediately:

1. Shutdown S02 West Hill Springs
2. Call DOH.
3. Distribute required notice, including to City of Algona and KC WD#111.
4. Interview staff. Inspect spring facility and transmission main for signs of contamination source.
5. In concert with DOH, begin work on corrective action plan to provide 4-log virus treatment before the first customer.

E. coli–Present Triggered Source Sample Response Plan – Source S03 Well No. 1

If we have E. coli in Source S03 Well No. 1 water we will immediately:

1. Shutdown S03 Well No. 1
2. Call DOH.
3. Distribute required notice, including to City of Algona and KC WD#111.
4. Interview staff. Inspect well facility for signs of contamination source.
5. In concert with DOH, begin work on corrective action plan to provide 4-log virus treatment before the first customer.

E. coli–Present Triggered Source Sample Response Plan – Source S04 Well No. 2

If we have E. coli in Source S04 Well No. 2 water we will immediately:

1. Shutdown S04 Well No. 2
2. Call DOH.
3. Distribute required notice, including to City of Algona and KC WD#111.
4. Interview staff. Inspect well facility, including Well 6, for signs of contamination source.
5. In concert with DOH, begin work on corrective action plan to provide 4-log virus treatment before the first customer.

E. coli–Present Triggered Source Sample Response Plan – Source S05 Well No. 3A

If we have E. coli in Source S05 Well No. 3A water we will immediately:

1. Shutdown S05 Well No. 3A
2. Call DOH.
3. Distribute required notice, including to City of Algona and KC WD#111.
4. Interview staff. Inspect well facility for signs of contamination source.
5. Keep contaminated well off-line until 4-log virus treatment is designed, approved, and installed.

E. coli–Present Triggered Source Sample Response Plan – Source S06 Well No. 5

If we have E. coli in Source S06 Well No. 5 water we will immediately:

1. Shutdown Source S06 Well No. 5.
2. Call DOH.
3. Distribute required notice.
4. Interview staff. Inspect well facility for signs of contamination source.
5. In concert with DOH, begin work on corrective action plan to provide 4-log virus treatment before the first customer.

E. coli–Present Triggered Source Sample Response Plan – Source S07 Well No. 4

If we have E. coli in Source S07 Well No. 4 water we will immediately:

1. Shutdown S07 Well No. 4
2. Call DOH.
3. Distribute required notice, including to City of Algona and KC WD#111.
4. Interview staff. Inspect well facility for signs of contamination source.
5. In concert with DOH, begin work on corrective action plan to provide 4-log virus treatment before the first customer.

E. coli–Present Triggered Source Sample Response Plan – Source S08 Well No. 3B

If we have E. coli in Source S08 Well No. 3B water we will immediately:

1. Shutdown S08 Well No. 3B
2. Call DOH.
3. Distribute required notice, including to City of Algona and KC WD#111.
4. Interview staff. Inspect well facility for signs of contamination source.
5. Keep contaminated well off-line until 4-log virus treatment is designed, approved, and installed.

E. coli–Present Triggered Source Sample Response Plan – Source S10 Well No. 5A

If we have E. coli in Source S10 Well No. 5A water we will immediately:

1. Shutdown S10 Well No. 5A
2. Call DOH.
3. Distribute required notice.
4. Interview staff. Inspect well facility for signs of contamination source.
5. In concert with DOH, begin work on corrective action plan to provide 4-log virus treatment.

E. coli–Present Triggered Source Sample Response Plan – Source S11 Well No. 7

If we have E. coli in Source S11 Well No. 7 water we will immediately:

1. Shutdown Source S07 Well No. 7.
2. Call DOH.
3. Distribute required notice, including to City of Algona and KC WD#111.
4. Interview staff. Inspect well facility for signs of contamination source.
5. Keep contaminated well off-line until 4-log virus treatment is designed, approved, and installed.

E. coli–Present Triggered Source Sample Response Plan – Source S12 Well No. 6

If we have E. coli in Source S12 Well No. 6 water we will immediately:

1. Shutdown S12 Well No. 6
2. Call DOH.
3. Distribute required notice, including to City of Algona and KC WD#111.
4. Interview staff. Inspect well facility, including Well 2, for signs of contamination source.
5. In concert with DOH, begin work on corrective action plan to provide 4-log virus treatment.

E. coli–Present Triggered Source Sample Response Plan – Source S13 Well No. 5B

If we have E. coli in Source S13 Well No. 5B water we will immediately:

1. Shutdown S13 Well No. 5B
2. Call DOH.
3. Distribute required notice.
4. Interview staff. Inspect well facility for signs of contamination source.
5. Keep contaminated well off-line until 4-log virus treatment is designed, approved, and installed.

E. coli–Present Triggered Source Sample Response Plan – Howard Road CCF (TW-S01-CCS)

If we have E. coli in Howard Road CCF (TW-S01-CCS) water we will immediately:

1. Call DOH.
2. Distribute required notice, including to City of Algona and KC WD#111.
3. Interview staff. Inspect Howard Road CCF and Coal Creek Springs.
4. If contamination is from Howard Road CCF, begin work on corrective action plan.
5. If contamination is from Coal Creek Springs, then keep the contaminated source off-line until 4-log virus treatment is designed, approved, and installed.

E. coli–Present Triggered Source Sample Response Plan – Fulmer CCF (TW-S14-WF)

If we have E. coli in Fulmer CCF (TW-S14-WF) water we will immediately:

1. Shutdown S04 Well No. 2, SO11 Well No. 6, and SO12 Well No. 7.
2. Call DOH.
3. Distribute required notice, including to City of Algona and KC WD#111.
4. Interview staff. Inspect Fulmer CCF, Well No.2, Well No. 6, and Well No. 7 for signs of contamination source.
5. If contamination is from Fulmer CCF, begin work on corrective action plan.
6. If contamination is from a well, then keep the contaminated well off-line until 4-log virus treatment is designed, approved, and installed. In concert with DOH, determine if contamination source can be isolated and allow non-contaminated wells to be brought on-line.

I. System Map

Washington State Department of Health
Division of Environmental Health
Office of Drinking Water
DOH 331-464
December 2011

Stage 2 DBP Monitoring Plan - Groundwater (Reduced Monitoring)

System Name	City of Auburn
PWSID#	03350V
Date	3/6/2018
Completed by	Chris Thorn
Population	55000

Initial Stage 2 Sampling Period First sampling period following **March 7, 2018**

Number of Samples Required 2 Dual Sample Sets per Year

Samples must be a dual sample set: one at the location and during the quarter with the highest TTHM single measurement and one at the location and during the quarter with the highest HAA5 single measurement.

	Stage 2 Compliance Monitoring Site ID	Projected Sampling Date
Highest TTHM Site	3705 West Valley Hwy N (C-7)	August
Highest HAA5 Site	3615 Orchard St SE (C-10)	August
Backup High TTHM	710 47th St SE (C-46)	
Backup High HAA5	5208 Nathan Loop SE (C-19)	

If any annual or triennial sample exceeds the MCL (0.080 ug/l for TTHM or 0.060 ug/l for HAA5) you must begin quarterly monitoring for both TTHM and HAA5 for at least four consecutive quarters to determine if you exceed the MCL.

To remain on reduced monitoring:

The TTHM LRAA must be less than or equal to 0.060 mg/l AND the HAA LRAA must be less than or equal to 0.045 mg/l at each monitoring location.

What happens if you exceed any of the above levels?

You must return to routine monitoring.

Determining Compliance

Our system is required to monitor annually (triennially). For compliance, we will determine that each sample taken is less than the MCL. If any sample exceeds the MCL, we must increase monitoring to dual sample sets once per quarter (taken every 90 days) at all locations. If the locational running annual average (LRAA) exceeds the MCL for either TTHM (0.080 mg/l) or HAA5 (0.060 mg/l), an MCL violation will have occurred. The LRAA is calculated based on four consecutive quarters of monitoring. Compliance will then be achieved if the TTHM and the HAA5 LRAA at each monitoring location for the four most recent quarters is less than or equal to 0.080 mg/l for TTHM and less than or equal to 0.060 mg/l for HAA5.

Disinfectant Monitoring for TTHM and HAA5

Chlorine residuals must be measured at the same time and place as routine or repeat coliform samples
MRDL for chlorine and chloramines = 4.0 mg/l as Cl_2

Determining Compliance for disinfectant residuals

Compliance is based on the running annual average (RAA) of 12 consecutive months
Daily residual measurements will / will not be included in the compliance calculations (circle one)

Attach a distribution map with sample locations

Comments

You will need to print a hard copy for your records and make it available upon request. You do not need to submit a copy to DOH.

If you need this publication in an alternate format, call (800) 525-0127. For TTY/TDD call (800) 833-6388.

Updated July 2012

Stage 2 DBP Monitoring Plan - Groundwater (Routine Monitoring)

System Name	Braunwood Estates
PWSID#	03336E
Date	7/30/2013
Completed by	Chris Thorn
Population	30

Initial Stage 2 Sampling Period First sampling period following **October 1, 2013**

Number of Samples Required 2 Samples per Year (1 TTHM and 1 HAA5)

You are required to take individual TTHM and HAA5 samples (instead of a dual sample set at the locations with the highest TTHM and HAA5 concentrations, respectively. If the highest TTHM and HAA5 concentrations occur at the same location (and month, if monitored annually) only one location with a dual sample set per monitoring period is needed.

	Stage 2 Compliance Monitoring Site ID	Projected Sampling Date
Highest TTHM Site	4431 47th St SE (A-8)	August
Highest HAA5 Site	4431 47th St SE (A-8)	August

If any annual sample exceeds the MCL (0.080 ug/l for TTHM or 0.060 ug/l for HAA5) you must begin quarterly monitoring for both TTHM and HAA5 for at least four consecutive quarters to determine if you exceed the MCL.

Determining Compliance for TTHM and HAA5

Our system is required to monitor annually. For compliance, we will determine that each sample taken is less than the MCL. If any sample exceeds the MCL, we must increase monitoring to dual sample sets once per quarter (taken every 90 days) at all locations. If the locational running annual average (LRAA) exceeds the MCL for either TTHM (0.080 mg/l) or HAA5 (0.060 mg/l), an MCL violation will have occurred. The LRAA is calculated based on four consecutive quarters of monitoring. Compliance will then be achieved if the TTHM and the HAA5 LRAA at each monitoring location for the four most recent quarters is less than or equal to 0.080 mg/l for TTHM and less than or equal to 0.060 mg/l for HAA5.

Disinfectant Monitoring

Chlorine residuals must be measured at the same time and place as routine or repeat coliform samples
MRDL for chlorine and chloramines = 4.0 mg/l as Cl_2

Chapter 1: General Information

1.00 Preface

Per Auburn City Code (ACC) 12.04.020, all public work construction contracts of the City, including but not limited to streets and sidewalks, storm water and sanitary sewer systems, and water systems, and all work within City public right-of-way performed by the City and others shall conform to the Engineering Design Standards (EDS). The EDS applies to City capital projects and for work performed by developers and others under construction permits (CON), grading permits (GRA), storm permits (STM), other utility permits, and public facility extensions (FAC). The City of Auburn has adopted the EDS to require the standardization of design and construction elements for consistency, to assure that public safety needs are met, and to comply with Local, State, and Federal regulations.

The design requirements contained within this manual do not set legal standards of care but provide guidance for possible engineering treatment under some circumstances.

Compliance with these standards does not alleviate the design engineer from using sound professional engineering practices and meeting the requirements of the specific utility in question. The design criteria contained herein are the minimum acceptable under standard conditions. Special conditions may require more stringent requirements that will be addressed during the plan review process.

1.01 Definitions

Note that additional definitions are included in the documents referenced in **Section 1.03.**

AASHTO – American Association of State Highway and Transportation Officials.

Access Point – A driveway or private street that connects to the general public street system. A public street is not considered an access point.

ACC – Auburn City Code.

Activity Centers – Locations such as schools, parks, retail areas and shopping centers, places of employment, or public service areas that attract people.

Accessible – Meeting Americans with Disabilities Act (ADA) requirements as established by the City's ADA Transition Plan.

ADT – Average Daily Traffic. The total two-directional volume of traffic passing through a given point during a given time period, divided by the number of days in that time period.

Aggregate – A mixture of various soil components (e.g., sand, gravel, and silt).

Alley – Right-of-way, usually narrower than a street with an all-weather surface, which provides access to the rear boundary of 2 or more residential or non-residential properties and is not intended for general traffic circulation. An alley is considered to be a classification of roadway/street.

Apartment – See ACC Chapter 18.04**.**

Applicant – The owner or their agent seeking approval from the city for any land use or other related permit or approval referenced in City of Auburn Code and which requires utilization of these Standards. References: See Developer.

Appurtenance – Equipment and/or accessories that are a necessary part of an operating utility system or subsystem.

APWA – American Public Works Association.

ASTM – American Society for Testing and Materials.

Backfill – Replacement of excavated material with suitable material compacted as specified.

Backwater – Water held back by some obstruction, natural or artificial.

Backwater Curve – A plot of depth versus location along the channel containing backwater.

Bicycle Facilities – A general term referring to improvements that accommodate or encourage bicycling, including parking facilities, bike racks, bicycle route mapping and bicycle route development.

Boring/Jacking – Grade and alignment-controlled mechanical or other method of installing a pipe or casing under a street without disturbing the surrounding medium.

Breakaway Structure or Breakaway Design – A structure or installation that has been crash tested in accordance with National Cooperative Highway Research Program procedures. (NCHRP 230).

Capacity – (1) The maximum number of vehicles that have a reasonable expectation of passing over a given roadway or section of roadway in one direction during a given time period under prevailing roadway and traffic conditions. (2) The volume of liquid or gas that can be transported by a pipe. (3) The load-carrying limit of a structure.

Casing – A larger pipe enclosing a another pipe that directly encloses a transmitted fluid or gas for the purpose of providing structural or other protection to the carrier and/or to allow for carrier replacement without re-excavation, jacking or boring.

CF – Cubic Feet.

Channelization – The separation or regulation of conflicting traffic movements into definite paths of travel by the use of pavement markings, raised islands or other suitable means to facilitate the safe and orderly movement of both vehicles and pedestrians.

Check – A short section of built-up channel placed in a canal or irrigation ditch and provided with gates or flashboards to control flow or raise upstream level for diversion.

City – The City of Auburn.

City Council – The City legislative authority.

City Engineer – The City Engineer for the City of Auburn. References: See Engineer.

Clean-Out – A pipe through which plumbing snakes can be pushed to unplug a sewer.

Clear Zone – The total streetside border area, starting at the edge of traveled way, available for safe use by errant vehicles. This area may consist of a shoulder, a recoverable slope, a non-recoverable slope, and/or a clear run-out area. The desired width is dependent upon the traffic volumes, speeds, and the streetside geometry.

Coating – Protective material applied to the exterior of a pipe or conduit to prevent or reduce abrasion and/or corrosion damage.

Commercial Property Use – Property with residential developments with four or more dwelling units per parcel or commercial developments. This is consistent with building permit administration in City of Auburn.

Conduit – An enclosed tubular runway for protecting wires or cables.

Contractor – The individual, partnership, firm, corporation or joint venture, contracting with the Developer to do prescribed work.

Concrete Thrust Blocking – Concrete that is used to support fittings in water mains.

Control Zone – That streetside area defined by the "Control Zone Distance Table"; found in Appendix 5 of the WSDOT Utilities Manual, within the street right-of-way in which placement of utility objects is controlled.

Corporation Stop – A brass fitting used to connect service lines to a water main.

Cover – Depth to top of pipe, conduit, casing, or gallery below the grade of a street or ditch.

Cross Connection – Connecting fire, irrigation and drinking water supplies together, or connecting storm and sanitary sewers together.

Cul-de-sac – A street closed at one end by widened pavement of sufficient width for vehicles to turn around.

CSBC – Crushed Surfacing Base Course.

CSTC – Crushed Surfacing Top Course.

CTP – The City of Auburn's current Comprehensive Transportation Plan. See **Section 1.03.03.**

CY – Cubic Yard.

Dead End Street – Street that accesses the roadway system only at one end. See also Stub End Street.

Dedication – The transfer of land or the interest of land by the owner of such land to the City for public uses, reserving no other rights than such are compatible with the full exercise and enjoyment of the uses the property has been dedicated.

Design Speed – Design speed is the maximum safe speed that can be maintained when conditions are so favorable that the design features of the highway govern.

Detention Tanks and Vaults – Detention tanks and vaults are underground facilities for the storage of surface water.

Developer – The Owner and any agent of the Owner authorized to represent the Owner. References see Applicant.

Development – All structures and other modifications of the natural site above and below ground on a particular site.

Domestic Water Service – Any service that connects directly to plumbing within a structure and is used for drinking, cooking, washing, and other standard uses of potable water.

Drain – Appurtenances to discharge accumulated liquids from casings or other enclosures.

Driveway – An access point providing motorized access to/from property(s), shared driveway or alleys to a street (public or private) or shared driveway. Driveway access roads and aprons are considered parts of a driveway.

Driveway Access Road – Driveway driving surface, including approach and adjacent non-motorized facilities (where present).

Driveway Approach – The portion of a driveway access road that connects the driving surface on the property(s), private street, or alley to the driveway apron.

Driveway Apron – The improved area that connects a driveway approach to a street, alley, or shared driveway which includes, when present, the sloped areas (wings) to the adjacent sidewalk or landscape strip, and also includes the area between the curb or edge of pavement and the back of the pedestrian pathway. Flush curbs across commercial driveway aprons are considered to be part of the driveway apron.

Easement – A right to use or control the property of another for designated purposes.

Edge of Traveled Way – The face of curb for streets that are or will be constructed to urban standards and the edge of pavement (not shoulder) for streets that are, or will be constructed to rural standards.

Embankment – A raised structure constructed of natural soil from an excavation or borrow source.

Encroachment – Occupancy of City right-of-way by non-roadway structures or other objects of any kind.

Engineer – The City Engineer for City of Auburn or any designee thereof.

Fixed Object – Any object that is not intended to move or break away upon impact.

Franchise – Occupancy and use document granted by the City required for occupancy of street rights of way.

Geometrics – The arrangement of the visible elements of a street such as alignment, grade, sight distance, widths, and slopes.

Grade – Rate or percent of change in slope, either ascending or descending from or along the roadway. It is measured along the centerline of the roadway or access point.

Gravity Distribution – A water supply that uses natural flow from an elevated tank or mountain reservoir to supply pressure.

Hazard – A side slope, an object, water, or a drainage device that, if impacted, would apply unacceptable impact forces on the vehicle occupants or place the occupants in a hazardous position. It may be either natural or man-made.

Hydraulic Analysis – A report that details the engineering process used to analyze water pressures, flow requirements, and velocities, for a development and the impacts on the system network as a result of the development.

Hydraulic Jump – The rapid change in the depth of flow from a low stage to a high stage resulting in an abrupt rise of water surface.

Impervious Layer – A geologic layer through which no water can pass.

Infiltration – (1) The act of stormwater permeating into the ground. (2) Groundwater that enters sewer pipe through cracks and joints, or the movement of water through the upper soil.

Interception – Rain that falls on vegetation and other impervious objects, which evaporates without contributing to the runoff.

Intersection – The connection of two or more public or private streets excluding alleys, driveways, and shared access roads.

Intersection Sight Distance – The distance required for a vehicle, traveling at or near the design speed to reduce its speed to avoid overtaking another vehicle, which has entered the intersection from another street. The entering vehicle can be making right, left-turning movements or crossings.

Island – A defined area between traffic lanes for control of vehicle movements and/or for pedestrian refuge.

Joint Use Driveway Tract – A jointly owned and maintained tract or easement serving 2 properties.

Landing – A road or driveway approach area to any public or private road.

Lateral – A sewer line that goes off at right angles to another.

Manhole – An opening in an underground utility system into which workers or others may enter for the purpose of making installations, inspections, repairs, connections, cleaning, and testing.

Main – A principal pipe in a system that distributes water or collects sewage.

Median – That portion of a divided roadway separating the traveled ways for traffic in opposite directions.

MPH – Miles per hour.

MSE Walls – Mechanically Stabilized Earth Walls.

MUTCD – Refers to the latest edition of the Manual of Uniform Traffic Control Devices as adopted by the Washington State Department of Transportation and as modified by applicable WAC and RCW.

Neighborhood – For the purposes of these design standards, a neighborhood is considered to be one or more residential subdivisions and parcels that are interconnected by local residential streets and typically bound by arterial and collector streets or other boundaries such as rivers, critical slopes, or jurisdictional boundaries.

Nonpotable – Fluid that is not for human consumption, but may be used for other purposes, such as sewage and stormwater runoff. Gas mains are also considered nonpotable.

Outfall – The pipe that discharges completely treated wastewater or stormwater runoff into a lake, stream, or river.

Pavement – The combination of gravel base, crushed rock, and asphalt concrete pavement placed on a subgrade to support the traffic load and distribute it to the subgrade.

Pavement Width – The distance measured from face of curb to face of curb for curbed sections of roadway or the distance measured from outside edge of shoulder to outside edge of shoulder for shouldered sections of roadway.

PC – Point of Curvature.

Peak-Hour – That period experiencing the highest volume of traffic.

Peak Period – Two hours during any a.m. or p.m. period when vehicle arrival and departure from the site or corridor is the highest.

Pipe – A structural tubular product designed, tested, and produced for the transmittance of specific liquids and gases under specific conditions.

Posted Speed – Is the signed speed limit along a street.

Potable – Water that is Drinkable.

PRC – Point of reverse curvature.

Pressure – Internal gage pressure in a pipe in pounds per square inch, gage (psig).

Private Street – A privately owned and maintained access provided for by a tract, easement or other legal means.

Professional Engineer – An engineer licensed to practice in the State of Washington.

Professional Land Surveyor – A surveyor licensed to practice in the State of Washington.

Public Street – A publicly owned facility that provides access, including the roadway and all other improvements.

Relocation – Planned change of location of an existing facility to a more advantageous place without changing the character or general physical nature of the facility.

Redevelopment – See ACC 13.48.010.

Replacement – Installation of a like element of a utility system or subsystem in the same or near-same physical location normally due to damage, wear or obsolescence of the element.

Restoration – All work necessary to replace, repair or otherwise restore the right-of-way and all features contained within to the same or equal condition as before any change or construction thereto.

Right-of-way (R/W) – All property in which the City has any form of ownership or title, and which is held for public street purposes, regardless of whether or not any street exists thereon or whether or not it is used, improved, or maintained for public travel.

Riprap – Pieces of broken stone used to protect the sides of waterways from erosion.

Roadway Intersection – location where two or more roadways intersect, including private roads but excluding alley's, driveways, shared driveways, and access tracts.

Rural – All lands regardless of current comprehensive plan designation not meeting the definition of Urban.

Separate Turn Lane – An auxiliary lane for traffic in one direction which has been physically separated from the intersection area by a traffic island or stripe. Separate turn lanes may be included within intersections or separated from intersection areas by traffic islands.

SF – Square Feet.

Shared Driveway – Driveway that provides access from a public or private street to more than one parcel or a driveway that provides access from a public or private street to a single parcel across one or more other parcels and/or an access tract or easement.

Shared Driveway Access Road – Shared driveway driving surface, including approach and non-motorized facilities (where present), but excluding parking lot drive aisles.

Shoulder – That portion of the roadway contiguous with the traveled way for accommodating stopped vehicles, for emergency use, and for lateral support of base and surface courses.

Slab – A cast concrete member of uniform thickness.

Standards – The City of Auburn Engineering Design Standards.

Stopping Sight Distance – The distance needed for a vehicle traveling at or near to stop before reaching a stationary object in its path.

Street or Roadway – A public way open for the passage of vehicles and persons. Limits include the outside edge of sidewalks, or curbs and gutters, or side ditches, including the appertaining shoulder and all slopes, ditches, channels, waterways, and other features necessary for proper drainage and protection within the right-of-way.

Street Frontage – Any part of private or public property that borders a public street.

Street Tree – A tree placed within the public right-of-way.

Substantial – In the sole opinion of the City Engineer, of ample or considerable amount, quantity, or size.

Surface Retention – That part of a storm that does not immediately appear as infiltration or surface runoff. Retention is made up of depression storage, interception, and evaporation.

Traffic Control – Those activities necessary to safeguard the general public, as well as all workers, during the construction and maintenance of roadway and other facilities within the right-of-way.

Traveled Way – That portion of the roadway intended for the movement of vehicles, exclusive of shoulders.

Trenched – Installation of a utility in an open excavation.

Trip – A one-direction movement that begins at the origin and ends at the destination. For example, a trip movement from a residence to a work place is a trip from home to work.

Trip Generation – A general term describing the analysis and application of the relationships that exist between the trip makers, the traffic study area, and the trip making. It relates to the number of trip ends in any part of the traffic study area.

Uniform Flow – Flow that has a constant depth, volume, and shape along its course.

Unopened Right-of-way – A City right-of-way that exists by dedication or deed, but for which no vehicular roadway has been constructed by the City or other parties, and the street is not maintained by the City.

Utility – A company providing such public services as gas, electric power, telephone, water, sewer, or cable television, whether or not such company is privately owned or owned by a governmental entity.

Wetpond – A stormwater pond that has been designed to retain a permanent pool of water "wetpool" to provide treatment of storm runoff.

Wetpool – The permanent pool of water retained in a wetpond or wetvault.

Wetvault – A stormwater vault that has been designed to retain a permanent pool of water "wetpool" to provide treatment of storm runoff.

1.02 Contact Information

Permit Center
Physical address:
Auburn Professional Plaza – Customer Service Center (2nd Floor)
One East Main Street

Department of Community Development:
Building Phone: (253) 931-3020
Planning Phone: (253) 931-3090
Email address: development@auburnwa.gov and/or permitcenter@auburnwa.gov

1.03 City Reference Material

Unless noted otherwise, reference material referred to herein may be obtained from the City of Auburn's website or by clicking on the hyperlink below:

Auburn Reference Material

1.03.01 City of Auburn Surface Water Management Manual (SWMM)

The City of Auburn Surface Water Management Manual (SWMM) is the 2019 Department of Ecology Stormwater Management Manual for Western Washington (DOE SWMMWW) and the City of Auburn Supplemental Manual. The SWMM is a manual of specific requirements related to storm drainage management. See **Section 8.07** for more information.

1.03.02 City of Auburn Engineering Construction Standards (ECS)

The Engineering Construction Standards (ECS) sets forth the standards used during the construction of all civil projects within the City's jurisdiction, including the extension of public water, sanitary sewer, storm drainage, and transportation facilities by private developments. The ECS includes three separate documents: General Special Provisions, Technical Special Provisions, and Standard Details. The General and Technical Special Provisions supplement and modify the current "Washington State Department of Transportation (WSDOT/APWA) Standard Specifications for Road, Bridge and Municipal Construction." The Standard Details, are comprised of the City's construction and design detail drawings for temporary erosion control, grading, water, sanitary sewer, storm drainage, and street work within the City. The Standard Details are supplemented by the "Washington State Department of Transportation's (WSDOT) Standard Plans."

The referenced details and plans in these Design Standards shall be the standard except as modified by the General and Technical Special Provisions and by this document, the Design Standards.

1.03.03 Planning Documents

The following planning documents can be found on the City's website or by clicking on the hyperlinks below:

Auburn Comprehensive Plan

Transportation Improvement Program

Comprehensive Transportation Plan

2016 Comprehensive Sewer Plan

2015 Comprehensive Water Plan

2015 Comprehensive Storm Drainage Plan

1.03.04 Informational Handouts

Handouts are currently available from the City to aid the public in planning and constructing development projects within the City of Auburn. Contact the Permit Center or see the City's website by clicking on the hyperlink below (select 'Information Handouts') for the most current list available:

https://www.auburnwa.gov/city_hall/public_works/standards_publications

1.03.05 Additional Technical Information

Additional design guidance and standards for specialized facilities such as pump stations, pressure reducing stations, and others are not included herein, but may be provided by the City as guidance to supplement efforts during design discussions.

1.03.06 Other Reference Material

The following publications are to be used for design applications and can typically be found on the publishing agency's website. In case of conflict between City publications and those referenced below, the City publication will take precedence:

A. Auburn City Code (ACC) related to development requirements.

B. Washington State Department of Transportation (WSDOT) "Standard Specifications for Street, Bridge and Municipal Construction" as amended by the City's Special Provisions (Part 1 of the Construction Standards). These will be referred to in City publications as the "WSDOT Standard Specifications."

C. Washington State Department of Transportation (WSDOT) "Design Manual" (latest edition).

D. Washington State Department of Transportation (WSDOT) "Standard Plans."

E. American Association of State Highway and Transportation Officials' (AASHTO) "A Policy on Geometric Design of Highways and Streets" (latest edition).

F. FHWA and Washington State Department of Transportation, MUTCD.

G. Transportation Research Board's (TRB) Roundabouts: An Informational Guide, 2nd Edition (NCHRP 672).

H. State of Washington Department of Ecology's "Criteria for Sewage Works Design" (latest edition).

I. State of Washington Department of Health (DOH) "Water Systems Design Manual" (latest edition).

J. American Water Works Association (AWWA) Standard Specifications (latest edition).

K. "IES Lighting Handbook" (Illuminating Engineering Society of North America) (latest edition).

L. American National Standard for Roadway Lighting ANSI/IESNA RP-8-00 (latest edition).

1.04 Deviation from Standards

In some cases, City standards may not best address a particular engineering application. In these instances, a design deviation from the City's standards may be requested from the City Engineer. Except deviations for City capital improvement projects, deviations shall be made using the City's Deviation Request Application and shall include applicable engineering justification for the deviation. Deviation requests and supporting justification must be sealed by a professional engineer. The City Engineer will evaluate the request and notify the applicant of a decision within 15 working days upon receipt of a complete deviation request or with the completion of the first review of the development review plans or plats (for Short Plats, Plats, FAC's and Grading Permits), whichever is later. Additional City review time may be required in certain circumstances and will be coordinated with the applicant. For deviation applications that are associated with a preliminary plat application submitted in compliance with ACC 17.10, the deviation application and a recommendation from the City Engineer must accompany the preliminary plat to the hearing examiner. The hearing examiner must obtain the concurrence of the City Engineer for any requests to modify any City of Auburn design or construction standard. Approved deviations must be shown on the final civil site improvement plans as specified in **Chapter 3.**

Deviations for City capital improvement projects will be reviewed and approved by the City Engineer during design review. The City Engineer signing the final plans as approved for construction constitute approval of any deviations from these Standards.

1.04.01 General Deviations

General deviations apply to all engineering design standards except for the Surface Water Management Manual's Minimum Requirement deviations.

The engineering design deviation, with compelling supporting justification, shall clearly demonstrate the engineering design standard for which the deviation is being sought is not physically or technically possible, would have undesirable impacts to public or private infrastructure and property, or would impact critical areas.

Additionally, the proposed deviation will meet or exceed the corresponding City standard for the following applicable criteria:

A. The functional intent of the design element.

B. Safety factors associated with the design element.

C. Operational concerns associated with the design element.

D. Maintenance concerns associated with the design element.

E. Liability concerns associated with the design element.

F. The capacity and/or efficiency of the design element.

G. The design life, historical performance, and durability of the design element.

H. The aesthetic and visual impacts of the design element.

I. The cost effectiveness and availability of any replacement components or materials.

J. Consistency with the spirit and purpose of the corresponding City design standard.

K. Demonstration that the environment will not be adversely affected.

L. Supported by published industry standards.

M. The effect on buildable lands within the City of Auburn.

1.04.02 Surface Water Management Manual (SWMM) Deviations

A deviation request from any of the 10 Minimum Requirements in the SWMM goes through a different process which includes a public notice requirement. This is to ensure that the Department of Ecology mandated surface water regulations are complied with. The 10 Minimum Requirements of the SWMM can be found in **Section 8.07**.

Requests for deviations from the 10 Minimum Requirements of the SWMM shall be in accordance with ACC 13.48.226 and these standards.

1.04.03 Appeal of City Engineer's Decision

Appeal of the City Engineer's decision shall follow the following procedure:

The applicant shall have 15 working days from the date of receipt of the City Engineer's decision in which to submit a written notice to the Public Works Director contesting the decision of the City Engineer. The Public Works Director shall then have 15 working days to notify the applicant

of a decision to uphold or modify the City Engineer's decision. For appeals of engineering deviations requests, the Public Works Director's determination shall be final.

1.04.04 Changes to Standards

Per ACC 12.04.010, the City Engineer is authorized to make any additions, deletions, or modifications stated in these Standards with consultation with the City Council on policy issues or broad Citywide implications.

This page intentionally left blank.

Chapter 2: Plan Approval Process

2.00 Preface

This Chapter contains standards and procedures that apply to the review and approval process for civil engineering plans. Development or redevelopment of property within the City of Auburn, and/or within the limits of Auburn's Utility Service Area, that require civil engineered plans to support a development action must follow the processes outlined in the subsections below.

2.01 Types of Plans

This section contains information regarding the types of civil engineering plans submitted to the City. Specific plan requirements are described in detail in **Chapter 3**.

2.01.01 Grading (GRA) Plans

Grading plans are required prior to the issuance of a Grading Permit and before commencement of construction, if triggered per ACC 15.74.

2.01.02 Building Site Plans

A Building Site Plan includes all civil site development requirements including site layout, building location, site access, parking, code required landscaping, utility service, and storm drainage control. An approved Site Plan is required prior to the issuance of a Building Permit and before commencement of construction.

A building Site Plan is required for all new non-residential developments and residential construction of 3 units or more per lot.

2.01.03 Public Facility Extension (FAC) Plans and Agreement

City of Auburn approved Public Facilities Extension (FAC) Plans and an executed FAC Agreement are required prior to construction of City of Auburn infrastructure (sanitary sewer, water, storm drainage, and/or transportation facilities) by any party other than the City of Auburn.

2.01.04 Other Plans

Some projects may also require other types of plans. The requirements for these additional plans will usually be addressed early in the submittal process. These plans could include, but are not limited to, the following:

A. Landscape plans, prepared in accordance with ACC 18.50.

B. Land clearing plans, prepared in accordance with ACC 15.74.

C. Irrigation plans, prepared in accordance with ACC 18.50.

D. Critical Area restoration/enhancement plans, prepared in accordance with ACC 16.10.

E. Retaining Wall Plans and Structural Calculations.

F. Illumination/Site Lighting Plans, prepared in accordance with ACC 18.55.

2.02 Review and Approval Process

2.02.01 Submittals

When submitting civil engineering plans to the City for review, the following steps are required to insure a complete submittal and timely approval of civil engineering plans:

A. Applicants are encouraged to meet with City staff prior to plan submittal. Information on applying for a Pre-Application Meeting is available through the City of Auburn Permit Center. All plans and associated documents submitted to the City will be assigned a project number and receive a preliminary review to make sure they adequately address the minimum requirements of a complete application. Any such plans and associated documents not meeting these requirements will be returned to the applicant or the applicant's designee as unacceptable for review, with a written explanation of necessary corrections required prior to the subsequent resubmission.

B. Prior to preparing civil engineering plans for submittal, the applicant shall review the submittal requirements outlined in the Civil Submittal Handout (FAC & GRA) on the City's website under Forms. This packet provides a summary of the Engineering Design Standard sections that apply to civil plan preparation but does not substitute for a thorough review of the Engineering Design Standards.

C. Civil Engineering plans and associated documents are to be submitted to the City for processing. All submittal documents (Reports & Plans) must be single .pdfs and not require collating, with file names that clearly state the document type and may be submitted through www.MyBuildingPermit.com. If you have any questions regarding the application process or submittal requirements please contact the City Permit Center at permitcenter@auburnwa.gov, (253) 931-3020 or Development Engineering at development@auburnwa.gov, (253) 876-1969, or in person at the City of Auburn Permit Center on the Second Floor of the Auburn Professional Plaza, One East Main Street.

D. After the receipt of a completed Civil Submittal, the City will make a preliminary review of the plans and supporting data to verify the scope of the proposed extension(s) and check for completeness of the application. The City requires 28 calendar days from the date of initial submittal, to determine if the application is complete. However, typical review times are generally shorter than this. Once the City is satisfied with the completeness of the application, the applicant will receive payment instructions, and once the application fees have been paid, the 1st detailed civil submittal review will begin.

E. Once the length of the public extension(s) and/or hours required for review/inspection have been verified/calculated, 30% of the review and inspection fees are due with the application for 2nd review. Detailed FAC Plan review work for the 2nd review will not continue until 30% of the review and inspection fee is paid. If no 2nd review is needed, then payment of the full review and inspection fee is due before the City signs the facility extension agreement.

F. All proposed public right-of-way dedications shall be dedicated to the City prior to start of construction with the exception of plats and short plats. A title report pulled within 30 calendar days of the application will be required to confirm property ownership and to verify that the portions of the property dedicated as right-of-way and/or easements have been cleared of encumbrances. The applicant is responsible for clearing all encumbrances the City determines to be inconsistent or in conflict with the intended purpose of the dedications. Title insurance shall be provided to the City for right-of-way dedications in the amount of $50.00 per square foot of right-of-way area dedicated, or other amount as proposed by the Developer

and accepted by the City Engineer. Refer to the Right-of-Way Dedication Handout on the City's website under Forms for additional information. Easements shall be executed by the Applicant prior to start of construction. Easement documents will be held by the City until the end of construction, at which time the easement exhibits and descriptions may need to be updated by the Applicant, based on as-built conditions, except easements that are being granted by someone other than the Applicant which will be recorded prior to the start of construction. Once the easements are confirmed to match field conditions, the easements will be recorded by the City.

G. The following applicable information may be required along with the plan submittal:

   1. Title report.
   2. The final biologist report, including the wetland mitigation plan, when appropriate.
   3. Traffic reports.
   4. A copy of other applicable applications (Short Subdivisions, Subdivisions, etc.).
   5. Letter indicating how SEPA and/or other applicable application conditions have been accounted for in the development/plan process.

H. All final plans, calculations, or reports submitted for review shall be stamped by a Professional Engineer. Electronically signed seals will only be accepted if they meet the requirements of WAC 196-23-070.

I. Where the plan review process is running concurrent with other applications (SEPA, Subdivisions, etc.), the above-referenced information may not be available at time of plan submittal. In such instances, other required applications shall be provided prior to final plan approval.

J. All final approved Plan submittals shall include the associated electronic AutoCAD files.

K. If the project is to be phased, phasing plans must be submitted per the requirements specified herein.

2.02.02 City Review

The City will review plans and associated calculations, reports, and AutoCAD files for conformance with City development requirements, standards, and policies. Marked up construction drawings, calculations, reports, and written plan review comments will be returned to the applicant's designated contact person for revisions. The applicant's engineer shall revise construction drawings, calculations, or reports to address City plan review comments and provide comprehensive comment responses in a unique color directly on the marked-up documents along with the updated documents or in other formats as determine to be acceptable by the City Engineer, or designee. The revised drawings (the required number will be determined by the City) and associated calculations and reports, along with the redline comments, shall be resubmitted to the City for additional review.

2.02.03 Plan Approval

Once the plan review process is completed and all City review comments have been addressed, the City will request that one electronic copy of the sealed plans and reports be submitted for approval.

Final reproducible plans shall be produced in .pdf format, signed and stamped by a professional engineer and provided to the City for approval signatures, along with the final AutoCAD files. Electronically signed seals must meet the requirements of WAC 196-23-070 and also provide permissions for City staff to apply signatures to the approved plans. The City will return the signed and approved plans to the Applicant.

All applicable AutoCAD files shall be submitted to the City on a compact disk or electronically transferred to development@auburnwa.gov for integration into the City's Geographic Information System (GIS). For more information on AutoCAD file submittal, please see **Appendix F** of **Chapter 3**.

2.02.04 Construction Plan Revision

If after plan approval the applicant desires to make changes to the approved plan(s), a revised plan(s) reflecting such changes shall be required. In some cases, minor changes may be considered and approved by the City Engineer without a formal plan revision. City Inspectors may not authorize changes to the approved plans. The following is the general process required for submitting revisions to the approved plans after plan approval:

A. Provide a written summary of the proposed plan/report changes to the Development Review Engineer assigned to the project and include development@auburnwa.gov on the email correspondence.

B. Submit for City review, comment, and approval, the revised plans.

C. Changes on the plans can be clouded for ease of review but will need to be removed prior to approval of the construction plan revision.

D. Provide the text "REVISION" in 0.2" height bold text above the **Approval Block (B-3) in Appendix A** on all sheets that are being revised and submitted for review.

E. Provide a date and brief revision description in the revision title block.

F. Include the cover sheet of the plans even if revisions are not proposed on the cover sheet as the cover sheet is the sheet that has approval lines for the Planner and City Engineer.

The following list are examples of changes that would require a formal plan revision process (Note that this list does not include all potential changes that would require a plan revision process):

A. Alternative pavement section;

B. Revised structural elements such as walls;

C. Revised City utility location of 2 feet or more horizontally or vertically;

D. Addition of structures such as catch basis and manholes;

E. Revised driveway location, width, or alignment;

F. Change in storm pond facility embankment slopes;

G. Addition of temporary irrigation;

H. Phasing Construction.

2.02.05 Project Close Out

The following is the general process required for accepting construction completion on a project:

Construction Record Drawings (also referred to as the Construction Redlines) refer to the field changes the Applicant clearly tracks and marks on the final approved and signed plans that are retained throughout construction, in accordance with the requirements specified in the Construction Standards.

After completion of construction, the Applicant shall submit the Construction Record Drawings to the City electronically for review and comment. After the City has concurred the Construction Record Drawings reflect the as-built conditions and meet City record drawing standards, as described in the City Construction Standards, the Applicant shall utilize them to produce the Final As-built Record Drawing set for submission to the City. A copy of the "Record Construction Document Packet" which outlines the complete record drawing process in detail can be obtained from the City.

The Applicant shall also provide the City the current AutoCAD drawing files to reflect any revisions that occurred after plan approval and submit an electronic PDF set to the City.

The City will apply an 'As-Built' stamp on each sheet of the submitted Final As-built Record Drawing set and apply a "Record Drawing Certification" block on the Cover sheet. The Record Drawing Certification will be signed by the City and the Final As-built Record Drawings will be archived and imported into the City's GIS database.

A final Stormwater Site Plan certification letter shall be stamped, signed and submitted by the Engineer of Record to the City verifying that the storm facilities were installed as designed or note any minor changes during construction that require no changes to the Stormwater Site Plan report.

Submit an electronic copy of the Stormwater Site Plan report and Geotechnical Report if there have been changes during construction.

The following shall also be completed for projects prior to project close out:

A. All legal documents, including Utility Easements, shall be updated as needed, executed, and recorded.

B. FAC Agreement shall be recorded.

C. For all FACs, a "Developer Contributions Document" for all public transportation, water, sewer, and storm facilities constructed as part of the project shall be obtained from the City, completed, and returned electronically to the City.

D. All Warranty Bonds or Assignments of Funds for the 1 to 2-year warranty period shall be in place.

This page intentionally left blank.

Chapter 3: Plan Preparation Requirements

3.00 Preface

This Chapter describes City requirements for plans submitted to the City for review and approval. Civil engineering plans must meet these standards in order to move through the review process in an efficient manner and in order to receive approval.

3.01 General Requirements

The following general requirements apply to civil engineering plans submitted for review and approval by the City:

A. The general construction requirements for the City shall be those contained in the City of Auburn's current Engineering Construction Standards Manual which supplements or modifies the "Washington State Department of Transportation (WSDOT) Standard Specifications for Road, Bridge and Municipal Construction," except where supplemented or modified by the City in this manual.

B. The civil engineering plans shall reference City Standard Specifications, Standard Details, and WSDOT Standard Plans as necessary. The City's Standard Specifications and Standard Details are contained in the Engineering Construction Standards, a copy of which shall be on-site during construction.

C. All civil engineering plans and reports shall be prepared and sealed by a professional engineer.

D. Property surveys shall be performed and prepared per WAC 332-130-145, sealed and signed by a professional land surveyor and be tied to the current City datum (NAVD 88) and horizontal control datum shall be NAD83 (1991) as officially adjusted and published by the National Geodetic Survey. (WAC 332-160-060 and RCW 58.20). A list of City Benchmarks is available upon request.

E. All civil engineering plans and calculations shall be neat, uncluttered, legible, and in conformance with the requirements herein.

F. All plans shall be prepared utilizing AutoCAD software in accordance with the standards specified herein.

G. For a Development project, all deviations from City's Engineering Design and Construction Standards must be shown on the plans with a note call-out and description that references the City assigned deviation number and deviation approval date. The format of these callouts and note descriptions shall be as shown in **Appendix C** of this Chapter.

H. Except as approved otherwise by the City Engineer, a project may qualify for a Minor Grading Permit Submittal. Refer to **Appendix E** for project thresholds to quality for a Minor Grading Permit and the submittal requirements.

3.02 Plan Format

The City requires that plan sets be submitted in an order consistent with this section. Depending on the complexity or simplicity of the project, the amount of detail and content required will be subject to change. Depending on the scope of the project the civil site improvement plans may be comprised of a combination of the grading, site and facility extension (FAC) plan elements outlined below to create a set of Civil Site Improvement Plans.

Civil Site Improvement Plans shall consist of the following sheets:

A. Cover sheet (See **Section 3.04.01**).

B. Temporary Erosion and Sediment Control (TESC)/Demo Sheet (Land Clearing when applicable) (See **Section 3.04.02**).

C. Grading and Private Storm Drainage Plan (See **Section 3.04.03**).

D. Utility Plan and Profiles if applicable (See **Sections 3.04.07 & 3.04.09**).

E. Street and/or Storm Plan and Profiles if applicable (See **Sections 3.04.08 & 3.04.09**).

F. Street Cross-Sections and Additional Street Elements if applicable (See **Section 3.04.09**).

G. Cross-Sections (See **Section 3.04.04**).

H. Details (See **Section 3.04.05**).

I. Street and/or Site and Landscape Plan (See **Section 3.04.10**).

J. Irrigation Plan if applicable (See **Section 3.04.11**).

If a separate associated grading plan has been submitted and approved, those areas covered under the grading plans will not need to be readdressed in the building site plans.

3.03 General Plan Requirements

3.03.01 Standard Plan Format

Applicable information in this section shall be shown on the plan set.

A. Each sheet of the plan set shall be stamped by a professional engineer.

B. North arrow.

C. The title block shall include the development/Capital project title (in bold print), the name, address and phone number of the firm preparing the plan and the owner/developer, a revision block (showing the date of the latest revision), page of pages numbering, and sheet title (e.g., road and storm drainage, grading, erosion/sedimentation control, water and sanitary sewer).

D. Indicate units of measurement for all slope callouts as either percent (%) or feet per foot (ft./ft.). Do not mix units of measurement on a plan set.

E. Provide all match lines with matched sheet numbers (stationing).

F. The street classification shall be provided under the street name on all plan views.

G. For the approved Development project plans, a City of Auburn approval block (4”x2”) shall be provided in lower right corner of each plan sheet except for the cover sheet which shall be per Section 3.04.01. Show project reference numbers (BLD for Building Permit, FAC for Public Facility Extension Plan, STM for Storm Permit and/or GRA for Grading/Erosion Control Permit) in the approval block area. A blank Auburn Engineering approval block is shown as **Approval Block (B-1) in Appendix A** of this Chapter.

H. The locations of the title blocks, approval blocks, and engineer’s stamp shall remain consistent throughout all the plan sheets.

I. All survey monuments as defined by WAC 332-120-020 within 25 feet of proposed ground disturbing activities shall be shown on the plans and the plans shall indicate the Department of Natural Resources permit number(s) issued for disturbance and re-setting/replacement of the monuments in accordance with Section 10.18 of the Engineering Design Standards. In addition to those typically found marking the City's Right of Way, survey monuments include, but are not limited to, set property corners, curb pins, reference or offset points, etc.

3.03.02 Drafting Standards

Drafting requirements are as follows:

A. Plan sheets should be formatted to print on 22"x34" size paper. Any variation must be approved by the City prior to plan submittal. Approved plans shall be produced per **Section 2.02.03** of the Engineering Design Standards. Margins should be set to provide for ½ size drawings to fit on 11"x 17" sheet size.

B. Lettering size shall be no smaller than one tenth (1/10) of an inch in height and shall be uppercase. Callouts and other information shall be printed horizontally in most cases.

C. Existing features shall be shown with dashed lines and/or screened back APWA line types and symbols (screening 45%).

D. Proposed features shall be shown with APWA symbols and line types. The intent is to clearly distinguish existing features from proposed improvements.

E. Minimum scale shall be:

- Site work: 1" = 40' horizontal.
- Public facility work: 1" = 20' horizontal.

Vertical scales are to be 1/10th the horizontal scale except for public facility work in areas with steep slopes, 1" = 5' may be used in place of 1" = 2'.

Use a scale that best utilizes paper space and gives the best overall view of the site.

F. Use APWA AutoCAD symbols and line types in the legend to identify both existing and proposed improvements and utilities.

G. Electronic AutoCAD files shall be prepared in accordance with the Layers Standard included in **Appendix F** of this Chapter. A .dwt file containing the AutoCAD layers can be found on the City's website or by clicking on the following hyperlink: Development AutoCAD Layers and Linetypes

H. Electronic AutoCAD files shall be geo-referenced per the standards specified herein.

3.04 Plan Sheet Elements

The following section covers the basic elements that are required to be shown on the different plan sheets. While all plan sets will have a cover sheet, there are other sheets covered here that may or may not be included in a particular projects plan set.

3.04.01 Cover Sheet

The Cover Sheet and General Information Sheet(s) shall incorporate all the requirements listed in **Section 3.02**, plus the following applicable items:

A. A general scaled site plan covering an area approximately 10 inches square.

B. Vicinity map (approximate scale) with north arrow covering an area approximately 5 inches square.

C. Site address.

D. Owner/Applicant, address, contact, phone number, and e-mail address.

E. Engineer/Surveyor/Architect address, contact, phone number, and e-mail address.

F. Elevations with City datum (NAVD 88) tied to City benchmarks with reference to the benchmarks' numbers and locations indicated. Horizontal control information (NAD83). See **Appendix E** of this Chapter for more information on survey requirements.

G. Monuments used for horizontal control per the City's horizontal control datum NAD83 (1991) with a description of the monument and northing and easting.

H. The permit number in 1 inch bold lettering shall be above the title block (located on the right side of the sheet) on the cover sheet only.

I. Sheet Index with reference to all civil, landscape, critical area mitigation and lighting plan sheets.

J. Legend of all existing and proposed lines and symbols used on the plans.

K. Full legal description(s) including quarter section, section, township, and range.

L. Parcel number(s).

M. Site zoning and adjacent zoning (may be shown on a separate vicinity map sheet).

N. Applicable plat name and lot numbers.

O. Applicable site information including the number of parking spaces required and the number of parking spaces provided.

P. Type of building construction as defined by the adopted Building Code and the building height as defined in **Appendix D** of the International Fire Code.

Q. Site access including adjacent driveways, roadways, and intersections that may have an impact on the location and type of site access.

R. An overall site plan key map shall be shown if the scope of work requires that the site plan be divided between 4 or more plan sheets, unless otherwise directed by the city.

S. Construction Sequence outlining a basic construction schedule for all elements of the project. (See **Section 5.05** for a sample construction sequence related to storm and TESC elements) In addition, depending upon the nature of the project, the construction of some public facilities may also dictate separate construction sequencing requirements that will also need to be indicated on the plans.

T. The City of Auburn General Notes as shown in **Appendix B** of this Chapter.

U. Provide a list of the additional non-building permits required for this project. The City will update this list with the 1st review comments.

V. Indicate approximate fill and excavation quantities in CY. Refer to the Civil Submittal Handout (FAC & GRA) located on the City's website for required format.

W. Storm drainage related quantities and information required to support calculation of System Development Charges (SDC). Refer to the Civil Submittal Handout (FAC & GRA) located on the City's website for required format.

X. The City of Auburn Engineering Approval Block, (min size 2" x 8.5") as shown in **Appendix A** of this Chapter. A blank Auburn Engineering approval block is shown as **Approval Block (B-3) in Appendix A** of this Chapter.

3.04.02 Temporary Erosion and Sediment Control (TESC) Plan Sheet

TESC design shall be in accordance with **Chapter 5 – TESC, Clearing, and Grading**, and include the following applicable items:

A. Marked clearing work limits, environmentally sensitive areas and their buffers, and trees that are to remain.

B. Indicate the location of the construction entrance.

C. Provide onsite stormwater facilities during construction.

D. Indicate the minimum temporary erosion control measures to be used on the site during construction, this may include, silt fencing, interceptor ditches, detention or retention facilities, flow control structures, etc.

E. Show containment locations for storing pollutants, including waste materials and demolition debris, prior to their removal from site.

F. All existing site features and conditions shall be shown on this sheet including the existing topography.

G. This sheet may also function as a demolition site plan and indicate all existing features and structures to be removed/demolished and those that will remain.

H. Provide the Auburn Grading and Erosion Control Notes as shown in **Appendix B** of this section.

3.04.03 Grading and Private Storm Drainage Plan Sheet

The Grading design shall be in accordance with **Chapter 5 – TESC, Clearing, and Grading**, and include the following applicable items:

A. Indicate slope of any fill or cut slopes.

B. Show or provide reference for type of fill material and associated compaction requirements or provide a reference to the approved Geotechnical Report with a date of the report, the firm that prepared it and the section in the report to reference.

C. Show existing significant trees and their dripline (6 inches in diameter and larger for evergreens and 4 inches in diameter or larger for deciduous). Indicate if tree is to either be retained or removed.

D. Provide storm drainage retention or detention facilities including City control structure, water surface (W.S.) elevations, seasonal high groundwater elevation, orifice sizes, design storms for the W.S. elevations, and release rates.

E. Show horizontal setback between the bottom of any fill placement and the top of the bank of a defined drainage channel per requirements noted in **Section 5.03**.

F. Show typical ditch sections.

G. Show connections of building roof and foundation drains to the site drainage system.

H. Show the existing topography shaded back and overlaid by the proposed grades.

I. Show existing and finished elevations and contours. Spot elevations may be required for relatively flat sites to supplement the contour elevations as necessary to adequately reflect existing and finish grades. Provide spot elevations along property line and a minimum of 30 feet beyond property line (at least 50-foot intervals).

J. Provide notes to protect and maintain erosion control facilities during grading operations.

K. Provide arrows to indicate drainage flow direction on paved surfaces.

L. Show layout of the entire storm drainage pipe with length, slope, and material type labeled and direction of flow indicated.

M. Provide site specific details and cross-section sheets for storm drainage detention or retention facilities.

N. Indicate the emergency overflow to the public storm system.

O. Show berm dimensions, materials, compaction requirements for ditches and detention ponds where applicable. When projects include storm ponds, include a storm pond profile sheet with seasonal high groundwater elevation, or reference to Geotechnical Engineering report detailing an accepted alternative analysis.

P. Show locations of manholes and catch basins, indicating type, stationing, offset, lid type, rim, and invert elevations. Number manholes and catch basins consecutively.

Q. Show existing and proposed sanitary sewers and water mains, identifying crossing and minimum vertical distance between utilities.

R. Provide type of material and size of energy dissipaters (riprap, etc.).

S. Provide details and cross sections of all low impact development, water quality, and flow control facilities for stormwater runoff.

T. Show trash racks, if applicable.

U. Show locations, widths, and types of easements.

V. Show locations and types of pumps, if applicable.

W. Provide planting and seeding requirements with establishment procedure in construction sequence for water quantity and quality systems.

X. Show finish floor elevations.

Y. Show the controlling downstream storm drainage elevations including the associated design conditions.

Z. For ponds, provide: aesthetics, fencing, power (if applicable), maintenance access, control structure, critical water surface elevations, and other items, such as walls and liners.

AA. Address bypass surface flows.

BB. Address subsurface flows and indicate water surface elevations.

3.04.04 Cross-Section Sheet

The Cross-Section plan sheet(s) shall be provided for projects that propose grading activities 10 feet or closer to the property line, excavations over 5 feet or fill over 8 inches in depth or more and have the following applicable items:

A. Cross-sections for fill and grading shall be shown through all properties to at least 30 feet beyond the property lines. Adequate cross-sections shall be shown to represent the site. At a minimum this shall include one shown in the north direction (west-east from left to right) and one shown in the east direction (south-north from left to right) cross-section.

B. This sheet may also contain cross-sections for the temporary storm drainage pond.

C. The scale used for the site cross-sections on this sheet should match the scale on the other sheets.

D. Some projects may be able to combine the cross-section sheet with the grading sheet depending on the complexity of the project.

3.04.05 Detail Sheet

The Detail sheet(s) shall have the following applicable items:

A. Any detail that is specific to this project.

B. City of Auburn Standard Details are not to be shown on this sheet unless they need to be modified for a project specific application, in which case the detail would be shown with the modifications explicitly called out/labeled and shall not include the City Engineer's signature from the original detail.

C. Storm control manholes shall be shown on this sheet.

D. This sheet shall contain cross-sections for the storm facility.

E. City of Auburn Standard Details and WSDOT Standard Plans are to be called out on the applicable plan sheet using the detail or standard plan number.

3.04.06 Utility Plan Sheets

The plan set shall include an overall utility plan that shows the private connections to the public water and sanitary sewer systems, together with the storm drainage system and proposed landscaping, and any required extensions of the public water and sanitary sewer systems. The overall utility plan shall be clearly visible on one to two plan sheets, with a maximum scale of 1"=100'. The overall utility plan is required in addition to plan/profile sheets prepared at the minimum scale defined in Section 3.03.02.E.

The scale of the plans may need to be increased to improve visibility. Construction Note Callouts shall be shown in the plan view (e.g., manholes, catch basins, etc.).

The more detailed Utility Plan sheet(s) shall have the applicable items identified in the following

sections.

3.04.06.A Water

Water system design shall be in accordance with **Chapter 7 – Water Facilities**, and shall include the following items:

A. Water pipe and fitting size, location, and type of material.

B. Details of connections to existing water mains, including details on the type(s) of connection fittings used.

C. Valve size, locations, type, and fittings.

D. Fire hydrant location(s).

E. Air/vacuum relief valve and blow-off locations.

F. Pressure reducing stations and associated valves, vaults and bypass piping as required.

G. Concrete blocking, mechanical or flanged joint, or restrained joint or locking gasket.

H. Water main, water meter, air and vacuum relieve valve, blowoff assembly, fire hydrant easements, and all appurtenances.

I. Meter size and service line size, material type, and location.

J. Irrigation meter size and service line size, material type, and location.

K. Proposed fire line, FDC line, and PIV locations. Provide a note with the underground fire line noting that a separate fire permit will be required for the underground fire line between the connection to the public water main to the building.

L. Backflow prevention assembly and detector check meter size, type and location.

M. For buildings requiring fire sprinklers, the fire sprinkler notes shall be shown on the plan, as shown in **Appendix B** of this Chapter.

N. Table or call out showing physical separation in feet between water lines and other utilities at crossings, when a profile is not required.

O. Cross connection control notes included in **Appendix B** of this Chapter.

P. For plat or road projects, provide unique stationing down the center of the road with the appropriate offset at all water main appurtenances. For all other projects, provide unique stationing down the center of the water main tied into known survey control.

Q. Private water mains and hydrants are labeled as “Private” or “PVT” when applicable.

3.04.06.B Sanitary Sewer

Sanitary sewer system design shall be in accordance with **Chapter 8 – Sanitary Sewer and Storm Drainage Facilities**, and include the following items:

A. Sanitary sewer pipe size, locations, and type of material.

B. Location of manholes. Indicate type of manhole, stationing, offset, and number manholes consecutively. During the City review process, manhole numbers shall be assigned by the City to be incorporated into the next submittal.

C. Indicate knockouts in manholes for future connections.

D. The direction of sewage flow shall be indicated with an arrow at the manhole. Proposed sewer shall have solid arrowheads while existing pipe and manholes shall be shown in ghost or screened lines with the arrowhead and manhole not filled. The location of the frame and cover on the manhole, positioned over the widest part of the shelf and not over a flow channel, shall be shown.

E. Drop manholes, if approved, are to be detailed on the plans.

F. Length, slope, type and class of material, and inverts for side sewers.

G. Stationing for side sewers, measured from downstream manholes.

H. Connection of a side sewer to the City's sanitary sewer pipe shall be indicated with a tee.

I. Locations of sanitary sewer cleanouts.

J. Locations of sanitary sewer easements.

K. Clearly define right-of-way and adjacent property lines. Parcel numbers for all lots adjacent to the improvements shall be indicated, with existing or proposed finished floor elevations.

L. Floor drains, drains from other covered areas potentially subject to pollutants, and wash areas within parking lots shall be connected to the sanitary sewer through an approved oil/water separator.

3.04.06.C Storm Drainage

Grading and Storm Drainage system design shall be in accordance with **Chapter 5 – TESC, Clearing, and Grading**, and **Chapter 8 – Sanitary Sewer and Storm Drainage Facilities** (which incorporates by reference the SWMM), and include the following applicable items:

A. The layout of all the storm drainage pipes with the length, slope, and material type indicated in the labeling of the storm drainage pipes. Provide arrows to indicate the direction of flow into the structures.

B. Typical ditch section.

C. Location of manholes and catch basins. Indicate type, stationing, offset, type of lid, rim and invert elevations, and number manholes and catch basins consecutively.

D. Existing and proposed sanitary sewers and water mains. Identify crossings and minimum distance between utilities.

E. Building downspouts or footing drain locations, inverts and connections to the storm drain system.

F. For single-family home sites, indicate means for collection and discharge of water from roof, foundation drains, wall drains, and driveways.

G. Provide arrows to indicate drainage direction in parking lots, roadway intersections and cul-de-sacs.

H. Reference to the detail/BMP and/or cross-section sheets for storm drainage detention or retention facilities such as the control discharge structure and pond cross-sections. Indicate water surface elevations, allowable discharge rates, and design storms.

I. Show an emergency overflow to the public storm drainage system.

J. Berm dimensions, material, and compaction requirements for ditches and detention ponds.

K. Indicate type of material and size of energy dissipaters (riprap, etc.).

L. Provide details of the storm drainage water quality facility.

M. Limits of surface water ponding within parking lots.

N. Trash racks.

O. Location and widths of easements.

P. Location and type of pumps.

Q. Stormwater treatment/quality control facility location, length, width, slopes, and cross-section.

R. Planting and seeding requirements with establishment procedure (construction sequence) for water quantity or quality systems.

S. Finish floor elevations of all buildings.

T. Indicate separation from any pipe, infiltration trench, open ditch, water quality and stormwater facilities to any property line, structure and obstruction.

U. For ponds, provide landscaping, fencing, maintenance access, critical water surface elevations, and other items, such as walls and liners.

V. Number the storm drain structures (Numbers will be provided by the City prior to final plan approval).

W. Low Impact Development (LID) facility location, length, width, slopes, and cross-section.

X. Provide the Auburn Storm Drainage Detention Pond Notes as shown in **Appendix B** of this Chapter when public detention ponds are proposed.

3.04.07 Utility Profile Sheet

Utility Profiles are to be included on the associated utility plan sheet(s) with plan view above the profile view and corresponding unique stationing. All existing and proposed parallel and crossing utilities shall be shown on the profile.

3.04.07.A Storm Drainage

Profiles shall be created for all designed storm systems. These profiles are to include the following items where applicable:

A. Structure size, location, type, station, invert elevation, type of lid or grate, rim elevation, stationing and offset.

B. Pipe size, type of material, slope (ft./ft.), and lineal footage.

C. Utility crossings shall identify size and type of utilities involved.

D. Ditches, size, type, and slope.

E. Existing and finished grade along pipe centerline.

F. Connections to existing structures.

3.04.07.B Water

Profiles shall be provided for all public water systems, including on-site systems and systems within the street/City right of way and easements, These profiles shall include the following items where applicable:

A. Pipe size, type of material, lineal footage, cover, stationing and offset.

B. Utility crossings shall identify size and type of utility involved.

C. Existing and finished grade along pipe centerline.

D. Connections to existing mains and fittings.

E. Label fittings and valves, including concrete blocking.

3.04.07.C Sanitary Sewer

A profile will be required for all public sanitary sewer mains. These profiles are to include the following items where applicable:

A. Structure size, location, type, station, invert elevations, type of lid, rim elevation, stationing and offset.

B. Pipe size, type of material, slope (ft./ft.), and lineal footage.

C. Utility crossings shall identify size and type of utility involved.

D. Existing and finished grade along pipe centerline.

E. Connections to existing structures.

F. Side sewer locations, stationing and offset.

3.04.08 Public Street Plan and Profile Sheet

When a project includes construction within a public street, excluding utility connections, both a plan and a profile shall be included in the plan set. The Public Street Plan and Profile sheet(s), when required, shall have the applicable items identified below:

3.04.08.A Plan View

The plan view shall include the following items where applicable:

A. Plan views shall be drawn at a 1” = 20’ scale.

B. Existing and proposed rights-of-way.

C. Existing and proposed contours and elevations.

D. Existing and proposed street names.

E. Existing and proposed centerline bearing and distance.

F. Existing and proposed signs and traffic control devices.

G. Existing and proposed storm drainage systems.

H. Existing and proposed sewers and water mains. Identify crossings and minimum distances between utilities.

I. Horizontal curves.

J. Horizontal stationing.

K. Location of curbs, sidewalks, wheelchair ramps, and driveways (by station).

L. Locations of monuments at all centerline intersections, cul-de-sacs, PCs, and PTs by station.

M. Street luminaires, conduit for street lights, traffic signals, and traffic signal loop detectors located within the vicinity of the project.

N. Mailbox types and locations where new or relocated mailboxes are proposed. Submit to postmaster for approval.

O. Address any horizontal utility conflicts in plan.

P. Street landscaping, if required.

Q. Construction limits.

R. Slope excavation and/or embankment limits.

S. Pavement and lane tapers.

T. Identify any non-standard street cross slopes.

U. ADA Maximum Extent Feasible (MEF) documented on the Plans with a notation indicating the deficiency and that the curb ramp was designed to the MEF.

V. All proposed and existing underground and overhead utilities shall be shown and labeled on the plan in grayscale. The locations shall be coordinated and approved through the appropriate utility purveyor.

3.04.08.B Profile

The profile shall include the following items where applicable:

A. Profiles shall be drawn using 1” = 20’ horizontal and 1” = 2’ vertical scales. 1” = 5’ vertical scale may be used in place of 1” = 2’ in areas with steep slopes.

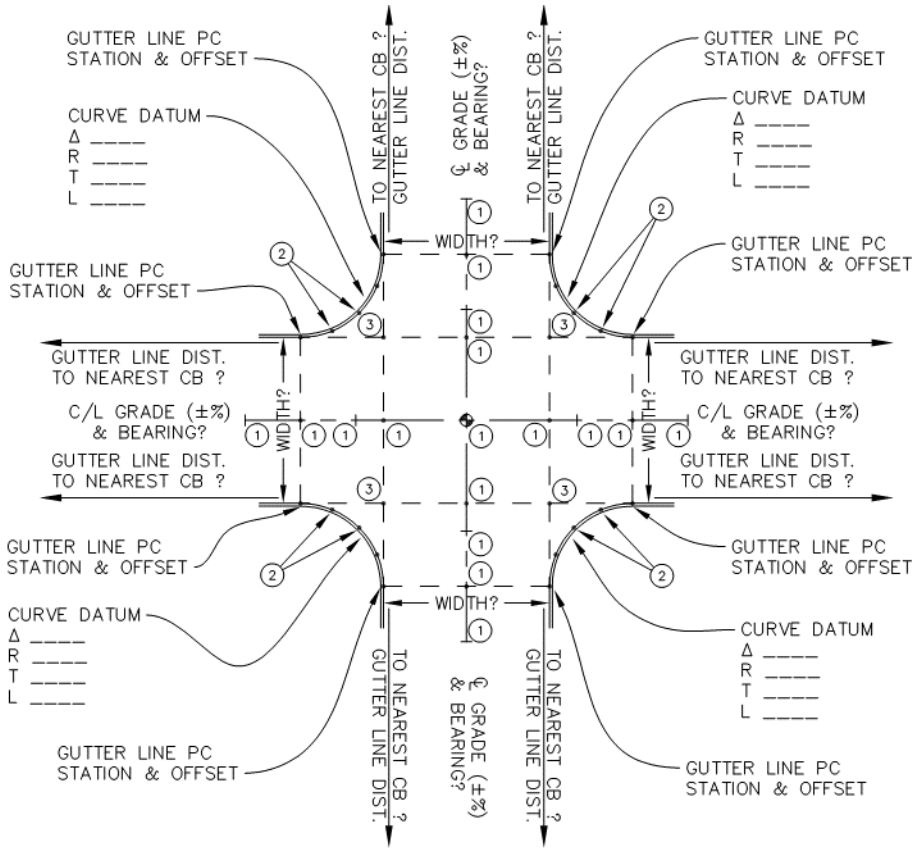
B. Existing and proposed centerline road grade.

C. Existing and proposed storm drainage systems.

D. Existing and proposed sewers and water mains (use ghost lines). Identify crossings and minimum distances between utilities.

E. Existing and proposed flowline grades.

F. Finish grade elevations every 50 feet and every 25 feet for vertical curves along design centerlines.



G. Vertical curve information in profile section.

H. Address vertical utility conflicts in profile.

3.04.08.C Intersections

Intersection plans shall be 20 scale drawings in conformance with **Figure 3-1** below:

Figure 3-1 Intersection Plan Sheet Requirements

NOTES:

A. LABEL INTERSECTION & STATIONING. SHOW FINISH ELEVATIONS AT:

(1) CENTER LINES, AS SHOWN.

(2) GUTTER LINE RADII: PC'S, PT'S, ¼ POINTS, & HIGH/LOW POINTS.

(3) GUTTER LINE PI'S.

B. IF RADIUS POINT FOR R.O.W. & GUTTER LINE DIFFER, PROVIDE DATA OF R.O.W. CURVE.

C. LABEL CENTERLINE INTERSECTION EQUATION STATIONS (IF APPLICABLE).

3.04.08.D Typical Roadway Sections

Typical roadway sections shall show pavement depths, widths and materials, cross-slopes of pavement (%), centerline, dimensioned right-of-way lines, curb and gutter, ditches, embankment and excavation slopes (1H:1V), walls, etc. Typical sections will be labeled within identified station ranges.

3.04.08.E Striping and Signing

Provide maximum 40 scale plans per these Standards, Auburn City Code, WSDOT and MUTCD, including lane markers, pavement markings, and signing.

3.04.08.F Signalization

Provide 20 scale separate detailed signalization plan per City of Auburn Standards, including poles, bases, conduits, and traffic loops.

Signal Plan Sheet

1. The plan sheet shall conform to the following requirements:
    a. For areas that require greater detail (such as the corner that has the controller), a blown-up detail may be necessary at a 1″=10′ scale.
    b. All proposed signal equipment, including signal poles, mast arms, heads, signs, junction boxes, conduit, loops, controller, and service cabinet shall be shown as bold.
    c. All existing and proposed right-of-way information shall be shown and labeled on the plan, including easements needed for signal equipment. The line type shall be different for easements and right-of-way.
    d. All proposed curb, sidewalk, proposed striping, and existing curb/striping (to remain) information shall be shown on the plan in gray scale (screened back).
    e. Sight triangle lines shall be shown on plans in gray scale.
    f. All proposed and existing underground and overhead utilities shall be shown and labeled on the plan in gray scale.
    g. Provide on the plan signal construction notes as shown in **Appendix B** of this chapter.
2. Construction notes shall contain, but not be limited to:
    a. Signal pole and foundation installation (including pole type, mast arm length, and installation of items on the pole).
    b. Controller cabinet and foundation installation.
    c. Coordination of utility removal/relocation.
    d. Coordination of connection of power, and power source type.
    e. Interconnect connection to other signals.
    f. Removal of existing signal and/or street light equipment.
3. Displays: The plan sheet shall include the following displays:
    a. Phase diagram display.
    b. Signal display showing signal layout of all vehicle signal heads and pedestrian heads.
4. Detection: The plan sheet shall include:
    a. Stop bar, intermediate and advanced loop location, and numbering.
    b. Pedestrian push button location.
    c. Preemption detection location and numbering.
5. Signal Poles and Associated Equipment: The plan sheet shall contain, but not be limited to:

a. Signal Pole Locations and Numbering: The locations shall be called out by the major arterial station and offset.
b. Signal head location and numbering.
c. Pedestrian head location and numbering.

6. Controller and Service Location:

   At least one corner of the controller/service foundation shall be called out by the major arterial station and offset. The footprint of the foundation shall be shown on the plans with the controller and service cabinets oriented on the foundation as they would be placed in the field. If the information required to show all the controller/service conduit connections and foundation footprint makes the plan too cluttered, a blown-up detail of the corner containing this information is needed at a 1″=10′ scale.

7. Power Source Location:

   The location of the power source shall be identified on the plans.

8. Wire Schedule:

   a. A wire schedule table shall include run numbers, conduit size, wire type, and comments.
   b. Comments shall include, but not be limited to, number of twisted loop pairs for runs between the detection loops and adjacent junction box, identification of spare conduits, conduits utilized only by interconnect or illumination, and power cables.
   c. For designs that include modifications to an existing signal, all existing wire runs affected by the design shall be shown on the wire schedule.

9. Junction box type and approximate location.

10. Signing:

    a. Signs shall be shown on all mast arms. Signs that are post mounted but are signal related (such as a “signal ahead” sign) shall be shown on the signal plan.
    b. A sign display shall be shown on the plan with the MUTCD sign designation, dimensions, and lettering type for all signs.
    c. Indicate removal of existing stop signs after signal is in operation.
    d. Installation of “New Signal Ahead” or “Signal Revision Ahead” signs.

11. Other Illumination:

    a. Proposed illumination that will use the signal service cabinet, but is located outside the four quadrants of the intersection, shall be shown as proposed on a separate illumination plan sheet. On the signal plan sheet, the illumination shall be shown as gray scale and labeled as “proposed illumination, see illumination plans.” However, once the illumination enters the quadrants of the intersection (i.e., when it is using the same junction box as the signal equipment), it shall be shown as proposed on the signal plan and gray scale on the illumination plan.
    b. Indicate the circuit that street lights are on.

Wire Diagram Plan

In general, the wire diagram shall include the following:

1. All signal heads, pedestrian heads, pedestrian push buttons, luminaires, preemption detectors, loops, and junction boxes drawn in schematic forms.

2. All termination points in the controller cabinet. The wire diagram shall include every termination point the controller will have, including those that may not be used for this particular signal design.

3. All wiring associated with the items above, as well as the wiring for interconnect. The wire diagram shall show how these items are connected to the controller.

4. Location of wire splices.

5. All termination numbering at each end of each wire. For example, the 5-conductor cable connecting a signal head to the controller shall have the termination numbering called out at the signal head and in the termination points in the controller.

6. All wire colors at each end of the wire.

7. A call out to each wire run noting the number and type of each wire.

8. Intersection schematic with a north arrow showing approach phase.

9. Pole, signal head, pedestrian head, preemption detection, and loops shall be numbered on the wire diagram.

Pole Schedule Plan

The pole schedule shall include the following:

1. A signal standard detail chart.

2. Pole orientation attachment and base detail, pole foundation detail, and signal standard detail.

3.04.08.G Illumination

A. Street Light Plans shall be labeled as Street Light Plans, and shall be prepared, stamped, signed, and dated by a professional engineer.

B. Street Light Plans will include references to all applicable City of Auburn Standard Details and/or Washington State Department of Transportation (WSDOT) Standard Plans, or copies of other specific details applicable to the project shall be shown on the plans.

C. Plans should show any proposed street trees and underground utilities in the background.

D. Street Light Plans shall be provided on separate and uncluttered sheets that do not show unrelated street, utilities, or on-site improvements. Street Light Plans shall be drawn to a maximum engineer's scale of 1" = 40'.

E. Street Light Plans shall at a minimum include the following applicable items for new or existing street lighting system:

1. Lighting schedule with the following information in a table format:
    a. Luminaire make and model
    b. Lamp/Ballast type
    c. Lamp wattage
    d. Uniformity Ratio
    e. Minimum Light Level
    f. Average Maintained Light Level
    g. Light standard type
    h. Mounting height (ft.)
    i. Bracket or davit arm length (ft.)
    j. Light distribution pattern
    k. Luminaire spacing distance (ft.)
2. Light standard locations by station and offset from the centerline of the street to the center of the light standard. Show all existing street lights for a distance of 500 feet in both directions from the limits of the project site, including both sides of the street(s) and in medians.

F. Wiring/Conduit schedule with the following information in a table format:

1. Circuit number
2. Conduit size, material, and purpose (street lighting, traffic signal interconnect, spares, etc.).

G. Location of points of service (the PSE connection or service location and the new or existing City Electrical Service Cabinet(s).

H. Location of junction boxes. Indicate junction box type and purpose (lighting, traffic signal, etc.).

I. Existing topography, including but not limited to the location of driveways, street trees (including species), street intersections, overhead utilities (including maximum and minimum heights), underground utilities (including sizes), medians, curb, and lane widths (pavement markings).

3.04.08.H Streetscape

Provide information on planting of the public landscape strips along the street frontage. Information shall include the following:

A. Type and size of trees.

B. Tree spacing.

C. Type of ground cover.

D. Root control/barrier.

E. Irrigation if applicable.

F. Show all proposed and existing surface features and underground utilities.

3.04.08.I Other Features

Include locations of any other feature including mailboxes and bus stops. Any mailbox placement that requires approval from the postmaster shall include the Postmaster **Approval Block (B-2) in Appendix A** of this chapter.

3.04.09 Site and Landscape Plan Sheet

The site and landscape sheets (separate plans may be more appropriate), when required, shall have the following applicable items:

A. Demonstrate conformance with ACC 18.50, “LANDSCAPING AND SCREENING” and ACC 18.52 “OFF-STREET PARKING AND LOADING”.

B. Label name, classification, and boundary of adjacent streets both public and private.

C. Pavement types with unique hatching.

D. Site signage and striping.

E. The boundaries and dimensions of site.

F. Show and label any easements.

G. Show and label any critical areas and buffers affecting the site.

H. The location of on-site buildings and their eaves or protrusions (decks, porches, covered entries, etc.) and other site features (generators, compressors, retaining walls, fuel tanks, etc.).

I. The location of on-site parking stalls, drive aisles, and loading/unloading areas and required fire lanes with dimensions.

J. The location and size of landscape areas (measured to the inside of curbs).

K. Landscape area calculations as required by ACC 18.50.040, “Landscape development standards.”

L. The species (common and scientific name), condition (bare root, balled & bur lapped) or containerized) and size of planting materials (shown within a “planting schedule”).

M. Notation of which species are native to, or adapted to the Pacific Northwest (minimum 50%).

N. Site preparation specifications (removal of construction debris, soil amendment, fertilizer, etc.).

O. The location and type of non-vegetated groundcovers such as rock, mulch, etc.

P. The location, size, and proposed screening of outdoor storage areas and dumpster/refuse areas.

Q. The location, species, and size (diameter at DBH) of all existing trees and measures to protect them.

R. Show all proposed and existing surface features and underground and above-ground utilities affecting the site.

S. Landscaping notes, including:

   a. Plant materials list substitutions requiring city approval and possibly "as-built plans."

   b. Planting notes (e.g., when to remove tree stakes).

   c. Soil quality and installation.

   d. Maintenance after installation.

T. Site furnishings such as light posts, bike racks, benches, trash cans, and shopping cart racks.

3.04.10 Site Irrigation Plan sheet

The site irrigation sheets, when required, shall have the following applicable items:

A. The connection point to the City system, together with the water meter size.

B. The size, location, and type of the backflow prevention.

C. The proposed layout of the irrigation system.

D. Be consistent with the site's building and landscaping plans.

E. Show the existing and/or proposed location of all parcel lines.

3.04.11 Critical Area Restoration/Mitigation

A critical area restoration or mitigation sheet, when required, shall include the items as required by the City pursuant to ACC 16.10 and 15.68.

3.04.12 Phasing Plans

Applications that propose to complete projects in phases shall submit a phasing plan which incorporates all required conditions of approval and details infrastructure improvements and sequencing of the phases. Prior to occupancy of any buildings within a phased project, complete construction, inspection, acceptance, and transfer of ownership to the City via Bill of Sale as well as recorded easements are required for all public utilities (water, sewer, & storm) serving the building and public road improvements/right of way dedications must be complete. If the private utilities are proposed to be constructed in phases, the points of connection between phases and how the future phases will be constructed without affecting the operation of the previous phases must be shown.

Phasing plans are subject to approval by the City Engineer and Building Official and shall include the following information:

1. Illustrative maps for each proposed phase which clearly mark in heavy lines the boundaries of the subject phase, label the phase alphabetically (to avoid confusion with lot numbers), and depict roads, lots, infrastructure, easements, dedications and open space which are included within the subject phase. The plan shall also illustrate those proposed improvements which mitigate impacts associated with the unbuilt portions of the project which are not located within the boundaries of the subject phase. Previously established phases, including roads, lots, infrastructure, easements, dedications, and open space, should be shown on the map shaded or gray-scaled. All phasing maps shall be drawn at the same scale.

2. A narrative description or table which describes each phase and its associated improvements. In addition, the narrative or table shall demonstrate that each phase would comprise a “stand-alone” development which, should no subsequent phases be constructed, would meet or exceed City standards and all other conditions of approval. The narrative should also describe the proposed timeline for completion of the entire project. The narrative must address emergency access, street improvements, and alternative construction access.

Appendix A – Approval Blocks

_____, PLANNER: _____ DATE: _____

Appendix B – Standard Notes

The following General Notes shall apply to Development projects:

GENERAL NOTES

1. CONSTRUCTION SHALL CONFORM TO THE CITY OF AUBURN'S ENGINEERING DESIGN AND CONSTRUCTION STANDARDS, EXCEPT AS OTHERWISE APPROVED BY DEVIATION, AND BE IN ACCORDANCE WITH THE APPROVED PLANS. ANY CHANGES FROM THE APPROVED PLAN WILL REQUIRE APPROVAL FROM THE OWNER, ENGINEER OF RECORD, AND THE CITY.

2. ALL WORKMANSHIP AND MATERIALS SHALL CONFORM TO THE "WASHINGTON STATE DEPARTMENT OF TRANSPORTATION (WSDOT) STANDARD SPECIFICATIONS FOR ROAD, BRIDGE, AND MUNICIPAL CONSTRUCTION (CURRENT EDITION)," EXCEPT WHERE SUPPLEMENTED OR MODIFIED BY THE CITY'S CONSTRUCTION STANDARDS MANUAL. THE ABOVE DOCUMENTS SHALL BE AVAILABLE AT THE JOB SITE DURING CONSTRUCTION.

3. A PRE-CONSTRUCTION MEETING SHALL BE REQUIRED PRIOR TO THE START OF ALL CONSTRUCTION. CONTACT THE PUBLIC WORKS DEPARTMENT AT (253) 931-3010, TO SCHEDULE A MEETING.

4. UNLESS STATED OTHERWISE, LOCATIONS SHOWN FOR EXISTING UTILITIES ARE APPROXIMATE. THE CONTRACTOR IS CAUTIONED THAT OVERHEAD UTILITY LINES MAY NOT BE SHOWN ON THE DRAWINGS. IT SHALL BE THE CONTRACTOR'S RESPONSIBILITY TO DETERMINE THE TRUE ELEVATIONS AND LOCATIONS OF ALL UNDERGROUND UTILITIES AND THE EXTENT OF ANY HAZARD CREATED BY OVERHEAD UTILITY LINES. IDENTIFICATION, LOCATION, MARKING, AND RESPONSIBILITY FOR UNDERGROUND FACILITIES OR UTILITIES, IS GOVERNED BY THE PROVISIONS OF SECTION 19.122 REVISED CODE OF WASHINGTON (RCW). PRIOR TO STARTING CONSTRUCTION, THE CONTRACTOR SHALL CALL ONE-CALL (811) FOR UTILITY LOCATIONS (WATER, SANITARY SEWER, STORM SEWER, GAS, POWER, TELEPHONE, AND CABLE).

5. IF A PROPOSED ROUTE IS NOT INCLUDED ON THESE PLANS, A PROPOSED ROUTE AND SCHEDULE FOR HAULING MATERIAL TO THE SITE SHALL BE SUBMITTED TO THE CITY FOR APPROVAL PRIOR TO THE START OF CONSTRUCTION. IF THE CITY BELIEVES THAT THE PROPOSED HAUL ROUTE WILL ADVERSELY IMPACT THE STREET NETWORK, A SEPA AMENDMENT MAY BE REQUIRED TO EVALUATE THE IMPACTS AND DETERMINE MITIGATION REQUIREMENTS BEFORE BEGINNING WORK. HAULING MAY BE LIMITED TO APPROPRIATE OFF-PEAK HOURS OR ALTERNATIVE ROUTES, AS DETERMINED BY THE CITY.

6. THE CONTRACTOR SHALL BE RESPONSIBLE FOR PUBLIC SAFETY ON AND AROUND THE PROJECT. PRIOR TO THE START OF WORK, ALL METHODS AND EQUIPMENT USED FOR TRAFFIC CONTROL AND STREET MAINTENANCE SHALL BE SUBMITTED TO THE CITY FOR APPROVAL. CONTRACTORS AND THEIR SURETY SHALL BE LIABLE FOR INJURIES AND DAMAGES TO PERSONS AND PROPERTY SUFFERED BECAUSE OF CONTRACTORS OPERATIONS OR NEGLIGENCE CONNECTED WITH THEM.

7. ALL CONSTRUCTION SURVEYING FOR EXTENSIONS OF PUBLIC FACILITIES SHALL BE DONE UNDER THE DIRECTION OF A WASHINGTON LICENSED LAND SURVEYOR OR A WASHINGTON LICENSED PROFESSIONAL CIVIL ENGINEER.

8. CERTIFIED DRAWINGS ARE REQUIRED PRIOR TO PROJECT ACCEPTANCE. REFER TO THE CITY'S "DEVELOPMENT RECORD CONSTRUCTION DOCUMENT" HANDOUT.

GRADING AND EROSION CONTROL NOTES

1. WITHIN THE CITY OF AUBURN, ALL REQUIRED SEDIMENTATION AND EROSION CONTROL FACILITIES INDICATED ON THE PLANS MUST BE CONSTRUCTED AND IN OPERATION PRIOR TO LAND CLEARING AND/OR OTHER CONSTRUCTION ACTIVITIES. THESE FACILITIES SHALL BE MAINTAINED AND UPGRADED, IF NECESSARY, TO ENSURE THAT SEDIMENT-LADEN WATER AND STORM DRAINAGE RUNOFF DOES NOT IMPACT THE ADJACENT PROPERTIES, NATURAL DRAINAGE WAYS, OR THE EXISTING CITY STORM DRAINAGE SYSTEM.

2. THE SOURCES FOR ALL MATERIAL IMPORTED TO THE SITE SHALL BE APPROVED BY THE CITY.

3. THE STORM DRAINAGE DETENTION (RETENTION IF INFILTRATION SYSTEM IS USED), SEDIMENTATION AND EROSION CONTROL FACILITIES DEPICTED ON THE APPROVED DRAWINGS ARE INTENDED TO BE MINIMUM REQUIREMENTS TO MEET ANTICIPATED SITE CONDITIONS. ADDITIONAL DRAINAGE AND EROSION CONTROL FACILITIES MAY BE REQUIRED AS SITUATIONS WARRANT DURING CONSTRUCTION. THE IMPLEMENTATION, MAINTENANCE, REPLACEMENT AND ADDITIONS TO THESE CONTROL SYSTEMS SHALL BE THE RESPONSIBILITY OF THE PERMITEE.

4. THE TEMPORARY EROSION CONTROL FACILITIES, INCLUDING ALL PERIMETER CONTROLS AND THE DETENTION (RETENTION IF INFILTRATION SYSTEM IS USED), CONTROL PONDS, SHALL REMAIN IN PLACE UNTIL FINAL SITE CONSTRUCTION IS COMPLETED. AFTER CITY APPROVAL, THE CONTRACTOR WILL BE RESPONSIBLE FOR REMOVING ALL TEMPORARY FACILITIES.

5. THE CONTRACTOR WILL BE REQUIRED TO WATER THE SITE, AS NECESSARY, TO REDUCE DUST EMISSIONS AS A RESULT OF CONSTRUCTION ACTIVITY.

6. NO TRACKING IN THE ROADWAY IS ALLOWED. IF SEDIMENT IS TRACKED ONTO THE ROAD, THE ROAD SHALL BE THOROUGHLY AND IMMEDIATELY CLEANED BY SHOVELING OR PICKUP SWEEPING. TRANSPORT SEDIMENT TO A CONTROLLED SEDIMENT DISPOSAL AREA. KEEP STREETS CLEAN AT ALL TIMES.

7. ALL AREAS OF ACTIVE EARTHWORK WHICH HAVE THE POTENTIAL FOR EROSION AND SEDIMENTATION IMPACTS ON ADJACENT PROPERTIES, NATURAL DRAINAGE WAYS, OR THE EXISTING CITY STORM DRAINAGE SYSTEM MUST BE STABILIZED ACCORDING TO THE FOLLOWING SCHEDULE: FROM MAY 1 TO SEPTEMBER 30, AREAS AT FINAL GRADE AND THOSE THAT ARE SCHEDULE TO REMAIN UN-WORKED FOR MORE THAN SEVEN (7) DAYS SHALL BE STABILIZED. FROM OCTOBER 1 TO APRIL 30 EARTHWORK ACTIVITIES SHALL BE CONDUCTED IN STAGES IN ORDER TO MINIMIZE SOIL EXPOSURE. EXPOSED

SOILS THAT WILL REMAIN UN-WORKED FOR MORE THAN TWO (2) DAYS SHALL BE STABILIZED IMMEDIATELY.

STORM DRAINAGE DETENTION POND NOTES

PUBLICLY OWNED AND MAINTAINED DETENTION FACILITIES SHALL MEET THE FOLLOWING REQUIREMENTS:

1. ALL POND CONSTRUCTION, LANDSCAPING, AND TEMPORARY IRRIGATION, IF USED AS NOTED BELOW, SHALL BE COMPLETED PRIOR TO SCHEDULING AN INITIAL PUNCHLIST INSPECTION. THE GRASS SHALL HAVE SPROUTED OVER AT LEAST 80% OF THE AREA TO BE SEEDED.

2. ALL POND ACCESS RAMPS SHALL BE CONSTRUCTED WITH A MINIMUM OF 8" COMPACTED BASE COURSE TOPPED WITH A MINIMUM OF 2" COMPACTED TOP COURSE. THE POND RAMP SUBGRADE SHALL BE COMPACTED TO A MINIMUM OF 95% MODIFIED PROCTOR.

3. THE POND SIDE SLOPES SHALL BE SCARIFIED, AND ALL VEGETATIVE AND CONSTRUCTION DEBRIS AND ROCKS LARGER THAN 2 INCHES SHALL BE REMOVED PRIOR TO HYDROSEEDING. HYDROSEEDING SHALL BE APPLIED OVER THE ENTIRE DETENTION POND BOTTOM (OR ON THE SLOPES ABOVE THE WATER QUALITY ELEVATION FOR WETPONDS) UP TO THE TOP OF THE BERM.

4. THE POND BOTTOM AND ALL INTERIOR SIDE SLOPES PER REQUIREMENT 3 ABOVE SHALL BE SEEDED WITH THE FOLLOWING GRASS MIXTURE:

TURF-TYPE TALL FESCUE AT	40%;
TURF-TYPE PERENNIAL RYE AT	30%;
RED FESCUE AT	25%;
COLONIAL BENTGRASS AT	5%

5. APPLICATION RATE: HYDROSEED AT 60 LBS/ACRE; HAND SEED AT 2 LBS/1,000 SQUARE FEET.

6. THE NEED FOR WATERING TO ESTABLISH THE HYDROSEEDING WILL DEPEND ON WHAT TIME OF YEAR THE HYDROSEEDING IS APPLIED AND HOW LONG IT TAKES FOR THE SEED TO BE ESTABLISHED. IF A TEMPORARY IRRIGATION SYSTEM IS USED, IT SHALL BE ATTACHED TO THE FENCE OR PLACED AT LOCATIONS THAT DO NOT INTERFERE WITH MOWING.

7. THE CONTRACTOR IS RESPONSIBLE FOR WEED CONTROL AND REMOVAL OF LITTER PRIOR TO PLANTING AND THROUGHOUT THE PLANT ESTABLISHMENT PERIOD.

8. THE CONTRACTOR IS RESPONSIBLE FOR REMOVING THE TEMPORARY IRRIGATION SYSTEM PRIOR TO EXPIRATION OF THE 1-YEAR WARRANTY PERIOD.

FIRE SPRINKLER SYSTEMS NOTES

SPRINKLER SYSTEMS SHALL MEET CITY OF AUBURN STANDARD 7.06.02 AND THE FOLLOWING REQUIREMENTS:

1. PROPOSED FIRE LINE TO BE SIZED BY A FIRE PROTECTION ENGINEER.

2. BACKFLOW PROTECTION IS REQUIRED ON FIRE SPRINKLER LINES.

3. A SEPARATE DETAILED PLAN OF THE UNDERGROUND FIRE SPRINKLER SUPPLY LINE SHALL BE APPROVED BY THE FIRE MARSHAL AND INSTALLED BY A WASHINGTON STATE CERTIFIED LEVEL “U” CONTRACTOR IN ACCORDANCE WITH WAC 212-80-010.

4. A POST INDICATOR VALVE SHALL BE INSTALLED ON THE FIRE SPRINKLER SUPPLY LINE TO ISOLATE THE SYSTEM FROM THE CITY’S WATER SYSTEM WHEN REQUIRED FOR REPAIR.

5. BLOCKING, PIPING, AND RODDING DETAILS SHALL BE PROVIDED WITHIN THE SUBMITTAL.

6. APPROVAL OF THE CIVIL PLANS DOES NOT APPROVE THE INSTALLATION OF THE SPRINKLER SYSTEM SUPPLY PIPING.

CROSS CONNECTION CONTROL NOTES

CROSS CONNECTION CONTROL SHALL MEET THE FOLLOWING REQUIREMENTS:

1. ALL BACKFLOW PREVENTION ASSEMBLIES SHALL BE INSTALLED IN A MANNER THAT WILL ALLOW PROPER OPERATION, AND IN-LINE TESTING AND MAINTENANCE.

2. A BACKFLOW ASSEMBLY PERMIT IS REQUIRED FOR ALL ASSEMBLIES INSTALLED WITHIN THE CITY OF AUBURN, AND/OR THE CITY’S WATER DISTRIBUTION SYSTEM.

3. BACKFLOW ASSEMBLIES MUST BE ON THE CURRENT WASHINGTON STATE DEPARTMENT OF HEALTH – BACKFLOW ASSEMBLIES APPROVED FOR INSTALLATION LIST.

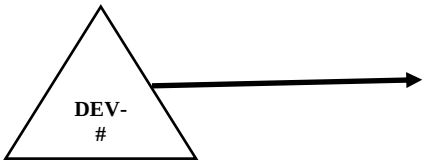
4. BACKFLOW ASSEMBLIES MUST BE TESTED BY A STATE CERTIFIED BACKFLOW ASSEMBLY TESTER, AND INSPECTED AND APPROVED BY A CITY OF AUBURN CROSS CONNECTION CONTROL SPECIALIST.

5. UPON RECEIVING APPROPRIATE FEE PAYMENTS AND VERIFYING THAT REDUCED PRESSURE BACKFLOW ASSEMBLY (RPBA) HAS BEEN INSTALLED (NOT BY CITY), THE CITY WILL INSTALL THE DOMESTIC METER INSIDE THE DOMESTIC METER BOX. THE PASSING TEST REPORT FOR THE RPBA MUST BE RECEIVED BY THE CITY WITHIN 72 HOURS OF THE INSTALLATION OF THE DOMESTIC METER.

6. UPON RECEIVING APPROPRIATE FEE PAYMENTS AND VERIFYING THAT DOUBLE CHECK VAULT ASSEMBLY (DCVA) HAS BEEN INSTALLED (NOT BY CITY), THE CITY WILL INSTALL THE IRRIGATION METER INSIDE THE IRRIGATION METER BOX. THE PASSING TEST REPORT FOR THE DCVA MUST BE RECEIVED BY THE CITY WITHIN 72 HOURS OF THE INSTALLATION OF THE IRRIGATION METER.

7. DOUBLE CHECK VALVE ASSEMBLY (DCVA, NOT BY CITY) TO BE INSTALLED BY THE CONTRACTOR ONTO THE FIRE SERVICE LINE, THE PASSING TEST REPORT FOR THE DCVA MUST BE RECEIVED BY THE CITY WITHIN 72 HOURS OF THE CONNECTION OF THE BUILDING FIRE SERVICE LINE TO THE CITY MAIN.

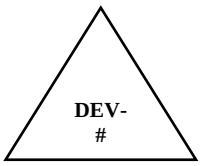
SIGNAL CONSTRUCTION NOTES



1. THE LOCATION OF ALL CONDUIT, JUNCTION BOXES, AND CABINETS SHOWN ON THIS PLAN ARE FOR GRAPHIC PRESENTATION ONLY AND FINAL LOCATION SHALL BE DETERMINED BY THE ENGINEER.

2. ALL TRAFFIC SIGNAL AND PEDESTRIAN HEADS AND PUSH BUTTONS SHALL BE SECURELY AND COMPLETELY COVERED WHILE SIGNAL IS NOT IN OPERATION.

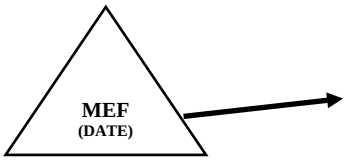
3. ALL CONDUCTORS FOR SIGNAL HEADS, LOOPS, PEDESTRIAN HEADS, PUSH BUTTONS AND STREET LIGHTS SHALL BE LABELED IN EACH JUNCTION BOX.



Appendix C – Deviations, Maximum Extents Feasible, and Deferral/Fee-In-Lieu

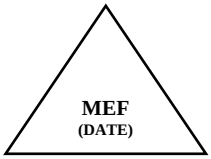
Plan Sheet Deviation Call-Out:

- Leader arrow points to deviation location.
- DEV-# is the City assigned deviation number.



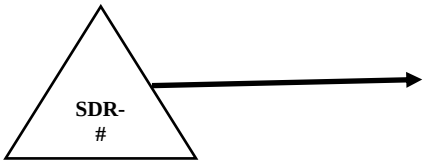
Plan Sheet Deviation Description:

SECTION X.X.X OF THE _____, APPROVED _____.



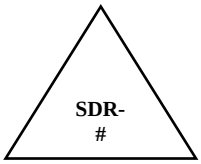
- Description is included with the construction notes on the plan sheet where the deviation is located.
- Description includes a specific citation to the Construction Standards, Design Standards, or SWMM Supplement, as applicable to the Deviation Request.
- Includes approval date in mm/dd/yyyy format.
- Includes a brief description stating why the deviation was allowed, as provided by the City.

Plan Sheet Maximum Extents Feasible (MEF) Call-Out:



- Leader arrow points to the MEF location. Date is City approval date in mm/dd/yyyy format.

Plan Sheet MEF Description:



- Description is included with the construction notes on the plan sheet where the MEF is located.
- Description explains what aspect of the facility does not meet ADA requirements and what is constraining it from meeting requirements.
- Includes approval date in mm/dd/yyyy format.

Plan Sheet Deferral (Street Delay) or Fee-In-Lieu Call-Out:

- Leader arrow points to deviation location.
- SDR-# is the City assigned street delay number.

Plan Sheet Deferral (Street Delay) or Fee-In-Lieu Description:

- Description is included with the construction notes on the plan sheet where the deferred improvements would have been located.
- Description includes a summary of the deferred improvements.

Appendix D – Survey Standards

COA Horizontal Datum & Basis of Bearing Information (Ref RCW 58.09.060; WAC 332-130-050)

The City of Auburn's horizontal datum is NAD83(1991), Washington State Plane Coordinates, North Zone, 4601

Basis of Bearings: Provide the observed or calculated bearing between two existing, recoverable monuments, along with NAD83(1991) coordinates and an accurate physical description of the monuments, including type, size and date visited. Clearly depict on the survey map ties to the project site from the basis of bearings.

For Example:

HORIZONTAL DATUM
NAD83(1991), Washington State Plane Coordinates, North Zone, 4601
Basis of Bearings:
The monumented centerline of 17th Street NE from COA Mon 509-036 at the intersection of Auburn Way North to COA Mon 509-010 at the intersection of I Street NE = S 89°04'04" E

COA Mon 509-036	**COA Mon 509-010**
N: 121004.23	**N: 120994.54**
E: 1296131.38	**E: 1296726.97**
DESC: Encased brass disk with "X"	**DESC: Encased brass disk with punch**

COA Vertical Datum & Benchmark Information (Ref WAC 332-130-050)

The City's vertical datum is NAVD88

Provide Project Benchmark information that includes a physical description of the benchmark, date visited and elevation. Clearly depict the project benchmark on the survey map. If the project benchmark is located a significant distance from the project site, it is recommended that a site benchmark be established in close proximity to the project site and also clearly labeled and depicted on the survey map.

For example:

VERTICAL DATUM
NAV88
Project Benchmark: COA 509-036 (BM B19)
Brass disk in concrete in monument case at SI of Auburn Way North & 17th St NE
Elevation = 65.99 (NAVD88)

Appendix D – Survey Standards (continued)

-- Existing Conditions – Topographic Map Checklist (Ref. WAC 332-130-145)

Topographic elements on maps—Requirements. For the purposes of this section, topographic elements consist of information shown on a map which depicts the horizontal and vertical positions of natural and/or fabricated features and existing terrain surfaces.

The following requirements shall apply to maps that include topographic elements, prepared by professionals registered under chapters 18.43 and 18.210 RCW.

The following elements must be included on every map that includes topographic elements:

☐	1	Name, stamp and dated signature of professional land surveyor licensed in State of Washington who prepared the map drawing.
☐	2	Contact information including company name, address, email address and phone number
☐	3	Location of site, including address (if applicable), tax parcel number, and quarter, quarter section, township and range
☐	4	Legend of symbols used. Symbol size matches in legend and in depiction.
☐	5	North Arrow.
☐	6	Map scale and graphic scale bar
☐	7	Legal description of the subject real property
☐	8	**Horizontal datum**: NAD83(1991), Washington State Place Coordinates (WSPC), North Zone.
☐	9	**Basis of Bearings statement:** Provide the observed or calculated bearing between two existing, recoverable monuments, along with NAD83(1991) coordinates and an accurate physical description of the monuments, including type, size and date visited. Clearly depict on the survey map ties to the project site from the basis of bearings.
☐	10	**Vertical Datum:** NAVD88
☐	11	**Basis of elevations statement:** a listing of reference benchmarks shall be included on the topographic map including elevations, descriptions and date visited.
☐	12	Listing of project benchmarks established on-site or in vicinity including descriptions and elevations clearly labeled and depicted in the map.
☐	13	Statement of horizontal control accuracy per WAC 332-130
☐	14	Clearly depict and label contours and intervals.
☐	15	Statement of elevation and contour accuracy.
☐	16	Statement on intended use and limitations of topographic elements shown on the map.
☐	17	Statement on the source of boundary information and methods used to relate area mapped to said boundaries. Provide indexing information for all record documents referenced.
☐	18	Statement specifying the source of all utilities depicted on the map (such as “surface markings”, “as-built drawings”, “potholing” or “field measurements”)
☐	19	Statement specifying the accuracy of all utilities depicted on the map (such as “locations of underground utilities shown hereon are based upon field measurements” or “…based upon City of Auburn Project CP1099 As-Built drawings”)
☐	20	Statement specifying the scope of work between the project owner and professional land surveyor regarding the comprehensiveness, exclusions, and limits of the utility investigations leading to utility depictions.

Appendix E – Minor Grading Permit Criteria

Except as approved otherwise by the City Engineer, projects meeting all of the following criteria qualify for a Minor Grading Permit Submittal:

A. The project is located on a single family parcel with an existing home, and does not include the construction of a new single family home (accessory dwelling unit is not considered a single family home) or the project is a remodel/tenant improvement on a non-residential project with all work occurring inside the existing building that is not exempt from a grading permit per ACC 15.74.

B. The project does not include the construction of public improvements and right of way dedications.

C. Project does not construct walls that are over 7-feet tall that are within a setback area (typically within 10 feet from the property line).

D. Combined cut and fill earthwork is less than 200 CY. Earthwork is calculated by adding cut and fill quantities together, no net earthwork volume.

E. Grading activities do not change existing drainage patterns and are not within 10-feet of the property line.

F. Project disturbs less than 1 acre of area.

G. Total area of new and/or replaced hard surfaces is less than 5,000 SF.

H. The project is a remodel/tenant improvement on a non-residential project that is inside of a building that is not exempt from a grading permit per ACC 15.74.

A project proposing 2,000 SF or more of new and/or replaced hard surfaces may qualify for a Minor Grading Permit in circumstances where the 2,000 SF threshold is exceeded due to utility work. Restoration associated with the utility work must replace the ground surface with in-kind materials with similar runoff characteristics. Applicability of this criteria to be determined at the discretion of the City Engineer, or designee.

Submittal Requirements – Refer to the Minor Grading Permit Guide on the City's website under Forms for minimum submittal requirements.

Contact the Development Engineering team at development@auburnwa.gov for a plan template, if eligible for the scope of work proposed.

All other projects requiring a Grading Permit shall submit a Grading Permit per the Civil Submittal Handout.

Appendix F – AutoCAD Layers Standards

FORMAT: Digital files shall be provided in AutoCAD 2019 (2018 format) or older ".DWG" format. All support files required to display or plot the files in the same manner as developed shall be delivered along with these files. Scanned hard copy drawings using raster-to-vector conversion will not be an acceptable digital format. AutoCAD files shall be prepared in accordance with the Layers Standard included in Appendix F, Chapter 3 of the City of Auburn Engineering Design Standards and the latest version of the United States National CAD Standard (NCS).

MEDIA: Digital files shall be submitted via an electronic delivery method acceptable to the City of Auburn. Disks and/or drives shall be clearly labeled with the project name, drawing name(s), name of the drafting/engineering company or individual(s), date, and appropriate City of Auburn identifiers (e.g., BLD#, FAC#, etc.).

SPATIAL REFERENCES: Drawings will be at full scale and shall be accurately located in State Plane Coordinates Washington North Zone, 4601, and tied to two existing and recoverable City of Auburn horizontal control monuments. Datum will be noted on the drawings. All drawings shall use survey control datum NAD 83/91 for horizontal control and NAVD 88 for vertical control.

CONTENTS: The digital drawing files shall include, at a minimum, the following:

The overall project site plan showing new and existing construction, property lines, easements, and survey references.
New and existing water, sanitary sewer, and storm drainage elements showing location, size, and material of utility lines and structures.
Separate layering showing existing impervious surfaces, new impervious surfaces, and annotation on the area of each in square foot units. Layer features for impervious surfaces shall be created from closed polylines to aid in verifying calculations of impervious surface area.

DOCUMENTATION: Final recorded changes shall be clearly reflected when Certified Record Construction Drawings are processed. Proposed features shall use the layer names and descriptions given below. Any layers included that do not meet the descriptions below shall be accompanied by a detailed list of layers and layer descriptions.

Appendix F – AutoCAD Layers Standards (continued)

Proposed Feature	AutoCAD Layer Name
Commercial Fiber – Polyline	C-COMM-FIBR
Conduit: Polyline	C-COMM-CDNT
Easements – Polygon	C-PROP-ESMT
Power Service Cabinets – Point	C-POWR-VALT
Sewer Cleanouts – Point	C-SSWR-SSCO
Sewer Laterals – Polyline	C-SSWR-LATR
Sewer Mains: Polyline	C-SSWR-PIPE
Sewer Manholes – Point	C-SSWR-MHOL
Sidewalks – Polygon	C-PVMT-CONC-SDWK
Storm Catch Basins – Point	C-STRM-STRC
Storm Culverts – Polyline	C-STRM-CULV
Storm Manholes – Point	C-STRM-MHOL
Storm Pipes – Polyline	C-STRM-PIPE
Street Lights – Point	C-POWR-LITE
Street Painted Lines – Polyline	C-ROAD-MRKG
Traffic Signal Cabinets – Point	T-POWR-SGNL-CBNT
Traffic Signal Poles – Point	T-POWR-SGNL-POLE
Traffic Signs – Point	C-SITE-SIGN
Traffic Vaults	T-POWR-VALT
Utility Poles – Point	C-POWR-POLE
Water Auxiliary Equipment – Point	C-WATR-FTTG
Water Hydrants – Point	C-WATR-FHYD
Water Laterals – Polyline	C-WATR-LATR
Water Mains – Polyline	C-WATR-PIPE
Water Meters – Point	C-WATR-METR
Water Valves – Point	C-WATR-VALV
Wetlands – Polygon	C-WETL-DELN

Chapter 4: Report Preparation Requirements

4.00 Preface

This Chapter describes how technical engineering reports are to be laid out to meet City requirements and provide a format that is easy to follow and understand. Reports need to meet these basic standards in order to move through the review process in an efficient manner.

4.01 General Requirements

The following general requirements shall be met for all technical engineering reports being submitted for review and approval:

A. All reports and calculations shall be prepared, stamped, signed, and dated by a professional engineer.

B. The topographic map prepared for the project shall be prepared, stamped, signed, and dated by a professional land surveyor.

C. All reports and calculations shall be neat, uncluttered, legible, and in conformance with the requirements herein.

D. All engineering reports shall be bound with the civil engineer's stamp clearly visible.

E. Reports shall reference City Standards as necessary.

F. All reports shall be provided in electronic format (PDF).

4.02 Report Types and Requirements

The following are basic types of reports submitted as supporting project information. Depending on the complexity or simplicity of the project and its location, the amount of detail, and the number and types of reports required will be subject to change. The examples given are the typical reports required for a standard project, there may be other reports required that are specific to a particular project.

4.02.01 Geotechnical Reports

Geotechnical reports are required to support the design and construction of various facilities as specified in the ACC, these design standards, the SWMM, the Engineering Construction Standards, and other documents. The geotechnical report format shall include (at a minimum) the following applicable items:

A. Title page including project name and address.

B. General information, which includes existing site conditions.

C. Site history including any prior grading.

D. Subsurface soil information and conditions including seasonal high groundwater and impermeable layer elevations. Seasonal groundwater levels shall be determined using groundwater monitoring well(s) and shall be required where consideration of groundwater levels is a design consideration.

E. Soil log information and locations of explorations.

F. Soil characteristics including suitability for fill and compaction requirements.

G. Slope stability analysis.

H. Seismic hazards.

I. Geological hazard areas as defined in the ACC 16.10.

J. Site plan showing the topography and proposed structures and paving.

K. Grading information including depth of cuts and recommended slopes.

L. Recommendations on temporary erosion and sediment control.

M. Conclusions and recommendations for foundations.

N. Appendix with test pit and boring logs.

O. Information on infiltration rates for use in designing low impact design facilities, retention ponds and infiltration trenches.

P. California Bearing Ratio (CBR) information for pavement design per Section 10.05 or AASHTO Pavement Design.

Q. Additional requirements for geotechnical reports are included in Volume I of the SWMM.

4.02.02 Stormwater Site Plan Report

The Stormwater Site Plan Report shall contain the information as noted in Appendix I-I of Volume I of the SWMM.

4.02.03 Critical Area Report

A. Title Page including project name, contact information for property owner, applicant, and preparer, a description of the proposal, site address, and the parcel number.

B. Identify all local, state, and other critical area related permits/approvals required for the proposal.

C. Indicate accuracy of the report.

D. Documentation of field work (such as field data sheets, and rating worksheets in the case of wetlands).

E. Description of methodologies used in the study.

F. Identify and characterize all critical areas including wetlands, streams, water bodies, buffers, regulatory floodplain, wildlife habitat, groundwater protection areas, critical erosion hazard areas, landslide hazard areas, seismic hazard and volcanic hazard areas on or adjacent (within 300 feet of the project boundaries) to the proposed project area.

G. Provide location and critical area rating/classification (if applicable) and required buffers based on a professional survey. Provide the classification according to ACC 16.10.080, “Classification and rating of critical areas” and identify the classification according to other agency standards for which permits/approvals are required.

H. A description of proposed actions, including estimated area of impacts to the critical area(s), and the impact to buffer(s).

I. An assessment of probable temporary, permanent, and cumulative impacts to the critical area(s) and buffer(s).

J. Mitigation measures proposed and relationship to applicable mitigation standards.

K. Scaled site plan.

L. Qualifications of person(s) preparing the report.

4.02.04 Traffic Impact Analysis

A. Title Page including project name and address.

B. Executive Summary.

C. Table of Contents.

D. Introduction consisting of a description of the project, location, site plans with access to city streets, circulation network, land use and zoning, phasing plan, project developer and contact person, reference other studies.

E. Traffic Analysis to include assumptions, existing and projected traffic volumes, project trip generations, trip distribution, level of service (LOS), and warrant analysis.

F. Appendix with all calculations.

G. Information as specified in **Section 10.01** of these design standards.

4.02.05 Construction Stormwater Pollution Prevention Plan (SWPPP)

See **Section 5.01.03** of these design standards and Section 2 of Volume II of the SWMM.

4.02.06 Other Reports

Other reports may be required on a site-specific basis. The specific information required in these reports shall be determined during the SEPA process or by the department requiring the report. These reports shall include the following basic items:

A. Title page including project name and address.

B. General information, which includes existing site conditions.

C. Site plan showing the topography, proposed structures, and paving.

D. Conclusions and recommendations.

E. Appendix with collected field information.

This page intentionally left blank.

Chapter 5 TESC, Clearing and Grading

5.00 Preface

Temporary Erosion and Sediment Control (TESC), clearing, and grading shall conform to the requirements herein.

Compliance with these standards does not alleviate the design engineer from using sound professional engineering practices. The design criteria contained herein are the minimum acceptable under standard conditions. Special conditions may require more stringent requirements that will be addressed during the plan review process.

The purpose of these requirements is to provide the design criteria necessary to preserve the City of Auburn's water courses; minimize surface and ground water quality degradation; control sedimentation in creeks, streams, rivers, ponds, lakes, and other water bodies; protect adjacent and downstream property owners from increased runoff rates which could cause erosion and flooding; and ensure the safety and stability of City of Auburn's roads and rights-of-way.

5.01 Temporary Erosion and Sediment Control (TESC)

TESC design requirements shall meet design criteria requirements as identified in Volume II of the City of Auburn Surface Water Management Manual (SWMM), and follow City of Auburn grading requirements.

All TESC measures regardless of design and implementation must meet the latest Nephelometric Turbidity Units (NTU) test requirements. The City may conduct tests and if the applicable limits are not met, the project will be halted until such time as it is brought into compliance.

The temporary sedimentation facilities (ponds and traps) shall be defined as the active storage available a minimum of 1 foot above the seasonal high ground water.

Any project with exposed soil meeting the requirements of the Chapter 2 of Volume II of the SWMM shall prepare a Stormwater Pollution Prevention Plan (SWPPP). The plan shall follow the SWPPP Template (available at the Dept. of Ecology's website) or City of Auburn Short Form (where approved by the City) from the SWMM.

For land clearing requirements see ACC 15.74 Plans for Land Clearing shall follow the requirements for Grading.

The TESC plan shall also include a construction sequence element which clearly identifies the timing and methodology required to:

A. Contain areas of active earthwork to prevent uncontrolled discharge of storm drainage.

B. Minimize erosion and the extent and time soils are exposed on-site.

C. Prevent tracking of sediment onto City streets.

D. Protect permanent on-site and off-site storm drainage systems.

5.02 Grading

The following section establishes the requirements for grading. These requirements do not supersede nor are they intended to be inconsistent with any landscaping requirement established by the Zoning Ordinance or other City action. A grading permit shall be required except for the situations described in ACC 15.74.050 and the following scenario:

A. The City Engineer may approve the broadcasting of less than 500 CY of topsoil, peat, sawdust, mulch, bark, chips, or solid nutrients used for landscaping or soil conditioning on a lot, tract or parcel of land during any 24-month period, provided the finished depth does not increase the grade from the existing grade by more than 8 inches.

5.03 Cut and Fill

Cut and fill slopes are subject to the requirements of ACC 16.10. Permanent cut and fill slopes shall be constructed no steeper than two horizontal to one vertical (2:1). Permanent cut and fill slopes within the public right of way or within 5 feet of a roadway shall be no steeper than three horizontal to one vertical (3:1). See **Section 5.04** for additional information.

Temporary fills, such as fill material placed for preloading of building pads, may use a slope one and one-half horizontal to one vertical (1.5:1).

Slopes shall be stabilized by terracing, cat tracking, jute mat, grass sod, hydro-seeding, or by other planting or surfacing materials acceptable to the City.

The City Engineer may require geotechnical analysis for the following:

A. As supporting documentation for deviation from these standards.

B. Cut or fill existing slopes of greater than five horizontal to one vertical (5:1).

C. Slopes with sub-surface or surface water flows.

D. In areas of questionable soils conditions or slope stability.

E. Where the length of the slope requires terracing.

Additional requirements for placement of fill material are as follows:

A. A minimum horizontal setback of 5 feet shall be provided between the bottom of any fill placement and the top of the bank of any defined drainage channel.

B. When filling a site, particular care shall be taken to prevent impeding the existing upstream surface drainage flow.

C. Prior to any fill being placed all vegetation, topsoil and other unsuitable material shall be removed unless dictated otherwise by the geotechnical engineer.

D. Fill material shall be placed in lifts of no more than 12 inches and compacted to 90% or greater of the maximum dry density as determined by ASTM D1557 Modified Proctor or as directed by the geotechnical engineer.

5.04 Retaining Walls

Except retaining walls built with City capital projects or through deviation, retaining walls will be located outside the public right-of-way such that they do not support the public right-of-way, be privately owned and maintained, and are subject to ACC Title 15. In addition to the standard deviation criteria, a deviation request for a wall in the right-of-way or supporting the right-of-way would need to address the risk to the right-of-way if the wall was not adequately maintained or was otherwise compromised and digging restrictions associated with the wall that could complicate or compromise use of the right-of-way for utilities, street lighting, and other use. Walls within or adjacent to the right-of-way shall be placed to address clear zone and vehicle recovery requirements per WSDOT Design Manual M 22-01 Chapter 1600.

Retaining wall systems with a vertical difference of 30-inches or greater require protective fencing along the top edge for safety. Per ACC 12.12.232, maintaining barriers or fences

between the edge of pavement or back of curb along any public street and the abutting property (defined by ACC 12.12.020 as “sidewalk”), where the sidewalk is elevated more than two feet above the abutting property is the responsibility of the abutting property owner.

Retaining walls require the wall owner to have property rights of sufficient terms and area, in the opinion of the City Engineer, to allow for construction, access, maintenance, repair, removal, and reconstruction of the wall. The minimum easement width required for walls that are less than 10 feet tall is 10 feet centered on the wall face and a minimum of 5 feet beyond any and all structural elements behind the wall. The minimum easement width required for walls 10 feet and taller is 15 feet and shall include a maintenance road along the wall base that is fenced and gated.

Public walls shall be reinforced concrete walls or block walls as directed by the City Engineer. Other wall types require deviation to be considered for City ownership and maintenance.

Tiebacks, pins, geogrids, anchors, footings, and any other elements of private walls are not allowed within the right-of-way.

5.04.01 Underdrains

Underdrains are required for all retaining walls over 4 feet in height (i.e., concrete walls, MSE walls, soil nail walls, block retaining walls, etc.).

A minimum 6-inch diameter perforated or slotted drainpipe shall be placed in a shallow excavated trench located along the inside edge of the keyway. The pipe shall be bedded on and surrounded by “Gravel Backfill for Drains” (WSDOT/APWA 9-03.12(4)) to a minimum height of 18 inches above the bottom of the pipe. A filter fabric shall surround the gravel backfill and shall have a minimum of 1 foot overlap along the top surface of the gravel. The perforated pipe shall be connected to a storm drain system or to an acceptable outfall.

5.04.02 Rock Walls

Rock Walls may be used for containment of cut slopes or fill embankment up to a maximum height of 8 feet. Rock Walls over 4 feet in height, surcharged, or in areas of questionable soil stability will require an engineered design. The engineered design shall include a soils investigation and report by a geotechnical engineer and calculations to support the rockery design.

The rock material shall be as rectangular as possible. No stone shall be used that does not extend through the wall. The quarried rock shall be hard, sound, durable, and free from weathered portions, seams, cracks, and other defects. The rock density shall be a minimum of 160 pounds per CF, measured accordingly to WSDOT test method 107 (Bulk Specific Gravity – S.S.D. basis).

5.04.03 Block Retaining Walls

Block retaining walls, (e.g., Keystone, Allan Block, Ecology Block) may be used for containment of cut slopes or fill embankment. Block retaining walls over 4 feet in height, surcharged, or in areas of questionable soil stability will require an engineered design. The engineered design shall include a soils investigation and report by a geotechnical engineer and structural calculations to support the block wall design.

Blocks used for retaining walls shall be in good condition and structurally sound; cracked and/or broken blocks are not acceptable. Unless designed as a gravity wall (ecology blocks), block walls over 4 feet in height shall employ geo-grid type material to increase the structural stability of the wall.

5.04.04 Reinforced Concrete Walls

Reinforced concrete walls or cast-in-place concrete walls may be used for containment of cut slopes or fill embankment. Concrete retaining walls over 4 feet in height, surcharged, or in areas of questionable soil stability will require an engineered design. The engineered design shall include a soils investigation and report by a geotechnical engineer and structural calculations to support the concrete wall design.

A minimum 3,000-psi structural reinforced concrete shall be used in the design of concrete retaining walls.

5.04.05 Mechanically Stabilized Earth Walls (MSE Walls)

MSE walls may be used in conjunction with other retaining walls or as a stand-alone application when constructing fill slopes. MSE walls will require an engineered design. The engineered design shall include a soils investigation and report by a geotechnical engineer and calculations to support the MSE wall design.

MSE walls shall employ well-draining structural soil compacted to the geotechnical engineer's specifications.

MSE walls are not allowed in the right-of-way.

5.05 Construction Sequence

A construction sequence is intended to ensure that the timing and installation of storm drainage and erosion control measures are in place prior to activities that may cause erosion to occur. The following elements are to be included in a construction sequence:

A. Establishment of clearing and grading limits.

B. Construction of temporary construction entrance.

C. Construction of perimeter ditches, filter fabric fences, and other erosion control devices as shown.

D. Construction of storm drainage control (applicant to be specific) facilities including emergency overflow as applicable.

E. Construction of ditches and swales as necessary to direct all surface water to the storm drainage control (be specific) facilities as clearing and grading progress. Prevention of uncontrolled surface water being allowed to leave the site at any time during the grading operations.

F. Establishment of at what point grading activities can begin, which is usually only after all perimeter drainage and erosion control measures are in place.

For sites with a final development plan, the following shall also be addressed when applicable:

A. Installation of on-site permanent storm drainage, sanitary sewer, and water facilities.

B. Site paving.

C. Indicate at what point building construction may begin.

D. A description of how to transition from the temporary to permanent storm facilities.

E. The possibilities of any phased construction.

F. Any off-site public or private improvements including the general timing and duration.

G. The removal of all TESC measures at project completion upon City approval.

This page intentionally left blank.

Chapter 6: Placement and Easement Requirements for City Facilities

6.00 Preface

This chapter includes placement and easement standards for all three City utilities (water, sanitary sewer, and storm drainage), City telecommunications, street lighting and other facilities such as power service cabinets, traffic signal poles, and traffic signal controller cabinets. Additional standards for City utilities are included in **Chapters 7, 8, and 9** of this document and in the Surface Water Management Manual (SWMM). **Chapter 9** describes specific additional requirements for City and non-City facilities, including utilities, within the public right-of-way. Chapter 10 includes specific requirements for street lighting and other street related facilities.

Compliance with these standards does not alleviate the design engineer from using sound professional engineering practices. The design criteria contained herein are the minimum acceptable under standard conditions. Special conditions may require more stringent requirements that will be addressed during the plan review process.

6.01 Easements

Public Utility Easements are required for the placement, operation, and maintenance of City facilities located outside the public right-of-way and not in tracts/parcels owned by the City for the specific use of the City facility. Easements shall encompass all portions of the facilities including, but not limited to, valves, manholes, hydrants, meters, catch basins, channels, access roads, vaults, junction boxes, foundations, junction boxes, and other appurtenances. Easement requirements for storm ponds, ditches, and channels are specified in the SWMM.

6.01.01 Easement Width

Easement widths for City facilities shall provide adequate space for access, operations, maintenance, repair, and open cut replacements.

Table 6-1 shows minimum required easement widths for City Utility pipes and appurtenances based on depth of pipe/appurtenance. Under certain circumstances (e.g., steep slopes, pipe diameters greater than 12 inches, excessive depths) the City may require wider easements than shown in the table. Minimum easement widths for non-pipe facilities and appurtenances, such as channels and ditches, shall be the minimum width required for the City to access, operate, maintain, repair, and replace the facility and to meet the other requirements specified herein and in the SWMM.

Table 6-1 Minimum Easement Width for City Utilities

PIPE INVERT DEPTH, FEET	EASEMENT WIDTH, FEET
< 10	15
10 – 15	25
15 – 20	30
> 20	40

Table 6-2 shows minimum easement widths for City conduits, including, but not limited to, conduits for street lighting, telecommunications, and traffic control device systems.

Table 6-2 Minimum Easement Width for City Conduit

CONDUIT COVER DEPTH, FEET	EASEMENT WIDTH, FEET
2 - 3	5
>3 - 5	7
>5 – 7	10
>7	To be determined by City Engineer, or designee

Easements for non-linear facilities such as traffic signal cabinets, street lights, and power service cabinets shall encompass the entire perimeter of the facility plus a minimum of 2 foot offset distance for the facility edges. Additional offset may be required and determined by the City Engineer, or designee, to be required for facility maintenance, operations, repair, and replacement.

6.01.02 Easement Form

Easements shall be provided on the City's standard easement form, with a separate easement for each facility. A legal description of the easement and the property that the easement encumbers, along with a sketch showing both, shall be stamped and signed by a professional land surveyor and incorporated into the easement form as exhibits. The legal descriptions and sketch shall have margins acceptable to the County of recording. The easements may also be described and recorded on a final plat document. Encumbrances that would conflict with the City's rights and ability to access, operate, maintain, repair, and replace the facilities require release/clearing from title.

The City will record approved easements in the appropriate County prior to acceptance of the public facilities unless part of a final plat document.

6.01.03 Location of Facilities within Easement

Facilities shall be located within the easement as follows:

The preferred location of pipes, channels, structures, and appurtenances is to be centered within the easement. Where facilities are not centered in the easement, additional easement width may be required and it shall be demonstrated, to the satisfaction of the City Engineer, or designee, that the placement will not impede the City's ability to access, operate, maintain, repair, and replace the facilities using typical City practices.

Utility facilities must be located within the easement so that each pipe face or edge of channel, structure, or appurtenance is no closer than 5 feet from its adjacent easement boundary. Telecommunications facilities must be located within the easement so that each conduit, vault, or appurtenance is no closer than 2 feet from its adjacent easement boundary.

6.02 Utility Pipe Separation

6.02.01 Potable and Non-Potable Separation Requirements

The requirements of this section are based on WAC 246-290-200, Washington State Department of Health (DOH), and the Washington State Department of Ecology (DOE). Potable

pipes include pipes conveying water for domestic purposes, including domestic service and irrigation service lines. Non-potable pipes include, but are not limited to, pipes conveying sewage, storm drainage, natural gas, gasoline, and oxygen. Natural gas service lines, drain pipes (yard drains, down spout drains, and wall drains), and storm drain catch basin lateral pipes that carry runoff from a cumulative area of 5,000 SF or less, are not subject to the potable/non-potable separation requirements, but are still subject to general separation requirements as specified herein. The following requirements apply to separation between pipes and appurtenances of potable and non-potable materials:

A. A Minimum of 10 feet horizontal separation is required between the outside walls/limits of parallel facilities where the crown of the non-potable pipe is less than 18 inches lower than the invert of the potable pipe.

B. A Minimum of 4 feet horizontal separation is required between the outside walls/limits of parallel facilities where the crown of the non-potable pipe is at least 18 inches lower than the invert of the potable pipe.

C. The invert of the potable pipe is required to be a minimum of 18 inches above the pipe crown of the non-potable pipe at crossings.

Where meeting separation requirements would require pumping/pressurization of an existing or new gravity non-potable pipe, the separation requirements may be reduced with the following additional requirements:

A. For construction of new potable pipes, the potable pipe shall be encased with ductile iron or steel pipe designed to withstand a minimum static pressure of 150 psi and extending at least 10 feet to either side of the crossing per **City of Auburn Standard Detail W-26**.

B. For construction of new non-potable pipes, the non-potable pipe shall be encased in controlled density fill for at least 10 feet to either side of the crossing.

C. Where non-potable pipe crosses over potable pipe, 18-inches of separation shall be maintained and one or both utilities will be encased, as deemed necessary by the City Engineer or designee.

6.02.02 General Separation Requirements

The following separation requirements are in addition to the other separation requirements specified herein. Placement of new City utility facility mains shall be done in a manner that allows the City to access, operate, maintain, repair, and replace the facilities without impacting other adjacent facilities or structures in the vicinity. Facilities shall be located a minimum horizontal distance of 10 feet from above-ground structures and their foundations. Except as noted above (for crossings of potable water), underground facilities that cross each other shall have a minimum separation of 12 inches. Non-potable facilities require a minimum horizontal distance of 5 feet from all other underground utilities. Where 12 inch vertical separation cannot be achieved, use of an Ethafoam pad between the utilities may be permitted by the City Engineer or designee.

Additional separation of City utility facilities from structures may be required where soil conditions are poor, facility depth is greater than 10 feet, or other conditions are present that require additional separation to ensure the City may access, operate, repair, and replace the facilities using standard City methods. The minimum separation between an underground facility and an adjacent structure shall be such that the zone of influence from the weight of a structure shall be below the invert of the underground facility.

6.03 Utility Access Roads

Public utilities within a utility easement, tract, or parcel that have appurtenances such as manholes, catch basins, stormwater ponds, vaults, fire hydrants, valves, blowoffs, etc. shall have an access road. The access road shall be constructed of gravel, asphalt, pervious concrete or pervious asphalt, or other surface material as approved by the City Engineer, and shall conform to the following requirements:

A. Maximum vertical profile shall be 12% for public facilities and 15% for private facilities.

B. A paved commercial driveway apron meeting City design standards shall be required for both public and private access where access roads connect to paved public roadways.

C. The driveway approach section of the access road shall not exceed a vertical profile of 5% for a minimum distance of 25 feet measured from the back of the driveway entrance. See City of Auburn Standard Detail T-34.

D. The minimum access road length shall be 50 feet as measured from the back of the driveway entrance. See City of Auburn Standard Detail T-34.

E. Access to the access road shall be limited by a double-posted gate with a minimum width of 15 feet (if the gate is connected to a fence), removable bollards, or other approved equal.

F. Except as noted in **Section 7.06.04**, access roads shall be a minimum of 15 feet in width on curves and 12 feet in width on straight sections, centered within the easement. Easement width will need to be increased at curves to accommodate the wider road and adjacent ditch described below. A hammerhead or a turnaround meeting IFC standards is required at the end of all access roads unless drive-through access is provided.

G. For access roads determined by the City Engineer, or designee, to require access by vactor trucks or other large vehicles, inside turning radii shall be a minimum of 45 feet. For all other access roads, minimum inside turning radii shall be 28 feet. Turning analysis may be required to verify movement of equipment.

H. Access roads whose vertical profile is greater than 8% shall be asphalt paved. See **Table 10-7** for paved access road requirements.

I. Unpaved gravel access roads and pond ramps shall meet the requirements of **Table 10-7**.

J. The access road shall have a cross slope of 2%.

K. Access roads will be constructed with appropriate drainage to prevent stormwater ponding on the road.

L. Access roads cut into a hillside will require regrading of the adjacent slopes. To reduce the length of unimpeded slope and to collect and reduce the probable impacts of sheet flow on the slope face, install benches at least 10 feet wide into the slopes adjacent to the access road, with 30 feet maximum vertical spacing between benches. On the uphill slope face, the first bench shall be adjacent to the ditch.

Chapter 7: Water Facilities

7.00 Preface

The design and construction of public and private Water Facilities shall conform to the State of Washington Department of Health (DOH) Design Standards for Group A Public Water Systems, the Standard Specifications of the American Water Works Association (AWWA), and the most recent published and adopted edition of the Uniform Plumbing Code (UPC), unless modified herein.

Compliance with these standards does not alleviate the design engineer from using sound professional engineering practices. The design criteria contained herein are the minimum acceptable under standard conditions. Special conditions may require more stringent requirements that will be addressed during the plan review process. Contact the City of Auburn Public Works Department for specific requirements for the design of pump stations, wells, reservoirs, treatment systems, and other special facilities.

The design criteria used to estimate future line capacities are established in the City's Comprehensive Water Plan. Anyone proposing to extend or modify the City's water system should contact the Public Works Department for information. Applicants needing to construct public water improvements shall enter into a Developer Public Facility Extension Agreement (FAC) with the City. The City's Permit Center can provide information on this agreement as well as applicable permit and connection fee estimates.

7.01 Water Mains and Appurtenances

7.01.01 Materials

Unless otherwise approved by the City Engineer, all water mains shall be the following:

Pipe Type	Construction Standard	Notes
Ductile Iron Pipe, Special Class 52 or 53*	9-30.1(1) (Ductile Iron Pipe)	Asphaltic coating on the exterior and cement mortar lining on the interior

* Class 53 is required for installations with less than 42-inches of cover.

The list of acceptable valves, fittings, and other appurtenances for water facility construction is subject to change as new and improved components become available. Refer to the Construction Standards for the most current information on these requirements.

7.01.02 Water Main Sizing and Main Extensions

New water mains shall be sized to meet flow/demands, pressure requirements and pipe velocity constraints, and as follows:

A. Water mains serving only properties and developments requiring 1,500 GPM @ 2 Hours per **Section 7.05.03** shall be a minimum of 8 inches in diameter.

B. Water mains serving properties and developments requiring 2,500 GPM @ 3 Hours per **Section 7.05.03** shall be a minimum of 12 inches in diameter.

C. Water mains serving properties and development requiring more than 2,500 GPM @ 3 Hours per **Section 7.05.03** shall require hydraulic analysis per **Section 7.06** for sizing and in no case shall be less than 12 inches in diameter.

D. The minimum allowed diameter of a water main in a cul-de-sac, shared access driveway, or dead end street serving only single family/duplex residential properties may be reduced to 4 inches after the last fire hydrant connection serving the cul-de-sac, shared access driveway, or dead end street, unless the City Engineer determines the water main in the cul-de-sac, shared access driveway, or dead end street may be extended in the future or unless minimum pressure requirements cannot be achieved.

Public water main extensions are required where a new service is being requested and there is no existing water main fronting the property(ies) or the existing water main does not extend across the full width of the property(ies) being developed, and shall be as follows:

A. Water main extensions shall be extended to and across the entire property frontage of the parcel being served. For cul-de-sacs or other similar instances where extending across the property frontage is not feasible, main extensions shall meet all other requirements herein, necessary to address fire flow and pressure requirements.

B. Water mains may be required to be extended beyond the property frontage or looped, as determined by the City Engineer, to address system deficiencies created by the development. Water main loops shall have a minimum of two separate connection points to the existing water system, with sufficient valves so that water can be delivered through either connection point independent of the other.

C. In addition to the water main extensions required in item A) and B) above, the City may require properties with service connections on more than one frontage to extend water main(s) across the frontage(s) with the service connection(s), as determined necessary by the City Engineer to accommodate future water system extensions and connections.

D. Water main extensions that may serve adjacent property or to which adjacent property may connect future extension(s), require additional easements, as determined by the City Engineer or designee, to be needed to accommodate the future connections.

7.01.03 Water Main Upsizing

Public water main upsizing is required where a new or modified service is taken from an existing water main that fails to meet minimum pressure requirements per **Section 7.01.05**, fire flow requirements per **Section 7.05.03**, or pipe velocity constraints per Section **7.01.04**, as demonstrated by a hydraulic analysis per **Section 7.06**. In such cases main upsizing shall be as follows:

A. Existing water mains shall be upsized, at a minimum, across the entire property frontage of the parcel being served.

B. Existing water mains may be required to be upsized beyond the property frontage, as determined by the City Engineer, to address system deficiencies created by the development.

C. When main upsizing is required, in no case shall the mains be upsized to be less than the minimum sizes for new mains identified in **Section 7.01.02**.

7.01.04 Water Main Velocities

All water mains shall meet the following velocity requirements:

A. The maximum flow velocity in distribution mains shall not exceed 8 feet per second under Peak Hour Demand (PHD) conditions. Maximum flow velocities in distribution mains may be exceeded under fire flow conditions, but in no case shall velocities exceed 18 feet per second when applying Maximum Day Demand plus Fire Flow (MDD + FF) conditions.

B. The maximum flow velocity in transmission mains shall not exceed 5 feet per second under PHD conditions.

7.01.05 Water Main Pressure

All water mains shall meet the following minimum pressure requirements under the conditions listed:

A. Peak Hour Demand - 30 psi

B. Max Day Demand Plus Fire Flow – 20 psi

7.01.06 Water Main Location

Water mains shall be installed with no less than 42 inches and no more than 72 inches of finished cover. The City Engineer or designee, may grant exceptions to the minimum and maximum cover requirements and may require measures to mitigate impacts of the decreased or increased cover. Said exceptions will only be considered based on the potential impacts to City utilities of constructing the water main within the allowed cover ranges and topographic constraints. When a reduction in pipe cover is granted, in no case shall the finished cover be less than 30 inches.

Public water mains shall be located in the public right-of-way or within a public water utility easement. Public water mains within a utility easement with appurtenances such as hydrants, valves, blowoffs, etc. shall have an access road to such appurtenances conforming to **Chapter 6**. Water mains located in the public right-of-way shall meet the requirements of **Chapter 9**.

For separation requirements between utilities, see **Chapter 6**.

7.01.07 Water Main Appurtenances and Fittings

A. Blow off assemblies (See **City of Auburn Standard Detail W-03 or W-04**) are required on dead-end water mains with a diameter of 6 inches or less; hydrants are required for dead-end mains over 6 inches in diameter. Blow off assemblies shall also be installed at the low point of a depressed “sag” section of a water main, except where a fire hydrant is installed within 50 feet of said area or on a short segment (20 feet or less) where the water main dips under other utilities. Blow off assemblies shall be placed in a level, clear area within the right-of-way or easement, be located as close to the main as possible, and be easily accessible to the City.

B. Combination air and vacuum relief valves (See **City of Auburn Standard Detail W-02**) are required at high points in water mains when an abrupt vertical change in pipe elevation exceeds one pipe diameter, except where fire hydrants are installed within 50 feet of said area. Combination air and vacuum relief valves shall also be installed at the end of all dead-end water mains in addition of a blowoff or fire hydrant, when there is a vertical change in pipe elevation that

exceeds one pipe diameter, and the dead end main is greater than 50 feet in length. Combination air and vacuum relief valves shall be placed within a level clear area within the right-of-way or easement, be located as close to the main as possible, and be easily accessible to the City.

C. All buried bends shall have mechanical restrained joints and concrete thrust blocking or flanged joints and concrete thrust blocking (See **City of Auburn Standard Detail W-01**). 90 degree bends are not allowed when making vertical pipeline adjustments.

D. Tees shall have flanged joints unless there is no valve against the Tee, in which case the Tee may be flanged or mechanical restrained joints. Tees shall include concrete thrust blocking (See **City of Auburn Standard Detail W-01**). When connecting to an existing water main, a tapping tee and valve may be used, if only a single valve is needed at the tee, or unless otherwise approved or required by the City Engineer or designee.

E. Tapping tees are not allowed on commercial fire lines or other water taps needing uninterruptible service; a cut-in tee or installed tee is required.

F. Size-on-size taps are not allowed unless authorized by the City Engineer or designee.

G. The maximum allowable deflection per joint for ductile iron water mains shall be half of the maximum joint deflection specified by the pipe manufacturer or 4 degrees, whichever is lesser.

7.02 Water Services

See **City of Auburn Standard Details W-06, W-13 through W-16a, and W-20.**

The City owns and shall maintain the water service line from the public main to the meter, the meter and setter, the meter radio, the meter tailpiece, and the meter box. The property owner owns and shall maintain the tailpiece connection fitting, shut-off valve, service line after the shut-off valve, and other facilities such as pressure reducing valves, pumps, or backflow prevention assemblies behind the meter.

For fire sprinkler connections, City ownership and maintenance responsibilities cease at the valve installed at the point of connection between the main and the fire service line.

7.02.01 Domestic Services

Domestic water services shall meet the following requirements:

A. Each parcel receiving water service shall have its own meter. Non-single-family developments with multiple buildings on a single parcel shall have a meter for each building unless otherwise authorized by the City Engineer or designee.

B. Water services shall be installed per City of Auburn Standard Details. All existing services shall be replaced when installing new water mains required for the project. The City will furnish and install the meter for services of 2 inches and smaller unless directed otherwise by the City Engineer.

C. Water meters 3 inches and larger will be purchased from the City and installed by the developer/contractor under City observation. Where vaults are required, the vault roof shall contain a 2-inch port for remote reading device.

D. Water meters shall be installed off City owned water mains and shall be located as close to the water main from which the service is taken as possible, while

meeting all other requirements as specified herein, with the distance not to exceed 50 feet.

E. Water meters serving residential lots shall be located in the right-of-way along the frontage of the lot being served. Water meters serving residential lots without right-of-way frontage (such as lots that access the right-of-way via a shared driveway access road) shall be placed in the right-of-way adjacent to the access connection (driveway connection) to the roadway.

F. Water meters shall be placed in landscape strips. If there is no landscape strip, the meter shall be placed behind the sidewalk (in a public water utility easement if not in right-of-way). If there is no landscape strip or sidewalk, the meter shall be placed at the right-of-way limits in a level area, outside of vehicle or pedestrian travel paths, outside parking areas, and away from obstructions.

G. Meters in landscape strips and other landscaped or unimproved areas shall be set 2 inches above the finished grade including landscaping and mulch.

H. Water meters that cannot be placed in the right-of-way while meeting other water meter location requirements may be placed within a public water utility easement adjacent to the right-of-way.

I. Commercial and industrial sites shall have meters located near driveway entrances within the right-of-way or within public water utility easements in landscape islands located near access driveways when, placement in right-of-way, attempting to meet other location requirements of this section, is not practical.

J. Meters may not be placed within sidewalks or pedestrian travel pathways except in cases where obstructions prevent the meter box from being placed behind the sidewalk or in a landscape strip (where a landscape strip is present). In such conditions, the meter box shall be placed in the back of the sidewalk.

K. The water service diameter and meter size shall be sized per Tables 610.3 and 610.4 of the current Uniform Plumbing Code and, upon request by the City Engineer or designee, supporting documentation of the meter size selection provided to the City. The length of the private service line between the right-of-way line and the structure shall not exceed 300 feet.

L. When installing multiple services to a public main, a minimum horizontal spacing of 5 feet shall be used between the corporation stops and tapping tees when the existing main material is ductile iron. A minimum spacing of 10 feet shall be used between the corporation stops and tapping tees on all other types of existing water main materials.

M. Domestic water services shall be connected to the public water main. Domestic water services shall not be connected to private water mains.

7.02.02 Other Services

Irrigation and other non-domestic water services shall meet all the above requirements as well as the following:

A. An Irrigation meter shall be installed in cases where water is used for landscape purposes by non-single-family customers and does not enter the sanitary sewer system.

B. For fire sprinkler service line requirements, see **Section 7.05.02**.

C. Cross connection control devices shall be installed per **Section 7.04**.

7.02.03 Service Abandonment

Services shall be abandoned when properties are redeveloped, and existing services will no longer be used. The following actions are required after removal of the meter:

A. Obtain the necessary permits (e.g., for work in the right-of-way, for meter abandonment)

B. Shut off the corporation stop at the main.

C. Disconnect the service line from the corporation stop.

D. Remove the meter box.

E. Restore the roadway or other surface(s) disturbed by construction activities (e.g., trench patch/overlay).

7.03 Water Valves

Water valves shall be as specified in the Construction Standards and the requirements of this section. See **City of Auburn Standard Details W-17 through W-19** for valve box and extensions.

Water valves shall be of the resilient wedge gate variety. Butterfly valves shall be placed on water mains 14" or larger in diameter. Valves larger than 12 inches may require the valve to be turned on its side with a gear to maintain minimum cover.

Water valves shall be located as follows:

A. Water valves shall be installed at a maximum spacing of 400 feet and at the intersection of lateral lines. A maximum of 20 service connections between valves shall be maintained except on dead end residential streets where up to 30 service connections between valves are allowed.

B. Water valves shall be located in clusters at tees and crosses when possible and shall be located so that each leg of the main line system can be isolated separately.

C. When extending public water mains, a water valve may be required near the end of lines where future extensions are projected.

D. Water valves shall not be placed within the wheel path of vehicle traffic.

A gravel or paved road surface may be required within the public water utility easement as needed to allow access to valves and other appurtenances.

Valves shall be adjusted to final grade in accordance with **City of Auburn Standard Detail T-05.**

7.04 Cross Connection Control

See **City of Auburn Standard Details W-22 through W-25.**

Water Systems shall be designed to protect the City water system from contamination via cross connection control in accordance with Washington State Law (WAC 246-290-490), Auburn City Code (ACC), the City's Cross Connection Control Program manual, and these design standards. Premises isolation shall be provided on service connections and proposed building tenant improvements in accordance with these standards.

7.04.01 Domestic Services

Backflow protection assemblies shall be installed on all new non-single family service connections. Backflow protection assemblies shall be installed on existing non-single family service connections as directed by the City Cross Connection Specialist. The type of backflow protection assembly shall be as determined by the City Cross Connection Specialists:

A. A Reduced Pressure Backflow Assembly (RPBA) shall be installed adjacent to the meter or at an alternate location where the service line enters the building. RPBA assemblies installed at an alternate location, require the approval of the City, shall have no connections between the meter and the assembly, and shall be installed with adequate drainage to accommodate discharges from the RPBA.

B. A Double Check Valve Assembly (DCVA) for domestic service shall be installed adjacent to the meter, unless installed at an alternate location approved by the City Cross Connection Specialists.

7.04.02 Irrigation Services

A backflow prevention assembly shall be installed on all irrigation service connections. The layout of the backflow prevention assembly shall be per **City of Auburn Standard Detail W-06** for single family residential services up to 2 inches and per **City of Auburn Standard Detail W-20** for non-single family residential services. The minimum level of backflow prevention required shall be provided by a Double Check Valve Assembly (DCVA) per **City of Auburn Standard Detail W-24**. A higher degree of protection may be required if deemed necessary by the City, which may include a Reduced Pressure Backflow Assembly (RPBA) per **City of Auburn Standard Detail W-22**.

The backflow prevention assembly shall be installed adjacent to the meter.

7.04.03 Fire Line Connections

A backflow prevention assembly shall be installed on all fire service connections. The layout of the backflow prevention assembly shall be per **City of Auburn Standard Detail W-09** for single-family residential services up to 2-inches and per **City of Auburn Standard Detail W-20** for non-single-family residential services. The minimum level of backflow prevention required shall be provided by a Double Check Valve Assembly (DCVA) per **City of Auburn Standard Detail W-24**. A higher degree of protection may be required if deemed necessary by the City, which may include a Reduced Pressure Backflow Assembly (RPBA) per **City of Auburn Standard Detail W-22**.

The backflow prevention assembly shall be located in the building riser room for non-single-family residential services.

7.04.04 General

A. A DCVA shall be installed to provide adequate access for inspection, testing and maintenance.

B. A DCVA located outside the building shall be installed in a vault, as described on **City of Auburn Standard Detail W-24.**

C. A DCVA located inside the building shall be installed per **City of Auburn Standard Detail W-25**.

D. An RPBA shall be installed in an above ground enclosure or at alternate location with no connections between the meter and assembly (See **City of Auburn Standard Detail W-23**). An RPBA is required for all services utilizing chemicals.

E. Prior to installation, 2 sets of backflow prevention assembly plans, including the connection point to the City main, shall be submitted for review and approval by the City.

F. Only assemblies listed on the current list of Backflow Prevention Assemblies Approved for Installation in Washington State shall be allowed. This list is maintained by the State of Washington and is available from the City.

G. When multiple buildings are proposed on a parcel the building backflow prevention devices shall all be located outside the buildings or all be located inside the buildings per City of Auburn Standards.

7.05 Fire Systems

7.05.01 Fire Hydrant Assemblies

See **City of Auburn Standard Details W-07 & W-08.**

Fire Hydrant Assemblies shall meet the following requirements:

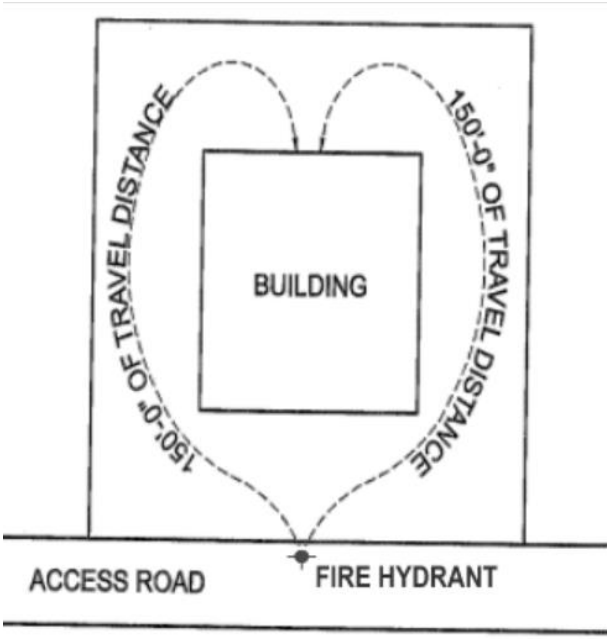
A. Fire hydrant service lines shall be installed at right angles to 8 inch minimum diameter supply mains.

B. Fire hydrants shall stand plumb, be set to meet manufacturer's specification for ground bury line, and have a clear, level area around the hydrant with a radius of no less than 36 inches.

C. Fire hydrants shall be located no closer than 50 feet to the surrounding structures, or at a distance as determined by the Fire Marshal and approved by the City Engineer or designee. Fire hydrants shall be located such that no portion of the fire hydrant is within 5 feet of any portion of a driveway (including throat, apron, and wings).

D. Fire hydrants shall be provided with two 2½ inch National Standard Thread (NST) hose ports and one 4½ inch NST by 5 inch hose port with a Storz adapter and cap.

E. The pumper port shall face the street or fire access road and be readily accessible to any fire vehicle for firefighting and pumping operations. There shall be at least 18 inches clear from the face of the pumper port to the edge of pedestrian or traveled ways.



F. The service line from the supply main to the fire hydrant shall be 6 inches in diameter unless the service line extends over 50 feet in length, in which case the service line shall be 8 inches in diameter. Service lines shall be restrained when the length of service line exceeds one pipe length.

G. Fire hydrants shall be installed with a maximum spacing of 600 feet along streets in single-family zones and 300 feet in all other zones.

H. The maximum distance allowed from any part of a single-family residential structure to the closest fire hydrant is 450 feet.

I. Buildings, other than single-family residences, located with portions of the building more than 150 feet in vehicular travel (see figure below) from a fire

hydrant assembly or with building fire flow over 2500 gpm, shall require on-site fire hydrant assemblies. A maximum length of 150 feet of water main serving a single fire hydrant shall be allowed. Any length greater than 150 feet will require the fire hydrant(s) to be served by a water main that loops around the building, or complex of buildings, and reconnects back to the distribution supply main.

7.05.02 Private Fire Hydrants and Water Mains

Private fire hydrant assemblies and associated water mains serving the fire hydrants shall meet all of the same standards as is for public facilities identified in these standards, including the following requirements:

A. The City Engineer, or designee, may require fire hydrants and water mains installed on private property solely for the purpose of providing fire protection to be privately owned and maintained by the benefitting property.

B. Privately owned and maintained fire hydrants shall be painted Safety red per the City Construction Standards to distinguish between publicly owned and privately owned fire hydrants.

C. Ownership of privately owned water mains begins immediately downstream of the valve at the point of connection to the public water main.

D. Private fire hydrant water mains require backflow protection in the form of a Double Check Detector Assembly (DCDA) to be installed on private property as close to the connection to the public main as possible.

E. Privately owned fire hydrants require fire hydrant use permits to be issued for non-maintenance activities to record the amount of water being used for said activity.

7.05.02 Fire Sprinkler Systems

Fire Sprinkler Systems shall meet the following requirements:

A. Any contractor offering to design, install, test, and/or provide maintenance of fire sprinkler systems in the State of Washington must be licensed with the State Fire Marshal's Office, Licensing Section.

B. Fire sprinkler systems shall be required in commercial/industrial and multifamily buildings according to the adopted fire code regulations. Sprinkler systems may be required in single-family residences when determined by the City and the Fire Authority.

C. Fire sprinkler supply lines for commercial buildings, unless designed by a Fire Protection Engineer, shall be a minimum of 8 inches in diameter.

D. Fire sprinkler supply lines for non-single-family buildings shall be connected to a looped water main.

E. Fire sprinkler supply lines shall be separated from the public water main by a valve located at the point of connection. The fire sprinkler supply line shall be installed with a cut-in tee and shall have a 3-valve cluster unless otherwise approved by the City Engineer.

F. The design of fire sprinkler supply lines for single-family/duplex shall be in accordance with **City of Auburn Standard Detail No. W-09.**

G. A Washington State Certified Level "U" contractor shall install underground fire sprinkler supply lines in accordance with WAC 212-80-010. Prior to installation, 3 sets of underground fire sprinkler supply line plans shall be submitted to the City for approval by the Fire Marshal. Both a State Certified Level "U" contractor and a Fire Protection Engineer shall stamp these plans. A letter from a state certified sprinkler system designer stating "FOR DESIGN PURPOSES ONLY" may be attached in lieu of a stamp from the Fire Protection Engineer.

H. A post indicator valve (PIV) shall be installed on the fire sprinkler supply line between the public water main and the building. PIV's shall be located in such a manner as to be easily visible to Fire Department personnel. A wall-mounted PIV may be installed when the exterior wall of the building is of non-combustible construction. A detail containing this information shall be included with the submitted plans.

I. Fire Department Connections (FDC's) shall be placed within 50 feet of a fire hydrant or as directed by the Fire Marshal. FDC's must be identified and approved by the Fire Marshal.

J. New water mains shall be constructed with valves on each side of fire line taps.

K. Fire sprinkler systems shall have backflow prevention in accordance with **Section 7.04**.

L. Fire sprinkler service lines shall not be connected to fire hydrant service lines.

M. Flow-through fire sprinkler systems may be installed for single family residential only. Design shall be according to NFPA 13D. Backflow prevention is not required for flow-through systems.

7.05.03 Fire Flows

New developments, redevelopment of existing sites, or changes in land use are required to meet the minimum City fire flow requirements listed below while maintaining the required minimum pressures. The developer shall provide information to the City to define the project specific fire flow requirements.

The minimum fire flow requirements within the Auburn Water Service areas are:

A. Single-Family Residential: 1,500 GPM @ 2 Hours

B. Industrial/Commercial/Multi-Family: 2,500 GPM @ 3 Hours

Additional fire flow may be required per ACC 15.36A.

Minimum fire flows outside Auburn Water Service areas shall be determined by the water service provider and the Fire Marshal.

When a hydraulic analysis is required to demonstrate the system meets fire flow and minimum pressure requirements, the developer may request that the City perform hydraulic modeling to support the hydraulic analysis at the applicants cost and the City may or may not agree to provide the modeling depending on resource availability and other considerations. See **Section 7.06** for hydraulic analysis requirements.

The Developer shall be responsible for any on-site and/or off-site improvements such as water main extensions, additional connections, fire hydrants, etc. to meet these requirements.

7.05.04 Fire Authority and Hydrant Access

Fire Authority and hydrant access shall meet the following requirements:

A. Access shall be a minimum of 20 feet wide with a minimum vertical clearance of 13½ feet.

B. Access roads shall be designed using a minimum inside radius of 28 feet and a minimum outside radius of 48 feet.

C. Except as noted otherwise in these standards, access that exceeds 150 feet in length from the face of curb or edge of the existing asphalt of the public road and does not return to a public road shall provide a turnaround within 150 feet of the dead-end. If a hammerhead configuration is utilized for the turnaround, it shall be designed per Figure D103.1 and Table D103.4 in Appendix D of the International Fire Code, or acceptable equivalent. If a cul-de-sac is utilized for the turnaround, it shall be designed per the City of Auburn Design Standards.

D. Single-family residential driveways shall have an 18 foot wide driveway apron and a minimum 20 foot wide paved surface to a location where all portions of a dwelling unit structure are no more than 150-ft, as measured by an unobstructed route around the exterior of the building.

7.06 Hydraulic Analysis

7.06.01 General

Hydraulic analysis is required for all new or modified connection(s) to an existing main(s), except when determined by the City Engineer, or designee, to not be required. In determining if an exception from the hydraulic analysis requirement is appropriate, the City Engineer, or designee, will consider whether the existing main meets sizing requirements for new mains per

Section 7.02.02 and the proposed use of the modified or new service connection(s). When a hydraulic analysis is required for a project, it shall include the following:

A. The hydraulic analysis shall be signed and sealed by a professional engineer.

B. Include a description of the project, location, and identify existing water facilities adjacent to the project boundaries.

C. Include a site map showing the project boundaries.

D. Include locations of proposed new or upsized water mains to be installed as part of the project, including pipe diameters and the locations of fire hydrants, if known.

E. For developments that are not solely single-family/duplex residential, provide the proposed type and size of meter(s) and backflow device(s).

F. Show the source node provided by the City with Hydraulic Grade Line (HGL) and existing pressure information.

G. Show on-site demand calculations.

H. Input tables shall be provided for each of the pipes showing the following minimum information:

Pipe No.	Pipe Nodes (Begin and End)	Length (ft)	Diameter (in)	Friction Coefficient

I. Input tables shall be provided for each of the nodes showing the following minimum information:

Node. No.	Connecting Pipes	Elevation (ft)	Demand (gpm)

J. A separate analysis and calculations shall be conducted for Maximum Day Demand (MDD), Maximum Day plus Fire Flow (MDD + FF), and Peak Hour Demand (PHD) scenarios. Explain any assumptions made.

K. Output calculation results for pipes shall include, at a minimum, the following information:

Pipe No.	Flow Rate (gpm)	Velocity (fps)	Head Loss (ft)

L. Output calculation results for nodes shall include, at a minimum, the following information:

Node No.	HGL (ft)	Pressure (psi)	Elevation (ft)	Demand (gpm)

M. Provide a summary table for each scenario analyzed (MDD, PHD, and MDD + FF) and include minimum and maximum static and residual pressures.

This page intentionally left blank.

Chapter 8: Sanitary Sewer and Storm Drainage Facilities

8.00 Preface

Compliance with these standards does not alleviate the design engineer from using sound professional engineering practices. The design criteria contained herein are the minimum acceptable under standard conditions. Special conditions may require more stringent requirements that will be addressed during the plan review process.

The City's Comprehensive Sanitary Sewer Plan and Comprehensive Storm Drainage Plan establish basins and design parameters used to estimate future line capacities. Anyone proposing to extend or modify the City's sanitary sewer system and/or storm drainage system should contact the Public Works Department for information on proposed line sizes and locations.

Sanitary Sewer:

The design of sanitary sewer facilities shall be in conformance with the State of Washington Department of Ecology's "Criteria for Sewage Works Design" manual (DOE Sewer Manual) unless modified herein. These standards are set forth as a minimum requirement for the planning and design of gravity sanitary sewer facilities. Sewage pump stations and special facilities are not included within this design manual due to the complexity of these facilities. When designing pump stations and special facilities, please contact the City of Auburn Engineering Services for specific requirements.

In lieu of constructing a public sewer system, the developer of a single, non-residential lot may construct a private sewer system, in accordance with the standards for public sanitary sewer systems consisting of manholes and sewer mains. The property owner is responsible for maintenance and repair of the private system. This option is only available if the sewer extension would not serve any additional upstream properties. Private sewer systems are not allowed in the public rights of way except where permitted through franchise agreement or right-of-way use permit.

Storm Drainage:

These storm drainage requirements provide the design criteria necessary to preserve the City of Auburn's water courses; to minimize surface and ground water quality degradation; to control the sedimentation in creeks, streams, rivers, ponds, lakes, and other water bodies; to protect adjacent and downstream property owners from increased runoff rates, which could cause erosion and flooding; to ensure the safety of City of Auburn's roads and rights-of-way; to decrease drainage-related damage to both public and private property, and to control runoff from development, redevelopment and construction sites. The design of storm drainage facilities shall be in conformance with the City of Auburn Surface Water Management Manual (SWMM) to comply with the Western Washington Phase II Municipal Stormwater Permit issued by the State of Washington Department of Ecology.

8.01 Sanitary Sewer and Storm Mains

8.01.01 Sizing/Slope

All new mains shall be sized as indicated in the City's current Comprehensive Plan. For lines not specified in the plan, the applicant must design the line with sufficient capacity to convey any future flows (based on current land use designations).

Sanitary sewer mains shall be designed and constructed to provide a minimum cleaning velocity of 2 ft/s when flowing at 80% full. If at final build out the planned contributing area will not achieve this capacity, additional provisions may be required.

Analysis of storm drainage pipe systems shall be per the requirements of the SWMM. The following are the minimum slopes for the corresponding Sanitary Sewer pipe sizes:

Table 8-1 Sanitary Sewer Pipe Sizes and Slopes

Pipe Diameter	Minimum Slope
8 inches*	0.50%
10 inches	0.30%
12 inches	0.25%
18 inches	0.15%

* Minimum sanitary sewer pipe size

8.01.02 Location

Standard installation depth for sanitary sewer mains is between 6 feet and 15 feet below the finished surface elevation. Mains less than 6 feet deep and over 15 feet deep, require approval by the City Engineer, or designee, and additional provisions may be required .

Mains shall be located in the public right-of-way or within a public utility easement per **Chapter 6**. Mains within a utility easement with appurtenances such as manholes shall have an access road to such appurtenances conforming to **Chapter 6**. Mains located in the public right-of-way shall meet the requirements of **Chapter 9**.

When the potential exists to serve upstream properties, mains shall extend through the property being served, through the shared driveway or access tract serving the property(s), or across the entire length of the lot frontage at the depth necessary to serve the upstream properties, as determined by the City Engineer or designee.

For separation requirements between utilities, see **Chapter 6**.

8.01.03 Material

The following is the City's list of required sanitary sewer and storm drainage pipe materials and depth criteria.

Table 8-2 Sanitary Sewer and Storm Drainage Pipe Material and Cover

Pipe Type	Construction Standard	Minimum Pipe Cover**	Maximum Pipe Depth
Solid Wall Polyvinyl Chloride (PVC) Pipe, SDR-21*****	9-05.12(1) (Solid Wall PVC Culvert Pipe, Solid Wall PVC Storm Sewer Pipe, and Solid Wall PVC Sanitary Sewer Pipe)	18 inches	22 feet
Solid Wall Polyvinyl Chloride (PVC) Pipe, SDR-35 (Requires 14 foot lengths.*****	9-05.12(1) (Solid Wall PVC Culvert Pipe, Solid Wall PVC Storm Sewer Pipe, and Solid Wall PVC Sanitary Sewer Pipe)	3 feet	18 feet
Solid Wall Polyvinyl Chloride (PVC) Pipe, PS46 (Requires 14 foot lengths.*****	9-05.12(1) (Solid Wall PVC Culvert Pipe, Solid Wall PVC Storm Sewer Pipe, and Solid Wall PVC Sanitary Sewer Pipe)	3 feet	18 feet
Solid Wall Polyvinyl Chloride (PVC) Pipe, C900	9-05.12(1) (Solid Wall PVC Culvert Pipe, Solid Wall PVC Storm Sewer Pipe, and Solid Wall PVC Sanitary Sewer Pipe)	12 inches	30 feet*
Ductile Iron Pipe, Special Class 50	9-05.13 (Ductile Iron Sewer Pipe)	6 inches	30 feet*
High Density Polyethylene Sanitary Sewer Pipe (HDPE)***	9-05.23 (High Density Polyethylene Pipe (HDPE))	2 feet	30 feet*
Triple Wall Polypropylene Culvert and Storm Sewer Pipe****	9-05.24(1) (Polypropylene Culvert Pipe and Storm Sewer Pipe)	N/A	N/A

* Sanitary sewers and storm drainage pipes deeper than 30 feet will require pre-approval from the City Engineer or designee.

** Minimum cover is depth of cover excluding cover depth provided by flexible pavements. No portion of any pipe shall be allowed within 6 inches of the bottom of the flexible or concrete pavement.

*** The design engineer is responsible for specifying a thickness ratio adequate to withstand all loads anticipated for this application.

**** For use in Storm Drainage applications only.

***** These are the City preferred material types that must be utilized unless depth, loading, or other conditions necessitate the use of other material types indicated in the table. Consideration of alternate material type requires deviation.

8.02 Sanitary Sewer and Storm Drainage Structures

8.02.01 Type and Size

Manholes, Catch Basins, and Inlets shall be constructed per the following:

Table 8-3 Sanitary Sewer and Storm Drainage Structure Types

Type	Construction Standard	Notes
Manhole (48-inch to 60-inch)	WSDOT Standard Plan B-15.20 or B-15.60 with an eccentric cone	
Manhole (72-inch to 96-inch)	WSDOT Standard Plan B-15.40 with a flat top instead of riser	
Catch Basin Type I	WSDOT Standard Plan B-5.20	15-inch diameter max. pipe size, 5-foot max. depth to invert.
Catch Basin Type II	WSDOT Standard Plan B-10.20	
Concrete Inlet	WSDOT Standard Plan B-25.60	15-inch diameter max. pipe size, 5-foot max. depth to invert., only utilized for single pipe and where a full depth catch basin is not feasible.
Cement Concrete Curb and Gutter Pan	WSDOT Standard Plan F-10.16	Utilized along curb and gutter sections.
Rectangular Vaned Grate	WSDOT Standard Plan B-30.30	Utilized for all catch basins along curb and gutter sections unless in a sag condition.
Rectangular Frame (Reversible)	WSDOT Standard Plan B-30.10	Utilized for all catch basins.
Combination Inlet	WSDOT Standard Plan B-25.20	Utilized in sag conditions along curb and gutter.

Shallow manholes (32”-50” deep) shall conform to **City of Auburn Standard Detail S-06** and may only be used upon approval of the City Engineer or designee.

Additional design provisions may be required by the City Engineer or designee for manholes over 20 feet deep.

Manhole diameters shall meet the following requirements based on the manhole depth and the size, number, and configuration of pipes entering as shown on **Table 8-3**.

Manholes shall provide a minimum of 0.10 foot of drop between the inlet pipe and the outlet pipe. Pipes of differing diameters shall be aligned so that the crowns of the pipes match. Where the slope of a pipe entering or exiting a manhole is greater than 5%, the slope shall be continued through the manhole and the invert elevations indicated on the plans.

Manholes are to be channeled from the entering pipe to the outlet pipe, with the sidewalls of the channel extended above the top of the largest connected pipe. See **City of Auburn Standard Detail S-08**. When making a new connection to an existing manhole, the manhole shall be rechanneled to match the new pipe configuration.

Table 8-4 Sanitary Sewer and Storm Drainage Structure Sizing

Manhole Diameter	Number & Diameter of pipes/ Connections Allowed	Depth of Manhole
48” Diameter	1 Pipe, 21” 2 Pipes, 12” – 18” 3 Pipes, 8” – 10”	4’ Minimum 12’ Maximum
54” Diameter	1 Pipe, 36” 2 Pipes, 21” – 30” 3 Pipes, 12” – 18” 4 Pipes, 8” – 10”	6’ Minimum 15’ Maximum
60” Diameter	1 Pipe, 42” 2 Pipes, 24” – 36” 3 Pipes, 15” – 21” 4 Pipes, 10” – 12” 5 Pipes, 8”	8’ Minimum 20’ Maximum
72” Diameter	1 Pipe, 48” – 54” 2 Pipes, 36” – 42” 3 Pipes, 18” – 24” 4 Pipes, 12” – 15” 5 Pipes, 8” – 10”	8’ Minimum 25’ Maximum

Pipes entering manholes must have a minimum of 8 inches between their penetrations on the inside of the manhole (See **City of Auburn Standard Detail S-08**).

The angle between inlet pipes and the outlet pipe shall not be less than 90-degrees.

Drop manholes are discouraged and require approval from City Engineer or designee. When approved, drop manholes shall be inside drops conforming to **City of Auburn Standard Detail S-05**.

8.02.02 Structure Locations

The design of new sanitary sewer and storm drainage conveyance systems shall be done in a manner that minimizes the total number of structures (manholes and catch basins), using the following criteria:

A. Structures shall be installed at a maximum spacing of 400 feet apart along the main.

B. A structure shall be installed at all junctions of two or more mains.

C. A structure is required whenever connecting to a main with an 8-inch or larger diameter pipe.

D. A structure shall be installed at all changes in vertical slope, horizontal direction, and/or pipe size.

E. In cases where a sewer main steeper than 5% must turn 90-degrees through a manhole, a transition manhole is required at least 20 feet upstream to reduce the pipe slope to a maximum of 2% and/or to change the angle to 45-degrees.

F. All public sanitary sewer lines shall end with a manhole. All end of the line sanitary sewer manholes with no side sewers connected directly to them shall conform to **City of Auburn Standard Detail S-07**.

G. Sanitary sewer manholes are not to be located within the limits of surface water ponding or flow lines associated with stormwater runoff.

H. Structure covers shall be located outside the wheel paths of roadways and outside driveway aprons.

I. Structures shall not be located within sidewalks, landscape strips trails, or curb and gutters, except as approved by the City Engineer, or Designee. In cases where structures are located in walking paths, the structure cover shall be non-skid, smooth top.

J. Cleanouts are not an acceptable alternative for structures (manholes or catch basins) except they may be used with City Engineer or designee approval at the end of a sanitary sewer main, when the future extension of the sanitary sewer main is planned, and the current end point is not a practical location for a manhole. When approved by the City Engineer or designee, public cleanouts shall conform to **City of Auburn Standard Detail S-03.**

K. Structures shall not be located on portions of streets or access roads with a slope greater than 8%.

L. Structures shall be subject to the separation requirements from buildings and structures specified in **Chapter 6**.

M. Structures set in gravel areas shall be set at the center of a 6-foot concrete apron flush with the finished grade of the apron.

N. Structures set in landscaped or unimproved areas shall be set 6 inches to 12 inches higher than the surrounding terrain and provided with a 6-foot diameter concrete apron around the manhole lid.

O. Frames and covers shall conform to **City of Auburn Standard Detail S-04**.

P. Structures shall be adjusted to grade per **City of Auburn Standard Detail T-05**. Rubberized adjustment rings may be required in certain circumstances as determined by the City Engineer.

8.03 Sanitary Side Sewers

See **City of Auburn Standard Details S-01, S-02 & S-03.**

Side sewers are defined as that portion of the sewer system that extends from 2 feet outside of the outer foundation wall of the structure to the public sanitary sewer main. The City maintains the portion of the side sewer located within the right-of-way. The property owner owns and maintains the portion of the side sewer located outside of the public right-of-way. Side sewers located within easements are the property owners' responsibility to maintain.

Side sewers shall meet the following requirements and shall be laid out per **Figure 8-01**:

A. A separate and independent side sewer from the public main shall be provided for each and every parcel.

B. A separate and independent side sewer from the public main shall be provided for each non-single family building on a parcel.

C. Side sewers within the public right-of-way and side sewers serving non-single family development shall be a minimum of 6-inches in diameter. The private portion of side sewers serving single family residences may be 4-inches in diameter within the parcel that it serves.

D. 6-inch diameter side sewers shall be connected to the public sanitary sewer main by the use of a tee (**City of Auburn Standard Detail S-01**) or connected directly to a manhole located along the public main. All side sewer manhole connections shall incorporate a channeled or rechanneled manhole.

E. Side sewers with a diameter of 8-inches or greater shall be connected to the sanitary sewer system by use of a sanitary sewer manhole which shall be channeled or rechanneled.

F. When constructing sanitary sewer mains in new developments, side sewer installation shall extend from the connection on the main line to the edge of any utility easements or the public right-of-way, whichever is further.

G. When installing new sanitary sewer mains or replacing existing mains in developed areas, side sewers shall be installed for all existing occupied structures and any buildable lots. Side sewers shall extend to the property lines and their location shall be clearly marked in conformance with **City of Auburn Standard Detail S-01**.

H. The maximum length of side sewer from the sanitary sewer main to the building shall not exceed 150 feet. The City Engineer or designee may allow this length to be exceeded in instances where the side sewer can maintain a 2% slope, a public sewer extension built to shorten the side sewer would not serve any other potential customers. Where the maximum length is exceeded and the minimum slope maintained, the City Engineer or designee may require additional cleanouts or other measures to mitigate the additional length.

I. Side sewers shall be designed and constructed with a minimum 2% slope from the building to the tee or manhole connection. Where site constraints require that the slope be less than 2%, the City Engineer or designee may require larger diameter pipe and/or additional cleanouts.

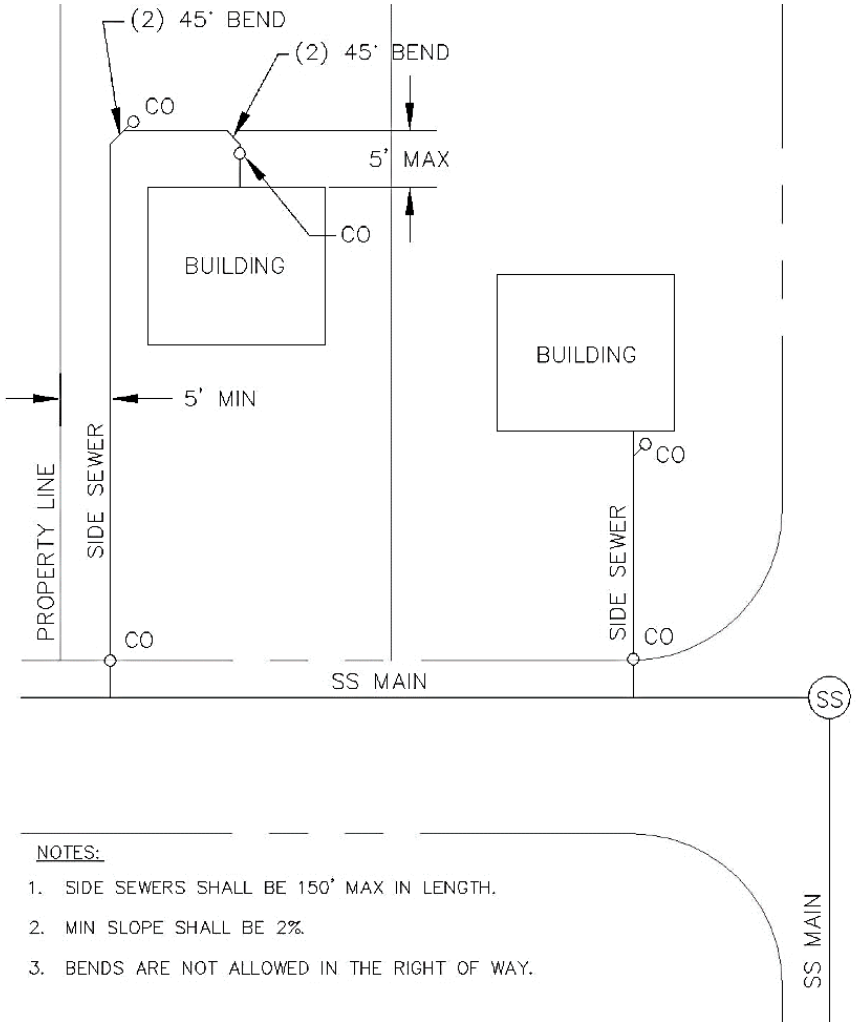
J. When an immediate connection to a building is not being made, side sewers shall be designed to provide a minimum depth at the property line of 5 feet below the floor to be served or 6 feet below the street, whichever is deeper. In cases of vacant properties with no anticipated building elevation, the side sewer shall be constructed at a 2% slope from the tee.

K. Side Sewers shall not have horizontal or vertical bends located within the right-of-way.

L. Side sewers shall have a minimum cover of 5 feet at the edge of right-of-way.

M. Side sewers shall be a minimum of 5 feet from potable water service lines.

N. Side sewer cleanouts shall be installed within 3 feet of the building foundation providing an access point into said line for future maintenance.



O. Side sewer cleanouts shall be installed at the edge of the property owner's side of the public right-of-way line or utility easement where the ownership of the side sewer changes from private to public.

P. Sanitary sewer cleanouts shall be installed in side sewers every 100 feet and for each change in direction totaling 90 degrees. See **Figure 8-01**.

Q. If the private portion of the side sewer crosses another private property other than the property being served, a minimum of a 10 foot wide private sewer easement (5 feet on either side of the pipe centerline) must be obtained granting the property owner being served permission to cross said property.

R. All side sewers must use push on gasketed joints. Glued joints are not allowed outside the building footprint.

Figure 8-01 Side Sewer Layout

8.04 Oil/Water Separators

Prior to discharging into the sanitary sewer system, oil separation facilities shall be used in pre-treating drainage flows from fuel islands, trash enclosures, wash pads, and floor drains where (in the opinion of the City Engineer or designee) heavy concentrations of oil may occur.

Pads with drains for trash enclosures and wash pads intended for washing the exterior surfaces of vehicles shall drain to a catch basin with a downturned 90-degree elbow prior to discharge to the sanitary sewer. Oil/water separators for other applications shall meet the following design criteria:

A. A forebay to collect floatable and the larger settleable solids.

B. A surface accessible inspection T inside the first chamber at the inflow pipe and a sample T at the last chamber at the outflow pipe.

C. Access to the separator shall be maintained free for inspection at all times.

D. A maximum of 200 SF of uncovered area open to rainfall may discharge to the separator. Refer to BMP S441 in the SWMM for applications where this may apply.

E. If a pump mechanism is required to convey the discharge from the site to the sanitary sewer system, the pump must be designed for discharge to a controlled gravity outlet flow into the City system.

F. The separator shall have a valve on the discharge pipe that can be closed during cleaning and in the event of a spill.

G. All piping entering and leaving the separator must be 6 inches minimum diameter.

H. Access points in the top of the separator vault must be provided to allow a minimum twelve-inch diameter access for observation and maintenance to all chambers of the separator.

I. Access doors shall be galvanized spring-assisted diamond plate with a penta-head bolt-locking latch and recessed lift handle.

J. Access doors must open a full 180 degrees.

8.05 Pressurized Sewer Systems

Private low pressure sewer systems are allowed only where the existing public system has already been extended to, or is within 200 feet of, the subject property and the elevation differences between the public sewer main and the subject property do not allow for a gravity connection. Extension of a private gravity sewer main onto the property(s) may be required if such extension could make gravity sewer service possible. Sewage from pressurized systems must be discharged into a minimum 6-inch diameter private gravity side sewer prior to connecting to the public portion of the side sewer.

Low pressure sewer systems are not allowed in public right-of-way or public easements.

Low pressure sewer systems shall be owned and maintained by those connecting to it. Systems serving multiple properties shall be within easements or tracts dedicated or owned by all properties connecting to the system.

All other proposed pressurized systems require deviation(s). In addition to the standard deviation considerations required by these standards, deviations requesting pressurized systems must show that extension of the public systems as intended per the Sewer Comprehensive Plan to serve the property(s) and that serving the property(s) with septic system(s) are not feasible. Septic systems may only be considered infeasible if there is no form or scale of a septic system(s) that the County would accept for at least one form of development of the property(s) that would be allowed under the current zoning and land use regulations. Determination that septic system(s) are not feasible require written documentation from the County.

8.06 Sanitary Sewer Meters

The use of sewer meters shall only be allowed if it is determined by the City Engineer that a sewer meter is the appropriate device for the accurate measurement of wastewater being sent into the public sewer system.

8.07 Storm Drainage System Requirements

All requests for developing a storm drainage system must comply with the City of Auburn Surface Water Management Manual (SWMM). The City has adopted the 2019 Department of Ecology Stormwater Management Manual for Western Washington and the City of Auburn Supplemental Manual as the SWMM. The Supplemental Manual provides guidance for applying specific sections of the Ecology document within the City of Auburn. All references to the City's SWMM include both documents. The City's Supplemental Manual can be found utilizing the following hyperlink:

Supplemental Manual

Storm drainage system design is guided by the 10 Minimum Requirements for Stormwater Management, listed below. The applicability of the Minimum Requirements is based on project size and the total new and/or replaced hard surfaces created by the project. It is recommended that the Minimum Requirements, especially LID, are considered at the beginning of project design to ensure that the required elements can be included in the project. The SWMM also addresses modeling standards and design criteria for conveyance, storage, treatment facilities, and other drainage system structures.

The SWMM is divided into five volumes that address different aspects of storm drainage system design. These volumes and the key components for design and application submittal are:

Volume I – What Requirements Apply to My Site?

The 10 Minimum Requirements (MR) for Stormwater Management are:

MR #1: Preparation of Stormwater Site Plans

MR #2: Construction Stormwater Pollution Prevention Plan

MR #3: Source Control of Pollution

MR #4: Preservation of Natural Drainage Systems and Outfalls

MR #5: On-Site Stormwater Management

MR #6: Runoff Treatment

MR #7: Flow Control

MR #8: Wetlands Protection

MR #9: Operations and Maintenance

MR #10: Off-Site Analysis and Mitigation (Supplemental Manual)

Volume II – Construction Stormwater Pollution Prevention

Volume III – Choosing, Modeling, and Documenting Your BMPs

Volume IV – Source Control BMP Library

Volume V – Runoff Treatment, Flow Control, and LID BMP Library

Chapter 9: Facilities in the Right of Way

9.00 Preface

The design of public and private facilities located within City right-of-way shall be in conformance with these standards. For the purposes of these standards, “facilities” shall include City owned and non-City owned potable water, irrigation water, sanitary sewer, storm drain, gas, communications, electrical, illumination, and any other utility facility and their appurtenances. This Chapter also covers non-utility facilities such as building foundation elements, awnings, and private signs.

When a non-City sponsored project requires the relocation of private utilities due to public utility extensions or other City required improvements, the cost of relocation of the private utility shall be borne by the developer.

9.01 Franchise/Public Way Agreement Requirement

Private facilities within the City right-of-way require prior approval from the City. Except as allowed otherwise by Auburn City Code, owners of private facilities in the right-of-way shall have a current franchise, public way agreement, or Right-of-Way Use Permit consistent with Title 20 and/or Title 13 and/or Title 12, if applicable, of the Auburn City Code.

9.02 Construction Permit Requirement

Any non-City entity intending to construct, repair, or replace any facility in City right-of-way shall apply for a construction permit. Applications for constructions permits can be made directly through MyBuildingPermit.com. A City permit must be obtained prior to any work within the City right-of-way.

9.03 Design Criteria

The City has established the following minimum requirements to ensure the efficient construction of facilities with the least impact to City transportation and public utility infrastructure:

A. Public water, sewer, storm, and telecommunications facilities shall be constructed per the Engineering Design and Construction Standards.

B. Private underground facilities shall be installed with no less than 36 inches of finished cover.

C. Private underground facilities shall be located a minimum horizontal distance of 5 feet from buildings and public facilities.

D. When crossing public underground facilities, private underground facilities shall be located a minimum vertical distance of 12 inches from the public utility. Additional separation may be required between potable and non-potable pipes per **Chapter 6** of these Engineering Design Standards.

E. Manholes, valve boxes, power vaults, etc., that are located in the paved area of a street shall be located outside of the wheel paths of vehicles and flush with the pavement surface.

F. The design of underground facilities shall seek to minimize the number of required structures and redundant pipes/conduits.

G. Structures located within parking lots, sidewalks, and paths/trails shall also be flush with the surface. In areas where traffic will pass over the structure, load-bearing lids shall be incorporated in the design.

H. Repair of existing cement concrete roadway panels shall be per **City of Auburn Standard Detail T-27.**

I. The City Engineer may allow required restoration overlays per **City of Auburn Standard Details T-02 and T-02A** of individual trenches to be deferred where a program or project exists that would complete the restoration/overlay of multiple trenches as a single project or effort. In all cases, permanent repair of the trench is required per **City of Auburn Standard Detail T-01** with the trench construction and backfill and cannot be deferred or delayed.

9.04 Pavement Trenching and Restoration

Trenching, backfill, and restoration shall, within paved areas, be per **City of Auburn Standard Details T-01 and T-02**. Manhole covers, valve covers, vault lids, and other utility appurtenances within pavement restoration areas, including areas of grind and overlay, shall be first lowered beneath the final wear course, paved over, and then raised to final grade per **City of Auburn Standard Detail T-05** and per the Construction Standards. This requirement may be waived by the City Engineer or designee when the total area of the final wear course paving area is less than 100 SF.

The City Engineer may allow required restoration overlays per **City of Auburn Standard Details T-02 and T-02A** of individual trenches to be deferred where a program or project exists that would complete the restoration/overlay of multiple trenches as a single project or effort. In all cases, permanent repair of the trench is required per **City of Auburn Standard Detail T-01** with the trench construction and backfill and cannot be deferred or delayed.

9.04.01 Perpendicular Trenching in Asphalt Pavement

Trenching through and within intersections is considered perpendicular trenching.

A. Perpendicular trench backfill shall be in accordance with **City of Auburn Standard Detail T-01.**

B. Pavement restoration shall match existing pavement type and thickness with a minimum thickness of 4-inches.

C. After trenching, the adjacent pavement on each side of the trench shall be sawcut and removed (full depth) to a minimum of 12 inches from the edges of trench to reveal a clean pavement edge to patch against. This is referred to as the “T-cut”.

D. In the process of perpendicular trenching, if the remaining section of pavement between the edge of T-cut and the edge of the pavement/gutter is less than 4 feet wide, the restoration/overlay will extend to the edge of the pavement/gutter.

E. In the process of perpendicular trenching, remaining sections of pavement between the edge of T-cut and lane line/lane edges less than 4 feet wide, shall be included in the restoration/overlay area.

F. When more than 1 perpendicular trench is constructed along a roadway, pavement areas between the limits of the restoration/overlay limits that are less than 10 feet wide are to be added to the required restoration/overlay area.

G. Perpendicular trenching to roadways may not be allowed on newer roads or streets that have been constructed or overlaid within the last five years.

H. Perpendicular trenching may not be allowed or may be limited to off-peak hours and/or weekends on principal arterials or where the construction activity will seriously impede large volume traffic patterns. Utility connections that have to be made within the roadway will be allowed after approval from the City.

I. Jacking/boring alternatives may be required as substitute methods for perpendicular trenching.

J. The minimum pavement patch width and overlay restoration for perpendicular/transverse trenches shall be per **City of Auburn Standard Detail T-02.**

K. When multiple trenches are required in close proximity, the asphalt patch shall encompass all the trenches.

L. The longitudinal edge of the perpendicular asphalt patch shall not lie within the wheel paths of vehicles.

M. Requirements for curb ramp installation, replacement, and/or upgrade associated with the utility trench work shall be in accordance with **Chapter 10**.

9.04.02 Longitudinal Trenching in Asphalt Pavement

Trenching outside of intersection limits (curb returns) and running parallel, or within 30 degrees of parallel, to the edge of pavement/flowline is considered longitudinal trenching.

A. Longitudinal trench backfill shall be in accordance with **City of Auburn Standard Detail T-01**.

B. Pavement restoration shall match existing pavement type and thickness with a minimum thickness of 4-inches.

C. After trenching, the adjacent pavement on each side of the trench shall be sawcut and removed (full depth) to a minimum of 12 inches from the edges of trench to reveal a clean pavement edge to patch against. This is referred to as the “T-cut”.

D. In the process of longitudinal trenching, if the remaining section of pavement between the edge of T-cut and the edge of the pavement/gutter is less than 4 feet wide, the restoration/overlay will extend from the trench to the edge of the pavement/gutter.

E. In the process of longitudinal trenching, remaining sections of pavement between the edge of T-cut and adjacent lane line/lane limits less than 4 feet wide, shall be included in the restoration/overlay area.

F. When more than 1 longitudinal trench is constructed along a roadway, pavement areas between the limits of the restoration/overlay limits that are less than 5 feet wide are to be added to the required restoration/overlay area.

G. The longitudinal edges of the asphalt patch shall not lie within the wheel paths of vehicles.

H. The minimum pavement patch width and overlay restoration for longitudinal trenches shall be per **City of Auburn Standard Detail T-02**.

I. For streets that have been constructed or overlaid within the last 5 five years the City Engineer may require additional restoration area.

J. For streets that have been constructed or overlaid within the last 5 five years, or for principal arterials where open trenching will impede large volume traffic patterns, the City Engineer may require that trenchless techniques be used as an alternative. The City Engineer may require that trenchless techniques be limited to off peak hours and/or weekends.

K. Requirements for curb ramp installation, replacement, and/or upgrade associated with the utility trench work shall be in accordance with **Chapter 10**.

L. The City Engineer may allow trench restoration/overlay of individual trenches to be included in a program or project to complete the restoration/overlay of multiple trenches as a single project or effort.

9.04.03 Trenching in Cement Concrete Pavement

A. Repair of existing cement concrete roadway panels shall be per **City of Auburn Standard Detail T-27.**

B. The edges of trenches in concrete pavement shall be sawcut prior to excavation to avoid damaging the slab. Concrete slabs 6 inches and over shall be drilled for the installation of dowels. Dowels shall be 1 and 1¼ inches in diameter, 18 inches long, and spaced 12 inches center to center.

C. The minimum pavement patch width for concrete trenches shall be 4 feet.

D. In the process of trenching concrete, if the section of pavement between the trench and the edge of the existing concrete panel is less than 4 feet, the section shall be removed and replaced.

E. Longitudinal trenches in concrete may be repaved with an asphalt pavement thickness of equivalent strength upon City approval.

9.05 Non-Pavement Trenching

Trenching in areas other than paved surfaces, including sidewalks, gravel shoulders, and landscape strips, shall conform, where applicable, to the previous sections and replace the disturbed material in kind or as directed by the City. Utility trench bedding and backfill shall conform to **City of Auburn Standard Detail T-01** and to the Construction Standards.

9.06 Aboveground Facilities

Unless otherwise provided in a public way agreement, franchise, or lease, all facilities must be located underground. Exceptions to this standard are as follows:

A. Fire Hydrants, Blow-offs, Air/Pressure Relief

B. Pipe and cable crossings of rivers and freeways

C. High voltage electrical facilities (transmission lines and substations)

D. Illumination and signal facilities

E. Telephone pedestals

F. Aerial cables hung on existing utility poles (with approval of City Engineer)

G. Small Wireless Facilities

H. Other facilities, that in the opinion of the City Engineer, cannot be reasonably constructed underground.

Where underground requirements do not apply, the following parameters shall be addressed in locating or relocating aboveground utilities:

A. Clear Zone Requirements: Non-breakaway utility poles and other fixed aboveground utility structures shall meet the clear zone requirements of these design standards, See **Chapter 10**. Respective utility owners shall be responsible for securing easements from adjacent property where clear zone requirements cannot be met within the public right of way.

B. ADA Requirements: Utility poles and other aboveground utility structures shall not be located within the sidewalk. This requirement may be waived by the City Engineer if the pole location in the sidewalk allows a minimum of 48 inches of unobstructed pedestrian travel way and the pole/structure meets clear zone/lateral separation requirements described in **Chapter 10**.

C. Utility poles and other aboveground utility structures shall be compatible with driveways, intersections, and all other road features. They shall not interfere with sight distance, road signing, traffic signals, culverts, etc. The City Engineer may require poles to be relocated to meet this requirement.

D. No utility pole or other aboveground utility structures shall be located in such a way as to pose a hazard to the general public. Utility companies shall locate and replace poles and other structures with primary consideration given to public safety and roadway functionality.

E. New overhead power and communications wires and appurtenances shall comply with the vertical clearance requirements established by WAC-468-34-290. Except as may be determined otherwise by the City Engineer to address safety issues, for the purposes of this overhead clearance requirement, replacement of existing facilities and overlashing of existing cables/wires that do not reduce the existing minimum vertical clearances are not considered to be new. Whether considered to be new or not, plans for overhead power and communications wires and appurtenances must show the existing and proposed vertical clearance of the facilities being installed or modified at each midspan location between poles.

F. If allowed by the City Engineer, wireless and radio facilities that are not considered Small Wireless Facilities per ACC 20.14 are subject to the concealment standards cited in **Chapter 9**.

G. A net increase in the number of poles is not allowed except that the City Engineer may determine that additional poles with service lines only serving properties not included in the project (no distribution lines) may be allowed. In making this determination, the City Engineer will consider the potential impact to structures of undergrounding service line connections.

9.07 Building and Structure Related Facilities

Permanent buildings, building shoring systems that would leave any elements in the right-of-way after construction, footings and foundations, and privately owned walls, gates, and fences are not allowed in the public right-of-way.

Facilities such as Awnings, overhangs, and elevated decks/patios/railing (only in the Downtown Urban Center Zone), and bus shelters may be permitted by the City Engineer with special conditions and considered on a case-by-case basis and subject to ACC 12.60.

9.08 Small Wireless Facilities

This section describes design standards for Small Wireless Facilities as set forth in ACC 20.14. The purpose of these standards is to provide concealment and safety standards for Small Wireless Facilities in the public right-of-way.

9.08.01 General Requirements

A. Small wireless facilities will comply with applicable Federal Communications Commission (FCC), Federal Aviation Administration (FAA), state, and City regulations and standards.

B. A Small Wireless Facility will not be used for mounting signs, billboards or message displays except as approved by the City for the purpose of providing concealment.

C. No lights, other than street lights, are permitted on any pole or antenna unless required by the Federal Communications Commission, the Federal Aviation Administration, or the City.

D. No Small Wireless Facility may be attached to a tree or any other vegetation.

E. Installation of a new pole in the public right of way to serve a Small Wireless Facility will not be allowed whenever an existing pole or other structure in the public right of way can meet technical and network location requirements and the owner of said pole or structure grants permission for the Small Wireless Facility Attachment. If the existing pole or structure does not meet the City's design standards or other requirements, with agreement from its owner, it may be replaced with a pole or structure that meets the design requirements and these standards. In these cases, all attachments must be transferred from the existing pole to the new pole and the existing pole must be completely removed and surface restored.

F. Small Wireless Facilities and all associated facilities, including support poles or structures, will be free from all manufacturer decals and/or logos.

G. Generators are not permitted for Small Wireless Facilities. A battery backup may be permitted through the submittal of a concealment plan and emergency spill response plan.

H. Installation of Small Wireless Facilities is not allowed where it would create a sight distance issue for vehicular or non-motorized traffic, identified in the City of Auburn Engineering Design and Construction Standards.

I. Applications for Small Wireless Facilities will include plans that conform to the plan requirements described in the City of Auburn Design and Construction Standards. Concealment plans will include photos of the proposed site location(s) with overlaid renderings of the proposed Small Wireless Facilities to demonstrate the facility's adherence to concealment standards.

J. Small Wireless Facilities may not share power service connections with City facilities unless specified otherwise in the applicable use agreement for City-owned property.

K. Record Construction Drawings are required in accordance with the City of Auburn Engineering Design and Construction standards.

9.08.02 Attachments to City Facilities

A. Attachment, modification, relocation, or replacement of City facilities requires an executed agreement with the City in addition to any applicable franchise or public right-of-way agreements.

B. Attachment to an existing City pole requires calculations sealed by a Professional Engineer that shows the existing pole can support the Small Wireless Facility. Where the existing facility being attached to is a City owned street light, signal pole, sign support structure, or Dynamic Message Sign (DMS) support structure, calculations must show compliance with the strength and loading parameters stated in the City's Construction Standards. The loading calculations will include consideration of potential future loading with planned or potential future City facility attachments.

C. Small Wireless Facilities are not permitted on City street light poles where they would interfere with street lighting, City banners, flower baskets, holiday lighting, holiday decorations, or other City uses of the pole.

D. Replaced City light poles will be of the same color and similar style as adjacent existing City light poles, unless otherwise approved by the City Engineer. Where a City light pole has been replaced or relocated the davit arm length will be replaced as needed to place the luminaire in-line with the other luminaires along the roadway and in accordance with City design standards.

E. Installation of Small Wireless Facilities on City facilities within secured sites is not allowed. Secure City facilities are those facilities that are enclosed by a fence with locked gate access and typically include water reservoirs, water treatment plants, pump stations, and water wells.

F. Installation of Small Wireless Facilities on traffic signal mast arms is not allowed.

9.08.03 General Pole Requirements

A. Installation of Small Wireless Facilities on poles intended to break-away from vehicular impact is not allowed.

B. New, replaced, or relocated poles are not allowed within the clear zone (as identified in the City of Auburn Engineering Design and Construction Standards). For the purposes of determining clear zone requirements, poles with Small Wireless Facilities attached are considered utility poles.

C. Small Wireless Facilities will be mounted such that no portion of the facility, including antenna, are higher than 50 feet, or 10% higher than the height of buildings or structures immediately adjacent to the right-of-way, or the Small Wireless Facility attachment does not extend the height of the pole to more than 50 feet or by more than 10 percent, whichever is greater.

D. A pole that is relocated or replaced for the purpose of attaching a Small Wireless Facility is considered an existing structure.

9.08.04 Wiring and Conduit

A. All wiring must be inspected and accepted by Washington Department of Labor and Industries and associated documentation provided to the City prior to being placed into service.

B. Except on wooden poles and other support structures where internal routing is not feasible, all cables, wires, and fiber must be routed internally in the pole or support structure and must not be visible externally.

C. Wiring, cables, and fiber associated with the Small Wireless Facility will be in their own conduit, interducts, and channels so they are not co-mingled with conduits and cables serving other uses. Electrical wiring will be separated from communications wiring with interduct or separate channels.

D. All interducts, channels, cables, and wiring will be clearly labeled at the pole ends, handholes, junction boxes, and other termination points. Record construction drawings will show and label all cables/wiring, interduct, and channels.

9.08.05 Concealment

Small Wireless Facilities will be screened, concealed, or camouflaged employing the best available technology, such as compatible materials, shrouding, location, color, and other tactics to minimize visibility of the facility.

Pole mounted equipment, antenna, conduits, cables, mounting hardware, and other visible components will match the color of the pole they are attached to unless specifically approved by the City. The City Engineer or the City Engineer's designee will consider the cumulative visual effects on the visual character of the surrounding area of Small Wireless Facilities mounted on existing structures and/or located on a given permitted site in evaluating concealment requirements.

Where conduit or cables are mounted external to the support structure, the outside cable conduit or cable will be the color of the support structure, and the City may require that the cable be placed in conduit. Full concealment of all conduits, cables, wires, and fiber is required within mounting brackets, shrouds, canisters, or sleeves if attaching to exterior antennas or equipment.

9.08.06 Pole Mounted Antennas and Equipment

Antennas will be located, mounted and designed so that visual and aesthetic impacts upon surrounding land uses and structures are minimized, and so that they blend into the existing environment.

Panel antennas shall not be mounted more than 12 inches from the surface of the utility pole, with the distance measured from inside edge of the antenna to the surface of the pole, unless an additional distance is required by the pole owner. An applicant may install a side-mounted canister antenna, so long as the inside edge of the antenna is no more than 12 inches from the surface of the pole.

Pole mounted equipment other than the antenna(s), electric meter, and disconnect switch must be concealed within equipment enclosures. Equipment enclosures will be installed flush to the pole and not extend more than 24 inches from the face of the pole.

All attachments to a pole that are projecting, or any equipment or appurtenance mounted on the ground, will comply with the Engineering Design and Construction Standards, the Americans with Disabilities Act (ADA) standards and will not obstruct an existing or planned sidewalk or walkway.

All proposed projecting attachments to the pole will provide a minimum vertical clearance of 12 feet over sidewalks, 16 feet over driveways, and 20 feet over roadways.

9.08.07 Non-Pole Mounted Equipment

A. Non-pole mounted equipment facilities will be placed underground if doing so is technically feasible and would not defeat the purpose of the facility.

B. Above ground equipment facilities that are not pole mounted will be screened from any street and adjacent property with fencing, landscaping, shrouding, topography, or a combination of these methods,

C. Above ground equipment facilities that are not pole mounted will be treated with graffiti resistant paint or material.

9.08.08 Strand Mounted Small Wireless Facilities

A. Each strand mounted Small Wireless Facility will not exceed three CFin volume.

B. The strand mounted Small Wireless Facility will be placed as close as possible to the nearest utility pole, but no more than five feet from the pole unless a greater distance is technically necessary or required by the pole owner for safety clearance.

C. No strand mounted Small Wireless Facility will be located in or above the portion of the roadway open to vehicular or non-motorized traffic.

D. Strand mounted small wireless facilities must be installed to cause the least visual impact and with the minimum excess exterior cabling or wires (other than the original strand) necessary to meet the technological needs of the facility.

This page intentionally left blank.

Chapter 10: Transportation

10.00 Preface

The intent of this Chapter is to encourage the uniform development of an integrated and accessible transportation system that will support all modes. Through the implementation of these standards, streets are built as transportation facilities as well as public space, contributing positively to the character of the City. These standards help create an efficient multimodal transportation system while minimizing environmental impacts to the community.

The design of Streets within the City of Auburn shall conform to the standards provided herein. The current editions of the American Association of State Highway and Transportation Officials (AASHTO), FHWA and Washington State Department of Transportation, MUTCD, and the State of Washington Department of Transportation (WSDOT) standards shall be utilized by the City Engineer when the design standards, standard specifications, or standard drawings are not covered by the scope of the City's standards.

The design criteria used to estimate future street usage are established in the City's Comprehensive Transportation Plan (CTP).

All streets shall be designed and constructed to comply with Federal Americans with Disabilities Act (ADA) laws. Additional guidelines and information can be found at WSDOT's ADA web page by clicking on the following hyperlink:

https://wsdot.wa.gov/about/americans-disabilities-act-ada

10.01 Development Activity Requirements

10.01.01 Traffic Impact Analysis

Per the Comprehensive Transportation Plan (CTP), development shall not be allowed when the impacts of the development on the transportation system degrade the level of service (LOS) below the adopted LOS standard, unless the impacts are mitigated by the improvements provided by the development. For more details regarding level of service standards and when mitigation is triggered, see the CTP.

A traffic impact analysis (TIA) is used to identify capacity and safety concerns, to assist in the evaluation of site design as it relates to traffic engineering issues, and to identify appropriate solutions and mitigation.

Projected trip generation shall be calculated based on the current edition of the Institute of Transportation Engineers (ITE) Trip Generation Manual.

10.01.01.A When Traffic Impact Analyses are Required

To adequately assess a development's traffic impact, the City Engineer, or designee, may require a TIA. The requirement for a TIA will be based on the size of the development proposed, existing street and intersection conditions, traffic volumes, crash history, safety considerations, community concerns, and other pertinent factors relating to traffic impacts attributable to the development. A traffic impact analysis is required for development activities that create one or more of the following conditions:

A. The development could potentially affect an intersection or corridor where an existing level of service is at or below standard.

B. The development generates more than 30 PM or AM peak hour trips on a corridor or intersection.

C. The development may potentially affect the implementation of the street system as outlined in the Comprehensive Transportation Plan and Six Year Transportation Improvement Program (TIP), or of any other documented transportation project.

D. The development proposes a rezone of the subject property.

E. The original Traffic Impact Analysis for a future development is outdated due to changes in traffic volumes in the vicinity of the proposed project or approved pipeline projects or a change in the proposed land use's trip generation and/or distribution.

F. The development could potentially affect safety or requires an analysis to assist in designing appropriate access.

G. Special event land uses which do not exhibit typical trip generation characteristics may require unique analysis, including but not limited to weekend and off-peak scenarios, and AM versus PM time frames. Examples of such uses would be school, concert stadiums, racetracks or uses which exhibit substantial traffic peaking associated with special events that are scheduled on a periodic basis. The traffic analysis for such uses may include a traffic management plan to control traffic impacts associated with the special events.

10.01.01.B Elements of a Traffic Impact Analysis

Development activities have a wide range of considerations and potential issues that vary depending on the proposed development and its setting. The TIA will be cooperatively scoped by the developer and City Engineer, or designee. However, the City Engineer, or designee, will make the final decision regarding what analyses must be included in the TIA. The TIA may include all or some of the following analyses:

A. Vehicle level of service analyses (Intersection delay and Intersection queueing).

B. Analysis of proposed street connections to other new and existing streets and resulting volumes to demonstrate the requirements of **Section 10.03.01** are met.

C. Critical gap analyses.

D. Roundabout analyses.

E. Traffic signal warrant analyses.

F. Stop control warrant analyses.

G. Turn lane warrant analyses.

H. Traffic calming evaluation.

I. Access management evaluation.

J. Mitigation identification and analyses confirm proposed mitigation addresses impacts. See Mitigation Identification section.

K. Neighborhood Circulation Plan. See Neighborhood Circulation Plan section.

L. Truck trip generation and routing analysis.

M. Evaluation of existing transit services and facilities and identification of modified or new transit services and facilities needed to serve the project.

N. Other analyses and information as required by the City Engineer, or designee.

10.01.01.C Mitigation Identification and Recommendation

To address the potential adverse impacts of a development activity and to fulfill an identified need for public services within the impacted area related to the development, the TIA shall identify any impacts and needs required to be addressed by the development. The TIA shall identify measures to address the impacts and needs and demonstrate through modeling and/or other analyses that the proposed measures provide adequate mitigation and fulfillment of the needs. The developer is responsible for mitigating on-site and off-site deficiencies for present and proposed phases of the development. The TIA shall propose improvements necessary for safe and efficient traffic flow and bicycle, pedestrian, and transit movement and access proportional to the identified impacts. Build-out year, and project phasing impacts shall be considered. Long range forecast modeling is required for proposed zoning changes or non-conforming uses. All or some of the following items are to be included in the mitigation identification:

A. Measures for mitigating on-site impacts and proposed mitigation.

B. Measures for mitigating off-site impacts and proposed mitigation.

C. Discussion of whether on-site and off-site improvements are justified, reasonably related to, and proportional to the impacts of the proposed development. In situations where mitigation of a development's impacts provides mitigation beyond what is caused by the development and beyond the required half street improvements, the City Engineer may consider under certain conditions and in accordance with applicable City Code, a traffic impact fee credit and/or a payback agreement.

D. Any requirements or mitigation measures associated with the Neighborhood Circulation Plan.

The Traffic Impact Analysis shall clearly state the mitigation measures recommended by the analysis and shall summarize how the recommended mitigations are proportional to the identified impacts. The recommended mitigation measures shall be explained in sufficient detail in the analysis to allow them to be understood and evaluated. The recommendation shall also include the following:

A. Clear statements of the applicant's recommended mitigation measures.

B. Conceptual plans depicting recommended mitigation improvements and their relationship to existing and proposed conditions if drawings are needed.

10.01.02 Neighborhood Circulation Plan

Per ACC 17.16, a Neighborhood Circulation Plan is a conceptual plan that outlines the vehicular and nonmotorized circulation within and between a proposed subdivision and the surrounding area consistent with the CTP. Per ACC 17.10, a Neighborhood Circulation Plan is required with all subdivision applications that meets the requirements of ACC 17.16 and RCW 58.17.110(2) for safe walking paths for students. This requirement applies to both residential and non-residential subdivisions. To satisfy this requirement, plans and supporting documentation (such as a TIA where applicable), must satisfy and demonstrate the following:

A. The planned street system must be compatible with the CTP. Development which is proposed in areas of the city which have a planned street system which

is a part of the comprehensive plan or the city's six-year plan, and any other street plan, shall make provisions for such streets and must not cause implementation of such street plans to become unattainable.

B. Make provisions for, and not otherwise obstruct, planned routes or facilities for bicycles, equestrian, or other nonmotorized transportation mode which is a part of the CTP or Transportation Improvement Plan (TIP).

C. Provide a nonmotorized circulation system that is integrated into the overall subdivision and the surrounding area as follows:

- Includes an integrated nonmotorized circulation system that connects buildings, open spaces, and parking areas with the adjacent street sidewalk system.
- Provides connections to existing or potential future trails/pedestrian routes on adjacent properties unless there are physical constraints such as sensitive areas that preclude the construction of a pedestrian connection.

D. For residential subdivisions, in coordination with the applicable school district(s), identify walking routes for students within the subdivision for which bus services are not provided or planned to be provided by the school district(s). At locations where the identified route is not on a sidewalk meeting minimum City standards or where the route crosses a roadway, the project shall include enhancements to meet the requirements of RCW 58.17.110(2). Enhancements shall be identified, designed, and documented by a professional engineer and are subject to acceptance by the City Engineer. In deciding whether the proposed enhancements are acceptable the City Engineer will consider factors such as operations, maintenance, and replacement. Roadway crossings at uncontrolled intersection legs or not at intersections shall require enhancement per **Section 10.09.05**.

10.01.03 Half Street Improvements

10.01.03.A Half-Street Triggers

The requirements described in this section are in addition to any requirements determined during the SEPA process and/or the traffic study process described in **Section 10.01.01**, to mitigate localized impacts of the proposed development activity. This section describes the requirements for public improvements triggered by permitted actions as set forth in ACC 12.64A.

10.01.03.B Half-Street Extents

A public street or alley frontage that requires public improvements is referred to as a "Half-Street". The Half-Street extents are determined using the frontage street's cross section applicable to the street's roadway classification as defined in the CTP. The Half-Street may apply to an existing roadway or to a planned roadway which has not yet been built and extends along the entire length of the subject property frontage(s) with vehicular and/or non-motorized access. When Half-Streets connect to an intersection, the nearest corner of the intersection on the side being improved shall be designed and constructed for the full build-out of the street and shall extend, at a minimum, the intersection curb returns. Half-Street elements may extend beyond the property frontage(s) as described herein to transition to existing improvements or to provide additional improvements as described in **Section 10.01.04**. Half-Street requirements associated with alley frontage is described in **Section 10.01.03.E**.

10.01.03.C Half-Street Width

Along existing roadways, the Half-Street width is the area from the planned right-of-way limits to the planned roadway centerline based on the roadway classification and the typical cross sections in **Section 10.03.06**. Along planned or unimproved roadways, the Half-Street width is either 1) the area from the planned right-of-way limits to the planned roadway centerline or 2) the area from the planned right-of-way limits to the limit required to provide 24 feet of pavement, whichever is greater.

10.01.03.D Required Half-Street New Improvements

Half-Streets shall include construction of the following elements: paved roadway, sidewalks, curb/gutter, street landscaping, street lighting system, storm drainage, and conduit for City telecommunications. Half-street improvements to planned or unimproved roadways shall include improvements to the un-finished side of the roadway (opposite of the subject property frontage), as follows: temporary curbing, shoulders, clear zones, guardrail, slope treatments, and drainage accommodations to assure proper drainage, bank stability, and traffic safety.

If a Half-Street does not connect at both ends to other streets, construction of a permanent or temporary cul-de-sac will be required.

Where Half-Streets are connected to existing streets, lane markings transition tapers are required in accordance with AASHTO where edges of pavement do not match. Pavement transition tapers shall be constructed to a minimum of 5:1 or as constrained by the existing right-of-way.

All public utility improvements required for the project and service connections in the right-of-way shall be installed during the Half-Street construction. The Half-Street will be designed to provide drainage for the constructed portion of the street and to connect to the existing storm drain systems (where present), or be designed to allow for connection of the system to future planned storm drain systems.

10.01.03.E Required Half-Street Existing Improvements

Half-Street improvements shall include removing and replacing existing driveway aprons that do not meet current ADA requirements. Half-Street improvements shall include addressing sidewalk obstructions in the Half-Steet area, including, but not limited to, replacing existing sidewalk areas that are an ADA obstruction.

Additionally, the City Engineer may make a determination that existing improvements within the Half-Street that do not conform to current City standards require improvement, upgrade, modification, or re-construction. In making this determination, the City Engineer will consider the proportionality of the required work to the potential impacts of the project, pedestrian and vehicular safety, ADA requirements, consistency and conformity with adjacent existing and planned improvements, and other factors as deemed relevant by the City Engineer. As part of this determination, the City Engineer may require existing driveway access(es) that do not meet current standards to be removed, relocated, and modified.

10.01.03.F Half-Street ROW Dedication

Right-of-way dedication is required for areas of the subject property within the Half-Street area along all frontages that are not already dedicated as right-of-way. Additional right-of-way dedication may be required as determined by the City Engineer per **Section 10.01.04**.

10.01.03.G Alley Half-Streets

Half-Street improvements in alleys shall include paving the alley to a width of 20 feet along the frontage of the property and, if the property frontage extends to the connection(s) of the alley to the roadway, the improvements shall also include construction of commercial driveway apron(s) at the alley entrance(s). Where a driveway apron already exists, the project shall be required to remove and replace it if the apron does not meet ADA requirements. Additional Half-Street improvements in alleys for projects constructing anything other than one single family residential unit shall include paving the alley to a width of 20 feet along the frontage limits and to the alley's roadway connection. For right-of-way dedication purposes, the Half-Street width along alley frontage is the area between the planned or existing centerline of the alley and the alley limits along the frontage (typically 10 feet offset towards the frontage along the planned or existing alley centerline), as determined by the City Engineer. The required paving width is reduced, as needed, to provide the maximum paved width available within the limits of the existing right-of-way and right-of-way dedicated by the project.

10.01.04 Additional Public Improvements

Additional public improvements besides the Half-Street improvements may be required as determined by the City Engineer to be necessary to mitigate the impacts of the development activity that may include the following improvements, not necessarily located on the property frontage:

A. Additional street lighting.

B. Additional storm drainage systems.

C. Traffic control and other safety systems including, but not limited to, roadway channelization, signage, non-motorized safety, and traffic calming.

D. Dedication of public right-of-way on public street frontages without vehicular or non-motorized access.

E. Off-site improvements identified in the TIA and/or through the SEPA process.

10.01.05 Deferred Public Improvements

Public improvements triggered per ACC 12.64A and/or undergrounding of overhead wiring triggered per ACC 13.32A for which the City Engineer has approved deferral or payment of a fee-in-lieu shall be documented on the Plans with a notation indicating the City street delay application number (SDR-####) and the applicable agreement(s) shall be signed by the applicant and returned to the City prior to Plan approval. Agreements associated with grading permit(s) shall be executed by the City and recorded prior to issuance of notice to proceed with construction activities. Agreements associated with FAC plans/agreements shall be executed and recorded by the City with final acceptance of the FAC.

10.02 Right of Way

Required right-of-way widths are shown on the typical cross sections in this Chapter. The required right-of-way will depend upon the width of the street and other improvements. Additional right-of-way may be required for bike/pedestrian trails, retaining walls, or storm facilities, for example. Right-of-way requirements may be variable within a street corridor due to intersections, turn lanes, bus loading zones, and other street features. Right-of-way radii required at intersections is shown on **Table 10-6**.

Right-of-way shall be conveyed to the City on a recorded plat, by a right-of-way dedication, or

a separate instrument. Right-of-way shall be free of title encumbrances that, in the opinion of the City Engineer, would conflict or inhibit existing or future use of the right-of-way and/or present an unacceptable risk or burden on the City. Right-of-way dedications shall require title insurance as deemed appropriate by the City Engineer.

10.03 Roadway Network

New streets and/or new street systems, other than local residential streets serving residential neighborhoods, shall be configured in conformance with the CTP guidelines and policies. Where the comprehensive plan lacks clear guidance to address a particular situation, the City may require traffic studies and other supporting analysis to help define the configuration and nature of the planned street system.

Streets and street networks will be configured to deter speeding and cut-through traffic. Cut-through traffic is traffic that utilizes local street(s) to connect from one arterial or collector street to another arterial or collector street. Traffic calming measures may also be required to deter speeding and cut-through traffic.

10.03.01 Connections and Vehicle Volumes

Analysis of proposed street connections to other new and existing streets and resulting volumes shall be submitted to demonstrate the requirements of this section are met.

Connection of new streets to existing streets or connections within new proposed street networks shall not be allowed if the connections result in traffic volumes in excess of the upper limit of the average daily traffic volume range for the roadway's classification as listed in **Table 10-1** below.

The layout of local street networks shall be such that the number of local street connections to arterials and collectors is the minimum number of connections required to limit the design ADT on existing and planned local streets in the network to be within the ADT range listed in **Table 10-1** below. This requirement generally limits local street networks with only a single connection to an arterial or collector street to 100 or less units. Traffic volume limits shall not restrict the improvement of an existing parcel to include one single family residential unit.

Table 10-1 Traffic Volumes by Roadway Classification

Roadway Classification*	Average Daily Traffic (ADT)
Principal Arterial	Over 15,000
Minor Arterial	10,000 – 15,000
Residential Collector	2,500 – 10,000
Non-Residential Collector	2,500 – 5,000
Rustic Collector	1,000 – 5,000
Local Residential	Up to 1,200
Local Non-Residential	Up to 1,200
Rustic Residential	Up to 1,000

* Roadway classifications are listed from highest to lowest classification.

10.03.02 Intersection Layout and Spacing

The horizontal approach angle of street intersections shall be between 85° and 95° at the centerlines of intersecting streets. Intersections shall be aligned so that opposing single left turn lanes and through lanes are not offset more than 4 feet as measured from the lane centerline approach tangent.

Intersection spacing for classified roadways shall be determined by the City Engineer on a case-by-case basis using the CTP, AASHTO, and contextual considerations. Local roadway intersections shall meet the minimum centerline spacing requirements as shown in **Figure 10-1** below. Local roadways shall not exceed 1,300 feet in length between intersections.

Figure 10-1 Minimum Local Street Intersection Spacing from Centerline to Centerline

10.03.03 Intersection Control (Local Residential Streets)

New local street intersections shall be designed with sufficient intersection sight distance such that all intersection legs do not require stop control. Design speeds for approaches without intersection control may be lowered per **Table 10-3** when the intersection includes a center traffic island and design speed justification documentation is provided. Projects creating new intersections or modifying existing intersections of local residential streets are required to provide analysis and documentation justifying the proposed intersection control approach.

10.03.04 Intersection Control (Traffic Signals and Roundabouts)

Per the City's Comprehensive Transportation Plan, roundabouts are generally preferred over traffic signals. Where a traffic signal is warranted, an evaluation to determine the feasibility of installing a roundabout instead of a traffic signal will be performed. The feasibility criteria will include right-of-way constraints and property impacts, critical areas, geometrics, context, and other factors as determined to be relevant.

Roundabouts shall be designed per WSDOT Design Manual Chapter 1320 and the Transportation Research Board's (TRB) Roundabouts: An informational Guide, 2nd Edition – Second Edition (NCHRP 672).

Traffic signals shall be designed per **Section 10.21.12**.

10.03.05 Dead End Streets and Cul-De-Sacs

New streets shall be planned, designed and constructed to connect to existing or future streets except when the City Engineer has determined that a new dead-end street is allowed. Where a dead-end street is allowed, the City Engineer will determine whether the dead-end street is considered permanent or temporary. In making these determinations, the City Engineer will

consider whether or not a future through street to connect adjacent properties and/or other streets is reasonably anticipated, feasible, needed, and desirable. Existing dead-end streets shall be linked to new or existing streets as determined by the City Engineer to be required. The following requirements apply to dead-end streets:

A. Dead-end streets that exceed 150 feet in length shall end in a cul-de-sac per the requirements of **Table 10-2**.

B. Dead-end streets shall not be more than 800 feet in length as measured from the center of the nearest intersection to the center of the cul-de-sac.

C. Dead-end streets shall not serve more than 30 dwelling units unless secondary emergency vehicle access is provided. See **Section 10.08.10** for emergency vehicle access driveway requirements.

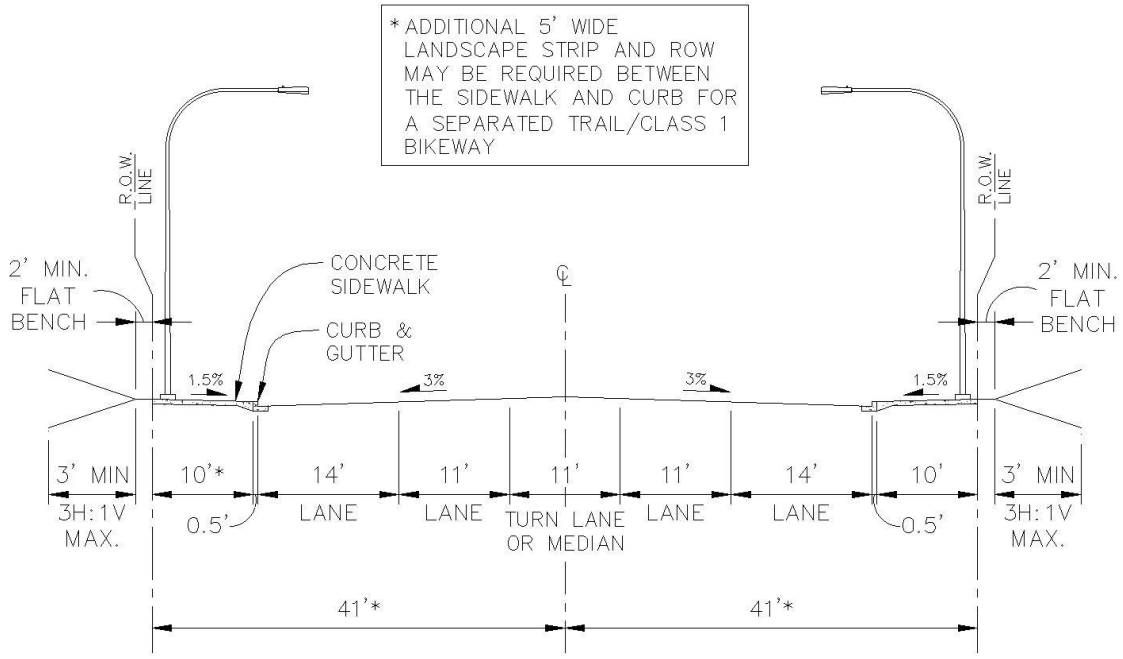
D. Dead-end streets determined by the City Engineer to be temporary shall include a sign posted at the end of the road indicating the road is planned to be extended in the future and to contact the City of Auburn Public Works Department for further information.

E. When applicable, non-motorized paths shall be provided at the end of dead-end streets to connect to adjacent streets, trails, schools, parks, neighborhoods, or other features.

Table 10-2 Cul-De-Sac Design Requirement

Requirement	Temporary Cul-De-Sac	Permanent Cul-De-Sac
Maximum cross slope and vertical grade as measured from center of cul-de-sac to all points along the curb	5%	5%
Minimum paved surface diameter	65 feet	75 feet
ROW Diameter (Easement allowed for temporary cul-de-sac)	65 feet	90 feet
Sidewalk width (street lights, fire hydrants, and other pathway obstructions must be placed in easement behind the sidewalk)	Not Required	7 feet

10.03.06 Street Classifications



The following section contains descriptions of the street classifications used in the City and typical cross-sections for each street classification. Under certain circumstances, typically to mitigate operational or a safety conditions, the City Engineer may require variations from the typical cross-sections. Examples of these variations include, but are not limited to acceleration and deceleration lanes, right and left turn pockets/lanes, and modified lane widths. Where required, left turn pockets shall be a minimum of 11 feet wide with right turn pockets a minimum of 14 feet wide.

Roadway travel width is measured from the face of curb to the face of curb. Sidewalk width excludes the width of the curb where present. Non-motorized facilities such as sidewalks and bikeways shall be incorporated into the roadway cross sections per the CTP and as determined by the City Engineer to be needed to comply with the City's Complete Streets Policy (See ACC Chapter 12.06).

10.03.06.A Principal Arterial

Principal Arterials are designed to move traffic between locations within the region and to access the freeways. Design emphasis is placed on providing movement of inter-city rather than intra-city traffic. Direct access to multi-family, commercial and industrial land uses is permitted, but managed to improve safety and reduce congestion. Direct access to single family residential land uses is not allowed unless there is no other access point available. Parking is generally not allowed on principal arterials except in certain areas of the Downtown Urban Center (See **Figure 10-14**) and other areas where parking is not prohibited due to specific circumstances. Auburn Way South is a principal arterial that, from the State Route 18 interchange to the southeastern City limits, is also State Route 164 and subject to both City and Washington State Department of Transportation (WSDOT) requirements.

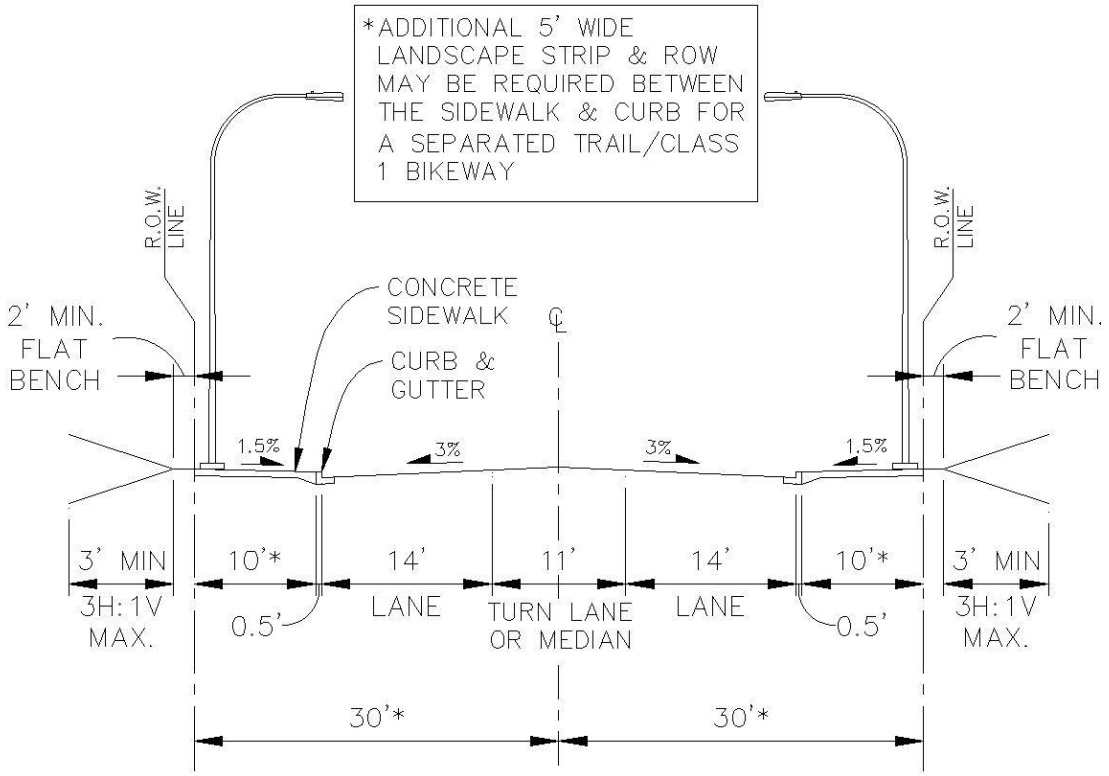


Figure 10-2 Principal Arterial Typical Cross Section

10.03.06.B Minor Arterial

Minor Arterials interconnect and augment principal arterials and provide service to trips of moderate length at a somewhat lower level of travel mobility than principal arterials. Relative to principal arterials, the minor arterial street system consists of facilities that place more emphasis on land access than the higher system and offers a lower level of traffic mobility. Minor Arterials may serve secondary traffic generators such as community business centers, athletic fields, neighborhood shopping centers, major parks, multifamily residential areas, medical centers, large church complexes, hospitals, and traffic from neighborhood to neighborhood within the City. Parking is generally not allowed on principal arterials except in certain areas of the Downtown Urban Center (See **Figure 10-14**) and other areas where parking is not prohibited due to specific circumstances.

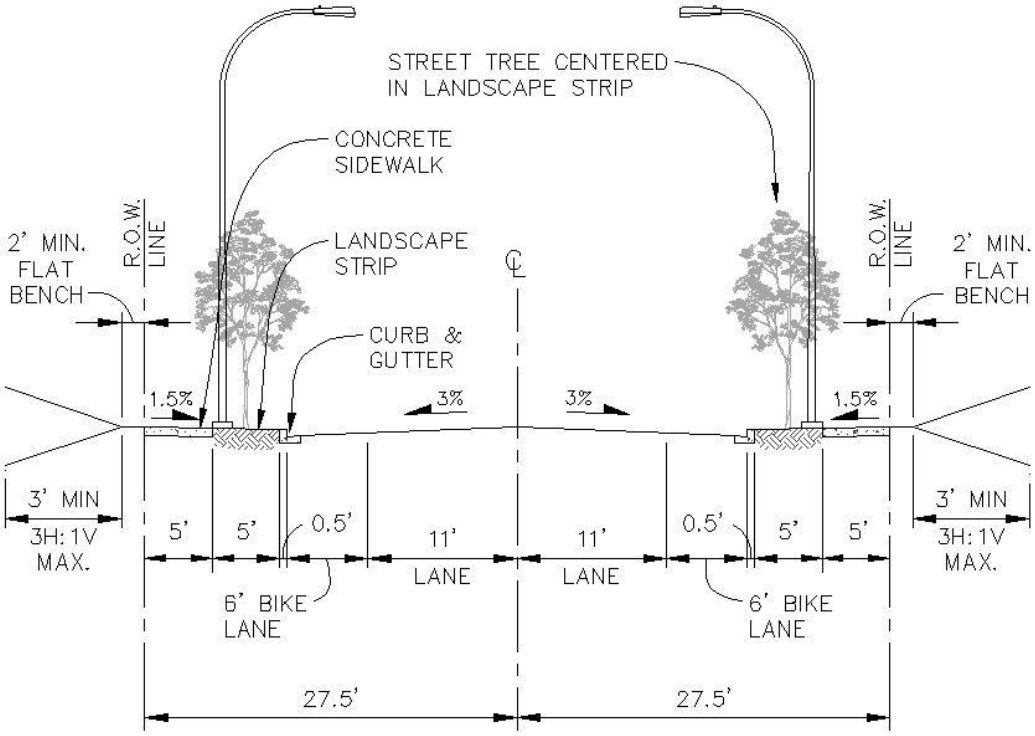

Figure 10-3 Minor Arterial Typical Cross Section

10.03.06.C Residential Collector

Residential collectors are used to connect local residential streets to arterial streets. Traffic using residential collectors is typically generated by single and multi-family residential neighborhoods, light commercial areas, neighborhood parks, and institutional use (schools, churches, community centers). Residential collectors are not intended to serve truck traffic or traffic between arterials. As residential collectors are intended to provide vital links in the City's non-motorized transportation network, they include bike lanes and sidewalks. The current standard configuration for residential collectors does not allow for parking on either side of the roadway. Direct access to residential collector streets from single family residential uses is discouraged but is allowed where no other access is available. Residential collector streets typically require a center left turn lane at an approach to an intersection with another collector or an arterial street. A center turn lane and/or median may be required on residential collectors in other circumstances as determined to be applicable by the City Engineer.

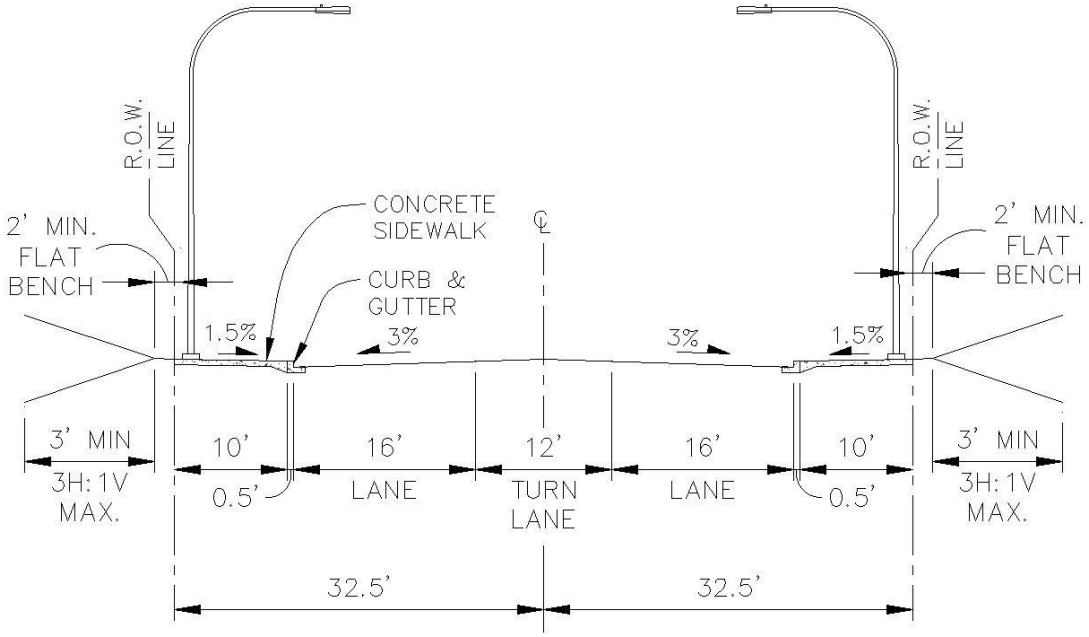

Figure 10-4 Residential Collector Cross Section

10.03.06.D Non-Residential Collector

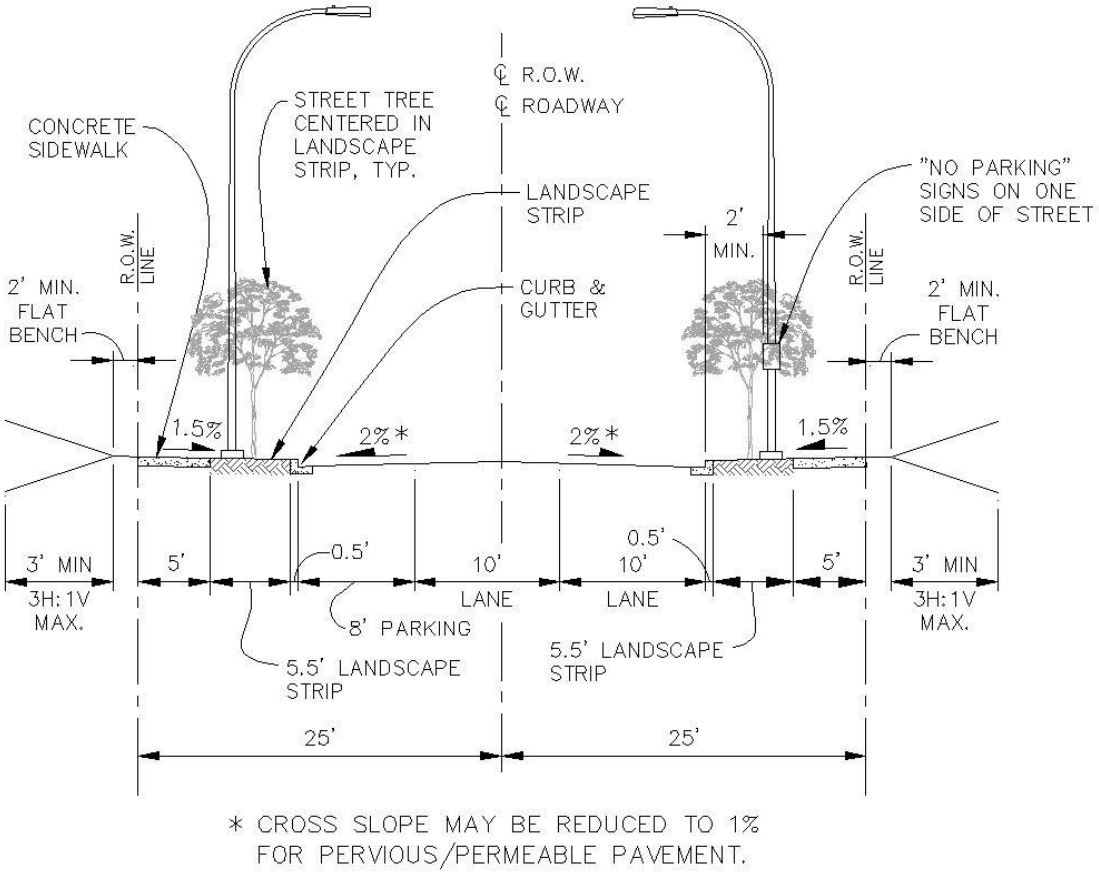
Non-residential collectors are used to connect local non-residential streets to arterial streets. Traffic using residential collectors is typically generated by industrial and heavy commercial land uses and therefore, are intended to serve truck traffic. Non-residential collectors are not intended to carry vehicular traffic between arterials. The current standard configuration for non-residential collectors does not allow for parking on either side of the roadway. However, there are many examples of existing non-residential collector streets built to previous standards that allow parking on one or both sides of the street. Non-residential collector streets have wide lanes to help facilitate turning movements for trucks.

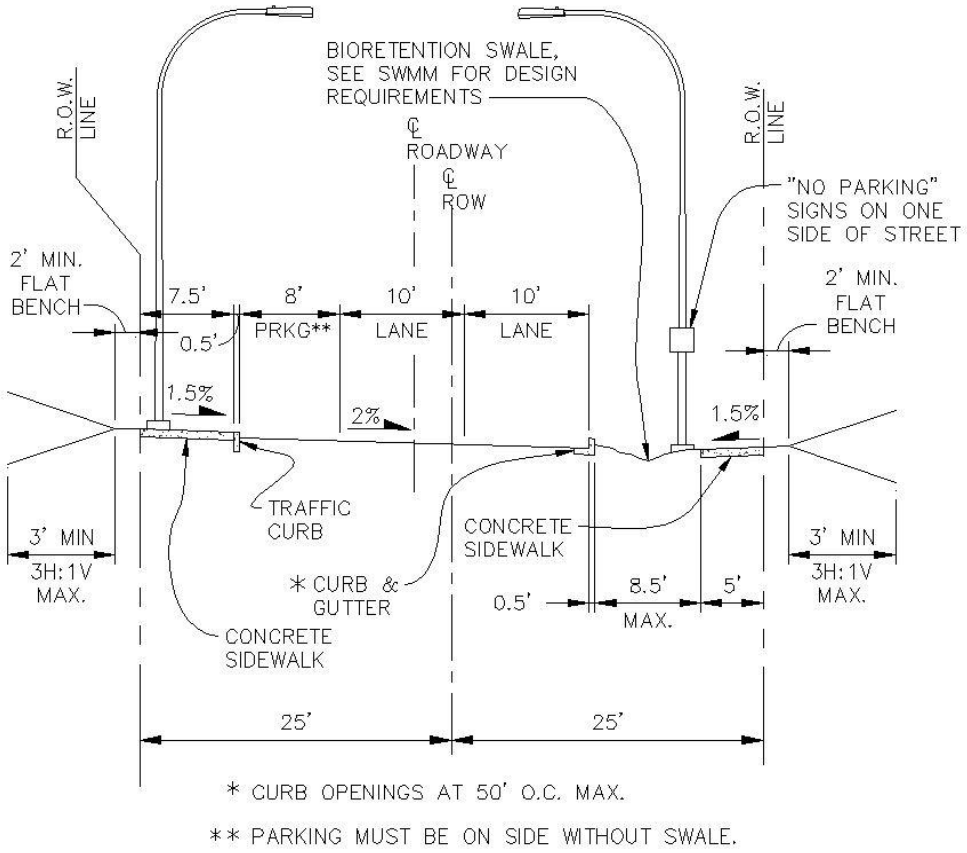
Figure 10-5 Non-Residential Collector Cross Section

10.03.06.E Local Residential

Local residential streets provide access to abutting residential land use and are designed to convey residential traffic to higher classification streets. A local street network usually carries no through traffic and includes a series of short interconnected streets and cul-de-sacs. Local residential streets are not intended to serve truck traffic or through traffic. Local residential streets provide non-motorized connections from residential dwelling units via sidewalks and the roadway. The current standard configuration for local streets allows for parking on one side of the roadway. Local streets are not striped with lane markings except as directed by the City Engineer.

Figure 10-6 Local Residential Cross Section





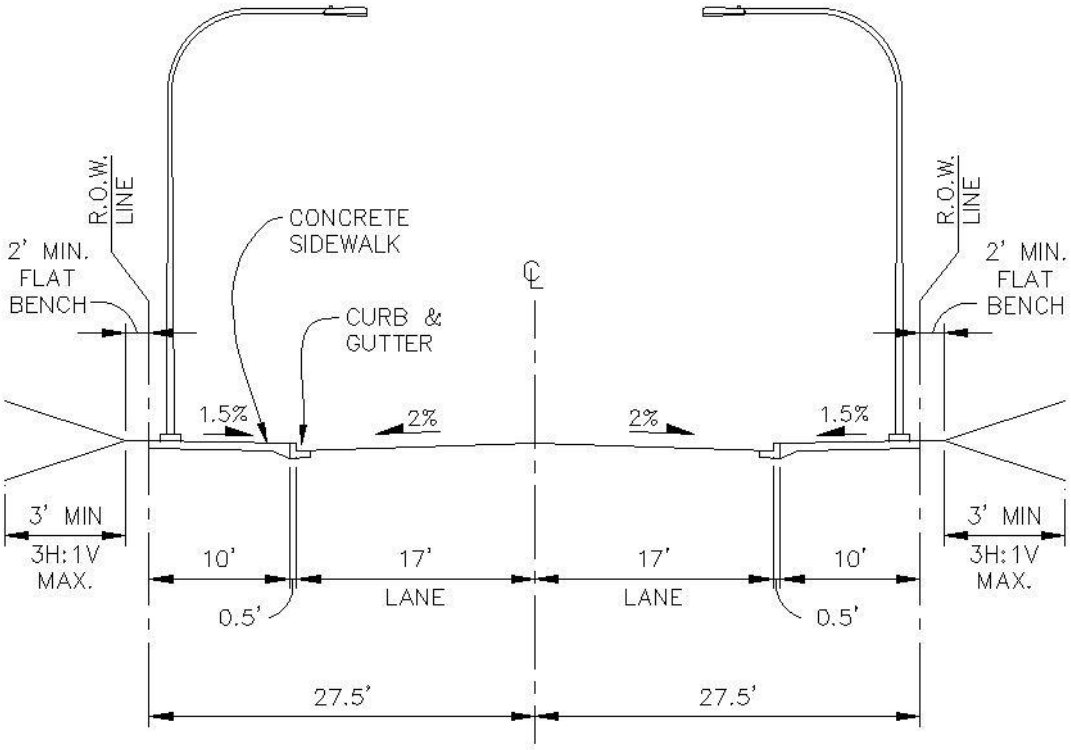


Figure 10-6A Local Residential Cross Section – Alternate w/ Bioretention Swale

10.03.06.F Local Non-Residential

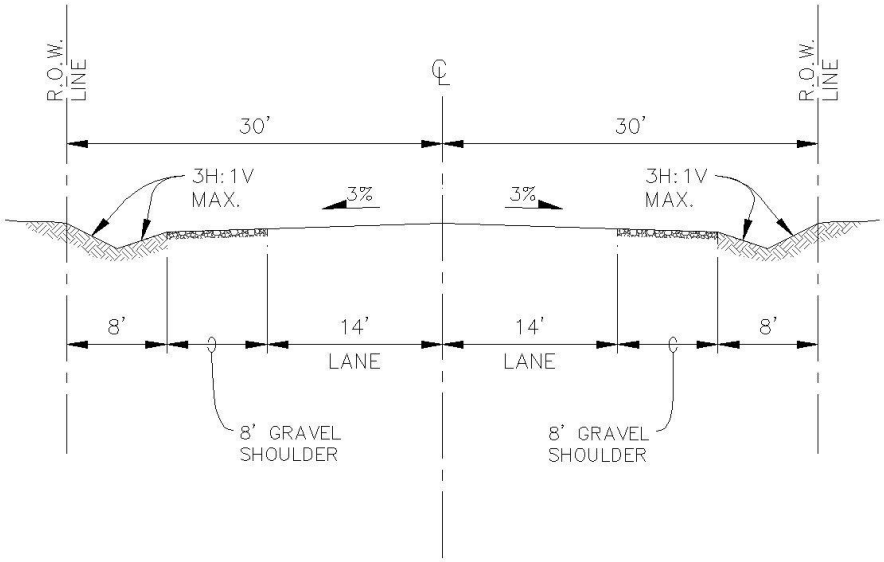
Local non-residential streets provide access to abutting heavy commercial and industrial land uses and are designed to conduct traffic between those uses and higher order streets. A local non-residential street usually carries no through traffic and includes a small network of short interconnected streets and cul-de-sacs. The wide lanes of local non-residential streets are intended to serve the turning movements of truck traffic. Parking is typically not allowed on local non-residential streets and the street is marked with a centerline.

Figure 10-7 Local Non-Residential Cross Section

10.03.06.G Rustic Streets

Rustic streets serve the City's residential conservancy zoning designation. For additional information regarding the context of these roads, see the CTP. Rustic collectors are a type of residential collector street. Rustic residential streets are a type of local residential streets.

Figure 10-8 Rustic Collector Cross Section



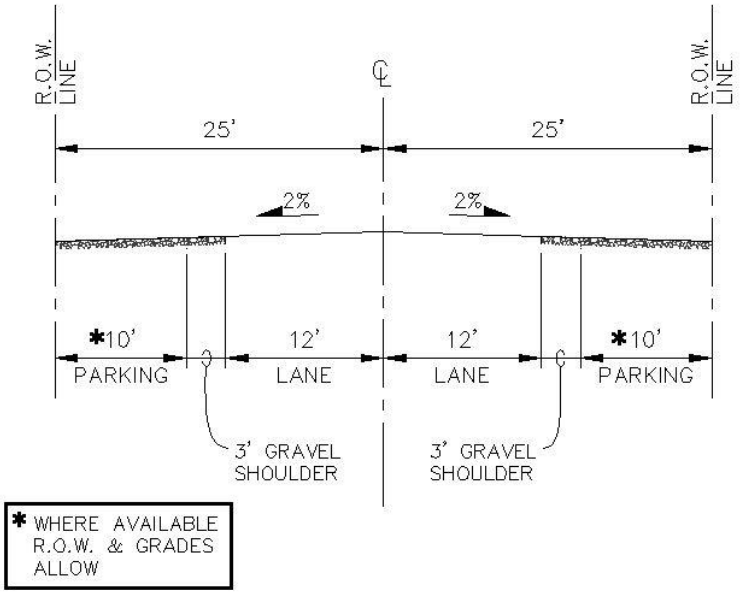


Figure 10-9 Rustic Residential Cross Section

10.03.07 Alleys

Alleys provide vehicular access to abutting properties and are not intended for general traffic circulation. Dead-end alleys are generally unacceptable; however, where dead-end alleys are determined suitable by the City Engineer, for short term or temporary applications, they shall be provided with adequate turnaround facilities at the dead-end. All new alleys shall be private. New alleys and existing alleys being improved shall meet the following requirements:

A. Minimum width of 20 feet of asphalt pavement.

B. Curb and gutter, sidewalk, lighting, and landscaping are not required along alleys.

C. Alleys may be paved with either a crown at centerline with asphalt wedge curbs on both sides to control drainage or be sloped to one side with an asphalt wedge curb on one side to control drainage. When necessary, storm drainage conveyance systems shall be installed along the alley to address storm drainage runoff from the paved surface.

D. Alleys shall connect to City streets via a commercial driveway apron. Alleys serving alley loaded lots shall include provisions for unimpeded vehicular circulation along the alley, and provisions for adequate sight distances along both the alley at driveways and at intersections with public streets.

10.03.08 Private Streets

The City Engineer will determine on a case-by-case basis whether or not a private street will be allowed. Private streets are generally discouraged and will only be considered for approval by the City Engineer under the following circumstances:

A. The street does not provide a current or future planned connection between public roadways.

B. The street does not provide current or future access to properties other than those whom would own the private street.

C. The street would not result in land locking present or planned parcels.

D. The street would only serve a single planned single family residential short subdivision, apartment, townhome, condominium, industrial, or commercial development project. Private streets are not allowed for residential subdivisions not meeting the definition of “Short Subdivision” per ACC 17.04.330.

E. The street would connect directly to a public street.

Roadway geometrics of private streets will be in conformance with the street standards that most closely reflect their intended use, with a minimum of 36 feet of pavement width or 28 feet of pavement width with a marked fire lane on one side.

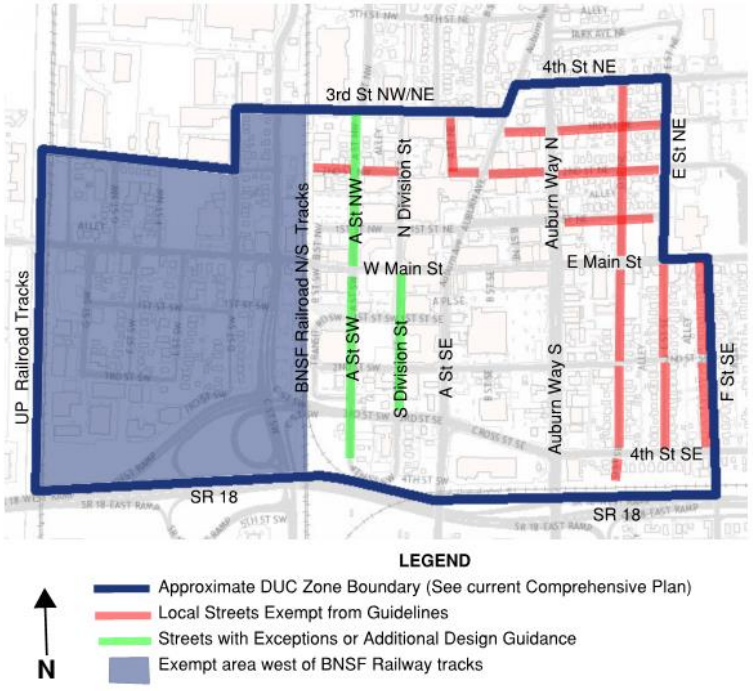
Private streets shall be located within permanently established tracts or easements. A capable, legally responsible owner or homeowners’ association shall be established to maintain private streets. A plat or short plat with private streets requires an executed recorded Private Street Maintenance Agreement and a Storm Water Easement and Maintenance Agreement that obligate the future property owners to maintain the infrastructure indefinitely.

10.03.09 Downtown Urban Center Standards

Streets in the downtown urban center (DUC) zone, as defined in the Comprehensive Plan zoning map, require sidewalks, street lights, street corners, crosswalks, and traffic signals that differ from other streets. In 2007, the City Council passed Resolution 4271 that approved and adopted for inclusion into the Engineering Design Standards the Auburn Sidewalk Design Guidelines (Guidelines). Since then, the Guidelines have been revised in consultation with the Downtown Redevelopment Committee (formerly a committee of City Council members) and at various Council Study Sessions. The Guidelines are included in the sections referenced below and are no longer a separate document:

A. Sidewalks, Street Trees, Driveway Transitions, and Street Corners (See **Section 10.09.01 and Section 10.12**)

B. Crosswalks (See **Section 10.09.06**)



C. Street Lighting (See **Section 10.16.03**)

D. Traffic Signals (See **Section 10.21.12**)

Where the DUC zone boundaries are shown along or within a street, the Guidelines apply to both sides of the street and extend to the curb returns of the exempt street. **Figure 10-10** illustrates the DUC zone and the applicability of the Guidelines within it. All local streets, except N. Division Street and B Street NW, are exempt from the Guidelines. South Division Street from 3rd Street SE/SW through W Main St, also referred to as the "Promenade" and incorporates specialized sidewalks and pedestrian crosswalks that vary from the Guidelines.

Additionally, in the DUC zone, street cross sections generally have one travel lane in each direction and parking on both sides of the street, regardless of the street classification.

Figure 10-10 Downtown Sidewalk Design Guidelines Applicability Map

10.04 Road Design Geometrics

10.04.01 Sight Distance

Minimum sight distance requirements are to be determined using the current edition of AASHTO's "A Policy on Geometric Design of Highway Streets". Roadway geometry shall be designed such that sight lines are unobstructed and within right-of-way, tract, or sight distance easement. Where AASHTO provides guidance for both a "desirable" sight distance and a "minimum" sight distance, the "desirable" sight distance shall be the City's required sight distance. Sight distance calculations supporting the roadway design geometrics shall be included in the plans.

10.04.02 Posted and Design Speeds

Posted speeds for new arterial and collector roadways shall be determined by the City Engineer and Comprehensive Transportation Plan policies. Posted speeds for new non-arterial or collector roadways and the design speeds for all existing roadways shall be per **Table 10-3**.

Table 10-3 Existing Road Design Speeds

	Arterial and Collector Streets	Local and Rustic Residential	Local Non-Residential	Shared Driveway Access Roads and Alleys
Posted Speed (mph)	Varies	25	30	Not Posted
Design Speed (mph)	Posted + 10 mph or 85th percentile per a speed study conducted within 1-year, whichever is greater.	30	35	15
Reduced Design Speed (mph)*	N/A	20	25	N/A

* Reduced design speed may be used within 150 feet of the following:

1) Permanent dead end

2) Permanent cul-de-sac

3) End of road @ T-Intersection

4) On stop controlled approach to local/local Intersection

5) On approaches to local/local intersection with a traffic circle (design speed justification documentation required)

10.04.03 Curves

Design calculations supporting the design of roadway curves shall be included in the plans.

Horizontal curves shall be designed to provide the minimum radii required for vehicles to safely negotiate a turn without leaving their driving lane and shall in no case violate minimum sight distance requirements.

Sections of straight roadway must be designed between curves to avoid quick left-right transitions that could potentially lead to loss of vehicular control. Where reverse curves are superelevated, tangents between curves shall be of sufficient length to accommodate

transitions into and out of the superelevated sections per AASHTO.

Vertical curves are required where a change in vertical alignment equals or exceeds a 1% algebraic grade difference. Crest vertical curves shall be designed to provide the required minimum stopping sight distance for the streets design speed. Sag vertical curve lengths shall be designed to provide headlight sight distance equal to or greater than the design speed stopping sight distance. All vertical curves must be symmetrical, parabolic, and meet AASHTO standards.

10.04.04 Vertical Grades

Table 10-4 Vertical Grades by Roadway Type

	Arterial	Collector & Local Non-Residential	Local Residential & Rustic Residential	Shared Driveway Access Roads & Alleys
Maximum Vertical Grade	6%	8%	8% (may be increased to 10% without deviation where all other geometric design requirements are met)	10% (may be increased to 12% without deviation in access roads without existing or planned public utilities)
Minimum Vertical Grade	0.5%	0.5%	0.5%	0.5%

Deviations to the maximum allowed vertical street grades of arterial and collector roadways shall generally not be granted unless it can be demonstrated that, and the City Engineer determines that, the public benefits significantly outweigh any potential detriments.

Deviations will only be considered for up to an 8% maximum grade for arterials and a 10% maximum grade for collector streets. If approved, deviations for roadway grades above 8% may trigger the additional following design considerations, as determined to be necessary by the City Engineer:

A. Increased travel lane widths

B. Enhanced Paving Section

C. Incorporation of Separated Multi-use trail

D. Incorporation of Median Islands

E. Enhanced Intersection/Signal Improvements

10.04.05 Cross Slopes

Cross slopes shall be as shown in the typical cross sections except roads with vertical grades of greater than 6% where cross slopes may be increased up to 3% and cross slopes of roadways constructed with pervious/permeable pavement may be reduced to 1%. Superelevation design shall be per AASHTO.

Intersections shall be designed to drain away from the higher classification street. Grades shall match at the center of intersections for equal classification streets. At intersections of differing classification streets, the crown shall be carried through the intersection for the higher classification.

10.04.06 Intersection Landings

The intersection landing approach is a defined segment of the street before the intersection and is measured back from the point of tangency of the curb radius on each approach to the intersection. Minimum requirements for intersection landings are shown in **Table 10-5**. Minimum requirements for driveway landings, which include landings for shared driveway access roads and alleys, are included in **Section 10.08.05**.

Table 10-5 Intersection Landing Requirements

	Arterial	Non-Arterial Roadways	Shared Driveway Access Roads & Alleys
Minimum Landing Approach Length (ft)	30	20	12
Maximum Landing Approach Grade	3%	5%	5%

10.04.07 Curb and Right-of-Way Radius

Table 10-6 lists minimum required curb and right-of-way radii. Intersections serving transit routes require analysis to determine if increased radii is needed. The analysis will demonstrate that busses may execute a right turn at 9 mph without crossing lanes or encroaching onto the adjacent curb. The design vehicle will be the largest bus expected currently or planned to be utilized at the intersection. The City Engineer may determine that additional right-of-way is required at or near intersections to accommodate auxiliary traffic lanes and equipment for existing or future traffic signals and street lights. At intersections with two different street classifications, the highest classification for curb radii shall be used except at intersections with local residential streets where the lowest order street shall be used.

Table 10-6 Minimum Curb and ROW Radii

Roadway	Minimum Intersection ROW Radii (ft)	Minimum Intersection Curb Radii (ft)
Principal Arterial	29.5	40
Minor Arterial	24.5	35
Residential Collector	14.5	25
Non-Residential Collector	19.5	30
Rustic Collector	17	30
Local Residential	9	20
Local Non-Residential	19.5	30
Rustic Residential	7	20

10.05 Pavement Design

Pavement design of public streets is based on the street classification per the CTP, subgrade conditions, and whether or not the street is on a transit or freight route. Pavement design of private streets will be in conformance with the street standards that most closely reflect their intended use. Roadway paving shall be asphalt except where cement concrete is approved by

the City Engineer.

10.05.01 Simplified Asphalt Pavement Design

The simplified pavement design approach described in this section may be utilized as a simplified approach to determine the required pavement section except for the following streets for which pavement sections must be designed per the current AASHTO design procedure:

A. Principal arterials

B. Designated transit and freight routes per the CTP

C. Streets where subgrade California Bearing Ratio (CBR) values are less than 3

This simplified approach has been developed so that extensive data and computer analysis is not necessary for developing pavement designs for most projects. The approach requires determination of the street's subgrade conditions and street classification which are then utilized to determine the required pavement design section. The California Bearing Ratio (CBR) shall be used to classify existing subgrade soils as poor, medium, good, or excellent.

The subgrade under the proposed street shall be evaluated by an independent testing laboratory or geotechnical firm to determine the CBR of the subgrade. The proposed roadway shall have a minimum of one test for every 1,000 feet of road and/or for every obvious change in subgrade material. With approval from the City Engineer, or designee, other information such as soils testing data from adjacent projects and field observations may be utilized instead of testing where, in the opinion of the City Engineer or designee, the information provides sufficient data to classify the soil type.

Table 10-7 Simplified Asphalt Pavement Section Design Chart

	Soil Type			
Street Type	Poor (CBR 3-5)	Medium (CBR 6-10)	Good (CBR 11-20)	Excellent (CBR >20)
Unpaved Utility Access Roads	2" CSTC 12" Base Course Geotextile Fabric	2" CSTC 8" Base Course	2" CSTC 8" Base Course	2" CSTC 8" Base Course
Alleys, Access Roads, Locals	6" HMA CL 1/2" 11.5" CSBC Geotextile Fabric	6" HMA CL 1/2" 7.5" CSBC	6" HMA CL 1/2" 4" CSBC	5" HMA CL 1/2" 4" CSBC
Collectors	7" HMA CL 1/2" 14" CSBC Geotextile Fabric	7" HMA CL 1/2" 9" CSBC	7" HMA CL 1/2" 6" CSBC	7" HMA CL 1/2" 4" CSBC
Minor Arterials	9" HMA CL 1/2" 18.5" CSBC Geotextile Fabric	9" HMA CL 1/2" 11" CSBC	7" HMA CL 1/2" 9.5" CSBC	7" HMA CL 1/2" 6" CSBC

10.05.02 AASHTO Asphalt Pavement Design

Engineered pavement designs may be utilized regardless of whether or not the simplified approach is applicable. Engineered pavement designs shall follow the latest "AASHTO Guide for Design of Pavement Structures" for flexible pavements except that the minimum asphalt pavement thicknesses shall apply:

Table 10-8 AASHTO Pavement Design Minimum Require Asphalt Pavement Thickness

Street Type	Minimum Asphalt Pavement Thickness
Local, Alley, Access Road/Tract	5"
Collectors and Arterials	7"

The subgrade under the proposed street shall be evaluated by an independent testing laboratory or geotechnical firm to determine the CBR and/or Resilient Modulus (M_r) of the subgrade for the pavement design. The proposed roadway shall have a minimum of one test for every 1,000 feet of road and/or for every obvious change in subgrade material. Documentation for these required tests shall be included in the Pavement Design Report.

For projects where a traffic analysis report was not required, to determine the amount of traffic for which a street is to be designed, contact the City to obtain the most recent street classification and traffic counts. Traffic counts are done assuming there is a 50/50 split in the direction of traffic. 100% of the 50/50 split must be assumed in the design lane, regardless of the number of lanes in each direction.

The existing traffic levels shall then be inflated to match the projected traffic at the end of the roadways design life (in most cases a twenty-year design life will be used). The annual rate of growth is 1.5% for residential streets and 3.5% for commercial/industrial streets and arterials streets. The minimum pavement section shall be as determined by the pavement design using the AASHTO pavement design approach with a 20-year service life except as limited by **Table 10-8**. The Reliability Level factors used in pavement design shall be in accordance with the following table:

Table 10-9 Pavement Design – Reliability Factors

Functional Classification	Required Level of Reliability	
	Urban	Rural
Principal Arterials	95	90
Minor Arterials	90	
Collectors	90	
Local	85	

10.05.03 Pavement Design Report

All pavement designs (whether per the AASHTO method or per the simplified approach) shall be documented in a Pavement Design Memorandum stamped and signed by a Professional Engineer and may be included in the project Geotechnical Report where applicable.

The report shall include a narrative of the site conditions, geotechnical boring logs, testing results, calculations, the pavement analysis, and applicable background information for review and approval. The report must contain all calculations regarding the pavement design, including spreadsheets, all variables and assumptions, as well as geotechnical engineering information on the subgrade soils.

10.05.04 Permeable Pavements

Pervious Cement and Asphalt Concrete Pavement must be designed by a professional engineer. The design shall be documented by a report that includes relevant calculations, data collection, and assumptions. The report must provide evidence that the permeable surfaces are designed to have at least a 30-year service life given the anticipated vehicle counts and vehicle classifications. The minimum pavement design section shall be as follows:

A. 6-inch-thick wearing course of porous asphalt or pervious concrete; over

B. 6-inch reservoir course (Permeable Ballast per Section 9-03.9(2) of the Construction Standards); over

C. Geotextile (Non-Woven, Moderate Survivability per Section 9-33.2(1) of the Construction Standards); over

D. Where treatment is required, and native subsoils do not meet water quality design criteria per the SWMM: 18-inch runoff treatment layer with specifications per the SWMM.

Permeable pavements shall be designed and constructed per the SWMM and the Construction Standards.

Pervious cement and porous asphalt concrete pavement within the public right-of-way shall not be utilized for storm water management of runoff from areas outside the public right-of-way.

10.05.05 Pavement Surface Restoration and Preservation

Restoration of pavement disturbed by trenching or other activities shall be per **Chapter 9**. When the total surface restoration area exceeds 1,000 SF feet, pavement core sample(s) are required to be collected in the required restoration area to determine the existing pavement thickness. The City Engineer, or designee, may waive or reduce the coring requirement where other information is available to determine the existing pavement thickness. This information could include, but is not limited to, as-built records, coring samples from other work at the same location, or observations made by the City during construction work at the same location. Where the existing pavement to be removed and replaced does not meet current City standards, the City Engineer, or designee, may determine that pavement replacement to meet City Standards is required. Minimum pavement restoration and widening width is 2 feet.

10.06 Roadside Design

10.06.01 Roadway Edge

Roadway edges shall be per the typical sections included in **Section 10.03.06**. Concrete curb and gutter shall be constructed per WSDOT Standard Plan F-10.12**.** Curbs that are not along stormwater flow paths shall be constructed as cement concrete traffic curb per WSDOT Standard Plan F-10.12. Rustic roads within the City may be designed with a gravel shoulder (minimum of 3 inches Crushed Surfacing Top Coarse (CSTC) over 8 inches of Gravel Base. Drainage inlets and grates along curbs shall be constructed per WSDOT Standard Plan F-10.16. Roadway edges without curbs shall include a marked fog line per **WSDOT Standard Plan M-20.10-04**.

10.06.02 Clear Zone – Lateral Separation from Fixed Objects

The following standards provide guidance for the required separation distance from roadway vehicle travel ways and fixed objects for many, but not all, roadways in Auburn. The following standards apply to all new or replaced facilities and do not obligate the City to retrofit or replace existing facilities for the sole purpose of meeting the standards below.

The City has adopted 4 feet as the minimum lateral separation from the edge of motor vehicular travel way to fixed objects for streets with vertical curbs within the urban environment. Utility and traffic signal poles along streets with vertical curbs within the urban environment, as defined in Chapter 10 of the AASHTO Roadside Design Guide require minimum 6 feet lateral separation from edge of motorized vehicular travel way. For the purpose of determining lateral separation, the distance from the edge of vehicular travel way on streets with on-street parking or bike lanes is measured from the edge of the parking area or bike lane along the motor vehicle travel way.

Under many conditions, additional lateral separation shall be required to provide adequate clear zone per the AASHTO Roadside Design Guide. These conditions include, but are not limited

to: streets without vertical curbs, horizontal curves, proximity to driveways, high design speeds (in excess of 45 mph), merge locations, crash history, roadways that are not built per existing City standards, and other conditions as deemed applicable by the City Engineer. Reduced minimum lateral separation along roadways with design speeds of 35 mph or less is allowed for street trees centered within landscape strips and for mailboxes. Minimum lateral separation from the face of curb to any roadside object (regardless if fixed or non-fixed) is 2 feet.

10.06.03 Traffic Barriers

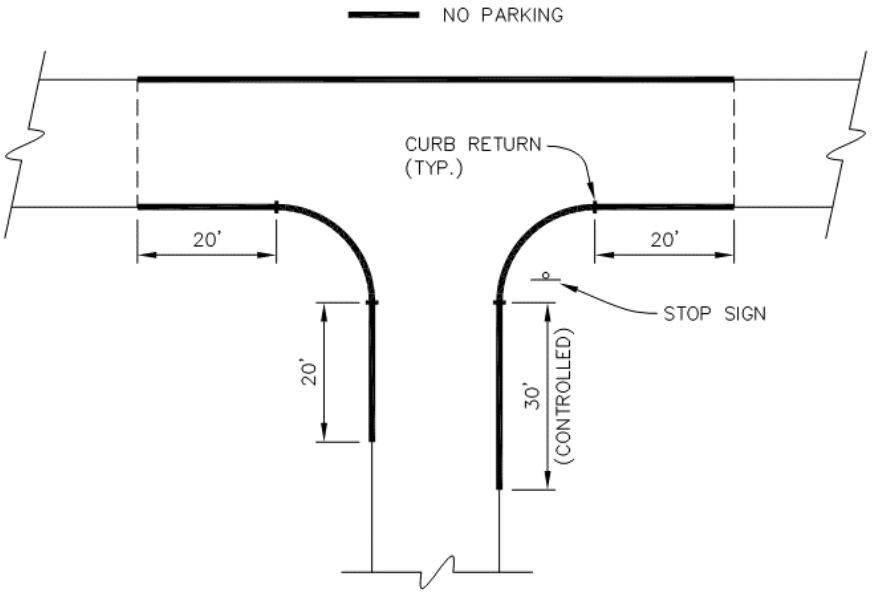
Evaluation of roadside conditions, including embankments, for traffic barriers, including guardrail installations, shall be in accordance with the WSDOT Design Manual.

Guardrail installations shall conform to WSDOT Standard Plan C-1, Beam Guardrail Type 1. End anchors shall conform to WSDOT Standard Plan C-6, Beam Guardrail Anchor Type 1.

10.07 On-Street Parking

On-street parking is generally not allowed on arterial, collector, and local non-residential streets. For Local Residential streets where parking is allowed on one side only and there are landscape strips present on both sides of the road, the parking shall be placed on the side of the street that can accommodate the most parking. Pavement parking space demarcations shall not be used except as directed by the City Engineer.

Parking is not allowed at any of the following locations. Signage, curb, and pavement markings are not required to establish these restrictions except as determined otherwise by the City Engineer, or designee, or as specified otherwise below:



A. Within fire lanes. Fire lanes shall require pavement marking and/or signage.

B. Within 20 feet of an uncontrolled intersection measured from the point of tangency on the entering curb radius.

C. Within 30 feet of a stop, yield or signal controlled intersection measured from the point of tangency on the entering curb radius.

D. Within any intersection. For “T” intersections, the no parking limits shall apply to both sides of the through street (top of the “T”). See **Figure 10-11** below.

Figure 10-11 - T-Intersection Parking Restrictions

E. In front of or within 15 feet of each side of a fire hydrant.

F. In front of or within 5 feet of each side of a driveway.

G. Where mid-block crosswalks are installed, no parking shall be allowed on either side of the street within 50 feet in advance of the nearest edge of the crosswalk and within 20 feet past the furthest edge of the crosswalk. In no case shall the advance parking restriction for crosswalks be less than the minimum stopping sight distance of the roadway.

Additional parking restriction may be required depending upon roadway geometrics, adjacent land use, and the proximity to bridges and railroads.

No parking signage shall be per **City of Auburn Standard Detail T-40**.

10.08 Driveways

Construction of driveway access to the public street right-of-way requires prior approval by the City Engineer, or designee. Connection between the driveway and street shall be with a driveway apron per **City of Auburn Standard Detail T-34 or T-35** except a driveway connection to a street that does not have curb/gutter and sidewalk may be with an apron constructed of the same material, thickness, and strength as the street with tapered corners that accommodate the largest vehicles anticipated to utilize the driveway apron.

Work that requires any portion of a driveway apron to be replaced triggers the requirement to upgrade/replace the entire driveway to meet ADA standards.

10.08.01 Number of Driveways

Regardless if a project includes one or multiples parcels, it is limited to one driveway access to a City street (including alleys) with the following exceptions:

A. Single family residential subdivision projects are allowed one driveway access to each single family residential parcel when all of the driveway accesses for the project are to a local residential roadway, alley, or a shared access tract/driveway.

B. Additional driveway(s) may be provided to satisfy International Fire Code Requirements IFC). These additional driveways are subject to the requirements of Emergency Vehicle Access Driveways per the IFC and these Engineering Design Standards. See **Section 10.08.10** for emergency vehicle access driveway requirements.

Subdivisions with a driveway access to a roadway classified higher than local residential or for non-single family residential projects shall be limited to a single access tract/driveway for the entire subdivision.

10.08.02 Driveway Classifications, Widths, and Spacing

Driveway spacing shall be per **City of Auburn Standard Detail T-04**. When the minimum spacing is not obtainable, to address safety concerns, or to mitigate impacts of traffic flow, the City Engineer, or designee, may determine that two contiguous parcels require a single driveway centered on the property line.

Driveway widths are measured across the driveway apron, excluding driveway wings/ramps. Spacing between driveways is measured from the limits the driveway apron wings/ramps.

Residential Driveway – A driveway serving one single family residential property or a duplex is a residential driveway. Residential driveway aprons width is 11 feet minimum and 18 feet maximum.

Commercial/Industrial Driveway - A driveway serving a commercial, industrial, or residential with 3 or more dwelling units (except accessory dwelling units) parcel is a commercial/industrial driveway. Commercial/Industrial driveway aprons shall be 24 feet wide except, the City may require commercial/industrial driveways along arterial roadways to be wider to accommodate the largest types of vehicles frequenting the parcel (design vehicle). These driveways shall be designed to accommodate design vehicle egress/ingress such that the design vehicle can make its turning movements without dragging outside the apron, does not swing into opposing traffic lanes, and can enter the driveway while another design vehicle is waiting at the driveway to exit. In these cases, design vehicle justification and turning templates are required.

Shared Driveways – A driveway serving two or more residential or commercial/industrial parcels is a shared driveway. See **City of Auburn Standard Detail T-31** and **Section 10.08.07**.

10.08.03 Driveway Lay Out

Driveways and on-site parking, other than that for single-family residences on local residential street or alleys, shall be designed such that vehicle-backing maneuvers will not occur onto the street. A properly designed driveway shall allow the largest typical vehicle that will use the driveway (i.e., tractor-trailers at large warehouses, delivery trucks at mini marts) to enter and exit the site without encroaching into opposing traffic lanes, including two-way left turn lanes.

When designing site layout and driveway access, internal circulation shall be such that on-site traffic will not backup the driveway impeding vehicles in the public street. The City may require

sites with internal traffic congestion to design driveways with long throat lengths to provide extra storage to avoid impacting City streets.

Per ACC 18.52.050, commercial and industrial driveways shall have at least a 40 foot throat from the street (not be intersected by parking aisle, parking space, or another access driveway for a minimum distance of 40 feet from the street right-of-way). The City Engineer may require additional throat distance or may allow less throat distance with the consideration of the following: classification and volumes of street from which access is being taken, total number of parking stalls, design vehicle for parking lot, size of parcel and parking area to which the driveway is providing access, and queueing analysis. If a gate is proposed across a driveway it shall be located a minimum distance of the largest vehicle accessing the site (excluding emergency vehicles), measured from the right-of-way line, unless there is adequate room for parking outside the travel lane(s) without blocking non-motorized facilities.

Driveways connecting non-single family residential development to non-local roadways shall accommodate waste management and other service vehicles serving the development such that the service vehicles do not stop on the roadway (they enter the site, perform services, and exit the site).

10.08.04 Driveway Locations

When a property has frontage on two or more streets (or alleys), the driveway will be located on the lowest classification of street (or alley).

Driveway accesses with any portion of the driveway (including wings) within the "Functional Intersection Boundary" shall be either prohibited or restricted. See **Table 10-10** and **Figures 10-12** and **10-13.** Single family residential driveways on local residential streets are exempt from functional intersection boundary requirements.

The functional intersection boundary is the portion of the street leading up to the intersection required to allow vehicle movements and storage. This is the area where drivers identify the situation, change lanes, come to a stop, and wait before proceeding through the intersection. The functional length of an intersection is measured from the point of curvature/point of tangency (PC/PT) of the curb return. Driveway restrictions include prohibiting either all left turn movements, left turns from, or left turns to the subject driveway.

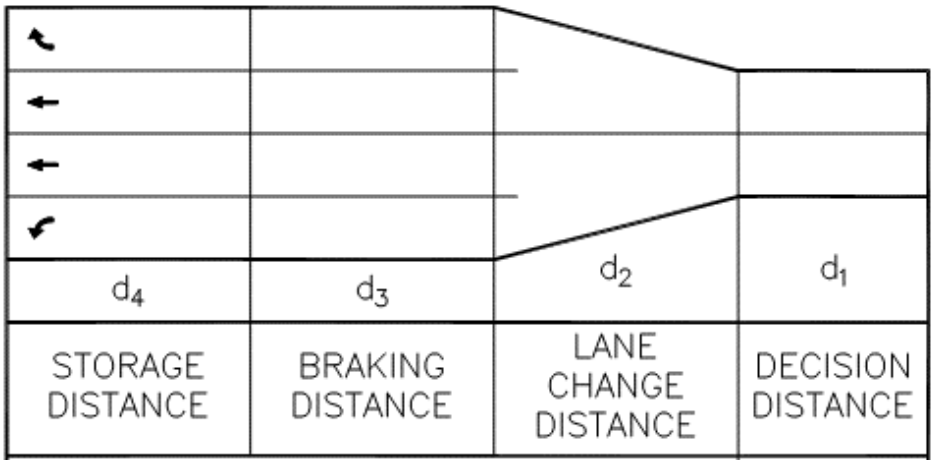
The City Engineer may also impose driveway restrictions at other locations when a safety hazard is identified or to mitigate impacts to traffic flow along a classified street. Such restrictions shall be incorporated into the design of the driveway in a manner that strives to maintain existing access turning movements to other adjacent properties.

Table 10-10 Distance Requirements for Functional Intersection Boundaries

Posted Speed (mph)	Speed (ft./sec)	Reaction Time (sec)	Decision Distance (ft.) "d_1"	Lane Change Distance (ft.) "d_2"*	Braking Distance (ft.) "d_3"	Storage Length (ft.) "d_4"	Distance A (Approaching) (ft.)	Distance A (Departing) (ft.)	Distance B (ft.)
25	37	1.0	37	25	60	50	135	80	172
30	44	1.0	44	40	86	50	176	107	220
35	51	1.0	51	60	118	100	278	140	329
40	59	1.0	59	85	154	100	339	179	405
45	66	1.0	66	105	194	100	399	216	465

* For single lane approaches where a lane change is not possible, "d_2" should be omitted.

Figure 10-12 Functional Length Diagram of an Intersection with Right and/or Left-Turn Lane



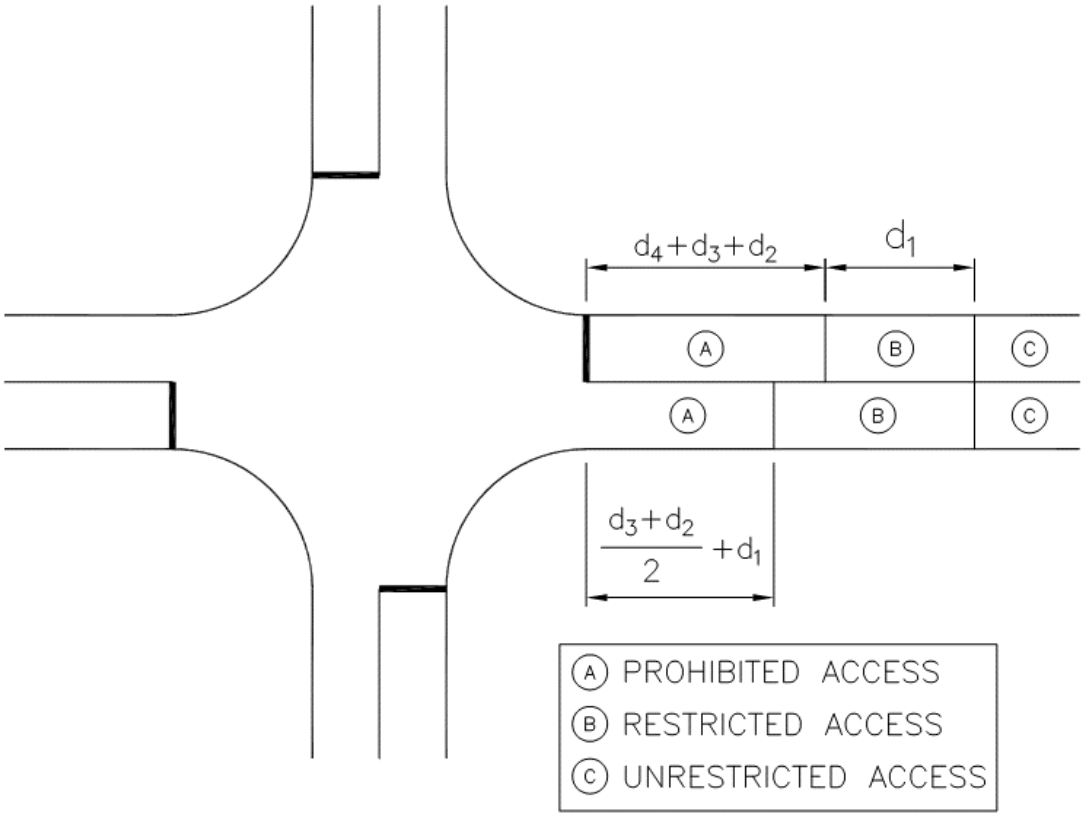


Figure 10-13 Functional Intersection Boundary Restricted Access Diagram

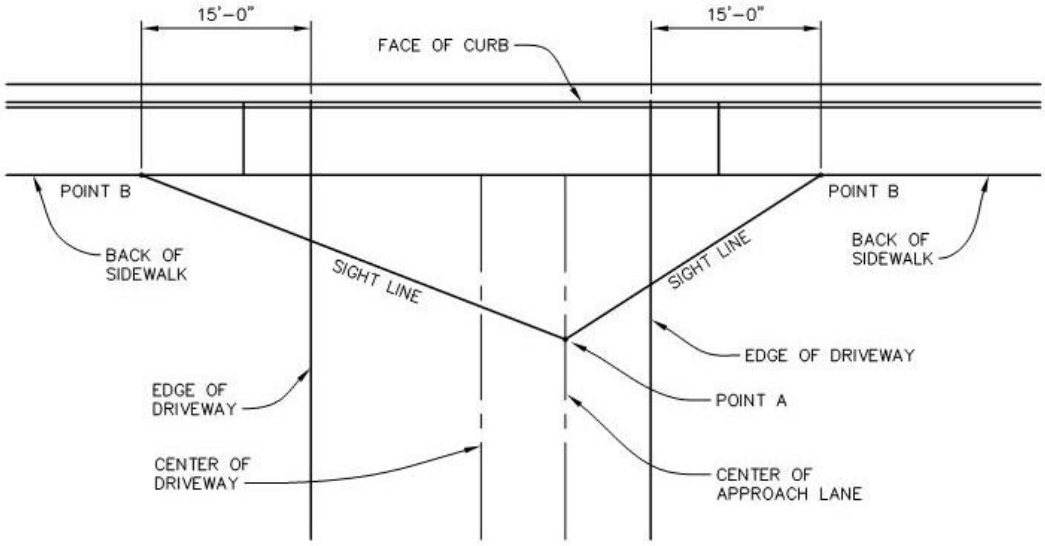
10.08.05 Driveway Alignment (Horizontal and Vertical)

The angle between the centerline of a driveway approach and the edge of a street travel way shall not be less than 85 degrees or greater than 95 degrees unless a “pork chop” or other

access control device is allowed. Where the edge of the roadway is curved, such as in cul-de-sacs, the angle will be measured from the tangential line to the travel way edge at the intersection of the driveway approach centerline.



The vertical grade behind the driveway apron shall not exceed 5% for a distance of 12 feet beyond back of sidewalk or right of way line except for the alternate driveway type per **City of Auburn Standard Detail T-35** where the 5 foot driveway ramp grade may be up to 10%. Driveways shall be designed to preclude vehicles from dragging when entering or exiting the site.

10.08.06 Driveway Sight Distance

Minimum sight distance requirements for driveways are to be determined using the current edition of the WSDOT Design Manual M 22.01.22 (Chapter 1340). Easements may be required to meet sight distance requirements.

The minimum sight distance for pedestrian safety shall be as shown in **Figure 10-14** and determined as follows: The driver of an exiting vehicle shall be able to view a one-foot-high object 15 feet away from the edges of the exiting lane or lanes, measured at the back of the sidewalk, when the driver's eye is 14 feet behind the back of the sidewalk.

Figure 10-14 - Pedestrian Sight Distance

10.08.07 Shared Driveway Access Roads

Residential shared driveway access roads may serve a maximum of 6 residential units except where a proposed single family residential unit, to be located on an existing lot, would exceed this threshold. Shared driveway access roads are privately owned and shall be maintained by the property owners who use them to access their property or as otherwise stipulated in the tract easement dedication documents or private agreements. Maintenance of shared driveway access roads shall not be the responsibility of the City.

Shared driveway access roads shall include storm drainage facilities in accordance with these standards. Shared driveway access roads shall have only a single connection to the

public/private roadway, except where an additional gated access exclusively for emergency vehicles and/or maintenance vehicles may be allowed.

The following requirements apply to shared driveway access roads except that one or more of the requirements may be waived by the City Engineer, or designee, for development of a single-family residence on an existing platted lot that only has access to an existing shared driveway where inclusion of the requirement would require additional property rights beyond the applicant's control, modification of existing building(s) and structure(s), impacts to critical areas, or other reason as deemed acceptable by the City Engineer:

A. **Easement/Tract Width:** Set within dedicated and recorded easement or tract with a minimum width of 22 feet for access roads serving 2 or less residential units, 26.5 feet for access roads serving 3 or more residential units, 35 feet for access roads serving commercial use(s), and 41 feet for access roads serving industrial use(s).

B. **Pavement Width:** Minimum asphalt pavement width of 20 feet for access roads serving residential unit(s), 24 feet for access roads serving commercial uses, and 30 feet for access roads serving industrial uses.

C. **Turnaround:** All access road ends that are 150 feet or more from the connection to the public/private roadway connection shall include turnarounds. If a hammerhead configuration is utilized for the turnaround, it shall be designed per Figure D103.1 in Appendix D of the International Fire Code or equivalent as determined to be acceptable by the City Engineer, or designee. If a cul-de-sac is utilized for the turnaround, it shall be designed per the City of Auburn Design Standards. The turnaround area must be paved and lie entirely within the access tract or easement.

D. **Length:** Maximum length of 600 feet as measured along the centerline of the access road to the centerline of the street to which the access road connects. Where an access road has multiple centerlines (due to a "T" or other discontinuous configuration, the total length is measured along all centerlines of the access road).

E. **Grades/Curves:** Geometrics per **Section 10.04**.

F. **Sidewalks:** Shared driveway access roads that serve 2 or less residential units or provide emergency access only do not require sidewalk along the access road. Access roads serving 3 or more residential units require sidewalk, curb and gutter along one side of the access road. Access roads serving commercial or industrial property(s) require sidewalk, curb and gutter along both sides of the access road. The minimum sidewalk width shall be 5 feet (not including curb) and shall be separated from the vehicular egress/ingress with curb and gutter. Where sidewalks are required and the residential units are along only one side of the access road, the sidewalk shall be placed on the side of the road with the residential units.

G. **Signage:** Identified as a fire lane with pavement markings and/or signage per ACC 10.36.175(E) such that a minimum clear width of 20 feet, free of parked vehicles or other obstructions, is provided. Signed as private drives inclusive of all addresses being served off the access road per **City of Auburn Standard Detail T-26**.

H. Edges of access roads without curb/gutter and sidewalk will have an asphalt wedge curb per **City of Auburn Standard Detail T-41**, along the edge(s) to which the roadway drains, if any. Wedge curb may be excluded/modified as required to accommodate drainage facilities serving the access road. Where

curb, gutter, and sidewalk are present along the shared access road, driveway connections to property(s) from the shared access road shall be by residential driveway apron.

I. Driveway connections to property(s) on the access tract are configured such that vehicles backing out of the driveway are able to turn around without entering another property.

10.08.08 Controlled Driveways

Where a driveway connection meets a signal warrant that cannot be addressed without a signal or roundabout, the City Engineer may allow signalized or roundabout access to a public street from a private access. In such situations, dedication to the City of any right-of-way necessary for maintaining and operating the intersection will be required. Additional mitigation measures may be required to ensure safe and efficient access to the public street. The private leg of the intersection within the right-of-way shall be designed to the applicable public street standard as determined by the City Engineer.

10.08.09 Restricted Access Driveways

Restricted Access Driveways are used to restrict turning movements out of or into driveways. Turning restrictions at driveway locations shall be by one or more of the following methods as deemed appropriate by the City Engineer, or designee:

A. Median Islands

B. Mountable Curbs

C. Pork Chops

D. Signage (turn restriction signage must be placed in the right-of-way)

10.08.10 Emergency Vehicle Access Driveways

Local street networks with over 30 dwelling units that do not have more than one street connection to a collector or arterial roadway are required to have a second access from the local street network to a collector or arterial via an emergency access driveway. The emergency vehicle access must be gated and restricted to emergency vehicles only with a knox lock. Non-motorized access may also be provided at the emergency vehicle access. Emergency access roadways shall meet the requirements for shared access driveways.

10.09 Sidewalks

Streets shall include sidewalks as shown on the typical sections in **Section 10.03** and as designated in the CTP. The City Engineer may determine that sidewalk widths that differ from the typical sections and CTP are required.

Sidewalks with landscape strips shall be per **City of Auburn Standard Detail T-13**.

Sidewalks without landscape strips shall be per **City of Auburn Standard Detail T-15**.

Pervious sidewalks shall be per **City of Auburn Standard Detail T-14**.

10.09.01 Downtown Sidewalks

The following requirements apply to sidewalks subject to DUC zone guidelines:

A. Shall be per **City of Auburn Standard Detail T-15** and will also include a 2-foot x 2-foot square scoring pattern with a light broom finish with minimal scoring depth to allow for easy cleaning.

B. Shall be a minimum of 10 feet in width except sidewalks along A Street NE/NW may be 7 1/2 feet wide at some locations, as determined by the City Engineer.

C. Shall include a single row of bricks to be used at transition points such as driveways per in **City of Auburn Standard Detail T-44**.

D. Shall include street trees per **City of Auburn Standard Detail T-06**. Where the tree planter area encroaches upon the minimum pedestrian clearance width, a tree grate shall be required per **City of Auburn Standard Detail T-30**. Pervious concrete sidewalks shall not be allowed where tree grates are required.

E. Shall include decorative street corners as follows:

   i. Corner bulbs shall be integrated into corners where on-street parking is allowed, dependent upon the adjacent street geometry, presence of bus routes or other large vehicle use, as determined by the City Engineer.

   ii. All street corners where a corner bulb is required or where both legs of the street corner have sidewalks that are at least 10-feet wide shall be constructed of brick pavers in a rectangular pattern as shown in the figure below. The specific type of brick pavers shall be approved by the City, including shape, size, and color. The brick pavers shall be set on a concrete base.

   iii. The bulb-out layout and limits shall generally be as depicted in **Figure 10-15**. The City Engineer, or designee, shall determine specific design parameters for bulb-outs on a case-by-case basis.

   iv. Construction of a new or replaced curb ramp on a street corner that does not meet the DUC zone standards shall require the street corner to be re-built in its entirety to meet the DUC zone standards.

Figure 10-15 Downtown Street Corner Illustration

10.09.02 Meandering Sidewalks

The City Engineer may approve meandering sidewalks along a corridor when the sidewalk, landscaping, lighting, signing, right-of-way, and other surface features are integrated into the design of the improvements. Additional right-of-way (or an easement) may be required to accommodate the meander of the sidewalk and other surface features.

10.09.03 Accessibility

All sidewalk cross slopes shall be designed to 1.5% and not exceed 2%. Sidewalk grade shall not exceed the grade of the adjacent street centerline, except at driveways and curb ramps. All sidewalks shall maintain a minimum walking zone of 5 feet in width, free of all obstructions including utilities, signage, street trees, furniture or other elements, permanent or temporary.

Sidewalks require a minimum overhead clearance from trees, street signs, and vegetation of 7-feet and a minimum overhead clearance of 10-feet from all other objects.

10.09.04 Curb Ramps

See WSDOT Standard Plans F-40.12, F-40.15 & F-40.16.

Curb ramps shall be provided at all intersections and pedestrian crossings having vertical curb sections. Every curb ramp shall have at least one receiving ramp. Existing curbed radius return access points also require curb ramps. All curb ramps shall have detectable warning patterns formed with manufactured truncated domes in accordance with WSDOT Standard Plan F-45.10. Truncated dome color shall be yellow except in the downtown urban core area where truncated dome color shall be brick red. Pervious cement concrete ramps and landings shall not be allowed.

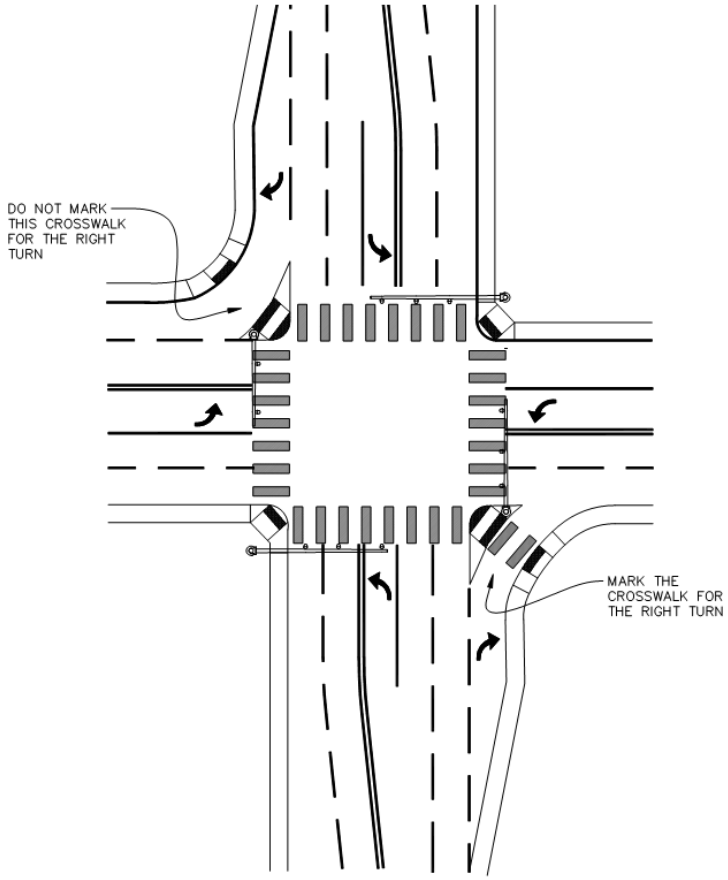
For any deficient element that does not meet ADA requirements, designers shall document the deficiency via a Maximum Extent Feasible (MEF) document stamped and signed by a

professional engineer. The MEF document will be reviewed for acceptance by the City. MEF's shall also be documented on the Plans with a notation indicating the deficiency and that the curb ramp was designed to the MEF per **Chapter 3, Appendix C** of these standards.

Trenching work and the associated patching and surface restoration that traverse crosswalks/pedestrian pathways (crossings) shall not trigger the requirement to replace curb ramps that do not meet current ADA standards at the crossing, unless, the cumulative width of surface restoration at the crossing for all work associated with the project equals or exceeds 50% of the crossing width, as measured from curb face or pavement edge at the pedestrian pathway entry into the vehicle travel way to curb face or pavement edge at the pedestrian pathway departure from the vehicle travel way. This distance is measured through medians, islands, and other pedestrian refuge areas. If the cumulative width of all surface restoration at a crossing equals or exceeds 50% of the crossing width, then the curb ramp(s) that intercept the impacted crosswalk that do not meet current ADA standards must be upgraded/replaced, including signal push-button replacement/relocation where applicable per **Section 10.21.12** of these Standards.

Whenever any portion of a curb ramp or intersection corner without a curb ramp is replaced or upgraded for any reason, the entire curb ramp or a new curb ramp is required to meet ADA standards and installation of curb ramp(s) on the receiving end(s) is required if not already present.

10.09.05 Crosswalks



Per RCW 46.04.160, crosswalks exist at all roadway intersections, whether marked or un-marked, and regardless of whether there are sidewalks at the intersection. Crosswalks also exist at non-intersection locations where they have been established with crosswalk markings (such as a midblock crossing). For the purposes of these standards, intersections are as defined in Chapter 1 of these standards.

Marked crosswalks shall be per WSDOT Standard Plan M-15.10 except where DUC zone standards apply marked crosswalk shall be per **Section 10.09.06**.

Crosswalks will be marked at the following intersection locations, except where pedestrian facilities are NOT present:

A. Traffic signal and stop controlled intersections as shown in the figure below:

Figure 10-16 Marked Crosswalks at Signalized Intersections

B. Yield controlled approaches to roundabouts.

C. Stop controlled approaches at intersections within the Downtown Urban Center.

D. Stop controlled approaches to Arterial Streets (Principal or Minor Arterials).

E. Stop controlled approaches at the intersection of two or more arterial and/or collector Streets.

F. Stop controlled approaches of Local Streets to Non-Residential Collector Streets.

Crosswalks at non-intersection locations, and intersection locations not listed above, are by-default not marked and when they are marked require enhancement(s) that reduce traffic speeds, shorten crossing distance, increase driver awareness of the crossing, and/or provide active warning of pedestrian presence. Selection of appropriate enhancements requires analysis and documentation by a professional engineer. Enhancements may include, but are not limited to, signage, rapid rectangular flashing beacon(s), and/or bulb-outs.

Permanently closed crosswalks across arterial and collector streets shall have signage indicating that pedestrian crossing is prohibited (**No Pedestrian Crossing Sign, MUTCD R9-3**). A supplementary plaque with arrow (**Use Crosswalk Plaque w/Arrow MUTCD R9-3bP**) will be included with the no pedestrian crossing sign where the closed crosswalk is at an intersection where one crosswalk is closed, and the adjacent crosswalk is open and at locations where an open crosswalk exists only in one direction from the closed crosswalk.

10.09.06 Downtown Crosswalks

Marked crosswalks subject to DUC zone standards shall be per **City of Auburn Standard Detail T-43**.

An existing marked crosswalk that does not meet the requirements of the Guidelines shall be re-built in its entirety to meet the requirements of the Guidelines with the any of the following construction activities:

A. On an arterial street, full depth pavement re-construction across half or more of the crosswalk width.

B. On a non-arterial street, surface pavement restoration across half or more of the crosswalk width.

The crosswalk width is measured from face of curb or pavement edge at the pedestrian pathway entry into the vehicle travel way to curb face or pavement edge at the pedestrian pathway departure from the vehicle travel way. This distance is measured through medians, islands, and other pedestrian refuge areas.

10.10 Bikeways

See **City of Auburn Standard Detail T-17** and WSDOT Standard Plan M-9.50.

Bikeways shall be incorporated into street and trail networks in accordance with the CTP and the typical sections in **Section 10.03**.

Bikeways shall be designed in accordance with AASHTO's current "Guide for the Development of Bicycle Facilities", the MUTCD, this section, and applicable City of Auburn standard details.

The City of Auburn's bicycle network consists of various classification bikeways. Typically, these bikeways are shared with other transportation modes, although they may be provided exclusively for bicycle use. Bikeways are categorized as follows: Class I, II, or III Bikeways.

10.10.01 Class I Bikeway

Class I Bikeways are facilities shared with other non-motorized modes and are physically separated from motorized vehicle roadways. For the purposes of this section, Class I Bikeway design standards are for bicycle facilities that generally parallel a roadway with minimal crossflow by motor vehicles. When required, Class I Bikeways shall be designed for two-way traffic. Class I Bikeways that are part of the City's Future Trails and Bicycle Network shall be public and shall be located within public right-of-way, tracts or easements.

Class I Bikeways shall be either asphalt or cement concrete, at the discretion of the City Engineer or designee. Asphalt bikeways shall have a minimum pavement section of 2 inches of CL ½" asphalt concrete pavement over 6 inches of Crushed Surfacing Base Course (CSBC). Cement concrete bikeways shall be per **City of Auburn Detail T-13**. When the California Bearing Ratio (CBR) of the existing soil is 5 or less, an additional 6 inches of gravel base shall be required. When the trail is also utilized as a vehicular service road, the pavement design shall be the Access Road classification on **Table 10-5**. Class I Bikeways shall be a minimum width of 10 feet and be separated from the vehicular travel way by a landscape strip or other

physical buffer with a minimum 5 foot width.

Where Class I Bikeways are intersected by driveways appropriate signing and pavement markings shall be provided consistent with requirements for midblock crossings.

10.10.02 Class II Bikeway

Class II Bikeways, or “Bike Lanes,” are incorporated within the roadway section adjacent to vehicle travel lanes. Bike lanes are exclusive one-way bicycle facilities delineated by pavement markings and signage. Bicycle traffic is carried in the same direction as the adjacent motorized vehicle traffic.

Bike lanes shall have a minimum width of 6 feet as measured from nearest edge of the travel way to face of curb, edge of pavement, or edge of parking lane. Bike lanes shall have the same pavement section as the adjacent roadway. Buffering from the vehicle travel ways may be required as determined by the City Engineer.

10.10.03 Class III Bikeway

Class III Bikeways, or “Shared Lanes,” are facilities shared by bicyclists and motorized vehicles Class III Bikeways may or may not be delineated with shared use pavement markings and signage as determined by the City Engineer. Generally, lower-speed/lower-volume streets are adequate for bicycle travel, so additional signing and pavement markings for bicycle use are unnecessary.

10.11 Landscape Strips

Landscape strips are required per the typical sections in **Section 10.03**. Landscape strips are also included as part of separated trails/Class I Bikeways. Landscape strips shall be located between the back of the curb and the sidewalk. Landscape strips shall meet the following requirements:

A. 5 foot minimum width.

B. Minimum 8 inch deep amended soils as bedding over minimum 4 inch layer of scarified/tilled base soils all free of rocks, construction debris, slurry, and other construction material.

C. Graded towards the curb at approximately 1.5%. Other grades may be allowed where it can be demonstrated to not cause drainage or maintenance issues.

D. Planted with grass or shrubs, vegetation groundcover, and street trees. Shrubs and vegetative groundcover must be low maintenance, minimal debris dropping, and not present a tripping hazard to pedestrians. Landscape strips shall not include gravel, rocks, or other aggregate. Artificial turf may be placed in landscape strips subject to the following requirements:

   i. Must have lifelike individual blades of grass that emulate natural turf in look and color (green).

   ii. Indoor or outdoor plastic or nylon carpeting is not allowed.

   iii. Pile height must be at least 1.5 inches and have a face weight of 50 ounces per square yard.

   iv. A minimum eight-year manufacturer’s warranty that protects against color fading and decreased pile height is required.

   v. Must not utilize rubber infill.

vi. Must be free of tears, bulges, wrinkles, ripples, and frayed edges.

vii. Must be anchored.

viii. Must be installed with the grain pointing in a single direction.

ix. Edges must be trimmed to fit against all regular and irregular edges to resemble a natural look.

x. Must be a minimum water permeability of thirty inches per hour per square yard after installation.

E. Driveways, lighting, fire hydrants, junction boxes, water meters and other appurtenances shall be configured such that no landscape strip has a net landscaped surface area (landscape strip area minus areas occupied by non-landscape features) of less than 50 SF and no portion of a landscaped surface within a landscape strip has a width less than 2 feet.

Landscape strips along local residential streets may be constructed as bioretention swales to provide low impact development (LID) surface water management. Bioretention swales in the public right-of-way shall be designed to collect, treat, and infiltrate runoff from the public right-of-way. If, after runoff from the public right-of-way has been accounted for, additional capacity remains in the bioretention swale, the bioretention swale may be utilized to treat and infiltrate runoff from adjacent private single family residential property(s) with a maintenance agreement between the City and property(s) draining to the swale that requires those property(s) to maintain the swale in perpetuity. The bioretention swale shall be designed and constructed in accordance with the SWMM. Street trees shall not be placed in landscape strips constructed as bioretention swales. Instead, required street trees shall be placed on adjacent private properties and/or tracts.

10.12 Street Trees

See **City of Auburn Standard Detail T-06**.

Street trees are required for local residential streets, residential collector streets, and streets within the DUC zone (except along Auburn Way).

10.12.01 Species Selection, Placement, and Spacing

Where street trees are required, they shall be installed at a spacing of 40 feet on center or no closer than 1-1/2 times the mature diameter of the tree canopy, whichever is greater. Street trees shall be placed such that the center of the tree trunk is at 2-1/2 feet from the back of the adjacent curb or centered in the landscape strip, whichever is greater. Selection of tree species, placement, and spacing requires consideration of the following:

A. **Sight Lines:** Trees shall be placed so that they do not obstruct the view of any street intersection, driveway, or visibility of any traffic control device or sign. Sight distance triangles may be required to analyze and confirm visibility at street intersections is not blocked by tree(s).

B. **Planting Next to a Building**: Where a building is placed close to the sidewalk, the mature size of a tree should be considered when selecting species. Trees with a pyramidal, columnar, or oval shaped canopy are preferable; a tree with a round head is generally unsuitable in this situation.

C. **Overhead Wires**: When trees must be planted directly under or when the mature canopy is within 12 feet of overhead utility lines, species with a mature maximum height of 25 feet or less must be selected.

D. **Street Lighting**: Street and pedestrian lights should be placed between street trees. The trees shall be located at least half their mature canopy width or 20 feet from street lights, whichever is greater.

E. **Underground Utilities:** Trees shall be planted to avoid impacts on underground utilities.

F. **Clearance:** Trees shall be pruned as they grow to provide at least 8 feet vertical clearance above sidewalks and 14 feet of vertical clearance above roadway surfaces.

Table 10-11 provides a selection of acceptable species of trees. Many other trees are appropriate and alternative selections may be proposed if desired. Alternative plant choices must be evaluated and approved by the City Engineer, or designee. Needled evergreens and trees with mature heights of over 35 feet are not allowed.

A. **Round:** These are generally wide spreading trees that need more space than other shapes.

B. **Oval:** Taller than they are wide and cause less interference with traffic.

C. **Columnar:** Useful in locations where there is little available room between the street and buildings, awnings, or other features. Branches of columnar trees tend to grow up rather than out. Many branch lower than other types of trees without causing problems with traffic or pedestrians.

D. **Pyramid:** Also called cone, typically broad at the base of the canopy and are somewhat pointed at the top. Planted close together, pyramidal trees can screen unwanted views or create vistas. Lower branches sometimes droop with age and may have to be limbed up in later years to provide the needed clearance.

E. **Vase:** (sometimes also called “v-shaped”) have canopies that are narrow toward the bottom and broad at the top. V-shaped trees may have arching branches that form a canopy over both street and sidewalk. They generally do not cause problems with overhead power lines or traffic.

Table 10-11 Street Trees

Common Name	Mature Height (ft.)	Mature Canopy Width (ft.)	Sidewalk Landscape Areas	Medians	Canopy Shape
Amur Maple 'Flame'	20	20	x		Round
Mt. St. Helens Plum 'Frankthrees'	20	20	x	x	Round
Rocky Mt Glow Maple 'Schmidt'	25+	15	x	x	Round
Flowering Plum 'Krauter Vesuvius'	30	15	x	x	Round
Pear 'Autumn Blaze'	30	25	x		Round
Pacific Sunset Maple 'Warrens Red'	30	25	x	x	Round
Serviceberry 'Princess Diana'	20	15	x		Round
Serviceberry 'Autumn brilliance'	20	15	x		Round
Queen Elizabeth Maple 'Evelyn'	35	30	x		Oval
Red Fox Katsura	30	16	x	x	Oval
Frans Fontain Hornbeam	35	15	x	x	Columnar
Cherry 'Columnarus'	35	15	x	x	Columnar
Cherry 'Spire'	30	10	x	x	Columnar
Pyramidal European Hornbeam 'Fastigiata'	35	25	x	x	Columnar
Red Obelisk	35	12	x	x	Columnar
"Marilee"	24	10	x	x	Pyramid
Pear 'Redspire'	35	25	x	x	Pyramid
Linden 'Redmond'	35	20	x	x	Pyramid
Chancelor Linden 'Chancole'	35	20	x	x	Pyramid
Flowering Cherry 'Amanogowa'	20	6	x	x	Vase
Flowering Cherry 'Akebono'	25	25	x		Vase

10.12.02 Root Direction Devices

Trees within sidewalks, landscape strips, and on public or private property that are within 10-feet of a street or sidewalk require root barrier devices to deflect tree roots downward into the soil. The root barrier will be placed on all sides of the tree root ball. For a tree outside the street cross section, the barriers may be omitted on the side of the tree root ball that is parallel and opposite to the street. Plan submissions shall indicate the location of root barriers and provide a specification sheet on the product to be used.

10.13 Ground Cover

Ground cover and shrubs plantings in landscape strips and medians shall adhere to the requirements of this section. Except street trees, landscape strips and median plantings shall have a mature height of less than 3 feet. **Table 10-9** provides several acceptable species of ground cover and shrubs. Many other types of plants may be appropriate and alternative selections may be proposed if desired. Alternative plant choices must be evaluated and approved by the City Engineer, or designee. The SWMM shall be utilized to select groundcover plantings within the wet areas of bioretention facilities.

Groundcover shall be planted from either four-inch pot with 12-inch spacing or one-gallon pot

with 18-inch spacing. Alternative spacing of particular species may be approved by the City Engineer, or designee, if documentation concerning the effectiveness of the groundcover is submitted with the landscape plan.

Table 10-12 Ground Cover

Common Name	Mature Height (ft.)	Can be utilized in: M (Medians), L (Landscape Strips)	Minimum Planting Area Width (ft.)
Kinnikinnick Bearberry	0.5 to 1	M, L	5’ to 6’
California Wild Lilac	1.5	M	6’ to 8’
Bearberry Cotoneaster	< 2	M	5 to 6’
Purple Leaf Winter Creeper	1.5	M	6’ to 8’
Blue Chip Juniper/Hughes Juniper	1	M	6’ to 8’
Siberian Carpet Cypress	1.5	M	7’ to 8’
Evergreen Bramble	1	M	6’
Mother of Thyme	0.25	M	1

10.14 Irrigation Systems

Irrigation systems for landscape strips in the public right of way shall conform to ACC 12.12.236 and shall adhere to the standards specified in the City of Auburn Construction Standards.

10.15 Mailboxes

See **City of Auburn Standard Details T-07, T-08 & T-09.**

Locating and installing mailboxes in connection with the construction or reconstruction of a City street shall follow AASHTO and Post Office guidelines.

Mailboxes shall be located a minimum of 2 feet back from the face of curb on streets which have a curb. For streets without a curb, setbacks shall be determined using ASSHTO standards. When locating mailboxes, access, sight distance, parking, and landscaping requirements shall be taken into account. Final locations shall be detailed on the civil plans and approved by the serving Post Office and the City Engineer.

When mailboxes are located in the sidewalk, individually or in clusters, sidewalks shall be widened to provide a minimum 5 feet of clearance around the mailboxes. Widening of the sidewalk may require the dedication of additional right-of way or easement.

The owners or residents served by mailboxes will install and thereafter maintain their own individual, clustered, or separated mailboxes as instructed by the U.S. Postal Service.

10.16 Illumination

10.16.01 Street Lighting Design

Street lighting design shall be in conformance with the design criteria in the most recent edition of the IES Lighting Handbook (Illuminating Engineering Society of North America) and applicable WSDOT and City of Auburn Design and Construction Standards.

Table 10-13 provides minimum lighting design criteria, lamp attachment types, heights, davit arm lengths, and typical spacing for various roadway classifications in the City. The schedule is based on typical straight roadway sections with a staggered lighting configuration. Wider road sections, curves, intersections, cul-de-sacs, single sided lighting configurations require additional analysis to determine the spacing, height, and davit arm lengths required to achieve the required lighting levels.

Street light standards shall be staggered from one side of the roadway to the other, except where site constraints make single sided lighting more feasible and equally effective. Street lights on streets with median islands 8 feet in width and greater shall be located in the medians using dual davit arms to light the street on both sides of the median. The Applicant shall provide project specific lighting calculations that demonstrate minimum illumination levels will be met. Light level calculations shall be done ignoring any existing substandard luminaires (PSE lights on wood poles, etc.).

Special consideration shall be given to light levels at crosswalks, curves, conflict points and street ends. The locations of street lights shall take into consideration any obstacles which may screen or impede lighting levels such as street trees and awnings. Minimum separation between street trees and street lights shall be 20 feet or ½ the mature tree canopy width, whichever is greater.

Marked crosswalks at traffic signal controlled intersections and sidewalks in the Downtown Urban Corridor (DUC) zone shall be lit to an average of 2-foot candles. All other marked crosswalks will be lit to a minimum of 1-½ times the required average light level per **Table 10-13**.

10.16.02 Luminaries

All City street lights shall be LED. Acceptable light fixtures/luminaries are shown on **City of Auburn Standard Detail T-37**. Use of other fixtures requires documentation showing they meet all applicable City standards and approved by the City Engineer, or designee.

Street and Pedestrian Luminaires shall operate on 240 Volt AC and all luminaires shall be full cutoff. All luminaires shall be provided with wattage labels for positive identification of Lamp (See **Table 10-10**). A maximum of 5% voltage drop across each circuit will be permitted.

All City Street lights must support dimming and have PCR7 photocell receptacle and utilize a Sensus wireless control node.

Table 10-13 Lighting Design Criteria

Street Classification	Lamp Attachment Type (See City of Auburn Standard Detail T-37)	Avg. Light Level (ft-candle)	Max. Uniformity Ratio	Min. Light Level (ft-candle)	Luminaire Mounting Height (ft)	Spacing* (ft)	Davit ** Arm Length (ft)
Principal Arterial	Type A	1.4	3 To 1	0.2	35**	190	12
Minor Arterial	Type B	0.9	3 To 1	0.2	35	190	12
Minor Arterial w/Center Turn Lane or Median	Type B	0.9	3 To 1	0.2	35	190	12
Non-Residential Collector	Type B	0.9	3 To 1	0.2	35	200	12
Residential Collector	Type D	0.6	3 To 1	0.2	30	175	14
Residential Collector w/Center Turn Lane or Median	Type D	0.6	3 To 1	0.2	30	175	14
Local Non-Residential	Type D	0.6	3 To 1	0.2	35	160	12
Rustic Roads*		N/A	N/A	N/A	N/A	N/A	N/A
Local Residential and Local Residential Alternate	Type F	0.4	6 To 1	0.1	30	185	8

* Lighting for rustic roads shall be at intersections only and meet the design criteria for Local Residential Roads.

** Davit arm lengths may change based on approved roadway cross section.

10.16.03 Light Poles

City street light poles shall be “cobra head” style per **City of Auburn Standard Detail T-19** except for streets within the DUC zone that shall be per **City of Auburn Standard Detail T-28 or T-39**. An alternate street light may be utilized along local residential streets per **City of Auburn Standard Detail T-29**.

Light Standards handholes shall be four inches by six inches nominal non-flush type in accordance with **City of Auburn Standard Detail T-19** with tamper resistant screws.

All light poles shall be placed on a foundation. Foundations for light standards shall conform to **City of Auburn Standard Details T-19, T-28, or T-29.**

Luminaire wiring, conduit, and pole placement within street cross sections that have curb, gutter, and sidewalks shall be per **City of Auburn Standard Detail T-18.**

10.16.04 Service Cabinet, Foundation, Conduit

See **City of Auburn Standard Detail T-21.**

All new luminaires shall be connected on an electrical circuit that is connected to a power source through a service cabinet. The service cabinet shall be within 50 feet of the Puget Sound Energy (PSE) point of service connection.

Service cabinets shall be installed within right-of-way, easement, or City property behind the sidewalk and at locations that do not impede maintenance access or sight distance. The cabinet shall be located in the center of the system so there are a near equal number of lights being

served on separate circuits from each side of the cabinet. The cabinet shall be labeled with "COA Lighting" and service site address.

The number of luminaires per service will be based upon the type of luminaire and the capacity of the service. Testing may be required to determine if additional luminaires may be added to an existing service.

Service cabinets shall be in conformance with the City of Auburn Engineering Construction Standards. All new luminaires shall have a 7 pin PCR7 receptacle and come with a Sensus VantagePoint wireless control node.

Street light conduit shall be per the City of Auburn Construction Standards.

10.17 Junction Boxes

See **City of Auburn Standard Detail T-20**.

Junction boxes shall be of the type specified on the plans and shall conform to the requirements of WSDOT Standard Plan J-40.10. All junction boxes shall be locking.

Type 1 junction boxes shall be located adjacent to the sidewalk within the landscaping strip, if provided, or adjacent to the back of sidewalk if there is not a landscape, or within the shoulder of a non-curbed roadway. Junction boxes remaining or placed within the sidewalk or walking paths shall have non-slide lids.

10.18 Survey Monuments

See **City of Auburn Standard Detail T-46.**

Survey monuments shall be placed or replaced in accordance with WAC 332-120 (Survey Monuments – Removal or Destruction), and RCW 58-09.120 and good practice in land surveying. Monuments are required along the centerline of improvement of all new or reconstructed streets. Monuments shall be placed at intersections, points of curvature (PC), and points of tangency (PT).

Unless approved otherwise by the City Engineer or designee, ground disturbing activities within 25 feet of an existing survey monument requires securing of a permit from the Department of Natural Resources in advance of those activities. All existing survey monuments that are disturbed, lost, or destroyed during construction shall be replaced by a registered land surveyor registered in the State of Washington at the expense of the responsible party. Any monuments set shall be permanently marked with the certificate number of the Professional Land Surveyor (PLS) setting it (which shall be the same PLS that prepares and certifies the associated monument recording information).

10.19 Bollards

See **City of Auburn Standard Detail T-03.**

When necessary to deny vehicle access to an easement, tract, or trail (except for maintenance vehicles) the point of access shall be closed by a line of bollards. These shall include one or more fixed bollards on each side of the traveled way and removable, locking bollards across the traveled way. Spacing shall provide one bollard on centerline of the trail and other bollards at a spacing of 3 feet on center. Where pedestrian access is intended, bollards shall include at least one space between them of 5 feet. Bollards are considered fixed roadside objects and shall meet separation requirements described in **Section 10.17**.

Emergency vehicle access roads shall not be blocked with bollards. Emergency vehicle access roads will be blocked with a gate and knox-lock.

10.20 Bus Transit Facilities

Transit facilities in the City of Auburn will be coordinated with the relevant transit agency.

When determined appropriate by the City Engineer, or requested by a transit service agency, an applicant for new or expanded development is required to consult with King County METRO, Pierce Transit, Sound Transit, and/or the Muckleshoot Indian Tribal Transit to determine the practicality of how the site can be served by transit-oriented improvements such as bus pullout lanes, bus stops, or other appurtenances.

Bus stops are located, designed and installed as part of a cooperative effort between the City and the operating transit agency. Bus stops are managed as part of a right of way use permit granted by the City to the operating transit agency. In general bus stop location and design decisions should follow the facility design guidelines of the operating transit agency.

10.20.01 Bus Stops Locations

In general bus stop location and design decisions should follow the facility design guidelines of the operating transit agency. The following are guidelines that indicate where bus stops are appropriate:

A. Projected or existing passenger boardings demand warrant a stop.

B. The stop is not at a location where traffic level of service standards are not being met or where the stop would cause traffic operations to drop below traffic level of service standards.

C. The stop does not obstruct minimum required sight distances.

D. The location meets the facility guidelines and fleet specifications of the operating transit agency.

E. The stop is required to meet all applicable ADA requirements.

10.20.02 Bus Stops Features

In general bus stop location and design decisions should follow the facility design guidelines of the operating transit agency. The following are some guidelines that would indicate what type of treatment would be appropriate by type of bus stop.

A. Shelters should be installed at bus stops with an existing or estimated 25 or more boarding per day.

B. Benches should be installed at bus stops with an existing or estimated 15 or more boarding per day.

C. Trash receptacles should be installed and maintained by the operating transit agency at all bus shelters. A sign should be placed indicating that the shelter stop is maintained by the operating transit agency and giving specific contact information to report problems with the stop including a phone number.

D. At all bus stops experiencing 15 or more boarding per day trash receptacles may be placed by the City or adopt a spot group and should be maintained by the City or the adopt a stop group.

E. Information schedules and schedule holders shall be placed at all inbound stops (stops where buses are headed toward a major Central Business District), at all transfer points and at heavily used outbound stops.

F. Additional bus stop lighting should be provided at locations where lighting levels are determined to be less than 1 foot candle.

10.20.03 Bus Pullout Lanes

The City Engineer may determine that bus pullout lanes are required where bus queuing or staging is required. In making this determination, the City Engineer will consider the following:

A. Traffic volumes, bus frequency, and ridership volumes.

B. Traffic impacts of an in-lane stop vs a pullout.

C. Posted speed limits.

Bus pullout locations shall meet the following requirements:

A. Placement of bus pullouts shall be on the far side of signalized intersections and non-signalized intersections immediately following the intersection. Distance between pullouts should not be less than 1,000 feet.

B. Pullouts should be constructed on both sides of a two-way street in a complementary pair.

C. When locating a bus pullout consideration shall be given to existing access points and where passengers have access to sidewalks, crosswalks, ramps, or other pedestrian facilities. Consideration shall also be given to trip attractors, and activity centers.

D. Bus pullouts shall be designed to provide for a bus leaving the pullout lane to enter traffic with minimum required entering sight distance per AASHTO.

E. Bus pullouts shall be located along roadways meeting minimum stop sight distance requirements per AASHTO.

10.21 Traffic Control Facilities

Traffic control facilities are all signs, signals, markings, medians, curbing, and other features used to regulate, warn, or guide traffic. All traffic control devices shall meet the requirements of the MUTCD and the standards herein.

10.21.01 Median Islands

The City Engineer may determine that a median island is needed to provide the following:

A. Manage/restrict access along a corridor.

B. Provide a traffic calming element.

C. Provide pedestrian refuge.

D. Improve roadway aesthetics.

E. Separate opposing travel lanes.

Median Islands shall be designed using the same geometric criteria as the street on which they will be constructed. Medians shall also meet the following requirements:

A. All edges shall require concrete curb per WSDOT Standard Plan F-10.12. Median edges towards which runoff flows shall include concrete curb and gutter per WSDOT Standard Plan F-10.12**.** The face of curb shall be offset at least 1 foot from the edge of adjacent travel way.

B. Median ends shall include reverse curves of the curb lane with 20 foot minimum radii to accommodate turning vehicles and street sweeping.

C. Minimum median width is 4 feet.

D. Median landscaping is not allowed on medians less than 9 feet wide and shall conform to the requirements of **Sections 10.11, 10.12 and 10.13.** Landscaped medians shall include irrigation systems. Landscaped medians shall provide a 1 foot wide, 6-inch thick, concrete maintenance apron around the perimeter of the median behind the curb.

E. Median hardscape shall be stamped concrete with colors and patterns as determined to be required by the City Engineer or designee.

F. Street lights on streets with median islands 8 feet in width and greater shall be located in the medians using dual davit arms to light the street on both sides of the median.

G. Medians with street lights and/or landscaping will be designed to allow maintenance of the lights or vegetation without requiring full closure of a travel direction(s).

10.21.02 Mountable Curbs

Mountable (also referred to as “C” Curbs), are curbs used for the restriction of turning movements and to aid in the channelizing of traffic. The City Engineer may determine that mountable curbs may be required in order to control access along a corridor within the restricted zones of any functional intersection boundary as defined in **Section 10.08.04**.

Mountable Curbs constructed to retrofit existing roadways shall be constructed per **City of Auburn Standard Detail T-32**. Mountable Curbs constructed on new roadway surfaces shall be cast-in-place curb per **City of Auburn Standard Detail T-47**. All Mountable Curb shall be painted to match the adjacent roadway striping (yellow or white) and shall be marked with raised pavement markers and flexible tubular delineators at the beginning and end sections as shown on **City of Auburn Standard Detail T-32**. Mountable curbs shall be designed to account for roadway drainage.

10.21.03 “Pork Chop” Islands

“Pork Chop” Islands are barrier islands used to restrict turning movements at driveways. The City Engineer may determine that a pork chop is required where left turns are restricted and other physical barriers such as median Islands or curbing is not feasible. When required, pork chops shall be accompanied by appropriate turn restriction signage in the right-of-way and pavement markings.

10.21.04 Signage

All signing shall be per the MUTCD and City of Auburn Engineering Construction Standards.

Applicants shall be responsible for providing and installing all traffic control signs, including but not limited to street name signs, regulatory signs, warning signs, barricades, and bicycle/pedestrian signs as required.

Sign posts shall be installed per **City of Auburn Standard Detail T-24.**

Mast arm mounted street name signs shall be per **City of Auburn Standard Detail T-25.**

Post mounted street name signs shall be per **City of Auburn Standard Detail T-26.**

10.21.05 Left Turn Lane Channelization

See WSDOT Standard Plans M-3.20 & M-3.40**.**

Single direction left-turn lane channelization shall include a minimum of 150 feet of full-width lane. The standard width of a left-turn lane will be 11 feet. Left-turn arrows per WSDOT Standard Plan M-24.40 shall be installed 25 feet behind the stop bar. Additional storage may be required for long vehicles, anticipated left-turn queues longer than the minimum storage, or to ensure that a left-turn lane is not blocked by an adjacent through queue. If storage length exceeds 150 feet, auxiliary turn arrows will be installed at 100 foot intervals. Deviation requests from the minimum left-turn lane storage requirements will need a traffic study submittal and approval by the City Engineer.

The installation of two-way left-turn lanes on City streets will be determined by the City Engineer based on street classifications and left turn requirements. The minimum width of a two-way left-turn lane shall be 11 feet. The delineation lines shall be Single Broken Yellow and a Single Solid Yellow along the opposing lanes per the MUTCD. Two-way traffic arrows shall be spaced every 250 feet along this lane with a minimum of one per block.

Left-turn lane at end of two-way left-turn lanes shall conform to WSDOT Standard Plan M-3.40.

Dual left turn lanes shall conform to WSDOT Standard Plan M-3.50.

10.21.06 Right Turn Lane Channelization

See WSDOT Standard Plan M-5.10

Right-turn lane pocket channelization shall include a minimum of 150 feet of full-width lane. The standard width of a right-turn lane will be 11 feet. Additional storage may be required for long vehicles, to accommodate anticipated right-turn queues longer than the minimum storage, or to ensure that a right-turn lane is not blocked by a through queue. Deviation requests from the minimum right-turn lane storage requirements will need a traffic study submittal and approval by the City Engineer. Right-turn arrows shall conform to WSDOT Standard Plan M-5.10.

"ONLY" lettering per WSDOT 80.10 is required where a through lane converts to a turn lane and other circumstances as determined by the City Engineer.

10.21.07 Lane Division

See WSDOT Standard Plan M-20.10 and **City of Auburn Standard Detail T-12.**

All pavement markings used to separate or channelize traffic shall conform to the referenced Standard Plans and to the City of Auburn Construction Standards.

Lane division pavement markings on Local Residential streets are not required, except as may be deemed necessary by the City Engineer.

10.21.08 Painted Islands

Painted islands will be allowed on a case-by-case basis with approval from the City Engineer. Pavement markings for painted islands shall meet the MUTCD requirements.

10.21.09 Other Pavement Markings

Railroad crossing marking shall be per the standard symbol shown on WSDOT Standard Plan M-11.10.

10.21.10 Construction Area Temporary Traffic Control

The contractor shall be responsible to provide and maintain all signs, barriers, warning lights, striping, and flag control required for maintaining public safety in construction areas. Traffic control shall be maintained at all times when construction is in progress on all streets, and access points in the construction area.

Construction activities will not be allowed in the public right of way without an approved traffic control plan. Contractor to refer to the Construction Standards for further details.

10.21.11 Roadway Barricades

Barricades shall conform to the standards described in the MUTCD.

Type I or Type II barricades may be used when traffic is maintained through an area being constructed/reconstructed.

Type III barricades may be used when streets are closed to traffic. Where provision must be made for access of equipment and authorized vehicles, the Type III barricades may be provided with movable sections that can be closed when work is not in progress, or with indirect openings that will discourage public entry. Where job site access is provided through the Type III barricades, the developer or contractor shall assure proper closure at the end of each working day.

Type III barricades shall be used at the end of a local access street terminating abruptly without cul-de-sac bulb or on temporarily stubbed off streets. Each such barricade shall be used together with an end-of-road marker. See **City of Auburn Standard Detail T-45**.

10.21.12 Traffic Signals

Traffic signals shall be designed and constructed in accordance with Sections 8-20, 9-29, and other applicable sections of the Construction Standards. Traffic signal facilities shall utilize video vehicular detection. Induction loops or other solution are only allowed where the City Engineer, or designee, has determined that video detection is not feasible. Wherever existing induction loops are damaged and require replacement, *the City Engineer may require their replacement with video detection. WSDOT Standard Plans shall be utilized except the following elements that shall be per City of Auburn Standard Details:*

Traffic Signal in the DUC Zone: **City of Auburn Standard Detail T-38**

Traffic Signal Controller and Foundation: **City of Auburn Standard Detail T-22**

Telecommunication and Luminaire Electrical Trench: **City of Auburn Standard Detail T-23**

The following definitions are referenced when determining what upgrades to pedestrian push-button and pedestrian signal head systems are triggered by development/construction activity:

A. **Functionally Accessible:** For pedestrian pushbuttons and pedestrian signal heads to be considered accessible from a functionality standpoint, they must be of the brands, makes, and models that are specified by the current Engineering Construction Standards.

B. **Location Accessible:** For pedestrian pushbuttons to be considered accessible from a location standpoint, they must be between 42 and 46 inches in height measured vertically from the centerline of the pushbutton and the adjacent level landing and the pushbutton must be 10 inches or less measured horizontally from the adjacent level landing.

In accordance with the City's adopted ADA Transition Plan, modification, or expansion of any portion of the electrical systems of a signalized intersection or enhanced crossing requires making all pedestrian pushbuttons and pedestrian signal heads at the intersection or crossing Functionally Accessible. Construction, modification, removal or replacement of any portion of any curb ramp at a signalized intersection or enhanced crossing requires making the pedestrian pushbutton serving the new, modified, or replaced ramp Location Accessible and making all of the pedestrian pushbuttons and pedestrian signal heads at the intersection or crossing Functionally Accessible.

10.21.13 Traffic Calming

The City Engineer may determine that traffic calming features are required on existing or new streets to address cut-through or speeding concerns. Potential traffic calming features include varying roadway sections, traffic circles, chicanes, medians, bulb-outs, raised intersections, and raised crosswalks. Speed cushions are not an acceptable traffic calming approach except when considered and installed as either: 1) Part of the City's Neighborhood Traffic Calming Program, or 2) With approval from the City Engineer, as mitigation on existing roadways where development activity creates the potential for cut-through and/or speeding traffic and the City Engineer determines that other traffic calming approaches would not be applicable or appropriate.

Where speed cushions are installed, they will be per **City of Auburn Standard Detail T-42.**

10.22 City Telecommunication Facilities

10.22.01 Preface

The design of City Telecommunications facilities, including intelligent transportation systems (ITS) and general communications fiber located within City right-of-way and easements shall be in conformance with these standards.

City telecommunications facilities shall be included in the Public Facility Extension Agreement (FAC) between the developer and the City when the Agreement includes street improvements per ACC 12.64A.

10.22.02 Design Criteria

The City has established the following minimum requirements to ensure the efficient construction of City telecommunication facilities with the least impact to City transportation and other utility infrastructure. The design of City telecommunications facilities shall also meet the requirements of **Chapter 9.**

Unless approved otherwise by the City Engineer, or designee, City telecommunications conduits and related facilities are required in conjunction with all street improvements constructing sidewalks, traffic signals, or traffic beacons and may be required with other improvements as determined by the City Engineer, or designee, in accordance with ACC 12.64A. When required, facilities shall extend the full length of the street improvement. Placement of the facilities shall accommodate connection with other existing or future telecommunication facilities within the corridor.

10.22.03 Conduits

City telecommunication conduits shall be 3-inch PVC Schedule 40 and shall have a minimum of 24 inches of cover and, except for street crossings, shall be located under the sidewalk per **City of Auburn Standard Detail T-23**. If no sidewalk is included in the scope of the required

street improvements, the conduit will be installed in the most feasible location within the street construction limits as directed by the City Engineer, or designee. Roadway crossings shall be minimized, and sweeps shall be long sweep 90-degree bends. Trace wire shall be placed within the conduit.

10.22.04 Splice Vaults and Pull Boxes

When required, splice vaults and pull boxes shall be per WSDOT Standard Plans J-90.21 and J-90.10, respectively, except that lid marking lettering shall be as specified in the Construction Standards and lids shall not be marked with WSDOT logos or text indicating WSDOT. Splice vaults shall be placed every 1,500 feet. Pull boxes shall be placed every 500 feet and at all intersections.

STANDARD DETAILS

February 2024

City of Auburn
Engineering Services
Public Works Department
25 West Main Street
Auburn, WA 98001-4998

Approved By:

Jacob Sweeting, P.E. — 2/7/24
Assistant Director of Engineering Services/City Engineer — Date

This page intentionally left blank.

PREFACE FOR THE CITY OF AUBURN STANDARD DETAILS

Per Auburn City Code (ACC) 12.04.020, all public work construction contracts of the City, including but not limited to streets and sidewalks, storm water and sanitary sewer systems, and water systems, and all work within City public right-of-way performed by the City and others shall conform to the Engineering Construction Standards (ECS). The ECS apply to City capital projects and to work performed by developers and others under construction permits (CON), grading permits (GRA), storm permits (STM), other utility permits, and public facility extensions (FAC). The City of Auburn has adopted the ECS to require the standardization of design and construction elements for consistency, to assure that public safety needs are met, and to comply with Local, State, and Federal regulations. This Standard Details document is a sub-part of the ECS.

Unless otherwise noted, references to specifications sections in the Standard Details refer to the Washington State Department of Transportation's (WSDOT) Standard Specifications (M41-10) for Road, Bridge and Municipal Construction, 2024 edition publication (Standard Specifications), as modified by City of Auburn Special Provisions.

This page intentionally left blank.

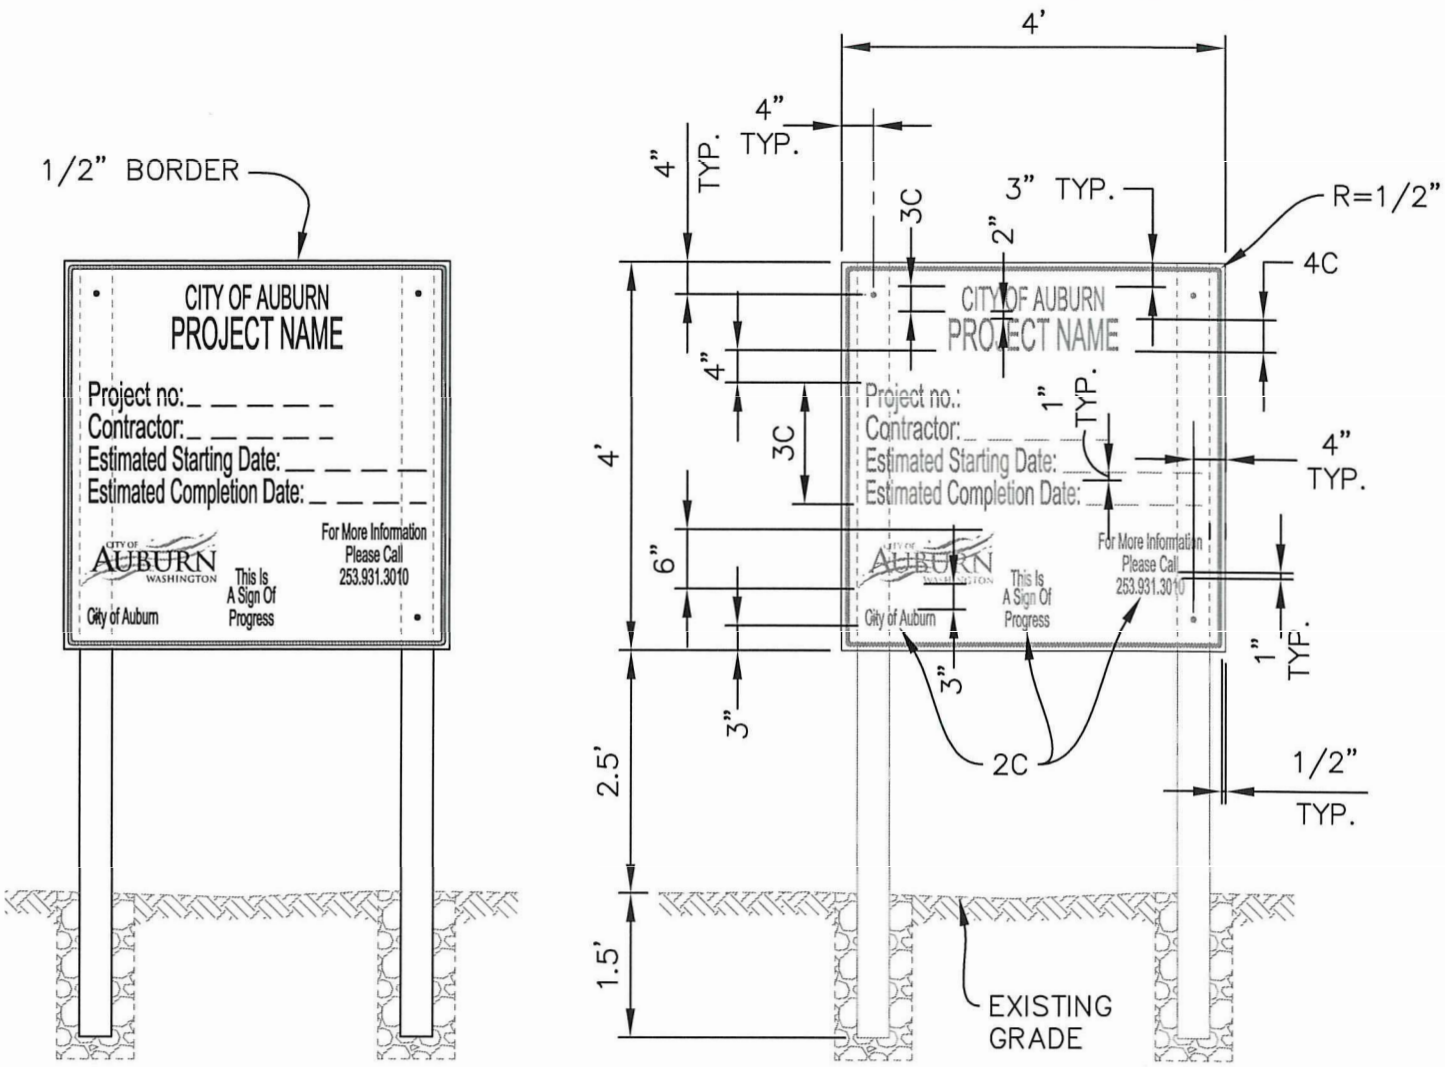
NOTES:

1. WIND SLOT SHALL BE 6" DIAMETER HALF CIRCLE, MINIMUM. THEY MAY BE LOCATED IN AREAS WHICH DO NOT DETRACT FROM THE BANNER.
2. WIND SLOTS SHALL BE SPACED ONE SLOT PER 5 FT. OF BANNER LENGTH.
3. BANNER SHALL BE DURABLE TEARING RESISTANT MATERIAL, I.E., NYLON, VINYL, ETC.
4. BANNER SHALL BE CONNECTED TO EXISTING CABLE WITH DETACHABLE 3¼"" LINK SNAP LOCKS AS SHOWN. OTHER METAL RING TYPES WILL NOT BE ACCEPTED. APPLICANT SHALL PROVIDE A MINIMUM OF 40 LINK SNAP LOCKS INSTALLED ON THE TOP AND BOTTOM OF BANNER AS SHOWN (20 ON EACH SIDE). NOT ALL LOCATIONS REQUIRE LINK SNAP LOCKS ON THE BOTTOM. APPLICANT TO VERIFY DURING BANNER APPLICATION SUBMITTAL.
5. REINFORCING STITCHES SHALL BE PROVIDED ON SEAMS AT TOP & BOTTOM OF BANNER.
6. BANNER SHALL BE CONSTRUCTED USING A SINGLE LAYER OF BANNER MATERIAL. DOUBLE SIDED BANNERS SHALL HAVE PRINT ON BOTH SIDES OF THE SINGLE LAYER MATERIAL.
7. BANNER CONSTRUCTION SHALL BE APPROVED BY THE CITY ENGINEER PRIOR TO BANNER BEING DEPLOYED AT THE PERMITTED LOCATION.



APPROVED BY CITY ENGINEER: Chris Upthegrove DATE: 12/26/19

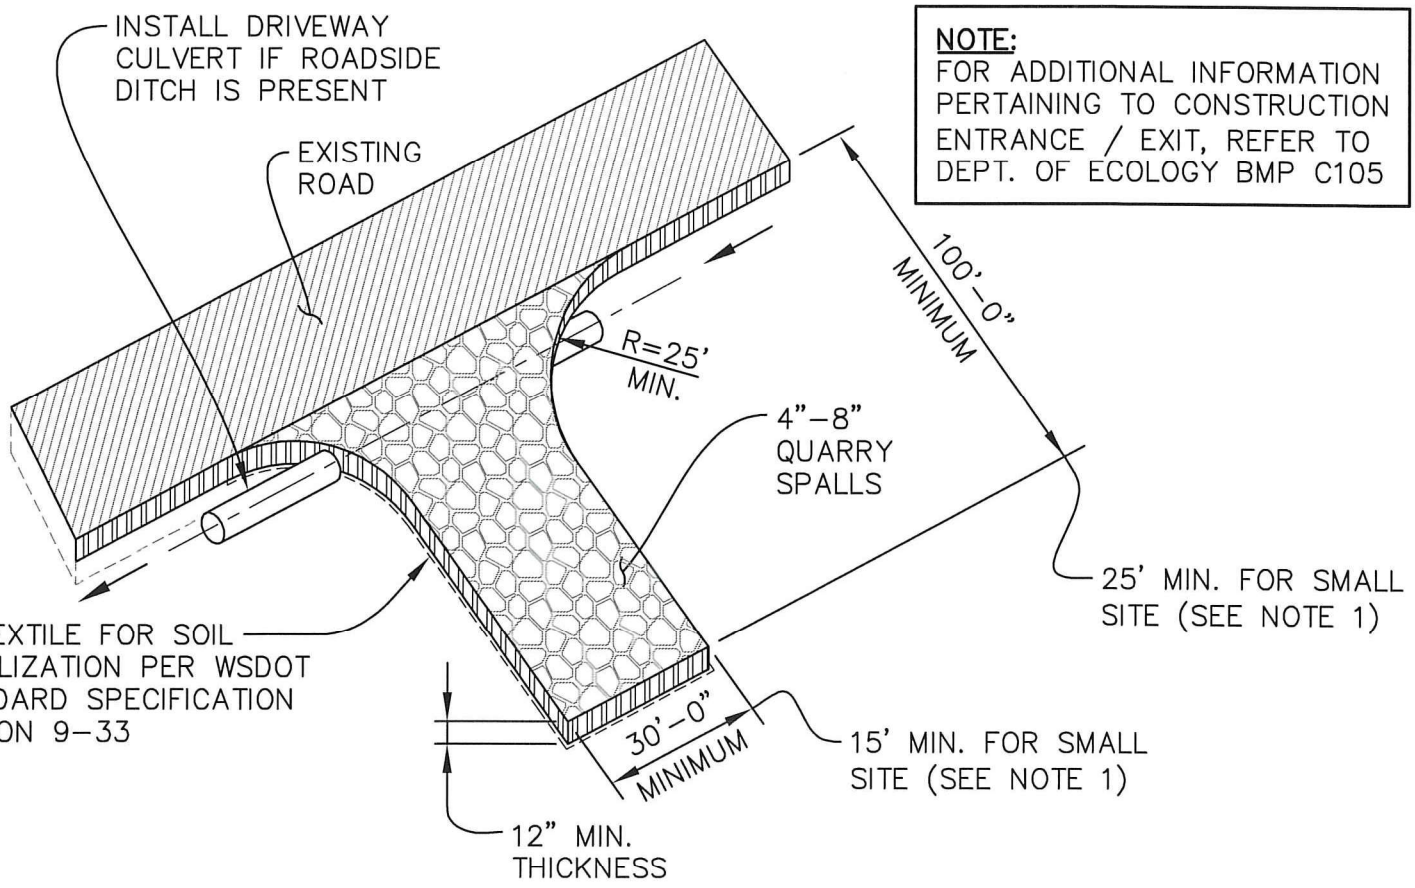
TEMPORARY CONSTRUCTION SITE SIGN BOARD (8'x4')



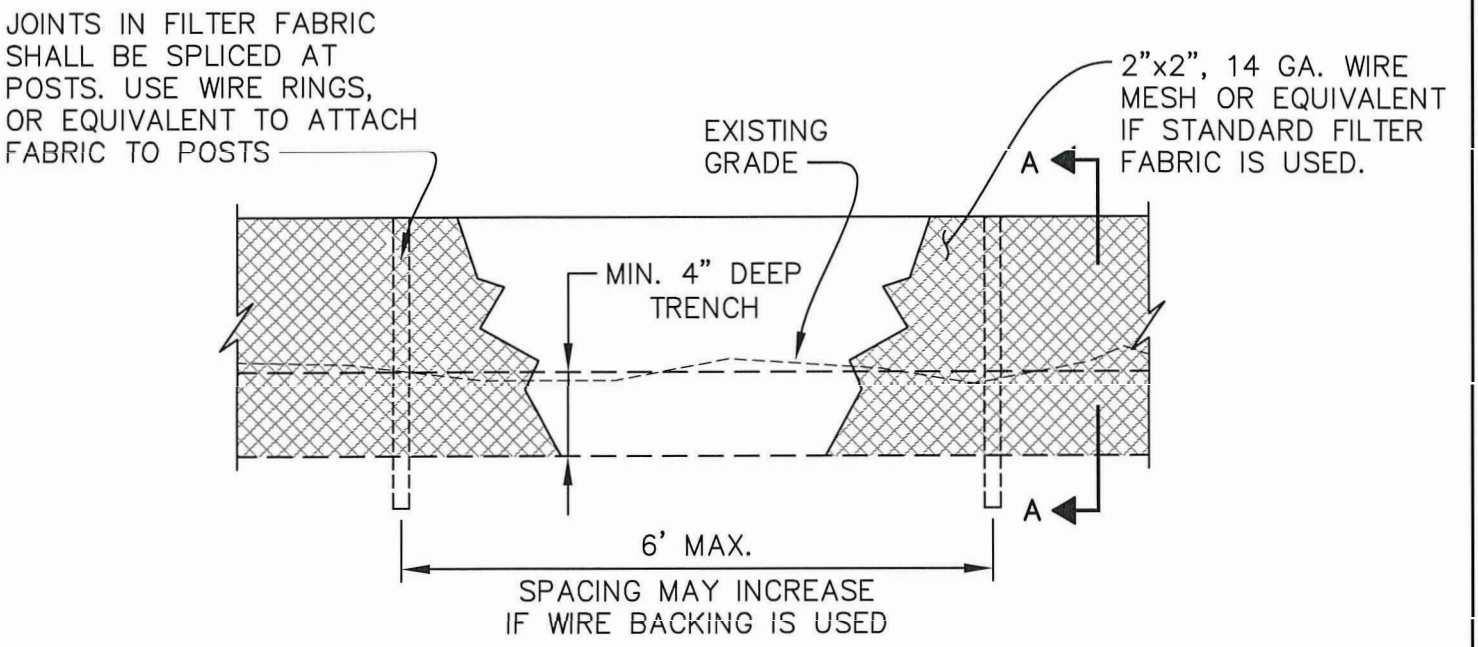
STANDARD DETAIL: G-05.1

CONSTRUCTION NOTES:

1. SIGN BOARD SHALL BE CONSTRUCTED FROM 4'x4'x3/4" EXTERIOR MARINE PLYWOOD.
2. ALL LETTERS AND NUMERALS SHALL BE SERIES C.
3. LETTERING SHALL BE BLACK ON WHITE BACKGROUND USING 3M SCOTCHLITE EC FILM SERIES 1700 OVER 3M DIAMOND GRADE VIP OR BETTER.
4. SIGN AND POSTS SHALL BE PLANTED INTO AN UNYIELDING SOIL AND REINFORCED BY TAMPING GRAVEL OR SMALL ROCKS WHEN NECESSARY TO ASSURE RESISTANCE AGAINST STRONG WIND. BRACING MAY BE REQUIRED AT SOME LOCATIONS AS DIRECTED BY THE ENGINEER.
5. SIGN BOARD SHALL BE FABRICATED AND MOUNTED ON 2 EACH 4"x4"x8' POSTS WITH THE FOLLOWING GALVANIZED FASTENERS AND SIZES AS INDICATED:

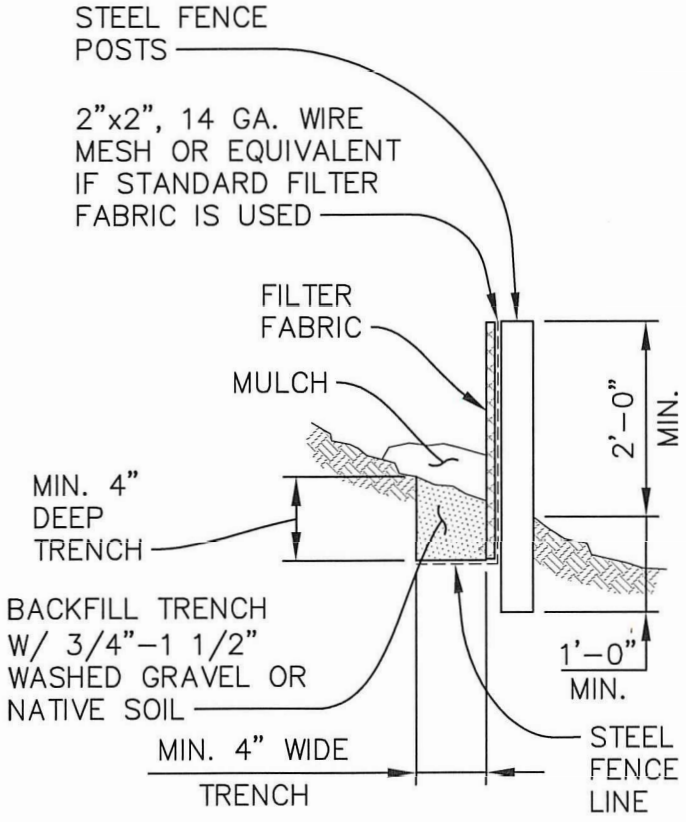
   4 EA. 3/8" DIA.x6"
   4 EA. 3/8" NUTS
   8 EA. 3/8" WASHERS

NOTE:
FOR ADDITIONAL INFORMATION PERTAINING TO CONSTRUCTION ENTRANCE / EXIT, REFER TO DEPT. OF ECOLOGY BMP C105



MAINTENANCE STANDARDS:

1. SMALL SITE IS DEFINED AS A SITE THAT ADDS OR REPLACES LESS THAN 5,000 SQUARE FEET OF IMPERVIOUS SURFACE & DISTURBS LESS THAN ONE ACRE.
2. QUARRY SPALLS PLUS WOVEN GEOTEXTILE FABRIC UNDER ROCK SHALL BE ADDED AS NEEDED TO KEEP THE ENTRANCE IN CONFORMANCE WITH THESE STANDARDS.
3. IF THE ENTRANCE IS NOT PREVENTING SEDIMENT FROM BEING TRACKED ONTO PAVEMENT, THEN ALTERNATIVE MEASURES TO KEEP THE STREETS FREE OF SEDIMENT SHALL BE USED. THIS MAY INCLUDE SHOVELING, PICKUP SWEEPING, & HAND SWEEPING, AN INCREASE IN THE ENTRANCE DIMENSIONS, OR THE INSTALLATION OF A SELF-CONTAINED WHEEL WASH STATION, (REFER TO DOE BMP C-106 FOR MORE INFORMATION).
4. ANY SEDIMENT THAT IS TRACKED ONTO STREET PAVEMENT SHALL BE REMOVED IMMEDIATELY BY SHOVELING, PICKUP SWEEPING, & HAND SWEEPING. THE SEDIMENT COLLECTED BY SWEEPING SHALL BE REMOVED OR STABILIZED ONSITE. PAVEMENT SHALL NOT BE CLEANED BY WASHING DOWN THE STREET, EXCEPT WHEN SWEEPING IS INEFFECTIVE & THERE IS A THREAT TO PUBLIC SAFETY. IF IT IS NECESSARY TO WASH THE STREETS, A CONSTRUCTION OF A SMALL SUMP SHALL BE CONSIDERED. SEDIMENT WOULD THEN BE WASHED INTO THE SUMP.
5. ANY ROCK SPALLS THAT ARE LOOSENED FROM THE DRIVEWAY PAD & ONTO THE ROADWAY SHALL BE REMOVED IMMEDIATELY. VACTOR TRUCK MUST BE USED TO CLEAN CATCH BASIN IF IT BECOMES PLUGGED.
6. VEHICLES SHALL NOT ENTER OR EXIT THE SITE OTHER THAN THE CONSTRUCTION ENTRANCE(S).
7. REMOVE TEMPORARY CONSTRUCTION ENTRANCE/EXIT UPON COMPLETION OF THE ON-SITE WORK.



APPROVED BY CITY ENGINEER:	DATE:	CITY OF AUBURN WASHINGTON	TEMPORARY CONSTRUCTION ENTRANCE / EXIT

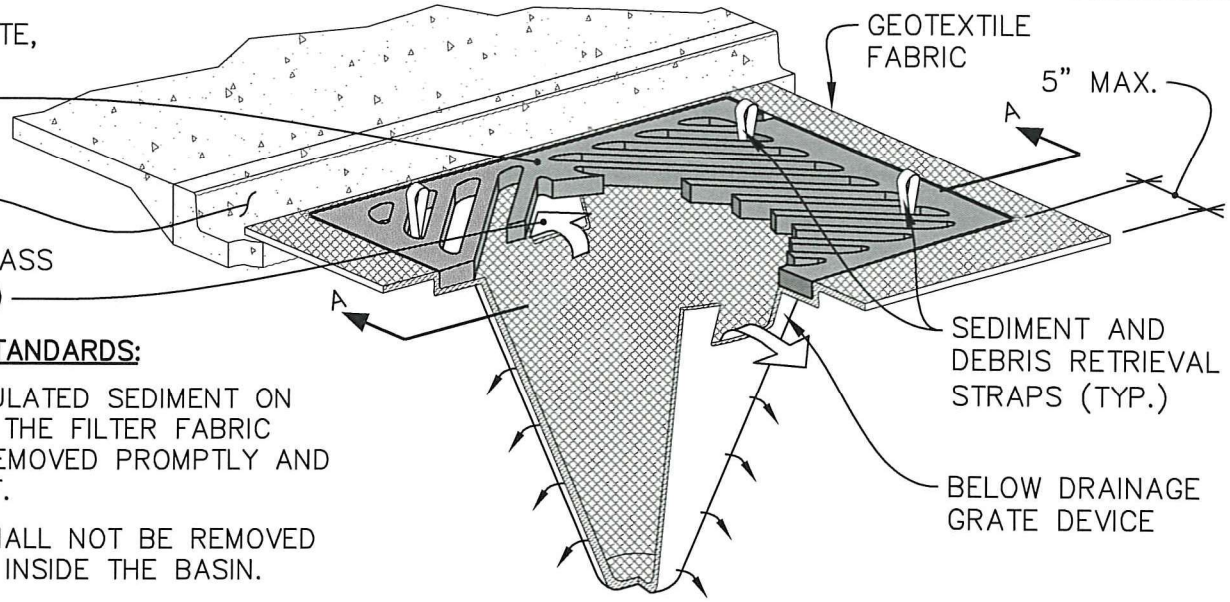
SILT FENCE
NOT TO SCALE

SECTION A-A
NOT TO SCALE

MAINTENANCE STANDARDS:



1. INSPECT WEEKLY ON ACTIVE SITES, MONTHLY ON INACTIVE SITES, & AFTER EACH STORM EVENT TO VERIFY PROTECTION IS STILL ADEQUATE. ANY DAMAGE SHALL BE REPAIRED IMMEDIATELY.
2. IF CONCENTRATED FLOWS ARE EVIDENT UPHILL OF THE FENCE, THEY MUST BE INTERCEPTED AND CONVEYED TO A SEDIMENT POND.
3. THE UPHILL SIDE OF THE FENCE SHALL BE PERIODICALLY CHECKED FOR SIGNS OF CLOGGING CAUSING CHANNELIZATION OF THE FLOWS PARALLEL TO THE FENCE. IN SUCH CASE, REPLACE THE FENCE AND OR REMOVE THE TRAPPED DEBRIS AND SEDIMENT.
4. SEDIMENT AND DEBRIS BUILD UP MUST BE REMOVED WHEN 6" HIGH.
5. REMOVE AND REPLACE DETERIORATED FILTER FABRIC DUE TO ULTRAVIOLET BREAKDOWN.
6. UPON COMPLETION OF WORK AND WHEN ALLOWED BY THE CITY OF AUBURN, THE CONTRACTOR SHALL REMOVE ALL FILTER FABRIC FENCE AND GRAVEL. PROVIDE FINISH GRADES WITH SURFACING MATERIAL AND LANDSCAPING AS REQUIRED.

NOTES:

1. FILTER FABRIC FENCES SHALL BE INSTALLED ALONG CONTOUR WHENEVER POSSIBLE.
2. FOR ADDITIONAL TECHNICAL INFORMATION, REFER TO WSDOE BMP C233.

SCHEMATIC DETAIL VIEW
NOT TO SCALE

MAINTENANCE STANDARDS:

1. ANY ACCUMULATED SEDIMENT ON OR AROUND THE FILTER FABRIC SHALL BE REMOVED PROMPTLY AND DISPOSED OF.
2. SEDIMENT SHALL NOT BE REMOVED WITH WATER INSIDE THE BASIN.
3. REGULAR MAINTENANCE IS REQUIRED. INSPECT WEEKLY ON ACTIVE SITES, MONTHLY ON INACTIVE SITES, & AFTER EACH STORM EVENT TO VERIFY PROTECTION IS STILL ADEQUATE. REPLACE AS NEEDED.
4. ANY SEDIMENT IN THE CATCH BASIN INSERT SHALL BE REMOVED WHEN IT HAS FILLED 1/3 OF THE STORAGE CAPACITY OF THE FILTER DEVICE.
5. THE GEOTEXTILE FABRIC FILTER MEDIA SHALL BE INSPECTED AFTER EACH STORM EVENT & CLEANED OR REPLACED WHEN 1/3 OF STORAGE CAPACITY IS REACHED, OR MONTHLY, UNDER NORMAL WEATHER CONDITIONS, WHICHEVER OCCURS FIRST.
6. REMOVE CATCH BASIN INLET PROTECTION DEVICE UPON COMPLETION OF THE WORK.

SECTION A–A
NOT TO SCALE

NOTES:

1. THIS DEVICE IS APPLICABLE TO WHERE PONDING OF WATER ABOVE THE CATCH BASIN WILL NOT CAUSE TRAFFIC PROBLEMS AND WHERE OVERFLOW WILL NOT RESULT
2. THIS INSERT DEVICE SHALL HAVE A MINIMUM OF 0.5 C.F. OF STORAGE. IT SHALL ALSO PROVIDE FOR DE–WATERING STORED SEDIMENT, AN OVERFLOW, AND EASE OF MAINTENANCE.
3. FOR ADDITIONAL TECHNICAL INFORMATION, REFER TO WSDOE BMP C220.

Plotted by: Craig Dobyns on 1/6/2022 File location: M:\Construction Standard Details\Current Working DWG\Water\STDETL–W–14.3

WATER SERVICE MATERIAL SCHEDULE

(1) THE CITY OF AUBURN ALLOWS 1" TO 2" POLYETHYLENE SDR-9 (IN COPPER TUBE SIZES) W/ STAINLESS STEEL LINERS IN ALL COUPLINGS & WRAPPED W/ A #10 INSULATED COPPER TRACER WIRE WRAPPED AROUND HDPE PIPE AS SHOWN. FOR 1" COPPER, IT SHALL BE TYPE K COPPER TUBING W/OUT TRACER WIRE FOR WATER SERVICE & TAILPIECE CONNECTION, IN ACCORDANCE W/ STANDARD SPECIFICATION SECTION 9-30.6(3). ALL CONNECTIONS TO POLYETHYLENE OR COPPER TUBING SHALL BE W/ MUELLER 110 COMPRESSION CONNECTIONS OR EQUAL. TAILPIECE SHALL EXTEND TO R.O.W. LINE (18" MINIMUM BEYOND METER) & SHALL BE THE SAME SIZE AS THE SERVICE LINE.

(2) SADDLES FOR 1", 1-1/2", OR 2" PIPE TAPS SHALL BE EPOXY COATED OR E-COATED DUCTILE IRON W/ DOUBLE STAINLESS STEEL STRAPS & NEOPRENE GASKETS. SADDLES SHALL HAVE I.P.S. FEMALE THREADS.

(8) CONTRACTOR SHALL FURNISH & INSTALL PRIVATE SERVICE LINE SHUT-OFF VALVE & RISER. FOR CAPITAL PROJECTS, SEE CONTRACT DOCUMENTS, OTHERWISE PROPERTY OWNER TO INSTALL PRIVATE SERVICE LINE SHUT-OFF VALVE AT POINT OF CONNECTION.

METER LOCATIONS:

1. WHERE LANDSCAPE STRIPS ARE PLANNED OR EXIST, THE METER & METER BOX WILL BE PLACED BETWEEN THE BACK OF THE CURB & THE SIDEWALK, ADJACENT TO THE SIDEWALK IF ROOM PERMITS;
2. WHERE THE SIDEWALK IS LOCATED ADJACENT TO THE BACK OF THE CURB OR THE LANDSCAPE STRIP IS TOO NARROW TO ACCOMMODATE THE METER BOX, THE METER & METER BOX WILL BE PLACED ADJACENT TO & AT THE BACK OF SIDEWALK;
3. WHERE METERS & METER BOXES ARE LOCATED IN THE STREET OR SIDEWALK OR IN LOCATIONS WHICH ARE SUBJECTED TO VEHICULAR TRAFFIC, INCLUDING DRIVEWAYS, ETC., A TRAFFIC BEARING METER BOX & LID OF APPROPRIATE LOAD RATING SHALL BE PROVIDED AS SPECIFIED (EAST JORDAN IRON WORKS, OR EQUAL).
4. LOCATE CURB VALVE IN THE METER BOX WHERE POSSIBLE & 1 FT. OUTSIDE IF NO ROOM INSIDE METER BOX IS AVAILABLE.
5. OFF STREET METER LOCATION SHALL BE APPROVED BY THE CITY.

BILL OF MATERIALS

PART NO.	QUANTITY	DESCRIPTION
1	1	METER PROVIDED BY CITY FOR CONTRACTOR INSTALLATION: SENSUS OMNI C2 COMPOUND METER OR APPROVED EQUAL FLANGED WITH BUILT-IN STRAINER AND ENCODERS COMPATIBLE WITH CURRENT SENSUS AMR/AMI SYSTEM
2	1	LOCK WITH CHAINS
3	3	AWWA C-509 OR C-515 GATE VALVE COMPLETE WITH HAND WHEEL
4	2	FIRST JOINT OUTSIDE VAULT REQUIRES FIELD LOK GASKET OR OTHER FORM OF JOINT RESTRAINT
5	1	PRECAST CONCRETE VAULT COMPLETE WITH COLLAR, C555 WHITE INTERIOR PAINT
6	1	36"x72" ALUMINUM HATCH H20-44 CLASS B, STATIC LOADING WITH HOLD OPEN ARM
7	1	O.S.H.A. APPROVED SAFETY LADDER W/ TELESCOPING SAFETY POST (IF VAULT IS OVER 30" DEEP). BOLT LADDER TO VAULT FLOOR AND TO VAULT WALL
8	2	GALVANIZED STEEL ADJUSTABLE PIPE SUPPORT
9	2	MEGALUG OR ROMAGRIP SEALED IN CONCRETE FILLING KNOCKOUT
10	1	SUMP DRAIN, CONNECT TO CITY STORM SYSTEM, IF GRAVITY DRAIN IS NOT FEASIBLE, A SUMP PUMP WITH CHECK VALVE ON DISCHARGE LINE IS REQUIRED
11	1	SPOOL, MINIMUM LENGTH 2'-0", ONE END OF SPOOL TO BE INSTALLED WITH A UNI-FLANGE W/ RESTRAINT LUGS.
12	1	2" AMR PORT
13	AS REQ'D	5/8" MINUS CRUSHED ROCK FOUNDATION WITH COMPACTED DEPTH OF 12" MINIMUM

STANDARD FABRICATION & FINISHING SPECIFICATION

1. ALL STEEL PIPE SHALL BE SANDBLASTED, EPOXY LINED AND COATED TO AWWA C-120 AND NSF-61 SPECIFICATIONS. FINISH COATING SHALL BE BLUE ENAMEL.
2. GATE VALVE ON THE BYPASS SHALL BE NORMALLY CLOSED AND LOCKED WITH THE GATE VALVE ON THE MAIN LINE AS SHOWN AND KEYS GIVEN TO THE CITY.
3. DUCTILE IRON PIPE SHALL BE ACCORDING TO 9-30.1(1) OF THE STANDARD SPECIFICATIONS.

PREFACE FOR THE
CITY OF AUBURN
TECHNICAL SPECIAL PROVISIONS

Per Auburn City Code (ACC) 12.04.020, all public work construction contracts of the City, including but not limited to streets and sidewalks, storm water and sanitary sewer systems, and water systems, and all work within City public right-of-way performed by the City and others shall conform to the Engineering Construction Standards (ECS). The ECS apply to City capital projects and to work performed by developers and others under construction permits (CON), grading permits (GRA), storm permits (STM), other utility permits, and public facility extensions (FAC). The City of Auburn has adopted the ECS to require the standardization of design and construction elements for consistency, to assure that public safety needs are met, and to comply with Local, State, and Federal regulations.

The Technical Special Provisions is a sub-part of the ECS and includes the following elements:

A) By reference, Divisions 2 through 9 of the Washington State Department of Transportation's (WSDOT) Standard Specifications (M41-10) for Road, Bridge and Municipal Construction, 2024 edition publication (Standard Specifications). The Standard Specifications are available at https://wsdot.wa.gov/engineering-standards/all-manuals-and-standards/manuals/standard-specifications-road-bridge-and-municipal-construction. Terms and conditions in the Standard Specifications that reference the following elements apply only to City Contracts and do not apply to CON, GRA, or FAC work: Bidding, Award, Claims, Payment, Measurement, Liquidated Damages, Compensation, Sales Tax, Requests to Sublet, and other terms and conditions that are specific a contractual obligations between the City and Contractor.

B) Special Provisions are adopted by the City that supplement, delete, replace, and revise the Standard Specifications. The Special Provisions include references that indicate the applicability of the special provision, the date it was last updated, and the source of the special provision contents:

("Applicability", "Month" "Year" "Specification Source")

Where "Applicability" indicates "City Contracts" the specification applies only to capital projects under contract with the City. Where applicability indicates "Non-City Contracts" the specification only applies to projects and work that is not a capital project under contract with the City. Where "Applicability" is omitted, the specification applies to all work.

C) Additional special provisions may be adopted on a project specific basis and provided separately with the specific project and/or permit that they apply to and are referred to as Project Specific Special Provisions.

DIVISION 2 Earthwork

2-01 Clearing, Grubbing and Roadside Cleanup

2-01.1 Description

(December 2016 City of Auburn GSP)

Supplement this section with the following:

Clearing and grubbing shall be done to the construction limits shown on the Plans. When no clearing and grubbing limits are shown, the clearing and grubbing limits shall be the smallest area required to complete the other Contract Work.

2-01.2 Disposal of Usable Material and Debris

2-01.2(1) Disposal Method No. 1 – Open Burning

(December 2016 City of Auburn GSP)

Delete this section and replace it with the following:

Open burning will not be permitted on this project.

2-01.2(3) Disposal Method No. 3 - Chipping

(January 2017 City of Auburn GSP)

Supplement this section with the following:

Woodchips shall not be utilized on the project site unless approved by the Engineer. Wood chips shall be disposed of by Disposal Method No. 2 – Waste Site.

2-01.3 Construction Requirements

(January 2018 City of Auburn GSP)

Supplement this section with the following:

Where the Plans indicate clearing and grubbing on private property, the terms of the easement agreements referenced in Section 1-07.24 (Rights of Way) shall dictate if the property owners are responsible for relocating trees, shrubs, or other landscaping from the work area, and the required advance notice to the property owner(s) from the Contractor. Absent of these stipulations, respective property owners are responsible for relocating or removing trees, shrubs, or any other landscaping material within the work areas that they wish to save, unless specified elsewhere in the contract documents, and the Contractor shall notify property owners a minimum of 7 calendar days in advance of clearing the site, to allow the owner time to remove landscape material.

2-02 Removal of Structures and Obstructions

2-02.1 Description

(January 2018 City of Auburn GSP)

Supplement this section with the following:

Items in the Plans designated to be removed are to be included in the lump sum bid price for “Removal of Structures and Obstructions.” If the Plans or other Contract Documents

provide quantities, they are estimates only and are provided for Contractor convenience as a basis for bidding only. The Contractor shall verify the listed items and quantities, as shown on the Plans, before bidding. When included in the Proposal, The lump sum bid price for "Removal of Structures and Obstructions" shall include all work specified in Section 2-02 (Removal of Structures and Obstructions), unless there is a separate and applicable pay item included in the Proposal.

Removal of all asphalt and/or cement concrete pavement, cement and/or asphalt flatwork (including sidewalks, driveways, and ramps), and curb and gutter, is included in the bid item price for "Roadway Excavation, Incl. Haul", unless specified otherwise.

2-02.3 Construction Requirements

2-02.3(2) Removal of Bridges, Box Culverts, and other Drainage Structures

(January 2017 City of Auburn GSP)

Supplement this section with the following:

The Contractor shall remove storm drainage structures as described in the Plans. The resultant void shall be backfilled with Gravel Borrow per Section 9-03.14(1) (Gravel Borrow), unless otherwise noted. All material removed from the site shall be properly disposed of, unless otherwise identified to be salvaged.

2-02.3(3) Removal of Pavement, Sidewalks, Curbs and Gutters

(City Contracts, December 2016 City of Auburn GSP)

Supplement this section with the following:

Saw cutting costs shall be included in the bid item for which the sawcut is being made and no separate payment for saw cutting shall be made.

(January 2018, City of Auburn GSP)

Add the following new section including subsections:

2-02.3(4) Removal and Resetting of Miscellaneous Items

(August 2016, City of Auburn GSP)

The Contractor shall remove and reset miscellaneous items as described in the Plans. Unless a separate and applicable pay item is included in the Proposal, removal and resetting of miscellaneous items shall be paid under the lump sum bid item "Removal and Resetting of Miscellaneous Items". When included in the Proposal ,Items listed in the Plans to be removed and reset are to be included in the lump sum bid price for "Removal and Resetting of Miscellaneous Items." If the Plans or other contract documents provide quantities, they are estimates only and are provided for Contractor convenience as a basis for bidding only. The Contractor shall verify the listed items and quantities, as shown on the Plans, before bidding.

2-02.3(4)A Remove and Reset Fencing

(January 2018 City of Auburn GSP)

This work consists of removing and resetting fencing as shown on the Plans. The Contractor is responsible for ensuring that any remaining fence and fence to be reset is

undamaged. The Contractor shall repair any damage caused by the Contractor's negligence at no additional cost to the City. Costs for the replacement of fencing components and finishes (such as gates, posts, foundations, fabric, stain, and other material) required for the resetting of removed fence shall be included in the costs for removing and resetting the fence.

For the protection of pets and security of the property, the Contractor shall schedule removal of fencing with the property owner at least 5 working days in advance. Unless approved by the property owner, no site shall be left unfenced.

2-02.3(4)B Remove and Reset Private Signs

(August 2016 City of Auburn GSP)

Where shown on the Plans, the Contractor shall remove existing private signs for placement in new locations.

The Contractor is responsible for ensuring that the sign(s) and mounting apparatus(es) remain undamaged. Any damage caused by the Contractor's negligence shall be repaired or replaced by the Contractor at the Contractor's expense. The new cement concrete foundation(s) shall be equal or larger in size than the existing foundation(s), unless otherwise designated in the Contract Documents.

All electrical work shall be performed in accordance with applicable subsections of Section 8-20 (Illumination, Traffic Signal Systems, and Electrical) of the Standard Specifications and as amended by these Special Provisions.

2-02.3(4)C Remove and Reset Private Luminaires

(August 2016 City of Auburn GSP)

Where shown on the Plans, the Contractor shall move existing private luminaires to new locations.

Following removal of the existing light fixture, the Contractor shall protect the fixture and all component parts from loss or damage until such time as the fixture is relocated. Any damage caused by the Contractor's negligence shall be repaired or replaced by the Contractor at the Contractor's expense. The new cement concrete foundation(s) shall be equal or larger in size than the existing foundation(s), unless otherwise designated in the Contract Documents.

All electrical work shall be performed in accordance with applicable subsections of Section 8-20 (Illumination, Traffic Signal Systems, and Electrical) of the Standard Specifications and as amended by these Special Provisions.

(September 2019 City of Auburn GSP)

Add the following new section:

2-02.3(5) Salvage

All casings, pipe, frames, grates, covers, traffic signal equipment, poles, luminaires and other material of recoverable value identified to be salvaged from the project shall be carefully delivered to the City of Auburn Maintenance & Operations Facility (1305 "C" Street SW) in their existing condition.

Items have been identified in the Plans.

The Contractor shall provide notice to the Engineer a minimum of 3 working days prior to delivery of any salvaged item.

All costs for salvaging and delivering salvaged items to the City shall be included in the appropriate unit Bid prices for the work involved and no further compensation will be paid.

Following removal items to be salvaged, the Contractor shall protect the items and all component parts from loss or damage until such time as all they are delivered by the Contractor to the City of Auburn Maintenance and Operations Facility. The Contractor shall replace lost, damaged, or destroyed items in kind, at the Contractor's expense. The Contractor shall coordinate the receiving of salvaged items by the City. The Contractor shall label any salvaged traffic signal poles, mast arms, and signal/lighting equipment with the City contract number and location from which they were salvaged. Labels shall be removable weather proof tags that will not damage or mark the salvaged item.

2-02.4 Measurement

(City Contracts, April 2022 City of Auburn GSP)

Supplement this section with the following:

Removal of cement concrete or asphalt flatwork will be measured by the square yard.

Removal of asphalt pavement will be measured by the square yard.

Removal of pipe will be measured by the linear foot of pipe removed outside the limits of other trench excavations.

Removal of curb and gutter will be measured by the linear foot.

Removal and reset fence will be measured by the linear foot.

Removal of catch basin will be measured per each.

Remove and reset private sign will be measured per each.

Removal of manhole will be measured per each.

2-02.5 Payment

(City Contracts, April 2017 City of Auburn GSP)

Supplement this section with the following:

Payment will be made for each of the following Bid items that are included in the Proposal:

"Remove and Reset Miscellaneous Items", Per Lump Sum
"Remove and Reset Fencing", Per Lineal Foot
"Remove and Reset Private Sign", Per Each
"Removal of Cement Concrete of Asphalt Flat Work", Per Square Yard
"Removal of Curb and Gutter", Per Lineal Foot
"Removal of Asphalt Pavement", Per Square Yard
"Removal of Pipe", Per Lineal Foot
"Remove Manhole", Per Each
"Remove Catch Basin", Per Each

The Contract price for “Remove and Reset Fencing” and “Remove and Reset Private Sign” shall be full pay for all labor, tools, and equipment to complete the work outlined in according to the Construction Plans and these Specifications.

The unit Contract price for “Removal of Cement Concrete of Asphalt Flat Work” shall be full pay for all labor, tools, and equipment to remove and dispose of the concrete flat work, including industrial or commercial driveways, saw cutting and any dowel bars or reinforcing steel, at the locations shown on the Contract plans.

Removal items include all applicable costs including, but not limited to, sawcutting, excavation, stockpiling, haul, disposal, furnishing (when the backfill material is not included in the Proposal) and installing backfill as specified, and protecting adjacent items to remain.

2-03 Roadway Excavation And Embankment

2-03.1 Description

(City Contracts, August 2016 City of Auburn GSP)

The second paragraph is revised as follows:

The work excludes these items if they are listed as individual bid items in the Proposal or if the specifications indicate the payment for these items is included with any other item(s) listed in the Proposal:

1. Haul.
2. Excavation for structures and ditches.
3. Removal of unsuitable materials.
4. Removal Items being separately paid for under Section 2-02 of these contract documents.

(December 2016 City of Auburn GSP)

Supplement this section with the following:

Any excavation beyond the set limits, unless ordered by the Engineer in writing, shall not be paid for. The Contractor, at Contractor expense, shall provide all work and material required to return these over excavated areas to their set limits or original conditions.

2-03.3 Construction Requirements

2-03.3(3) Excavation Below Subgrade

(January 2018 City of Auburn GSP)

Supplement this section with the following:

The Contractor shall remove and dispose of unsuitable roadway subgrade material. The Contractor shall replace the removed material with crushed surfacing base course per Section 9-03.9(3) (Crushed Surfacing), unless otherwise specified in the Contract Documents. When specified in the Plans, the Contractor shall place construction geo-synthetic beneath the crushed surfacing base course.

2-03.3(7) Disposal of Surplus Material

2-03.3(7)C Contractor-Provided Disposal Site

(February 2023 City of Auburn GSP)

Supplement this section with the following:

If, during the course of this project, it becomes necessary to dispose of either excess or unsuitable materials, the additional following requirements shall be observed:

1. In no case shall any waste materials be disposed of on any site within the City limits of Auburn, unless the Contractor has a valid Grading (Fill) Permit according to Section 1-07.5(7) (City of Auburn Requirements) in this document;

2. Grading (Fill) Permits are issued by the City of Auburn Community Development Department after all conditions have been met to the satisfaction of the City Engineer;

3. The Grading Permits are issued to the legal owner of the property. Any questions regarding the requirements should be directed to the City of Auburn Community Development Services at 253.931.3020 (Option 3) or permitcenter@auburnwa.gov;

4. Any waste material disposed of outside the City limits of Auburn shall be at the Contractor's risk. The Contractor is responsible for complying with all local codes and ordinances;

5. Time lost by failure to satisfy these requirements shall be insufficient reason for granting extensions of Contract time.

(City Contracts, February 2023 City of Auburn GSP)

Supplement this section with the following:

6. Failure to comply with the above requirements shall be grounds to withhold payment of money due until such time as the requirements have been satisfied;

2-03.3(14) Embankment Construction

(December 2016 City of Auburn GSP)

Supplement this section with the following:

Embankments shall be constructed in compacted layers of uniform thickness by Method C of Section 2-03.3(14)C (Compacting Earth Embankments).

2-03.4 Measurement

(City Contracts, February 2023 City of Auburn GSP)

All references in this section to measurement of roadway excavation are replaced with the following:

Excavation that is not classified as Structure Excavation under Section 2-09 (Structure Excavation) and is not included under other bid items listed in the Proposal shall be measured and paid at the unit contract price per cubic yard for "Roadway Excavation Including Haul".

The original ground elevation will be determined only once on this project. Measurement for Roadway Excavation and Embankment will be based on the original ground elevations recorded before the award of this Contract, and the alignment, profile, grade, and roadway section as shown in the Plans. Control stakes will be set during construction to provide the Contractor with alignment, slope, and grade information for the construction of excavation and embankments.

If discrepancies are discovered in the ground elevations that will change the original bid quantities of earthwork by more than 25%, the original computations of earthwork quantities will be adjusted accordingly.

Earthwork quantities will be computed, either manually or electronically, by using the average end area method.

With at least 2 business days advance request to the Engineer, electronic copies of the ground cross-section notes will be made available for the bidder's inspection before the opening of bids at the City of Auburn Public Works Department, Customer Service Center, One East Main Street, Auburn, Washington. Upon award of the Contract, copies of the original ground cross-sections will be furnished the successful bidder upon request to the Engineer.

”Gravel Backfill for Roadway Subgrade” will be measured per ton of material placed and compacted as roadway subgrade.

2-03.5 Payment

(City Contracts, January 2018 City of Auburn GSP)

Supplement this section with the following:

Payment will be made for each of the following Bid items that are included in the Proposal:

“Gravel Backfill for Roadway Subgrade”, Per Ton

Payment for “Gravel Backfill for Roadway Subgrade” shall include all costs to remove and dispose of material that is unsuitable for the roadway subgrade and all costs to furnish and install crushed surfacing base course. When a bid item is not included in the proposal for channel excavation or ditch excavation all costs shall be included in the bid item price for ‘Roadway Excavation, Including Haul’.

2-04 Haul

2-04.2 Hauling on other than City Streets

(January 2017 City of Auburn GSP)

Supplement this section with the following:

If the sources of materials provided by the Contractor necessitate hauling over roads other than City of Auburn streets, the Contractor shall, at the Contractor’s expense, make all arrangements for the use and cleaning, if necessary, of the haul routes.

2-04.4 Measurement

(City Contracts, December 2016 City of Auburn GSP)

Delete this section and replace it with the following:

No measurement shall be made for hauling.

2-04.5 Payment

(City Contracts, December 2016 City of Auburn GSP)

Delete this section and replace it with the following:

All costs associated with hauling materials of any description to, from, and within the project site shall be included in the appropriate unit Bid prices in the Proposal and no further compensation will be paid.

2-06 Subgrade Preparation

2-06.3 Construction Requirements

2-06.3(1) Subgrade for Surfacing

(September 2020 City of Auburn GSP)

Supplement this section with the following:

Before placing base course, subgrade shall be shaped to conform to the "typical cross-section" shown in the Plans. Adequate water shall be spread on the subgrade to obtain optimum moisture content for compaction. The subgrade shall be graded to a uniform cross-section true to line and grade and compacted as directed by the Engineer prior to placing base material.

(March 9, 2016 APWA GSP)

Add the following new section:

2-06.3(3) Subgrade for Permeable Pavements

Before placing permeable ballast for Porous HMA/WMA, the Contractor shall bring the Subgrade to the required line, grade, and cross-section. The Contractor shall compact the Subgrade to a depth of 6 inches to at least 90 percent, but not more than 92 percent, of the maximum density as determined by the compaction control tests described in Section 2-03.3(14)D. Two (2) density tests will be conducted for every 5,000 square feet of prepared subgrade; or four (4) tests per 200 lineal feet of roadway or sidewalk. All subgrade shall be firm and unyielding as determined by the Engineer.

The Contractor shall take measures to protect the prepared and approved subgrade from traffic, water run-on, standing water, or other damage. Subgrade that has been over compacted, shall be scarified to a minimum depth of eight (8) inches and recompacted.

Material used to protect the Subgrade from traffic or provide access to adjacent facilities shall be removed and the subgrade compacted prior to placing geotextile, if used and/or permeable ballast.

2-06.5 Measurement and Payment

(City Contracts, March 9, 2016 APWA GSP)

Supplement this section with the following:

Measurement for Subgrade for Permeable Pavement will be in accordance with 2-06.5.

2-06.5(1) Subgrade Constructed Under Same Contract

(City Contracts, January 2018 City of Auburn GSP)

The second sentence of the first paragraph is deleted.

Supplement this section with the following:

"Subgrade Preparation," for building a Subgrade for surfacing or treated base, will be measured by the square yard of full depth (subgrade to surface) roadway constructed or re-constructed. Quantities for "Subgrade Preparation" will be measured at a width of 1 foot beyond the outside face of curbs or 18-inches beyond the edge of pavement where no curbs are installed.

Payment will be made for each of the following Bid items that are included in the Proposal:

"Subgrade Prep", Per Square Yard

2-07 Watering

2-07.3 Construction Requirements

(December 2016 City of Auburn GSP)

Supplement this section with the following:

The Contractor shall water to control dust and shall have a water truck available for watering.

2-07.4 Measurement

(City Contracts, January 2017 City of Auburn GSP)

Delete this section and replace it with the following:

No Measurement for water will be made.

(February 2023 City of Auburn GSP)

Add the following new section:

2-07.4(1) Water from City Hydrants

The Contractor shall obtain a Fire Hydrant Meter Permit from the City of Auburn Permit Center (1 East Main Street) before taking of water from hydrants. Water will be furnished by the City from the fire hydrant to be designated at the time a Fire Hydrant Meter Permit is obtained and in accordance with the terms of the Fire Hydrant Meter Permit. To obtain a Fire Hydrant Meter Permit the Contractor shall complete a hydrant permit application

at MyBuildingPermit.com. The Contractor shall pay all permit fee(s) and deposit(s). The deposit covers the use of a water meter, hydrant wrench, brass adapter, backflow prevention device and hydrant gate valve, and is refundable if returned in acceptable condition. When the meter, hydrant wrench, backflow prevention device, and gate valve are returned in an acceptable condition and all water usage fees have been paid, the deposit will then be refunded to the Contractor. The Contractor shall pay a base fee for a 3" meter size per month and all water usage will be paid by the applicant at the commercial customer class rate per hundred cubic feet. Fees, deposits, and rates shall be as published in Auburn City Code 13.06.511 and 13.06.360 at the time of hydrant permit application submission.

The Contractor shall furnish all required equipment and material necessary for transporting the water from the hydrant, including gauges for testing (except the meter, wrench and valve as stated above).

(City Contracts, February 2023 City of Auburn GSP)

Supplement this section with the following:

The Contractor shall be responsible to contact the City and verify hydrant fee and water usage rates when preparing the bid. Adjustment of these rates by the City will not be the basis for any contract unit price adjustment.

END OF DIVISION 2

DIVISION 3 Aggregate Production and Acceptance

3-04 Acceptance of Aggregate

3-04.3 Construction Requirements

3-04.3(8) Price Adjustment for Quality of Aggregate

(December 2016 City of Auburn GSP)

Delete this section and replace it with the following:

No aggregate compliance price adjustments shall be made.

END OF DIVISION 3

DIVISION 4 Bases

No Revisions.

END OF DIVISION 4

DIVISION 5 Surface Treatments and Pavements

5-04 Hot Mix Asphalt

(July 18, 2018 APWA GSP)

Delete Section 5-04 and amendments, Hot Mix Asphalt and replace it with the following:

5-04.1 Description

This Work shall consist of providing and placing one or more layers of plant-mixed hot mix asphalt (HMA) on a prepared foundation or base in accordance with these Specifications and the lines, grades, thicknesses, and typical cross-sections shown in the Plans. The manufacture of HMA may include warm mix asphalt (WMA) processes in accordance with these Specifications. WMA processes include organic additives, chemical additives, and foaming.

HMA shall be composed of asphalt binder and mineral materials as may be required, mixed in the proportions specified to provide a homogeneous, stable, and workable mixture.

(January 2017, City of Auburn GSP)

Supplement this section with the following:

HMA Class 3/8-inch, Class 1/2-inch, and Class 3/4-inch are designated as leveling or wearing courses. HMA Class 1-inch is designated as a pavement base course. All mixtures are considered dense graded HMA.

(Non-City Contracts, February 2023, City of Auburn GSP)

Supplement this section with the following:

The Contractor shall be responsible for performing all sampling, testing, and reporting described throughout Section 5-04 at its own cost.

5-04.2 Materials

(July 18, 2018 APWA GSP)

Materials shall meet the requirements of the following sections:

Asphalt Binder	9-02.1(4)
Cationic Emulsified Asphalt	9-02.1(6)
Anti-Stripping Additive	9-02.4
HMA Additive	9-02.5
Aggregates	9-03.8
Recycled Asphalt Pavement	9-03.8(3)B
Mineral Filler	9-03.8(5)
Recycled Material	9-03.21
Portland Cement	9-01

Sand	9-03.1(2)
(As noted in 5-04.3(5)C for crack sealing)	
Joint Sealant	9-04.2
Foam Backer Rod	9-04.2(3)A

The Contract documents may establish that the various mineral materials required for the manufacture of HMA will be furnished in whole or in part by the Contracting Agency. If the documents do not establish the furnishing of any of these mineral materials by the Contracting Agency, the Contractor shall be required to furnish such materials in the amounts required for the designated mix. Mineral materials include coarse and fine aggregates, and mineral filler.

The Contractor may choose to utilize recycled asphalt pavement (RAP) in the production of HMA. The RAP may be from pavements removed under the Contract, if any, or pavement material from an existing stockpile.

The Contractor may use up to 20 percent RAP by total weight of HMA with no additional sampling or testing of the RAP. The RAP shall be sampled and tested at a frequency of one sample for every 1,000 tons produced and not less than ten samples per project. The asphalt content and gradation test data shall be reported to the Contracting Agency when submitting the mix design for approval on the QPL. The Contractor shall include the RAP as part of the mix design as defined in these Specifications.

The grade of asphalt binder shall be as required by the contract. Blending of asphalt binder from different sources is not permitted.

The Contractor may only use warm mix asphalt (WMA) processes in the production of HMA with 20 percent or less RAP by total weight of HMA. The Contractor shall submit to the Engineer for approval the process that is proposed and how it will be used in the manufacture of HMA.

Production of aggregates shall comply with the requirements of Section 3-01.

Preparation of stockpile site, the stockpiling of aggregates, and the removal of aggregates from stockpiles shall comply with the requirements of Section 3-02.

(January 2018, City of Auburn GSP)

Supplement this section with the following:

The crack sealant material shall be rubberized asphalt per Section 9-04.2(1) (Hot Poured Joint Sealants).

5-04.2(1) How to Get an HMA Mix Design on the QPL

(July 18, 2018 APWA GSP)

If the contractor wishes to submit a mix design for inclusion in the Qualified Products List (QPL), please follow the WSDOT process outlined in Standard Specification 5-04.2(1).

5-04.2(1)A Vacant

5-04.2(2) Mix Design – Obtaining Project Approval

(July 18, 2018 APWA GSP)

No paving shall begin prior to the approval of the mix design by the Engineer.

Nonstatistical evaluation will be used for all HMA not designated as Commercial HMA in the contract documents.

Commercial evaluation will be used for Commercial HMA and for other classes of HMA in the following applications: sidewalks, road approaches, ditches, slopes, paths, trails, gores, prelevel, and pavement repair. Other nonstructural applications of HMA accepted by commercial evaluation shall be as approved by the Project Engineer. Sampling and testing of HMA accepted by commercial evaluation will be at the option of the Project Engineer. The Proposal quantity of HMA that is accepted by commercial evaluation will be excluded from the quantities used in the determination of nonstatistical evaluation.

Nonstatistical Mix Design. Fifteen days prior to the first day of paving the contractor shall provide one of the following mix design verification certifications for Contracting Agency review;

- The WSDOT Mix Design Evaluation Report from the current WSDOT QPL, or one of the mix design verification certifications listed below.
- The proposed HMA mix design on WSDOT Form 350-042 with the seal and certification (stamp & sig-nature) of a valid licensed Washington State Professional Engineer.
- The Mix Design Report for the proposed HMA mix design developed by a qualified City or County laboratory that is within one year of the approval date.**

The mix design shall be performed by a lab accredited by a national authority such as Laboratory Accreditation Bureau, L-A-B for Construction Materials Testing, The Construction Materials Engineering Council (CMEC's) ISO 17025 or AASHTO Accreditation Program (AAP) and shall supply evidence of participation in the AASHTO: resource proficiency sample program.

Mix designs for HMA accepted by Nonstatistical evaluation shall;

- Have the aggregate structure and asphalt binder content determined in accordance with WSDOT Standard Operating Procedure 732 and meet the requirements of Sections 9-03.8(2), except that Hamburg testing for ruts and stripping are at the discretion of the Engineer, and 9-03.8(6).
- Have anti-strip requirements, if any, for the proposed mix design determined in accordance with AASHTO T 283 or T 324, or based on historic anti-strip and aggregate source compatibility from previous WSDOT lab testing.

At the discretion of the Engineer, agencies may accept verified mix designs older than 12 months from the original verification date with a certification from the Contractor that the materials and sources are the same as those shown on the original mix design.

Commercial Evaluation Approval of a mix design for "Commercial Evaluation" will be based on a review of the Contractor's submittal of WSDOT Form 350-042 (For commercial mixes, AASHTO T 324 evaluation is not required) or a Mix Design from the current WSDOT QPL or from one of the processes allowed by this section. Testing of the HMA by the Contracting Agency for mix design approval is not required.

For the Bid Item Commercial HMA, the Contractor shall select a class of HMA and design level of Equivalent Single Axle Loads (ESAL's) appropriate for the required use.

5-04.2(2)B Using Warm Mix Asphalt Processes

(July 18, 2018 APWA GSP)

The Contractor may elect to use additives that reduce the optimum mixing temperature or serve as a compaction aid for producing HMA. Additives include organic additives, chemical additives and foaming processes. The use of Additives is subject to the following:

- Do not use additives that reduce the mixing temperature more than allowed in Section 5-04.3(6) in the production of mixtures.
- Before using additives, obtain the Engineer's approval using WSDOT Form 350-076 to describe the proposed additive and process.

5-04.3 Construction Requirements

5-04.3(1) Weather Limitations

(July 18, 2018 APWA GSP)

Do not place HMA for wearing course on any Traveled Way beginning October 1st through March 31st of the following year without written concurrence from the Engineer.

Do not place HMA on any wet surface, or when the average surface temperatures are less than those specified below, or when weather conditions otherwise prevent the proper handling or finishing of the HMA.

Minimum Surface Temperature for Paving

Compacted Thickness (Feet)	Wearing Course	Other Courses
Less than 0.10	55◦F	45◦F
0.10 to .20	45◦F	35◦F
More than 0.20	35◦F	35◦F

5-04.3(2) Paving Under Traffic

(July 18, 2018 APWA GSP)

When the Roadway being paved is open to traffic, the requirements of this Section shall apply.

The Contractor shall keep intersections open to traffic at all times except when paving the intersection or paving across the intersection. During such time, and provided that there has been an advance warning to the public, the intersection may be closed for the minimum time required to place and compact the mixture. In hot weather, the Engineer may require the application of water to the pavement to accelerate the finish rolling of the pavement and to shorten the time required before reopening to traffic.

Before closing an intersection, advance warning signs shall be placed and signs shall also be placed marking the detour or alternate route.

During paving operations, temporary pavement markings shall be maintained throughout the project. Temporary pavement markings shall be installed on the Roadway prior to opening to traffic. Temporary pavement markings shall be in accordance with Section 8-23.

All costs in connection with performing the Work in accordance with these requirements, except the cost of temporary pavement markings, shall be included in the unit Contract prices for the various Bid items involved in the Contract.

5-04.3(3) Equipment

5-04.3(3)A Mixing Plant

(July 18, 2018 APWA GSP)

Plants used for the preparation of HMA shall conform to the following requirements:

1. **Equipment for Preparation of Asphalt Binder** – Tanks for the storage of asphalt binder shall be equipped to heat and hold the material at the required temperatures. The heating shall be accomplished by steam coils, electricity, or other approved means so that no flame shall be in contact with the storage tank. The circulating system for the asphalt binder shall be designed to ensure proper and continuous circulation during the operating period. A valve for the purpose of sampling the asphalt binder shall be placed in either the storage tank or in the supply line to the mixer.
2. **Thermometric Equipment** – An armored thermometer, capable of detecting temperature ranges expected in the HMA mix, shall be fixed in the asphalt binder feed line at a location near the charging valve at the mixer unit. The thermometer location shall be convenient and safe for access by Inspectors. The plant shall also be equipped with an approved dial-scale thermometer, a mercury actuated thermometer, an electric pyrometer, or another approved

thermometric instrument placed at the discharge chute of the drier to automatically register or indicate the temperature of the heated aggregates. This device shall be in full view of the plant operator.

3. **Heating of Asphalt Binder** – The temperature of the asphalt binder shall not exceed the maximum recommended by the asphalt binder manufacturer nor shall it be below the minimum temperature required to maintain the asphalt binder in a homogeneous state. The asphalt binder shall be heated in a manner that will avoid local variations in heating. The heating method shall provide a continuous supply of asphalt binder to the mixer at a uniform average temperature with no individual variations exceeding 25°F. Also, when a WMA additive is included in the asphalt binder, the temperature of the asphalt binder shall not exceed the maximum recommended by the manufacturer of the WMA additive.
4. **Sampling and Testing of Mineral Materials** – The HMA plant shall be equipped with a mechanical sampler for the sampling of the mineral materials. The mechanical sampler shall meet the requirements of Section 1-05.6 for the crushing and screening operation. The Contractor shall provide for the setup and operation of the field testing facilities of the Contracting Agency as provided for in Section 3-01.2(2).
5. **Sampling HMA** – The HMA plant shall provide for sampling HMA by one of the following methods:
    a. A mechanical sampling device attached to the HMA plant.
    b. Platforms or devices to enable sampling from the hauling vehicle without entering the hauling vehicle.

5-04.3(3)B Hauling Equipment

(July 18, 2018 APWA GSP)

Trucks used for hauling HMA shall have tight, clean, smooth metal beds and shall have a cover of canvas or other suitable material of sufficient size to protect the mixture from adverse weather. Whenever the weather conditions during the work shift include, or are forecast to include, precipitation or an air temperature less than 45°F or when time from loading to unloading exceeds 30 minutes, the cover shall be securely attached to protect the HMA.

The contractor shall provide an environmentally benign means to prevent the HMA mixture from adhering to the hauling equipment. Excess release agent shall be drained prior to filling hauling equipment with HMA. Petroleum derivatives or other coating material that contaminate or alter the characteristics of the HMA shall not be used. For live bed trucks, the conveyer shall be in operation during the process of applying the release agent.

5-04.3(3)C Pavers

(July 18, 2018 APWA GSP)

HMA pavers shall be self-contained, power-propelled units, provided with an internally heated vibratory screed and shall be capable of spreading and finishing courses of HMA plant mix material in lane widths required by the paving section shown in the Plans.

The HMA paver shall be in good condition and shall have the most current equipment available from the manufacturer for the prevention of segregation of the HMA mixture installed, in good condition, and in working order. The equipment certification shall list the make, model, and year of the paver and any equipment that has been retrofitted.

The screed shall be operated in accordance with the manufacturer's recommendations and shall effectively produce a finished surface of the required evenness and texture without tearing, shoving, segregating, or gouging the mixture. A copy of the manufacturer's recommendations shall be provided upon request by the Contracting Agency. Extensions will be allowed provided they produce the same results, including ride, density, and surface texture as obtained by the primary screed. Extensions without augers and an internally heated vibratory screed shall not be used in the Traveled Way.

When specified in the Contract, reference lines for vertical control will be required. Lines shall be placed on both outer edges of the Traveled Way of each Roadway. Horizontal control utilizing the reference line will be permitted. The grade and slope for intermediate lanes shall be controlled automatically from reference lines or by means of a mat referencing device and a slope control device. When the finish of the grade prepared for paving is superior to the established tolerances and when, in the opinion of the Engineer, further improvement to the line, grade, cross-section, and smoothness can best be achieved without the use of the reference line, a mat referencing device may be substituted for the reference line. Substitution of the device will be subject to the continued approval of the Engineer. A joint matcher may be used subject to the approval of the Engineer. The reference line may be removed after the completion of the first course of HMA when approved by the Engineer. Whenever the Engineer determines that any of these methods are failing to provide the necessary vertical control, the reference lines will be reinstalled by the Contractor.

The Contractor shall furnish and install all pins, brackets, tensioning devices, wire, and accessories necessary for satisfactory operation of the automatic control equipment.

If the paving machine in use is not providing the required finish, the Engineer may suspend Work as allowed by Section 1-08.6. Any cleaning or solvent type liquids spilled on the pavement shall be thoroughly removed before paving proceeds.

(January 2018, City of Auburn GSP)

Supplement this section with the following:

When laying HMA, the paver shall be operated at a uniform forward speed consistent with the plant production rate and roller train capacity to result in a continuous operation. The auger speed and flight gate opening shall be adjusted to coordinate with the operation.

5-04.3(3)D Material Transfer Device or Material Transfer Vehicle

(October 2019, City of Auburn GSP)

A Material Transfer Device/Vehicle (MTD/V) only applies to paving on State Routes and within the right of way of the State, unless other-wise required by the contract.

When used, the MTD/V shall mix the HMA after delivery by the hauling equipment and prior to laydown by the paving machine. Mixing of the HMA shall be sufficient to obtain a uniform temperature throughout the mixture. If a windrow elevator is used, the length of the windrow may be limited in urban areas or through intersections, at the discretion of the Engineer.

To be approved for use, an MTV:

1. Shall be self-propelled vehicle, separate from the hauling vehicle or paver.
2. Shall not be connected to the hauling vehicle or paver.
3. May accept HMA directly from the haul vehicle or pick up HMA from a windrow.
4. Shall mix the HMA after delivery by the hauling equipment and prior to placement into the paving machine.
5. Shall mix the HMA sufficiently to obtain a uniform temperature throughout the mixture.

To be approved for use, an MTD:

1. Shall be positively connected to the paver.
2. May accept HMA directly from the haul vehicle or pick up HMA from a windrow.
3. Shall mix the HMA after delivery by the hauling equipment and prior to placement into the paving machine.
4. Shall mix the HMA sufficiently to obtain a uniform temperature throughout the mixture.

5-04.3(3)E Rollers

(July 18, 2018 APWA GSP)

Rollers shall be of the steel wheel, vibratory, oscillatory, or pneumatic tire type, in good condition and capable of reversing without backlash. Operation of the roller shall be in accordance with the manufacturer's recommendations. When ordered by the Engineer for any roller planned for use on the project, the Contractor shall provide a copy of the manufacturer's recommendation for the use of that roller for compaction of HMA. The number and weight of rollers shall be sufficient to compact the mixture in compliance with the requirements of Section 5-04.3(10). The use of equipment that results in crushing of the aggregate will not be permitted. Rollers producing pickup, washboard, uneven compaction of the surface, displacement of the mixture or other undesirable results shall not be used.

5-04.3(4) Preparation of Existing Paved Surfaces

(July 18, 2018 APWA GSP)

When the surface of the existing pavement or old base is irregular, the Contractor shall bring it to a uniform grade and cross-section as shown on the Plans or approved by the Engineer.

Preleveling of uneven or broken surfaces over which HMA is to be placed may be accomplished by using an asphalt paver, a motor patrol grader, or by hand raking, as approved by the Engineer.

Compaction of preleveling HMA shall be to the satisfaction of the Engineer and may require the use of small steel wheel rollers, plate compactors, or pneumatic rollers to avoid bridging across preleveled areas by the compaction equipment. Equipment used for the compaction of preleveling HMA shall be approved by the Engineer.

Before construction of HMA on an existing paved surface, the entire surface of the pavement shall be clean. All fatty asphalt patches, grease drippings, and other objectionable matter shall be entirely removed from the existing pavement. All pavements or bituminous surfaces shall be thoroughly cleaned of dust, soil, pavement grindings, and other foreign matter. All holes and small depressions shall be filled with an appropriate class of HMA. The surface of the patched area shall be leveled and compacted thoroughly. Prior to the application of tack coat, or paving, the condition of the surface shall be approved by the Engineer.

A tack coat of asphalt shall be applied to all paved surfaces on which any course of HMA is to be placed or abutted; except that tack coat may be omitted from clean, newly paved surfaces at the discretion of the Engineer. Tack coat shall be uniformly applied to cover the existing pavement with a thin film of residual asphalt free of streaks and bare spots at a rate between 0.02 and 0.10 gallons per square yard of retained asphalt. The rate of application shall be approved by the Engineer. A heavy application of tack coat shall be applied to all joints. For Roadways open to traffic, the application of tack coat shall be limited to surfaces that will be paved during the same working shift. The spreading equipment shall be equipped with a thermometer to indicate the temperature of the tack coat material.

Equipment shall not operate on tacked surfaces until the tack has broken and cured. If the Contractor’s operation damages the tack coat it shall be repaired prior to placement of the HMA.

The tack coat shall be CSS-1, or CSS-1h emulsified asphalt. The CSS-1 and CSS-1h emulsified asphalt may be diluted once with water at a rate not to exceed one part water to one part emulsified asphalt. The tack coat shall have sufficient temperature such that it may be applied uniformly at the specified rate of application and shall not exceed the maximum temperature recommended by the emulsified asphalt manufacturer.

(January 2017, City of Auburn GSP)

Supplement this section with the following:

The Contractor shall remove existing pavement markers, lane markers, and plastic markings.

5-04.3(4)A Crack Sealing

5-04.3(4)A1 General

(November 2019 City of Auburn GSP)

When the Proposal includes a pay item for crack sealing, seal all cracks ¼ inch in width and greater.

Cleaning: Ensure that cracks are thoroughly clean, dry and free of all loose and foreign material when filling with crack sealant material. Use a hot compressed air lance to dry and warm the pavement surfaces within the crack immediately prior to filling a crack with the sealant material. Do not overheat pavement. Do not use direct flame dryers. Routing cracks is not required.

Hot Poured Sealant: For cracks that are to be filled with hot poured sealant, apply the material in accordance with these requirements and the manufacturer's recommendations. Furnish a Type 1 Working Drawing of the manufacturer's product information and recommendations to the Engineer prior to the start of work, including the manufacturer's recommended heating time and temperatures, allowable storage time and temperatures after initial heating, allowable reheating criteria, and application temperature range. Confine hot poured sealant material within the crack. Clean any overflow of sealant from the pavement surface. If, in the opinion of the Engineer, the Contractor's method of sealing the cracks with hot poured sealant results in an excessive amount of material on the pavement surface, stop and correct the operation to eliminate the excess material.

5-04.3(4)B Soil Residual Herbicide

(November 2019 City of Auburn GSP)

The Contractor shall apply one application of an approved soil residual herbicide. Any area that has not been paved within the 24 hour time limit or that has been rained on, shall be treated again at the Contractor's expense. The herbicide shall be applied uniformly in accordance with the manufacturer's recommendations.

Use herbicide registered with the Washington State Department of Agriculture for use under pavement. Before use, obtain the Engineer's approval of the herbicide and the proposed rate of application. Include the following information in the request for approval of the material:

- Brand Name of the Material;
- Manufacturer;
- Environmental Protection Agency (EPA) Registration Number;
- Material Safety Data Sheet; and
- Proposed Rate of Application

5-04.3(4)C Pavement Repair

(July 18, 2018 APWA GSP)

The Contractor shall excavate pavement repair areas and shall backfill these with HMA in accordance with the details shown in the Plans and as marked in the field. The Contractor

shall conduct the excavation operations in a manner that will protect the pavement that is to remain. Pavement not designated to be removed that is damaged as a result of the Contractor's operations shall be repaired by the Contractor to the satisfaction of the Engineer at no cost to the Contracting Agency. The Contractor shall excavate only within one lane at a time unless approved otherwise by the Engineer. The Contractor shall not excavate more area than can be completely finished during the same shift, unless approved by the Engineer.

Unless otherwise shown in the Plans or determined by the Engineer, excavate to a depth of 1.0 feet. The Engineer will make the final determination of the excavation depth required. The minimum width of any pavement repair area shall be 40 inches unless shown otherwise in the Plans. Before any excavation, the existing pavement shall be sawcut or shall be removed by a pavement grinder. Excavated materials will become the property of the Contractor and shall be disposed of in a Contractor-provided site off the Right of Way or used in accordance with Sections 2-02.3(3) or 9-03.21.

Asphalt for tack coat shall be required as specified in Section 5-04.3(4). A heavy application of tack coat shall be applied to all surfaces of existing pavement in the pavement repair area.

Placement of the HMA backfill shall be accomplished in lifts not to exceed 0.35-foot compacted depth. Lifts that exceed 0.35-foot of compacted depth may be accomplished with the approval of the Engineer. Each lift shall be thoroughly compacted by a mechanical tamper or a roller.

(April 2020, City of Auburn GSP)

Supplement this section with the following:

HMA for pavement repair shall be HMA Class 1/2-inch PG 58H-22 or as shown in the Plans. Pavement repair areas shown in the Plans, if any, are for reference only. The repair areas shall be as directed by the Engineer in the field.

5-04.3(5) Producing/Stockpiling Aggregates and RAP

(July 18, 2018 APWA GSP)

Aggregates and RAP shall be stockpiled according to the requirements of Section 3-02. Sufficient storage space shall be provided for each size of aggregate and RAP. Materials shall be removed from stockpile(s) in a manner to ensure minimal segregation when being moved to the HMA plant for processing into the final mixture. Different aggregate sizes shall be kept separated until they have been delivered to the HMA plant.

5-04.3(5)A Vacant

5-04.3(6) Mixing

(July 18, 2018 APWA GSP)

After the required amount of mineral materials, asphalt binder, recycling agent and anti-stripping additives have been introduced into the mixer the HMA shall be mixed until complete and uniform coating of the particles and thorough distribution of the asphalt binder throughout the mineral materials is ensured.

When discharged, the temperature of the HMA shall not exceed the optimum mixing temperature by more than 25°F as shown on the reference mix design report or as approved by the Engineer. Also, when a WMA additive is included in the manufacture of HMA, the discharge temperature of the HMA shall not exceed the maximum recommended by the manufacturer of the WMA additive. A maximum water content of 2 percent in the mix, at discharge, will be allowed providing the water causes no problems with handling, stripping, or flushing. If the water in the HMA causes any of these problems, the moisture content shall be reduced as directed by the Engineer.

Storing or holding of the HMA in approved storage facilities will be permitted with approval of the Engineer, but in no event shall the HMA be held for more than 24 hours. HMA held for more than 24 hours after mixing shall be rejected. Rejected HMA shall be disposed of by the Contractor at no expense to the Contracting Agency. The storage facility shall have an accessible device located at the top of the cone or about the third point. The device shall indicate the amount of material in storage. No HMA shall be accepted from the storage facility when the HMA in storage is below the top of the cone of the storage facility, except as the storage facility is being emptied at the end of the working shift.

Recycled asphalt pavement (RAP) utilized in the production of HMA shall be sized prior to entering the mixer so that a uniform and thoroughly mixed HMA is produced. If there is evidence of the recycled asphalt pavement not breaking down during the heating and mixing of the HMA, the Contractor shall immediately suspend the use of the RAP until changes have been approved by the Engineer. After the required amount of mineral materials, RAP, new asphalt binder and asphalt rejuvenator have been introduced into the mixer the HMA shall be mixed until complete and uniform coating of the particles and thorough distribution of the asphalt binder throughout the mineral materials, and RAP is ensured.

5-04.3(7) Spreading and Finishing

(July 18, 2018 APWA GSP)

The mixture shall be laid upon an approved surface, spread, and struck off to the grade and elevation established. HMA pavers complying with Section 5-04.3(3) shall be used to distribute the mixture. Unless otherwise directed by the Engineer, the nominal compacted depth of any layer of any course shall not exceed the following:

HMA Class 1”	0.35 feet
HMA Class ¾” and HMA Class ½”	
wearing course	0.30 feet
other courses	0.35 feet

HMA Class ⅜"	0.15 feet

On areas where irregularities or unavoidable obstacles make the use of mechanical spreading and finishing equipment impractical, the paving may be done with other equipment or by hand.

When more than one JMF is being utilized to produce HMA, the material produced for each JMF shall be placed by separate spreading and compacting equipment. The intermingling of HMA produced from more than one JMF is prohibited. Each strip of HMA placed during a work shift shall conform to a single JMF established for the class of HMA specified unless there is a need to make an adjustment in the JMF.

(November 2019 City of Auburn GSP)

Supplement this section with the following:

In all instances, wearing courses of 3 inches or greater shall be created using a maximum depth of 1 ½-inch lifts.

5-04.3(8) Aggregate Acceptance Prior to Incorporation in HMA

(July 18, 2018 APWA GSP)

For HMA accepted by nonstatistical evaluation the aggregate properties of sand equivalent, uncompacted void content and fracture will be evaluated in accordance with Section 3-04. Sampling and testing of aggregates for HMA accepted by commercial evaluation will be at the option of the Engineer.

5-04.3(9) HMA Mixture Acceptance

(July 18, 2018 APWA GSP)

Acceptance of HMA shall be as provided under nonstatistical, or commercial evaluation.

Nonstatistical evaluation will be used for the acceptance of HMA unless Commercial Evaluation is specified.

Commercial evaluation will be used for Commercial HMA and for other classes of HMA in the following applications: sidewalks, road approaches, ditches, slopes, paths, trails, gores, prelevel, temporary pavement, and pavement repair. Other nonstructural applications of HMA accepted by commercial evaluation shall be as approved by the Engineer. Sampling and testing of HMA accepted by commercial evaluation will be at the option of the Engineer.

The mix design will be the initial JMF for the class of HMA. The Contractor may request a change in the JMF. Any adjustments to the JMF will require the approval of the Engineer and may be made in accordance with this section.

HMA Tolerances and Adjustments

1. **Job Mix Formula Tolerances** – The constituents of the mixture at the time of acceptance shall be within tolerance. The tolerance limits will be established as follows:

   For Asphalt Binder and Air Voids (Va), the acceptance limits are determined by adding the tolerances below to the approved JMF values. These values will also be the Upper Specification Limit (USL) and Lower Specification Limit (LSL) required in Section 1-06.2(2)D2

Property	Non-Statistical Evaluation	Commercial Evaluation
Asphalt Binder	+/- 0.5%	+/- 0.7%
Air Voids, Va	2.5% min. and 5.5% max	N/A

   For Aggregates in the mixture:

   a. First, determine preliminary upper and lower acceptance limits by applying the following tolerances to the approved JMF.

Aggregate Percent Passing	Non-Statistical Evaluation	Commercial Evaluation
1", ¾", ½", and 3/8" sieves	+/- 6%	+/- 8%
No. 4 sieve	+/-6%	+/- 8%
No. 8 Sieve	+/- 6%	+/-8%
No. 200 sieve	+/- 2.0%	+/- 3.0%

   b. Second, adjust the preliminary upper and lower acceptance limits determined from step (a) the minimum amount necessary so that none of the aggregate properties are outside the control points in Section 9-03.8(6). The resulting values will be the upper and lower acceptance limits for aggregates, as well as the USL and LSL required in Section 1-06.2(2)D2.

2. Job Mix Formula Adjustments – An adjustment to the aggregate gradation or asphalt binder content of the JMF requires approval of the Engineer. Adjustments to the JMF will only be considered if the change produces material of equal or better quality and may require the development of a new mix design if the adjustment exceeds the amounts listed below.

   a. **Aggregates** –2 percent for the aggregate passing the 1½″, 1″, ¾″, ½″, ⅜″, and the No. 4 sieves, 1 percent for aggregate passing the No. 8 sieve, and 0.5 percent for the aggregate passing the No. 200 sieve. The adjusted JMF shall be within the range of the control points in Section 9-03.8(6).

   b. **Asphalt Binder Con**tent – The Engineer may order or approve changes to asphalt binder content. The maximum adjustment from the approved mix design for the asphalt binder content shall be 0.3 percent

5-04.3(9)A Vacant

5-04.3(9)B Vacant

5-04.3(9)C Mixture Acceptance – Nonstatistical Evaluation

(July 18, 2018 APWA GSP)

HMA mixture which is accepted by Nonstatistical Evaluation will be evaluated by the Contracting Agency by dividing the HMA tonnage into lots.

5-04.3(9)C1 Mixture Nonstatistical Evaluation – Lots and Sublots

(July 18, 2018 APWA GSP)

A lot is represented by randomly selected samples of the same mix design that will be tested for acceptance. A lot is defined as the total quantity of material or work produced for each Job Mix Formula placed. Only one lot per JMF is expected. A sublot shall be equal to one day's production or 800 tons, whichever is less except that the final sublot will be a minimum of 400 tons and may be increased to 1200 tons.

All of the test results obtained from the acceptance samples from a given lot shall be evaluated collectively. If the Contractor requests a change to the JMF that is approved, the material produced after the change will be evaluated on the basis of the new JMF for the remaining sublots in the current lot and for acceptance of subsequent lots. For a lot in progress with a CPF less than 0.75, a new lot will begin at the Contractor's request after the Engineer is satisfied that material conforming to the Specifications can be produced.

Sampling and testing for evaluation shall be performed on the frequency of one sample per sublot.

5-04.3(9)C2 Mixture Nonstatistical Evaluation Sampling

(July 18, 2018 APWA GSP)

Samples for acceptance testing shall be obtained by the Contractor when ordered by the Engineer. The Contractor shall sample the HMA mixture in the presence of the Engineer and in accordance with AASH-TO T 168. A minimum of three samples should be taken for each class of HMA placed on a project. If used in a structural application, at least one of the three samples shall to be tested.

Sampling and testing HMA in a Structural application where quantities are less than 400 tons is at the discretion of the Engineer.

For HMA used in a structural application and with a total project quantity less than 800 tons but more than 400 tons, a minimum of one acceptance test shall be performed. In all cases, a minimum of 3 samples will be obtained at the point of acceptance, a minimum of one of the three samples will be tested for conformance to the JMF:

- If the test results are found to be within specification requirements, additional testing will be at the Engineer's discretion.
- If test results are found not to be within specification requirements, additional testing of the remaining samples to determine a Composite Pay Factor (CPF) shall be performed.

5-04.3(9)C3 Mixture Nonstatistical Evaluation – Acceptance Testing

(July 18, 2018 APWA GSP)

Testing of HMA for compliance of V_a will at the option of the Contracting Agency. If tested, compliance of V_a will use WSDOT SOP 731.

Testing for compliance of asphalt binder content will be by WSDOT FOP for AASHTO T 308.

Testing for compliance of gradation will be by FOP for WAQTC T 27/T 11.

5-04.3(9)C4 Mixture Nonstatistical Evaluation – Pay Factors

(July 18, 2018 APWA GSP)

For each lot of material falling outside the tolerance limits in 5-04.3(9), the Contracting Agency will determine a Composite Pay Factor (CPF) using the following price adjustment factors:

Table of Price Adjustment Factors	
Constituent	**Factor "f"**
All aggregate passing: 1½″, 1″, ¾″, ½″, ⅜″ and No.4 sieves	2
All aggregate passing No. 8 sieve	15
All aggregate passing No. 200 sieve	20
Asphalt binder	40
Air Voids (Va) (where applicable)	20

Each lot of HMA produced under Nonstatistical Evaluation and having all constituents falling within the tolerance limits of the job mix formula shall be accepted at the unit Contract price with no further evaluation. When one or more constituents fall outside the nonstatistical tolerance limits in the Job Mix Formula shown in Table of Price Adjustment Factors, the lot shall be evaluated in accordance with Section 1-06.2 to determine the appropriate CPF. The nonstatistical tolerance limits will be used in the calculation of the CPF and the maximum CPF shall be 1.00. When less than three sublots exist, backup samples of the existing sublots or samples from the Roadway shall be tested to provide a minimum of three sets of results for evaluation.

5-04.3(9)C5 Vacant

5-04.3(9)C6 Mixture Nonstatistical Evaluation – Price Adjustments

(July 18, 2018 APWA GSP)

For each lot of HMA mix produced under Nonstatistical Evaluation when the calculated CPF is less than 1.00, a Nonconforming Mix Factor (NCMF) will be determined. The NCMF equals the algebraic difference of CPF minus 1.00 multiplied by 60 percent. The total job mix compliance price adjustment will be calculated as the product of the NCMF, the quantity of HMA in the lot in tons, and the unit Contract price per ton of mix.

If a constituent is not measured in accordance with these Specifications, its individual pay factor will be considered 1.00 in calculating the Composite Pay Factor (CPF).

5-04.3(9)C7 Mixture Nonstatistical Evaluation – Retests

(July 18, 2018 APWA GSP)

The Contractor may request a sublot be retested. To request a retest, the Contractor shall submit a written request within 7 calendar days after the specific test results have been received. A split of the original acceptance sample will be retested. The split of the sample will not be tested with the same tester that ran the original acceptance test. The sample will be tested for a complete gradation analysis, asphalt binder content, and, at the option of the agency, V_a. The results of the retest will be used for the acceptance of the HMA in place of the original sublot sample test results. The cost of testing will be deducted from any monies due or that may come due the Contractor under the Contract at the rate of $500 per sample.

5-04.3 (9)D Mixture Acceptance – Commercial Evaluation

(July 18, 2018 APWA GSP)

If sampled and tested, HMA produced under Commercial Evaluation and having all constituents falling within the tolerance limits of the job mix formula shall be accepted at the unit Contract price with no further evaluation. When one or more constituents fall outside the commercial tolerance limits in the Job Mix Formula shown in 5-04.3(9), the lot shall be evaluated in accordance with Section 1-06.2 to determine the appropriate CPF. The commercial tolerance limits will be used in the calculation of the CPF and the maximum CPF shall be 1.00. When less than three sublots exist, backup samples of the existing sublots or samples from the street shall be tested to provide a minimum of three sets of results for evaluation.

For each lot of HMA mix produced and tested under Commercial Evaluation when the calculated CPF is less than 1.00, a Nonconforming Mix Factor (NCMF) will be determined. The NCMF equals the algebraic difference of CPF minus 1.00 multiplied by 60 percent. The Job Mix Compliance Price Adjustment will be calculated as the product of the NCMF, the quantity of HMA in the lot in tons, and the unit Contract price per ton of mix.

If a constituent is not measured in accordance with these Specifications, its individual pay factor will be considered 1.00 in calculating the Composite Pay Factor (CPF).

5-04.3(10) HMA Compaction Acceptance

(July 18, 2018 APWA GSP)

HMA mixture accepted by nonstatistical evaluation that is used in traffic lanes, including lanes for intersections, ramps, truck climbing, weaving, and speed change, and having a specified compacted course thickness greater than 0.10-foot, shall be compacted to a specified level of relative density. The specified level of relative density shall be a Composite Pay Factor (CPF) of not less than 0.75 when evaluated in accordance with Section 1-06.2, using a LSL of 92.0 (minimum of 92 percent of the maximum density). The maximum density shall be determined by WSDOT FOP for AASHTO T 729. The specified level of density attained will be determined by the evaluation of the density of the pavement. The density of the pavement shall be determined in accordance with WSDOT FOP for WAQTC TM 8, except that gauge correlation will be at the discretion of the Engineer, when using the nuclear density gauge and WSDOT SOP 736 when using cores to determine density.

Tests for the determination of the pavement density will be taken in accordance with the required procedures for measurement by a nuclear density gauge or roadway cores after completion of the finish rolling.

If the Contracting Agency uses a nuclear density gauge to determine density the test procedures FOP for WAQTC TM 8 and WSDOT SOP T 729 will be used on the day the mix is placed and prior to opening to traffic.

Roadway cores for density may be obtained by either the Contracting Agency or the Contractor in accordance with WSDOT SOP 734. The core diameter shall be 4-inches minimum, unless otherwise approved by the Engineer. Roadway cores will be tested by the Contracting Agency in accordance with WSDOT FOP for AASHTO T 166.

If the Contract includes the Bid item “Roadway Core” the cores shall be obtained by the Contractor in the presence of the Engineer on the same day the mix is placed and at locations designated by the Engineer. If the Contract does not include the Bid item “Roadway Core” the Contracting Agency will obtain the cores.

For a lot in progress with a CPF less than 0.75, a new lot will begin at the Contractor’s request after the Engineer is satisfied that material conforming to the Specifications can be produced.

HMA mixture accepted by commercial evaluation and HMA constructed under conditions other than those listed above shall be compacted on the basis of a test point evaluation of the compaction train. The test point evaluation shall be performed in accordance with instructions from the Engineer. The number of passes with an approved compaction train, required to attain the maximum test point density, shall be used on all subsequent paving.

HMA for preleveling shall be thoroughly compacted. HMA that is used for preleveling wheel rutting shall be compacted with a pneumatic tire roller unless otherwise approved by the Engineer.

Test Results

For a sublot that has been tested with a nuclear density gauge that did not meet the minimum of 92 percent of the reference maximum density in a compaction lot with a CPF below 1.00 and thus subject to a price reduction or rejection, the Contractor may request that a core be used for determination of the relative density of the sublot. The relative density of the core will replace the relative density determined by the nuclear density gauge for the sublot and will be used for calculation of the CPF and acceptance of HMA compaction lot.

When cores are taken by the Contracting Agency at the request of the Contractor, they shall be requested by noon of the next workday after the test results for the sublot have been provided or made available to the Contractor. Core locations shall be outside of wheel paths and as determined by the Engineer. Traffic control shall be provided by the Contractor as requested by the Engineer. Failure by the Contractor to provide the requested traffic control will result in forfeiture of the request for cores. When the CPF for the lot based on the results of the HMA cores is less than 1.00, the cost for the coring will be deducted from any monies due or that may become due the Contractor under the Contract at the rate of $200 per core and the Contractor shall pay for the cost of the traffic control.

5-04.3(10)A HMA Compaction – General Compaction Requirements

(July 18, 2018 APWA GSP)

Compaction shall take place when the mixture is in the proper condition so that no undue displacement, cracking, or shoving occurs. Areas inaccessible to large compaction equipment shall be compacted by other mechanical means. Any HMA that becomes loose, broken, contaminated, shows an excess or deficiency of asphalt, or is in any way defective, shall be removed and replaced with new hot mix that shall be immediately compacted to conform to the surrounding area.

The type of rollers to be used and their relative position in the compaction sequence shall generally be the Contractor’s option, provided the specified densities are attained. Unless the Engineer has approved otherwise, rollers shall only be operated in the static mode when the internal temperature of the mix is less than 175°F. Regardless of mix temperature, a roller shall not be operated in a mode that results in checking or cracking of the mat. Rollers shall only be operated in static mode on bridge decks.

5-04.3(10)B HMA Compaction – Cyclic Density

(July 18, 2018 APWA GSP)

Low cyclic density areas are defined as spots or streaks in the pavement that are less than 90 percent of the theoretical maximum density. At the Engineer’s discretion, the Engineer may evaluate the HMA pavement for low cyclic density, and when doing so will follow WSDOT SOP 733. A $500 Cyclic Density Price Adjustment will be assessed for any 500-foot section with two or more density readings below 90 percent of the theoretical maximum density.

5-04.3(10)C Vacant

5-04.3(10)D HMA Nonstatistical Compaction

5-04.3(10)D1 HMA Nonstatistical Compaction – Lots and Sublots

(July 18, 2018 APWA GSP)

HMA compaction which is accepted by nonstatistical evaluation will be based on acceptance testing performed by the Contracting Agency dividing the project into compaction lots.

A lot is represented by randomly selected samples of the same mix design that will be tested for acceptance. A lot is defined as the total quantity of material or work produced for each Job Mix Formula placed. Only one lot per JMF is expected. A sublot shall be equal to one day's production or 400 tons, whichever is less except that the final sublot will be a minimum of 200 tons and may be increased to 800 tons. Testing for compaction will be at the rate of 5 tests per sublot per WSDOT T 738.

The sublot locations within each density lot will be determined by the Engineer. For a lot in progress with a CPF less than 0.75, a new lot will begin at the Contractor's request after the Engineer is satisfied that material conforming to the Specifications can be produced.

HMA mixture accepted by commercial evaluation and HMA constructed under conditions other than those listed above shall be compacted on the basis of a test point evaluation of the compaction train. The test point evaluation shall be performed in accordance with instructions from the Engineer. The number of passes with an approved compaction train, required to attain the maximum test point density, shall be used on all subsequent paving.

HMA for preleveling shall be thoroughly compacted. HMA that is used to prelevel wheel ruts shall be compacted with a pneumatic tire roller unless otherwise approved by the Engineer.

5-04.3(10)D2 HMA Compaction Nonstatistical Evaluation – Acceptance Testing

(July 18, 2018 APWA GSP)

The location of the HMA compaction acceptance tests will be randomly selected by the Engineer from within each sublot, with one test per sublot.

5-04.3(10)D3 HMA Nonstatistical Compaction – Price Adjustments

(July 18, 2018 APWA GSP)

For each compaction lot with one or two sublots, having all sublots attain a relative density that is 92 percent of the reference maximum density the HMA shall be accepted at the unit Contract price with no further evaluation. When a sublot does not attain a relative density that is 92 percent of the reference maximum density, the lot shall be evaluated in accordance with Section 1-06.2 to determine the appropriate CPF. The maximum CPF

shall be 1.00, however, lots with a calculated CPF in excess of 1.00 will be used to offset lots with CPF values below 1.00 but greater than 0.90. Lots with CPF lower than 0.90 will be evaluated for compliance per 5-04.3(11). Additional testing by either a nuclear moisture-density gauge or cores will be completed as required to provide a minimum of three tests for evaluation.

For compaction below the required 92% a Non-Conforming Compaction Factor (NCCF) will be determined. The NCCF equals the algebraic difference of CPF minus 1.00 multiplied by 40 percent. The Compaction Price Adjustment will be calculated as the product of CPF, the quantity of HMA in the compaction control lot in tons, and the unit Contract price per ton of mix.

5-04.3(11) Reject Work

5-04.3(11)A Reject Work General

(July 18, 2018 APWA GSP)

Work that is defective or does not conform to Contract requirements shall be rejected. The Contractor may propose, in writing, alternatives to removal and replacement of rejected material. Acceptability of such alternative proposals will be determined at the sole discretion of the Engineer. HMA that has been rejected is subject to the requirements in Section 1-06.2(2) and this specification, and the Contractor shall submit a corrective action proposal to the Engineer for approval.

5-04.3(11)B Rejection by Contractor

(July 18, 2018 APWA GSP)

The Contractor may, prior to sampling, elect to remove any defective material and replace it with new material. Any such new material will be sampled, tested, and evaluated for acceptance.

5-04.3(11)C Rejection Without Testing (Mixture or Compaction)

(City Contracts, July 18, 2018 APWA GSP)

The Engineer may, without sampling, reject any batch, load, or section of Roadway that appears defective. Material rejected before placement shall not be incorporated into the pavement. Any rejected section of Roadway shall be removed.

No payment will be made for the rejected materials or the removal of the materials unless the Contractor requests that the rejected material be tested. If the Contractor elects to have the rejected material tested, a minimum of three representative samples will be obtained and tested. Acceptance of rejected material will be based on conformance with the nonstatistical acceptance Specification. If the CPF for the rejected material is less than 0.75, no payment will be made for the rejected material; in addition, the cost of sampling and testing shall be borne by the Contractor. If the CPF is greater than or equal to 0.75, the cost of sampling and testing will be borne by the Contracting Agency. If the material is rejected before placement and the CPF is greater than or equal to 0.75, compensation for

the rejected material will be at a CPF of 0.75. If rejection occurs after placement and the CPF is greater than or equal to 0.75, compensation for the rejected material will be at the calculated CPF with an addition of 25 percent of the unit Contract price added for the cost of removal and disposal.

5-04.3(11)D Rejection - A Partial Sublot

(July 18, 2018 APWA GSP)

In addition to the random acceptance sampling and testing, the Engineer may also isolate from a normal sublot any material that is suspected of being defective in relative density, gradation or asphalt binder content. Such isolated material will not include an original sample location. A minimum of three random samples of the suspect material will be obtained and tested. The material will then be statistically evaluated as an independent lot in accordance with Section 1-06.2(2).

5-04.3(11)E Rejection - An Entire Sublot

(July 18, 2018 APWA GSP)

An entire sublot that is suspected of being defective may be rejected. When a sublot is rejected a minimum of two additional random samples from this sublot will be obtained. These additional samples and the original sublot will be evaluated as an independent lot in accordance with Section 1-06.2(2).

5-04.3(11)F Rejection - A Lot in Progress

(July 18, 2018 APWA GSP)

The Contractor shall shut down operations and shall not resume HMA placement until such time as the Engineer is satisfied that material conforming to the Specifications can be produced:

1. When the Composite Pay Factor (CPF) of a lot in progress drops below 1.00 and the Contractor is taking no corrective action, or
2. When the Pay Factor (PF) for any constituent of a lot in progress drops below 0.95 and the Contractor is taking no corrective action, or
3. When either the PFi for any constituent or the CPF of a lot in progress is less than 0.75.

5-04.3(11)G Rejection - An Entire Lot (Mixture or Compaction)

(July 18, 2018 APWA GSP)

An entire lot with a CPF of less than 0.75 will be rejected.

5-04.3(12) Joints

5-04.3(12)A HMA Joints

5-04.3(12)A1 Transverse Joints

(July 18, 2018 APWA GSP)

The Contractor shall conduct operations such that the placing of the top or wearing course is a continuous operation or as close to continuous as possible. Unscheduled transverse joints will be allowed and the roller may pass over the unprotected end of the freshly laid mixture only when the placement of the course must be discontinued for such a length of time that the mixture will cool below compaction temperature. When the Work is resumed, the previously compacted mixture shall be cut back to produce a slightly beveled edge for the full thickness of the course.

A temporary wedge of HMA constructed on a 20H:1V shall be constructed where a transverse joint as a result of paving or planing is open to traffic. The HMA in the temporary wedge shall be separated from the permanent HMA by strips of heavy wrapping paper or other methods approved by the Engineer. The wrapping paper shall be removed and the joint trimmed to a slightly beveled edge for the full thickness of the course prior to resumption of paving.

The material that is cut away shall be wasted and new mix shall be laid against the cut. Rollers or tamping irons shall be used to seal the joint.

5-04.3(12)A2 Longitudinal Joints

(July 18, 2018 APWA GSP)

The longitudinal joint in any one course shall be offset from the course immediately below by not more than 6 inches nor less than 2 inches. All longitudinal joints constructed in the wearing course shall be located at a lane line or an edge line of the Traveled Way. A notched wedge joint shall be constructed along all longitudinal joints in the wearing surface of new HMA unless otherwise approved by the Engineer. The notched wedge joint shall have a vertical edge of not less than the maximum aggregate size or more than ½ of the compacted lift thickness and then taper down on a slope not steeper than 4H:1V. The sloped portion of the HMA notched wedge joint shall be uniformly compacted.

5-04.3(12)A3 Asphalt Concrete Pavement Butt Joints

(April 2020 City of Auburn GSP)

The Contractor shall provide butt joints where the new asphalt concrete pavement meets the existing pavement as shown on the Plans in a manner to produce a smooth riding connection to the existing pavement. The depth of butt joint required shall be determined by the depth of new asphalt concrete pavement specified on the Plans, but not less than 2 inches. The surface elevation of new and existing Asphalt Concrete Pavement shall be the same at all butt joints.

All asphalt concrete joints shall be sealed with asphalt binder PG 58H-22 per Section 9-02 (Bituminous Materials).

5-04.3(12)B Bridge Paving Joint Seals

5-04.3(12)B1 HMA Sawcut and Seal

(July 18, 2018 APWA GSP)

Prior to placing HMA on the bridge deck, establish sawcut alignment points at both ends of the bridge paving joint seals to be placed at the bridge ends, and at interior joints within the bridge deck when and where shown in the Plans. Establish the sawcut alignment points in a manner that they remain functional for use in aligning the sawcut after placing the overlay.

Submit a Type 1 Working Drawing consisting of the sealant manufacturer's application procedure.

Construct the bridge paving joint seal as specified ion the Plans and in accordance with the detail shown in the Standard Plans. Construct the sawcut in accordance with the detail shown in the Standard Plan. Construct the sawcut in accordance with Section 5-05.3(8)B and the manufacturer's application procedure.

5-04.3(12)B2 Paved Panel Joint Seal

(July 18, 2018 APWA GSP)

Construct the paved panel joint seal in accordance with the requirements specified in section 5-04.3(12)B1 and the following requirement:

1. Clean and seal the existing joint between concrete panels in accordance with Section 5-01.3(8) and the details shown in the Standard Plans.

5-04.3(13) Surface Smoothness

(July 18, 2018 APWA GSP)

The completed surface of all courses shall be of uniform texture, smooth, uniform as to crown and grade, and free from defects of all kinds. The completed surface of the wearing course shall not vary more than ⅛ inch from the lower edge of a 10-foot straightedge placed on the surface parallel to the centerline. The transverse slope of the completed surface of the wearing course shall vary not more than ¼ inch in 10 feet from the rate of transverse slope shown in the Plans.

When deviations in excess of the above tolerances are found that result from a high place in the HMA, the pavement surface shall be corrected by one of the following methods:

1. Removal of material from high places by grinding with an approved grinding machine, or
2. Removal and replacement of the wearing course of HMA, or
3. By other method approved by the Engineer.

Correction of defects shall be carried out until there are no deviations anywhere greater than the allowable tolerances.

Deviations in excess of the above tolerances that result from a low place in the HMA and deviations resulting from a high place where corrective action, in the opinion of the Engineer, will not produce satisfactory results will be accepted with a price adjustment. The Engineer shall deduct from monies due or that may become due to the Contractor the sum of $500.00 for each and every section of single traffic lane 100 feet in length in which any excessive deviations described above are found.

When utility appurtenances such as manhole covers and valve boxes are located in the traveled way, the utility appurtenances shall be adjusted to the finished grade prior to paving. This requirement may be waived when requested by the Contractor, at the discretion of the Engineer or when the adjustment details provided in the project plan or specifications call for utility appurtenance adjustments after the completion of paving.

Utility appurtenance adjustment discussions will be included in the Pre-Paving planning (5-04.3(14)B3). Submit a written request to waive this requirement to the Engineer prior to the start of paving.

5-04.3(14) Planing (Milling) Bituminous Pavement

(July 18, 2018 APWA GSP)

The planing plan must be approved by the Engineer and a pre planing meeting must be held prior to the start of any planing. See Section 5-04.3(14)B2 for information on planing submittals.

Locations of existing surfacing to be planed are as shown in the Drawings.

Where planing an existing pavement is specified in the Contract, the Contractor must remove existing surfacing material and to reshape the surface to remove irregularities. The finished product must be a prepared surface acceptable for receiving an HMA overlay.

Use the cold milling method for planing unless otherwise specified in the Contract. Do not use the planer on the final wearing course of new HMA.

Conduct planing operations in a manner that does not tear, break, burn, or otherwise damage the surface which is to remain. The finished planed surface must be slightly grooved or roughened and must be free from gouges, deep grooves, ridges, or other imperfections. The Contractor must repair any damage to the surface by the Contractor’s planing equipment, using an Engineer approved method.

Repair or replace any metal castings and other surface improvements damaged by planing, as determined by the Engineer.

A tapered wedge cut must be planed longitudinally along curb lines sufficient to provide a minimum of 4 inches of curb reveal after placement and compaction of the final wearing course. The dimensions of the wedge must be as shown on the Drawings or as specified by the Engineer.

A tapered wedge cut must also be made at transitions to adjoining pavement surfaces (meet lines) where butt joints are shown on the Drawings. Cut butt joints in a straight line with vertical faces 2 inches or more in height, producing a smooth transition to the existing adjoining pavement.

After planing is complete, planed surfaces must be swept, cleaned, and if required by the Contract, patched and preleveled.

The Engineer may direct additional depth planing. Before performing this additional depth planing, the Contractor must conduct a hidden metal in pavement detection survey as specified in Section 5-04.3(14)A.

(November 2019, City of Auburn GSP)

Supplement this section with the following:

The full depth beginning and end of each lane of planing shall be squared-off to form a uniform, transverse joint.

The Contractor shall provide for safe vehicle travel over existing manholes, valve boxes, catch basins, etc., for planed areas opened to traffic. Before opening the roadway to traffic, any delaminating of the planed asphalt surface shall be removed and the resulting holes patched with HMA. Also, the surface shall be cleaned by sweeping to remove dust and foreign matter. Where the plans call for a grind an overlay, the overlay work shall commence within 5 working days of completing the pavement grinding except where specified otherwise in the Contract.

Planing tailings may be used as trench backfill. Planing tailings may also be used as crushed surfacing when mixed with Crushed Surfacing per Section 9-03.9(3) (Crushed Surfacing) per Section 4-04.3(3) (Mixing).

5-04.3(14)A Pre-Planing Metal Detection Check

(July 18, 2018 APWA GSP)

Before starting planing of pavements, and before any additional depth planing required by the Engineer, the Contractor must conduct a physical survey of existing pavement to be planed with equipment that can identify hidden metal objects.

Should such metal be identified, promptly notify the Engineer.

See Section 1-07.16(1) regarding the protection of survey monumentation that may be hidden in pavement.

The Contractor is solely responsible for any damage to equipment resulting from the Contractor’s failure to conduct a pre-planing metal detection survey, or from the Contractor’s failure to notify the Engineer of any hidden metal that is detected.

5-04.3(14)B Paving and Planing Under Traffic

5-04.3(14)B1 General

(July 18, 2018 APWA GSP)

In addition the requirements of Section 1-07.23 and the traffic controls required in Section 1-10, and unless the Contract specifies otherwise or the Engineer approves, the Contractor must comply with the following:

1. Intersections:
    a. Keep intersections open to traffic at all times, except when paving or planing operations through an intersection requires closure. Such closure must be kept to the minimum time required to place and compact the HMA mixture, or plane as appropriate. For paving, schedule such closure to individual lanes or portions thereof that allows the traffic volumes and schedule of traffic volumes required in the approved traffic control plan. Schedule work so that adjacent intersections are not impacted at the same time and comply with the traffic control restrictions required by the Traffic Engineer. Each individual intersection closure or partial closure, must be addressed in the traffic control plan, which must be submitted to and accepted by the Engineer, see Section 1-10.2(2).
    b. When planing or paving and related construction must occur in an intersection, consider scheduling and sequencing such work into quarters of the intersection, or half or more of an intersection with side street detours. Be prepared to sequence the work to individual lanes or portions thereof.
    c. Should closure of the intersection in its entirety be necessary, and no trolley service is impacted, keep such closure to the minimum time required to place and compact the HMA mixture, plane, remove asphalt, tack coat, and as needed.
    d. Any work in an intersection requires advance warning in both signage and a number of Working Days advance notice as determined by the Engineer, to alert traffic and emergency services of the intersection closure or partial closure.
    e. Allow new compacted HMA asphalt to cool to ambient temperature before any traffic is allowed on it. Traffic is not allowed on newly placed asphalt until approval has been obtained from the Engineer.
2. Temporary centerline marking, post-paving temporary marking, temporary stop bars, and maintaining temporary pavement marking must comply with Section 8-23.
3. Permanent pavement marking must comply with Section 8-22.

5-04.3(14)B2 Submittals – Planing Plan and HMA Paving Plan

(July 18, 2018 APWA GSP)

The Contractor must submit a separate planing plan and a separate paving plan to the Engineer at least 5 Working Days in advance of each operation’s activity start date. These

plans must show how the moving operation and traffic control are coordinated, as they will be discussed at the pre-planing briefing and pre-paving briefing. When requested by the Engineer, the Contractor must provide each operation's traffic control plan on 24 x 36 inch or larger size Shop Drawings with a scale showing both the area of operation and sufficient detail of traffic beyond the area of operation where detour traffic may be required. The scale on the Shop Drawings is 1 inch = 20 feet, which may be changed if the Engineer agrees sufficient detail is shown.

The planing operation and the paving operation include, but are not limited to, metal detection, removal of asphalt and temporary asphalt of any kind, tack coat and drying, staging of supply trucks, paving trains, rolling, scheduling, and as may be discussed at the briefing.

When intersections will be partially or totally blocked, provide adequately sized and noticeable signage alerting traffic of closures to come, a minimum 2 Working Days in advance. The traffic control plan must show where police officers will be stationed when signalization is or may be, countermanded, and show areas where flaggers are proposed.

At a minimum, the planing and the paving plan must include:

1. A copy of the accepted traffic control plan, see Section 1-10.2(2), detailing each day's traffic control as it relates to the specific requirements of that day's planing and paving. Briefly describe the sequencing of traffic control consistent with the proposed planing and paving sequence, and scheduling of placement of temporary pavement markings and channelizing devices after each day's planing, and paving.
2. A copy of each intersection's traffic control plan.
3. Haul routes from Supplier facilities, and locations of temporary parking and staging areas, including return routes. Describe the complete round trip as it relates to the sequencing of paving operations.
4. Names and locations of HMA Supplier facilities to be used.
5. List of all equipment to be used for paving.
6. List of personnel and associated job classification assigned to each piece of paving equipment.
7. Description (geometric or narrative) of the scheduled sequence of planing and of paving, and intended area of planing and of paving for each day's work, must include the directions of proposed planing and of proposed paving, sequence of adjacent lane paving, sequence of skipped lane paving, intersection planing and paving scheduling and sequencing, and proposed notifications and coordinations to be timely made. The plan must show HMA joints relative to the final pavement marking lane lines.
8. Names, job titles, and contact information for field, office, and plant supervisory personnel.
9. A copy of the approved Mix Designs.
10. Tonnage of HMA to be placed each day.
11. Approximate times and days for starting and ending daily operations.

5-04.3(14)B3 Pre-Paving and Pre-Planing Briefing

(July 18, 2018 APWA GSP)

At least 2 Working Days before the first paving operation and the first planing operation, or as scheduled by the Engineer for future paving and planing operations to ensure the Contractor has adequately prepared for notifying and coordinating as required in the Contract, the Contractor must be prepared to discuss that day's operations as they relate to other entities and to public safety and convenience, including driveway and business access, garbage truck operations, Metro transit operations and working around energized overhead wires, school and nursing home and hospital and other accesses, other contractors who may be operating in the area, pedestrian and bicycle traffic, and emergency services. The Contractor, and Subcontractors that may be part of that day's operations, must meet with the Engineer and discuss the proposed operation as it relates to the submitted planing plan and paving plan, approved traffic control plan, and public convenience and safety. Such discussion includes, but is not limited to:

1. General for both Paving Plan and for Planing Plan:
    a. The actual times of starting and ending daily operations.
    b. In intersections, how to break up the intersection, and address traffic control and signalization for that operation, including use of peace officers.
    c. The sequencing and scheduling of paving operations and of planing operations, as applicable, as it relates to traffic control, to public convenience and safety, and to other con-tractors who may operate in the Project Site.
    d. Notifications required of Contractor activities, and coordinating with other entities and the public as necessary.
    e. Description of the sequencing of installation and types of temporary pavement markings as it relates to planning and to paving.
    f. Description of the sequencing of installation of, and the removal of, temporary pavement patch material around exposed castings and as may be needed
    g. Description of procedures and equipment to identify hidden metal in the pavement, such as survey monumentation, monitoring wells, street car rail, and castings, before planning, see Section 5-04.3(14)B2.
    h. Description of how flaggers will be coordinated with the planing, paving, and related operations.
    i. Description of sequencing of traffic controls for the process of rigid pavement base repairs.
    j. Other items the Engineer deems necessary to address.
2. Paving – additional topics:
    a. When to start applying tack and coordinating with paving.
    b. Types of equipment and numbers of each type equipment to be used. If more pieces of equipment than personnel are proposed, describe the sequencing of the personnel operating the types of equipment. Discuss

the continuance of operator personnel for each type equipment as it relates to meeting Specification requirements.

c. Number of JMFs to be placed, and if more than one JMF how the Contractor will ensure different JMFs are distinguished, how pavers and MTVs are distinguished if more than one JMF is being placed at the time, and how pavers and MTVs are cleaned so that one JMF does not adversely influence the other JMF.

d. Description of contingency plans for that day's operations such as equipment breakdown, rain out, and Supplier shutdown of operations.

e. Number of sublots to be placed, sequencing of density testing, and other sampling and testing.

5-04.3(15) Sealing Pavement Surfaces

(July 18, 2018 APWA GSP)

Apply a fog seal where shown in the plans. Construct the fog seal in accordance with Section 5-02.3. Unless otherwise approved by the Engineer, apply the fog seal prior to opening to traffic.

5-04.3(16) HMA Road Approaches

(July 18, 2018 APWA GSP)

HMA approaches shall be constructed at the locations shown in the Plans or where staked by the Engineer. The Work shall be performed in accordance with Section 5-04.

5-04.3(17) Asphalt Cold Patch

(November 2019, City of Auburn GSP)

"Asphalt Cold Patch" for temporary pavement patching and temporary pedestrian ramps or walkways shall be placed by the Contractor immediately upon the request of Engineer as required for maintenance of traffic as specified in Section 1-07.23(1) (Construction Under Traffic) in this document. "The Asphalt Cold Patch" shall be removed in its entirety before asphalt concrete pavement is placed.

5-04.3(18) Porous HMA

(November 2019, City of Auburn GSP)

Subgrade Preparation and Permeable Ballast/Choker Course Placement

The Contractor shall prepare subgrade in conformance with Section 2-06 and in accordance to the Plans except that subgrade soil shall be compacted to 90 percent of the maximum density under the tests described in Section 2-03.3(14)D.

Protect gravel borrow subgrade to remain. Keep traffic off of the prepared subgrade during construction. Final 12-inch excavation of gravel borrow subgrade to be done at time of placement of permeable ballast/choker course in order to protect the existing subgrade infiltration capabilities. Final excavation shall proceed as machinery is pulling back and travelling on preliminary grade as final grade is excavated.

To prevent compaction when installing the permeable ballast/choker course, these materials shall be dumped onto the subgrade from the edge of the installation and pushed out onto the

subgrade. Subsequent load shall be dumped from the top of the sand filter sand and permeable ballast/choker course as the installation progresses.

Maintain flow diversion measures to prevent runoff and sediment from entering the work limits. Remove debris or sediment that has accumulated on the finished subgrade after viewing and before placing permeable ballast/choker course.

Place and compact permeable ballast/choker course aggregate to the grades indicated on the Plans in 6-inch maximum compacted lifts. Compaction shall be performed using a 10-ton vibratory drum compactor. The required compaction effort for each aggregate type shall be determined using a test strip. Compact the test strip using a predetermined number of passes with the compactor. Measure the density of the permeable ballast/choker course using a nuclear densometer gauge in backscatter mode. Perform additional passes with the roller and measure the aggregate density again. Repeat until the increase in density achieved with the additional passes of the compactor is less than or equal to 1.2 pounds per cubic foot on average. The number of passes with the compactor required to achieve this density shall be used to compact the remainder of the aggregate for the project. Compaction testing using the nuclear densometer gauge shall be used to confirm compaction at a frequency of one test per 2,000 square feet.

Protect placed aggregate from stormwater run-on and contamination from adjacent exposed soils.

Pervious Asphalt Concrete Pavement

The Contractor shall prepare and place asphalt pavement in conformance with Section 5-04.

Testing and acceptance requirements for Commercial HMA described in Section 5-04 of the Standard Specifications and of these Special Provisions shall apply to pervious asphalt concrete.

Transport the mix to the job site in clean vehicles with smooth dump beds that have been sprayed with a non-petroleum release agent. Limit the time of haul to avoid drainage of the asphalt to the bottom of the truck bed. The mix should be covered during transportation to prevent cooling and the formation of lumps.

Pavement shall be laid utilizing a self-propelled paving machine of 5-foot-minimum width and laser plane control or unit with an activated screed or strike-off assembly, capable of being heated if necessary, and capable of spreading and finishing the mixture without segregation for the widths and thicknesses required.

Roller shall be steel tandem drum-type, static-type of a 5 to 10 ton size. Maximum loading shall be 265 lbs. per linear inch of drum. The asphalt pavement shall be rolled a minimum of two rollings. The surface shall receive a final rolling utilizing a one-ton roller to remove all roller marks and imperfections in the surface.

Compaction shall be commenced when the asphalt mix temperature mix is at a range of 200 degrees to 240 degrees F.

Compacted depth of pervious asphalt pavement of any layer shall not exceed 0.25 foot.

Allow the pervious pavement to cure for 24 hours before applying any vehicular traffic loading.

5-04.4 Measurement

(City Contracts, November 2019 City of Auburn GSP)

HMA Cl. ___ PG ___, HMA for ___ Cl. ___ PG ___, and Commercial HMA will be measured by the ton in accordance with Section 1-09.2, with no deduction being made for the weight of asphalt binder, mineral filler, or any other component of the mixture. If the Contractor elects to remove and replace mix as allowed by Section 5-04.3(11), the material removed will not be measured.

Roadway cores will be measured per each for the number of cores taken.

Preparation of untreated roadway will be measured by the mile once along the centerline of the main line Roadway. No additional measurement will be made for ramps, Auxiliary Lanes, service roads, Frontage Roads, or Shoulders. Measurement will be to the nearest 0.01 mile.

Pavement repair excavation will be measured by the square yard of surface marked prior to excavation.

Asphalt for prime coat will be measured by the ton in accordance with Section 1-09.2.

Prime coat aggregate will be measured by the cubic yard, truck measure, or by the ton, whichever is designated in the Proposal.

Asphalt for fog seal will be measured by the ton, as provided in Section 5-02.4.

Planing bituminous pavement will be measured by the square yard.

Temporary pavement marking will be measured by the linear foot as provided in Section 8-23.4.

No measurement for Water will be made.

Asphalt Cold Patch will be measured by the ton of cold patch furnished and installed.

Rubberized Asphalt for Crack Sealing" will be measured by the ton.

Porous HMA will be measured by the ton.

No measurement for Soil Residual Herbicide will be made.

No measurement for Longitudinal Joint Seals will be made.

5-04.5 Payment

(City Contracts, July 18, 2018 APWA GSP)

Payment will be made for each of the following Bid items that are included in the Proposal:

"HMA Cl. ___ PG ___", per ton.

"HMA for Approach Cl. ___ PG ___", per ton.

"HMA for Preleveling Cl. ___ PG ___", per ton.

"HMA for Pavement Repair Cl. ___ PG ___", per ton.

"Commercial HMA", per ton.

The unit Contract price per ton for "HMA Cl. ___ PG ___", "HMA for Approach Cl. ___ PG ___", "HMA for Preleveling Cl. ___ PG ___", "HMA for Pavement Repair Cl. ___ PG ___", and "Commercial HMA" shall be full compensation for all costs, including anti-stripping additive, incurred to carry out the requirements of Section 5-04 except for those costs included in other items which are included in this Subsection and which are included in the Proposal.

"Preparation of Untreated Roadway", per mile.

The unit Contract price per mile for "Preparation of Untreated Roadway" shall be full pay for all Work described under 5-04.3(4) , with the exception, however, that all costs involved in patching the Roadway prior to placement of HMA shall be included in the unit Contract price per ton for "HMA Cl. ___ PG ___" which was used for patching. If the Proposal does not include a Bid item for "Preparation of Untreated Roadway", the Roadway shall be prepared as specified, but the Work shall be included in the Contract prices of the other items of Work.

"Preparation of Existing Paved Surfaces", per mile.

The unit Contract Price for "Preparation of Existing Paved Surfaces" shall be full pay for all Work described under Section 5-04.3(4) with the exception, however, that all costs involved in patching the Roadway prior to placement of HMA shall be included in the unit Contract price per ton for "HMA Cl. ___ PG ___" which was used for patching. If the Proposal does not include a Bid item for "Preparation of Untreated Roadway", the Roadway shall be prepared as specified, but the Work shall be included in the Contract prices of the other items of Work.

"Crack Sealing", by force account.

"Crack Sealing" will be paid for by force account as specified in Section 1-09.6. For the purpose of providing a common Proposal for all Bidders, the Contracting Agency has entered an amount in the Proposal to become a part of the total Bid by the Contractor.

"Pavement Repair Excavation Incl. Haul", per square yard.

The unit Contract price per square yard for “Pavement Repair Excavation Incl. Haul” shall be full payment for all costs incurred to perform the Work described in Section 5-04.3(4) with the exception, however, that all costs involved in the placement of HMA shall be included in the unit Contract price per ton for “HMA for Pavement Repair Cl. ___ PG ___”, per ton.

“Asphalt for Prime Coat”, per ton.

The unit Contract price per ton for “Asphalt for Prime Coat” shall be full payment for all costs incurred to obtain, provide and install the material in accordance with Section 5-04.3(4).

“Prime Coat Agg.”, per cubic yard, or per ton.

The unit Contract price per cubic yard or per ton for “Prime Coat Agg.” shall be full pay for furnishing, loading, and hauling aggregate to the place of deposit and spreading the aggregate in the quantities required by the Engineer.

“Asphalt for Fog Seal”, per ton.

Payment for “Asphalt for Fog Seal” is described in Section 5-02.5.

“Longitudinal Joint Seal”, per linear foot.

The unit Contract price per linear foot for “Longitudinal Joint Seal” shall be full payment for all costs incurred to perform the Work described in Section 5-04.3(12).

“Planing Bituminous Pavement”, per square yard.

The unit Contract price per square yard for “Planing Bituminous Pavement” shall be full payment for all costs incurred to perform the Work described in Section 5-04.3(14).

“Temporary Pavement Marking”, per linear foot.

Payment for “Temporary Pavement Marking” is described in Section 8-23.5.

“Water”, per M gallon.

Payment for “Water” is described in Section 2-07.5.

“Job Mix Compliance Price Adjustment”, by calculation.

"Job Mix Compliance Price Adjustment" will be calculated and paid for as described in Section 5-04.3(9)C6.

"Compaction Price Adjustment", by calculation.

"Compaction Price Adjustment" will be calculated and paid for as described in Section 5-04..3(10)D3.

"Roadway Core", per each.

The Contractor's costs for all other Work associated with the coring (e.g., traffic control) shall be incidental and included within the unit Bid price per each and no additional payments will be made.

"Cyclic Density Price Adjustment", by calculation.

"Cyclic Density Price Adjustment" will be calculated and paid for as described in Section 5-04.3(10)B.

(City Contracts, April 2020, City of Auburn GSP)

Supplement this section with the following:

Payment will be made for each of the following Bid items that are included in the Proposal:

"Asphalt Cold Patch", Per Ton

The unit contract price per ton for "Asphalt Cold Patch," shall be full compensation for all costs incurred to carry out the requirements of Section 5-04.3(17) (Asphalt Cold Patch) except for those costs included in other items which are included in this sub-section and which are included in the proposal.

"Rubberized Asphalt for Crack Sealing", Per Ton

The unit contract price for "Rubberized Asphalt for Crack Sealing" shall be full pay for all costs of material, labor, tools, and equipment necessary for the application of the crack sealant as specified including all costs associated with preparation, placing, blotting, and spreading sand.

"Porous HMA", Per Ton

If HMA can be installed with a paving machine, it will not be paid for as "Commercial HMA", but instead will be paid for as "HMA Cl. ___ PG ___.

All costs associated with providing, placing, and sealing new joints in the asphalt concrete shall be included in the unit Contract price for "HMA Cl. ___ PG ___".

All cost incurred to obtain, provide and install herbicide for "Soil Residual Herbicide" in accordance with Section 5-04.3(4)B shall be included in the unit contract price per ton for HMA.

Longitudinal Joint Seals between the HMA and cement concrete pavement shall be included in the unit contract price per ton of the HMA.

Hot or cold mix asphalt concrete for temporary patches shall not be measured for separate payment. All costs associated with temporary patches shall be included in the appropriate unit bid prices for the work involved.

5-05 Cement Concrete Pavement

5-05.3 Construction Requirements

5-05.3(1) Concrete Mix Design for Paving

(January 2017, City of Auburn GSP)

Supplement this section with the following:

Proportioning of Concrete

A. The Contractor shall design the concrete mix determining the proportions of Portland cement, coarse and fine aggregate, and water necessary to produce a workable concrete meeting the following requirements:
   (1) A compressive strength of 4,000 psi at 28 calendar days.
   (2) A maximum slump of 3 inches for fixed form paving and 2 ½ inches for slip form paving.
   (3) If air-entrained concrete is used, the mix shall contain no more than 6 percent entrained air as determined by AASHTO T 152.

B. The Contractor shall design the mix on the basis of an absolute volume method such as outlined in the American Concrete Institute (ACI) Standard 211.1, “Recommended Practice for Selecting Proportions for Normal Weight Concrete”.

C. Water reducing, set retarding or superplasticizer chemical admixtures may be used at the option of the Contractor but subject to approval by the Engineer. The Contractor shall indicate in advance the particular type and name product of admixtures that they proposes to use and only such admixtures approved by the Engineer may be incorporated into the concrete mix. Admixtures selected for use shall be compatible with all other components of the concrete. The use of calcium chloride as an admixture will not be permitted.

D. The Contractor shall submit for the record, not later than 15 calendar days prior to the start of paving operations, the proposed mix design including the aggregates grading to be used. The submission shall be accompanied with certified laboratory reports on the tests performed on the trial mixes. In the event that the concrete mix designed by the Contractor does not produce concrete of the specified strength and workability, the Contractor shall adjust the mix as required to meet the specified requirements at no additional cost to the City and shall submit new certified test results.

E. In the event the Contractor elects to use an air-entraining admixture, they shall determine by trials the amount of the selected admixture that will produce

concrete having the desired air content and the amount shall not be varied except as approved by the Engineer. The admixture shall be added during batching at the plant in accordance with the admixture manufacturer's recommendations.

F. The Contractor shall determine the proportions and batch weights for air-entrained concrete in the same manner as for regular concrete provided, however, that in making such adjustments as may be necessary by reason of air-entrainment, the minimum quantity of fine aggregate and the minimum quantity of water shall be used which will provide concrete of the required workability.

G. Whenever the Contractor modifies the concrete mix, other than minor adjustments in the relative quantities of fine and coarse aggregates, they shall submit a copy of the new mix design, together with certified copies of tests results, to the Engineer.

H. No change in the sources or character of the materials shall be made without due notice to the Engineer. No new materials shall be used until approved by the Engineer and until new trial mixes have been designed, tested and accepted.

5-05.3(8) Joints

(August 2016, City of Auburn GSP)

The first paragraph is revised to read:

The Contractor shall submit for approval to the Engineer a Joint Plan at least 10 working days prior to the commencement of any pavement construction. Transverse and longitudinal joints shall be contraction or through joints (including construction joints). Joints shall be constructed in accordance with the detail shown in the Contract Plans and shall be of the type and at the locations indicated on the Contract Plans. The faces of all joints shall be constructed perpendicular to the surface of the cement concrete pavement.

5-05.3(8)D Isolation Joints

(January 2017, City of Auburn GSP)

Delete this section and replace it with the following:

Isolation joints are placed only where shown on the Plans. The joint alignment shall be at right angles to the Pavement Structure centerline unless otherwise specified in the Contract.

Longitudinal isolation joints shall be constructed with premolded material, ½-inch in thickness and conform to Section 9-04.1(2) (Premolded Joint Filler for Expansion Joints). They shall extend from 1 inch below the bottom of pavement to ¾ inch below the top of pavement.

The joint material shall be held accurately in place during the placing and finishing of the concrete by a bulkhead, a holder, metal cap or any other approved method. The joint shall be perpendicular to the paved surface and the holder shall be in place long enough to prevent sagging of the joint material.

A wood filler strip or metal cap shall be placed on the top of the premolded joint filler to form the groove ¾ inch deep, and shall remain in place until after the finishing and the concrete is sufficiently set to resist sloughing in the groove. The joint filler shall be stapled together at the ends to preserve continuity.

Immediately after removal of side forms, the edges of the pavement shall be carefully inspected and wherever the joint filler is not fully exposed, the concrete shall be chipped down until the edge of the filler is fully exposed for the entire depth.

(August 2016, City of Auburn GSP)

Add the following new section:

5-05.3(8)E Sealing through Joints

After the pavement is cured and before carrying any traffic, the space left by the removal of the wood filler strip or the metal cap above the top of the expansion joint filler strip shall be thoroughly cleaned of all loose material. The ¾ inch wide groove shall be completely free of any projecting concrete from the sides and the groove shall be continuous across the slab to each edge. It shall then be filled level with the pavement surface with joint sealant meeting the requirements of Section 9-04.2 (Joint Sealants).

The joint sealant material shall be heated and placed in accordance with the manufacturer's instructions. Burned material will be rejected. The through joint groove shall be dry at the time of pouring the sealing compound.

Add the following new section:

5-05.3(9) Integral Cement Concrete Curb on New Pavement

(August 2016, City of Auburn GSP)

Integral doweled curb on new pavement shall be constructed as shown in the Contract Plans.

The pavement width shall be extended to the back of the curb. The pavement where the curb is to be placed shall be roughened or otherwise treated so that a permanent bond can be secured between the curb and the pavement. Curing compound shall not be used on the pavement where the curb is to be constructed.

Curb shall be constructed in accordance with Section 8-04.3(1) (Cement Concrete Curbs, Gutters and Spillways) and the Contract Plans.

5-05.3(10) Tie Bars and Corrosion Resistant Dowel Bars

(August 2016, City of Auburn GSP)

The first paragraph is revised to read:

Epoxy-coated tie bars shall be placed at all longitudinal contraction and construction joints, in accordance with the requirements shown in the Contract Plans. In addition, epoxy-coated dowel bars shall be installed when concrete curbs are constructed on top of concrete pavement in accordance with the requirements shown in the Contract Plans.

(January 2017, City of Auburn GSP)

Supplement this section with the following:

Curb dowels shall be placed at 28 inches on center in the fresh concrete pavement. Curb dowels shall be placed in all segments of curbing that is full depth and shall be placed in transition areas for curb cuts in which a minimum of 1 inch of cover from the top of the finished curb can be achieved.

Dowel bars shall be set while the concrete is still plastic enough to not require hammering them into place.

(September 2016, City of Auburn GSP)

Add the following new section including subsections:

5-05.3(23) Cement Concrete Pavement for Alley

(September 2016, City of Auburn GSP)

This work consists of placing Cement concrete pavement for alleyways.

5-05.3(23)A Pavement and Alley Requirements

(August 2016, City of Auburn GSP)

Cement concrete pavement for alleys shall meet the requirements of Section 5-05 (Cement Concrete Pavement). Alleys shall meet the requirements for driveways in Section 8-06 (Cement Concrete Driveway Entrances).

5-05.3(23)B Extra Concrete for Alley Approach Ramp

(August 2016, City of Auburn GSP)

When constructing and finishing cement concrete Alley pavement, the Engineer may in some cases require the Contractor to place additional concrete over the surface of the Alley pavement to serve as an integral ramp or vehicular access to abutting private property. Additional thickness for such ramps shall not exceed 6 inches above the original planned concrete surface at any point, and will be addressed in accordance with Section 1-04.4 (Changes).

5-05.4 Measurement

(City Contracts, January 2017, City of Auburn GSP)

Supplement this section with the following:

Measurement for “Cement Concrete Pavement – Crosswalk” will be by the square yard.

Measurement for Cement Concrete Pavement – Including Dowels will be by the square yard of concrete in place, including the area placed underneath curbs. No deduction will be made for castings in pavement.

5-05.5 Payment

(City Contracts, April 2017, City of Auburn GSP)

Supplement this section with the following:

Payment will be made for each of the following Bid items that are included in the Proposal:

“Cement Concrete Pavement – Including Dowels”, Per Square Yard

"Cement Concrete Pavement – Crosswalk", Per Square Yard

The unit contract price per square yard for "Cement Concrete Pavement – Including Dowels," shall be full compensation for all costs incurred to carry out the requirements of

The unit contract price for "Cement Conc. Pavement – Crosswalk" shall be full pay for all costs of labor, tools, materials, and equipment necessary to complete the cement concrete pavement to the lines, grades, and depths specified on the Plans including the saw cutting of the grid pattern and other finishing requirements.

Section 5-05 (Cement Concrete Pavement) at the thickness required in the Plans including furnishing and installing epoxy coated dowel bars and tie bars, block outs, joints, thickened edges, and integral curbs on concrete pavement in accordance to the Standard Details and Contract Plans.

(February 2023, City of Auburn GSP)

Supplement Division 5 with the following section, including subsections:

5-06 Pervious Concrete Pavement

5-06.1 Description

This work shall consist of constructing a pervious cementitious pavement composed of 66nclude66 cement concrete on a prepared subgrade or subbase in accordance with these Specifications and in conformity with the lines grades, thicknesses, and typical cross-sections shown in the Plans or established by the Engineer.

5-06.2 Materials

Materials shall meet the requirements of the following sections:

Portland Cement	9-01
Aggregates for Portland Cement Concrete	9-03.1
Premolded Joint Filler for Expansion Joints	9-04.1(2)
Curing Materials and Admixtures	9-23
Water	9-25

Hydration stabilizing admixtures shall conform to the requirements of Section 9-23.6(3) or 9-23.6(5).

Synthetic Fibers for Concrete

When specified synthetic fibers to be included in the mix for 66nclude66 cement concrete shall conform to the requirements of ASTM D 7508/7508M.

5-06.3 Construction Requirements

5-06.3(1) Pervious Concrete Construction Meeting

Prior to the start of construction of the pervious concrete pavement section, including excavation of the pavement section, the Contractor shall coordinate, schedule and attend a

preconstruction meeting for the pervious concrete pavement. The following are required to attend the meeting:

1. Contracting Agency representative.
2. General Contractor's representative(s).
3. Engineer of Record for the pervious concrete pavement.
4. Concrete placement lead person(s).
5. Associated Subcontractor's representative.
6. Pervious concrete Supplier's representative.
7. Material Testing Laboratory's representative.

The meeting shall cover all aspects of the work including, but not limited to:

1. Submittals.
2. Short and long term schedule.
3. Inspection of the Work.
4. Protection of the Work.
5. Pervious concrete placement.
6. Curing.
7. Materials.
8. Specifications.
9. Testing.
10. Test panel and JMF.
11. Acceptance criteria.

5-06.3(2) Pervious Concrete Mix Design

The Contractor shall provide a mix design for pervious concrete and shall submit the mix design to the Engineer in writing. Pervious concrete shall not be placed in the test panels without a mix design that has been reviewed and accepted by the Engineer.

5-06.3(2)A Mix Design Criteria

The Contractor shall include the following elements and results of the described procedures in the proposed mix design:

1. A unique identification number for the mix design that is approved for the Job Mix Formula (JMF).
2. Portland cement shall be Type I, Type II, Type I-II Type IP, or Type IS.
3. The cementitious content, including pozzolans if used, shall be a minimum of 480 pounds per cubic yard.
4. The mix shall incorporate a hydration stabilizing admixture.

5. Synthetic microfibers may be utilized at the manufacturer's recommended dosage rate.
6. The water / cement ratio shall not exceed 0.35.
7. No more than 25 percent of 68nclude68 cement in the mix, by weight, may be replaced by fly ash, ground granulated blast furnace slag, or a combination of both.
8. Coarse aggregate shall conform to Section 9-03.1(4), AASHTO Grading No.8.

5-06.3(2)B Job Mix Formula (JMF)

The approved mix design established through the approved test panel becomes the JMF.

5-06.3(3) Submittals

In accordance to Section 1-05.3, the Contractor shall submit the following items to the Engineer for acceptance prior to placing any pervious concrete pavement:

1. The source of all materials proposed for use in constructing pervious concrete pavement.
2. Batch weights for all constituents of one (1) cubic yard of the proposed pervious concrete mix.
3. The specific gravity (SSD) of all aggregates to be used in the proposed pervious concrete mix.
4. The proposed gradation of coarse aggregates used in pervious concrete.
5. The designed volume in cubic feet of all proposed components for 1(one) cubic yard of the proposed pervious concrete mix.
6. The design water / cement ratio of the proposed mix design.
7. The fresh density of the proposed pervious concrete mixture as determined by ASTM C1688.
8. Catalogue cuts and Certificates of Compliance for all proposed admixtures.
9. Mill Certification of the 68nclude68 cement and pozzolans, if used, for the current lot to be used in the production of the proposed pervious concrete mix. The Contractor shall maintain this submittal throughout the duration of the project as lots change.
10. Current certification by the National Ready Mix Concrete Association (NRMCA) for the batch plant(s) to be used in the production of pervious concrete.
11. Current certifications by the NRMCA for the trucks to be used in transporting pervious concrete from the batch plant to the point of placement.
12. Qualification documentation for current certifications by the NRMCA for the Contractor's personnel who will be installing pervious concrete. See Section 5-06.3(10)A. Valid acceptable documentation is the NRMCA issued wallet card or certification certificate.
13. At the time of delivery of the material to the site, the Contractor shall provide an original Certificate of Compliance for each truckload of pervious concrete. The Certificate of Compliance shall include information noted in Section 6-02.3(5)B. If the Certificate of Compliance from the concrete producer is not provided to the Engineer upon delivery, the truckload shall not be placed.

5-06.3(4) Equipment

Equipment necessary for handling materials, mixing, delivering, and performing all parts of the Work, shall be in good repair, designed for the task, and operated by trained and qualified personnel.

5-06.3(4)A Batching Plant and Equipment

Pervious concrete shall be centrally mixed in a plant with a current NRMCA certification.

5-06.3(4)B Mixer Trucks

Pervious concrete shall be transported to the location by truck mixers, non-agitating trucks shall not be used for the transport of pervious concrete. The drums on mixer trucks used to transport pervious concrete shall have fins that are not excessively worn, damaged or have excessive concrete buildup. Mixer trucks shall have a current NRMCA certification.

5-06.3(4)C Side Forms

Pervious concrete shall be placed in stationary forms. If pervious concrete is to be placed against a curb, previously placed concrete, or other existing structure, they may be used as a side form for the pervious concrete paving. Forms for pervious concrete shall be made of steel or wood and shall be in good condition, and shall be capable of being anchored in place so that they will be true to grade, line and slope. Forms shall be sufficiently rigid to maintain specified tolerances and capable of supporting concrete and mechanical concrete placing equipment. Forms shall be in good condition, straight, clean, free of debris, non-adherent rust and hardened concrete.

Set, align, and brace forms so that they hardened pavement meets the lines, grades and slopes as shown in the drawings. Apply form-release agent to the form face, which will be in contact with concrete, immediately before placing concrete. Form release agent shall not be applied to previously placed concrete. Previously placed pavement shall be protected from damage.

The Contractor shall inspect all forms for line, grade and slope. No pervious concrete shall be placed until the forms have been inspected by the Engineer.

5-06.3(4)D Finishing Equipment

Finishing equipment for pervious concrete paving shall be designed for the intended work, shall be clean and in good operating condition.

Equipment used for striking off the pervious concrete shall leave a smooth surface at the planned grades and shall not cause excess paste to be left on, or drawn to, the surface. If rollers or spinning screeds are used to compact, they shall be of sufficient weight and width to compact the pervious concrete uniformly through its depth and to grade without marring the surface. Equipment used for compacting pervious concrete shall not cause the surface to close or otherwise clog and shall produce a surface that is free of ridges or other imperfections. Tools used for producing joints shall be designed and manufactured for the purpose and shall not otherwise damage or mar the surface.

Vibrating equipment shall not be used for placement or compaction of pervious concrete.

5-06.3(5) Measuring and Batching Materials

Measuring and batching materials for pervious concrete pavement shall conform to the requirements of Section 5-05.3(4).

5-06.3(6) Acceptance

For acceptance, pervious concrete pavement will be divided into lots as follows: A single lot (lot) is represented by the lesser of: one (1) day's production or 360 square yards of pervious concrete in place. Where the Contractor has more than one crew placing pervious concrete, lots will be associated with each crew. Representative lot size will be determined to the nearest square yard. If no sample is taken on a Day, that Day's quantities may be included in the next or previous Day's lot(s). The Engineer may isolate an area of pervious concrete within a lot that is deemed to be defective in any way and such an area will be considered to be a new lot for purposes of acceptance. New lots determined in this manner shall be extended as necessary such that they are bounded by planned joints. Acceptance of a lot of pervious concrete pavement will be based on the following criteria:

1. Grade: Conform to the dimensions, lines, slopes and grades specified on the plans. Pervious concrete pavement shall be true to planned grades and shall not deviate from grade more than ¼ inch in ten (10) feet. Where abutting existing facilities such as sidewalks, walkways, curbs, driveways or other pavements, the pervious concrete shall be flush.

2. Conformance to JMF: The pervious concrete pavement used shall conform to the mix design for the JMF within the limits as set forth in Section 6-02.3(5)C and as determined from the accepted test panel.

3. Compacted Thickness and Average Hardened Density: After a minimum of seven (7) calendar days of curing, remove and measure three (3) cores from each lot. Remove cores in accordance with ASTM C42/C42M. Measure the length of each core in accordance with ASTM C1542/1542M. No single core shall be less than 3/4 inch of the design depth on the drawings. The average of all cores from a lot shall be within minus 3/8 inch of the design depth on the plans. After length is measured, measure hardened density of each core in the lot in accordance with ASTM C1754/C1754M. The hardened density from a lot must be within +/- 5 percent of the average hardened density of the JMF (approved test panel).

4. Infiltration Rate: The infiltration rate at any single test point shall not be less than 100 inches per hour.

5. Fresh Density: The fresh density of each lot will be measured by ASTM C1688 at the point of placement shall be within +/- five (5) pounds per cubic foot of the fresh density determined from the JMF (approved test panel).

6. Appearance: The appearance of each lot shall be consistent with the JMF (approved test panel). The pervious concrete pavement shall have a consistent surface texture, shall not be raveled, shall be free of ridges or other surface imperfections, shall have joints that are in the specified location and are constructed per specification, and shall be free of cracks.

Testing for acceptance will be performed by the Engineer.

5-06.3(6)A Infiltration Rate of Placed Pavement

The infiltration rate of the pervious concrete shall be determined at four (4) random locations within each lot. The locations for conducting infiltration tests will be determined by the Engineer. The Contractor shall coordinate and schedule testing with the Engineer a minimum of five (5) Working Days in advance. The infiltration rate on the finished surface will be determined in accordance with ASTM C1701, except the infiltration ring diameter may be 12-inches to 24-inches in diameter. The infiltration test will be conducted after a minimum of seven (7) calendar days of curing has occurred.

If the measured infiltration rate is less than 100 inches/hour at any test location, the Contractor may request in writing that the Engineer perform additional infiltration tests for the purpose of assessing overall infiltration performance and/or determining a defective lot in accordance with Section 5-06.3(6). The determination of a defective lot, or lots, and the extent(s), will be by the Engineer. The cost of additional testing shall borne by the Contractor.

5-06.3(7) Rejection

Pervious concrete may be rejected by the Contractor for any reason.

A truckload of pervious concrete will be rejected if the Certificate of Compliance is not provided at the time of delivery of the material to the site. See Section 5-06.3(4)B.

Pervious concrete that is improperly cured or is allowed to freeze during the initial seven (7) day curing period will be rejected.

Pervious concrete pavement that does not meet the acceptance criteria put forth in Section 5-06.3(6) will be rejected by the Engineer on a lot by lot basis.

During the removal process of the rejected pavement, The Contractor shall implement measures to protect the adjacent pervious concrete pavement to remain. If pervious concrete pavement becomes damaged by the Contractor during removal of the rejected pavement then additional pavement areas may be rejected by the Engineer to the next planned joint.

Fresh pervious concrete that has been rejected by the Engineer, or the Contractor, shall not be placed, or shall be removed and replaced, at no additional cost.

5-06.3(8) Mixing Pervious Concrete

Batch, mix and deliver pervious concrete in compliance with ASTM C94/C94M except that pervious concrete shall not be transit mixed or shrink mixed. If water is added to the mix after it is delivered on site, the fresh density for the pervious concrete shall meet the requirements of the approved JMF referenced in this section.

5-06.3(8)A Limitations of Mixing Pervious Concrete

Mixing and placing concrete shall be discontinued when a descending air temperature in the shade away from artificial heat reaches 40º F and shall not be resumed until an ascending air temperature in the shade and away from artificial heat reaches 40º F.

The temperature of fresh pervious concrete shall not be less than 55° F, nor more than 90° F when placed.

Pervious concrete shall not be mixed with aggregates at less than 32° F.

5-06.3(9) Subgrade Preparation And Base

Prepare and protect subgrade in accordance with Section 2-06.

Prepare and protect subbase in accordance with Section 4-04.

5-06.3(10) Placing, Spreading, Finishing, Edging, Tolerances, and Curing

Pervious concrete shall not be placed, compacted or finished when the natural light is inadequate, unless an adequate lighting system is in operation. The adequacy of light will be determined by the Engineer.

Wet the surface of the subbase with water immediately before placing pervious concrete. Deposit concrete either directly from the transporting equipment or by conveyor on the subbase, unless otherwise specified. Pervious concrete shall not be placed on frozen subbase. Deposit concrete between the forms to an approximately uniform height. Spread the concrete using mechanized equipment or hand tools. Vibrating equipment shall not be used for spreading pervious concrete.

Strike off concrete between forms using a form-riding paving machine, roller screed, or spinning screed.

Compact concrete to a uniformly dense structure without clogging the surface with paste.

Finish the pervious concrete to a uniform, open-textured surface to match the appearance of the approved JMF test panel.

Edges shall be hand tooled to a radius of ¼ inch.

Curing materials for pervious concrete shall be in place no more than 20 minutes of discharge onto the subbase. The pavement surface and all exposed edges shall be completely covered with sheet curing materials conforming to Section 9-23.1. The curing material shall secured at all exterior edges and interior laps without damaging the pervious concrete. The method of securing the curing material shall prevent wind from removing the sheet and from blowing under the sheet across the surface of the concrete. Cure the pavement for a minimum of seven (7) uninterrupted days.

All traffic (foot and vehicular), staging, stockpiling or other work shall be kept off of the pervious concrete pavement during the curing period. Any testing for acceptance shall not occur until the end of the curing period.

Protect concrete from freezing and cold weather in accordance with 5-06.3(12).

5-06.3(10)A Contractor's Qualifications

The contractor shall employ no less than one (1) National Ready Mixed Concrete Association (NRMCA) certified Pervious Concrete Craftsman for each crew, who must be on site, over-seeing the work during all pervious concrete placement; or employ no less than three (3) NRMCA Certified Pervious Concrete Installers per crew, who must be on site working during each pervious concrete placement. The minimum number of certified individuals must be present on each crew for every pervious concrete placement, including the test panel placements, and a certified individual must be in charge of the placement crew and procedures.

If, in the opinion of the Engineer, personnel used for installing pervious concrete are unqualified, inattentive to quality, or unsafe, they shall be removed or reassigned from installation of pervious concrete at the written request of the Engineer.

5-06.3(10)B Test Panel

Production placement of pervious concrete shall not occur until the Contractor has completed a test panel of pervious concrete pavement that meets all of the acceptance criteria described herein and is accepted by the Engineer.

The Contractor shall construct a test panel utilizing a minimum of seven (7) cubic yards of pervious concrete. If multiple pavement section depths are shown on the plans, a test panel shall be constructed for each pavement section depth/thickness. The width of the test panel shall have a width no smaller than the greatest width to be used during the construction and installation of the pervious concrete onsite. The test panel(s) shall include at least one joint and at the spacing specified on the plans and specifications. Test panels may be placed non-contiguously. The test panel(s) shall be equivalent and representative of the production pervious concrete pavement in all aspects including subbase, depth, joints, method of placement, curing, and preparation. Construction and evaluation of the test panel shall occur as follows:

1. Notify the Engineer at least ten (10) Working Days before installing pervious concrete test panels.
2. Coordinate the location of the test panel with the Engineer.
3. Install the test panel in accordance with the Specifications and Drawings.
4. Notify the Engineer when the test panel is ready for inspection and acceptance testing.
5. Acceptance testing will be conducted in accordance with Section 5-03.3(6).
6. Remove, replace, and dispose of any unsatisfactory portions of test panels as determined by the Engineer, at no additional cost to the Contracting Agency.

Failure to install acceptable test panel(s) of pervious concrete will indicate an unapproved test panel(s) and require new test panel(s) for review.

The completed and approved test panel(s) shall establish the JMF.

The approved test panel shall meet the requirements of Section 5-03.3(6).

Upon successful completion of the infiltration test, unless otherwise determined by the Engineer, three (3), cores will be cut in accordance with ASTM C42 and will be used to validate the mix design under the acceptance criteria of Section 5-06.3(6). Cores shall be taken at the same location where the infiltration test was conducted. The average hardened density of the cores shall be the hardened density used for the JMF. The hardened density of each core used for determining the JMF shall be within five (5) percent of the mean value of the three cores. Core holes shall be filled by the Contractor with pervious concrete meeting the proposed JMF and shall match adjacent pavement color, texture and grade.

The completed and accepted test panels shall be maintained and protected throughout the duration of the Work and may not be demolished and disposed of without written permission from the Engineer. If the test panel(s) is incorporated into the Work, it shall remain in place accepted as a single lot.

5-06.3(11) Joints

Construct joints at the locations, depths and with horizontal dimensions indicated on plans unless noted otherwise in this section. Joints shall be of three (3) types: construction, contraction, isolation. Construction joints shall be formed at the end of a day's work or when

necessary to stop production for any reason. Contraction joints shall be used to control random cracking. Isolation joints shall be used where the pervious concrete abuts existing facilities or where shown on the Plans.

5-06.3(11)A Construction Joints

Construction joints shall be located at the location of a planned contraction or isolation joint. Construction joints are to be formed by placing a header between the forms, at right angles, to the full depth of the finished pervious concrete, and set to the height of the forms. Pervious concrete shall be placed against the header and compacted and finished as normal, including edging. The header shall remain in place until paving resumes.

5-06.3(11)B Contraction Joints

Contraction joints (transverse and longitudinal) shall be constructed at the locations and intervals shown in the Contract. Contraction joints shall be a depth of 1/3 the thickness of the pervious concrete pavement section and have a width of no more than 1/4 inch. Contraction joints shall not be saw cut unless specifically noted on the Plans. Saw cut joints shall have a minimum width of 1/8 inch. Plastic formed contraction joints shall be tooled on both sides of the joint with a radius of ½ inch. Tool joint to the depth and width in fresh concrete immediately after the concrete is compacted.

5-06.3(11)C Isolation Joints

Isolation joints shall be placed where the pervious concrete abuts existing structures or where shown on the Plans. Isolation joints shall continue through the depth of the pervious concrete using a 3/8 inch premolded joint filler meeting the requirements of Section 9-04.1(2). Isolation joints may be formed by forming a construction joint and affixing the premolded joint filler against one side of the joint and placing fresh pervious concrete against it. Isolation joints and filler shall be flush with the surrounding pervious concrete and shall not deviate from the acceptance criteria for smoothness as shown in Section 5-06.3(6). The edge of the pervious concrete adjacent the premolded joint filler shall be hand tooled with a ½ inch radius.

5-06.3(12) Cold Weather Work

When concrete is being placed and the ambient air temperature is expected to drop below 35° F during the day or night, the Contractor shall protect the concrete from freezing. The Contractor shall submit for approval a Cold Weather Plan prior to placing concrete when ambient air temperature below 35° F is anticipated, or when requested by the Engineer. When a Cold Weather Plan is required, pervious concrete shall not be placed without an approved Cold Weather Plan.

Under the Cold Weather Plan, the Contractor shall, provide a sufficient supply of straw, hay, blankets, or other suitable blanketing material and spread it over the pavement to a sufficient depth to prevent freezing of the concrete. The blanket material shall be placed on top of the sheet curing materials and covered with a layer of burlap or plastic sheeting, weighted or anchored to prevent the wind from displacing the insulation. At no time during the curing period shall the temperature of the pervious concrete be allowed to drop below 55° F. The Engineer may require recording thermometers if daytime temperature is below 50°. The curing period may be extended by the Engineer if the pervious concrete temperature has been allowed to drop below 55° F.

The cold weather protection shall be maintained for seven (7) days. Pervious concrete that has frozen during this period will be rejected.

5-06.3(13) Protection of Pervious Concrete Pavement

As part of the Construction Stormwater Pollution Prevention plan (SWPPP), rain runoff, surface water of any kind and sediment shall be prevented from entering the area of pervious concrete construction, including excavation, until the pervious concrete application has cured, testing is completed and determined to meet specifications and the adjacent areas that sheet flow/drain onto the pervious concrete are permanently stabilized from erosion and plantings are established. Once pavement is placed, flow diversion measures and protective covers shall continually be maintained until adjacent areas are permanently stabilized and concrete has been accepted. Construction vehicular traffic shall not be allowed onto the pervious concrete pavement.

Do not open the pavement to vehicular traffic until the concrete has cured for at least seven (7) uninterrupted days, testing has been completed, and the pavement has been accepted by the Engineer.

The Contractor shall take every precaution to protect the pervious concrete pavement from damage, including the introduction of foreign materials to the surface, throughout the course of the work. Pervious concrete pavement that is damaged or has been adversely impacted by the introduction of foreign materials shall be remediated to the satisfaction of the Engineer or rejected and replaced to the nearest joint.

(City Contracts, February 2023, City of Auburn GSP)

Supplement this section with the following subsections:

5-06.4 Measurement

Measurement for “Pervious Concrete Pavement – Sidewalk” will be by the square yard of finished surface of pervious concrete walk. No measurement will be made for blocked out areas, castings or other discontinuities in the sidewalk nine (9) square feet or larger.

Measurement for “Pervious Concrete Pavement-Vehicular” will be by the square yard for the finished surface of pervious concrete pavement. No Measurement will be made for blocked out areas, castings or other discontinuities in the pavement nine (9) square feet or larger.

5-06.5 Payment

Payment will be made in accordance with Section 1-04.1, for each of the following Bid Items that are included in the Proposal:

“Pervious Concrete Pavement – Sidewalk”, Per Square Yard

“Pervious Concrete Pavement – Vehicular”, Per Square Yard

The Unit contract price per square yard for “Pervious Concrete Pavement – Sidewalk” shall be full pay for furnishing all labor, tools, equipment and materials required to construct the pervious concrete sidewalk as specified in this Section, including but not limited to; performing mix designs, and placing pervious concrete.

The Unit contract price for “Pervious Concrete Pavement-Vehicular” shall be full pay for furnishing all labor, tools, equipment and materials required to construct the pervious concrete pavement as specified in this Section, including but not limited to; performing mix designs, and placing pervious concrete.

(February 2023, City of Auburn GSP)

Supplement Division 5 with the following section, including subsections:

5-07 Textured Asphalt

5-07.1 Description

This work consists of texturing and coloring asphalt concrete pavement in areas indicated on the Contract Drawings. Work includes imprinting the hot mix asphalt surface with a textured finish, and coating the finish surface with a colored epoxy material. All imprinting work shall be performed by an Authorized Street Print Applicator or substituted in its entirety with an approved equivalent described here in accordance with 1-06.7(4) (Proposed Equivalents).

5-07.2 Materials

The following specifications and methods are referenced as part of these Special Provisions.

American Society for Testing and Materials

1) ASTM D-4541 Standard Test Method for Pull-Off Strength of Coatings Using Portable Adhesion Tester
2) ASTM D-4060 Test Method for Abrasion Resistance of Organic Coatings by the Taber Abraser
3) ASTM D-2697 Standard Test Method for Volume of Nonvolatile Matter in Clear or Pigmented Coatings

5-07.2(1) Coating Material

The coating material shall be a premium high performance material consisting of epoxy modified acrylic polymers blended with sand and aggregate, “StreetBond SP150E,” or an approved equivalent.

5-07.2(2) Colorant

The colorant shall be a highly concentrated, high quality, UV stable pigment blend designed to be added to coating material to provide color to the coating. The colorant shall be StreetBond Colorant, with the color “Bedrock,” and the same colorant shall be used in each coating layer applied to the asphalt surface. One pint of StreetBond Colorant shall be used with one 5-gallon pail of StreetBond SP150E Coating Material.

5-07.3 Construction Requirements

The Contractor shall follow the latest StreetPrint Application Procedures as issued by Integrated Paving Concepts Inc.

5-07.3(1) Textured Asphalt Terms

Textured Asphalt Pavement shall be described as “StreetPrint Pavement Texturing”, “StreetPrint”, or approved equivalent pavement on the Contract Plans and documents related to the project.

Pavement Texturing is defined as a finishing system, which treats the surface of Hot Mix Asphalt (HMA) by imprinting fully compacted asphalt pavement with “grid style” or other

styles of depressions to replicate, in relief, the concrete grout depressions common to hand-laid brick or cobblestone, or any other design as shown on the Plans or described in the specifications, and coating the imprinted asphalt surface using an approved surfacing system. This system shall be the "StreetPrint" system utilizing the "StreetBond HW Surfacing System" or an approved equivalent.

Imprinting Asphalt Concrete Pavement is defined as pressing flexible templates into hot, ***fully-compacted***, Asphalt Concrete Pavement to create the appearance of grout lines or patterns in the asphalt surface.

Surfacing System is defined as multiple applications of premium coating material, and shall be StreetBond HW Surfacing System applying StreetBond SP150E.

"Authorized StreetPrint Applicator" is a contractor licensed by Integrated Paving Concepts Inc., (Tel. 800-688-5652), and shall have a foreman, supervisor or lead hand on site who has successfully completed a StreetPrint Level 1 or Level II Accreditation Training Program.

5-07.3(2) Certification

The contractor shall furnish certification of test results showing that surfacing materials has the following properties:

1. Adhesion (PLI) To an Asphalt substrate (ASTM D-4541) Result: Cohesive failure of asphalt prior to adhesive failure.
2. Taber Abrasion H-10(Dry Wear Index) (ASTM D-4060). Maximum of 0.98 grams/1000 cycles after 7 calendar days cure.
3. Solids by Volume (%) (ASTM D-2697). Minimum = 24 +/-2%.

5-07.3(3) Equipment

All equipment, tools, and machines used to perform the work shall be maintained in satisfactory working order at all times. Descriptive information on the surfacing application equipment shall be submitted to the Engineer for approval not less than 5 working days before the work starts.

5-07.3(3)A Templates

Templates shall be manufactured from flexible, woven wire rope cut and welded into the patterns used for imprinting Asphalt Concrete Pavement.

5-07.3(3)B Reciprocating Infra-Red Heater

Reciprocating Infra-Red Heater shall be used to apply heat to the asphalt surface in designated areas for imprinting. The heating equipment used shall allow continuous monitoring of the surface temperature to ensure the asphalt does not over heat and burn. Equipment that is specifically excluded from this section shall not be used for reheating of the asphalt in any form, including direct flame heaters.

5-07.3(3)C Vibratory Plate Compactor

Vibratory Plate Compactor shall be used for pressing the wire templates into the heated asphalt to create the specified pattern.

5-07.3(3)D Spray Equipment

Spray Equipment shall be capable of applying the coating material to the asphalt surface in a controlled thin film.

5-07.3(4) Construction

5-07.3(4)A Surface Preparation Prior to Coating

The asphalt surface shall be free of dirt, debris, oil or anything that will adversely affect the adhesion of the new coating system. All loose material on the asphalt surface shall be removed and prior to applying the coatings, the asphalt surface shall be completely dry.

5-07.3(4)B Layout and Imprinting

Layout and imprinting of the pattern into the surface of the HMA is shown in the Plans.

5-07.3(4)C Heating of Asphalt

Direct flame heaters shall not be allowed for the purpose of heating the asphalt. Hot air portable heaters may only be used for heating isolated areas. The temperature of the asphalt surface shall be regularly monitored during the reheating process. The asphalt pavement shall be adequately heat soaked (softened) to a depth of at least 1/2 inch, without burning the asphalt. If during the re-heating process the surface is overheated and begins to emit black smoke, the contractor shall stop work immediately. The damaged surface area shall be removed by milling the upper 1-1/2 inch and replaced by a partial depth patch with the topmost layer matching the existing surface layer mix and binder. Patching and all work associated with the repair effort shall be at no cost to the City.

5-07.3(4)D Sample Area

Prior to installing the Surfacing System to the entire project, a sample area shall be completed. Upon approval from the Engineer for appearance of color, the Contractor may proceed with completing the Surfacing System installation.

5-07.3(4)E Coating Installation

The Contractor shall apply the Surfacing System only when the air temperature is at least 50°F and rising, and will not drop below 50°F within 8 hours of application of the coating material. There should be no precipitation expected within 2 hours after applying the final layer of coating material.

5-07.3(5) Quality Control

5-07.3(5)A General

At all times the Contractor shall have a representative familiar with all manufacturer's recommendations for products used on site, or if the StreetPrint process is utilized then a foreman, supervisor or lead hand who is registered with Integrated Paving Concepts, Inc., as a Level 1 or Level II Accredited StreetPrint Installer shall be onsite at all times during installation; certification must be submitted for approval 5 working days prior to commencing construction.

5-07.3(5)B Stamping Depth

Upon completion, the patterned area shall be checked for proper depth of print. 98% of the stamped area shall have an imprint depth of 1/4 inch. If any sample areas have an imprint depth that is less than 1/4 inch, those areas shall be re-heated and re-stamped prior to applying the coatings.

5-07.3(5)C Coating Thickness

The total thickness shall be monitored by measuring the volume of material used per unit area. For this project an average coverage area for the combined coating layers shall be per manufacturer's recommendation or 150 square feet coated per 5-gallon pail of StreetBond SP150E material used. The Contractor shall provide proof of material usage.

5-07.3(5)D Protection of Existing Pavement Markings

The Contractor shall protect all existing pavement markings from contamination from the asphalt sealant including any existing markings on curbing. All disturbed pavement markings shall be returned to their original condition, at no additional cost to the City as specified in Section 8-22 (Pavement Markings).

(City Contracts, February 2023, City of Auburn GSP)

Supplement this section with these subsections:

5-07.4 Measurement

Measurement for "Textured Asphalt" shall be by the square yard of surface area completed.

5-07.5 Payment

Payment will be made for each of the following Bid items that are included in the Proposal:

"Textured Asphalt", Per Square Yard

The unit contract price for "Textured Asphalt" shall be full pay for all costs of labor, tools, and equipment necessary to install the asphalt texturing, including heating, imprinting, and coloring the asphalt.

Costs for placing and compacting the HMA Cl. ½ inch pavement receiving the texturing shall be paid for as indicated in Section 5-04 (Hot Mix Asphalt) of these Special Provisions.

(February 2023, City of Auburn GSP)

Supplement Division 5 with the following section, including subsections:

5-08 Stamped Colored Cement Concrete

5-08.1 Description

This work shall be for the completion of stamped concrete medians as indicated on the Plans.

5-08.2 Materials

Stamped concrete shall be air entrained concrete Class 4000 in accordance with the requirements of Section 6-02.

Solomon Liquid Colors Inc. colorant (Solomon Colors, PO Box 8288, Springfield, Illinois 62791. Phone (800) 624-0261 / (217) 522-3112. Fax (800) 624-3147 / (217) 522-3145. Web Site www.solomoncolors.com. E-Mail sgs@solomoncolors.com.), or approved equivalent, shall be added to the concrete mixture per the following specifications:

Colorant Material Specifications:

- Color: ColorFlo Liquid Color
- Name: Dark Redwood
- Number: 489
- Compliance: ASTM C 979.
- Material: Predispersed iron oxide pigments containing high pigment solids in aqueous base liquid.

Produce uniform and consistent color.

- Permanent, inert, stable to atmospheric conditions, sunfast, weather resistant, alkali resistant, water insoluble, lime proof, and nonbleeding.
- Free of deleterious fillers and extenders.
- Particle Size: 95 to 99 percent minus 325 mesh.
- Specific Gravity: 1.9 to 2.0.

Color Mixing Specifications:

- Mixer shall be loaded to a minimum of 40% capacity to ensure good color suspension.
- The mix design shall be consistent and the water cement ratio shall be maintained with a maximum 4 inch slump.
- The Contractor shall reverse the drum, bringing the concrete to the back of the truck, prior to adding color to the ready mix truck.
- The Contractor shall mix the concrete at high speed for a minimum of 5 minutes before pouring concrete.

5-08.3 Construction Requirements

Construction Requirements for Stamped Colored Concrete:

- Measuring, Batching, Mixing, and Delivering Concrete: As specified in Section 6-02, except as specified in this section.
    1. Measure, batch, mix, and deliver concrete with pigments in accordance with manufacturer's instructions.
    2. Ensure mixer is clean and free of washout water before loading.
    3. Load mixer to a minimum of 40 percent capacity.
    4. Do not load mixer beyond recommended capacity.
    5. Add concrete materials to mixer in same order for each batch.
    6. Do not add pigment to mixer as first concrete material.
    7. Maintain consistent amounts of batch water in each batch.
- Placing, Finishing, and Curing Concrete: As specified in Section 6-02, except as specified in this section.
    1. Place, finish, and cure concrete with pigments in accordance with manufacturer's instructions.
    2. Allow excess surface water to evaporate before finishing.
    3. Do not over-finish surface. Avoid burning surface.
    4. Do not fog with water or cover surface of colored concrete during initial curing process for a minimum of 48 hours.
- Add liquid pigments to concrete batch automatically by use of metering, volumetric, or weight measuring system or manually by weight or volume in accordance with manufacturer's instructions.
- Recycle liquid pigments while in their container before use to ensure uniformity and proper viscosity.
- Add liquid pigments to concrete batch after prewetted aggregate and before cement addition.

Calcium chloride shall not be permitted in the concrete mix, as it causes discoloration.

Forms shall be as specified in Section 8-14.3(2).

Cleaning:

- Clean concrete of efflorescence in accordance with manufacturer's instructions.
- Ensure concrete has sufficiently cured before cleaning.
- Use concrete cleaner approved by pigment manufacturer. Do not use cleaners containing acid.
- Apply cleaner in accordance with cleaner manufacturer's instructions.

5-08.3(1) Stamping

The Contractor shall apply a Brickform, or approved equivalent, Antique Release agent, to the concrete as soon as all standing water has disappeared from the concrete surface and prior to beginning the stamping process.

The Contractor shall apply a Brickform, or approved equivalent, concrete sealer to the finished concrete after it has cured for 28 calendar days.

While the initially finished concrete is plastic, the Contractor shall accurately align and place stamp "skins" or semi rigid mats in sequence and changing direction of patterns as necessary to produce the pattern shown in the Plans. The Contractor shall uniformly load mats and press into concrete to produce the required imprint pattern and depth of imprint on the concrete surface. The Contractor shall remove the stamp mats immediately. The Contractor shall hand stamp edges and surfaces unable to be imprinted by stamp mats.

The Contractor shall utilize a stamping template that matches the pattern specified in the Plans. Upon completion, the patterned area shall be checked for proper depth of print. 98% of the stamped area shall have an imprint depth of 1/4 inch. If any sample areas have an imprint depth that is less than 1/4 inch, those areas shall be re-stamped prior to applying the coatings. The stamped pattern shall be neat, with clean lines and intersections.

(City Contracts, February 2023, City of Auburn GSP)

Supplement this section with these subsections:

5-08.4 Measurement

Measurement for "Colored Stamped Cement Concrete" shall be per Square Yard.

5-08.5 Payment

Payment will be made for each of the following Bid items that are included in the Proposal:

"Colored Stamped Cement Concrete", Per Square Yard

The unit contract price for "Colored Stamped Cement Concrete" shall be full pay for all costs of labor, tools, materials, and equipment necessary to mix, pour, grade, finish, stamp, apply the colored release agent, apply the concrete sealer, and color the stamped concrete.

(February 2023, City of Auburn GSP)

Supplement Division 5 with the following section, including subsections:

5-09 Slurry Seal Surface Treatment

5-09.1 Description

This work consists of applying an emulsified asphalt slurry seal to prepared designated street surfaces in complete and strict accordance with these Special Provisions.

The slurry seal surface shall consist of a mixture of emulsified asphalt, mineral aggregate, and water, properly proportioned, mixed, and spread evenly on the surface as specified in this document. The cured slurry shall have a homogenous appearance, fill all cracks, adhere firmly to the surface, and have a skid resistant texture.

5-09.1(1) Applicable Specifications

The following specifications and methods are referenced as part of these Special Provisions:

AASHTO __ American Association of State Highway Testing Officials;
ASTM __ American Society for Testing and Materials;
ISSA __ International Slurry Seal Association.

5-09.2 Materials

5-09.2(1) Asphalt Emulsion

Emulsified asphalt shall conform to the requirement of ASTM or ISSA Specification for type SS1h, CSS1h, or Quick Setting Mixing Grade Emulsion.

5-09.2(2) Aggregate

The mineral aggregate shall consist of natural or manufactured sand, slag, crusher fines, and others or a combination thereof. Smooth-textured sand of less than 1.25% water absorption shall not exceed 50% of the total combined aggregate. The aggregate shall be clean and free of vegetable matter and other deleterious substances. When tested by AASHTO T176 or ASTM D2419, the aggregate blend shall have a sand equivalent of not less than 45. When tested according to AASHTO T104 or ASTM C88 the aggregate shall show a loss of not more than 15%. When tested according to AASHTO T-96 or ASTM C131 the aggregate shall show a loss of not more than 35. Mineral fillers such as Portland Cement, limestone dust, fly ash, and others shall be considered part of the blended aggregate and shall be used in minimum required amounts and must meet the gradation requirements of ASTM D242. Mineral fillers shall only be used if needed to improve the workability of the mix or gradation of the aggregate.

The combined mineral aggregate shall conform to the following gradation:

Sieve Size	Percent Passing (Type III)
½ inch – (12.5mm)	
3/8 inch – (9.5mm)	100

Theoretical Asphalt **Content % Dry**	
Aggregate	6.5-12

5-09.2(3) Water

All water used with the slurry mixture shall be potable and free from harmful soluble salts.

5-09.2(4) Laboratory Testing

Sources for all materials shall be identified before they are required for use on the project. All samples must be taken according to previously mentioned procedures. All

materials shall be pretested in a qualified laboratory to determine their suitability for use in slurry. The theoretical asphalt content shall be determined. The laboratory shall also determine if mineral filler is required, and if so, how much should be used. Test samples shall be made and tested on a Wet Track Abrasion Machine.

The Contractor must submit the complete laboratory analysis and test report with abraded and unabraded slurry test samples, to the Engineer before application of the slurry seal can begin.

5-09.2(5) Stockpiling Of Aggregates

Precautions shall be taken to insure that stockpiles do not become contaminated with oversized rock, clay, silt, or excessive amounts of moisture. The stockpile shall be kept in areas that drain readily. Segregation of the aggregate will not be permitted.

5-09.2(6) Storage

The Contractor shall provide suitable storage facilities for the asphalt emulsion. The container shall be equipped to prevent water from entering the emulsion. Suitable heat shall be provided, if necessary, to prevent freezing.

5-09.2(7) Sampling

The Contractor shall furnish samples of materials and of the finished slurry surface during progress of the work. The Contractor may be requested to supply test reports as additional materials arrive.

5-09.2(8) Verification

Each machine will make test strips after calibration and before construction. Test strips shall be a portion of the project. Samples of the Slurry Seal will be taken and verification made as to mix consistency and proportioning. Verification of the rate of application will also be made. If any of the tests fail to meet minimum standards, additional test strips will be required until the Engineer approves each unit. These additional test strips will be performed at no additional cost to the City. Any unit failing to pass the tests after the third trial will not be permitted to work on the project. Test strips must be accepted or rejected within 24 hours after application.

5-09.3 Construction Requirements

5-09.3(1) Equipment

All equipment, tools, and machines used to perform this work shall be maintained in satisfactory working order at all times. Descriptive information on the slurry mixing and application equipment shall be submitted to the Engineer for approval not less than 5 working days before the work starts.

5-09.3(1)A Slurry Mixing Equipment

The slurry-mixing machine shall be a continuous flow-mixing unit and shall be capable of accurately delivering a predetermined proportion of aggregate, water, and asphalt emulsion to the mixing chamber and to discharge the thoroughly mixed product on a continuous basis. The aggregate shall be pre-wetted immediately before mixing with the emulsion. The mixing unit of the mixing chamber shall be capable of thoroughly blending all ingredients. No violent mixing is permitted. The mixing machine shall be equipped with an

approved fines feeder that provides an accurate metering device or method to introduce a predetermined proportion of mineral filler into the mixer at the same time and location as the aggregate. The fines feeder shall be used whenever added mineral filler is a part of the aggregate blend.

5-09.3(1)B Slurry Spreading Equipment

A mechanical type squeegee distributor shall be attached to the mixing machine. It shall be equipped with flexible material in contact with the pavement and shall be maintained to prevent loss of slurry from the distributor. It shall also be adjustable to ensure uniform spread. There shall be a steering device and a flexible strike-off. The spreader box shall have an adjustable width. The box shall be kept clean, and build-up of asphalt and aggregate on the box will not be permitted. The Engineer shall approve the use of burlap drags or other drags.

5-09.3(1)C Cleaning Equipment

Power brooms, power blowers, air compressors, water flushing equipment, and hand brooms shall be suitable for cleaning the surface and cracks of the old surface.

5-09.3(1)D Auxiliary Equipment

The Contractor shall provide hand squeegees, shovels, and other equipment as necessary to perform the required work.

5-09.3(1)E Calibration

Each slurry-mixing unit used to perform the work shall be calibrated in the presence of the Engineer, before construction. Documentation of previous calibration that covers the exact materials being used may be an acceptable substitute provided they were made during the same calendar year. The documentation shall include an individual calibration of each material at various settings that can be related to the machine's metering device(s). No machine will be allowed to work on the project until calibration has been completed and accepted.

5-09.3(2) Preparation of Surface

Immediately before applying the slurry, the surface shall be cleaned of all loose material, silt spots, vegetation, and other objectionable material. Any standard cleaning method to clean pavements is acceptable, except water flushing which is not permitted in areas where there are numerous cracks present in the pavement surface. The Engineer shall give final approval of the surface preparation.

5-09.3(3) Composition and Rate of Application of the Slurry Mix

The amount of asphalt emulsion to be blended with the aggregate shall be as determined by the laboratory report after final adjustment in the field. A minimum amount of water shall be added as necessary to obtain a fluid and homogeneous mixture. The rate of application shall be at least 15 pounds per square yard but not greater than 20 pounds per square yard.

Adjustment may be required during construction based on field conditions. The Engineer will give final approval for all such adjustments.

5-09.3(4) Weather Limitations

The slurry seal surface shall not be applied if either the pavement or air temperatures are 55 degrees F or below and falling, but may be applied when both the air and pavement temperatures are 45 degrees F or above and rising. The mixture should not be applied if high relative humidity prolongs curing beyond a reasonable time.

5-09.3(5) Traffic Control

The Contractor is responsible for all Traffic Control. Suitable methods such as barricades, flaggers, pilot cars, etc., shall be used to protect the uncured slurry surface from all types of traffic. Any damage caused by the Contractor's negligence to the uncured slurry will be the responsibility of the Contractor. The Engineer shall give final approval to the traffic control methods used.

5-09.3(6) Application of Slurry Surfaces

5-09.3(6)A General

The surface may be pre-wetted by fogging ahead of the slurry box if required by local conditions. Water used in pre-wetting the surface shall be applied at a rate so that the entire surface is damp with no apparent flowing water in front of the slurry box. The slurry mixture shall be of the desired consistency when deposited on the surface and no additional elements shall be added. Total time of mixing shall not exceed 4 minutes. A sufficient amount of slurry shall be carried in all parts of the spreader at all times so that complete coverage is obtained. No lumping, balling or unmixed aggregate shall be permitted. If the coarse aggregate settles to the bottom of the mix, the slurry will be removed from the pavement. No excessive breaking of the emulsion will be allowed in the spreader box. No streaks, such as those caused by oversized aggregate, will be left in the finished pavement.

5-09.3(6)B Joints

Neither excessive build-up nor unsightly appearance shall be permitted on longitudinal or transverse joints.

5-09.3(6)C Hand Work

Approved squeegees shall be used to spread slurry in areas not accessible to the slurry mixer. Care shall be exercised so that no unsightly appearance results from handwork.

5-09.3(6)D Curing

Treated areas will be allowed to cure until the Engineer permits their opening to traffic.

Rolling is normally not required on slurry surfaces. However, in areas of slow turning traffic the paved surface should be rolled by a five-ton roller. The paved area should be subjected to a minimum of five coverages. If a pneumatic roller is used, it should be operated at a tire pressure of 50 pounds per square inch.

5-09.3(6)E Protection of Existing Monuments and Utility Covers

The Contractor shall protect all existing survey monuments and utility covers during the resurfacing operation by placing a paper plate or similar material over them. Following the resurfacing operation, paper plates or similar materials shall then be removed to leave the monuments clean and exposed.

(City Contracts, February 2023, City of Auburn GSP)

Supplement this section with these subsections:

5-09.4 Measurement

"Slurry Seal Surface Treatment" will be measured by the square yard of work completed and accepted.

5-09.5 Payment

Payment will be made for each of the following Bid items that are included in the Proposal:

"Slurry Seal Surface Treatment", Per Square Yard

Payment for "Slurry Seal Surface Treatment" shall include all costs to complete the work, including, but not limited to surface preparation, calibration, furnishing and applying slurry treatment, and curing.

(February 2023, City of Auburn GSP)

Supplement Division 5 with the following section, including subsections:

5-10 Non-Woven Fabric for Pavement Overlays

(January 2018, City of Auburn GSP)

5-10.1 Description

(January 2018, City of Auburn GSP)

This work consists of placing Non-woven Fabric for pavement overlays as shown in the Plans.

5-10.2 Materials

(April 2020, City of Auburn GSP)

Asphalt Binder PG 58H-22 per Section 9-02 (Bituminous Materials).

Fabric: Non-woven polypropylene material.

Elastic Recovery, at 15 pounds wet or dry	**100%**
Weight	**3 to 5 oz./square yard**
Tensile Strength, either direction	**80 pounds minimum**
Elongation	**50% minimum**
Asphalt Retention	**0.2 gallons/square yard minimum**
Melting Point	**300 degrees or greater**
Minimum Width	**75 inches**

5-10.3 Construction Requirements

(January 2018, City of Auburn GSP)

Equipment Requirements

All equipment, tools, and machines are subject to the approval of the Engineer.

Surface cleaning equipment shall be capable of removing oil, grease, and other objectionable materials from the pavement surface.

Application equipment shall consist of brooms and distributor. The distributor shall have a capacity of not less than 1,000 gallons. Asphalt shall be uniformly applied at the specified rate.

The distributor shall be equipped with a 10-foot spray bar and extensions, pressure pump and gauge, volume gauge located to be easily read by an inspector from the ground, a tachometer to accurately control the speed and spread of the asphalt, and two thermometers indicating continuous asphalt temperatures, (one of which is permanently installed).

An independent power unit developing a minimum of 25-psi pressure at the spray bar shall supply power for the pressure pump.

Surface Preparation

The pavement surface shall be dry and free of all foreign materials such as dirt, grease, oil, etc. Cracks shall be filled per Section 5-04.3(4)A (Crack Sealing). Holes shall be repaired per Section 5-04.3(4)C (Pavement Repair).

Where existing Asphalt Concrete Pavement depths are 2 inches or less, soil residual herbicide shall be applied to the roadway surface per Section 5-04.3(4)B (Soil Residual Herbicide).

Asphalt Application

The asphalt, with a minimum temperature of 290 degrees F, shall be sprayed uniformly at the rate of 0.25 to 0.30 gallons per square yard over the area to be fabric covered. The Contractor shall shield the preceding application to avoid laps and ridges where separate applications of asphalt meet. In inaccessible areas asphalt application may be provided by a suitable hand sprayer.

Fabric Application

The Contractor shall not begin fabric application until the Engineer has determined that all materials, equipment, and labor are ready.

Fabric cannot be moved once placed, therefore, the initial alignment is very important. If alignment is to be changed, the fabric shall be cut and realigned with an overlapping joint a minimum of 6 inches in the direction of traffic. Fabric shall be also lapped a minimum of 6 inches at transverse and longitudinal fabric joints. The lapped top 6 inches of fabric shall be folded back and asphalt shall be applied to the bottom fabric at the rate of 0.05 gallons per square yard. The top fabric shall be immediately replaced and the joint shall be broomed and squeegeed to form a smooth, tight lapjoint.

The fabric shall be broomed into the asphalt eliminating all air bubbles. Air bubble removal can be best accomplished by brooming from the center of the fabric toward the outer edges.

Membrane Curing

The entire surface of the fabric shall be pneumatically rolled until the fabric is well embedded into the asphalt.

Asphalt Concrete Overlay

The asphalt concrete overlay shall immediately follow the fabric installation in accordance with Section 5-04 (Hot Mix Asphalt (HMA)).

The fabric manufacturer's recommendations and requirements regarding asphalt temperature, protection of fabric, rolling temperature and techniques, etc., shall be followed.

A representative of the manufacturer shall be on the project at the beginning of fabric placement. The representative shall remain on the site until the Contractor has demonstrated to the Engineer an understanding required to satisfactorily perform the work.

The Contractor shall not place more fabric than can be overlaid in the same day.

No fabric, except that which is required for normal lapped joints, shall be exposed to traffic. If traffic must drive on the fabric, the fabric shall be dusted with sand to prevent vehicles from picking up the asphalt. Before resuming asphalt overlay, the sand shall be swept clean from the fabric.

(City Contracts, February 2023, City of Auburn GSP)

Supplement this section with these subsections:

5-10.4 Measurement

(City Contracts, January 2018, City of Auburn GSP)

"Non-Woven Fabric" will be measured by the square yard of area actually covered.

5-10.5 Payment

(City Contracts, January 2018, City of Auburn GSP)

Payment will be made for each of the following Bid items that are included in the Proposal:

"Non-Woven Fabric", Per Square Yard

Payment for "Non-Woven Fabric" shall include all costs to complete the work, including, but not limited to surface preparation, furnishing and applying asphalt, furnishing and applying fabric, and curing.

(February 2023, City of Auburn GSP)

Supplement Division 5 with the following section, including subsections:

5-11 High Friction Surface Treatment

5-11.1 Description

This work consists of applying a High Friction Surface Treatment (HFST) consisting of one application of a single layer of a binder resin system covered with a single layer of calcined bauxite aggregate as shown.

5-11.1(1) Definitions

High Friction Surface Treatment (HFST) – A product composed of calcined bauxite bound with a polymeric resin.

5-11.2 Materials

5-11.2(1) Aggregate

Furnish calcined bauxite aggregate meeting the requirements listed below. Deliver the aggregate to the construction site in super sacks labeled clearly for identification. Provide aggregate that is virgin, clean, dry, and free from foreign matter. A sample of the aggregate lot/batch shall be supplied upon request.
Aggregate Requirements

Property	Test Method	Requirement
Aggregate Gradation: % Passing the #4 sieve Minimum % Passing the #6 sieve Maximum % Passing the #16 sieve	AASHTO T27 & T11	 100 95 5
Los Angeles Abrasion, % Max (Loss after 100 Revolutions)	AASHTO T96	10
Moisture Content, % Maximum	AASHTO T 255 (note 1)	0.2
Aluminum Oxide Content, % Minimum	ASTM C-25	87

Notes 1: For each application, perform AASHTO T 255 within 3 hours of and prior to placement of the HFST material.

5-11.2(2) Binder Resin System

Provide a modified binder resin system, meeting the requirements below, recommended by the manufacturer as suitable for use on the intended pavement surface and for the potential range of atmospheric exposure. A sample of the resin binder system for each lot/batch shall be supplied upon request.

Epoxy Resin Binder Material Properties Requirements

Property	Test Method	Requirements Polymeric Resin
Viscosity, Poises	ASTM D 2556 (note 1)	Class C: 7 – 30
Gel Time	AASHTO M 235 (note 2)	Class C: 10 minute: min.
Ultimate Tensile Strength, psi	AASHTO M 235 (note 3)	2,000 – 5,000
Elongation at Break	AASHTO M 235 (note 4)	30 – 70%
Water Absorption, %	AASHTO M 235 (note 5)	1 max.

Durometer Hardness (Shore D)	AASHTO D2240 (note 6)	60 – 80
Compressive Strength, psi	ASTM C 579 (note 7)	1,000 min. (3 hours) 5,000 min. (7 days)
Cure Rate (Dry through time), hours	ASTM D 1640, 55 mil wet thickness @ 75 °F (note 8)	3 max.
Mixing Ratio	Provide manufacturer's recommendations a minimum of 60 days prior to construction.	Per Manufacturer
Adhesion Strength, psi @ 24 hrs	ASTM D 7234 (note 9)	250 min. or 100% substrate failure
Infrared Spectrum	AASHTO T 237	Note 10

Notes:

1. Prepare a one pint sample per manufacturer's recommendation and mix for 2 to 3 minutes before testing. Use X1.1 for Spindle Selection. Perform testing at a temperature of 73 ± 2°F [23 ± 1°C].
2. Prepare a 60g sample per manufacturer's recommendation. Perform testing at a temperature of 73 ± 2°F [23 ± 1 °C].
3. Prepare sample as per manufacturer's recommendation. Prepare Type I specimens in accordance with ASTM D638. Cure specimens for 7 days at 73 ± 2°F [23 ± 1 °C] and 50 ± 2°F [10 ± 1 °C]. Test specimens at 73 ± 2°F [23 ± 1°C] without delay.
4. Prepare sample as per manufacturer's recommendation. Prepare Type I specimens in accordance with ASTM D638. Cure specimens for 7 days at 73 ± 2°F [23 ± 1 °C] and 50 ± 2°F [10 ± 1 °C]. Test specimens at 73 ± 2°F [23 ± 1°C] without delay
5. Prepare sample as per manufacturer's recommendation. Cure specimens for 7 days at 73 ± 2°F [23 ± 1°C] and 50± 2°F [10 ± 1°C]. Test specimens at 73 ± 2°F [23 ± 1°C] without delay after immersion.
6. Prepare sample as per manufacturer's recommendation. Use the Type 1 Precision-Type D Durometer Method. Cure specimens for 7 days at 73 ± 2°F [23 ± 1°C] and 50 ± 2°F [10 ± 1°C]. Test specimens at 73 ± 2°F [23 ± 1°C] without delay.
7. Prepare sample as per manufacturer's recommendation. Prepare specimen according to Method "B", 2" x 2" cube, using 2.75 parts of sand to one part of mixed polymer resin binder by volume. Sand shall meet ASTM C778, 20-30 sand. Cure specimens at 73 ± 2°F [23 ± 1°C] and 50 ± 2°F [10 ± 1°C]. Test specimens at 73 ± 2°F [23 ± 1°C] without delay.
8. Prepare sample as per manufacturer's recommendation. Prepare a specimen of 50-55 wet mil thickness. Cure specimens for 3 hours max at 73 ± 2°F [23 ± 1°C] and 50± 2°F [10 ± 1°C]. Test specimens at 73 ± 2°F [23 ± 1°C] without delay.
9. Prepare sample as per manufacturer's recommendation. Use method D, E, or F with a 2 inch loading fixture. Cure specimens for 24 hours at 73 ± 2°F [23 ± 1°C] and 50± 2°F [10 ± 1°C]. Test specimens at 73 ± 2°F [23 ± 1°C] without delay.

10. To be established by each manufacturer for each individual component and combination of components.

5-11.2(3) Manufacturer's Certificate of Compliance

Submit a Manufacturer's Certificate of Compliance and supporting tests for the Binder Resin System and HFST aggregate demonstrating compliance with these specification requirements a minimum of 14 calendar days prior to the start of HFST Work.

5-11.2(4) Quality Control (QC) Plan

Submit a QC Plan to the Project Manager for approval at least 30 days prior to the placement. The QC Plan shall show proposed methods to control the equipment, materials, mixing, and paving operations to ensure conformance with these specifications. Discuss the QC Plan requirements at the pre-construction, pre-placement, and progress meetings. The QC Plan shall contain at a minimum the following information.

(a) Key Personnel and contact information.
(b) Moisture control methods of aggregate.
I List of manufacturer recommendations for the following:
Method of Surface Preparation and required surface condition for adequate bonding;
Crack Repair and slurry requirements;
Weather, moisture and temperature requirements and a plan for the chance/or occurrence of a rain event;
Mixing ratio and application rates for polymer resin and aggregate;
Application methods; and
Curing time and requirements for opening to traffic.
(d) Cleaning and maintenance schedule for truck mounted application machine, including metering and monitoring deviceI(e) Corrective actions that will be taken for unsatisfactory construction practices and d eviations from specifications.

The QC Plan shall designate a QC Manager, who shall have full authority to institute any action necessary for the successful operation of the QC Plan. The QC Manager shall be on the jobsite at all times during placement of the HFST.

A field technician shall be present at the job site unless otherwise approved in the QC Plan. The field technician shall be responsible for the required field quality control sampling and testing in conformance with the approved quality control plan and contract documents. All sampling shall be performed in the presence of and in locations as directed by the Engineer. Maintain and make available upon request complete records of sampling, testing, actions taken to correct problems, and quality control inspection results. Any deviation from the approved QC Plan shall be cause for immediate suspension of operations.

5-11.3 Construction Requirements

5-11.3(1) Equipment

Provide a Truck Mounted Application Machine, air compressor, portable shot blast equipment, regenerative air sweeper and other necessary equipment to insure efficient

operation and construction to meet specified results. Provide equipment in sufficient number and capacities that will provide coordinated and uniform progress of the work. .

5-11.3(1)A Truck Mounted Application Machine

The HFST application machine shall be an HFST system manufacturer approved self-propelled, fully automated truck mounted application machine capable of continuously applying resin and aggregate at a uniform thickness and rate, respectively, in varying widths of up to 12 ft.

The application machine shall be capable of continuously and thoroughly mixing epoxy resin binder components to the ratio recommended by the epoxy resin binder manufacturer (±2 percent by volume). The epoxy resin binder shall be uniformly applied to the pavement surface at a minimum coverage rate of 12 gals/min with a uniform application thickness of 55-65 mils.

The aggregate shall be applied by the same application machine which includes an aggregate drop spreader capable of mechanically continuously spreading bauxite aggregate at a rate of 12-15 lb/sqyd, with a maximum height from spreader to pavement surface of 12 in. to achieve proper spread of aggregate. The use of chip spreaders, vehicle tires, rollers, vibratory compactors or devices that throw loose aggregate onto any part of the live roadway lanes will not be allowed to apply the aggregate onto the wet uncured resin.

The HFST application machine shall be capable of the uniform application of the epoxy resin binder and aggregate at a minimum continuous application rate of 2,300 sq yd/hour.

5-11.3(1)B Air Compressor

The air compressor shall be capable of producing a minimum pressure of 90 psi at the end of the discharge hose. The air stream shall discharge onto the pavement through an appropriate air lance. The tool lubricator shall be bypassed and a filter installed on the discharge valve to keep water and oil out of the line.

5-11.3(1)C Shot Blasting Equipment

Furnish mono-directional or bi-directional electric powered shot blast machines with single or multiple blast wheels that cover a width of at least 2.5 feet per pass, and conform to EPA air pollution requirements by containing dust and steel abrasive media. If the equipment is not equipped for simultaneous bi-directional blasting, make separate passes in opposite direction to ensure equal cleaning on all side of exposed aggregate.

5-11.3(1)D Regenerative Air Sweeper (RAS)

The Regenerative Air Sweeper (RAS) shall be self-propelled with power brooms capable of cleaning the existing pavement and removing loose aggregate without dislodging the bonded HFST aggregate. The regenerative air vacuum sweeper shall blast re-circulated, filtered air through a vacuum head having a minimum width of 6.0 feet at a minimum rate of 10,000 cubic feet per minute. The RAS shall be capable of being used without water for dust suppression to ensure a dry surface will be maintained.

5-11.3(2) Labor

5-11.3(2)A Manufa’turer's Representative

The manufacturer of the binder resin system is required to have a representative at the pre-construction or pre-placement meeting and at the construction site to provide technical assistance to the Engineer and Contractor personnel before placement of the high friction surface treatment and as necessary during the surface preparation, material placement and during any necessary corrective actions. Follow the recommendations of the manufa’turer's representative when installing the HFST. Instruct the manufa’turer's representative to alert the Contractor and the Engineer of anything that could affect the performance of ’he HFST.

5-11.3(2)B Applicator Qualifications

A minimum of 10 calendar days prior to the pre-placement meeting, the Contractor shall submit these following qualifications: a minimum of 3 projects with the’owner's contact information on which the HFST Contractor has installed a cumulative minimum of 10,000 square yards of HFST using applicator vehicle equipped with an automated continuous application device within the past three years demonstrating a friction reading of 65 FN40R or higher when tested in accordance to ASTM E 274, or 0.80 when tested according to ASTM E 1911. An installer who does not meet this minimum shall be allowed if they are certified by the manufacturer to install and a manufa’turer's representative is onsite during all installations.

5-11.3(2)C Quality Control Personnel

QC Manager, Field Technician

5-11.3(3) Construction

5-11.3(3)A General

Do not begin HFST installation until all materials and equipment necessary to perform the installation and all required repairs are at the job site.

(a) Season, Weather & Temperature Limitations – Apply the epoxy resin binder material on dry surfaces (including no condensation moisture from construction vehicles in front of binder application), when the ambient temperature is within the following range.

Minimum Temperature (surface and ambient): The minimum temperature at time of placement shall be 55 ˚F and rising, unless the epoxy resin manufacturer can provide test data to support installations at lower temperatures.

Maximum Temperature (surface and ambient): The maximum temperature at time of placement shall be 105 ˚F or when the anticipated weather conditions or pavement surface temperature would prevent the proper application of the surface treatment in accordance with the manufacturer’s recommendations.

Ensure the epoxy resin components are capable of being mixed at lower than ambient temperatures in the event that the components are stored outdoors.

Do not place HFST within 72 hours of a rain event, and when rain is forecast within 24 hours of application. When there is a 40% or greater chance of rain forecasted within 24 hours of application the Contractor will discuss a plan of action as required by 5-06.2(4), Quality Control (QC) Plan. Do not place the high friction surface treatment if the material can't be applied, cured and open to traffic prior to the ambient temperature decreasing to 40ºF, surface temperature decreasing to 50ºF and/or it begins to rain; or the contractor will remove and replace said section of treatment.

There shall be no visible, or near surface moisture present in or on the pavement surface at the time of application of the HFST. A plastic sheet left taped in place for a minimum of two hours, according to ASTM D 4263, shall be used to identify moisture in the pavement.

(b) Handling of Mate–ials - Deliver aggregate to the construction site in clearly labeled bags or sacks that are uniquely identifiable and shall include the following: manufactures batch #, lot # and date. Protect materials from moisture and contaminants. Protect the epoxy resin binder materials from temperatures according to the manufacturer's requirements.

Pre-Placement Me–ting - Five (5) working days prior to the Contractor beginning the work, a pre-activity meeting will be held between the Contractor, resin binder system manufa'turer's representative, the Engineer and such other interested parties as may be invited. The purpose of the pre-activity meeting wil

(c) l be:

1. To review the initial progress schedule;
2. To establish a working understanding among the various parties associated or affected by the work;
3. To establish and review procedures for progress payment, notifications, approvals, submittals, etc.
4. To establish working hours for the work;
5. To review safety standards and traffic control; and
6. To discuss such other related items as may be pertinent to the work.

5-11.3(3)B Surface Preparation:

Prior to placement of the HFST remove, or protect as shown all reflective markers, durable pavement markings, and legends from pavement surfaces by hydro, sand or shot blasting. Cover or otherwise protect all drainage structures, utility covers, expansion joints, curbs, and any other structure within the enclosed surface area of HFST prior to HFST placement.

Temporarily block all drains and catch basins while preparing the surface and placing the HFST. Do not allow any sawing, sandblasting, shot-blasting, sweeping, water blasting, cleaning, flushing, or HFST material to enter drains, or catch basins.

The surface to receive the HFST shall be thoroughly clean, dry and free of all dust, oil, debris and other deleterious materials. Pavement surfaces contaminated with oils, greases, or other deleterious materials not removed by the surface preparation shall be washed with a detergent solution, rinsed with clean water, and dried using a hot compressed air lance.

Where HFST will be applied on either new ACP or new concrete surface or patches in a project, construct the HFST a minimum of 30 days after placement of underlying and adjacent pavement.

Clean asphalt pavement surfaces using mechanical sweepers and high pressure air wash with sufficient oil traps. Mechanically sweep all surfaces to remove dirt, loose aggregate, debris, and deleterious material. Vacuum sweep or air wash using a minimum of 180 cfm of clean and dry compressed air, all surfaces to remove all dust, debris, and deleterious material. Maintain the tip of the air lance within 12 inches of the surface.

Clean concrete pavement surfaces by shot blasting and vacuum sweeping. Shot blast all surfaces to remove all curing compounds, loosely bonded mortar, surface carbonation, and deleterious material. The prepared surface shall comply with the International Concrete Repair Institute (ICRI) standard for surface roughness CSP 5. After shot blasting, vacuum sweep or air wash, with a minimum of 180 cfm of clean and dry compressed air, all surfaces to remove all dust, debris, and deleterious material. Maintain air lance perpendicular to the surface and the tip of the air lance within 12 in. of the surface.

Do not allow HFST materials to cover or penetrate joints in concrete pavements.

Clean and fill all cracks greater than ¼ inch in width and/or depth. Fill cracks with a slurry created with the epoxy resin binder and aggregate specified herein. Once the slurry in the pretreated areas has gelled proceed with the installation of the high friction surface treatment.

Do not allow general traffic on the prepared pavement surfaces.

A prime coat shall be applied if required by the epoxy resin binder system manufacturer. The prime coat shall be applied in accordance with the epoxy resin binder system manufa’turer's recommended application procedures.

Do not place HFST on new ACP or concrete pavements prior to the elapse of a 30 calendar day cure period.

5-11.3(3)C Installation

The binder resin system shall be mixed and placed onto the pavement using a Truck Mounted Application Machine at a uniform application thickness of 50-65 mils (25-32 sf /gal). If recommended by the Binder manufacturer, use a heated metering pump. The binder resin system shall be blended and mixed within 2% of the ratio recommended by the manufacturer and shall be continuously applied once blended. Flow meter readings shall be recorded and supplied to the Engineer.

Immediately and prior to the epoxy resin system gelling, apply the calcined bauxite aggregate using the same integrated application truck and at a uniform rate of 12-15 lbs. per square yard. Completely cover the Binder Resin System with the aggregate to achieve a uniform surface with no exposed resin binder visible on the surface.

It is the responsibility of the HFST installer to ensure full embedment of the calcined bauxite aggregate.

Irregular areas or areas outside the travel lane of less than 250 square yards in area that are inaccessible to truck mounted application machine may be placed by hand methods in accordance with the epoxy resin binder system manufa'turer's recommendations.

Cover wet spots with the aggregate prior to the gelling of the epoxy resin binder system. Equipment and traffic shall not be allowed on the HFST until cured to the epoxy resin binder system manufacturer's recommendations.

A new continuous section of HFST placement shall be delineated whenever the following occur:

- Installation process stops for a period of time exceeding the curing time of the resin binder, resulting in a cold joint in the HFST.

  Any time there is a change in the installation process, such as a switch from machine applied to hand applied or hand applied to machine ap

- plied

Place the calcined bauxite fully covering the polymer binder such that none of the binder is exposed. Do not allow the mixed material to separate, cure, dry, be exposed or otherwise harden in such a way as to impair retention and bonding of the high friction surfacing aggregate. Remove and replace any section of wet, uncured resin that is contacted by foreign material or becomes contaminated at the contractor's expense.

Recovered, uncontaminated, clean and dry calcined bauxite aggregate may only be reused once. Recovered aggregate must be blended with new aggregate at a rate of 3:1 (three parts of new calcined bauxite to one part recovered bauxite). Provide a written record of the recovered aggregate and mark containers holding the recovered aggregate as "Recovered Calcined Bauxite" with the project number.

5-11.3(3)D Clean up

Remove excess and loose aggregate from the traveled way and shoulders using the Regenerative Air Sweeper following initial installation once the application has cured. Sweep an application of HFST on highway ramps a second time 24-48 hours after application. Sweep the entire HFST application area a final time 3-5 days after installation and as directed by the Engineer.

5-11.3(3) E- Post-installation Dynamic Friction Testing

The agency will use Dynamic Friction Testing (DFT) to measure the friction characteristics of the high friction surface treatment in accordance with ASTM E 1911 within five days after the placement (once the surface is deemed cured) of each continuous section and again 90 days after the initial test of each continuous section. The initial test of the surface may be conducted as early as the same day and as late as the 5th day. The earliest the Agency may conduct the second round of testing on each continuous section shall be a minimum of 90 days after the installation. A minimum DFT result of 0.90 is required within 5 days after placement of the high friction surface treatment and a minimum of 0.80 is required 90 days after completion of the high friction surface treatment for each reading.

a) The DFT testing will be conducted on each continuous section as stated below.

The first test location should be within the first 25 LF of the continuous section, and the second test should be at least 200 LF beyond the first test, unless the continuous section is less than 225 LF, in which case it should be located at the approximate midpoint of the continuous section. Each subsequent test should be conducted 200 LF beyond the last test for each continuous section. If the first four DFT testing results are satisfactory, the frequency of testing may be decreased to one DFT test for every 1000 LF as approved by the Engi

b) neer.

Each test location shall contain 3 separate tests. Each test shall report the DFT values for 12, 24, and 36

c) mph.

Testing will be conducted in right or left wheel path of a lane, approximately 3 LF from the centerline or shoulder stripe or in the apparent wheel

d) path.

Additional DFT tests will be conducted at the location of any surface anomalies or deficiencies, at the discretion of the Engineer. Anomalies which may require an additional test from the agency include but are not limite

e) d to:

1) Locations where the resin shows through the aggregate.

Locations of surface defects/impressions from construction operations (e.g. wheel and foot tra

2) cks).

Locations of manual patching after completion of installa

3) tion.

Test locations where the friction values are as described in item (g) b

4) elow.

f) Note the location of any continuous sections where any friction values fall below the specification limit of 0.90 at 35 mph.

Note any continuous sections where the friction values from the two DFT tests differ by more than 10 percent, regardless of whether the friction value was above the

specification limit. Note any continuous sections with a single DFT test where the friction value differs by more than 10 percent from the previous continuous sec

g) tion.

5-11.3(3)F Post-installation Bond Strength Test

Before opening to traffic, perform a minimum of two bond strength tests and no less than two bond tests per 500 feet of each HFST placement per ASTM D 7234 for each complete placement in the presence of and at locations designated by the Engineer. Cut 2 or 3 inch diameter cores and conduct bond tests on the cores.

The bond tests consist of:

- Coring through the HFST and approximately 1 inch into the existing pavement surface.
- Attaching a device to the top of the core.
- Exerting a tensile load to the core sufficient to cause failure or achieve 250 psi, whichever occurs first.

Perform bond tests when the pavement surface temperature is less than 80 °F.

A successful test is the failure of the substrate, or 250 psi loading without failure of the HFST-substrate bond.

After coring and testing, restore the area voided by the cores by blowing with compressed air and filling with HFST material.

Additional bond strength tests may be required by the Engineer. Additional bond strength tests, performed by the Contractor when required by the Engineer that show successful results will be paid in accordance with Section 1-09.6. The Engineer may self-perform bond strength tests, in addition to those performed by the Contractor to the same limits shown above.

5-11.3(4) Maintenance

5-11.3(4)A Correction of Defects

Correct all defects in material and work, as directed, at no additional cost to the Agency, according to the following:

Remove and replace high friction surface treatment that the Engineer determines has any raveling, delamination, streaking, bond test failure or failure to meet the DFT friction values following initial testing and the testing done after a minimum of 90 days following placement. Ensure the minimum replacement is the full lane width and no less than ten feet long and as approved by the Engineer. Replace with acceptable high friction surface treatment at the Contractor’s expense. Replaced areas will be retested and evaluated according to 5-06.3(3)E and 5-06.3(3)F for acceptance or further corrective action.

Any roadway features disturbed by the work or the Contractor's operations shall be restored in like kind materials and design as directed by the Engineer at no additional cost to the agency.

(City Contracts, February 2023, City of Auburn GSP)

Supplement this section with these subsections:

5-11.4 Measurement

The quantities of high friction surface treatment will be measured on a square yard basis, and will be the sealed surface area, and will be limited to the neat lines and dimensions shown or directed.

5-11.5 Payment

Payment will be made for each of the following Bid items that are included in the Proposal:

"High Friction Surface Treatment", per Square Yard

The unit Contract price per square yard for "High Friction Surface Treatment" shall be full compensation for all costs incurred to carry out the requirements of Section 5-06 including but not limited to furnishing and placing all materials and equipment, labor, testing, retesting, road surface preparation and incidentals necessary to complete the work as specified.
Payment for work done under this section will be limited to 90% upon passing 5-day DFT testing and 100% following passing 90 day DFT testing

No separate or additional payment will be made for reinstallation and retesting of HFST where the initial installation was determined to be defective.

END OF DIVISION 5

DIVISION 6 Structures

6-02 Concrete Structures

6-02.1 Description

(January 2017 City of Auburn GSP)

Supplement this section with the following:

This work shall consist of constructing cast-in-place cement concrete walls as shown on the Plans.

6-02.4 Measurement

(City Contracts, January 2017 City of Auburn GSP)

Supplement this section with the following:

"Cement Concrete Wall" shall be measured by the square foot, from the bottom of the concrete footing to the top of the finished wall.

6-02.5 Payment

(City Contracts, April 2017 City of Auburn GSP)

Supplement this section with the following:

Payment will be made for each of the following Bid items that are included in the Proposal:

"Cement Concrete Wall", Per Square Foot

The Unit contract price per square foot for "Cement Concrete Wall" shall be full pay for all labor, tools, equipment and materials required to construct the wall, including all costs for formwork, weep holes, reinforcement and other integral items to the construction and function of the wall structure.

6-07 PAINTING

6-07.1 Description

(February 2024 City of Auburn GSP)

Supplement this section with the following:

This work shall consist of painting and applying painting systems to metal roadway luminaires and metal luminaire parts to downtown decorative lighting and traffic signals.

6-07.2 Materials

(January 2018 City of Auburn GSP)

Supplement this section with the following:

Paint materials shall comply with the requirements in Section 9-08 unless described in this section.

The Contractor shall submit 3 samples of the color specified, textures, and gloss for approval. Metal coupon samples shall be 3 inches by 5 inches. Paint color and paint system shall be as shown in the following table for the following items:

Specification Section	Item	Paint Color	Paint system
9-29.6(1)A	New Decorative Traffic Signal Poles and Mast arms, Luminaire Arms	RAL #9004 "Signal Black"	Polyester TGIC Powder Coating by Tiger Drylac (or approved alternate))
9-29.10(2)	New Decorative Roadway Luminaires	RAL #9004 "Signal Black"	Polyester TGIC Powder Coating by Tiger Drylac (or approved alternate)

All steel hardware components and materials shall be galvanized to meet ASTM 153 requirements.

6-07.3(10)H Paint System

(January 2018 City of Auburn GSP)

Delete this section and replace it with the following:

The paint system applied to new steel surfaces shall consist of the following five-coat system:

Primer Stripe Coat:	Section 9-08.1(2)F
Primer Coat:	Section 9-08.1(2)F
Intermediate Stripe Coat:	Section 9-08.1(2)G
Intermediate Coat:	Section 9-08.1(2)G
Top Coat:	Section 9-08.1(2)H

The powder coat system shall be factory primed and powder coat to a minimum of 3.0-mils in accordance to the manufacturer's recommendation and shall meet the following performance requirements when performed at a minimum film thickness of 3.0 mils:

Property	Specification	Performance Requirement
Salt Spray Resistance	ASTM B117	Minimum required by the Specification
Humidity Resistance	ASTM D2247	Minimum required by the Specification
Weatherability	ASTM 336	Minimum required by the Specification

Chemical and Solvent Resistance	-	Polyester family of powder coatings shall have a good resistance to most chemicals and solvents except alkalis and ketones. Verification should be made for each chemical or solvent proposed for use with the coating.

The paint system shall be approved for exterior application and UV-resistant.

Surface finish shall be of consistent and uniform color, texture, and gloss to match the approved sample.

6-07.3(10)I Paint Color

(January 2018 City of Auburn GSP)

Supplement this section with the following:

Surface finish shall be of consistent and uniform color, texture, and gloss to match the approved sample.

Prepare surfaces and touch-up damaged, missed and discolored areas to bring coating system to full dry film thickness, in color and gloss matching that of adjacent coated areas.

(January 2018 City of Auburn GSP)

Add the following new section:

6-07.3(15) Painting of Aluminum Surfaces

All aluminum items specified herein to be powder coated shall be factory primed and powder coated in accordance with the manufacturer's recommendations.

The paint color of aluminum surfaces shall be per 6-07.2

6-07.5 Payment

(City Contracts, January 2018 City of Auburn GSP)

Supplement this section with the following:

Measurement and payment for all painting and finishes shall be included in the lump sum bid item price for "Traffic Signal System_____" including all labor, equipment, materials and tools necessary to complete the work required by the Specifications.

END OF DIVISION 6

DIVISION 7 Drainage Structures, Storm Sewers, Sanitary Sewers, Water Mains and Conduits

7-01 Drains

7-01.2 Materials

(August 2016 City of Auburn GSP)

Replace the first two paragraphs after the list of materials with the following:

Non-perforated drainpipe shall be manufactured of polyvinyl chloride (PVC) and shall meet the requirements of Section 9-05.12 and perforated drain pipe shall be manufactured of PVC and meet the requirements of Section 9-05.2(6). Trench drains shall be Polydrain Part No. 420 with stainless steel grates Polydrain Part No. 440 or approved equivalent placed on cement concrete Class 4000 per Section 6-02 (Concrete Structures).

7-01.3 Construction Requirements

(January 2018 City of Auburn GSP)

Supplement this section with the following:

PVC drain pipe shall be used to connect existing roof drains and downspouts to the roadway drainage system. The amount of pipe shown in the proposal is approximate and provided for bidding purposes only.

The trench drain shall be installed per the manufacturer's recommendations and shall be flush with the cement concrete surface to provide the proper surface drainage control. The trench drain shall be connected to the nearest catch basin with drain pipe as shown on the Plans.

7-01.5 Payment

(City Contracts, April 2017, City of Auburn GSP)

Supplement this section with the following:

Payment will be made for each of the following Bid items that are included in the Proposal:

"Trench Drain", Per Linear Foot

(City Contracts, August 2016, City of Auburn GSP)

Revise reference to payment for Drain Pipe to the following:

The unit contract price for "Drain Pipe - ___In. Diam." Per linear foot shall be full pay for all work to complete the installation, including structure excavation and installation of bedding and backfill.

The unit contract price for "Trench Drain" per linear foot shall be full pay for all work to complete the installation, including structure excavation and installation of bedding and backfill.

7-04 Storm Sewers

7-04.2 Materials

(October 2021 City of Auburn GSP)

Replace the first paragraph and list of materials with the following:

Only the pipe materials listed below are approved for use on City storm sewer systems. Materials shall be in accordance with all provisions of the following sections:

Solid Wall Polyvinyl Chloride (PVC) Pipe, SDR-35	9-05.12(1) (Solid Wall PVC Culvert Pipe, Solid Wall PVC Storm Sewer Pipe, and Solid Wall PVC Sanitary Sewer Pipe)
Solid Wall Polyvinyl Chloride (PVC) Pipe, SDR-21	9-05.12(1) (Solid Wall PVC Culvert Pipe, Solid Wall PVC Storm Sewer Pipe, and Solid Wall PVC Sanitary Sewer Pipe)
Solid Wall Polyvinyl Chloride (PVC) Pipe, C900	9-05.12(1) (Solid Wall PVC Culvert Pipe, Solid Wall PVC Storm Sewer Pipe, and Solid Wall PVC Sanitary Sewer Pipe)
Ductile Iron Pipe, Special Class 50	9-05.13 (Ductile Iron Sewer Pipe)
High Density Polyethylene Pipe (HDPE)	9-05.23 (High Density Polyethylene Pipe (HDPE))
Triple Wall Polypropylene Culvert and Storm Sewer Pipe	9-05.24(1) (Polypropylene Culvert Pipe and Storm Sewer Pipe)

The laying length for PVC (SDR-35) shall not exceed 14 feet.

7-04.3 Construction Requirements

7-04.3(1)F Low Pressure Air Test for Storm Sewers Constructed of Non Air-Permeable Materials

(January 2017 City of Auburn GSP)

Supplement this section with the following:

If the test shows zero leakage after a five-minute test time, the Engineer has the authority to accept and end the test immediately.

(January 2017 City of Auburn GSP)

Add the following new section:

7-04.3(1)G Television Inspection

All of the provisions of 7-17.3(2)H (Television Inspection) shall apply.

7-04.4 Measurement

(City Contracts, January 2017 City of Auburn GSP)

Supplement this section with the following:

The television inspection work will be measured per linear foot.

7-04.5 Payment

(City Contracts, April 2017 City of Auburn GSP)

Supplement this section with the following:

Payment will be made for each of the following Bid items that are included in the Proposal:

"Solid Wall PVC Storm Pipe, SDR-35, ___ In. Diam.", Per Linear Foot

"Solid Wall PVC Storm Pipe, SDR-21, ___ In. Diam.", Per Linear Foot

"Ductile Iron Pipe, Special Class 52, Storm Pipe, ___ In. Diam.", Per Linear Foot

"Storm Sewer Television Inspection", Per Linear Foot

The unit contract price per linear foot for "Storm Sewer Television Inspection" shall be full pay for all work to complete the Television Inspection including all associated cleaning and flushing.

(City Contracts, October 2021 City of Auburn GSP)

Revise references to payment for storm sewer pipe to the following:

The unit contract price per linear foot for storm sewer pipe of the kind and size specified shall be full pay for all work to complete the installation including the following:

- Furnishing and installing pipe, pipe fittings, and other pipe appurtenances.
- Adjusting inverts to manholes and catch basins
- Testing of pipes
- Sawcutting (including additional sawcutting for pavement restoration)
- Trenching
- Structure Excavation Class B (including haul)
- Installing bedding and backfill materials within the trench
- Furnishing and installing temporary patches or steel plates over unfinished portions of trenches crossing traveled ways
- Disposal of surplus trench excavation
- General pipe installation work including plugs and connections
- Plugging existing pipes for abandonment
- Temporary plugs, bypass pumping, or both
- Normal Dewatering and disposal of groundwater

7-05 Manholes, Inlets, Catch Basins, and Drywells

7-05.2 Materials

(November 2020 City of Auburn GSP)

Supplement this section with the following:

Manholes shall be complete with frames and covers. All manhole frames and covers shall be bolt-down and from East Jordan Iron Works: EJ product #00370781 (Eon #3715ZPT Frame and #3705CPT Cover) for Sanitary Sewer and EJ product #00370782 (Eon #3717ZPT

Frame and #3705CPT Cover) for Storm Drainage, or approved equivalent. Catch Basins shall be complete with frames and grates unless otherwise specified on the Plans to be provided with solid metal covers or manhole frames and covers. Castings for manhole frames shall be gray iron or ductile iron and covers and grates shall be ductile iron. All storm sewer grates shall have the words "OUTFALL TO STREAMS, DUMP NO POLLUTANTS" cast in place. Manhole and catch basin steps and handholds shall be steel-reinforced copolymer polypropylene (ASTM D4101) with ½ inch steel reinforcing bar (ASTM A615 Grade 60) and in conformance with ASTM C478.

The fabricator of all precast sanitary manholes shall seal them with Tamoseal Cement Based Waterproof Finish or approved equivalent applied to all interior and exterior surfaces in accordance with the manufacturer's recommendations. The Contractor shall have adequate product on hand to seal any field modifications to sanitary sewer manholes.

(August 2016 City of Auburn GSP)

Add the following new section:

7-05.2(1) Trash Racks

Trash racks shall be constructed in accordance with Section 6-02 (Concrete Structures), 6-03 (Steel Structures), and as detailed in the Plans.

7-05.3 Construction Requirements

(January 2017 City of Auburn GSP)

Supplement this section with the following:

All pipes entering or leaving new or existing manholes, catch basins or inlets shall be placed on firmly compacted bedding, particularly within the area of the manhole excavation, which normally is deeper than that of the pipe trench. Special care shall be taken to see that the openings through which pipes or adapters penetrate the manhole are completely and firmly rammed full of non-shrink grout to ensure water tightness.

Manhole adapters shall be provided when connecting PVC or Polyethylene pipes to any new or existing manholes, catch basins or inlets. All manhole adapters for PVC and Polyethylene pipe shall be of a style as required and manufactured for the specific application with sufficient tangent at the ends to allow for proper joint connections. Field fabricated manhole adapters will not be permitted. All manhole adapters must have approval from the Engineer in writing before being installed.

See Section 2-09.3(3)D (Shoring and Cofferdams) for "Shoring or Extra Excavation Class B" and Section 7-08 (General Pipe Installation Requirements) for foundation material and imported bedding and backfill materials.

7-05.3(1) Adjusting Manholes & Catch Basins to Grade

(November 2020 City of Auburn GSP)

Supplement this section with the following:

Manholes or catch basins shall not be adjusted to finish grade until the asphalt paving is completed, at which time the center of each structure shall be carefully relocated from references previously established by the Contractor. The pavement shall be cut in a restricted area and the base material removed to permit removal of the frame or ring. The structure shall be adjusted to finish grade. Temporary access to manholes and catch basins shall be provided as soon as practical after paving.

The frame or ring shall be placed on concrete blocks and/or wedged up to the desired grade. When the Contract Plans call for rubberized adjustment risers, they shall be the Infra-Riser manufactured by EJCO, or approved equivalent. The asphalt concrete pavement shall be cut and removed, the dimensions of which shall be equal to the inside dimensions of the opening plus 2 feet. The base materials and crushed rock shall be removed and Class 3000 cement concrete shall be placed so that the entire volume of the excavation is replaced to within, but not to exceed 6 inches of the finished pavement surface. A quick setting admixture shall be added to the cement concrete backfill. Once manholes or catch basins have been adjusted to finished grade and the cement concrete backfill has cured (the day following placing the cement concrete), HMA Class ½-inch shall be placed and compacted with hand tampers and a patching roller within 48 hours.

7-05.3(3) Connections to Existing Manholes

(January 2017 City of Auburn GSP)

Supplement this section with the following:

Where shown in the Plans, new storm drain lines shall be extended to connect to an existing manhole. The pipe extension shall be the same diameter as the existing pipe. Dissimilar pipes shall be joined per Section 7-08.3(2)G (Jointing of Dissimilar Pipe) of these Special Provisions.

(August 2016 City of Auburn GSP)

Add the following new section:

7-05.3(5) Channels for Manholes

Channels for manholes shall be made to conform accurately to the sewer grade, and shall be brought together smoothly with well-rounded junctions. Channel sides shall be carried up vertically to the crown elevation of the various pipes, and the concrete shelf between channels shall be smoothly finished and warped evenly with slopes to drain towards the manhole outflow.

Channels for manholes shall be constructed with non-shrinking mortar. Mortar shall be composed of approximately one part Type II Portland Cement, 1½ to 2 parts sand, and 2 to 3 fluid ounces of water-reducing retarder per sack of cement. Sand, cement, and water shall be as specified for concrete. Water-reducing retarder shall meet ASTM C494 specification for chemical admixture for concrete.

(August 2016 City of Auburn GSP)

Add the following new section:

7-05.3(6) New Castings

Where new castings are indicated to be installed on existing structures in the Plans, the Contractor shall furnish and install new castings of the type specified. Casting shall include frame and grate, or ring and cover and new adjustment section(s) as necessary to set the casting to final grade. Install to the finished grade as shown.

Salvaged castings shall be cleaned and delivered to the City of Auburn as specified in Section 2-02.3(5) (Salvage).

7-05.4 Measurement

(City Contracts, August 2016 City of Auburn GSP)

Replace the first paragraph with the following:

Manholes, catch basins, and other structures listed in this section will be measured per each complete structure installed without adjustment for height.

(City Contracts, April 2019 City of Auburn GSP)

Replace the third paragraph with the following:

No measurement will be made for adjustment of new structures. Adjustment of existing manholes and catch basins will be measured per each.

(City Contracts, August 2016 City of Auburn GSP)

Replace the fourth paragraph with the following:

No measurement for structure excavation class B or structure excavation class B including haul will be made.

7-05.5 Payment

(City Contracts, April 2017 City of Auburn GSP)

Supplement this section with the following:

Payment will be made in accordance with Section 1-04.1 (Intent of the Contract) for the following bid items:

"Manhole Ring and Solid Cover", Per Each

"Trash Rack", Per Each

"Connect to Existing Catch Basin", Per Each

"Connect to Existing Manhole", Per Each

The unit contract prices per each for "Connect to Existing Catch Basin" and "Connect to Existing Manhole" shall be full pay for all work to complete the connection including all materials, labor, and equipment to extend the new pipe and connect to the existing structure.

The unit contract price per each for "Manhole Ring and Solid Cover" shall be full pay for all work, equipment and materials necessary to remove the existing manhole ring and cover and furnish and install a new manhole ring and cover, and to complete final adjustment to finish grade (including asphalt concrete patches).

(City Contracts, August 2022 City of Auburn GSP)

Revise references to payment for manholes, catch basins, and other structures listed in this section to the following:

The unit contract price per each for manholes, catch basins, and other structures listed in this section shall be full pay for all work to complete the installation including the following:

- Furnishing and installing structures, and structure accessories
- Testing of structures

- Sawcutting (including additional sawcutting for pavement restoration)
- Trenching
- Structure Excavation Class B (including haul).
- Installing bedding and backfill materials
- Furnishing and installing temporary patches or steel plates over unfinished portions of trenches crossing traveled ways
- Disposal of surplus excavation
- General structure installation work
- Plugging existing pipes for abandonment
- Extending existing pipes for making connections
- Connecting both new and existing pipes to the new drainage structure
- Temporary plugs, bypass pumping, or both
- Normal Dewatering and disposal of groundwater
- Protection of the structures during other work including construction of the roadway subgrade.
- Adjustment of the castings to final grade, including the castings and the surface restoration (including HMA pavement patching)

7-07 Cleaning Existing Drainage Structures

7-07.5 Payment

(City Contracts, November 2019 City of Auburn GSP)

Delete this section and replace it with the following:

Costs for the cleaning of facilities installed by the Contractor are included in the costs for those facilities and no separate payment for cleaning those facilities shall be made. Costs for cleaning existing facilities that accumulate debris, obstruction due to the Contractor's activities or due to inadequate temporary erosion and sedimentation control measures are the sole responsibility of the Contractor and no payment shall be made.

7-08 General Pipe Installation Requirements

7-08.1 Description

(January 2017 City of Auburn GSP)

Delete this section and replace it with the following:

This information shall cover the general requirements for installing culverts, storm sewers, sanitary sewers, and water mains. The Contractor shall also follow all provisions of Sections 7-02 (Culverts), 7-04 (Storm Sewers), 7-09 (Water Mains), 7-17 (Sanitary Sewers), and 1-07.23 (Public Convenience and Safety) as it applies to the specific kind of work. In case of conflicting specifications between Section 7-08 and 7-09, the specifications of Section 7-09 shall take precedence for the installation of water mains and appurtenances.

7-08.2 Materials

(January 2018 City of Auburn GSP)

Delete this section and replace it with the following:

Imported bedding, backfill and foundation material shall meet the requirements of the following sections:

Pipe Zone Bedding and Select Trench Backfill	9-03.9(3) (Crushed Surfacing)
Pipe Foundation Material	9-03.10 (Aggregate for Gravel base)
Imported Pipe Trench Backfill	9-03.14(1) (Gravel Borrow)
Controlled Density Fill for Trench Backfill	2-09.3(1)E (Backfilling)

7-08.3 Construction Requirements

7-08.3(1) Excavation and Preparation of Trench

7-08.3(1)A Trenches

(April 2017 City of Auburn GSP)

The second sentence of the third paragraph is deleted.

(January 2018 City of Auburn GSP)

The first sentence of the eighth paragraph is deleted and replaced with the following:

If any of the excavated (also referred to as native) material meets the specifications of material listed in Section 7-08.2 (Materials), the Engineer may require that native material, in the quantity required, be selectively removed, stockpiled separately, and used as pipe zone bedding, foundation material, or trench backfill instead of the quantities of pipe zone bedding, foundation material, or trench backfill respectively.

7-08.3(1)B Shoring

(January 2017 City of Auburn GSP)

Supplement this section with the following:

Shoring shall meet the requirements of Section 2-09.3(3)D (Shoring and Cofferdams), the Occupational Safety and Health Act (OSHA), and the Washington Industrial Safety and Health Act of 1973 (WISHA), Chapter 296-155 WAC, and RCW Chapter 49.17, shall apply to all excavation, trenching and ditching operations on this project. All trenches four (4) feet and over in depth shall be shored in compliance with applicable Federal and State regulations. Extra Excavation Class B will be allowed only with the approval of the Engineer.

7-08.3(2)B Pipe Laying – General

(January 2017 City of Auburn GSP)

Supplement this section with the following:

The Contractor shall use neat, vertical full-depth saw cuts for trenching through existing asphalt or cement concrete pavement surfaced areas.

All pipe shall be neatly cut using an approved mechanical cutter without causing damage to the pipe.

7-08.3(2)G Jointing of Dissimilar Pipe

(January 2017 City of Auburn GSP)

Supplement this section with the following:

Where new pipe is connected to existing pipe, the Contractor shall verify the type of existing pipe and join pipes with a pipe adapter specifically manufactured for joining the pipes involved.

(August 2016 City of Auburn GSP)

Add the following new section:

7-08.3(2)J Joining High Density Polyethylene Pipe (HDPE) Pipe

Sections of HDPE shall be joined into continuous lengths on the job site above ground. The joining shall be the butt fusion method and shall be performed in strict accordance with the pipe manufacturer's recommendations. The butt fusion equipment used in the joining procedures shall be capable of meeting all conditions recommended by the pipe manufacturer, including but not limited to, temperature requirements of 400 degrees F, alignment, and 75 psi interfacial fusion pressure.

(August 2016 City of Auburn GSP)

Add the following new section:

7-08.3(2)K Packaging, Handling, Storage High Density Polyethylene Pipe (HDPE) Pipe

The manufacturer shall package the pipe in a manner designed to deliver the pipe to the project neatly, intact, and without physical damage. The transportation carrier shall use appropriate methods and intermittent checks to insure the pipe is properly supported, stacked, and restrained during transport such that the pipe is not nicked, gouged, or physically damaged. Pipe shall be stored on clean, level ground to prevent undue scratching or gouging of the pipe. If the pipe must be stacked for storage, such stacking shall be done in accordance with the pipe manufacturer's recommendations. The handling of the pipe shall be done in such a manner that it is not damaged by dragging over sharp objects or cut by chokers or lifting equipment.

Sections of pipe having been discovered with cuts or gouges in excess of 10% of the wall thickness of the pipe shall be cut out and removed. The undamaged portions of the pipe shall be rejoined using butt fusion joining method.

Fused segments of pipe shall be handled so as to avoid damage to the pipe. When lifting fused sections of pipe, chains or cable type chokers must be avoided. Nylon slings are preferred. Spreader bars are recommended when lifting long fused sections. Care must be exercised to avoid cutting or gouging the pipe.

(August 2016 City of Auburn GSP)

Add the following new section:

7-08.3(2)L Dewatering Trenches

Where water is encountered in the trench, it shall be removed during pipe-laying operations and the trench so maintained until the ends of the pipe are sealed and provisions are made to prevent floating of the pipe. Trench water or other deleterious materials shall not be allowed to enter the pipe at any time.

"Normal Trench Dewatering" is defined as dewatering methods occurring in, or directly adjacent to, the trench, including trash pumps, sump pumps, or other methods in the excavated areas. "Normal Trench Dewatering" does not include a dewatering system such as well points, well screens, or deep wells. All "Normal Trench Dewatering" work associated with maintaining a trench suitable for pipeline construction will be included in the cost of the pipes or other facilities being installed.

Where groundwater cannot be removed using "Normal Trench Dewatering" methods, the Contractor shall provide a dewatering system that will be used to lower the water table 2 feet below the depth of excavation. See Section 8-05 (Dewatering System) for dewatering system requirements. The dewatering plan must be received 10 calendar days prior to dewatering operations and approved by the Engineer before underground utility installation begins.

7-08.3(3) Backfilling

(January 2017 City of Auburn GSP)

Supplement this section with the following:

The Engineer may require "Controlled Density Fill" where uniform compaction around other utilities, foundations or other fixed objects is not possible.

7-08.3(4) Plugging Existing Pipe

(January 2018 City of Auburn GSP)

Delete this section and replace it with the following:

All existing sanitary sewer, storm, and drain pipes shown on the Plans to be abandoned and plugged, shall be plugged on the inlet and outlet ends for a distance of three times the diameter with Class 3000 cement concrete. Care shall be used in placing the concrete in the pipe to ensure that the openings are completely filled and thoroughly plugged.

All existing water pipes shown on the Plans to be abandoned and plugged, shall be plugged on the ends with Mechanical Joint plugs.

All existing sanitary sewer, storm, and water pipes shown on the Plans to be abandoned and filled, shall be filled with concrete that has a compressive strength of 1,500 psi or less for the entire length of pipe specified.

The Contractor shall seal abandoned or filled pipe connections at manholes or catch basins with Class 3000 cement concrete and grout to provide a smooth, watertight seal.

(November 2019 City of Auburn GSP)

Add the following new section:

7-08.3(5) Pipe Trench Restoration

Trenches excavated as part of a new street construction shall be completed to subgrade before placing surfacing materials and sidewalks. Final restoration will be completed with the street surfacing.

In existing streets, sidewalks and other native or landscaped areas, the restoration shall be to a minimum of the existing adjacent surfaces. Asphalt and cement concrete pavement, sidewalks, etc., shall be replaced upon a firm unyielding base to match existing

surface thickness. Unless otherwise shown on the plans, the minimum asphalt concrete pavement replacement section shall be 2 inches thick.

7-08.4 Measurement

(City Contracts, January 2017 City of Auburn GSP)

Supplement this section with the following:

Measurement for "Imported Pipe Trench Backfill", "Select Pipe Trench Backfill", "Pipe Zone Bedding" and "Pipe Foundation Material" will be by the ton.

"Controlled Density Fill (CDF) for Trench Backfill" and "Controlled Density Fill (CDF) for Filling Pipe" will be measured by the cubic yard.

7-08.5 Payment

(City Contracts, April 2017 City of Auburn GSP)

Delete this section and replace it with the following:

Payment will be made for each of the following Bid items that are included in the Proposal:

"Pipe Foundation Material", Per Ton

"Pipe Zone Bedding", Per Ton

"Select Pipe Trench Backfill", Per Ton

"Imported Pipe Trench Backfill", Per Ton

"Controlled Density Fill (CDF) for Trench Backfill", Per Cubic Yard

"Controlled Density Fill (CDF) for Filling Pipe", Per Cubic Yard

The unit contract price for "Pipe Foundation Material", "Pipe Zone Bedding", "Select Pipe Trench Backfill," "Imported Pipe Trench Backfill", "Controlled Density Fill (CDF) for Trench Backfill" shall include all costs associated furnishing the material and all costs associated with the over-excavation and disposal of the surplus and unsuitable trench excavation replaced by these items.

The unit contract price for "Controlled Density Fill (CDF) for Filling Pipe" shall include all costs associated with furnishing and placing the material, including labor and equipment.

All costs associated with trenching, installing bedding and backfill materials within a trench, disposal of surplus trench excavation, general pipe installation work including "Normal Trench Dewatering," plugs and connections, and plugging existing pipes for abandonment shall be included in the unit contract price for the type and size of pipe installed.

"Structure Excavation Class B" and "Structure Excavation Class B Including Haul" for pipe trenching in accordance with all provisions of Section 2-09 (Structure Excavation) shall be included in the unit contract price for the type and size of pipe installed.

Payment for pipe trench restoration will be made under the applicable items listed in the Proposal Form. If no pay items for the materials required for the trench restoration are included in the bid proposal, pipe trench restoration shall be included in the unit contract price for the type and size of pipe installed.

7-09 Water Mains

7-09.1 Description

(January 2017 City of Auburn GSP)

Supplement this section with the following:

The Contractor shall also follow the requirements of Section 7-08 (General Pipe Installation Requirements). In case of conflicting specifications between Section 7-08 and 7-09, the specifications of Section 7-09 shall take precedence for the installation of water mains and appurtenances.

7-09.2 Materials

(January 2018 City of Auburn GSP)

Delete 'Aggregates' and the reference sections pertaining to Foundation Material, Gravel Backfill for Pipe Zone Bedding, Pipe Zone Bedding, and Trench backfill, from the list in the first paragraph.

Supplement this section with the following:

Ductile Iron Pipe per Section 9-30.1(1) with Ductile Iron Fittings per Section 9-30.2(1) shall be the only pipe and fitting materials allowed for water systems owned by the City of Auburn.

7-09.3(10) Backfilling Trenches

(January 2017 City of Auburn GSP)

Supplement this section with the following:

Water mains shall be installed with 42-inch minimum finished pipe cover, unless the Engineer determines less cover is adequate where existing facilities, not to be relocated, might interfere with the pipe laying operation.

7-09.3(13) Handling of Pipe

(January 2017 City of Auburn GSP)

Supplement this section with the following:

Strict adherence to the requirements preventing debris from entering the pipe will be required, including plugging of pipe during transport, storage, and placement. If, in the opinion of the Engineer, any pipe or fitting has been installed with dirt, foreign material, or diesel residue in it, it shall be removed, cleaned, and re-laid at Contractor expense.

7-09.3(19) Connections

7-09.3(19)A Connections to Existing Mains

(January 2017 City of Auburn GSP)

Supplement this section with the following:

The Contractor shall field verify all existing piping, dimensions, and elevations to ensure proper fit prior to any connections being made to existing mains.

7-09.3(19)B Maintaining Service

(January 2017 City of Auburn GSP)

Supplement this section with the following:

Water main shut-offs shall be in accordance with Section 1-07.17(1) (Disruption to City Water Services).

7-09.3(21) Concrete Thrust Blocking

(January 2018 City of Auburn GSP)

Supplement this section with the following:

Where trench conditions are such that thrust restraint is not accomplishable with concrete, the Contractor shall provide restrained joints in accordance with Section 9-30.2(6) (Restrained Joints) to replace or supplement concrete blocking or anchors. Supplement and replacement restrained joints shall be provided as recommended by the manufacturer and approved by the Engineer.

7-09.3(23) Hydrostatic Pressure Test

(January 2017 City of Auburn GSP)

Supplement this section with the following:

Add the following sentence at the beginning of the first paragraph:

Hydrostatic tests shall be made on all new pipeline in accordance with the applicable portions of this Standard Specification and ANSI/AWWA C600, except as modified in this document.

Add the following sentence between the first and second sentence of the first paragraph:

Test pressures shall not exceed the rated pressure of the valves when the pressure boundary of the test section includes closed, resilient-seated gate valves or butterfly valves.

Add the following sentence at the end of the second paragraph:

Sections of pipe between valves shall be pressure tested immediately upon completion of each section. Each section shall be immediately backfilled upon the Engineer approving the hydrostatic pressure test results.

7-09.3(24) Disinfection of Water Mains

(December 2021 City of Auburn GSP)

Supplement this section with the following:

The City will take bacteriological test samples. If no appropriate appurtenance is available, the Contractor may be required to install corporation stops in the main at all locations required to take bacteriological test samples. If original test samples prove unsatisfactory, a charge of $100.00 will be made for processing each additional sample.

7-09.3(24)J Preventing Reverse Flow

(November 2019 City of Auburn GSP)

Supplement this section with the following:

Prior to beginning the water main installation, the Contractor shall prepare a Prevention of Reverse Flow Plan per Section 1-06 (Control of Material), showing the intended method, in detail, which will be incorporated to insure the prevention of reverse flows from entering the existing distribution system. The plan shall meet the requirement of WAC 246-902-490.

The Contractor shall consider this plan as a submittal, and submit it per the specifications in Section 9-38 (Submittal Approval). The Engineer must approve this plan prior to the Contractor starting work on the water main.

7-09.3(24)N Final Flushing and Testing

(January 2017 City of Auburn GSP)

Supplement this section with the following:

Accomplish line flushing in accordance with the latest provisions of AWWA C601. Flush all dead end mains with a temporary blow off. The Contractor is responsible for disposal of water flushed from the line. An approved bacteriological test is required before connection to the existing system. The City will measure water consumed for flushing.

The Contractor shall submit a de-chlorination plan per Section 1-06 (Control of Material) indicating how chlorine concentration and pH adjustment will be achieved per this Section. All costs to submit the plan shall be included in the unit contract price per linear foot of pipe.

(July 2021 City of Auburn GSP)

Add the following section:

7-09.3(25) Pipe Casing

Steel casing pipe shall meet ASTM A-53, having a minimum tensile strength of 60,000 psi and a minimum yield strength of 35,000 psi. Minimum wall thicknesses for casing diameter 14” shall be 0.25”. All joints shall be welded. Provide shop applied polyamide epoxy-coal tar anticorrosive coating on casing exterior conforming to AWWA C210. Minimum coating thickness of 16 mils dry film thickness (DFT), do not exceed manufacturer’s maximum thickness. A ductile iron casing meeting the requirements of water pipe may be used in lieu of steel.

The carrier pipe shall be installed with casing spacers as shown on the plans. Spacers shall be designed for center restraint and provide a maximum space of 1-inch between the upper runners and the inside of the steel casing. The spacers shall prevent the pipe bells from touching the inside of the casing. Metal components of casing spacers shall be Type 304 (18-8) 14-gauge (minimum) stainless steel. The liner shall be neoprene rubber or PVC, and the runners shall be polyethylene.

Where casing spacers must be custom designed to account for a specific grade of the carrier pipe inside the casing, submittals must be provided which include drawings and dimensions for each of the casing spacers and the respective location of each of the spacers relative to the casing and carrier pipe.

Casing end seals shall be 1/8-inch thick synthetic rubber, pull on type, with stainless steel bands and clamps.

7-09.4 Measurement

(City Contracts, January 2017 City of Auburn GSP)

Supplement this section with the following:

Measurement for payment of "Connect to Existing Water Main" will be per each.

(City Contracts, July 2021 City of Auburn GSP)

Supplement this section with the following:

Cased crossings will be measured by the linear foot of casing installed.

7-09.5 Payment

(City Contracts, April 2017 City of Auburn GSP)

Supplement this section with the following:

Payment will be made for each of the following Bid items that are included in the Proposal:

"Connect to Existing Water Main", Per Each

"2-In. Blowoff Assembly", Per Each

The unit contract price per each for "Connection to Existing Water Main" shall include all costs for furnishing labor, materials, and equipment necessary to cut into the main and make the connection complete in place including verification of existing condition, temporary blocking, capping, temporary blow offs and other items required for testing including all required notifications to water users of disruptions to their service.

The unit contract price per each for "2-Inch Blow Off Assembly" shall be full pay for all work to install the blow off assembly, including but not limited to excavating, backfilling, laying and jointing pipe, tapping the main, corporation stop, pipe and fittings, gate valve, meter box, and cover and cleanup.

The cost of valve assemblies shall be paid for under separate bid items.

Where bolted flanged joint pipe is used on this project, the flange shall be attached to "Special Class 53 D.I. Pipe" and payment will be at the same rate as the unit contract price for "Special Class 52 D.I. Pipe", unless otherwise specified.

(July 2021 City of Auburn GSP)

Supplement this section with the following:

"Cased Crossing" Per LF

The unit contract price per linear foot for "Cased Crossing" shall include all costs for furnishing labor, materials, and equipment necessary to construct a cased crossing in accordance with the detail shown on the Plans, where designated on the Plans or by the Engineer.

(City Contracts, October 2021 City of Auburn GSP)

All references to payment for water pipe is revised to the following:

The unit contract price per linear foot for water main pipe listed in this section shall be full pay for all work to complete the installation including the following:

- Furnishing and installing pipe, pipe accessories, and other appurtenances.
- Sawcutting (including additional sawcutting for pavement restoration)
- Trenching
- Structure Excavation Class B (including haul).
- Installing bedding and backfill materials
- Furnishing and installing temporary patches or steel plates over unfinished portions of trenches crossing traveled ways
- Disposal of surplus excavation
- General pipe installation work
- Plugging existing pipes for abandonment
- Extending existing pipes for making connections
- Preparation and implementation of reverse flow prevention plan
- Preparation and implementation of a de-chlorination plan
- Normal Dewatering and disposal of groundwater
- Disinfection, flushing and testing of pipe
- Protection of the pipe during other work including construction of the roadway subgrade.

7-12 Valves for Water Mains

7-12.3 Construction Requirements

(January 2018 City of Auburn GSP)

Add the following new section:

7-12.3(2) Adjust Valve Boxes

The Contractor shall adjust water valve boxes to finish grade as specified in the Plans and in accordance with the applicable City of Auburn Standard Details. Water valve boxes shall be accessible at all times.

Valve boxes shall not be adjusted to finish grade until the asphalt paving is completed, at which time, each valve box shall be carefully relocated from references previously established by the Contractor. The pavement shall be cut in a restricted area and the base material removed to permit adjustment.

The base materials and crushed rock shall be removed and Class 3000 cement concrete shall be placed so that the entire volume of the excavation is replaced to within, but not to exceed 6 inches of the finished pavement surface. A quick setting admixture shall be added to the cement concrete backfill. Once the valve boxes have been adjusted to finished grade and the cement concrete backfill has cured (the day following placing the cement concrete), HMA Class ½-inch shall be placed and compacted with hand tampers and a patching roller within 48 hours.

(August 2016 City of Auburn GSP)

Add the following new section:

7-12.3(3) Combination Air Release/Air Vacuum Valve Assembly

"Combination Air Release/Air Vacuum Valve Assembly" shall be constructed at locations shown on the Plans and shall be a minimum of 1 inch diameter in accordance with the applicable City of Auburn Standard Detail(s).

(August 2016 City of Auburn GSP)

Add the following new section:

7-12.3(4) Valve Wrench Extension Box

The Contractor shall furnish and install valve wrench extension boxes where the valve nut will exceed 48 inches below the top of the finished valve box and finish grade, where shown on the Plans, in accordance with the applicable City of Auburn Standard Detail(s) for deep buried valves.

7-12.5 Payment

(City Contracts, April 2017 City of Auburn GSP)

Supplement this section with the following:

Payment will be made for each of the following Bid items that are included in the Proposal:

"Adjust Valve Box", Per Each

The unit contract prices for "Adjust Valve Box" shall be full pay for all work including providing all materials, equipment and labor to lower the structure b120nclude120laning and adjust structures to finish grade after the overlay is complete (including asphalt concrete patches).

(January 2017 City of Auburn GSP)

The second paragraph is revised to read:

The unit contract price per each for the valves specified shall be full pay for all work, equipment, and materials to furnish and install each valve complete in place on the water main, including trenching, jointing, blocking of valve, painting, disinfecting, hydrostatic testing, valve box, valve wrench extension box, marker post, and final adjustment to finish grade (including asphalt concrete patches).

7-14 Hydrants

7-14.3 Construction Requirements

(January 2017 City of Auburn GSP)

Supplement this section with the following:

A type 2BB Blue Raised Pavement Marker(s) is required at each hydrant location. Location of the blue marker shall be 1-foot offset of centerline in the direction of the hydrant at each hydrant location. Hydrants located within 50-feet of the curb face of an intersection shall be marked on both streets. The reflective surfaces of the raised pavement markers shall

be perpendicular to the flow of traffic. The Raised Pavement Markers shall be installed in accordance with Section 8-09 (Raised Pavement Markers).

7-14.3(1) Setting Hydrants

(February 2024 City of Auburn GSP)

Delete this section and replace it with the following:

Where shown in the Plans, the "Hydrant Assembly" shall be installed perpendicular to the supply main. A 6-inch resilient-wedge gate valve with valve box in accordance with Section 7-12 (Valves for Water Mains) shall be installed on each hydrant supply line.

All hydrants shall be inspected upon delivery in the field to ensure proper working order. After installation, fire hydrants, auxiliary gate valves, and other appurtenances thereto shall be subjected to a hydrostatic test and disinfection procedures as specified in Section 7-09 (Water Mains).

After installation each hydrant shall receive 2 field-coats of paint. The first coat shall be Formula B-1-57 iron oxide, and the second coat shall be:

For Public Fire Hydrants: Safety Yellow conforming to Sherwin Williams Industrial Enamel B54 Y 37, or approved equivalent.

For Private Fire Hydrants: Safety Red conforming to Sherwin Williams Industrial Enamel B54 R 38, or approved equivalent.

During the chlorination process for the newly laid pipe, all valves associated with each hydrant assembly shall be operated while the pipeline is filled with the chlorinating agent and under normal operating pressure.

Any hydrant not in service shall be identified by covering with a burlap or plastic bag properly secured.

7-14.3(4) Moving Existing Hydrants

(January 2018 City of Auburn GSP)

Supplement this section with the following:

Existing hydrants shall be moved where shown in the Plans. Moving existing hydrants shall include removal of all component parts from the water main to the hydrant.

The Contractor shall provide and install the following new components at the new hydrant location shown on the Plans:

- Special Class 52 Ductile Iron pipe;
- 6 inch tee or tapping tee and gate valve with box;
- Restraint system;
- Blocking.

7-14.5 Payment

(City Contracts, January 2018 City of Auburn GSP)

References to payment for "Hydrant Assembly" are revised to the following:

The unit contract price per each for "Hydrant Assembly" shall be full pay for all work to furnish and install fire hydrant assemblies, including all costs for valves, restrain systems, tees, tie rods, storz adapter, concrete blocks, gravel, painting, type 2BB pavement marker(s),

connecting to the water main, and all pipe required for the complete installation- of the hydrant assembly.

References to payment for “Resetting Existing Hydrant” are revised to the following:

The unit contract price per each for “Resetting Existing Hydrant” shall be full pay for all work to reset the existing hydrant, including restrain system, painting, type 2BB pavement marker(s), reconnecting to the main, and all pipe and other materials required.

References to payment for “Moving Existing Hydrant” are revised to the following:

The unit contract price per each for “Moving Existing Hydrant” shall be full pay for all work to move the existing hydrant, including new hydrant lateral tee, restraint system, painting, 2BB pavement marker(s), connecting to the main, and all pipe and other materials required.

References to payment for “Hydrant Extension” are revised to the following:

The unit contract price per each for “Extensions” shall be full pay for all work including materials, labor, and equipment required to extend the hydrant vertically.

7-15 Service Connections

7-15.2 Materials

(September 2021 City of Auburn GSP)

Replace the reference to Service pipe from the list of materials and replace with the following:

Service Pipe & Tail Piece	9-30.6(3)A (Copper Tubing), 9-30.6(3)B (Polyethylene Tubing)

All water service materials shall be low lead brass CDA89833 or CDA89520, and shall meet ANSI/AWWA C800 and NSF 61 Annex G maximum lead requirements.

7-15.3 Construction Requirements

(January 2017 City of Auburn GSP)

Supplement this section with the following:

Water service connections shall be installed where shown on the drawings in accordance with these documents and the applicable Standard Details. Multiple service connections to the same main must be made with a 2 foot minimum separation at the main and be staggered horizontally, so that adjacent services are at differing elevations along the pipe. Meter box and water meters shall not be placed in locations which are subjected to vehicular traffic (including driveways, etc.) unless approved by the Engineer and a traffic bearing meter box is provided. Tail pieces (that portion of the service line between the meter and the property line) shall be furnished and installed and shall be of the same material and size as the service line. Connection of the tail piece to the service line from the building shall be made with compression couplings or capped as appropriate. Service pipes shall be installed without joints from the water main to the curb valve near or within the meter box. Tailpieces shall also be installed without joints from the water meter outlet to its termination (18 inches minimum beyond the meter but not beyond the right-of-way line). The existing ¾-inch water meter shall be reinstalled to the new meter setter once the new 1-inch service line,

meter setter, and tailpiece, have been installed and the new meter box has been adjusted to grade.

All new materials (service line, meter setter, tailpiece, and meter box) shall be used for water meter relocations. Materials shall match existing size unless otherwise shown on the Plans.

When removing existing meters, the Contractor shall protect all automated meter reading equipment including radios, receivers/transmitters, and other equipment. The removed meters/equipment will be stored in such a manner to prevent damage to the equipment. The Contractor will request and complete training from City staff on proper measures and techniques required to protect the equipment prior to removing any equipped meters.

7-15.5 Payment

(City Contracts, April 2017 City of Auburn GSP)

Supplement this section with the following:

Payment will be made for each of the following Bid items that are included in the Proposal:

"Water Service Connection ¾ In. Meter with 1 In. Diam. Service Line", Per Each

"Water Service Connection ___In. Diam.", Per Each

"Dual Water Service Connection Renewal ¾ In. Diam.", Per Each

"Water Service Connection Renewal ____ In. Diam.", Per Each

The unit contract price for each size of "Water Service Connection ¾ In. Meter with 1 In. Diam. Service Line " shall be per each, in place, and shall be full compensation for all labor, equipment, and materials necessary to furnish and install the new water service including tap and corporation stop, 1-inch service line from the main to the meter, 1-inch to ¾ inch Mueller adaptors, 1 inch curb valve, 1 inch meter yoke with angle check valve and angle valve, traffic bearing meter box and lid, tailpiece, shutoff valve assembly, reconnecting the existing service or capping the end as appropriate, and reconnecting the old meter to the new service line. The City will provide and set ¾ inch meters for new 1 inch diameter service connections.

The unit contract price for each size of "Water Service Connection, ____In. Diam." Shall be per each, in place, and shall be full compensation for all labor, equipment, and materials necessary to furnish and install the new water service including tap and corporation stop, service line from the main to the meter, adaptor, curb valve, meter yoke with angle check valve and angle valve, meter box, tailpiece, and reconnecting the existing service or capping the end as appropriate. The City will provide and set ¾ inch diam. Meters for new 1 inch diam. Service connections.

The unit contract price for each size of "Water Service Connection Renewal ___ In, Diam." Shall be per each, in place, and shall be full compensation for all labor, equipment and materials necessary to renew existing water services, including new service line, from the main to the meter, curb valve, meter yoke with angle check valve and angle valve, meter box, tailpiece, and reconnecting the existing service.

7-17 Sanitary Sewers

7-17.2 Materials

(October 2021 City of Auburn GSP)

Delete this section and replace it with the following:

Only the pipe materials listed below are approved for use on City sanitary sewer systems.

Materials shall be in accordance with following Sections:

Solid Wall Polyvinyl Chloride (PVC) Pipe, SDR-35	9-05.12(1) (Solid Wall PVC Culvert Pipe, Solid Wall PVC Storm Sewer Pipe, and Solid Wall PVC Sanitary Sewer Pipe)
Polyvinyl Chloride (PVC) Pipe, SDR-21	9-05.12(1) (Solid Wall PVC Culvert Pipe, Solid Wall PVC Storm Sewer Pipe, and Solid Wall PVC Sanitary Sewer Pipe)
Solid Wall Polyvinyl Chloride (PVC) Pipe, C900	9-05.12(1) (Solid Wall PVC Culvert Pipe, Solid Wall PVC Storm Sewer Pipe, and Solid Wall PVC Sanitary Sewer Pipe)
Ductile Iron, Special Class 50	9-05.13 (Ductile Iron Sewer Pipe)
High Density Polyethylene Pipe (HDPE)	9-05.23 (High Density Polyethylene Pipe (HDPE))

The laying length for PVC (SDR-35) shall not exceed 14 feet.

7-17.3 Construction Requirements

7-17.3(1) Protection of Existing Sewage Facilities

(January 2017 City of Auburn GSP)

Supplement this section with the following:

Connections to the existing system shall be plugged during the entire period of sewer construction to prevent dirt, water, and debris from entering the existing system

7-17.3(2) Cleaning and Testing

7-17.3(2)A General

(August 2016 City of Auburn GSP)

Delete the first paragraph and replace with the following:

Sewers and appurtenances, where required in the Plans, shall be cleaned and tested after backfilling by the low pressure air method except if the Engineer approves hydrostatic testing of short sections of small diameter pipe.

(January 2017 City of Auburn GSP)

Supplement this section with the following:

Before final acceptance, the Contractor shall have all sewer lines inspected by the use of a television camera per Section 7-17.3(2)H (Television Inspection). Manholes and

other structures shall be cleaned and tested per Section 7-07 (Cleaning Existing Drainage Structures).

Special sealants shall not be used to seal leaks and the use of any such materials will be cause for rejection of the sewer lines.

7-17.3(2)C Infiltration Test

(January 2017 City of Auburn GSP)

Revise the second sentence of the second paragraph to read:

"Maximum leakage (in gallons per hour)" = $0.16 \times \frac{\sqrt{H}}{\sqrt{6}} \times D \times \frac{L}{100}$

7-17.3(2)F Low Pressure Air Test for Sanitary Sewers Constructed of Non Air-Permeable Materials

(January 2017 City of Auburn GSP)

Supplement this section with the following:

If the test shows zero leakage after a five minute test time, the Engineer has the authority to accept and end the test immediately.

Cleaning and testing of pipes and structures shall be included in the unit contract prices for those items installed.

7-17.3(2)H Television Inspection

(May 2019 City of Auburn GSP)

Delete this section and replace it with the following:

The Contractor shall be responsible for having all sewer lines installed by the Contractor inspected by City approved private inspection services that includes the use of a television camera. An approved list of inspection services may be obtained from the Engineer.

After completion of the following, authorization from the City shall be required before the Contractor can perform the initial television camera work:

1. The acceptable placement of applicable pipe, ballast, bedding, and backfill material.

The acceptable completion of all applicable channels and grout

2. work.

The acceptable debris removal, cleaning, and flushing of all applicable pipes and struct

3. ures.

The television inspection requirements shall include the provisions of:

1. The television camera shall be a pan and tilt camera system specifically designed and constructed for sewer environments.

A dye solution to be introduced in sufficient quantity to travel from the structure that is the highest point of inspection to the downstream terminus of the inspection limits. Red or purple dye shall be used for PVC pipe and green dye for ductile iron and concrete

2. pipe.

A one-inch reference ball to be mounted to the camera in order to drag along the bottom of the pipe during the entire inspection proce

3. dure.

Linear measure references to be measured from the center of the beginning structure to the center of the next inline structure and include the direction of flow. The locations of lateral pipes and all distinctive pipe conditions shall be referenced to the centerline of the beginning structure. All structure references shall utilize the designated structure reference numbers shown on the P

4. lans.

The following television inspection information shall be provided to the y:

8. 1. A clear color DVD or USB Flash Drive which encompasses the limits of the inspection area and including all reference data as described herein. The recorded reference time and date for the start of each run shall also be indica.

8. 2. A written report shall be provided corresponding to the recorded inspection and including all reference data as described herein. The report shall consist of a written narrative of all distinctive pipe conditions including ponding areas in excess of ¼ inch.

7-17.4 Measurement

(City Contracts, January 2017 City of Auburn GSP)

Supplement this section with the following:

Television inspection work will be measured per linear foot.

7-17.5 Payment

(City Contracts, April 2017 City of Auburn GSP)

Supplement this section with the following:

Payment will be made for each of the following Bid items that are included in the Proposal:

"PVC Sanitary Sewer Pipe, SDR-35, ___ In. Diam.", Per Linear Foot

"PVC Sanitary Sewer Pipe, SDR-21, ___ In. Diam.", Per Linear Foot

"Ductile Iron Pipe, Special Class 52 Sanitary Sewer Pipe, ___ In. Diam.", Per Linear Foot

"HDPE Sanitary Sewer Pipe, ____ In. Diam.", Per Linear Foot

"Sanitary Sewer Television Inspection", Per Linear Foot

The unit contract price per linear foot for "Sanitary Sewer Television Inspection" shall be full pay for all work to complete the Television Inspection including all associated cleaning and flushing.

(City Contracts, August 2018 City of Auburn GSP)

Revise references to payment for sanitary sewer pipe to the following:

The unit contract price per linear foot for sanitary sewer pipe of the kind and size specified shall be full pay for all work to complete the installation including the following:

- Furnishing and installing pipe, pipe fittings, and other pipe appurtenances.
- Adjusting inverts to manholes
- Testing of pipes
- Sawcutting (including additional sawcutting for pavement restoration)
- Trenching
- Structure Excavation Class B (including haul).
- Installing bedding and backfill materials within the trench
- Furnishing and installing temporary patches or steel plates over unfinished portions of trenches crossing traveled ways
- Disposal of surplus trench excavation
- General pipe installation work including plugs and connections
- Plugging existing pipes for abandonment
- Temporary plugs, bypass pumping, or both
- Normal Dewatering and disposal of groundwater

7-18 Side Sewers

7-18.3 Construction Requirements

7-18.3(1) General

(January 2017 City of Auburn GSP)

Supplement this section with the following:

All joints shall be approved rubber-gasket joints except the joint between the new and existing pipe that shall be made with approved flexible transition couplings. Side sewers shall be installed to a minimum slope of two percent or as shown on the Plans unless otherwise directed by the Engineer and shall be 6-inches diameter from the street sewer to the private property line.

Existing side sewers to be connected shall be trimmed to the limit of the right-of-way except where otherwise shown on the Plans and connected to the new sewer with PVC SDR-35 with a diameter to match the existing side sewer or 6 inches, whichever is greater.

(August 2016 City of Auburn GSP)

The third paragraph is replaced with the following:

No joint deflections shall be allowed on side sewers. No horizontal bends shall be allowed in the right-of-way. Vertical bends require Engineer approval.

7-18.3(3) Testing

(January 2017 City of Auburn GSP)

Supplement this section with the following:

During construction in areas with more than one side sewer per structure, the Contractor shall test each connected structure to verify which side sewer is used by that structure. The test shall involve flushing every toilet or running every sink or tub on each floor of each structure and directly observing which side sewer the effluent discharges from. Only these side sewers shall be connected. All others are to be abandoned in place per Section 7-08.3(4) (Plugging Existing Pipe).

The Contractor shall be responsible for verifying all City customers originally connected to the sanitary sewer conveyance line are connected to the new sanitary sewer conveyance line. Prior to project completion the Contractor shall document to the City that all City customers have had their services re-established.

All pipes for side sewer and sewer stubs (pipes not ending in a manhole) shall be adequately plugged or capped.

7-19 Sewer Cleanouts

7-19.3 Construction Requirements

(January 2018 City of Auburn GSP)

Delete this section and replace it with the following:

Sewer cleanouts shall be installed as indicated in the applicable Standard Details.

END OF DIVISION 7

DIVISION 8 Miscellaneous Construction

8-01 Erosion Control and Water Pollution Control

8-01.3 Construction Requirements

(February 2018 City of Auburn GSP)

Supplement this section with the following:

The Contractor shall comply with the requirements of the Construction Stormwater General Permit (CSWGP), when the Contract is covered by a CSWGP. When the Contract does not identify CSWGP coverage, then the requirements identified in this section, that would only be required in the event of permit coverage, are not applicable. All other requirements identified in this section are applicable regardless if the Contract has a CSWGP or not.

8-01.3(1) General

(November 2019 City of Auburn GSP)

The second to last paragraph is revised to read:

> When applicable, the Contractor shall be responsible for all Work required for compliance with the CSWGP.

8-01.3(1)A Submittals

(November 2019 City of Auburn GSP)

Supplement this section with the following:

The Contractor's TESC plan shall be submitted to the Engineer for approval per Section 9-38 (Submittal Approval) prior to beginning construction.

The TESC plan shall also cover dewatering and the Contractor's proposed method of treating and disposing of dewatering effluent and other impacts of caused by dewatering activities.

Modifications to the temporary erosion and sediment control (TESC) Plans included in the Contract Plans, shall meet all requirements of the City of Auburn Surface Water Management Manual (SWMM).

Prior to beginning any concrete or grinding work, the Contractor shall submit a plan, for the Engineer's review and approval, outlining the procedures to be used to prevent high pH stormwater or dewatering water from entering surface waters. The plan shall include how the pH of the water will be maintained between pH 6.5 and pH 8.5 prior to being discharged from the project or entering surface waters.

The Contractor shall allow at least 5-working days for the Engineer to review any original or revised TESC Plan. Failure to approve all or part of any such Plan shall not make the Contracting Agency liable to the Contractor for any Work delays.

8-01.3(1)C Water Management

8-01.3(1)C1 Disposal of Dewatering Water

(September 2019 City of Auburn GSP)

The first paragraph is revised to read:

When uncontaminated groundwater is encountered in an excavation on a project, when approved by the Engineer, it may be infiltrated within vegetated areas of the right of way not designated as Sensitive Areas or incorporated into an existing stormwater conveyance system at a rate that will not cause erosion or flooding in any receiving surface water.

(November 2019 City of Auburn GSP)

Add the following new section:

8-01.3(1)F SWPPP Preparation and General Permit Compliance

The Contractor shall amend, revise, or replace the City provided Draft Storm Water Pollution Prevention Plan, (Draft SWPPP), see Appendix to these Special Provisions, to address the Contractors specific means and methods of completing the work and to comply with both the Construction Stormwater General Permit (CSWGP) included as an Appendix to these Special Provisions, and the City's Surface Water Management Manual (SWMM). The resulting document is the Storm Water Pollution Prevention Plan (SWPPP).

The Contractor shall prepare and submit the SWPPP for City approval per Section 9-38 (Submittal Approval). Approval of the SWPPP document is required prior to the beginning of any ground disturbing activities. The Contractor shall allow a minimum of 5 working days for the Engineer's review of the SWPPP. Failure to approve all or part of any such plan shall not make the Contracting Agency liable to the Contractor for any work delays.

The Contractor shall use, implement, modify, and document the approved SWPPP in compliance with the CSWGP. This work shall include, but is not be limited to, the following:

- Preparing, revising, maintaining the SWPPP in compliance with the CSWGP;
- Designing and planning, sediment control/erosion control measures, (BMPs), needed to meet CSWGP requirements;
- Planning, performing and reporting of storm water monitoring;
- Preparing and maintaining documentation required by the CSWGP.

During construction, the Contractor shall modify the SWPPP to address specific site conditions. The SWPPP and Contractor's revisions shall consist of the Contractor's complete strategy to meet the requirements of the CSWGP. The Contactor shall include and modify as necessary the erosion control measures provided in the Contract Plans. The Contractor shall review and modify the SWPPP as necessary to be consistent with the actual work schedule, sequencing, and construction methods that will be used on the project. The SWPPP and revisions shall meet the requirements of the CSWGP. The Contractor shall provide and maintain on-site the standby equipment and materials to comply with the CSWGP.

The S130ncludeincluding any Contractor revisions, shall document all the erosion and sediment control Best Management Practices (BMPs) proposed, whether permanent or temporary. The plan shall document installation procedures, materials, scheduling, and maintenance procedures for each erosion and sediment control BMP.

In addition, the SWPPP shall outline the procedures to be used to prevent high pH stormwater or dewatering water from entering surface waters of the state. The plan shall include how the pH of the water will be maintained in compliance with the CSWGP prior to being discharged from the project or entering surface waters.

SWPPP Contents

The SWPPP shall include narrative(s) and site plan(s) that address the following as applicable to the Work:

- Clearing Limits
- Establishment of Construction Access
- Flow Rate Controls
- Sediment Controls
- Soil Stabilization
- Slope Protection
- Drain Inlet Protection
- Channels and Outlets Stabilization
- Pollutant Controls
- De-watering Control
- Maintenance of Best Management Practices
- Project Management
- Protection of Low Impact Development Best Management Practices

The SWPPP will indicate discharge monitoring locations that shall also be clearly marked in the field by the Contractor. The SWPPP will indicate the Contractor's process for controlling, monitoring, and reporting of turbidity and pH in discharges.

On-Site Documentation

The Contractor shall collect, prepare, compile, and maintain hardcopies of the following documents on-site at all times while work is underway and shall make them available in accordance with the CSWGP requirements:

1. Bound notebook #1 with a cover labeled "SWPPP Documents", with the following contents separated by labeled tabbed dividers:
    - Permit Coverage Letter
    - Construction Stormwater General Permit
    - Stormwater Pollution Prevention Plan
    - Erosion Control Plan
2. Bound notebook #2 with a cover labeled "SWPPP Site Log Book", with the following contents separated by tabbed dividers:
    3. Erosion inspection reports.
    4. SWPPP Modifications

5. Discharge Monitoring Reports (DMR)
6. Spill Reports

Stormwater Monitoring Requirements

The Contractor shall conduct monitoring of discharges of stormwater runoff for comparisons to benchmark values for turbidity and pH as described in the CSWGP. The Contractor shall provide weekly stormwater monitoring of the project stormwater discharge locations for turbidity and pH as required in the CSWGP. The Contractor shall establish specific project sampling locations for sampling and monitoring at each discharge location to determine background, outfall, and downstream water quality conditions and provide these locations on a m132ncludeincluded in the SWPPP for approval.

The Contractor shall establish procedures that adapt to unanticipated events such as severe storms, schedule adjustments, modified construction techniques, etc. to be included in the SWPPP. Contractor shall submit any modifications to the procedures to the Engineer for approval.

Contractor shall calibrate equipment according to manufacturers' recommendations and according to their specified schedule. If data appears suspect, the Contractor shall perform additional calibrations immediately.

The Contractor shall complete all online reporting as required by the CSWGP.

Turbidity and pH Exceedances

Following any exceedances of the turbidity or pH benchmarks, the Contractor shall provide the following at no additional cost to the Contracting agency:

1. The necessary SWPPP revisions and on-site measures/revisions including additional source control, BMP maintenance, and/or additional stormwater treatment BMPs that are necessary to prevent continued exceedance of turbidly and/or pH benchmarks.
2. The regulatory notification to the Dept of Ecology and to the Engineer of any monitoring results requiring regulatory notification.
3. The additional daily sampling and reporting measures described in the CSWGP to verify when project site runoff is in compliance.

At no cost to the City, the Contractor shall be responsible for paying any fines levied against the City for any failure by the Contractor to comply with the permit requirements as listed in these specifications and as indicated in the permit(s) included in the Appendix to these Special Provisions.

(January 2018 City of Auburn GSP)

Add the following new section:

8-01.3(1)G Temporary Water Pollution /Erosion Control Installation

This work consists of furnishing and installing all temporary water pollution and erosion control items as detailed in the Contract Plans. If additional measures as approved by the City are required beyond those shown in the Contract Plans, they will be paid for under the unit cost bid item(s) determined by the Engineer to be applicable, or, if the Engineer determines additional measures are not applicable to unit cost bid item(s), the measures will be paid under the Force Account bid item for "Erosion/Water Pollution Control".

8-01.3(2) Temporary Seeding and Mulching

8-01.3(2)B Temporary Seeding

(January 2017 City of Auburn GSP)

Supplement this section with the following:

Seeding:

The following composition, proportion, and quality of grass seed shall be applied at the rate of 5 pounds per 1,000 square feet on all areas requiring roadside seeding (noted "hydroseed" on the Plans) within the project:

Kind and Variety of Seed in Mixture	Percent by Weight	Minimum Percent Pure Seed	Minimum Percent Germination
Colonial Bentgrass (Highland or Astoria)	10%	9.8%	85%
Red Fescue (Illahee, Rainier, or Pennlawn)	40%	39.20%	90%
English Perennial Rye	50%	29.40%	90%
Weed Seed (maximum %)		0.50%	
Inert and Other Crops (minimum %)		1.50%	
	TOTAL 100.00%		

Fertilizer:

The Contractor shall submit three samples of existing soil in the project area, and one of each specified type of topsoil to a soil laboratory for testing to determine fertilizer/amendment composition. Results shall be submitted to the Engineer and fertilizer and soil amendment formulation and application rates will be based on the laboratory recommendations. However, the minimum fertilizers requirements are as follows:

Total Nitrogen as N-3 1.5 pound per 1,000 square feet;

Available Phosphoric Acid as P2O5-1 2 pounds per 1,000 square feet;

Soluble Potash as K2O-2 20 pounds per 1,000 square feet;

1 pound of nitrogen applied per 1,000 square feet shall be derived from ureaform or ureaformaldehyde. The remainder may be derived from any source.

The fertilizer formulation and application rate shall be approved by the Engineer before use.

8-01.3(2)E Tackifiers

(January 2017 City of Auburn GSP)

Supplement this section with the following:

The moderate-term mulch soil binder for hydroseeding shall be a bonded fiber matrix with integral tackifier specifically manufactured for hydroseeding applications and erosion control. The moderate-term mulch shall be dyed an appropriate color to facilitate visual metering of application of the materials. The moderate-term mulch shall be 'ECO-AEGIS' as manufactured by Canfor, or approved alternate.

8-01.4 Measurement

8-01.4(1) Lump Sum Bid for Project (No Unit Items)

(City Contracts, November 2019 City of Auburn GSP)

This Section is deleted.

8-01.4(2) Item Bids

(November 2019 City of Auburn GSP)

The first paragraph is deleted.

(City Contracts, January 2018 City of Auburn GSP)

Supplement this section with the following:

"Sediment Trap" shall be measured per square yard of trap bottom surface area.

No specific unit of measurement shall apply to the lump sum contract price of CSWGP documentation compliance or TESC Plan.

8-01.4(3) Reinstating Unit Items with Lump Sum Erosion Control and Water Pollution Prevention

(City Contracts, November 2019 City of Auburn GSP)

This Section is deleted.

8-01.4(4) Items not included with Lump Sum Erosion Control and Water Pollution Prevention

(City Contracts, November 2019 City of Auburn GSP)

This Section is deleted.

8-01.5 Payment

8-01.5(1) Lump Sum Bid for Project (No Unit Items)

(City Contracts, November 2019 City of Auburn GSP)

This Section is deleted.

8-01.5(2) Item Bids

(City Contracts, April 2017 City of Auburn GSP)

Supplement this section with the following:

"TESC Plan", Per Lump Sum

"Sediment Trap", Per Square Yard

"High Visibility Fence", Per Linear Foot

"General Permit Documentation Compliance", Per Lump Sum

The lump sum price for "TESC Plan" shall be full payment for all costs to prepare, update, and modify/maintain the 'living' Temporary Erosion and Sediment Control Plan, and included Dewatering Plan elements, when needed, for the duration of the Contract.

Payment for "Sediment Traps" shall be full payment for all labor, tools, and materials to construct a sediment trap and maintain it for the duration of the Project.

The lump sum contract price for "General Permit Documentation Compliance" shall be full pay to maintain and update the SWPPP and file all electronic reports necessary to comply with the permit conditions with the Washington State Department of Ecology.

No additional payment will be made for any supplemental measures to control seepage, groundwater, or artesian head.

(City Contracts, November 2019, City of Auburn GSP)

References to payment for street cleaning is revised to the following:

Per Section 1-07.23(1)A (Dust and Mud Control and Street Cleaning), no additional payment will be made for Street Cleaning.

8-01.5(3) Reinstating Unit Items with Lump Sum Erosion Control and Water Pollution Prevention

(November 2019 City of Auburn GSP)

This Section is deleted.

8-01.5(4) Items not included with Lump Sum Erosion Control and Water Pollution Prevention

(November 2019 City of Auburn GSP)

This Section is deleted.

8-02 Roadside Restoration

8-02.1 Description

(January 2017, City of Auburn GSP)

Supplement this section with the following:

This work also involves any minor repair or replacement work to restore roadside features the Engineer discovers during construction.

8-02.3 Construction Requirements

8-02.3(1) Responsibility During Construction

(January 2017, City of Auburn GSP)

Supplement this section with the following:

Landscape construction is anticipated to begin after all curbs, sidewalks, rockeries, utilities, and associated roadside work is completed.

The Contractor shall keep the premises clean, free of excess soils, plants, and other materials, including refuse and debris, resulting from his work throughout the planting operation. The Contractor shall maintain continuous pedestrian access and shall not stockpile materials or park equipment in any manner that may create hazards or obstacles to this access. At the end of each workday, and as each planting area is completed, it shall be neatly dressed and all surrounding walks and paved areas shall be cleaned to the satisfaction of the Engineer.

Cleaning by flushing into sewers will not be allowed. The Contractor shall remove surplus soils, materials, and debris from the construction site and shall leave the project in a clean condition at the conclusion of the work.

8-02.3(4) Topsoil

(February 2024, City of Auburn GSP)

Supplement this section with the following:

Topsoil shall be used to restore any landscape beds or planter areas disturbed by the Work.

Depths of topsoil placement shall be as shown in the plans. Where no depths are identified in the plans, the contractor shall furnish sufficient quantities of topsoil for placement in all seeding areas (4 inch depth topsoil) and planting areas (6 inch depth topsoil) and for tree and shrub planting soil requirements, plus a reserve quantity for restoring additional areas outside designated planting and seeding areas that are disturbed by the Contractor's activities.

8-02.3(4)A Topsoil Type A

(January 2017, City of Auburn GSP)

Supplement this section with the following:

Topsoil Type A is to be used for all planting and seeding areas and shall be tested in an independent, certified soil testing lab to determine need for fertilizers, or amendments, or both, based on its intended use. The topsoil shall be modified according to the soil testing laboratory recommendations at no additional cost to the City.

8-02.3(4)C Topsoil Type C

(January 2017, City of Auburn GSP)

Supplement this section with the following:

Native as used in this context shall mean naturally occurring material.

8-02.3(5) Roadside Seeding, Lawn and Planting Area Preparation

(February 2018, City of Auburn GSP)

Supplement this section with the following:

Upon approval of the subgrades by the engineer, a topsoil layer shall be placed with a minimum organic matter content of 10% dry weight in planting beds, and 5% organic matter content in lawn sod areas, and a pH from 6.0 to 8.0 or matching the pH of the adjacent undisturbed soil. The topsoil layer hall have a minimum depth of 8 inches, except where tree

roots limit the depth of incorporation of amendments needed to meet the criteria. The subsoils below the topsoil layer shall be cultivated to a depth of 4 inches with some incorporation of the upper material to avoid stratified layers, where feasible. Cultivation of the soil shall be done by a method approved by the Engineer. This operation should be done at right angles to the natural flow of water on slopes. Remove rocks, roots, clods, stumps and debris over 2 inches in diameter. Lightly compact soil and establish a smooth and uniform finished grade that protects against obstruction to surface drainage and ponding. For bark mulched shrub and groundcover beds, finish grade prior to placement of bark shall be 2 inches below top of adjacent finish grade.

(August 2016, City of Auburn GSP)

Add the following new section:

8-02.3(5)D Root Control Barrier

Root control material shall be CP-Series Root Barrier Panels as manufactured by Century Root Barrier, Universal Guide as manufactured by Deep Root, or Dual Purpose Panels as manufactured by Villa Root Barriers or approved alternate.

Install continuous section of root control material in all tree planting areas as shown on the Plans. Backfill with topsoil material being careful not to damage or displace root control material.

8-02.3(6) Mulch and Amendments

(January 2017, City of Auburn GSP)

Supplement this section with the following:

GroCo (GroCo Inc. tel. 206-622-5141), Tagro (City of Tacoma Tel. 253-502-2150), or Cedar Grove Compost shall be mixed with native topsoil to produce a 75/25 mix ratio (topsoil 75 percent and amendment 25 percent).

8-02.3(7) Layout of Planting, Lawn and Seeding Areas

(January 2017, City of Auburn GSP)

Supplement this section with the following:

The Contractor is responsible for determining required quantities of plant material to complete the landscape plan as shown.

It is anticipated that some minor arranging of plant material will be necessary during the progress of work.

From the centerline of the first row of shrubs or ground covers to the edge of the planting bed shall be ½ the typical dimension shown on the Plans and details.

Plant trees a minimum of 3 feet from curbs and sidewalks when the space is available; otherwise they shall be centered in the available space. Trees in tree wells shall be centered within the tree grate and frame.

8-02.3(8) Planting

(January 2017, City of Auburn GSP)

Supplement this section with the following:

Plant trees and shrubs in planting pits and install tree frames and grates as detailed on Plans.

Do not over excavate planting pit depth, however, over excavation of planting pit width is desirable.

Trees shall be handled by the rootball, not by the trunk. Burlap and wire shall remain intact until trees are set in their positions within each planting pit. Remove all wire, twine, and burlap from the top third of the rootball before backfilling. Plant trees and shrubs upright, rotating them to give the best placement to adjacent plants, topography, and structures. Hold plant rigidly in position until topsoil has been backfilled and tamped firmly around the ball or roots.

When the planting pit is backfilled halfway, place the specified quantity of fertilizer plant tablets and stakes, if necessary, as shown on the Plans. Evenly space the fertilizer tablets around the perimeter of and immediately adjacent to the root system. Carefully place, water, and compact planting topsoil filling all voids. Do not injure the root system.

When the planting pit is three-quarters (3/4) backfilled, fill with water and allow it to soak away. Fill pits with additional topsoil and continue backfilling as detailed on Plans. Ground bark shall be placed over all tree-planting saucers to a compact depth of 2 inches. Water trees immediately after planting.

The root systems of all bare root plant material shall be dipped in a slurry of silt and water immediately prior to planting.

8-02.3(9) Seeding, Fertilizing, and Mulching

(January 2017, City of Auburn GSP)

Supplement this section with the following:

Trees, shrubs, and groundcover shall be fertilized as follows:

Formula 4-2-2 “Transplanter” as manufactured by Pacific Agro Co., with Hercules nitroform and W.R. Grace’s “Magamp” and trace elements. Apply at a rate of:

Trees	8 ounces
Shrubs	2 ounces
Groundcover	1 ounce

Agriform Tablets: Planting tablets, 21-ram size, as manufactured by Agriform International Chemicals, Inc., 20-10-5 analysis. Apply at a rate of:

Trees	4 tablets for every foot of rootball diameter
Shrubs	3 tablets
Groundcover	1 tablet

8-02.3(10) Lawn Installation

(January 2017, City of Auburn GSP)

Supplement this section with the following:

Except in areas where the Plans specify hydro-seed, lawn seeding will not be permitted on this project. “Lawn Sod” per Section 9-14.7(4) (Sod) shall be laid smoothly in place in accordance with the typical section(s) in the Plans.

Prior to installing “Lawn Sod” all dry soil shall be moistened by sprinkling with water. On sloped areas, the sod shall be laid with the long dimension parallel to the toe or top of slope. The “Lawn Sod” shall be rolled and heavily watered by sprinkler after placement.

8-02.3(10)C Lawn Establishment

(January 2017, City of Auburn GSP)

Supplement this section with the following:

The lawn establishment period may be extended or shortened by the Engineer based on the Engineer's opinion of whether or not the lawn has been established. Physical Completion and Final Acceptance will not be allowed until after the lawn establishment period has ended.

Lawn establishment requirements outside the City of Auburn right of way shall be subject to the applicable agreements, easements, and permit conditions for the property on which they are associated.

8-02.3(10)D Lawn Mowing

(January 2017, City of Auburn GSP)

Supplement this section with the following:

Lawn mowing beyond the mowing required during the lawn establishment period shall only be required when indicated in the Plans. Lawn mowing will not be required beyond the Physical Completion and Final Acceptance of the project.

(August 2016, City of Auburn GSP)

Add the following new section:

8-02.3(10)E Fertilizer for Sodded Area

Prior to placing sod, a 10-2-10 fertilizer shall be rototilled into the top 3 inches of the soil at a rate of 4 pounds of available nitrogen per 1,000 square feet.

8-02.3(11) Mulch

(January 2017, City of Auburn GSP)

Supplement this section with the following:

Ground bark shall be placed over all planting beds and over all tree-planting saucers to a compact depth of 2 inches. Ground bark shall be placed around existing trees and bushes disturbed by construction to a compact depth of 2 inches. Thoroughly water and hose down plants with a fine spray to wash the leaves of the plants immediately after bark application.

8-02.3(12) Completion of Initial Planting

(January 2017, City of Auburn GSP)

Delete this section and replace it with the following:

Upon completion of the initial planting and per the request of the Contractor the Engineer will make an inspection of all plant material and notify the Contractor, in writing, of any replacements or corrective action necessary to meet the Contract Document requirements. The Contractor shall replace all materials requested or missing and correct unsatisfactory conditions within 15 working days. The Engineer will provide the Contractor with written notification when the initial planting is accepted; at which time the plant establishment period shall begin.

Completion of initial planting includes the following:

1. Installation of root control barriers and watering systems for trees.
2. Installation of all required planting materials (trees, shrubs, and groundcovers).
3. Planting area cleanup.
4. Full operation of the irrigation system, complete bark mulch coverage, and all planting areas in a weed-free condition.
5. Approval of Plant Establishment Plan.

8-02.3(13) Plant Establishment

(August 2016, City of Auburn GSP)

Supplement this section with the following:

Plant establishment requirements outside the City of Auburn right of way shall be subject to the applicable agreements, easements, and permit conditions for the property on which they are associated.

The plant establishment period may be extended or shortened by the Engineer based on the Engineer's opinion of whether or not the plantings have been adequately established. Physical Completion and Final Acceptance will not be allowed until after the plant establishment period has begun. The Plant Establishment period may occur during the contract Guarantee Period specified in Section 1-05.10.

Plant establishment includes only those plants listed with "PSIPE _____" (Plant Selection Including Plant Establishment) in the Proposal.

(August 2016, City of Auburn GSP)

The second, third, and fourth paragraphs are replaced with the following:

The plant establishment period shall begin immediately upon written notification from the Engineer of the completion of the initial planting for the project. The Contractor shall maintain all plant materials for a period of 1-year after the Plant Establishment period has begun. During this period, the Contractor shall maintain a healthy growing condition for all plant materials and water, prune, spray, weed, and perform other necessary maintenance operations. Planting beds shall be kept free of all weeds, grass and other undesirable vegetation. Plants shall be inspected by the Contractor at least monthly from October 1st to April 30th and at least once a week from May 1st to September 30th and maintenance performed promptly. Dead or impaired plants shall be promptly replaced during the planting season specified in Section 8-02.3(8) and all soil ridges shall be removed from around the watering basins before the end of the maintenance period. At the determination of the Engineer, replacement plants may require an additional acceptance and establishment period.

After completion of the landscape establishment period, the Contractor shall request an inspection by the Engineer. The Contractor shall correct all conditions unsatisfactory to the Engineer within a 10-day period, weather permitting, immediately following the inspection.

8-02.3(14) Plant Replacement

(January 2017, City of Auburn GSP)

Supplement this section with the following:

Completion of the Plant Establishment period will be certified, in writing, by the Engineer.

8-02.4 Measurement

(City Contracts, January 2017, City of Auburn GSP)

Supplement this section with the following:

Measurement of "Root Control Barrier" will be by the linear foot completed in place.

Measurement of "Tree Grate and Frame" will be measured per each after installation completed and accepted.

No unit of measure shall apply to "Roadside Restoration".

(City Contracts, August 2016, City of Auburn GSP)

References to measurement of topsoil and mulch in this section are revised to the following:

Topsoil Types "_" will be measured by the square yard for the surface area of the landscape areas multiplied by the specified topsoil thickness for seeded and planting areas, converted to cubic yards.

Bark mulch will be measured by the cubic yard for the surface area of the landscape area multiplied by the specified bark thickness, converted to cubic yards.

8-02.5 Payment

(City Contracts, April 2017, City of Auburn GSP)

Supplement this section with the following:

Payment will be made for each of the following Bid items that are included in the Proposal:

"Topsoil Type __", Per Cubic Yard

"Root Control Barrier", Per Lineal Foot

"Seeding, Fertilizing, and Mulching", Per Square Yard

"Bark Mulch", Per Cubic Yard

"Tree Grate and Frame", Per Each

"Roadside Restoration", by force account as provided in Section 1-09.6.

(City Contracts, September 2016, City of Auburn GSP)

References to payment for topsoil is revised to the following:

The unit contract price per cubic yard for "Topsoil Type __" shall be full pay to furnish and install Topsoil including all costs associated with preparing the Topsoil for installation, for preparing the site prior to placement of the Topsoil including removal of all excess material and debris, and for all costs associated with supplying and using required soil amendments, and for furnishing all labor, tools, equipment, and materials necessary to complete the work as specified.

The unit Contract price per cubic yard for "Bark Mulch" shall be full pay for furnishing and spreading the mulch onto the existing soil.

(City Contracts, August 2018, City of Auburn GSP)

References to partial payment for plants that include plant establishment is deleted.

8-03 Irrigation Systems

8-03.1 Description

(January 2017, City of Auburn GSP)

Supplement this section with the following:

This work also consists of the replacement and/or repair of existing irrigation systems.

8-03.2 Materials

(January 2017, City of Auburn GSP)

Supplement this section with the following:

Irrigation conduit shall be PVC pipe and be in accordance with Section 9-15.1(2) (Polyvinyl Chloride Pipe and Fittings).

8-03.3(4) Irrigation Water Service

(January 2017, City of Auburn GSP)

Delete this section and replace it with the following:

Water meter(s) will be installed at location(s) shown on the Plans in accordance with Section 7-15 (Service Connections).

8-03.3(5) Irrigation Electrical Service

(January 2017, City of Auburn GSP)

Delete this section and replace it with the following:

Electrical service and or wires will be installed at location(s) shown on the Plans in accordance with Section 8-20.3(10) (Services transformer, Intelligent Transportation System Cabinet).

8-03.3(6) Excavation

(January 2017, City of Auburn GSP)

Supplement this section with the following:

Backfilling shall be done when pipe is not in an expanded condition due to heat or pressure. Cooling of the pipe can be accomplished by operating the system for a short time before backfilling, or by backfilling in the early part of the morning before the heat of the day.

8-03.3(7) Piping

(January 2017, City of Auburn GSP)

Supplement this section with the following:

Due to the nature of PVC pipe and fittings, the Contractor shall exercise care in handling, loading, unloading and storing to avoid damage. The pipe and fittings shall be stored under cover and shall be transported in a vehicle with a bed long

enough to allow the length of pipe to lay flat, so as not to be subject to undue bending or concentrated external load at any point. Any pipe that has been dented or damaged shall be set aside until such damage has been cut out and the pipe is rejoined with a coupling.

8-03.3(8) Jointing

(January 2017, City of Auburn GSP)

Supplement this section with the following:

Solvent welded joints shall be given at least 15 minutes set-up time before moving or handling. Pipe shall be partially center loaded to prevent arching and slipping. No water shall be permitted in pipe until a period of at least 10 hours has elapsed for solvent weld setting and curing.

The Contractor shall take great care to insure that the inside of the pipe is absolutely clean. Any pipe ends not being worked on shall be protected and not left open.

No PVC pipe may be threaded or connected to a threaded fitting without an adapter.

8-03.3(9)F Cross Connection Control Device Installation

(January 2017, City of Auburn GSP)

Supplement this section with the following:

Backflow preventer assembly shall be installed at location(s) shown on the Plans.

8-03.3(9)G Electrical Wire Installation

(January 2017, City of Auburn GSP)

Supplement this section with the following:

Splices shall be made with a dry-splice wire connector, PVC construction body and snap-lock plug with copper crimp sleeve, three flapped openings for wires and sealer packet such as Rainbird ST-03UL/PT-55 Snap-Tite, UL Wire Connectors and PT-55 Sealer System, Glendora, California or equivalent. Install per manufacturer's specifications.

8-03.3(10) Flushing and Testing

(January 2017, City of Auburn GSP)

Supplement this section with the following:

Before pressure testing, soluble weld joints shall be given at least 24 hours curing time. Before backfilling and installation of automatic valve, all sprinkler lines with risers installed and capped shall be flushed and pressure-tested. The final test must be performed and approved under the direction and supervision of the Engineer. The location, inspection and testing provisions of these specifications shall be strictly adhered to. Any part of the sprinkler system backfilled before location, testing, or approved inspection by the Engineer, will be completely uncovered and exposed until approved for backfilling by the Engineer.

8-03.3(11) Backfill

(January 2017, City of Auburn GSP)

Supplement this section with the following:

Trenches under roads or paved areas shall be backfilled and tamped with a mechanical tamper in successive 6 inch lifts. Paving shall be replaced to the satisfaction of the Engineer. Jacking under paved areas will be allowed with Engineer's approval.

Unless otherwise specified, trenches shall be deep enough to allow 18 inches cover over sprinkler lines and 24 inches cover over supply lines. All trenches must be straight and not have abrupt changes in grade. Bedding for irrigation lines shall be washed sand from a minimum of 3-inches below to 3-inches above all irrigation lines. Native material may be used as backfill for the remainder of the trench when not in paved areas. Rocks larger than 3-inches in diameter shall be removed from any native material used as backfill.

8-03.3(14) System Operation

(January 2017, City of Auburn GSP)

Supplement this section with the following:

The Contractor shall perform sprinkler coverage tests to determine if coverage and operation of the system is complete and satisfactory before the sprinkler system will be accepted. If any part of the system is inadequate because of Contractor workmanship or material, repairs or replacement shall be made at Contractor expense and the test repeated until accepted by the Engineer.

(August 2016, City of Auburn GSP)

In the third paragraph, the last sentence is revised to read:

> Potable water shall not flow through the cross-connection control device to any downstream component until tested and approved for use by the City in accordance with Section 8-03.3(12) (Cross Connection Control Device Installation).

(City Contracts, August 2016, City of Auburn GSP)

Add the following new section:

8-03.4 Measurement

No measurement shall be made for "Automatic Irrigation System Complete".

Measurement for "Double Check Valve Assembly" shall be per each double check valve assembly completed.

8-03.5 Payment

(City Contracts, April 2017, City of Auburn GSP)

Delete this section and replace it with the following:

Payment will be made for each of the following Bid items that are included in the Proposal:

"Automatic Irrigation System Complete", Per Lump Sum

"Double Check Valve Assembly", Per Each

The lump sum contract price for "Automatic Irrigation System Complete" shall be full pay for the construction of the complete irrigation system, modifying existing systems, or

both, as shown in the Plans and herein specified, including excavation, backfilling, concrete foundations, piping, sprinkler heads, conduit, wiring, restoring facilities destroyed or damaged during construction, salvaging existing materials, and for making all required tests. All additional materials and labor, not shown in the Plans or called for herein and which are required to complete the irrigation system shall be included in the lump sum price. Payment for required irrigation water service connections will be paid separately as identified in Section 7-09.5 of these Special Provisions.

Payment for "Double Check Valve Assembly" shall be full pay for furnishing all material and equipment, installation, permitting, and testing, required for a double check valve assembly. Payment for the water service line, where applicable, shall be separate.

8-04 Curbs, Gutters and Spillways

8-04.3 Construction Requirements

8-04.3(1) Cement Concrete Curbs, Gutters, and Spillways

(January 2017, City of Auburn GSP)

Supplement this section with the following:

Reinforcing shall be constructed at catch basins in accordance with the applicable Standard Detail(s).

When slip-form equipment is used to place the curb and gutter, the concrete mix design may be modified as follows: The Grade No. 2 coarse aggregate (1½ inch minus) may be replaced by Grade No. 5 coarse aggregate (1 inch minus) when required to accommodate the equipment.

(August 2016, City of Auburn GSP)

The fourth paragraph is replaced with the following:

Joints in the curb and gutter shall be spaced to match joints in the abutting driveways and sidewalks or cement concrete pavement. All expansion/through joints shall extend entirely through the curb and gutter section. Maximum joint spacing shall be as follows:

A. ¾ inch expansion/through joints at 20-foot maximum spacing, or 3/8-inch expansion/through joints at 10-foot maximum spacing;

B. 1/8 inch x 1 inch deep saw cut or scored joints per Standard Specification 8-04.3(1) (Cement Concrete Curbs, Gutters, and Spillways) at intervening 10-foot maximum spacing.

8-04.3(1)A Extruded Cement Concrete Curb

(January 2017, City of Auburn GSP)

Supplement this section with the following:

"Extruded Cement Concrete Curb" shall be type 6 as detailed in the applicable Standard Plan.

8-04.4 Measurement

(City Contracts, August 2016, City of Auburn GSP)

References to measurement of curb and gutter in this section shall be revised as follows:

Measurement for "Cement Concrete Traffic Curb and Gutter" will not include cement concrete curb and gutter which will be reinforced and poured integral with an Industrial or Commercial Driveway Apron slab.

8-04.5 Payment

(City Contracts, April 2017, City of Auburn GSP)

Supplement this section with the following:

Payment will be made in accordance with Section 1-04.1 (Intent of the Contract) for the following bid items:

"Bumper Curb", Per Each

The unit contract price per each for 'Bumper Curb' shall be full pay for all labor, materials, and equipment necessary to furnish and install each bumper curb.

(City Contracts, September 2020, City of Auburn GSP)

Supplement this section with the following:

"Cement Conc. Pedestrian Curb – Variable Height", per linear foot.

The unit contract price per each for "Cement Conc. Pedestrian Curb – Variable Height" shall be full payment for all costs to construct the varying height curb as shown in the Plans or as staked by the Engineer.

8-05 VACANT

This section, including title, is replaced with the following including subsections:

(August 2016, City of Auburn GSP)

This section, including title, is replaced with the following including subsections:

8-05 Dewatering System

8-05.1 General

(February 2023, City of Auburn GSP)

When dewatering trenches requires a dewatering system the Contractor shall design and provide a dewatering system using accepted and professional methods consistent with current industry practice to eliminate water entering the excavation under hydrostatic head from the bottom and/or sides. The Contractor shall design the system to prevent differential hydrostatic head that would result in floating out soil particles in a manner termed as a "quick" or "boiling" condition. The system shall not be dependent solely upon sumps or pumping water from within the excavation where differential head would result in a quick condition, which would continue to worsen the integrity of the excavation's stability.

Where the Engineer determines that the Contractor cannot sufficiently dewater the trench using the "Normal Trench Dewatering" described in Section 7-08.3(2)L (Dewatering

Trenches) of these Special Provisions, the Contractor shall provide a dewatering system of sufficient size and capacity to prevent ground and surface water flow into the excavation and to allow all work to be installed in a dry condition.

The Contractor shall control, by acceptable means, all water regardless of source and be fully responsible for disposal of the water.

The Contractor shall confine discharge piping and/or ditches to available easements or to additional easements obtained by Contractor and provide necessary permits and/or additional easements at no additional cost to the City.

The Contractor shall control groundwater in a manner that preserves strength of foundation soils, does not cause instability or raveling of excavation slopes, and does not result in damage to existing structures. Where necessary to these purposes, the Contractor shall lower water levels in advance of excavation, utilizing wells, well points, jet educators, or similar positive methods. The water level as measured by piezometers shall be maintained a minimum of 2 feet below prevailing excavation level.

The Contractor shall commence dewatering prior to any appearance of water in excavation and continue until work is complete to the extent that no damage results from hydrostatic pressure, flotation, or other causes.

Open pumping with sumps and ditches shall be allowed, provided it does not result in boils, loss of fines, softening of the ground, or instability of slopes.

The Contractor shall install wells and/or well points, if required, with suitable screens and filters, so that continuous pumping of fines does not occur, arrange discharge to facilitate collection of samples by the City. During normal pumping, and upon development of well(s), levels of fine sand or silt in the discharge water shall not exceed 5 ppm. The Contractor shall install sand tester on discharge of each pump during testing to verify that levels are not exceeded.

The Contractor shall control grading around excavations to prevent surface water from flowing into excavation areas.

(City Contracts, February 2023, City of Auburn GSP)

Supplement this section with the following:

No additional payment will be made for any supplemental measures to control seepage, groundwater, or artesian head.

8-05.1(1) Design

(August 2016, City of Auburn GSP)

Contractor shall designate and obtain the services of a qualified dewatering specialist to provide a dewatering plan as may be necessary to complete the work.

Contractor shall be responsible for the accuracy of the drawings, design data, and operational records required.

Contractor shall be solely responsible for the design, installation, operation, maintenance, and any failure of any component of the system.

8-05.1(1)A Dewatering Discharge

(January 2018, City of Auburn GSP)

Discharge Limits

1. Turbidity – less than 5 NTUs above background
2. Sand Content – less than 10 ppm
3. pH between 6.5 and 8.5
4. No visible sheen in the stormwater discharge or in the receiving water

Contractor shall conduct Daily Monitoring and provide records of:

PH

TSS (NTU)

Volume Discharged (gpd)

Water levels in monitoring wells

Sand content (first 5 days after startup)

Contractor shall conduct Weekly Monitoring and provide records of:

Sand Content

Sampling and Analysis

Preliminary testing of dewatering discharge will be conducted by the Contractor during the initial dewatering activities prior to discharging water to the City's stormwater system. Contractor shall use the preliminary water testing results to evaluate what treatment components, if any, will need to be added to the dewatering system. During initial dewatering activities, water will be pumped into a series of storage containers. Water will be sampled from the last tank in the series and analyzed for the constituents specified in the table above.

Contractor shall provide monitoring records to the City on a daily basis.

The total flow quantified by the flow totalizer and water levels in monitoring wells will be recorded on the daily contractor logs and at the time effluent water samples are collected. The total flow measurements will be included in the effluent sampling summary reports.

8-05.1(1)B Temporary Dewatering Plan

(May 2017, City of Auburn GSP)

The Contractor shall submit a Temporary Dewatering Plan to the Engineer for review per Section 9-38 (Submittal Approval). The Temporary Dewatering Plan shall be prepared by a Professional Engineer or Hydrogeologist who is licensed to practice in the State of Washington, and who has a minimum of five years of experience in the design of dewatering systems for similar projects.

The Temporary Dewatering Plan shall include:

- A narrative of the Contractor's proposed dewatering system methodology,
- Working drawings showing system layout and components including number and location of dewatering wells, wellpoints, and/or eductors with a well numbering system,
- Design calculations demonstrating system and equipment adequacy,
- Specifications of proposed materials and equipment, including pump curves,
- Pumps and sumps for removal of incidental seepage, perched groundwater, etc.

- Provision for the settlement and removal of sediments prior to discharge (e.g., settling tanks),
- Number and location of temporary monitoring wells to be installed (Note that one monitoring well is present on-site. However, this well will be impacted during construction activities and therefore cannot be used as one of the temporary monitoring wells used during dewatering efforts.),
- Dewatering schedule, including mobilization, installation, development, testing, water quality analysis, start-up, monitoring, operation, shutdown, decommissioning, clean-up, and removal,
- Describe how groundwater will be treated to meet the applicable discharge limits, and
- Proposed plans of operation.

Any changes to the proposed system shall be submitted to the Engineer for review prior to implementation.

In addition to the Temporary Dewatering Plan, the submittal shall include:

- A Contingency Plan for storm events or other conditions (including failure of the dewatering system) that could raise groundwater levels and overwhelm the capacity of the dewatering system pumps or discharge facilities. In the Contingency Plan, the Contractor should:
    - Make provision to suspend dewatering operations for anticipated events (e.g., storms) and unanticipated events that may occur prior to excavation work and that would require dewatering.
    - Provide methods to secure such items as the excavation, shoring, side slopes, equipment, dewatering system components, base of excavation, and any installed facilities from the adverse effects of elevated groundwater levels.
    - A Water Quality Sampling Plan

The Engineer's review of the Temporary Dewatering Plan shall not constitute approval nor relieve the Contractor from full responsibility for errors therein nor from the entire responsibility for complete and adequate groundwater level control and volume removal in the excavated areas; formation protection; and protection of existing and proposed structures to the extent specified herein. The Contractor shall be solely responsible for control of the groundwater levels and hydrostatic pressures to the depths herein specified and for avoiding settlement outside the excavation as herein specified. The Contractor shall bear sole responsibility for proper design, installation, operation, maintenance, and any failure of any component of the temporary dewatering system for the duration of the Contract.

8-05.2 Vacant

8-05.3 Construction Requirements

8-05.3(1) Damages

(August 2016, City of Auburn GSP)

Contractor shall be responsible for and shall repair without cost to the City, any damage to work in place, or other contractor's equipment, utilities, residences, highways, roads, railroads, private and municipal well systems, adjacent structures, natural resources,

habitat, existing wells, and the excavation, including, damage to the bottom due to heave and including but not limited to, removal and pumping out of the excavated area that may result from Contractor's negligence, inadequate or improper design and operation of the dewatering system, and any mechanical or electrical failure of the dewatering system.

The Contractor shall remove subgrade materials rendered unsuitable by excessive wetting and replace with approved backfill material at no additional cost to the Owner.

8-05.3(2) Settlement Monitoring Program

(January 2018, City of Auburn GSP)

Contractor shall develop and submit to the City a Settlement Monitoring Program for review and approval prior to beginning dewatering per Section 9-38 (Submittal Approval).

Contractor shall establish a settlement monitoring program and perform all survey and inspections necessary for monitoring existing site features. All surveys shall be performed under the direction of a licensed land surveyor. Vertical and horizontal measurements shall be accurate to 0.01 feet or smaller.

Contractor shall set survey monuments on permanent structures, the roadway, and utilities. The survey monuments may consist of PK nails with a washer with an identification number. Contractor shall record the identification number, elevation, and coordinate location prior to initiating dewatering, and submit the baseline information to the Engineer. The method of installing survey monuments, and the locations and number of survey monuments shall be as approved by the Engineer. The Engineer shall be notified a minimum of one day prior to setting survey monumentation. The initial survey to record the monuments baseline horizontal and vertical location shall be completed by conducting three separate level loops for each monument. Each loop shall be run so that they start and stop at a different location each time. The intent of running multiple level loops on each monument is to catch potential survey errors.

Contractor shall perform an initial survey prior to commencement of the Work, daily for the first 5 days after the dewatering system is started up, subsequently two days per week when the dewatering system is active, and one day per week for a month after the dewatering system is turned off. If pumping or dewatering of excavations are interrupted or cannot be adequately maintained, the survey monuments and targets shall be checked a minimum of once every 24 hours for as long as the conditions exist.

Contractor shall immediately notify the Engineer of any cumulative change in elevation or location of any monument or target in excess of 1/4 inch. If the cumulative change in elevation or location exceeds 1/2 inch, the Contractor shall immediately notify the Engineer and resolve the problem using methods defined in the Contingency Plan or other reasonable methods.

The Contractor shall maintain in a log the survey data taken for each monument or target. A copy shall be sent to the Engineer after each addition of data.

Contingency Plan

Contractor shall prepare a Contingency Plan to mitigate the effects of excessive settlement or movement of existing Site features. The Contingency Plan is not to restrict the Contractor from using the best construction methods available to meet the conditions but is required to demonstrate a reasonable preparedness to mitigate the effects of excessive movement or settlement. The following are minimum requirements for a Contingency Plan:

1. The Contingency Plan shall outline steps to be taken to protect structures, buildings, and utilities and to stop excessive movement or settlement identified by the settlement monitoring program.
2. Contractor shall have all material, manpower, equipment, and other items identified in the Contingency Plan available at all times while excavations are ongoing or excavated areas are open."

8-05.3(3) Maintaining Excavation in Dewatering Condition

(August 2016, City of Auburn GSP)

Dewatering shall be a continuous operation. Interruptions due to power outages or any other reason will not be permitted.

The Contractor shall continuously maintain excavation in a dry condition with positive dewatering methods during preparation of subgrade, installation of pipe, and construction of structures until the critical period of construction and/or backfill is completed to prevent damage of subgrade support, piping, structure, side slopes, or adjacent facilities from flotation or other hydrostatic pressure imbalance.

The Contractor shall provide standby equipment on site, installed, wired, and available for immediate operation if required to maintain dewatering on a continuous basis in the event any part of the system becomes inadequate or fails. If dewatering requirements are not satisfied due to inadequacy or failure of dewatering system, perform such work as may be required to restore damaged structures and foundation soils at no additional cost to City.

System maintenance shall include but not be limited to 24-hour supervision by personnel skilled in the operation, maintenance, and replacement of system components and any other work required to maintain excavation in dewatered condition.

8-05.3(4) System Removal

(August 2016, City of Auburn GSP)

The Contractor shall abandon and remove from the site, in accordance with WAC Chapter 173-160 and RCW Chapter 18.104, all groundwater control and monitoring system elements. The Contractor shall be, or employ the services of, a water well contractor licensed in the State of Washington to abandon all wells, and/or well points. The Contractor shall assume ownership and responsibility for the disposal of all removed groundwater control pumps, pipes, and other assorted system hardware.

The Contractor shall abandon and remove the groundwater control and monitoring systems in such a manner that groundwater does not flow or seep through groundwater control or monitoring system penetrations into any structure or facility. Wells decommissioned within roadways shall be capped beneath the roadway base course with at least 24-inches of class 3000 concrete. Beneath the concrete cap, the Contractor may utilize bentonite to fill the well per Department of Ecology requirements.

8-05.4 Measurement

(City Contracts, August 2016, City of Auburn GSP)

"Dewatering System" will be measured per linear foot along the construction centerline. Only sections approved for dewatering by the Engineer will be included in the

measurements. Pipe lengths installed using "Normal Dewatering Methods," or installed using the dewatering system without approval from the Engineer will not be included in the measurement for "Dewatering System."

"Normal Trench Dewatering" as described in Section 7-08.3(2)L (Dewatering Trenches) will not be measured for payment, but instead will be included in the per linear foot price of the utility being installed.

8-05.5 Payment

(City Contracts, April 2017, City of Auburn GSP)

Payment will be made for each of the following Bid items that are included in the Proposal:

"Dewatering System", Per Linear Foot

The unit bid price in the Proposal for "Dewatering System", per linear foot shall be full compensation for the costs of all labor, tools, equipment, and materials necessary or incidental to design, install, operate, maintain, and remove a complete dewatering system. This Bid item shall also include, but not be limited to, dewatering handling, preliminary testing prior to discharge, storage, permitting, daily monitoring, weekly monitoring, and disposal of clean groundwater and sediment. Providing, installing, operating, and maintaining settling tank(s), or other equipment necessary to meet the discharge requirements, shall be included in this lump sum cost and shall not be measured for separate payment.

The unit price shall also include all costs to continuously operate the dewatering system, all power costs and connections, permits, pumps, wells, pipes, fittings, and appurtenances.

All costs for design of dewatering systems and preparation and implementation of the Temporary Dewatering Plan (including the Contingency Plan, Water Quality Sampling Plan, and Settlement Monitoring Program, including Contingency Plan) shall be included in the dewatering lump sum cost and shall not be measured for separate payment.

Dewatering" shall only be paid for when a dedicated system using well points is used for dewatering. All "normal trench dewatering" work, as defined in Section 7-08.3(2)L, will be incidental to and included in the unit cost for the pipe, structure, etc. being installed.

Restoration of property damaged due to dewatering or settlement caused by the dewatering system shall be the Contractor's responsibility.

8-06 Cement Concrete Driveway Entrances

8-06.1 Description

(January 2017, City of Auburn GSP)

Supplement this section with the following:

Driveway approaches shall be considered to be that portion of the private driveways, which require removal and replacement to transition between the new cement concrete driveway aprons and the existing private driveway. "Cement Concrete Driveway Approaches" shall be constructed and finished as specified for driveways, except they shall be 4-inch thick slabs and not reinforced.

8-06.2 Materials

(January 2017, City of Auburn GSP)

Supplement this section with the following:

Materials shall meet the requirements of the following sections:

Wire Mesh (Welded Wire Fabric)	9-07.7
Concrete Curing Materials and Admixtures	9-23

8-06.3 Construction Requirements

(January 2017, City of Auburn GSP)

Supplement this section with the following:

Concrete driveways shall be cured per methods described in Section 5-05.3(13) (Curing), with the following exceptions if the curing compound method is used:

- The Contractor shall use Type I clear curing compound per Section 9-23 (Concrete Curing Materials and Admixtures).
- The Contractor shall not use white pigmented curing compound.
- The curing agent shall be applied immediately after brushing and be maintained for a period of 5 calendar days.

The Contractor shall have readily available sufficient protective covering, such as waterproof paper or plastic membrane, to cover the pour of an entire day in event of rain or other unsuitable weather.

Additional requirements for curing in hot weather shall be as follows:

In periods of low humidity, drying winds, or high temperatures, a fog spray shall be applied to concrete after placement as soon as conditions warrant to prevent the formation of shrinkage cracks. The spray shall be continued until conditions permit the application of liquid curing membrane or other curing media.

Additional requirements for curing in cold weather shall be as outlined in Section 5-05.3(14) (Cold Weather Work).

8-06.4 Measurement

(City Contracts, February 2024, City of Auburn GSP)

Supplement this section with the following:

Measurement for “Cement Concrete Driveway Approach” will be by the square yard of finished surface, excluding area measured as driveway apron.

Measurement for “Residential Driveway Apron” will be by the square yard of finished surface, excluding the cement concrete curb and gutter area.

Measurement for “Industrial or Commercial Driveway Apron” will be by the square yard of finished surface including the cement concrete curb and gutter which will be reinforced and poured integral with the driveway apron slab.

8-06.5 Payment

(City Contracts, April 2017, City of Auburn GSP)

Supplement this section with the following:

Payment will be made for each of the following Bid items that are included in the Proposal:

"Residential Driveway Apron", Per Square Yard

"Industrial or Commercial Driveway Apron", Per Square Yard

"Cement Concrete Driveway Approach", Per Square Yard

The unit contract price per square yard for "Residential Driveway Apron" shall be full pay for all work to complete the installation including subgrade preparation, thickened edges, and wings.

The unit contract price per square yard for "Industrial or Commercial Driveway Apron" shall be full pay for all work to complete the installation including subgrade preparation and integrated cement concrete curb and gutter.

Payment for "Cement Concrete Driveway Approach" shall be full pay for all costs to construct the approach.

Payment for cement concrete curb and gutter will be in accordance with the provisions of Section 8-04 (Curbs, Gutters, and Spillways), except for locations where the curb and gutter is integral with the Industrial and Commercial Driveway Apron.

Payment for water will be in accordance with the provisions of Section 2-07 (Watering).

8-07 Precast Traffic Curb

8-07.2 Materials

(February 2024, City of Auburn GSP)

Supplement this section with the following:

Materials shall meet the requirements of the following sections:

Epoxy Adhesive for Curb	9-26.2
Glass Beads	9-34.4
Raised Pavement Markers	9-21.2
Adhesive for RPMs	9-02.1(8)
36" Delineators	9-17 and COA Std Detail T-32
Adhesive for Delineators	9-02.1(8)

8-07.3 Construction Requirements

8-07.3(16) Installing Curbs

(January 2017, City of Auburn GSP)

Delete the first paragraph and replace it with the following:

The curb shall be installed in accordance with the applicable City of Auburn Standard Detail.

The second sentence is revised to read:

Before the epoxy adhesive is applied, all dirt shall be cleaned from the pavement surface by washing.

The fourth paragraph is revised to read:

All joints between adjacent pieces of curb except joints for expansion and/or drainage shall be filled with epoxy.

8-07.4 Measurement

(City Contracts, January 2017, City of Auburn GSP)

Delete this section and replace it with the following:

Precast curb shall be measured along the length of the precast curb system installed, from delineator to delineator, without deduction for gaps.

8-07.5 Payment

(City Contracts, April 2017, City of Auburn GSP)

Supplement this section with the following:

Payment will be made in accordance with Section 1-04.1 (Intent of the Contract) for the following bid items:

"Precast Curb with Delineators", Per Linear Foot

The unit contract price per linear foot for 'Precast Curb with Delineators' shall include all costs to furnish and construct the mountable curb system, including, raised pavement markers, epoxy, and delineators.

8-09 Raised Pavement Markers

8-09.3 Construction Requirements

8-09.3(2) Surface Preparation

(January 2017, City of Auburn GSP)

Supplement this section with the following:

The Contractor shall pre-mark the layout of all channelization and receive approval from the Engineer before installing "Raised Pavement Markers" (RPM's). Pre-marks shall consist of painted spot markings or other approved methods. The Contractor shall request the Engineer's approval of the pre-mark for channelization at least 2 full working days prior to installation of the RPMs.

(August 2016, City of Auburn GSP)

Add the following new section:

8-09.3(8) Remove Raised Pavement Markings

All raised pavement markings shall be removed before placing a new asphalt concrete pavement overlay. Removal of markers shall be conducted in a manner that prevents damage to existing pavement. Damage to the existing pavement caused by Contractor's negligence shall be repaired by the Contractor at the Contractor's expense. Repairs shall be to the satisfaction of the Engineer.

8-09.4 Measurement

(City Contracts, April 2019, City of Auburn GSP)

Raised Pavement Markers will be measured by the unit for each marker furnished and installed.

8-09.5 Payment

(City Contracts, February 2020, City of Auburn GSP)

Supplement this section with the following:

Payment will be made in accordance with Section 1-04.1 (Intent of the Contract) for the following bid items:

"Remove Raised Pavement Markers", Per Each

"Raised Pavement Markers", Per Each

(City Contracts, September 2016, City of Auburn GSP)

References to payment for Raised Pavement Markers are revised to the following:

The unit contract price per each for "Raised Pavement Markers Type __" shall be full pay for furnishing and installing the markers in accordance with these specifications including all cost involved with traffic control except for reimbursement for labor for traffic control in accordance with Section 1-10 (Temporary Traffic Control).

The unit contract price per each for "Remove Raised Pavement Markers" shall be full pay to remove each pavement marker.

8-12 Chain Link and Wire Fence

8-12.2 Materials

(July 2023, City of Auburn GSP)

Supplement this section with the following:

Coated Chain Link Fence

Chain link fence fabric shall be hot-dip galvanized with a minimum of 0.8 ounce per square foot of surface area.

Fencing materials shall be coated with an ultraviolet-insensitive plastic or other inert material at least 2 mils in thickness. Any pretreatment or coating shall be applied in accordance with the manufacturer's written instructions. The Contractor shall provide the Engineer with the manufacturer's written specifications detailing the product and method of fabrication. All components of the fence shall be black.

8-12.4 Measurement

(City Contracts, July 2023, City of Auburn GSP)

Supplement this section with the following:

Coated chain link fence will be measured by the linear foot of completed fence along the ground line. No separate measurement will be made for coated chain link fence end, corner, or pull posts.

8-12.5 Payment

(City Contracts, July 2023, City of Auburn GSP)

Supplement this section with the following:

Payment will be made for each of the following Bid items that are included in the Proposal:

Coated Chain Link Fence Type _____, per linear foot.

Payment for "Coated Chain Link Fence Type ___" shall include all costs to furnish and install end, corner, and pull posts as required to construct the fence. No separate measurement or payment will be made for the different types of posts.

8-13 Monument Cases

8-13.1 Description

(January 2017, City of Auburn GSP)

Supplement this section with the following:

This work consists of constructing, or adjusting, monuments, to proper grade, and the furnishing and placing of materials and other related work for monuments.

8-13.2 Materials

(January 2017, City of Auburn GSP)

Supplement this section with the following:

Monument cases and covers shall be in accordance with the applicable City of Auburn Standard Details. Concrete used for setting the monuments shall be Class 3000. Bronze plug markers will be furnished by the City and provided to the Contractor.

8-13.3 Construction Requirements

(January 2018, City of Auburn GSP)

The second sentence of the second paragraph is revised to read:

After the monument or monument case has been in place for a minimum of 3 calendar days, the roadway surface shall be patched in a workman like manner with Class ½ inch asphalt concrete pavement.

(January 2017, City of Auburn GSP)

Supplement this section with the following:

The bronze plug marker shall be inserted in the concrete mix to the required line and grade. The concrete base shall be placed on a well-compacted foundation. When Type B

monuments are installed, the monument case shall be placed in such a manner that will not disturb the bronze plug markers.

Where called for on the Plans, the Contractor shall adjust existing monuments to the grade as staked. The existing cast iron case and cover shall first be removed and thoroughly cleaned for reinstalling at the new grade.

(August 2016, City of Auburn GSP)

Add the following new section:

8-13.3(3) Reference Points

(August 2016, City of Auburn GSP)

The Engineer shall reference all monuments in advance of construction and shall reset the points and grades at the proper time.

It shall be the responsibility of the Contractor to furnish materials and install required castings in accordance with the Plans. The Contractor shall carefully protect all reference points to the monuments and shall give the Engineer reasonable notice of the schedule for monument work in order to avoid destruction of the points.

8-13.4 Measurement

(City Contracts, January 2017, City of Auburn GSP)

Supplement this section with the following:

Monument adjustment shall be measured by each monument adjusted to final grade.

8-13.5 Payment

(City Contracts, December 2020, City of Auburn GSP)

Supplement this section with the following:

Payment will be made for each of the following Bid items that are included in the Proposal:

"Monument Type A (Modified)", Per Each

"Monument Type B (Modified)", Per Each

"Adjust Existing Monument", Per Each

Payment for "Monument Type B (Modified)" shall be full pay for the materials, labor, survey work, recording, adjustments to finish grade (including asphalt concrete patches), and other costs to install each monument.

Payment for "Adjust Existing Monument" shall be full pay for the materials, labor, survey work, recording, asphalt concrete patches, and other costs to adjust each monument to final grade.

8-14 Cement Concrete Sidewalks

8-14.1 Description

(January 2017, City of Auburn GSP)

Delete this section and replace it with the following:

This work shall consist of construction of cement concrete sidewalks, including curb ramps with detectable warning strips.

8-14.3 Construction Requirements

8-14.3(1) Excavation

(January 2017, City of Auburn GSP)

Supplement this section with the following:

Excavation for sidewalk and for curb ramps shall be in accordance with Section 2-03, (Roadway Excavation and Embankment).

Embankments shall be compacted by Method B as specified in Section 2-03.3(14)C (Compacting Earth Embankments). Approved tampers shall be used in areas inaccessible to normal compaction equipment.

The subgrade shall be graded to within 1 inch of established grade and the area between the sidewalk and the adjacent private property line shall be shaped to line, grade, and section shown on the Plans before the forms are set.

8-14.3(2) Forms

(January 2017, City of Auburn GSP)

Supplement this section with the following:

Low areas in the subgrade shall be backfilled and compacted to the satisfaction of the Engineer. All high areas in the subgrade shall be cut down to meet the subgrade requirements.

8-14.3(3) Placing and Finishing Concrete

(February 2023, City of Auburn GSP)

The fourth paragraph is revised to read:

Curb Ramps shall be constructed in accordance with the Plans. If any slope exceeds a maximum slope specified on the Standard Plans or Contract Plans or if any dimension is less than a minimum dimension specified on the Standard Plans or Contract Plans, the Contractor shall replace the curb ramp or a portion of the curb ramp as necessary and approved by the Engineer to bring the curb ramp into compliance. This work will be at the Contractor's cost.

(January 2017, City of Auburn GSP)

Supplement this section with the following:

Expansion and contraction (dummy) joints shall be located and constructed in accordance with the Standard Details.

Expansion joints shall be formed by first cutting a groove in the concrete with a tee bar of a depth equal to, but not greater than the joint filler material, and then working the pre-molded joint filler into the groove. Pre-molded joint filler used for expansion joints shall be normal to and flush with the surface of the sidewalk. All joints, expansion and dummy, shall be positioned in true alignment at right angles to the line of the sidewalk.

Where the sidewalk abuts a curb, or curb and gutter, the sidewalk shall be constructed with a thickened edge.

Joints and the sidewalk perimeter shall be edged with a 3/8 inch to 1/2 inch radius edger.

The surface of the sidewalks shall be brushed with a fiber hair brush of an approved type in a transverse direction except that at driveway and alley crossings it shall be brushed longitudinally.

(August 2016, City of Auburn GSP)

Add the following new section:

8-14.3(3)A Special Sidewalk

(August 2016, City of Auburn GSP)

(Downtown Sidewalk – 2x2 Scoring)

The “Special 2x2 Scored Cement Concrete Sidewalk” shall be concrete with 2 ft. x 2 ft. scoring pattern with a light broom finish.

(Downtown Street Corner Sidewalk - Brick)

The “Special Brick Sidewalk” at street corners as specified on the Plans shall be constructed of brick pavers in a rectangular pattern. The patterns shall extend from the back of curb to the building face or property line and minimum of 10 feet in either direction from the corner of the property lines. The brick pavers shall be Mutual Materials “Holland” 8cm, or approved equivalent and the color shall be per Plans.

8-14.3(4) Curing

(January 2017, City of Auburn GSP)

Delete this section and replace it with the following:

Concrete sidewalks shall be cured per methods described in Section 5-05.3(13) (Curing), with the following exceptions if the curing compound method is used:

- The Contractor shall use Type I clear curing compound per Section 9-23 (Concrete Curing Materials and Admixtures).
- The Contractor shall not use white pigmented curing compound.
- The curing agent shall be applied immediately after brushing and be maintained for a period of 5 calendar days.

The Contractor shall have readily available sufficient protective covering, such as waterproof paper or plastic membrane, to cover the pour of an entire day in event of rain or other unsuitable weather.

Additional requirements for curing in hot weather shall be as follows:

In periods of low humidity, drying winds, or high temperatures, a fog spray shall be applied to concrete after placement as soon as conditions warrant to

prevent the formation of shrinkage cracks. The spray shall be continued until conditions permit the application of liquid curing membrane or other curing media.

Additional requirements for curing in cold weather shall be as outlined in Section 5-05.3(14) (Cold Weather Work).

8-14.4 Measurement

(City Contracts, January 2017, City of Auburn GSP)

Supplement this section with the following:

"Sidewalk Ramp Detectable Warning Retrofit," will be measured by the square foot of truncated dome material installed on the existing ramp.

8-14.5 Payment

(City Contracts, April 2017, City of Auburn GSP)

Supplement this section with the following:

Payment will be made for each of the following Bid items that are included in the Proposal:

"Special 2x2 Scored Cement Concrete Sidewalk", Per Square Yard

"Special Brick Sidewalk", Per Square Yard

"Sidewalk Ramp Detectable Warning Retrofit", Per Square Foot

The unit contract price per square yard for "Cement Concrete Sidewalk", "Special 2x2 Scored Cement Concrete Sidewalk", and "Special Brick Sidewalk" shall be full pay for all work to complete the installation including subgrade preparation and thickened edges where identified.

The unit contract price per square yard for "Sidewalk Ramp Detectable Warning Retrofit" shall be full pay for complete installation of the detectable warning patterns including all preparation of the existing sidewalk, labor, equipment and materials.

8-18 Mailbox Supports

8-18.2 Materials

(January 2017, City of Auburn GSP)

Supplement this section with the following:

Anchor Bolts, Nuts, and Washers for the Neighborhood Delivery and Collection Box Unit shall be in accordance with Section 9-06.5 (Bolts) and Section 9-06.22 (Bolts, Washers, and Other Hardware).

8-18.4 Measurement

(City Contracts, January 2017, City of Auburn GSP)

Supplement this section with the following:

Relocation of mailboxes shall be measured per each unit or cluster of mailboxes relocated.

8-18.5 Payment

(City Contracts, April 2017, City of Auburn GSP)

Supplement this section with the following:

Payment will be made for each of the following Bid items that are included in the Proposal:

"Relocate Type III Mailbox Support w/ boxes", Per Each

"Relocate Type IV N.D.C.B.U. (mailboxes)", Per Each

The unit contract price per each for relocating mailboxes shall be full payment to remove and re-install existing mailbox group, including all new materials necessary to install the support.

8-20 Illumination, Traffic Signal Systems, Intelligent Transportation Systems, and Electrical

8-20.1 Description

8-20.1(1) Regulations and Code

(April 2018, City of Auburn GSP)

The fourth paragraph is revised to read:

Safe-wiring labels required by Labor and Industries shall apply on this project.

8-20.1(3) Permitting and Inspections

(April 2018, City of Auburn GSP)

Supplement this section with the following:

The Contractor shall obtain electrical permit(s) from Washington State Department of Labor and Industries. Electrical Service inspection(s) will be performed by Labor and Industries. Obtaining the permit, requesting inspections, making corrections, and securing L&I approval is the responsibility of the Contractor.

8-20.2(1) Equipment List and Drawings

(January 2017, City of Auburn GSP)

Delete this section and replace it with the following:

Supplemental data for pole equipment, luminaries, splice kits, vehicle signal heads, pedestrian signal heads, pedestrian push button assemblies, video detectors, PTZ camera(s), junction boxes, conduit, conduit fittings, wiring, service/battery back-up cabinet,

controller cabinet (including controller and all other associated equipment in the cabinet), preemption detectors and discriminators, and all other electrical materials to be used on this project shall be submitted for approval before being incorporated into the work. Quantity, pole height, davit arm length, and mast arm length shall be indicated and consistent with the Plans.

The Contractor shall submit supplemental data and material shop drawings for all structural items. The shop drawings and structural calculations shall clearly identify the type of equipment to be used and shall be stamped by a registered professional engineer registered. Shop drawings shall conform to the contract Plans.

All material to be reviewed for the signal system shall be submitted in a single package.

The City of Auburn reserves the right to inspect the manufacturing process of all materials. Final inspection and acceptance of the installed materials will not be given until final installation and testing has been completed on the system. Approval to install materials and equipment must be obtained from the Engineer at the job site, before installation.

8-20.3 Construction Requirements

(December 2020, City of Auburn GSP)

Add the following new section:

8-20.3(1)D Order of Work

Except as specifically allowed in Section 8-20.3(1) (General), each element of existing signal, illumination, communication and ITS systems shall remain in operation until modified systems to replace such are operational and accepted by the Contracting Agency. This includes, but is not limited to temporary vehicle detection which shall be provided by the Contractor during construction to replace the function of existing vehicle detection systems prior to any project work that adversely impacts the function of existing detection systems. Temporary vehicle detection equipment shall be compatible with City signal cabinet and installation shall be coordinated with City traffic signal technicians. Contractor shall be responsible for ensuring temporary vehicle detection systems function properly at all times while in use.

All existing illumination and traffic signal display and detection system equipment shall remain operational until the corresponding new equipment is constructed, tested, operational and accepted by the Engineer. Temporary video detection equipment shall be fully operational and accepted by the Engineer as a substitute for the function of any existing induction loop or video detection prior to any construction activities that render such existing traffic detection ineffective. Temporary video detection systems shall be in accordance with Section 8-20.3(14)I (Video Detection System) of these specifications.

8-20.3(4) Foundations

(December 2021 City of Auburn GSP)

Supplement this section with the following:

Before placing the concrete, the Contractor shall block out around any other underground utilities that may lie in the excavated base to prevent foundation adherence to

the utility line. Concrete foundations shall be troweled, brushed, and edged. Exposed anchor bolts and conduits shall be promptly cleaned of any concrete after installation.

Where no sidewalk is planned or exists, the top of the foundation shall be a minimum of 12 inches above roadway centerline, unless otherwise noted on the Plans.

The joint between traffic signal cabinet and its foundation shall be sealed using a clear, waterproof, silicone caulk.

8-20.3(5) Conduit

8-20.3(5)A General

(April 2018, City of Auburn GSP)

Supplement this section with the following:

Unless specified on the Plans, metal conduit shall not be used.

Location wire placed for conduit containing, or that are to contain, fiber optic cable shall be 12 AWG.

Conduit shall be in accordance with all provisions of Section 9-29.1 (Conduit, Innerduct, and Outerduct).

Conduit runs installed entirely under sidewalk, driveways, and landscape areas may be Schedule 40 PVC unless otherwise noted on the Plans. The same type and schedule of conduit shall be used for the entire length of the run from outlet to outlet and from Schedule 80 PVC conduit crossing the roadway to the nearest junction box. Bends for conduits serving existing or future interconnect and fiber optic cables shall be no less than 4 feet in diameter. All conduit ends shall have bell end PVC bushings.

Stubouts shall be installed as shown on the Plans.

A pull tape shall be installed in all spare conduits for future conductors. The pull tape shall have printed sequential measurement markings at least every 3 feet. At least 2 feet of pull tape shall be doubled back into the conduit at each termination. Conduits without conductors (spare conduits) shall be plugged on both ends with mechanical plugs. Locate wire shall be installed in all empty or spare conduits, not in joint trench with conductors.

Loop stubouts that are installed before the final lift of pavement shall be surrounded with a 6 inch PVC sleeve. This sleeve shall be extended below the top of the stubout and be flush with finished grade. All loop conduit shall be appropriately capped and sealed with a molded plug cap. Molded plug cap installation shall comply with manufacturer's installation and recommendations. With the exception of connections to HDPE conduit, joints shall be connected with medium grade gray cement solvent applied per the manufacturer's recommendations. The loop wires shall pass through a hole in the cap. The end of the conduit will also be sealed with moldable duct sealing compound. Sifted sand will be used to cover all exposed loop wires before final filling with loop sealant.

All conduit shall display the Underwriter Laboratories certification (UL Listed).

8-20.3(6) Junction Boxes, Cable Vaults, and Pull Boxes

(April 2018, City of Auburn GSP)

Supplement this section with the following:

All lids shall open away from the traveled way. Prior to construction of finished grade, if cable vaults are installed or adjusted, pre-molded joint filler for expansion joints may be placed around the cable vaults. The joint filler shall be removed prior to adjustment to finished grade.

Junction boxes shall conform with all provisions of Section 9-29.2 (Junctions Boxes, Cable Vaults, and Pull Boxes). Junction Boxes shall be of the types indicated on the Plans. All Junction Boxes shall have slip-resistant surfaces, locking lids, and be equipped with Penta Head tamper resistant bolts as specified and detailed in the Plans.

6 inches of washed drain rock shall be placed inside the junction box and be spread evenly around all conduits.

All three-way service connections leading to luminaires, including street crossings and service cabinet junction boxes shall be made with a SEC Model 1791-DP or approved equivalent.

Box and vault lids shall be inscribed with a welded bead message with each letter being 4 inches tall and 3 inches wide as follows:

"LT" if used exclusively for lighting

"TS" if used exclusively for Traffic Signals

"TS" "LT" if jointly used for lighting and traffic signals

"COA COMM" if used for City of Auburn communications and/or for traffic signal interconnect.

The lids and frames shall be hot dipped galvanized after the welded bead legend is installed.

8-20.3(8) Wiring

(January 2017, City of Auburn GSP)

Supplement this section with the following:

All cable entering cabinets shall be neatly bundled and wrapped.

The Contractor shall pull out and dispose of wire for the existing illumination system that is no longer needed. All costs for removal and disposal of wire shall be included in the unit contract price for "Illumination System Complete".

8-20.3(9) Bonding, Grounding

(January 2017, City of Auburn GSP)

Supplement this section with the following:

The Contractor shall provide junction boxes or other Engineer approved cover over all grounding rods.

All junction boxes containing conductors carrying 120 volts or higher will have the lid and frame bonded to the system ground. The connections to the lid and frame will be made with approved compression type ring terminals. The braid will be of sufficient length so that the lid may be easily removed and placed next to the junction box. It will be routed around all cables so that it does not pass thorough any cable loops. In the case of Type 8 junction boxes, both lids shall be bonded.

When loop lead-in wires or interconnect wire are the only wires in the junction box, bonding is not required.

8-20.3(10) Service, Transformer, and ITS Cabinets

(April 2018, City of Auburn GSP)

Delete this section and replace it with the following:

A three-wire electrical service shall be used at 120/240 volts. Electrical service cabinets shall be per Section 9-29.24 (Service Cabinets) and shall be installed where shown on the Plans.

Power service cabinets shall be labeled by the Contractor to meet PSE Construction meter requirements: The label shall indicate the "City of Auburn" identification, the specific use of the service, and the general site address (example: City of Auburn, Street Lighting – 123 E Main St). The label shall be a permanent engraved phenolic nameplate or die-cut adhesive label at least 1 inch high. PSE will not provide the power meter without this permanent label.

Where underground power service is not utilized, overhead electrical service shall be brought to the power service cabinet through a conduit riser with a weather head on the service pole. The service shall be split in the load center into a 120 VAC/240 VAC circuit for the traffic signal and street lighting systems.

The Contractor shall provide and install service wire and PVC conduit between the service cabinet and the point of power service location as shown in the Plans.

8-20.3(11) Testing

(August 2016, City of Auburn GSP)

The last paragraph is revised to read:

Unless otherwise approved by the Engineer, signal turn-on will only be allowed Monday through Thursday (except for holidays or the day before a holiday), between the hours of 9:00 a.m. and 2:00 p.m.

(April 2018, City of Auburn GSP)

Supplement this section with the following:

For traffic signal turn-on, City personnel will put the signal into operation. The Contractor shall be present during the turn-on with adequate equipment to repair any deficiencies of signal operation.

All newly installed signal and pedestrian heads and pedestrian pushbuttons shall be fully covered with black plastic or yellow nylon cloth that is firmly attached, until such time for the signal turn-on.

8-20.3(13) Illumination Systems

8-20.3(13)A Light Standards

(April 2018, City of Auburn GSP)

Supplement this section with the following:

The poles shall be plumb with no shims. The poles shall be plumbed on leveling nuts secured to the anchor bolts and locking nuts on top of the base flange. The side of the shaft opposite the load shall be plumbed using the leveling nuts.

The void between the foundation and the pole flange shall be no larger than 2 inches and shall be completely filled around the conduit(s) with dry pack mortar and neatly troweled. A ¼ inch weep hole shall be installed on the downward slope side of the pad.

The dry pack mortar consists of 1:2 cement to fine sand mixture with enough water to allow the mixture to stick together when molded into a ball by hand, but which will not exude water when pressed.

8-20.3(13)C Luminaires

(November 2020, City of Auburn GSP)

Supplement this section with the following:

All luminaires, shall be in accordance with all provisions of Section 9-29.10 (Luminaires) and shall be installed according to the manufacturer's recommendations and as specified herein. Contractor shall furnish man-lift truck for use in final inspection of luminaire system. Luminaires shall be leveled in 2 planes. One plane perpendicular to the curb (parallel to davit arm), the other plane parallel to the roadway surface.

The luminaire shall be bolted to the davit arm by means of cast-in inserts and this detail shall be coordinated with the standard manufacturer to ensure proper fit. The terminal board shall have lugs of a 240-volt 3-wire power source. Terminals shall be labeled line-neutral-line. The neutral terminal shall be grounded to the metal housing of the luminaire.

All luminaires shall be provided with markers for positive identification of light source and wattage per Section 9-29.10 (Luminaires) of the Standard Specifications.

(August 2016, City of Auburn GSP)

Add the following new section:

8-20.3(13)F Luminaire Fusing

Luminaire fusing and electrical connections at lighting standard bases shall be per Section 9-29.7 (Luminaire Fusing and Electrical Connections at Light Standard Bases, Cantilever Bases and Sign Bridge Bases) except that light standards shall be provided with 2 in-line fuse holders, per this section, with the fuses mounted inside the pole and readily accessible from the access hole, electrical splices shall be in the junction box near each pole in accordance with the applicable City of Auburn Standard Details.. All luminaries shall be fused in the pole base with a “Y” type quick disconnect fuse system.

8-20.3(14) Signal Systems

8-20.3(14)B Signal Heads

(January 2017, City of Auburn GSP)

Supplement this section with the following:

Vehicular Signal Heads

All signal heads shall meet the requirements of Section 9-29.16(2) (Conventional Traffic Signal Heads). Lens sizes shall be as shown in Contract Plans, Signal Head Type Details.

Overhead mounted signals shall be adjusted in the field such that a person standing on the pavement can see the brightest image of all vehicle signal sections from a distance complying with current MUTCD standards. Signal heads shall be plumbed, and aiming shall be by reference to the RED signal section.

Masking of optically programmed signal heads shall take place just before "turn-on" and after all field adjustments have been made. After masking, no further head position adjustments shall be made without the approval of the Engineer. Any final adjustments required shall be made in the Engineer's presence.

Pedestrian Signal Heads

Pedestrian signals shall be in accordance with all provisions of Section 9-29.20 (Pedestrian Signals).

Pedestrian signal heads shall be mounted with the bottom of the signal housing 8 feet above the sidewalk or ground surface.

8-20.3(14)C Induction Loop Vehicle Detectors

(April 2018, City of Auburn GSP)

Supplement this section with the following:

Loops shall be wound clockwise and consist of 4 turns of loop conductor.

From the loops to the junction box, the loop wires shall be twisted two turns per foot and labeled at the junction box in accordance with the loop schematics included in the Plans. A 3/8-inch saw cut will be required for the twisted pair.

Loop wires shall be connected to the lead-in cable using compression sleeves and sealed with 2-inch wide rubber mastic tape. An extra 10 feet of both loop wires and lead-in cable shall be coiled neatly in the junction boxes for future work. Loops shall be round and saw cuts shall be 6-foot diameter and shall be constructed using equipment designed for cutting round loops. The equipment shall use a concave, diamond-segmented blade. The saw cuts shall be vertical and shall be a minimum of 0.25 inches wide. The saw cut depth shall be minimum of 2 ½ inches and maximum of 3 inches measured at any point along the perimeter. The bottom of the saw cut shall be smooth. No edges created by differences in saw cut depths will be allowed.

Unless shown otherwise shown on the Plans, the stop bar loops shall be spliced in series per lane, mid and advance loop wires shall be spliced in parallel per lane and system loops shall be spliced into individual home runs per lane.

8-20.3(14)E Signal Standards

(January 2017, City of Auburn GSP)

Supplement this section with the following:

The poles shall be installed on leveling nuts secured to the anchor bolts and locking nuts on top of the base flange. The side of the shaft opposite the load shall be plumbed using the leveling nuts.

The void between the foundation and the pole flange shall be completely filled around the conduit(s) with dry pack mortar and neatly troweled. The distance between the foundation and the bottom of pole flange shall be less than 2 inches except for poles located within sloping portion of curb ramps where the distance may be up to 3 inches.

The dry pack mortar consists of 1:2 cement to fine sand mixture with enough water to allow the mixture to stick together when molded into a ball by hand but will not exude water when pressed.

The lower handhole cover shall be fastened with a tamperproof bolt.

(August 2016, City of Auburn GSP)

Add the following new section:

8-20.3(14)F Emergency Vehicle Pre-Emption

Detector

The Contractor shall provide and install 3M Company 700 Series preemption detectors at locations as shown in the Plans. The emergency preemption detectors shall be solid-state devices in weather resistant housing. The detectors shall be capable of detecting an optical signal generated by an Opticom brand emitter (3M Company). The detectors shall detect the optical signals from the emitter, amplify the signal, and transmit it to the phase selector. The detectors shall have a range control capable of being adjusted up to a maximum of 1/3 mile. Detectors shall be installed in compliance with manufacturer installation instructions and recommendations.

Phase Selector

The Contractor shall provide phase discriminator units as required to obtain the necessary number of channels for each leg of the intersection. The phase discriminator shall be a solid state, rack mounted device which shall provide power to the detectors. The phase selector shall receive the amplified signal from the detector, verify it as valid, and send an input to the controller. This input shall be for the duration of the detected signal plus 8 to 10 seconds additional time after the signal is lost. Four channels shall be provided.

The phase selector shall also include the following features:

1. High and low priority discrimination,
2. Settable signal intensity threshold for up to at least 2,500 feet,
3. Computer based user interface,
4. Front panel switches and indicators for testing, and
5. 20,000 priority/ vehicle class/ vehicle code ID combinations.

(August 2016, City of Auburn GSP)

Add the following new section:

8-20.3(14)G Interconnect Network

Traffic signal interconnect cable shall be installed as shown in the Plans and in accordance with all provisions of Section 9-29.3 (Fiber Optic Cable, Electrical Conductors, and Cable). All cable shall be installed in compliance with the manufacturer's installations and recommendations.

(December 2021, City of Auburn GSP)

Add the following new section:

8-20.3(14)H Pedestrian Push Buttons and Signs

Push buttons shall be in accordance with Section 9-29.19 (Pedestrian Push Buttons) and installed per the manufacturer's directions and recommendations.

Pedestrian push button assemblies shall be securely fastened to the signal standard or pedestrian pole using stainless steel fasteners. Signal standards shall be drilled and tapped for mounting push buttons. Push buttons shall be installed between 42-inches and 46-inches measured from the centerline of push buttons to the adjacent level landing. The push button must be reachable within 10 inches from the level landing. Braille is required on push button placards and the contractor is responsible to make sure they are placed in the correct locations.

(November 2020, City of Auburn GSP)

Add the following new section:

8-20.3(14)I Video Detection System

When video detection is shown in the Plans, the Contractor shall provide and install a fully functional Trafficon by Kar-Gor or Econolite Vision video detection camera system, as called out in the plans including all auxiliary equipment, cameras, housings, and mounts, and all required mounting hardware, cables, connectors, and wiring per Section 9-29.23 (Video Detection Cameras).

The Contractor shall allow two weeks to schedule a Kar-Gor or Econolite representative to assist with the system installation and turn on.

Final adjustment of the cameras shall be done by the Contractor in the presence and at the direction of the City of Auburn Traffic Signal Technician.

(April 2018, City of Auburn GSP)

Add the following new section including subsections:

8-20.3(14)J Closed Circuit Television (CCTV) Camera System

8-20.3(14)J.1 Description

(April 2018, City of Auburn GSP)

This work consists of providing a television surveillance camera system to include provision and installation of camera assemblies (camera, lens, and housing), pan and tilt drives, Ethernet switch, cables, patch cords and other equipment necessary to provide a complete and operable fiber optic-based closed circuit television (CCTV) system. The CCTV camera or camera's shall be delivered to the City of Auburn Maintenance and Operations building for setup and testing.

8-20.3(14)J.2 Materials

(April 2018, City of Auburn GSP)

CCTV system materials shall be per Section 9-29.27 (CCTV System). The CCTV camera shall be a Cohu RISE 4260. Unless otherwise indicated in the Plans or specified in the Special Provisions, all materials shall be new.

8-20.3(14)J.2(1) Mounting

(August 2016, City of Auburn GSP)

Mounting of camera on luminaire/signal poles shall utilize Cohu pole mounts and equipment and hardware shown in the Plans.

8-20.3(14)J.3 Construction Requirements

(April 2018, City of Auburn GSP)

For each new CCTV camera shown in the Plans, the Contractor shall furnish, install, and setup a CCTV camera system that includes the camera, mounting materials, cables, cable splices, Ethernet switch, and any additional equipment and hardware required for a complete and operational CCTV camera system, per Section 9-29.27 (CCTV SYSTEM).

8-20.3(14)J.3(1) General Cable Installation

(April 2018, City of Auburn GSP)

The Contractor shall submit to the Engineer the method that is intended to be used to install the various cables. Any cable runs which have damaged jackets or do not pass the appropriate test will be rejected and shall be replaced by the Contractor at no additional cost to the City of Auburn.

Shielded cables terminated at a cabinet shall have their shields grounded at the cabinet at one end and insulated at the other. Insulated spade type terminals shall be used when connecting wire to terminal blocks.

Cables at the camera end shall be soldered to the connectors provided with the equipment using established techniques.

The rear connection area shall be filled with silicone rubber compound. The cables to the camera shall be encased in a flexible sheath to form one cable between the camera and the local control cabinet.

All cables shall be supported so that there is no weight being transferred from the camera cable to the entry points through poles or extrusions. All holes through poles shall be sealed with outdoor rated watertight grips.

All cables shall be tagged with permanent markers of PVC identifying their use. Cables shall be tagged at both ends and at every junction box location.

8-20.3(14)J.3(2) Camera Cable

(August 2016, City of Auburn GSP)

Camera cables shall extend from the camera control receiver to the camera and pan/ tilt drive unit. These cables shall provide camera power, environmental housing heater power, pan/ tilt drive power and controls, camera lens controls, and additional wires for preset positioning of pan/ tilt and lens. The number and size of wires required in the camera cable is dependent upon the vendor selected for pan/tilt drives. The Contractor shall provide and install camera cables with the proper type and quantity of conductors to enable connection as recommended by the selected vendors and as required to provide for proper operation of the closed circuit television system.

Camera cables shall be as per the manufacturer's specifications and designed for long life operation under adverse weather conditions. Cable connectors at the camera housing and pan/tilt drive shall be waterproofed in accordance with vendor

recommendations. Camera cables shall be terminated on terminals in the camera control cabinet.

8-20.3(14)J.3(3) CCTV System Test

(April 2018, City of Auburn GSP)

The Contractor shall allow the City 2 weeks to setup and test the PTZ camera(s). If problems are found by the City during each testing phase, the Contractor shall repair, replace, or reconfigure each CCTV camera installation as necessary, at no additional cost to the Contracting Agency.

(August 2016, City of Auburn GSP)

Add the following new section including subsections:

8-20.3(14)K Wireless Broadband Communications System

8-20.3(14)K.1 Description

(August 2016, City of Auburn GSP)

The work specified in this section shall include the furnishing and installation of wireless interconnect communication system devices, cables, outdoor hardened Ethernet hub or switch, patch cords and associated components in accordance with the Plans and specifications.

The Contractor shall provide materials, equipment, labor and the expertise required for the construction of a traffic signal/ITS wireless broadband communication system to interconnect the proposed traffic signal and ITS equipment with the City of Auburn's existing ITS system infrastructure as shown in the Plans and in accordance with these Special Provisions. All equipment shall be installed in compliance with the manufacturer's installations and recommendations.

8-20.3(14)K.2 Wireless Broadband System Materials

(August 2016, City of Auburn GSP)

The Contractor shall provide all products and materials required for the installation and splicing of the specified communications cables and associated interface devices.

8-20.3(14)K.3 Testing, Mounting and Wiring

(November 2020, City of Auburn GSP)

Broadband radio/panel antenna units shall be mounted on signal mast-arms or signal poles as indicated in the Plans. All units shall be installed utilizing Pelco Products, Inc. Astro-Brac or approved equivalent mounts per the wireless equipment manufacturer's recommendations for outdoor pole-mounted applications. All mountings shall have stainless steel hardware and provide a weather-tight cable passage between the wireless unit and the pole.

All wireless AP, and Ethernet setup, configurations and testing shall be done in consultation with the City's IT department and the Engineer.

The Contractor shall drill a 1-inch-diameter hole in the pole, deburr and provide rubber grommet prior to pulling cables. Cables shall be routed through traffic signal system conduits and junction boxes as shown in the Plans and terminated in the local signal controller cabinet.

Sufficient cable, 10 feet where bending radius permits, shall be left in each cabinet to properly terminate the cables. No splicing of communication cables shall be allowed.

Ethernet cables shall be routed in the cabinet and be plugged into a RUGGEDCOM RS900 Ethernet switch

8-20.4 Measurement

(City Contracts, January 2017, City of Auburn GSP)

Supplement this section with the following:

No unit of measure shall apply to the lump sum signal and lighting items specified in this section.

Vaults and junction boxes shall be measure per each unit installed.

Removal and resetting of the traffic signal items listed in the payment section shall be per each item removed and re-installed.

8-20.5 Payment

(City Contracts, April 2017, City of Auburn GSP)

Supplement this section with the following:

Payment will be made for each of the following Bid items that are included in the Proposal:

"Signal Interconnect System Complete", Per Lump Sum

"Video Detection System Complete", Per Lump Sum

"Splice Vault", Per Each

"Pull Box", Per Each

"Locking Junction Box", Per Each

"Adjust Existing Junction Box", Per Each

"Remove Signal Head", Per Each

"Remove Traffic Video Detection Camera", Per Each

"Remove and Reset Signal Head", Per Each

"Remove and Reset Video Detection Camera", Per Each

"Replace & Recycle Signal Head Modules", Per Each

"Replace Signal Controller Cabinet", Per Each

"Backplate Tape", Per Each

"Louvered Backplate", Per Each

"Traffic Video Detection Camera", Per Each

"Wide Angle Traffic Video Detection Camera", Per Each

"Signal Pole Terminal Cabinet", Per Each

"Signal Head with Mount", Per Each

"Signal Controller and Smart Monitor", Per Each

"Remove Street Light", Per Each

"Induction Loop Vehicle Detector", Per Each

The unit contract cost for "Remove Signal Head" and "Remove Traffic Video Detection Camera" shall include all work related to salvaging and removal of existing system components.

The Lump Sum Contract price for "Traffic Signal Revision Signage" shall be full pay for supplying, installing, maintaining and removing the sign and posts according to the Contract documents, including. Supplying and installing the warning placards on each of the signal heads identified in Detail A and Detail D of the Contract Plans.

The unit Contract prices for "Remove and Reset Signal Head" and "Remove and Reset Video Detection Camera" shall be full pay for Work associated with the removing, transporting, resetting, rewiring, repairing existing mounting location, and for supplying and installing all materials and any needed mounting fixtures and wiring.

The unit Contract price for "Replace & Recycle Signal Head Modules" shall be full pay for Work associated with removal and recycling of existing modules and supplying and installing LED modules.

The unit Contract price for "Replace Signal Controller Cabinet" shall be full pay for Work associated with removing existing cabinet and components from the foundation and salvaging, supplying and installing all necessary materials including cabinet, signal controller, MMU, other specified internal components, wiring, mounting hardware, and testing.

The unit Contract price for "Backplate Tape" shall be full pay for Work associated with supplying the materials and installing according to the Contract Plans.

The unit Contract price for "Louvered Backplate" shall be full pay for Work associated with supplying the materials and installing according to the Contract documents.

The unit Contract prices for "Traffic Video Detection Camera" and "Wide Angle Traffic Video Detection Camera" shall be full pay for Work associated with supplying and installing all necessary materials including cameras, wiring, mounting fixtures, surge suppressors, BNC two wire adapter, fuse blocks and video cards for a complete system. Note: only one video card is required per two traffic video cameras per intersection installed; the Wide Angle Traffic Video Detection camera uses one Trafficam "Edge" card.

The unit Contract price for "Signal Pole Terminal Cabinet" shall be full pay for Work associated with supplying and installing all materials and wiring according to the Contract documents.

The unit Contract price for "Signal Head with Mount" shall be full pay for Work associated with supplying materials (including louvered backplate with tape), wiring,

mounting, and installing according to the Contract documents; no adjustment will be made signal head type nor for mounting type.

The unit Contract price for "Traffic Signal Controller and Smart Monitor" shall be full pay for Work associated with supplying and installing the controller and smart monitor boards, including wiring, and testing according to the Contract Plans.

The unit contract cost for "Remove Street Light" shall include all work, materials, and labor to remove the street light and components, and for all costs related to salvaging, when identified.

The unit contract cost for "Induction Loop Vehicle Detector" shall include all Work associated with installing, splicing, and testing each loop.

8-21 Permanent Signing

8-21.3 Construction Requirements

(January 2017, City of Auburn GSP)

Supplement this section with the following:

Signs shall be manufactured and installed in accordance with the current edition of the Washington State Sign Fabrication Manual of the Department of Transportation, and the Manual on Uniform Traffic Control Devices, and all provisions of Section 9-28 (Signing Materials and Fabrication). Code numbers on the Plans are in reference to the Washington State Sign Fabrication manual.

Signs located in sidewalks or paved areas only shall be installed with Sono tubes. Relocated signs shall be installed on new posts unless otherwise specified. Postholes shall allow placement of backfill around the post.

8-21.3(4) Sign Removal

(January 2017, City of Auburn GSP)

Supplement this section with the following:

Costs for removing existing signs shall be included in the lump sum contract price for "Permanent Signing".

8-21.4 Measurement

(City Contracts, January 2017, City of Auburn GSP)

Supplement this section with the following:

"Relocate Permanent Traffic Sign and Post" shall be measured per each unit of work completed and accepted.

"Remove Traffic Sign" and "Traffic Sign" will be measured by each sign removed or installed.

8-21.5 Payment

(City Contracts, February 2024, City of Auburn GSP)

Supplement this section with the following:

Payment will be made for each of the following Bid items that are included in the Proposal:

"Relocate Permanent Traffic Sign and Post", Per Each

"Remove Traffic Sign", Per Each

"Traffic Sign", Per Each

The unit Contract price for "Relocate Permanent Traffic Sign and Post" shall be full pay for Work associated with the removing, salvaging, repairing existing mounting location, and reinstalling the sign and post according to the Contract Plans and these Specifications.

The unit Contract price for "Remove Traffic Sign" shall be full pay for Work associated with the removing, salvaging, and repairing existing mounting location.

The unit Contract price for "Traffic Sign" shall be full pay for supplying and installing the sign and mounting hardware according to the Contract Plans and these Specifications.

8-22 Pavement Marking

8-22.1 Description

(January 2017, City of Auburn GSP)

Supplement this section with the following:

The Contractor shall notify the Engineer of intention to receive approval of the channelization pre-mark at least 48 hours in advance.

8-23 Temporary Pavement Markings

8-23.1 Description

(January 2017, City of Auburn GSP)

Supplement this section with the following:

Short Term Temporary Pavement Markings shall only be used when the temporary striping is anticipated to last less than 6 months. Phasing that will require temporary alignment longer than 6 months should install striping per Section 8-22 (Pavement Marking).

8-24 Rock and Gravity Block Wall and Gabion Cribbing

8-24.2 Materials

(January 2017, City of Auburn GSP)

Supplement this section with the following:

Materials shall meet the requirements of the following sections of the Standard Specifications or as noted.

Spall Backfill for Walls	9-13.1

Perforated PVC Underdrain Pipe	9-05.2(6)

Rock used for rock wall shall be sound, hard, durable, ledge rock of a uniform color and obtained from a commercial quarry. Rock is to be free of seams, cracks, loose stratification or other defects tending to destroy its resistance to weather. The rock shall have a density of at least 145 pounds per cubic foot.

All two-man rocks (200-600 pounds) shall be a minimum of 12 inches in the least dimension. All three-man rocks (600-1,000 pounds) shall be a minimum of 18 inches in the least dimension.

8-24.3 Construction Requirements

(January 2017, City of Auburn GSP)

Supplement this section with the following:

The rock wall shall be constructed one course at a time. Rock selection and placement shall be such that at least 80% of the exposed face of the wall is rock.

Each horizontal row of rocks shall be seated and bedded by placing the specified backfill behind the rock to provide a stable condition for the entire wall. Each rock shall be keyed into adjacent rocks by utilizing the natural irregular shapes of the rocks. Voids larger than 2 inches shall be filled by wedging smaller rock of the same quality into the voids until the maximum remaining void is 2 inches or less.

8-24.4 Measurement

(City Contracts, January 2017, City of Auburn GSP)

Delete this section and replace it with the following:

"Rock Wall" will be measured by the length and height of finished wall surface including that portion of the "Rock Wall" toed into existing ground.

8-24.5 Payment

(City Contracts, April 2017, City of Auburn GSP)

Delete this section and replace it with the following:

Payment will be made for each of the following Bid items that are included in the Proposal:

"Rock Wall", Per Square Foot

The unit contract price for "Rock Wall" shall include all costs for excavation, backfill, underdrain pipe installation, and rock placement. Piping and connection to storm sewer system, if required, shall also be included in the unit price for "Rock Wall," unless otherwise specified.

(August 2016, City of Auburn GSP)

Supplement Division 8 with the following new section including subsections:

8-32 Fiber Optic Communications

8-32.1 Description

(November 2020, City of Auburn GSP)

The work specified in this section shall include the furnishing and installation of fiber optic cables, splices, splice enclosures, custom labels patch panels and associated components in accordance with the Contract Documents.

The Contractor shall provide materials, equipment, labor and the expertise required for the underground installation of fiber optic cables as components of the ITS network. Fiber optic communications materials shall be per Section 9-29.3 (Fiber Optic Cable, Electrical Conductors, and Cable).

8-32.2 Construction Requirements

8-32.2(1) Contractor Qualifications

(August 2016, City of Auburn GSP)

Installation and testing of fiber optic communications is a specialized trade that requires specific skills that can only be gained by experience. The City has determined that the successful completion of the fiber optic communications work specified in the Contract Documents require that the Contractor or its subcontractor, whichever shall be completing the fiber optic communications work, meet the following minimum qualification requirements: 5-years' experience installing fiber optic systems, including cable and splices, and fiber optic systems of similar type and size to those specified in the Contract Documents, ability to provide three (3), non-City of Auburn, public agency references that can provide verification of the Contractor's or subcontractor's experience and confirm that the Contractor or subcontractor successfully completed the installation and testing of fiber optic systems of similar type and size to those specified in the Contract Documents. The Contractor or its subcontractor will not be allowed to begin work on fiber optic communications until the City has verified that the Contractor or its subcontractor satisfies these qualifications requirements.

8-32.2(2) Quality Assurance

(August 2016, City of Auburn GSP)

All work described in this section shall meet or exceed the applicable provisions of the following documents:

1. ANSI/EIA/TIA-455, Standard Test Procedures for Fiber Optic Fibers, Cables, Transducers, Connecting and Terminating Devices, and Other Fiber Optic Components.
2. ANSI/TIA/EIA-526-7, Measurement of Optical Power loss of Installed Single-Mode Fiber Cable Plant.
3. ANSI/TIA/EIA-568-B, Commercial Building Telecommunications Cabling Standard
4. ANSI/TIA/EIA-569-A, Commercial Building Standard for Telecommunication Pathways and Spaces.
5. ANSI/TIA/EIA-598, Optical Fiber Cable Color Coding.
6. ANSI/TIA/EIA-607, Commercial Building Grounding and Bonding Requirements for Telecommunications.

7. ANSI/TIA/EIA-758, Customer-Owned Outside Plant Telecommunications Cabling Standard.
8. BICSI: BICSI Telecommunications Cabling Installation Manual (TCIM).
9. BICSI: BICSI Telecommunications Distribution Methods Manual.
10. BISCI: BICSI Customer-Owned Outside Plant Design Manual.

8-32.2(3) Fiber Optic Cable Installation

(August 2016, City of Auburn GSP)

Fiber optic cables shall be installed in continuous lengths without intermediate splices throughout the entire project, except at the location(s) specified in the Plans. The cable installation personnel shall be familiar with the cable manufacturer's recommended procedures including but not limited to the following:

1. Proper attachment to the cable strength elements for pulling during installation.
2. Cable tensile limitations and the tension monitoring procedure.
3. Cable bending radius limitations.

The Contractor shall comply with the cable manufacturer's specifications.

To accommodate long continuous installation lengths, bi-directional pulling of the fiber optic cable is approved and shall be implemented as follows:

From the midpoint, pull the fiber optic cable into the conduit from the shipping reel. When this portion of the pull is complete, the remainder of the cable must be removed from the reel to make the inside end available for pulling in the opposite direction. This is accomplished by hand pulling the cable from the reel and laying into large figure eight loops on the ground. The purpose of the figure eight pattern is to avoid cable tangling and kinking. The loops must be laid carefully one upon the other (to prevent subsequent tangling) and must be in a protected area. The inside reel end of the cable is then available for installation. In some cases, it may be necessary to set up the winch at an intermediate cable vault. The required length of cable is pulled to that point, and brought out of the cable vault and coiled into a figure eight. The figure eight is then turned over to gain access to the free cable end which can then be reinserted into the duct system for installation into the next section.

Installation shall involve the placement of the fiber optic cables in a specified innerduct or conduit as defined in the Plans. The Contractor shall ensure that innerducts are secured to prevent movement during the cable installation.

Prior to pulling fiber optic cables through existing conduits, the Contractor shall verify that the conduits are clear of any debris and that the conduits have enough room to accommodate the new fiber and any existing conductors (where present and not specified for removal). Where noted on the Plans, the Contractor shall remove the existing copper interconnect cable prior to installing the new fiber optic cable.

The pulling eye/sheath termination hardware on the fiber optic cables shall not be pulled over any sheaves.

When power equipment is used to install the fiber optic cables, it must be designed to be used with fiber optic cable. Low speeds shall be used, not to exceed 100 feet per minute. The equipment must show the rate of pull, tension and automatically shut down if any cable pulling parameters are exceeded. The tensile and bending limitation for fiber optic cables shall not be exceeded under any circumstances. The use of large diameter wheels,

pulling sheaves, and cable guides shall be used to maintain the appropriate bending radius. Tension monitoring shall be accomplished using commercial dynamometers or load-cell instruments.

8-32.2(4) Fiber Optic Cable Splicing

(August 2016, City of Auburn GSP)

This section describes minimum requirements for splicing and connecting of the specified fiber optic cables. Field splices for mainline to lateral cables and for end-to-end mainline cables shall be located as shown in the Plans. No additional splices shall be allowed without the approval of the Engineer

All fusion splicing equipment shall be in good working order, properly calibrated, and meet all industry standards and safety regulations. Cable preparation, closure installation, and splicing shall be accomplished in accordance with accepted and approved industry standards.

Upon completion of the splicing operation, all waste material shall be deposited in suitable containers, removed from the job-site, and disposed of in an environmentally acceptable manner.

The Contractor shall use the fusion method with local injection and detection for all fiber optic splicing.

The average splice loss of each fiber shall be 0.10 dB or less. The average splice loss is defined as the summation of the attenuation as measured in both directions through the fusion splice, divided in half.

No individual splice loss measured in a single direction shall exceed 0.15 dB.

The Contractor shall seal all cables where the cable jacket is removed. The cable shall be sealed per the cable manufacturer’s recommendation with an approved blocking material.

All below ground splices shall be contained in re-enterable waterproof splice enclosures.

All splices shall be contained in splice trays utilizing strain relief, such as heat shrink wraps, as recommended by the splice tray manufacturer.

Upon sealing the splice closure, the Contractor shall show that the closure maintains 100 psi of pressure for a 24-hour period.

At all fiber optic splice locations, the Contractor shall neatly coil and secure a slack loop of fiber optic cable in a manner that is consistent with optical fiber specifications, including minimum bend radius.

8-32.2(5) Fiber Optic Cable Labeling

(December 2020, City of Auburn GSP)

Permanent cable labels shall be used to identify fibers and patch cords at each termination point. The cable labels shall consist of white colored heat shrink wraps with identification showing the cable segment, and the far end of the cable. The cable shall be labeled with non-fading permanent ink. Fiber Optic Cable shall have custom City of Auburn labels in Vaults and at aerial attachment points.

8-32.2(6) Fiber Optic Cable Racking in Cable Vaults

(August 2016, City of Auburn GSP)

After the cables are installed and spliced, cables, and innerducts shall be racked with spare conduits and innerducts sealed. Since there is substantial risk of damage to optical fibers by careless handling of the cables, much care shall be exercised, especially with regard to observing the minimum bending limitations. Cables shall be racked in vertical figure eight loops, which shall permit pulling slack from the vault without introducing twist to the cable.

Lateral cables shall be placed behind the main cables when changing levels. Cables or innerducts shall be secured in racked position with outdoor rated cable ties.

City of Auburn identification/warning tags shall be securely attached to the cables or innerducts in at least two locations in each cable vault or pull box and once in every J-box passed through. The Identification Tag shall be a custom orange label saying **"COA Fiber Optic Cable, If Damaged Call 911"** and label origin and destination of the fiber identified.

All coiled cable shall be suitably protected to prevent damage to the cable and fibers. Racking shall include securing cables or innerducts to brackets (racking hardware) that extend from the side walls of the cable vault or pull box. The Contractor shall provide all required brackets and other racking hardware required for the fiber optic cable racking operations as specified. All racking hardware shall be stainless steel.

8-32.2(7) Fiber Optic Patch Panels

(August 2016, City of Auburn GSP)

A fiber optic patch panel shall be installed in every signal controller cabinet where a new fiber optic connection is shown in the Plans per Section 9-29.13 (Traffic Signal Controllers).

The patch panel shall be attached to Contractor supplied ¼-inch aluminum plate attached to the signal side rails with spring nuts.

8-32.2(8) Fiber Optic Splice Case

(August 2016, City of Auburn GSP)

Splice enclosures shall be supplied and installed where shown the Plans that specify installation of a new fiber optic connection in a Vault or Pull box per Section 9.29.3(1)A (Singlemode FiberOptic Cable) (SCF).

The SCF splice closures shall be available in canister (butt) and in-line styles to fit most applications. All end-caps feature two express ports for uncut feeder cables. QUICK-SEAL™ Mechanical Seal drop ports shall be utilized because they allow for rapid and easy installation during initial build or future expansions.

The Splice Closure Housing shall be non-metallic. It shall be resistant to solvents, stress cracking and creep. The housing materials shall also be compatible with chemicals and other materials to which they might be exposed in normal applications. The optical fiber closure shall be capable of accepting any optical fiber cable commonly used in interoffice, outside plant and building entrance facilities. As an option, the ability to double the cable capacity of an installed canister splice closure by use of a kit shall be available. Such a conversion shall not disturb existing cables or splices.

Encapsulation shall not be required to resist water penetration. The splice closure shall be re-enterable. The closure end-cap shall be capable of accepting additional cables without removal of the sheath retention or strength-member-clamping hardware on

previously installed cables or disturbing existing splices. The optical fiber splice closure shall provide a clamping mechanism to prevent pistoning of the central member or strength members and to prevent cable sheath slip or pullout. The splice closure shall have appropriate hardware and installation procedures to facilitate the bonding and grounding of metal components in the closure and the armored cable sheath. The cable bonding hardware shall be able to accommodate a copper conductor equivalent to or larger than 6 AWG.

8-32.3 Fiber Optic Cable Testing

(August 2016, City of Auburn GSP)

The Contractor shall provide certified documentation or test results that demonstrate that all fiber optic cables meet the specified optical and mechanical performance criteria before and after installation.

Upon completion of the fiber optic cable installation (and splicing) the Contractor shall perform testing specified herein. The Contractor shall provide the Engineer with a minimum of 7 calendar days prior notice of the start of testing. The installed optical fiber cable shall comply with the transmission requirements of this specification, the cable and hardware manufacturer's specifications, and prescribed industry standards and practices.

All backbone and horizontal cabling, which is terminated by the contractor, shall be tested to applicable EIA/TIA Standards.

Upon completion of the tests all fiber optic cable coils shall be secured with ends capped to prevent intrusion of dirt and water.

8-32.3(1) Insertion Loss Testing

(August 2016, City of Auburn GSP)

Insertion loss testing shall be used to measure end-to-end attenuation on each new fiber installed between a field device and the City control facility.

The insertion loss for each mated fiber optic connector pair shall be $\leq$ 0.75 dB Reflectance for single-mode single fiber UPC cable assemblies shall be $\leq$ -55 dB Mated connector pair loss testing shall be based on one unidirectional optical time domain reflectometer (OTDR) inspection in accordance with the OTDR operating manual for systems greater than 300 feet.

In addition to connector insertion loss for each mated pair, the contractor shall perform end-to-end insertion loss testing for each multimode fiber at 850 nm and 1300 nm from one direction for each terminated fiber span in accordance with EIA/TIA-526-14A (OFSTP 14) and single-mode fibers at 1310 nm and 1550 nm from one direction for each terminated fiber span in accordance with TIA/EIA-526-7 (OFSTP 7). For spans greater than 300 feet, each tested span must test to a value less than or equal to the value determined by calculating a link loss budget. For horizontal spans less than or equal to 300 feet, each tested span must be < 2.0 dB.

The Contractor shall inspect each terminated multimode fiber span for continuity and anomalies with an OTDR at 1300 nm from one direction in accordance with the OTDR operating manual for systems greater than 300 feet. The Contractor shall inspect each terminated single-mode fiber span for continuity and anomalies with an OTDR at 1550 nm from one direction in accordance with OTDR operating manual for systems greater than 300 feet.

Prior to commencing testing, the Contractor shall submit the manufacturer and model number of the test equipment along with certification that it has been calibrated within 6 months of the proposed test dates.

The following information shall be documented for each fiber test measurement:

- Wavelength
- Fiber type
- Cable, tube and fiber IDs
- Near end and far end test locations
- End-to-End Insertion Loss Data
- Individual Splice Loss Data
- Date, time, and operator

8-32.3(2) Optical Time Domain Reflectometer (Otdr) Testing

(August 2016, City of Auburn GSP)

A recording optical time domain reflectometer (OTDR) shall be utilized to test for end-to-end continuity and attenuation of each optical fiber. The OTDR shall be equipped with a 1,310 nm and 1,550 nm light source for single-mode optical fibers. The OTDR shall have an X-Y plotter to provide a hard copy record of each test measurement.

The OTDR shall be equipped with sufficient internal masking to allow the entire cable section to be tested. This may be achieved by using an optical fiber pigtail of sufficient length to display the required cable section, or by using an OTDR with sufficient normalization to display the required cable section. A hard copy X-Y plot shall be provided for all fiber optic attenuation tests.

Prior to commencing testing, the Contractor shall submit the manufacturer and model number of the OTDR test unit along with certification that it has been calibrated within 6 months of the proposed test dates.

Each new mainline and lateral fiber shall be tested in both directions at the 1310 and 1550 nanometer wavelengths. Existing mainline and lateral fibers that are spliced to or re-spliced as part of this contract shall also be tested in both directions and at both wavelengths. Splices to existing fibers shall also be measured and recorded.

The following information shall be documented for each fiber test measurement:

X-Y plot scaled for fiber length

Wavelength

Refraction index

Fiber type

Averaging time

Pulse width

Cable and fiber IDs

Near end and far end test locations

Date, time, and operator

Event table that includes: event ID, type, location, loss, and reflection.

8-32.3(3) Fiber Cable Testing Documentation

(August 2016, City of Auburn GSP)

The Contractor shall submit the fiber test results to the Engineer for approval per Section 9-38 (Submittal Approval). 1 licensed copy if the OTDR manufacturers software shall be provided to the City of Auburn at the time the fiber test results are provided, for viewing and printing the OTDR results. The Contractor shall take corrective actions on portions of the fiber installation determined to be out of compliance with these specifications.

The184ollowingg information shall be included in each test result submittal:

1. Contract number, contract name, contractor name and address.
2. Dates of cable manufacture, installation, and testing.
3. Manufacturer's test results of the cable as shipped.
4. Location of all splices.
5. OTDR test results.
6. End-to-End Insertion Loss Data.
7. Individual Splice Loss Data.
8. Connector Insertion Loss Data
9. "As Installed" Diagram

8-32.4 Measurement

(City Contracts, August 2016, City of Auburn GSP)

"Fiber Optic Cable – ____ Strand SMFO" will be measured by the lineal foot of cable installed and accepted, including slack storage.
"Fiber Optic Patch Panel" will be measured per each unit installed and accepted.
"Fiber Optic Splice Case" will be measured per each splice case installed and accepted.

8-32.5 Payment

(City Contracts, August 2016, City of Auburn GSP)

Payment will be made in accordance with Section 1-04.1, for each of the following bid items that are included in the proposal:

"Fiber Optic Cable – _____ Strand SMFO", Per Lineal Foot

"Fiber Optic Splice Case", Per Each

"Fiber Optic Patch Panel", Per Each

The unit bid item prices per each for splice cases and patch panels shall be full pay to furnish, install, and test the specified equipment.

The bid item prices for "Fiber Optic Cable – _____ Strand SMFO" shall include, but not be limited to, all costs for the following:

- Furnishing, installing and testing the fiber optic cable.
- Furnishing and installing racking hardware in existing and proposed pull boxes and vaults for fiber optic cable where the Plans specify slack storage.
- Pulling fiber through vaults and junction boxes
- Removing existing fiber messenger cable from aerial attachments and from conduits and junction boxes for the installation of fiber optic cable as indicated in the Plans.

- Protecting and preserving existing conductors as indicated in the Plans and as required to maintain the existing signal and ITS system functions,

(January 2018, City of Auburn GSP)

Supplement Division 8 with the following new section including subsections:

8-33 Bollards

8-33.1 Description

(January 2018, City of Auburn GSP)

This work consists of building, furnishing, and installing bollards where shown on the Plans and as detailed in the Standard Detail(s).

8-33.2 Materials

Materials shall meet the requirements of the following sections:

Timber and Lumber	Section 6-04 (Timber Structures) and 9-09 (Timber and Lumber)
Structural Steel and Related Material	Section 9-06 (Structural Steel and Related Materials)

8-33.4 Measurement

(City Contracts, January 2017, City of Auburn GSP)

"Removable Bollard" and "Fixed Bollard" shall be measured per each bollard installed and accepted.

8-33.5 Payment

(City Contracts, April 2017, City of Auburn GSP)

Payment will be made for each of the following Bid items that are included in the Proposal:

"Removable Bollard", Per Each

"Fixed Bollard", Per Each

The Unit contract price per each for "Removable Bollard" and "Fixed Bollard" shall be full pay for all labor, tools, equipment and materials required to furnish and install each bollard.

(August 2016, City of Auburn GSP)

Supplement Division 8 with the following new section including subsections:

8-34 Wood Fence and Gates

8-34.1 Description

(August 2016, City of Auburn GSP)

This work shall consist of installing new "Wood Fence" and "Wood Gate" where shown and as detailed on the Plans.

8-34.2 Construction Requirements

(August 2016, City of Auburn GSP)

All work shall be in accordance with the applicable portions of Section 6-04 (Timber Structures), 8-11 (Guardrail), 8-12 (Chain Link Fence and Wire Fence), 9-06 (Structural Steel and Related Materials), 9-09 (Timber and Lumber), and 9-16 (Fence and Guardrail) of the Standard Specifications and these Special Provisions.

All lumber shall be Douglas Fir Surfaced four side (S4S), Number 1 Structural per Western Lumber Grading Rules unless otherwise noted. All lumber shall be pressure treated with ChemoniteTM or approved equivalent per AWPB-LP22. Fencing boards shall be tight knot western red cedar, Number 2 or better.

Metal fabrications, fasteners and hardware shall be in accordance with Section 9-06.22 (Bolts, Washers, and Other Hardware) of Standard Specifications.

Nail fasteners shall be galvanized standard wire nails.

Concrete shall be Cement Concrete Class 3000 in accordance with Section of 6-02 (Concrete Structures) of the Standard Specifications.

8-34.4 Measurement

(City Contracts, August 2016, City of Auburn GSP)

"Wood Fence" shall be measured per linear foot of work completed and accepted.

"Wood Gate" shall be measured per each unit of work completed and accepted.

8-34.5 Payment

(City Contracts, April 2017, City of Auburn GSP)

Payment will be made for each of the following Bid items that are included in the Proposal:

"Wood Fence", Per Linear Foot

"Wood Gate", Per Each

The unit contract price shown in the proposal for "Wood Fence" shall be full pay for labor, tools, materials, and equipment necessary to perform the work, complete.

The unit contract price shown in the proposal for "Wood Gate" shall be full pay for labor, tools, materials, and equipment necessary to perform the work, complete.

END OF DIVISION 8

DIVISION 9 Materials

9-05 Drainage Structures and Culverts

9-05.7 Concrete Storm Sewer Pipe

9-05.7(1) Plain Concrete Storm Sewer Pipe

(January 2017 City of Auburn GSP)

Supplement this section with the following:

Concrete storm drainpipe shall conform to ASTM C14 Class 3.

9-05.7(2) Reinforced Concrete Storm Sewer Pipe

(January 2017, City of Auburn GSP)

Supplement this section with the following:

Reinforced concrete storm drainpipe shall conform to ASTM C76, Class IV.

9-05.12 Polyvinyl Chloride (PVC) Pipe

9-05.12(1) Solid Wall PVC Culvert Pipe, Solid Wall PVC Storm Pipe, And Solid Wall PVC Sanitary Sewer Pipe

(August 2016, City of Auburn GSP)

Revise the first sentence of the second paragraph to the following:

Solid wall PVC pipe shall meet the requirements of ASTM D3034 for the class or SDR of pipe specified.

9-05.13 Ductile Iron Sewer Pipe

(August 2016, City of Auburn GSP)

Delete the first sentence of the last paragraph and replace it with the following:

All fittings shall be ductile. All joints including fittings shall be push-on rubber gasket joints. Mechanical joints shall not be used.

9-14 Erosion Control and Roadside Planting

9-14.2 Topsoil

9-14.2(1) Topsoil Type A

(February 2024, City of Auburn GSP)

Supplement this section with the following:

The topsoil shall be a loamy sandy loam textural class as determined by the U.S. Department of Agriculture Classification System, free from materials toxic to plant growth, noxious weed seeds, rhizomes, roots, subsoil, and debris.

9-14.2(3) Topsoil Type C

(January 2017, City of Auburn GSP)

Supplement this section with the following:

Small tree/brush stumps and roots shall be removed and topsoil shall contain no more than two percent (2%) aggregate by weight remaining on a ½ inch sieve.

9-14.5 Mulch and Amendments

(January 2017, City of Auburn GSP)

Supplement this section with the following:

Specific topsoil amendment and fertilizer specification for the plant types specified on the Plans shall be as per a certified soils laboratory recommendations from, representative topsoil samples furnished by the Contractor to the approved Soils Laboratory.

9-14.5(3) Bark or Wood Chips

(January 2017, City of Auburn GSP)

Supplement this section with the following:

The Contractor shall submit sample of the bark or wood chips for approval before delivery to the job site. Bark shall be free from weed seeds, sawdust and splinters, and shall not contain wood fiber or other compounds detrimental to plant life. Source shall be from freshwater mill.

9-14.6(1) Polyacrylamide (PAM)

(January 2017, City of Auburn GSP)

Supplement this section with the following:

PAM will only be used upon approval of the Engineer.

(January 2017, City of Auburn GSP)

Add the following new section:

9-14.7 Plant Materials

9-14.7(5) Tagging

All plant material except groundcover shall be legibly tagged. Tagging may be by species or variety with minimum of one tag per 10 trees or shrubs.

(January 2017, City of Auburn GSP)

Add the following new section:

9-14.7(6) Inspection

Samples may be submitted to the Engineer for approval as to size, grade, and overall specifications.

9-15 Irrigation System

9-15.1(2) Polyvinyl Chloride Pipe and Fittings

(January 2017, City of Auburn GSP)

Supplement this section with the following:

The triple-swing joint assembly shall be constructed as detailed with Schedule 80 PVC nipples and "Marlex" street ells as manufactured by "LASCO Fluid Distribution Products" or approved equivalent.

9-15.3 Automatic Controllers

(January 2017, City of Auburn GSP)

Supplement this section with the following:

Controller shall be Weathermatic Valcon SL Series Controller with Remote Control Technology "FLM" Series Connector installed at controller for remote control operation from the City of Auburn central control station.

The automatic controller electrical enclosure shall be a Metered Cold Rolled Steel Vandal Resistant enclosure #SB-24CR/120V with CSA controller subassembly. Enclosure shall be installed on a concrete base and shall be prime-coated and painted with baked enamel finish; dark green color as selected by the Engineer as manufactured by "V.I.T. Product, Inc." or approved equivalent.

9-15.5 Valve Boxes

(January 2017, City of Auburn GSP)

Supplement this section with the following:

Install a gravel sump at the bottom of each valve box.

The automatic control boxes shall be Model No. 1320 valve box with locking cover, and extensions as required as manufactured by "Carson Industries, Inc." or approved equivalent.

9-15.6 Gate Valves

(January 2017, City of Auburn GSP)

Supplement this section with the following:

The gate valve boxes shall be 5 and ¼ inch Roadway Valve Box #111129-03 with cast iron "Water" cover #111026 as manufactured by "Ametek" or approved equivalent.

9-15.7(2) Automatic Control Valves

(January 2017, City of Auburn GSP)

Supplement this section with the following:

Automatic control valves shall be Weathermatic 8200CR brass valves capable of communicating with the controller. Size as noted on drawing.

9-15.8 Quick Coupling Equipment

(January 2017, City of Auburn GSP)

Supplement this section with the following:

The quick coupler valves shall be Buckner QB5LRC10 quick coupling valves with RC25001 valve keys or approved equivalent. Quick coupler valves shall be installed at the point of connection at the end of the main line, and at each cluster of automatic control valves.

The quick coupling valve boxes shall be Model 910-12B 10 inch Round Valve Box with locking green top extensions as manufactured by "Carson Industries, Inc." or approved equivalent.

9-15.9 Drain Valves

(January 2017, City of Auburn GSP)

Supplement this section with the following:

Drain valves shall be 1 inch diameter.

The drain valve box shall be 5 and ¼ inch Roadway Valve Box #111129-03 with cast iron "Water" cover #111026 as manufactured by "Amtek" or approved equivalent.

9-15.11 Cross Connection Control Devices

(September 2021, City of Auburn GSP)

Supplement this section with the following:

The Double check valve assembly shall be a Febco 850 or approved equivalent sized to match the irrigation meter size and be approved by the State of Washington Dept of Health.

The Double-Check Valve Backflow Assembly Vault for ¾ inch to 2 inch assemblies shall be a Carson molded box, or approved equivalent, and for assemblies larger than 2 inch a No. 25-TA Concrete Vault with Locking Metal Cover as manufactured by PIPE, Incorporated or approved equivalent.

9-15.17 Electrical Wire and Splices

(January 2018, City of Auburn GSP)

Supplement this section with the following:

Electrical wire shall be #14 UF wire. Utilize direct bury underground splice kits. Do not splice or connect wires outside of valve boxes. Coil 3 feet length of wire at each connection.

Provide 4 extra valve wires (yellow) routed from the controller through each valve box to the farthest valve.

9-15.18 Detectable Marking Tape

(January 2017, City of Auburn GSP)

Supplement this section with the following:

Detectable marking tape shall be 3-inch wide detectable tape on main lines only.

9-29 Illumination, Signal, Electrical

9-29.1 Conduit, Innerduct, Outerduct

(April 2018, City of Auburn GSP)

Supplement this section with the following:

Traffic Signal, ITS, and Street light conduit shall be Schedule 80 PVC-ASTM D1785 and as shown on the Plans.

9-29.2 Junction Boxes, Cable Vaults, and Pull Boxes

(September 3, 2019, WSDOT GSP)

Supplement this section with the following:

Slip-Resistant Surfacing for Junction Boxes, Cable Vaults, and Pull Boxes

Where slip-resistant junction boxes, cable vaults, or pull boxes are required, each box or vault shall have slip-resistant surfacing material applied to the steel lid and frame of the box or vault. Where the exposed portion of the frame is ½ inch wide or less, slip-resistant surfacing material may be omitted from that portion of the frame.

Slip-resistant surfacing material shall be identified with a permanent marking on the underside of each box or vault lid where it is applied. The permanent marking shall be formed with a mild steel weld bead, with a line thickness of at least 1/8 inch. The marking shall include a two character identification code for the type of material used and the year of manufacture or application. The following materials are approved for application as slip-resistant material, and shall use the associated identification codes:

1. Harsco Industrial IKG, Mebac #1 - Steel: M1
2. W. S. Molnar Co., SlipNOT Grade 3 – Coarse: S3
3. Thermion, SafTrax TH604 Grade #1 – Coarse: T1

9-29.3 Fiber Optic Cable, Electrical Conductors, and Cable

(April 2018, City of Auburn GSP)

Supplement this section with the following:

Illumination

Wire conductors for underground feeder runs and for circuitry from the in-line fuse in the poles to the junction box shall be 600 volts (minimum rated at 75 degree C) # 8 AWG single conductor stranded-copper, U.S.E. insulated, in accordance with the Insulated Power Cable Engineer's Association Specifications. SPEC 2150.

Wire conductors inside the pole from the ballast to the in-line fuse, shall be 600 volt, pole and bracket cable, 2 conductor, stranded-copper No. 10, Type HMW grade or better. Conductor insulation shall consist of a 45-mil polyvinyl chloride with a 95-mil polyethylene jacket.

Single conductors for street lighting shall be stranded copper with insulation conforming to USE 600 volt minimum rated at 75 degree C and shall be color-coded in a consistent manner throughout the project.

A three-wire electrical service shall be used at 120/240 volts. The contractor shall have the service inspected by the Department of Labor and Industry and coordinated with the Power Company to have the service installed.

Overhead electrical service, when allowed, shall be brought to the load center through a conduit riser with a weather head on the service pole.

Traffic Signals

1. Loop Lead-In Cable shall be #14 AWG and Pedestrian Push Button cable shall be, #14 AWG, two conductor stranded copper, twisted approximately two turns per foot. The conductors shall be covered with a foil shield and protected with an outer jacket. The cable shall conform to IMSA Spec. No. 50-2.

2. Detector Loop Wire (sawcut) shall be No. 14 AWG class B stranded copper wire with cross-linked polyethylene type USE insulation and conform to IMSA Spec. 51-3.

3. The detector lead-in cable for Emergency Vehicle Preemption (EVP) shall be 3M OPTICOM Model 138 shielded detector cable or approved equivalent. No splicing will be allowed between the detector and the controller cabinet.

4. Signal Interconnect Cable shall be copper or fiber as shown in the Plans. For Copper the traffic signal interconnect system shall conform to REA Spec. PE-38 (self-supporting combination signal cable and messenger cable) or PE-39 for underground. The signal cable shall consist of 12 pair No. 19 AWG conductors. For fiber optic cable, the cable shall be single mode all dielectric gel free loose tube single mode fiber optic with a minimum of 48 count.

5. Traffic Video Detection Camera Cable shall be a parallel construction of one PVC-jacketed RG 59/U (Coaxial) and one PVC-jacketed five conductor (Power) 18 AWG cable under an oval black flame retardant polyvinyl chloride jacket meeting the requirements of the video detection system manufacturer's recommendations.

Video camera cable shall meet the following requirements, or approved equivalent meeting the requirements of the video detection system manufacturer's recommendations:

RG 59/U (Coaxial)

Conductor:	20 AWG solid bare copper 0.032″.
Dielectric:	0.054″ wall of gas injected foamed polyethelene to 0.140″ nom.
Braid:	36 AWG bare copper with 95% coverage. Pull in aluminum/polyester tape under braid.
Jacket:	0.035″ wall black 75 degrees C polyvinyl chloride to 0.232″ nom.

18 AWG Cable (Power)

Conductor:	5-18 AWG bare copper 0.048″.
Insulation:	0.012″ wall polyvinyl chloride per the color code to 0.072″ nom.
Cabling:	Five 18 AWG conductors cabled together in a 3¼″ left hand lay to a nom. diameter of 0.194″.
Jacket:	0.025″ wall black 75 degrees C polyvinyl chloride to 0.244″ nom.
Color Code:	White, Red, Black, Brown, Blue.
Rating:	Multi-conductor leg is rated at 600V.

9-29.3(1)A Singlemode Fiber Optic Cable

(January 2017, City of Auburn GSP)

Supplement this section with the following:

All fiber optic cable shall be ALTOS All-Dielectric Gel Free Cables by Corning, or approved equivalent, per the following schedule:

Fiber Count	Nominal Cable Weight (lb/1000ft)	Minimum Installed Bend Radius (in)
12	49	4.1
48	49	4.1
288	131	7.2

All optical fibers shall be identifiable by standard color codes as defined in ANSI/TIA/EIA-598.

Fiber optic cable shall be tested according to Section 8-31.3 (Fiber Optic Cable Testing).

Splice cases shall be Corning, Tyco or approved equivalent.

(September 2021, City of Auburn GSP)

Add the following new section:

9-29.6(1)A Lighting & Signal Standards & Davit Arms

Lighting Standards

Lighting standards shall be aluminum, davit-style units in accordance with Section 9-29.6 (Light and Signal Standard) of the Standard Specifications and these special provisions.

Mounting heights for light fixtures shall be as noted on the Plans.

Lighting standards shall have 2 through-bolts where the davit arm intersects the pole in accordance with the applicable City of Auburn Standard Details. All poles to be furnished shall maintain a minimum safety factor of 4.28 on yield strength of weight load and 2.33 for basic wind pressure. All materials shall be natural polished aluminum color.

A grounding nut or provision in the handhole frame for accommodating a threaded bolt for the purpose of attaching a grounding connector shall be provided on the inside of the shaft. After fabrication, the handhole shall have the mechanical strength of not less than the temper of the material utilized for the manufacturer of the pole.

All bolts (not including Anchor Bolts), nuts, screws, and washers, shall be stainless steel, unless designated otherwise.

VMS Support Structure

VMS Support structure shall meet the above stated criteria for traffic signal standards and the dimensions and details included in the plans.

The following loads shall be used for design of the VMS sign pole and mast arm structure: dead loads shall consist of the weight of the sign times a safety factor of two; wind loads shall be taken as 30 PSF for the sign and 24 PSF for the supporting structure and, (including the effect of gust and shape factors), on the greatest area of signs and structure in any elevation view; live load may be omitted.

Signal Standard

A signal standard shall consist of the following components: a round tapered steel vertical pole shaft, a round tapered horizontal mast arm, a davit style luminaire arm attachment, anchor bolts with nuts, washers and all associated hardware.

The pole shaft and signal mast arm shall not vary in roundness more than 1/16 inch in straight sections.

Longitudinal seam welds shall have full penetration for not less than 60% of their full length. Butt welds in the shafts shall have back-up rings and full penetration for 100% of the circumference. All welds shall be deburred.

Materials, construction and assembly techniques shall be as specified on the Standard Plans and as shown in the Plans. All materials shall be hot-dipped galvanized after fabrication in accordance with ASTM A-123.

Design shall be in accordance with the requirements of the 2011 AASHTO Standard Specifications for Structural Supports for Highway Signs, Luminaires and Traffic Signals and the values on the Detail Sheet as shown in the Plans. Sizes on the Detail Sheet as shown in the Plans shall govern in differences between the Standard Plan and the Detail Sheet as shown in the Plans.

The following loads shall be used: dead loads shall consist of the weight of the signals and signs times a safety factor of two; wind loads shall be taken as 30 PSF for the signals and signs and 24 PSF for the supporting structure, (including the effect of gust and shape factors), on the greatest area of signals, signs and structure in any elevation view; live load may be omitted.

Complete calculations for structural design shall be submitted with the shop drawings for approval before fabrication or ordering material. These calculations shall include the stresses in the pole and cantilever arms, the attachment of the signals and signs to the structure, the connection between the cantilever arms and vertical pole, pole section at handhole, base plate, anchor bolts and foundations.

Pole Shaft

The round tapered pole shaft shall be made of one-ply, hot-rolled basic open-hearth steel. Structural steel having a minimum yield point of 33,000 psi or more shall be used for all structural parts and shall be galvanized after fabrication in accordance with ASTM A-123.

A flange plate shall be attached to the vertical pole shaft for the purpose of mounting the mast arm. The flange plate shall be supported by side plates tangent to the shaft and

gusset plates on top and bottom. A 3-inch wire way hole shall be provided (matching the wire way hole in the mast arm flange plate). Four holes for mounting the mast arm shall be drilled and tapped for high tensile bolts.

A 7" x 21" Internal Terminal Cabinet shall be constructed integral to the pole with a stainless steel hinged door and a best slam lock. It shall be no lower than 4 ft 6" from the ground.A 4-inch x 6½ inch reinforced hand hole frame and rain-tight cover with tamper resistant screws shall be provided. The frame shall be welded into the shaft 18 inch above the base plate on the opposite side of the mast arm attachment. A grounding nut or provision for accommodating a threaded bolt or stud shall be provided in the frame.

A second hand hole shall be provided and welded into the shaft directly opposite the mast arm mounting plate. A J-hook wire support shall be provided inside the pole shaft between the frame and mast arm mounting plate.

Vehicle Signal Mast Arm

The vehicle signal mast arm shall be sized as shown on the Plans.

End caps shall be supplied and be weather tight and all unused tenons or holes shall be plugged and sealed.

A mast arm flange plate matching the pole shaft flange plate shall be welded to the mast arm base segment. The flange plate shall have a hole cut in the center equal to the outside diameter of the mast arm base.

The flange plate shall be welded to the mast arm by two continuous arc welds, one on the outside and the other on the inside. The outside weld shall be on top face of the flange plate. The inside weld shall be in the gap between the bottom face of the mast arm and the inside face of the flange hole.

Four holes for high tensile bolts shall be drilled in the flange plate matching the four tapped holes in the pole shaft mast arm mounting flange plate.

For the purpose of mounting the traffic signal displays, 2 inch couplings shall be welded to the mast arm extension segment at the locations specified on the Detail Sheet as shown in the Plans. A ½ inch diameter hole shall be drilled in each coupling to allow for the thru-bolt.

Signal Pole Anchor Base

Four holes sized to receive the anchor bolts shall be drilled in the base. Slotted holes ¼ inch larger than the anchor bolt shall be permitted. Minimum bolt circle pattern shall be as specified in the Plans.

Four high-strength anchor bolts A307 shall be furnished with each pole. Each anchor bolt shall have an "L" bend at the bottom end or multiple anchor plates per the manufacturers recommendation, and shall have 7-inch minimum thread on top. Anchor bolt dimensions shall be per Detail Sheet as shown in the Plans or per Manufacturer's recommendations whichever is larger. All anchor bolts shall be furnished with 2 heavy hex nuts, two standard washers, bolt covers and provisions for mounting with stainless steel screws. Threaded ends of bolts, nuts and washers shall be hot dipped galvanized in accordance with ASTM A-123. The anchor bolts shall be capable of resisting at yield strength stress the bending moment of this shaft at its yield strength stress.

Luminaire Attachment

Unless otherwise indicated in the Plans all traffic signal poles shall be equipped with davit style luminaire arms as shown in the Plans. The davit style arm shall be secured to the top of the pole shaft using a cone reducer providing a flush, smooth transition. From the cone reducer the luminaire shaft shall be continuously tapered at the same rate as the pole shaft while incorporating a 5-foot, 9-inch radius bend at the end. A pipe tenon of the diameter and length specified for the luminaire shall be provided in the end of the davit arm. The tenon shall be two degrees above level. Luminaires shall be adjusted to be parallel to the roadway and shall follow the slope of the roadway on inclines/hills.

(August 2016, City of Auburn GSP)

Add the following new section:

9-29.6(1)B Wrapping

The aluminum pole shaft and bracket arm assembly shall be entirely wrapped with a heavy, water-resistant paper for protection during shipment. Any marks or stain resulting from wrapping materials shall be cause for rejection. Scratching, marking, denting, or other damage to poles and fittings at the point of delivery shall also be cause for rejection.

(April 2018, City of Auburn GSP)

Add the following new section:

9-29.6(2)A Anchor Bases

A one-piece anchor base of adequate strength, shape, and size shall be secured to the lower end of the shaft so that the base shall be capable of resisting the bending movement of the shaft at its yield-strength stress. The base shall be provided with 4 slotted or round holes to receive the anchor bolts. Bolt covers shall be provided with each pole. Base plates for Type II signal poles shall not exceed 18 ½ inches square.

9-29.6(4) Welding

(January 2017, City of Auburn GSP)

Supplement this section with the following:

All welds shall be deburred.

9-29.6(5) Foundation Hardware

(November 2020, City of Auburn GSP)

Supplement this section with the following:

Four high-strength steel anchor bolts shall be furnished with the poles. Threaded ends and all nuts and washers shall be hot-dipped galvanized. The anchor bolts shall be capable of resisting at yield-strength stress the bending movement of the shaft at its yield-strength stress.

9-29.7 Luminaire Fusing & Electrical Connections at Light Standard Bases, Cantilever Bases and Sign Bridge Bases

(April 2018, City of Auburn GSP)

Delete this section and replace it with the following:

Fuses shall be Bussmann Slow Blow or approved equivalent.

Fuse connector kits shall be SEC Model 1791-SF (2 each) or approved equivalent.

Connector kits to connect luminaires to the system in the junction box shall be SEC Model 1791-DP, or approved equivalent.

9-29.9 Ballast, Transformers

(January 2017, City of Auburn GSP)

Supplement this section with the following:

The luminaire shall contain an integral high-power factor-regulator ballast suitable for 240-volt operation with a 10% voltage variation. The ballast shall be prewired to the lamp socket and terminal board, requiring only connection of the power supply leads to the terminal board.

9-29.10 Luminaires

(November 2020, City of Auburn GSP)

Delete this section and replace it with the following:

The LED Street Light Shall meet the following specifications;

Housing

Luminaire housing shall be die cast aluminum with integral cooling fins universal four-bolt slip fitter for mounting to $1^1/_4$ " to 2" ($1^5/_8$" to $2^3/_8$" O.D.) diameter mast arm. Housing must be similar shape to traditional cobra head. Housing meets ANSI C136.31-2001 and CalTrans 611 vibration standards. Conductors from power supply to terminal block and LED board must be spliced with quick style electrical disconnects Photocontrol receptacle is standard for ANSI C136.41-2013, 7-pin, photocell by others. Fixture must be capable of using a 7-pin photocell with field adjustable drive current. Photocontrol shall be rotatable without tools. Housing shall have a leveling bubble for adjusting the head.

Light Emitting Diodes

Hi-flux/Hi-power white LEDs shall produce a minimum of 90% of initial intensity at 100,000 hours of life at 700mA, TM-21 Calculator required. LEDs shall be tested in accordance with IESNA LM-80 testing procedures. They shall have a mean correlated color temperature of 4000K (standard) ± 300K and a minimum CRI >70.

Optical Systems

Micro-lens optical systems shall produce IESNA Type 2, and 3 distributions. Fixture shall not use acrylic or plastic secondary exterior lens over the LEDs. Emitters shall be of single LED per die design. Luminaire shall be classified as "full-cutoff" and produce 0% total lumens above 90º with a BUG rating of U-0.

Electrical

The Driver shall be dimmable. The power supply shall have a minimum power factor of .90 and <20% Total Harmonic Distortion (THD). Power supply drive current shall be field adjustable without tools.

Finish

Housing shall receive a fade and abrasion resistant, epoxy polyester powder coat light gray finish standard.

Accessories

Optional flush mounted house side and cul-de-sac shield shall be available. The house side shield cuts off light at ½ mounting height behind the luminaire and the cul-de-sac shield cuts light off ½ mounting height behind and 1 ½ mounting height on either side of the pole. Both shields must be factory or field installable without the use of tools.

Listings/Ratings/Warranties

Luminaires shall be UL listed for use in wet locations in the United States and Canada. Optical systems shall maintain an IP66 rating. Ten-year limited warranty is required for all components. All units are listed by Design Lights Consortium (DLC).

Photometry

All luminaires shall be photometrically tested by certified independent testing laboratories in accordance with IESNA LM-79 testing procedures.

Warranty

All luminaires shall have a Ten-year manufacturer's product warranty to be free of defects in workmanship and/or material. This warranty includes all electrical and mechanical components including finish and gaskets. Failure of over 10% of the LEDs in the luminaire during the warranty period will constitute a luminaire "failure". Manufacturer will repair or replace any units found to be defective or that fail within this period.

9-29.11(2) Photoelectric Controls

(December 2020, City of Auburn GSP)

Supplement this section with the following:

The photoelectric control shall be Vantage Point Lighting Control Module manufactured by Sensus USA Inc.

9-29.12(1) Illumination Circuit Splices

(January 2017, City of Auburn GSP)

Supplement this section with the following:

Approved copper splice "C" crimp connectors shall be used to connect bonding wires.

9-29.12(2) Traffic Signal Splice Material

(January 2017, City of Auburn GSP)

Supplement this section with the following:

Loop lead-in wires shall be spliced at the junction box; with a waterproof splice leaving 10 feet each of loop wire and loop lead-in cable for future work. The connection shall be

made using compression sleeves sealed with black 50-mm wide, ethylene propylene rubber mastic tape.

(August 2016, City of Auburn GSP)

Add the following new section:

9-29.12(6) Sealants

Loop detector sealant specifically manufactured for loop wire shall be used to imbed the loop wire into the pavement and fill the sawcut to within 1/16 inch of the top of the pavement. Sealant shall completely cover the foam backer rod.

Loop Sealant shall be:

1. Crafco Loop Detector Sealant 271;
2. Max Cutter Seal No. 3;
3. 3M Black 5000; or
4. Engineer approved equivalent.

Installation shall conform to the manufacturer recommendations.

9-29.13(2) Traffic Signal Controller Assembly Testing

(January 2017, City of Auburn GSP)

Delete this section and replace it with the following:

The entire controller cabinet, complete with all auxiliary equipment, shall be delivered to the City of Auburn Maintenance & Operation facility, located at 1305 C Street SW, for testing in the Traffic Signal Shop. The period of testing shall be for a minimum of 2 weeks in duration and is intended to demonstrate the operation of all equipment. Any deficiencies or equipment failures discovered shall be corrected by the Contractor, at his expense.

In the event that it is not possible for the City and the Contractor to agree on the cause of a malfunction, the City's decision shall be binding.

The successful completion of the performance test will constitute acceptance of the equipment by the City.

9-29.13(3) Traffic Signal Controller

(January 2017, City of Auburn GSP)

Delete this section and replace it with the following:

General

The traffic signal controller shall be the Cobalt model by Econolite.

9-29.13(6) Emergency Preemption

(January 2017, City of Auburn GSP)

Supplement this section with the following:

Emergency Preemption System equipment shall be compatible with the operational requirements of the existing Opticom brand (3M Company) emitters, detectors, and phase selectors owned by the City.

9-29.13(10) NEMA and Type 2070 Controllers and Cabinets

(December 2021, City of Auburn GSP)

Section 9-29.13(10) including title is replaced with the following:

9-29.13(10) Traffic Signal Controller Cabinet Unit

Controller cabinet furnished and installed by the Contractor shall be one of the following types, as specified in the Plans:

Western Systems Modified P-Plus Cabinet Requirements
Western Systems controller cabinets shall be NEMA TS-2 Type 1 P style cabinet per the City of Auburn approved Western Systems Part # 3012500000 with Alpha BBS. The cabinet shall be fully loaded with BIU's, MMU Smart Monitor, 16 detector cards, load switches, and a GTT 3M 764 Opticom.

Econolite P 44 Cabinet Requirements
Econolite controller cabinets shall be NEMA Type 2 TS-1 P style cabinet per City of Auburn approved Econolite part #166799B. The cabinet shall be fully loaded with BIU's, MMU SmartMonitor, 16 detector cards, load switches, and a GTT 3M 764 opticom.

The cabinet shall meet the following additional requirements:

- Wired and tested to the 2003 NEMA Traffic Controller Assemblies specification with NTCIP Requirements Version 02.06 (as amended herein).

- Equipped with all auxiliary equipment and plug-ins required to operate 8 vehicle phases, 4 pedestrian phases and 4 overlap phases (NEMA TS-2, Type 1).

- Designed for 16 channel operation where each load switch socket can be configured for a vehicle phase, pedestrian phase or overlap operation. These load switch sockets shall be configured in this manor without rewiring the back side of the load-bay. BIU load switch drivers 1-16 shall be wired to appropriate load switch sockets via a terminal block located on the front side of the load bay so as to allow checking voltage inputs to the load switch sockets without dropping the load bay.

- Wired for up to a minimum of (32) channels of detection, (4) channels of Opticom™ preemption.

- The complete cabinet assembly with electronics shall undergo complete input/output function testing by the manufacturer before being released to the City of Auburn.

- Field Terminal Labels
  Field terminals shall be labeled with City of Auburn numbering as well as manufacturers.

- Device Labeling

Every module or device shall have affixed thereto; permanent nametags or nameplates stating the component's function within the composite signal control system. Specifically each loop detector unit shall be labeled, so as to indicate the loop numbers connected to each channel. The front of the shelf where each item is to be placed shall have a similar label so those items can be replaced during maintenance in an expedient fashion.

- Schematics, Software and Manuals
  The controller cabinet shall have a waterproof envelope with a side access attached to the inside of the cabinet door. At the time of delivery, the envelope shall have one complete set of schematics and manuals for each assembly and subassembly located in the cabinet, and a complete wiring diagram for the cabinet and the controller assembly. In addition, a duplicate copy of the above shall be provided to the City of Auburn Traffic Engineering Section.

- Fiber Optic Patch Panels
  Where fiber optic connections are shown in the Plans, the fiber patch panel shall be a pre-terminated Corning 12 port Single-Panel Housing (SPH-01P) with a 12 ct pigtail and corning buffer tube fanout kit and Unicam SC connectors..

9-29.16 Vehicular Signal Heads, Displays, and Housing

(August 2016 City of Auburn GSP)

Replace the first sentence of the second paragraph with the following:

Backplates shall be constructed of 5-inch-wide, .050-inch-thick corrosion-resistant flat black finish, louvered aluminum, attached with stainless steel hardware.

9-29.16(2) Conventional Traffic Signal Heads

(January 2017 City of Auburn GSP)

Supplement this section with the following:

Vehicle signal head housings shall be rigid mount type M.

9-29.16(2)A Optical Units

(April 2018 City of Auburn GSP)

Supplement this section with the following:

The LED's shall have a 15 year manufacturer's warranty. The LED shall be Dialight Light Emitting Diode (LED) with clear lenses. Part numbers for Dialight LEDs are as follows:

Size	Description	Part Number
12 inch	RED Ball	433-1270-003XL15
12 inch	AMBER Ball	433-3270-901XL15
12 inch	GREEN Ball	433-2270-001XL15
12 inch	RED Arrow	432-1374-001XOD15
12 inch	AMBER Arrow	431-3374-901XOD15
12 inch	GREEN Arrow	432-2374-001XOD15
12 inch	GREEN/AMBER Arrow	430-6370-001

12 inch	AMBER/AMBER Flashing Arrow)	430-6370-805

9-29.16(2)E Painting Signal Heads

(April 2018, City of Auburn GSP)
The first sentence of the first paragraph is revised to read:

Traffic signal heads shall be finished with two coats of dark green (SAE AMS Standard 595) oven baked powder coating comprised of resins and pigments.

9-29.18 Vehicle Detector

(January 2017 City of Auburn GSP)

Supplement this section with the following:

Vehicle detectors shall be 2 channel rack mount style and compliant with NEMA TS1 and TS2 standards. They shall be capable of auto tuning and be able to withstand temperatures ranging from minus 40 degrees to plus 80 degrees C. They shall have a minimum of 15 sensitivity levels, 4 frequencies plus sequential scanning to avoid crosstalk, and have pulse and short and long presence modes. They shall have separate detect and fault LED's on the front face.

9-29.19 Pedestrian Push Buttons

(December 2021 City of Auburn GSP)

Replace the first paragraph with the following:

The Pedestrian Push Button Assembly shall be an Guardian APS manufactured by H.D. Campbell Company, 1486 NW 70th Street, Seattle, WA 98117 and shall be black in color with a white button.

Specifics of voice programming shall be provided as part of the submittal review and subject to the Engineer's approval prior to submittal acceptance.

APS push button stations shall include a control module that the Contractor shall install in corresponding pedestrian signal head and manufacturer-supplied multi-conductor interconnect cable that the Contractor shall install per the manufacturer's recommendations between the control module and push button station.

9-29.20 Pedestrian Signals

(January 2017 City of Auburn GSP)

Supplement this section with the following:

Pedestrian signals shall be a LED, filled hand/walking person countdown display.

The maximum overall dimensions of the signal shall be 19 inch wide by 18¾ inch high by 8¾ inch deep, including the egg crate Z type visor and hinges. The signal shall be furnished complete and ready to operate. In order to facilitate installation and maintenance, the signal shall be designed so that all components are readily accessible from the front by opening the door.

Each signal shall be provided with an egg crate visor constructed of polycarbonate material. The egg crate or "Z" crate type sun shield, if used, shall be held in place by the use

of stainless steel screws. The complete egg crate or "Z" crate assembly shall be 1½ inch deep.

The case shall be one-piece corrosion resistant aluminum alloy die-casting. Integrally cast hinge lug pairs, two at the top and two at the bottom of each case, shall be provided for operation of a swing door down. The unit shall be mounted with Type E mountings unless indicated otherwise on the attached Plans. All terminal compartments shall be either ferrous metal or bronze.

Pedestrian signal heads shall be Dialight ITE compliant Light Emitting Diode (LED) or approved equivalents.

(February 2023, City of Auburn GSP)

Add the following new section:

9-29.22 Rectangular Rapid Flashing Beacon (RRFB)

The contractor shall provide and install a hardwired 120 volt power Rectangular Rapid Flashing Beacon (RRFB) with hardwire communication between the multiple beacons. The beacons shall conform to the latest MUTCD.

The RRFB shall utilize two frontside LEDs that are approximately 5" by 2" and a minimum of 7" apart. They shall be double sided where shown in the plans. There shall be end mounted indicator flashers in the direction of the pedestrian crossing only. The system shall utilize the black Campbell AGPS pushbutton with modified 5" x 7" yellow R10-25 MUTCD signs.

The pole shall be a 4 1/2" OD Galvanized steel or aluminum pipe threaded at one end to fit a square pedestal 4 bolt aluminum frangible pole base. The top of the 4 ½" pole shall be capped with a waterproof factory cap. The four bolt concrete foundation shall be a minimum of 18" round by 3 feet deep and meet the manufacturers recommendations.

Equipment enclosures shall be mounted out of reach above or behind the pedestrian signage.

The RRFB units shall be Eltec or Carmanah.

(November 2020, City of Auburn GSP)

Add the following new section:

9-29.23 Video Detection Cameras

The Video Detection System shall be Econolite Vision or Trafficon by Kar-Gor and the presence detector boards shall be Trafficon VIP3D.2, which monitors only two cameras. Both systems shall include built in ethernet communication for our ITS system.

The cameras shall be located as indicated on the Plans. Cameras shall be mounted on signal mast arms as shown in the Plans utilizing Pelco Extended Tilt & Pan pole mount, for installation on the signal arm with cable mount and 72-inch tube or approved equivalent. The cable mount shall be suitable for the mast arm diameter at each camera installation location.

The camera housings and internal cameras shall be the latest approved models.

9-29.24 Service Cabinets

(November 2020 City of Auburn GSP)

Supplement this section with the following:

Service cabinet shall be a metered aluminum Skyline Electric Series 47700-A1-R1, with Underwriters Laboratory label on the panel boards as in accordance with the applicable City of Auburn Standard Details. The service cabinet shall comply with all requirements of Puget Sound Energy and Washington State Labor and Industries. It shall be the Contractor's responsibility to obtain these requirements and ensure that the cabinet complies with the requirements. The service cabinet shall be equipped with a stainless steel handle, a three-point locking system, and a Best six-tumbler mortise cabinet lock with dead bolt.

Two copper ground rods shall be installed per WSDOT and the NEC.

The cabinet shall contain the following branch breakers as applicable:

20 AMP	2 pole	Lighting Circuit A
20 AMP	2 pole	Lighting Circuit B
30 AMP	1 pole	Traffic Signal
100 AMP	2 pole	Main

(October 2016 City of Auburn GSP)

Supplement Division 9 with the following new section:

9-29.26 Traffic Signal Battery Backup System

All battery backup power units shall utilize the newest Alpha Inverter/Charger unit, complete with associated remote control display panel.

Batteries shall be connected utilizing approved quick-connect modular battery connectors. Battery cable sizing shall be appropriate for the type and quantity of batteries supplied.

Batteries shall be 12 Volts DC, 110 amp hour minimum, absorbed glass mat type, group 27. Batteries shall meet or exceed specification MIL B-8565J (Sec 4.6.22). There shall be 4 batteries supplied by the Contractor.

All battery backup power units shall possess an AC voltage bypass/disconnect switch or relay. The bypass/disconnect method shall couple the normal AC power source directly to the signal controller cabinet, while completely isolating the inverter/charger unit from the circuit.

(February 2023, City of Auburn GSP)

Supplement Division 9 with the following new section:

9-29.27 CCTV System

CCTV cameras shall be a Axis M5525-E 2 MP Mini PTZ Dome with a Axis Ethernet 15 Watt POE injector.

The ethernet switches shall be shelf mount Ruggedcom RS900G gigabit ethernet switches with SM fiber ports and necessary 120 volt power cords and ethernet cords and jumpers.

Camera mounting equipment shall be use a custom 1-1/2" threaded pipe Painted Signal black, T94A01D Pendant mounting kit and Pelco AstroBrac 90 degree pole mount and other equipment and hardware as shown in the plans and as required for a complete and operational CCTV camera system. The signal pole mount may have to be modified as shown in the plans.
(November 2020 City of Auburn GSP)

Supplement Division 9 with the following new section:

9-29.28 Variable Message Sign System

Major elements of the variable message sign (VMS) system shall consist of the variable message sign, sign structure, foundation and ground-mounted VMS field cabinet including the VMS controller, Alpha Battery Backup, compact batteries, fiber optic patch panel, ethernet switch, power supply, and associated equipment. Conduit, junction boxes and wiring/cabling to connect the sign, controller and various components of the system shall be per the manufacturer's requirements.

VMS Display and Housing

The sign display shall be supplied by one of the following vendors:

Daktronics, Inc.
331 32nd Ave.
P.O. Box 5128
Brookings, SD 57006-5128
Tel: (888) 325-8726
Email: transportation@daktronics.com

The sign display shall be a continuous matrix of amber LED pixels, with a minimum of 18 pixels high and 75 pixels wide with a pitch of 44 mm to 48 mm. Each pixel shall be made from a grouping of amber light emitting diodes and contain no moving parts. The matrix of pixels shall be capable of displaying a messages with 2 lines of 12-inch text, 12 characters long.. The sign display and other associated VMS components shall permit a test message using all pixels (1350 min.) simultaneously running at the maximum brightness and 100 percent duty.

The sign display shall provide front service for all LED display modules, electronics, power supplies, environmental control equipment, air filters, wiring, and other internal VMS components.

The nominal external dimensions of the sign shall not exceed 13.0 feet in width, 4.0 feet in height, and 1.5 feet in depth. The VMS back and side housing walls shall be vertical. Display modules shall be parallel to the front VMS wall, so that use of the LED viewing cone is optimized. The dead load of the housing and contents shall not exceed 600 lbs.

VMS housing exterior sheet material shall be 5052 aluminum alloy and shall have a minimum thickness of 0.125 inches. Exterior sheet seams shall be chemically bonded or continuously welded and waterproof. VMS housing structural frame members (I-beams, C-channels, Zee-extrusions, and bar stock) shall be aluminum alloy number 6061-T6.

VMS housings shall be constructed to present a clean, neat appearance, and the equipment located within shall be protected from rain, snow, dirt, and corrosion. Weep holes shall be fabricated in a manner which prevents the entrance of insects.

The front of the LED display matrix shall be completely covered with polycarbonate sheeting that is weather tight, ultraviolet (UV) light protected, non-glare, and which has a minimum

thickness of 0.11 inches. To achieve maximum display contrast and legibility, the outside of the polycarbonate sign face shall be fully covered with a mask, which is formed from aluminum sheeting. The mask shall have a minimum thickness of 0.09 inches and shall contain a circular opening for each pixel. The openings shall not hinder the 15° half-angle LED viewing angle (30° inclusive viewing cone). All exposed metal on the VMS front face, which is visible to viewing motorists, shall be coated with black Kynar 500 resin or an equivalent oven-fired fluoropolymer-based coating having a minimum outdoor service life of 20 years. This shall include the aluminum face mask, the aluminum border outside the LED display matrix, and all the mounting and assembly hardware.

All VMS equipment, components, modular assemblies and other non-structural elements of the sign shall be removable, transportable, and capable of being installed by a single technician utilizing a one-person aerial lift truck.

Ribbon cable shall be protected at all points of physical contact where it touches metallic frameworks. Either the ribbon cable or the frame, or both, shall be wrapped with a protective covering where the cable touches the framework, to prevent cable insulation rub-through from road induced vibration in the sign framework.

The interior VMS environment shall be monitored and controlled by the sign controller. Environmental control shall be designed to maintain the internal VMS temperature at or below +140°F when the outdoor ambient temperature is at or below +115°F. The VMS environmental control system shall consist of four primary subsystems as follows:

Internal Temperature Sensors and Cooling/Heating Systems

The VMS shall contain two internally-mounted temperature sensors which are equipped with external thermocouples and which the sign controller continuously monitors. This temperature information shall be used by the sign controller to determine when to activate and deactivate the environmental control systems described herein. Sensors shall be located on opposite ends of the upper 1/3 of the LED display matrix, and their external thermocouples shall be attached to and make contact with an LED pixel circuit board.

The thermocouple and LED board shall be easily detached, in the event that one of the units requires removal and replacement. Sensors shall be capable of measuring temperatures from -40°F to +185°F. The sign controller shall automatically shut down the LED display whenever one or both sensors indicate that LED board temperature has exceeded +140°F. The sign controller shall automatically restart the LED display whenever the suspect temperature falls below +130°F. Both shutdown and re-start temperature thresholds shall be user-programmable. Sensor temperatures and VMS shutdown/re-start events shall be reportable to the VMS Central Software.

LED Display Cooling System

The VMS shall contain a ventilation system to monitor and control internal cabinet temperature with user-programmable temperature thresholds. This system shall be comprised of fan-forced air to control ventilation in the cabinet. . The sign controller shall initially be programmed to activate the LED cooling fan system based on the manufacturer's recommendations for the application(s) on this project. Cooling fans shall be located so as not to hinder removal of LED display modules and driver boards.

Front Face Panel Defog/Defrost System - The VMS shall contain a defog/defrost system which circulates warm, fan-forced air across the inside of the polycarbonate front face whenever LED board temperature falls below a user-programmable threshold. The air

source shall consist of a fan or fans that provide uniform airflow across the polycarbonate face panel.

The sign controller shall initially be programmed to activate the defog/defrost system whenever LED board temperature falls below +40°F and shall deactivate the defog/defrost system whenever LED board temperature exceeds +105°F. A 100-watt heating element shall be mounted in front of each defog/defrost fan and shall serve to warm the air directed across the VMS face. Heating elements shall be on only when the defog/defrost fans are on.

VMS Mounting Hardware

A VMS, sign structure and foundation are included in the construction. The sign housing shall be provided with all necessary hardware including sign mounting beams, vertical and horizontal brackets, maintenance walkways, and all related hardware to install the VMS.

The VMS housing, structural framing, face covering, and mounting members shall be designed to withstand a wind velocity of 100 mph with a 30 percent gust factor and shall otherwise comply with the latest requirements of AASHTO's Standard Specifications for Structural Supports for Highway Signs, Luminaires and Traffic Signals.

VMS Sign Structure

The VMS sign structure shall be as specified for ***VMS Support Structure*** Special Provision 9-29.6(1)A.

Ground-mounted VMS Field Cabinet

The field cabinet shall be as specified in Section 9-29.13(10) and shall contain the VMS sign controller, Alpha Battery Backup, Compact batteries, ethernet switch and fiber optic patch panel for communication with the City of Auburn fiber optic ITS network.

VMS Sign Controller

Each VMS shall include an associated sign controller, which shall be installed in the field cabinet.

To support the VMS and VMS controller functions, they shall be provided with two serial communication ports.

One communication port shall be used to connect a laptop to the controller. The interface shall be wired as a 9-pin, EIA-232 DCE port. The port shall connect to a laptop computer using a straight-through 9-pin cable. One cable shall be supplied for each VMS installed in this contract.

The second communication port is for remote control of the sign from the central computer. The interface shall be wired as a 9-pin, EIA-232 DTE serial port. This port shall be connected to a communication interface (modem) specified elsewhere in this contract. A cable shall be supplied to connect the VMS communication port to the modem port (the modem port may be a non-standard pin-out and require a custom-made cable).

The sign controller hardware and software shall support all VMS communication, control, and diagnostic features as listed herein.

Memory

Sign controllers shall have both permanent and semi-permanent memory. Permanent memory shall be EE-PROM integrated circuits and shall contain the executable sign controller software. Semi-permanent memory shall be RAM integrated circuits with a battery backup that retains the data in memory for a minimum of one year following a power failure. Semi-permanent memory shall contain the library of messages, the message display schedule and programmable

operating parameters. Each message shall have the capability to be defined and stored as a three-page message.

Power Interruptions

Contents of the sign controller's memory shall be preserved by battery backup during AC power interruptions and the controller shall automatically resume operation once AC power is restored. Upon recovering from a power interruption, the sign controller shall display the message identified by the Power Recovery Message parameter. The sign controller shall report to the central computer that it has recovered from a power interruption.

Sign Controller Software

The sign controller shall cause the desired message to be displayed on the VMS. The sign shall display alphanumeric character fonts. The sign controller shall provide a default value for each NTCIP object supported.

Message Selection

The central computer or laptop computer shall cause the sign controller to implement a message selected from those stored in controller memory, or a new message entered via the communication port.

The sign controller shall incorporate CRC checks to verify MULTI strings. The sign shall not display a message unless the Message Activation Code CRC matches the Message CRC.

A message shall remain displayed on the sign until either a command to change the current message or a command to blank the display is received. A command to display a message shall not succeed if the activation priority is less than the run time priority of the message currently displayed.

Data Transmission Requirements

Each sign controller shall contain two communication ports. Each communication port shall be labeled ("Local" or "Central") and shall be set to 9600 baud at the factory. Each port shall operate independently at baud rates of 1200, 2400, 9600, and 19,200 bits per second. The user shall select the baud rate for each port via a DIP switch.

Communication

The sign controller hardware and software shall communicate with the central computer in a polled multi-drop operation. In the polled multi-drop operation, several sign controllers shall share the same communication channel, with each controller assigned a unique ID number. Controller ID numbers shall conform to the NTCIP requirements for address numbers. A sign controller shall only reply to messages labeled with its ID. In polled multi-drop mode, sign controllers never initiate communication, but merely transmit their responses to messages from the central computer.

A laptop computer connected to the sign controller's local communication port shall have the same control and diagnostic capabilities as the central computer. However, local laptop control capability shall be limited to the VMS which is directly connected to that sign controller.

NTCIP Requirements

The sign controller software shall comply with the National Transportation Communications for ITS Protocol (NTCIP) documents and all related errata sheets published before July 1, 1999 and as referenced herein.

The sign controller software shall support the following standards:

1. NTCIP 1101, *Simple Transportation Management Framework* (STMF), Conformance Level 1 (Simple Network Management Protocol (SNMP))
2. NTCIP 2001, *Class B Profile*. All serial ports on the device shall support communications according to these standards.
3. NTCIP 2101, *SP-PMPP/RS232* Point-to-Multi-Point Protocol (PMPP)
4. NTCIP 2201, *NTCIP TP-Null* Transport Profile Null (TP-NULL)

The sign controller software shall implement all mandatory objects of all mandatory conformance groups as defined in NTCIP 1201, *Global Object Definitions*, and NTCIP 1203, *Object Definitions for Dynamic Message Signs*. Software shall implement the following conformance groups:

NTCIP 1203, Object Definitions for DMS

1. VMS Sign Configuration
2. MULTI Configuration
3. Default Message Control
4. Pixel Service Control
5. MULTI Error Control
6. Sign Status
7. Status Error
8. Pixel Error Status
9. Lamp Error Status
10. Fan Error Status
11. Power Status
12. Temperature Status

The software shall implement the following optional objects:

NTCIP 1203, Object Definitions for DMS

1. dmsMessageBeacon
2. dmsMessagePixelService
3. dmsCommunicationsLossMessage
4. dmsPowerLossMessage
5. dmsTimeCommLoss
6. dmsMultiOtherErrorDescription
7. dmsStatDoorOpen
8. fanFailures
9. fanTestActivation
10. lineVolts
11. tempMaxSignHousing

Objects required by these specifications shall support all values within its standardized range. The standardized range is defined by a size, range, or

enumerated listing indicated in the object's SYNTAX field and/or through descriptive text in the object's description field. The following list indicates the modified object requirements for these objects.

Object Name	Object ID	Minimum Requirements
Number of Fonts	numFonts	9
Maximum Characters per Font	maxFontCharacters	255
Default Background Color	defaultBackgroundColor	0
Default Foreground Color	defaultForegroundColor	9
Default Justification Line	defaultJustificationLine	2, 3, and 4
Default Justification Page	defaultJustificationPage	2, 3, and 4
Number of Permanent Msgs.	DmsNumPermanentMsg.	2
Maximum No. Changeable Msg.	DmsMaxChangeableMsg.	8
Maximum Number Volatile Msg. *	dmsMaxVolatileMsg.	8
Control Mode	dmsControlMode	2, 4, and 5

***** Changeable messages in excess of the minimum requirement are considered to meet the specification for an equivalent number of Volatile messages.

The first permanent message shall be used to blank the sign display. The second permanent message shall be the diagnostic message.

Sign controller software shall implement the following tags (opening and closing where defined) of the Mark-Up Language for Transportation Information (MULTI) as defined in NTCIP 1203:

1. Flash
2. Font
3. Justification Line
4. Justification Page
5. Moving Text
6. New Line
7. New Page
8. Page Time

Documentation

Software shall be supplied with all documentation on 1.44Mb IBM-compatible diskette(s). ASCII versions of the following Management Information Base (MIB) files in Abstract Syntax Notation 1 (ASN.1) format shall be provided on CD-ROM:

1. The official MIB Module referenced by the device functionality.

2. A manufacturer-specific version of the official MIB Module with the non-standardized range indicated in the SYNTAX field. The filename shall match the official MIB Module, with the extension "spc".

3. A MIB Module of all manufacturer-specific objects supported by the device with accurate and meaningful DESCRIPTION fields and the supported ranges indicated in the SYNTAX field.

Control Software
This work shall consist of furnishing Variable Message Sign (VMS) control software. The control software shall be a 32-bit application, designed to operate on Microsoft® Windows NT™, 98™, or 2000™ operating system. The control software shall provide for command and control of the following functions:

VMS Control
Software shall retrieve, display, update and download/upload the following functional parameters to the local sign controller in response to user-initiated instructions. The sign controller shall not perform pixel service tests when VMS are displaying messages. Software shall perform the following operations in conjunction with its monitoring and logging functions:

Display a message
Blank the current message
Change message priority
Pixel service, lamp and fan tests
Set time and date in the sign controller
Retrieve sign controller ID, type, and manufacturer

Communications
Communications between the control software and sign controller shall be NTCIP compliant, as indicated in the Special Provision for Variable Message Sign System.

The control software shall verify all communications for errors. If a response from a sign controller contains a communication error, or if there is no response, the Control Software shall re-establish communications.

Data Collection
The control software shall retrieve errors detected, message number currently being displayed, and current message priority. Using different commands, the software shall retrieve message MULTI strings, a map of defective pixels, the time and date, the event schedule, and configuration parameters.

Message Library
The control software shall store messages and transfer messages to a sign for storage and/or display. When a user desires to send a message to a sign, the control software shall offer as choices only those messages compatible with the sign in question. The control software shall allow message names of up to 25 characters in length. If the selected name already exists, the software shall notify the user and give the option of replacing the existing message or selecting another name.

The control software shall display all character fonts supported by the Variable Message Sign System. Messages shall be displayed on the computer monitor in exactly the same format (font, text centering and justification) as on the Variable Message Sign.

Software Duplication Rights
The City of Auburn shall have the right to duplicate the Variable Message Sign Control Software as needed for use in controlling signs under its jurisdiction.

Documentation
The Contractor shall furnish 1 copy of the Control Software user manuals to the Engineer. In addition, 2 sets of the software, installation program, instructions and user manual shall be furnished on CD ROM or diskettes to the Engineer.

9-30 Water Distribution Materials

9-30.1 Pipe

9-30.1(1) Ductile Iron Pipe

(February 2018, City of Auburn GSP)

The third sentence of the first paragraph in the list is revised to read:

All other ductile iron pipe shall be Special Thickness Class 52.

9-30.2 Fittings

9-30.2(1) Ductile Iron Pipe

(September 2020, City of Auburn GSP)

Supplement this section with the following:

All pipe fittings, adapters and joints for ductile iron pipe shall be ductile iron designed to AWWA Specification (unless otherwise approved in writing by the Engineer) with sufficient tangent at the ends to allow for proper joint connections and shall be coated to give them protection equal to that of the pipe. Field fabricated fittings will not be permitted. Flexible couplings shall be of the style as required for specific application.

9-30.2(6) Restrained Joints

(September 2020, City of Auburn GSP)

Delete this section and replace it with the following:

Bolted restrained joint (R.J.) fittings shall be Megalug RomaGrip, Star, or approved alternate. All welding associated with the restraint system shall be performed in the pipe manufacturer's shop. No field welding will be permitted.

Mechanical joint restrain systems shall meet the following requirements:

Restrainers shall be manufactured of ductile iron and shall meet or exceed all the requirements of ANSI A21.11 (A WW A C 111) and ASTM A536. The restrainer system shall provide anchoring ductile iron pipe and fittings, valves and PVC pipe to mechanical joint pipe or fittings, or bell to spigot PVC pipe joints. The restrainer shall accommodate the full working pressure rating of the pipe plus surge allowance. In the assembly of the restrain device, the contractor shall tighten the bolts to the correct torque range as recommended by the restraint manufacturer. The restrainers shall be painted black for ductile iron pipe and painted red for PVC pipe applications. The restraining device shall not damage or lower the working pressure of the pipe installed. Restrainers shall be properly stored to minimize sand and

debris build-up. Specifically, the twist-off-screws and associated threads shall be clean (free of sand) prior to installation.

Restrainer specifically for ductile iron pipe may be restrained by utilizing a joint restraint gasket which includes a stainless steel locking segment vulcanized into the rubber gasket. The gasket shall be rated for operating pressures up to 250 psi based on the performance requirements of ANSI/ A WW A C 111/ A21.11.

9-30.3 Valves

9-30.3(1) Gate Valves (3-inches to 16-inches)

(July 2022, City of Auburn GSP)

Delete this section and replace it with the following:

Resilient wedge gate valves shall be used on all 12 inch and smaller water lines and shall be manufactured by Clow, American Flow Control, Waterous, M & H, Kennedy or Mueller with epoxy-coated valve interiors. The valves shall conform to ANSI/AWWA Specifications C509 or C515 with a 200-psi working pressure rating (minimum). They shall be iron bodied, bronze-mounted, non-rising stem and counterclockwise opening with a 2 inch square operating nut. All valves on the fire hydrant line(s) shall be 6-inch diameter mechanical joint by flange. All other valves shall be either mechanical joint by flange or Mechanical joint shackled to tees or crosses. Valve stems shall be provided with O-ring seals.

9-30.3(3) Butterfly Valves

(December 2020, City of Auburn)
Supplement this section with the following:

Butterfly valves shall conform to AWWA Specification C-504, Class 150 B shall have Mechanical joint ends and be rated at 150 psi or higher working pressure and shall be manufactured by Mueller, Clow, M&H, or Kennedy. Operator shall have standard AWWA 2 inch square nut.

9-30.3(4) Valve Boxes

(February 2018, City of Auburn GSP)

Supplement this section with the following:

Valve boxes shall be two-piece, adjustable, cast-iron (with additional extension pieces, if necessary), as manufactured by the Olympic Foundry Company, East Jordan Iron Works, or approved equivalent, with a minimum inside diameter of 5 inch. The word “WATER” shall be cast in relief on the top of all valve box covers. In addition, the letters “NC” shall be cast in place on valve box covers for those valves that are normally closed. Valve box covers shall have a deep skirt per City of Auburn Standard Detail W-18.

9-30.3(7) Combination Air Release/Air Vacuum

(September 2021, City of Auburn GSP)

The first sentence of the second paragraph is revised to read:

The body and cover shall be ductile iron.

9-30.3(8) Tapping Sleeve and Valve Assembly

(January 2017, City of Auburn GSP)

Supplement this section with the following:

Tapping sleeves and valves shall conform to the following:

1. For wet taps on mains 12 inch diameter and larger or size-on-size, the tapping sleeve shall be the full M.J. type, cast-iron, twin seal as manufactured by Mueller, Tyler, Taylor, M & H, or epoxy-coated fabricated-steel, as manufactured by JCM, Rockwell or approved equivalent;

2. For wet taps on mains 10 inch diameter and smaller, or at least 2 inch diameter smaller than the main size, the tapping sleeve shall be the wraparound style, stainless steel or epoxy-coated fabricated-steel, or cast-iron M.J. as manufactured by Romac, Ford, M & H, Rockwell, Smith Blair, or approved equivalent.

9-30.5 Hydrants

(September 2020, City of Auburn GSP)

Supplement this section with the following:

Fire hydrants shall have two 2½-inch hose ports (National Standard Thread) and one 4½-inch pumper port (National Standard Thread) with caps and no chains, 1¼ inch pentagonal operating nut (counterclockwise) opening, O-ring-type stuffing box, automatic barrel drain, and 5¼ inch valve opening. Hydrants shall be equipped with a 5 inch Storz adapter with blind cap, or approved equivalent. Hydrants shall conform to the latest revision of AWWA Specification C502 for dry-barrel fire hydrants for ordinary water service. Hydrants shall be Mueller “Super Centurion 250” or M & H Style 129.

9-30.6 Water Service Connections (2 inches and Smaller)

9-30.6(3) Service Pipes

9-30.6(3)B Polyethylene Tubing

(October 2023, City of Auburn GSP)

Replace this section with the following:

Polyethylene tubing shall meet the requirements of AWWA C901. Tubing shall be high molecular mass with a 200 psi rating. Tubing used for 1 and 2 inch shall be SDR 9 (copper tube size) with stainless steel liners in all couplings and wrapped a #10 insulated copper tracer wire wrapped around pipe.

9-37 VACANT

(August 2016, City of Auburn GSP)
This section, including title, is replaced with the following including subsections:

9-37 Filter Fabric

9-37.1 Filter Fabric for Infiltration Systems

(September 2021, City of Auburn GSP)

Filter fabric for permanent infiltration systems shall be a non-woven, needle punched polypropylene geotextile fabric meeting the requirements of AASHTO M-288-06 for class 3 applications.

(February 2018, City of Auburn GSP)

Supplement Division 9 with the following new section including subsections:

9-38 Submittal Approval

9-38.1 Submittals

(February 2018, City of Auburn GSP)

This section applies to all items that are required to be submitted to the Engineer for review, approval, and acceptance, including, but not limited to:

- Non-Material Submittals (i.e haul routes, Traffic Control Plans (TCP's), requests for substitution, breakdown of lump sum items, schedules, road closure requests, material product samples, color palettes or swatches, warranty documentation, Operations and Maintenance (O&M) manuals, Spill Prevention, Control, and Countermeasure (SPCC) Plan, Stormwater Pollution Prevention (SWPP) Plan, schedule of submittals, etc.);
- Material Submittals (i.e. Request for Approval of Material (RAM) or Request for use of an item on the WSDOT Qualified Product List (QPL)); and
- Material Acceptance Documentation (i.e. Certification of Material Origin (CMO), Manufacturer's Certificate of Compliance (MCC), miscellaneous certificates of compliance, mill and test reports, Catalog Cuts, Shop Drawings, Visual Acceptance, Reduced Acceptance Criteria, Sampling and Testing, etc.).

9-38.1(1) Submittal Transmittal Procedures

(February 2023, City of Auburn GSP)

Except as specified otherwise in the Contract Documents, all submittals shall be made electronically. Each electronic email shall be limited to 10 MB's in size. All electronic submittals shall be clear, sharp high contrast electronic files provided in Microsoft Word 2016, Microsoft Excel 2016, PDF, or other Engineer approved formats.

In the event the Contractor cannot meet the 10 MB's size limit for a specific submittal, the Contractor may request to submit the individual submittal to the City as a hardcopy or other submittal approach subject to Engineer approval. Such requests shall be made in writing and include an explanation of why the Contractor is requesting to make a hardcopy submittal(s). It will be at the Engineer's sole discretion whether the request to submit hard copy submittals is approved and no additional compensation or time extension shall be granted in relation to the Engineer's decision. Hardcopy submittals shall be either mailed to the City of Auburn Public Works Department at 25 West Main St, Auburn, WA 98001 or dropped off at the City

of Auburn Customer Service Center located on the 2nd floor of the One East Main St, Auburn WA 98001 building.

(City Contracts, February 2023, City of Auburn GSP)

Supplement this section with the following:

Submittals shall be transmitted via e-mail to PWSubmittals@auburnwa.gov. The e-mail subject line of electronic submittals shall include the following: <<<Project Number>>>, <<<Project Name>>> - <<<Submittal Title>>>.

(Non-City Contracts, February 2023, City of Auburn GSP)

Supplement this section with the following:

All submittals shall be made electronically and shall be transmitted via e-mail to devsubmittals@auburnwa.gov. The e-mail subject line of electronic submittals shall include the following: <<<Permit/FAC Number>>>, <<<Project Name>>> - <<<Submittal Title>>>.

9-38.1(2) Request for Submittal Approval (RSA) Form Instructions

(February 2018, City of Auburn GSP)

All submittals shall accompany a City of Auburn "Request for Submittal Approval" (RSA) form as a cover letter.

The City provided RSA form is a writable Portable Document Format (PDF) form and shall remain writable until the City returns the signed reviewed submittal. Any submittals made without this form or without all of the required information on the form filled out by the Contractor shall be rejected without review. No additional compensation or time extension shall be granted for a Contractor not supplying this form as a cover letter for their submittals or for an improperly filled out form.

The RSA form shall be completed by the Contractor as follows:

1. For any item being submitted to the City for review and approval for the first time, check the "New Submittal" box. The City will assign the item a submittal number. For items that have been previously submitted and require a re-submittal, check the "Re-submittal of No. ___" box and fill in the submittal number that was assigned by the City to the original submittal. For submittals that are providing Material Acceptance Documentation for a submittal that has been previously made, the Contractor shall check the "Material Acceptance Documentation for Submittal No.___" box and fill in the submittal number that was assigned by the City for which the Contractor is supplying the acceptance documentation for.
2. Fill in the Contract Number (I.E. ## - ##) and Contract/Project Name;
3. Fill in the Project Identifying Number (I.E. CP####);
4. Fill in the Date the Submittal was transmitted to the City;
5. Provide the Contractor's name and, if applicable, the name of Subcontractor or supplier who prepared the submittal;
6. The Contractor is strongly encouraged to submit only one material or item per RSA form, however if more than one material or item is listed on the form then provide a

General Submittal Title that is applicable to the group. If only one material or item is submitted on the form then provide the same name described in bullet point number 8 for the General Submittal Title.

- Do not group non-like materials or items on the same form.
- Do not group multiple bid item numbers for the same material. In instances where a material is applicable to multiple bid item numbers, then list that material for as many times as there are bid item numbers (For instance, if Crushed Surfacing Top Course is the material being submitted on, and this material is applicable to bid item numbers 27 and 56, then this material shall be listed twice on the RSA form).

7. When applicable, provide the Bid Item number the submittal is referencing;
8. Provide a submittal description (be specific). For material submittals, provide the Type of Material, the Manufacturer's Product/Type, or the trade name of the product;
9. When applicable, provide the Name and the Location of the Fabricator or the Manufacturer's name or the Pit Number. This should be the actual manufacturer, not the supplier or distributor,
10. Provide the Contract Specification section number(s) or the page number the submittal material is referencing, or you can list the Plan Sheet number; and
11. For material submittals, indicate whether the submittal is requesting use of the WSDOT Qualified Product List (QPL) or if the submittal is a Request for Approval of Material (RAM) that is not in the QPL, by checking the appropriate box. For non-material submittals and for material acceptance documentation these boxes shall be left blank. If the Contractor elects to use a product listed in the QPL, the submittal documentation shall be prepared in accordance with the instructions in the WSDOT QPL program and shall be the most current list available at the time the product is proposed to be used. If the Contractor elects not to use the QPL or if the material is not listed in the QPL, then supporting documentation for the RAM shall be submitted for review and approval per Section 9-38.1(3) (Request for Approval of Material (RAM) Submittal Content).

9-38.1(3) Request For Approval Of Material (RAM) Submittal Content

(February 2018, City of Auburn GSP)

This Section covers content for Requests for Approval of Material (RAM). RAM submittals shall include the following, where applicable:

1. Each submittal shall include all of the items and materials required for a complete assembly, system or Specification Section.
2. Submittals shall contain all of the physical, technical and performance data required by the specifications or necessary to demonstrate conclusively that the items comply with the requirements of the Contract Documents.
3. Include information on characteristics of electrical or utility service required and verification that such requirements have been coordinated with service provided by the work and by other interconnected elements of the work.
4. Provide verification that the physical characteristics of items submitted, including size, configurations, clearances, mounting points, utility connection points and service access points, are suitable for the space provided and are

compatible with other interrelated items that are existing or have or will be submitted.

5. Label each Product Data submittal with the information required in this Section. Highlight or mark every page of all Product Data submittals to show the specific items being submitted and all options included or choices offered.

6. Label each Shop Drawing and Sample with the information required in this Section. Highlight or mark every page of every copy of all Product Data submittals to show the specific items being submitted and all options included or choices offered.

7. Additional requirements for submittals are contained in the Technical Specification sections.

8. Designation of work as Not in Contract (NIC) or "by others" shown on the Shop Drawings, shall mean that the work will be the responsibility of the Contractor rather than the subcontractor or supplier who has prepared the Shop Drawings.

A separate letter explaining deviations shall accompany any submittal(s) that contain deviations from the requirements of the Contract Documents. The Contractor's letter shall:

1. Cite the specific Contract requirement, including the Specification Section and paragraph number, for which approval of a deviation is sought.

2. Describe the proposed alternate material, item or construction and explain its advantages and/or disadvantages to the City.

3. State the reduction in Contract Price, if any, that is offered to the City.

9-38.1(4) Shop Drawings, Product Samples, and Operation and Maintenance Manuals

(November 2022, City of Auburn GSP)

This section covers Shop Drawings, Product Samples, Color Swatches, and Operation and Maintenance (O&M) Manuals that are required to be submitted in hard copy format for review and approval.

1. Shop Drawings: Submit 1 copy electronically for review. The Contractor is responsible for distributing the City returned submittals to its superintendent, subcontractors and suppliers.

2. Product Samples and Color Swatches/Palettes: Unless stated otherwise in each individual specification section referencing a product where a sample is requested, the Contractor shall submit 1 labeled product sample or 1 set of manufacturers' full range of colors and finishes as ordered by the Engineer and at no additional cost to the Contracting Agency. Product samples or manufacturer color swatches/palettes will not be returned to the Contractor.

3. O&M Manuals: For Draft O&M Manuals, Submit 1 copy electronically for review. The Contractor is responsible for making and distributing the required number of additional copies of the City returned submittals to its

superintendent, subcontractors and suppliers. Contractor shall submit 1 copy electronically and 1 hard copy of each final and approved O&M Manual.

9-38.1(5) Engineer's Submittal Review

(November 2019, City of Auburn GSP)

Submittals will be reviewed and approved by the Engineer per the following:

- For all Non-Material Submittals, the Engineer will mark the RSA form with one of the 'Submittal Approval Codes' listed under column 'A' on the form.
- For Material Submittals requesting the use of the QPL, the Engineer will mark the RSA form with the appropriate QPL approval code found on the QPL form. The QPL approval code is represented by a four digit number.
- For Material Submittals requesting a RAM, the Engineer will mark the RSA form with one of the 'Material Acceptance Codes' listed under column 'B' on the form. If a RAM is submitted for a material that is found on the QPL, the Engineer may mark the RAM with the appropriate QPL code for that material.
- For Material Acceptance Documentation, the Engineer will mark the RSA form with one of the 'Submittal Approval Codes' listed under column 'A' on the form.

The Provisions of Section 1-06 (Control of Material) shall also apply to this section.

The City will return an electronic signed copy of each reviewed submittal to the Contractor at the email address on record with the City. The Contractor is responsible for distributing the electronic copies or making the required number of hard copies of City returned submittals to its superintendent, subcontractors and suppliers.

9-38.1(6) Submittal Approval and Acceptance Codes

(February 2018, City of Auburn GSP)

This section covers the definitions of the 'Submittal Approval' codes and 'Material Acceptance' codes found on the RSA form.

Submittal Approval Codes will indicate:

1. "NET" (NO EXCEPTIONS TAKEN) – The submittal is approved subject to its compatibility with future submissions and additional partial submissions for portions of the work not covered in this submission. Does not constitute approval or deletion of specified or required items not shown in the partial submission.
2. "MCN" (MAKE CORRECTIONS NOTED (NO RESUBMISSION REQUIRED) – The submittals is approved subject to minor corrections that shall be made by the Contractor and subject to its compatibility with future submissions and additional partial submissions for portions of the work not covered in this submission. Does not constitute approval or deletion of specified or required items not shown in the partial submission. No resubmission is required.
3. "AR" (AMEND AND RESUBMIT) – The submittal is rejected because of major inconsistencies or errors which shall be resolved or corrected by the

Contractor prior to subsequent submittal. An amended resubmission is required.

4. "RR" (REJECTED – RESUBMIT) – The submittal does not conform to the Contract Plans and Specifications in major respect. A new submission is required.

5. "NR" (NOT REVIEWED) – The submitted information is not required on project and was not reviewed by the Engineer.

The 'Material Acceptance Code' will indicate the required documentation for the material to be accepted for use on the project:

Code 1. Acceptance based upon a "Satisfactory" Test Report for samples of materials to be incorporated into project for acceptance – Material is approved and requires certified testing for acceptance.

Code 2. Submit a Manufacturer's Certificate of Compliance (MCC) for "Acceptance" prior to use of material – Material is approved and requires a MCC for acceptance.

Code 3. Submit Catalog Cuts for acceptance prior to use of material – Material is approved and requires a catalog cut(s) prior to acceptance.

Code 4. Submit Shop Drawings for "Approval" prior to fabrication of material – Material requires approved shop drawing(s) for acceptance.

Code 5. Only "Approved for Shipment," "WSDOT Inspected," or "Fabrication Approval decal" material shall be used. *(Federal Projects Only)*- Fabricated material that requires a WSDOT inspected stamp or marking for acceptance.

Code 6. Submit a Certificate of Materials Origin (CMO). *(Federal Projects Only)*- Iron or steel material and requires a CMO for acceptance.

Code 7. N/A – This code is not used for material acceptance.

Code 8. Source Approved: - Material may be proprietary. Material requires a visual inspection upon arrival to the job site for acceptance.

Code 9. Approval Withheld: Submit samples for preliminary evaluation. – Material approval is withheld pending review of product samples or manufacturer's color palettes.

Code 10. Approval Withheld: (See City remarks on the Form)

Code 11. Miscellaneous Acceptance Criteria: - Material is approved and conditionally accepted as noted.

Code 12. LAG – Approved Catalog Cut Documented with: □ Mfg. Cert. of Comp. □ Visual Inspection - Material is approved with a Catalog Cut and requires either a Manufacturer's Certificate of Compliance or a Visual Inspection for acceptance.

When a material is marked as approved, it does not necessarily constitute acceptance of the material for incorporation into the work. All of the additional acceptance actions, as noted on the RSA form or on the QPL must be completed prior to the material being accepted for use.

Change orders or force account work requires the same material approval and acceptance as any other bid item.

9-38.2 Schedule of Submittals

(City Contracts, November 2022, City of Auburn GSP)

The Contractor shall submit a preliminary Schedule of Submittals. The Schedule of Submittals shall include the intended dates for which each submittal required by the Contract Documents will be made. The Schedule of Submittals must be accepted prior to payment. Identify the items that will be included in each submittal by listing the item or group of items and the specification section and paragraph number under which they are specified. Indicate whether the submittal is required for product review of proposed equivalents, Shop Drawings, Product Data or Samples or required for product information only. It is the Contractors responsibility to anticipate and provide all submittals required for the project.

The time required to evaluate and review requests for submittals is not the same for all submittals. The Contractor shall allow a minimum of 15 working days, unless otherwise noted, for the Engineer's review. The Contractor shall also allow adequate time for manufacturer delivery at the construction site without causing delay to the work. All submittals shall be in accordance with the approved Schedule of Submittals. Submittals shall be made early enough to allow for unforeseen delays such as:

1. Failure to obtain favorable review because of inadequate or incomplete submittal or because the item submitted does not meet the requirements of the Contract Documents.
2. Delays in manufacture.
3. Delays in delivery.

End Of Division 9

GENERAL SPECIAL PROVISIONS

February 2024

City of Auburn
Engineering Services
Public Works Department
25 West Main Street
Auburn, WA 98001-4998

Approved By:

Jacob Sweeting

2/16/2024

Jacob Sweeting, P.E.
Assistant Director of Engineering Services/City Engineer

PREFACE FOR THE
CITY OF AUBURN
GENERAL SPECIAL PROVISIONS

Per Auburn City Code (ACC) 12.04.020, all public work construction contracts of the City, including but not limited to streets and sidewalks, storm water and sanitary sewer systems, and water systems, and all work within City public right-of-way performed by the City and others shall conform to the Engineering Construction Standards (ECS). The ECS apply to City capital projects and to work performed by developers and others under construction permits (CON), grading permits (GRA), storm permits (STM), other utility permits, and public facility extensions (FAC). The City of Auburn has adopted the ECS to require the standardization of design and construction elements for consistency, to assure that public safety needs are met, and to comply with Local, State, and Federal regulations.

The General Special Provisions is a sub-part of the ECS and includes the following elements:

A) By reference, Division 1 of the Washington State Department of Transportation's (WSDOT) Standard Specifications (M41-10) for Road, Bridge and Municipal Construction, 2024 edition publication (Standard Specifications). The Standard Specifications are available at https://wsdot.wa.gov/engineering-standards/all-manuals-and-standards/manuals/standard-specifications-road-bridge-and-municipal-construction. Terms and conditions in the Standard Specifications that reference the following elements apply only to City Contracts and do not apply to CON, GRA, or FAC work: Bidding, Award, Claims, Payment, Measurement, Liquidated Damages, Compensation, Sales Tax, Requests to Sublet, and other terms and conditions that are specific a contractual obligations between the City and Contractor.

B) Special Provisions are adopted by the City that supplement, delete, replace, and revise the Standard Specifications. The Special Provisions include references that indicate the applicability of the special provision, the date it was last updated, and the source of the special provision contents:

("Applicability", "Month" "Year" "Specification Source")

Where "Applicability" indicates "City Contracts" the specification applies only to capital projects under contract with the City. Where applicability indicates "Non-City Contracts" the specification only applies to projects and work that is not a capital project under contract with the City. Where "Applicability" is omitted, the specification applies to all work.

C) Additional special provisions may be adopted on a project specific basis and provided separately with the specific project and/or permit that they apply to and are referred to as Project Specific Special Provisions.

DIVISION 1 General Requirements

1-01 Definitions and Terms

1-01.1 General

(April 2006 City of Auburn GSP)
Add the following before the first paragraph:

Whenever the words “as directed”, “as required”, “as permitted”, or words of the like effect are used, it shall be understood that the direction, requirement or permission of the City of Auburn is intended. The words “sufficient”, “necessary”, “proper”, and the like shall mean sufficient, necessary or proper in the judgment of the City of Auburn. The words “approved”, “acceptable”, “satisfactory”, or other words of the like shall mean approved by, or acceptable to, the City of Auburn.

1-01.3 Definitions

(February 2024 City of Auburn GSP)
Supplement this section with the following:

All references in the Standard Specifications, Amendments, or WSDOT General Special Provisions, to the terms “State”, “Department of Transportation”, “Washington State Transportation Commission”, “Commission”, “Secretary of Transportation”, “Secretary”, “Headquarters”, and “State Treasurer” shall be revised to read “Contracting Agency”.

All references to the terms “State” or “state” shall be revised to read “Contracting Agency” unless the reference is to an administrative agency of the State of Washington, a State statute or regulation, or the context reasonably indicates otherwise.

All references to “State Materials Laboratory” shall be revised to read “Contracting Agency designated location”.

Business Day
A business day is any day from Monday through Friday except holidays as listed in Section 1-08.5.

City of Auburn
See Contracting Agency.

Contract Documents
See definition for “Contract”.

Current Edition
The latest specifications, standards, or requirements of the respective issuing agencies which have been published as of the date that the work is advertised for bids, shall apply; except to the extent that said standards or requirements may be in conflict with applicable laws, ordinances, or governing codes.

Equal Products
The terms “or equal”, “approved equal”, “approved equivalent” “or equivalent”, etc., as used in the Contract Documents, shall mean a manufactured article, material, method, or work, which in the opinion of the Engineer, is equally desirable or suitable for the purposes intended in the Contract Documents, as compared with similar articles specifically mentioned therein.

Project

The term Project shall mean the Work governed by the Contract Documents.

Shop Drawings
Same as "Working Drawings" as defined in the Standard Specifications.

Standard Details
Same as "Standard Plans" as defined in the Standard Specifications.

Standard Plans
The manual of standard Plans adopted by the City of Auburn is the City of Auburn Standard Details, which includes City of Auburn Standard Details and certain WSDOT Standard Plans by reference.

Standard Specifications
The Standard Specifications for Road, Bridge and Municipal Construction, 2024 edition as issued by the Washington State Department of Transportation, hereinafter referred to as the "Standard Specifications".

Traffic
Both vehicular and non-vehicular traffic, such as pedestrians, bicyclists, wheelchairs, and equestrian traffic.

(City Contracts, January 2024 City of Auburn GSP)
Delete the heading **Completion Dates** and the three paragraphs that follow it, and replace them with the following:

Dates

Bid Opening Date
The date on which the Contracting Agency publicly opens and reads the Bids.

Award Date
The date of the City letter to the Contractor notifying the Contractor of the contract award.

Contract Execution Date
The date the Contracting Agency officially binds the Agency to the Contract.

Notice to Proceed Date
The date stated in the Notice to Proceed on which the Contract time begins.

Substantial Completion Date
The day the Engineer determines the Contracting Agency has full and unrestricted use and benefit of the facilities, both from the operational and safety standpoint, any remaining traffic disruptions will be rare and brief, and only minor incidental work, replacement of temporary substitute facilities, plant establishment periods, or correction or repair remains for the Physical Completion of the total Contract.

Physical Completion Date
The day all of the Work is physically completed on the project. All documentation required by the Contract and required by law does not necessarily need to be furnished by the Contractor by this date.

Final Acceptance Date
See Completion Date.

Completion Date
The day all the Work specified in the Contract is completed and all the obligations of the Contractor under the contract are fulfilled by the Contractor. All documentation

required by the Contract and required by law must be furnished by the Contractor before establishment of this date.

(City Contracts, February 2023 City of Auburn GSP)
Supplement this section with the following:

All references to "Final Contract Voucher Certification" shall be interpreted to mean the final payment form established by the Contracting Agency.

Additive
A supplemental unit of work or group of bid items, identified separately in the Bid Proposal, which may, at the discretion of the Contracting Agency, be awarded in addition to the base bid.

Alternate
One of two or more units of work or groups of bid items, identified separately in the Bid Proposal, from which the Contracting Agency may make a choice between different methods or materials of construction for performing the same work.

Bid Proposal Package
The documents to be submitted by the Contractor for bid consideration. The "Bid Proposal Package" includes those documents identified in the Bidder's Checklist, and may include, but not be limited to the following:

- Bidder's Checklist
- Proposal Form
- Contractor Certification Wage Law Compliance
- Responsible Bidder Information
- Proposed Equipment and Manpower Schedule
- Local Agency Subcontractor List
- Bid Bond

Contract Time
The period of time established by the terms and conditions of the Contract within which the Work must be physically completed.

Equitable Adjustment or Eq. Adj.
The term Equitable Adjustment or Eq. Adj. used in the Bid Proposal Form for Units shall mean that the City has included an estimated dollar amount for that bid item only to provide a common proposal for Bidders. All such dollar amounts are to become part of the Contractor's total bid.

Estimate
The term Estimate or Est. used in the Bid Proposal Form for Units shall mean that the City has included an estimated dollar amount for that bid item, only to provide a common proposal for Bidders. All such dollar amounts are to become part of the Contractor's total bid.

Incidental Work
The terms incidental to the project, incidental to the involved bid item(s), etc., as used in the Contract Documents shall mean that the Contractor is required to provide the specified work complete and the cost of such work shall be incidental and included in the unit contract prices as specified in Section 1-04.1 (Intent of the Contract). No additional payment will be made for this work.

Major Contract Bid Item

A major contract bid item is any bid item, unless specifically excluded in the special provisions, for which the contract price amounts to 10 percent or more of the total contract price as determined by the original proposed quantities and the unit contract prices at the time of award.

Notice of Award
The written notice from the Contracting Agency to the successful bidder signifying the Contracting Agency's acceptance of the Bid Proposal.

Notice to Proceed
The written notice from the Contracting Agency or Engineer to the Contractor authorizing and directing the Contractor to proceed with the Work and establishing the date on which the Contract time begins.

Supplemental Drawings and Instructions
Additional instructions by the Engineer at the request of the Contractor by means of drawings or documents necessary, in the opinion of the Engineer, for the proper execution of the work. Such drawings and instructions are consistent with the Contract Documents.

(Non-City Contracts, February 2023 City of Auburn GSP)
Supplement this Section with the following:

Contractor
Contractor shall refer to the applicant, permit(s) holder, and/or developer.

Contract Execution and Contract Execution Date
Contract Execution shall refer to the Notice to Proceed.

Contract Plans
The City approved plans and the Standard Details and/or Standard Plans referenced by them, which show location, character, and dimensions of the prescribed work including layouts, profiles, cross-sections, and other details.

Contract Time
The period of time established by the terms and conditions of the Contract between Notice to Proceed and Final Acceptance.

Current Edition
The latest specifications, standards, or requirements of the respective issuing agencies which have been published as of the date of the plan approval or permit issuance, as applicable, shall apply; except to the extent that said standards or requirements may be in conflict with applicable laws, ordinances, or governing codes.

Dates

Completion Date
See Final Acceptance Date

Final Acceptance Date and Final Acceptance
For public facility extension (FAC) work, the Final Acceptance Date is the date on which the Developer has satisfied the terms of the FAC Agreement such that the City accepts the public portions of the FAC work for ownership and maintenance and the warranty period begins. For non-FAC work, the Final Acceptance Date refers to the date the City has verified the work performed by the Contractor is complete and all associated permit and other requirements have been satisfied.

Physical Completion and Physical Completion Date

Physical completion refers to the City's determination that the Contractor has completed all physical Work.

Engineer
The term Engineer shall be used to mean the City Engineer or any designee thereof and does not refer to the Developer's, Permit holder's, or Contractor's engineer.

Measurement
The term Measurement, when used in reference to measuring material for payment, is used in reference to City contract bid items and is not applicable to Non-City projects and work.

Notice to Proceed and Notice to Proceed Date
The written notice from the Contracting Agency or Engineer to the Contractor authorizing and directing the Contractor to proceed with the Work and establishing the date on which the Contract time begins, or, as applicable, the issuance of permit(s) by the City that authorizes the Contractor to proceed with the Work as may be conditioned by the permit(s).

Payment
The term Payment is used in reference to City Contract bid items and is not applicable to Non-City projects and work.

1-02 Bid Procedures and Conditions

1-02.1 Prequalification of Bidders

(City Contracts, January 24, 2011 APWA GSP)
Delete this section and replace it with the following:

1-02.1 Qualifications of Bidder

Before award of a public works contract, a bidder must meet at least the minimum qualifications of RCW 39.04.350(1) to be considered a responsible bidder and qualified to be awarded a public works project.

(City Contracts, April 2006 City of Auburn GSP)
Supplement this section with the following:

The bidder shall fill out and sign the "Responsible Bidder Information" and the "Proposed Equipment and Manpower Schedule" contained in the "Bid Proposal Package" of this document. These forms must be completed and submitted with the bid.

1-02.2 Plans and Specifications

(City Contracts, August 2020 City of Auburn)
Delete this section and replace it with the following:

Information as to where Bid Documents can be obtained or reviewed will be found in the Call for Bids (Advertisement for Bids) for the work.

1-02.4 Examination of Plans, Specifications and Site of Work

1-02.4(1) General

(City Contracts, January 19, 2022 APWA GSP Option A)
The first sentence of the ninth paragraph, beginning with "Any prospective Bidder desiring…", is revised to read:

Any prospective Bidder desiring an explanation or interpretation of the Bid Documents, must request the explanation or interpretation in writing soon enough to allow a written reply to reach all prospective Bidders before the submission of their Bids.

1-02.4(2) Subsurface Information

(City Contracts, August 2022 City of Auburn GSP)
The third and fourth sentences in the first paragraph are revised to read:

The Summary of Geotechnical Conditions and the boring logs, if and when included as an appendix to the Special Provisions, shall be considered as part of the Contract. The boring logs and associated data, if and when included as an appendix to the Special Provisions, shall be considered as part of the Contract.

(City Contracts, January 2017 City of Auburn GSP)
Supplement this section with the following:

Because of the varying soil composition and ground water levels encountered in various areas and at different seasons of the year, the City of Auburn makes no representation of such conditions as they may pertain to this project. The Contractor shall be responsible for any and all cribbing, sheet piling, de-watering, or other construction methods or procedures, which may be necessary to complete the project and additional compensation will not be allowed, unless otherwise specified in this document.

1-02.5 Proposal Forms

(City Contracts, July 31, 2017 APWA GSP)
Delete this section and replace it with the following:

The Proposal Form will identify the project and its location and describe the work. It will also list estimated quantities, units of measurement, the items of work, and the materials to be furnished at the unit bid prices. The bidder shall complete spaces on the proposal form that call for, but are not limited to, unit prices; extensions; summations; the total bid amount; signatures; date; and, where applicable, retail sales taxes and acknowledgment of addenda; the bidder's name, address, telephone number, and signature; the bidder's UDBE/DBE/M/WBE commitment, if applicable; a State of Washington Contractor's Registration Number; and a Business License Number, if applicable. Bids shall be completed by typing or shall be printed in ink by hand, preferably in black ink. The required certifications are included as part of the Proposal Form.

The Contracting Agency reserves the right to arrange the proposal forms with alternates and additives, if such be to the advantage of the Contracting Agency. The bidder shall bid on all alternates and additives set forth in the Proposal Form unless otherwise specified.

1-02.6 Preparation of Proposal

(City Contracts, January 4, 2024 APWA GSP 1-02.6, Option B)

Supplement the second paragraph with the following:

4. If a minimum bid amount has been established for any item, the unit or lump sum price must equal or exceed the minimum amount stated.
5. Any correction to a bid made by interlineation, alteration, or erasure, shall be initialed by the signer of the bid.

Delete the last two paragraphs, and replace them with the following:

The Bidder shall submit with their Bid a completed Contractor Certification Wage Law Compliance form, provided by the Contracting Agency. Failure to return this certification as part of the Bid Proposal package will make this Bid Nonresponsive and ineligible for Award. A Contractor Certification of Wage Law Compliance form is included in the Proposal Forms.

The Bidder shall make no stipulation on the Bid Form, nor qualify the bid in any manner.

A bid by a corporation shall be executed in the corporate name, by the president or a vice president (or other corporate officer accompanied by evidence of authority to sign).

A bid by a partnership shall be executed in the partnership name, and signed by a partner. A copy of the partnership agreement shall be submitted with the Bid Form if any DBE requirements are to be satisfied through such an agreement.

A bid by a joint venture shall be executed in the joint venture name and signed by a member of the joint venture. A copy of the joint venture agreement shall be submitted with the Bid Form if any DBE requirements are to be satisfied through such an agreement.

(City Contracts, June 2017 City of Auburn GSP)
Supplement this section with the following:

Any correction to a bid made by interlineation, alteration, or erasure, may also be initialed by an authorized representative of the bidder.

1-02.7 Bid Deposit

(City Contracts, May 2015 City of Auburn GSP)
This section is revised as follows:

The third and fourth sentences of the first paragraph are deleted.

The last paragraph is deleted and replaced with the following:

The failure to furnish a Bid deposit of a minimum of 5 percent with the Bid shall make the Bid nonresponsive and shall cause the Bid to be rejected by the Contracting Agency.

(City Contracts, March 8, 2013 APWA GSP)
Supplement this section with the following:

Bid bonds shall contain the following:

1. Contracting Agency-assigned number for the project;
2. Name of the project;

3. The Contracting Agency named as obligee;
4. The amount of the bid bond stated either as a dollar figure or as a percentage which represents five percent of the maximum bid amount that could be awarded;
5. Signature of the bidder's officer empowered to sign official statements. The signature of the person authorized to submit the bid should agree with the signature on the bond, and the title of the person must accompany the said signature;
6. The signature of the surety's officer empowered to sign the bond and the power of attorney.

If so stated in the Contract Provisions, bidder must use the bond form included in the Contract Provisions.

If so stated in the Contract Provisions, cash will not be accepted for a bid deposit.

1-02.9 Delivery of Proposal

(City Contracts, January 2023 City of Auburn GSP)
Delete this section and replace it with the following:

The City will not consider proposals it receives after the time fixed for opening bids as specified in Section 1-02.12 (Public Opening of Proposals).

Executed Bid Proposal Package documents shall be submitted in a sealed envelope provided by the Bidder, to the following address:

Office of the City Clerk
City of Auburn
25 West Main Street
Auburn, WA 98001-4998

The sealed Bid Proposal Package shall be plainly marked with the Bidder's firm name, return address and telephone number, and in the lower left-hand corner marked with "Sealed Bid for:" followed by the project number, project name, and bid opening date and time.

Proposals may also be sent by mail. Mailed proposals shall be sealed in a second envelope, also addressed and marked as stated above. If the mail option is chosen, it is the Contractor's sole responsibility to ensure that the City receives the Proposal prior to the specified Bid Opening date and time. Proposals received after the specified Bid Opening date and time will be deemed non-responsive and will not be opened or considered.

1-02.10 Withdrawing, Revising, or Supplementing Proposal

(City Contracts, July 23, 2015 APWA GSP)
Delete this section, and replace it with the following:

After submitting a physical Bid Proposal to the Contracting Agency, the Bidder may withdraw, revise, or supplement it if:

1. The Bidder submits a written request signed by an authorized person and physically delivers it to the place designated for receipt of Bid Proposals, and
2. The Contracting Agency receives the request before the time set for receipt of Bid Proposals, and
3. The revised or supplemented Bid Proposal (if any) is received by the Contracting Agency before the time set for receipt of Bid Proposals.

If the Bidder's request to withdraw, revise, or supplement its Bid Proposal is received before the time set for receipt of Bid Proposals, the Contracting Agency will return the unopened Proposal package to the Bidder. The Bidder must then submit the revised or supplemented package in its entirety. If the Bidder does not submit a revised or supplemented package, then its bid shall be considered withdrawn.

Late revised or supplemented Bid Proposals or late withdrawal requests will be date recorded by the Contracting Agency and returned unopened. Mailed, emailed, or faxed requests to withdraw, revise, or supplement a Bid Proposal are not acceptable.

1-02.12 Public Opening of Proposals

(City Contracts, January 2023 City of Auburn GSP)
Supplement the Section with the following:

Bid Proposal Packages will be opened and publicly read aloud by the City Clerk's Office in the Auburn City Hall located at 25 West Main Street, Auburn WA at the bid opening date and time specified in the Invitation for Bids.

City of Auburn bid openings will be held virtually and telephonically. Access to the Virtual Meeting and phone number to listen to the public bid opening is included in the Bid Proposal Package.

1-02.13 Irregular Proposals

(City Contracts, January 4, 2024 APWA GSP)

Delete this section and replace it with the following:

1. A Proposal will be considered irregular and will be rejected if:
   a. The Bidder is not prequalified when so required;
   b. The Bidder adds provisions reserving the right to reject or accept the Award, or enter into the Contract;
   c. A price per unit cannot be determined from the Bid Proposal;
   d. The Proposal form is not properly executed;
   e. The Bidder fails to submit or properly complete a subcontractor list (WSDOT Form 271-015), if applicable, as required in Section 1-02.6;
   f. The Bidder fails to submit or properly complete a Disadvantaged Business Enterprise Certification (WSDOT Form 272-056), if applicable, as required in Section 1-02.6;
   g. The Bidder fails to submit Written Confirmations (WSDOT Form 422-031) from each DBE firm listed on the Bidder's completed DBE Utilization Certification that they are in agreement with the bidder's DBE participation commitment, if applicable, as required in Section 1-02.6, or if the written confirmation that is submitted fails to meet the requirements of the Special Provisions;
   h. The Bidder fails to submit DBE Good Faith Effort documentation, if applicable, as required in Section 1-02.6, or if the documentation that is submitted fails to demonstrate that a Good Faith Effort to meet the Condition of Award in accordance with Section 1-07.11;
   i. The Bidder fails to submit a DBE Bid Item Breakdown (WSDOT Form 272-054), if applicable, as required in Section 1-02.6, or if the documentation that is submitted fails to meet the requirements of the Special Provisions;

j. The Bid Proposal does not constitute a definite and unqualified offer to meet the material terms of the Bid invitation.

2. A Proposal may be considered irregular and may be rejected if:
   a. The Proposal does not include a unit price for every Bid item;
   b. Any of the unit prices are excessively unbalanced (either above or below the amount of a reasonable Bid) to the potential detriment of the Contracting Agency;
   c. The authorized Proposal Form furnished by the Contracting Agency is not used or is altered;
   d. The completed Proposal form contains unauthorized additions, deletions, alternate Bids, or conditions;
   e. Receipt of Addenda is not acknowledged;
   f. A member of a joint venture or partnership and the joint venture or partnership submit Proposals for the same project (in such an instance, both Bids may be rejected); or
   g. If Proposal form entries are not made in ink.

1-02.14 Disqualification of Bidders

(City Contracts, May 17, 2018 APWA GSP, Option A)
Delete this section and replace it with the following:

A Bidder will be deemed not responsible if the Bidder does not meet the mandatory bidder responsibility criteria in RCW 39.04.350(1), as amended.

The Contracting Agency will verify that the Bidder meets the mandatory bidder responsibility criteria in RCW 39.04.350(1). To assess bidder responsibility, the Contracting Agency reserves the right to request documentation as needed from the Bidder and third parties concerning the Bidder's compliance with the mandatory bidder responsibility criteria.

If the Contracting Agency determines the Bidder does not meet the mandatory bidder responsibility criteria in RCW 39.04.350(1) and is therefore not a responsible Bidder, the Contracting Agency shall notify the Bidder in writing, with the reasons for its determination. If the Bidder disagrees with this determination, it may appeal the determination within two (2) business days of the Contracting Agency's determination by presenting its appeal and any additional information to the Contracting Agency. The Contracting Agency will consider the appeal and any additional information before issuing its final determination. If the final determination affirms that the Bidder is not responsible, the Contracting Agency will not execute a contract with any other Bidder until at least two business days after the Bidder determined to be not responsible has received the Contracting Agency's final determination.

(City Contracts, April 2014 City of Auburn GSP)
Supplement this section with the following:

The City of Auburn reserves the right to determine the lowest responsible bidder based on factors other than just price, including but not limited to the following:

1. Liability exposure;
2. References and past performance;
3. Judgments entered against the bidder within the last 5 years that shows a history of failing to meet the terms of the contract;
4. History of claims with other agencies on similar projects;

5. Inadequate or ambiguous specifications;
6. Specifications have been revised;
7. Lowest responsible bid deemed not the best price obtainable;
8. Bids not independently arrived or submitted in bad faith (i.e., price fixing);
9. A determination made that all the necessary requirements of the bid process have not been met;
10. Insufficient competition; and,
11. Other claims or other indications that cancellation or rejection of all bids is clearly in the best interest of the City.

For the purpose of this criterion, 'bidder' shall include the registered construction company submitting the bid, as well as the owner(s) of the company, and any other construction companies the owner(s) may currently or previously have owned.

1-02.15 Pre-Award Information

(City Contracts, December 30, 2022 APWA GSP)
Revise this section to read:

Before awarding any contract, the Contracting Agency may require one or more of these items or actions of the apparent lowest responsible bidder:

1. A complete statement of the origin, composition, and manufacture of any or all materials to be used,
2. Samples of these materials for quality and fitness tests,
3. A progress schedule (in a form the Contracting Agency requires) showing the order of and time required for the various phases of the work,
4. A breakdown of costs assigned to any bid item,
5. Attendance at a conference with the Engineer or representatives of the Engineer,
6. Obtain, and furnish a copy of, a business license to do business in the city or county where the work is located.
7. Any other information or action taken that is deemed necessary to ensure that the bidder is the lowest responsible bidder.

1-03 Award and Execution of Contract

1-03.1 Consideration of Bids

(City Contracts, January 23, 2006 APWA GSP)
Revise the first paragraph to read:

After opening and reading proposals, the Contracting Agency will check them for correctness of extensions of the prices per unit and the total price. If a discrepancy exists between the price per unit and the extended amount of any bid item, the price per unit will control. If a minimum bid amount has been established for any item and the bidder's unit or lump sum price is less than the minimum specified amount, the Contracting Agency will unilaterally revise the unit or lump sum price, to the minimum specified amount and recalculate the extension. The total of extensions, corrected where necessary, including sales taxes where applicable and such additives and/or alternates as selected by the Contracting Agency, will be used by the Contracting Agency for award purposes and to fix the Awarded Contract Price amount and the amount of the contract bond.

(City Contracts, September 2021 City of Auburn GSP)
Add the following new section:

1-03.1(2) Additive and Deductive Schedules

The City reserves the right to select any, all, or none of the additive and/or deductive bid schedules provided on the Proposal Form. The Contractor must complete each additive and/or deductive bid schedule to be considered a responsive bid. The Contract award will be made based on the lowest responsible and responsive total bid, including any selected additive and/or deductive bid schedules, as determined by the City.

1-03.3 Execution of Contract

(City Contracts, January 2024 City of Auburn GSP)
Revise this section to read:

Within 15 calendar days after the award date, the successful bidder shall return an insurance certification as required by Section 1-07.18, and a satisfactory bond as required by law and Section 1-03.4. Within 20 calendar days after the award date, the successful bidder shall return the signed Contracting Agency-prepared contract. Before execution of the contract by the Contracting Agency, the successful bidder shall provide any pre-award information the Contracting Agency may require under Section 1-02.15.

Until the Contracting Agency executes a contract, no proposal shall bind the Contracting Agency nor shall any work begin within the project limits or within Contracting Agency-furnished sites. The Contractor shall bear all risks for any work begun outside such areas and for any materials ordered before the contract is executed by the Contracting Agency.

If the bidder experiences circumstances beyond their control that prevents return of the contract documents within the calendar days after the award date stated above, the Contracting Agency may grant up to a maximum of 7 additional calendar days for return of the documents, provided the Contracting Agency deems the circumstances warrant it.

1-03.4 Contract Bond

(City Contracts, September 2019 City of Auburn GSP)
Delete the first paragraph and replace it with the following:

The successful bidder shall provide executed payment and performance bond(s) for the full contract amount. The bond shall be a combined payment and performance bond and shall:

1. Be on Contracting Agency-furnished form(s);
2. Be signed by an approved surety (or sureties) that:
   a. Is registered with the Washington State Insurance Commissioner, and
   b. Appears on the current Authorized Insurance List in the State of Washington published by the Office of the Insurance Commissioner,
3. Guarantee that the Contractor will perform and comply with all obligations, duties, and conditions under the Contract, including but not limited to the duty and obligation to indemnify, defend, and protect the Contracting Agency against all losses and claims related directly or indirectly from any failure:
   a. Of the Contractor (or any of the employees, subcontractors, or lower tier subcontractors of the Contractor) to faithfully perform and comply with all contract obligations, conditions, and duties, or
   b. Of the Contractor (or the subcontractors or lower tier subcontractors of the Contractor) to pay all laborers, mechanics, subcontractors, lower tier

subcontractors, material person, or any other person who provides supplies or provisions for carrying out the work;

4. Be conditioned upon the payment of taxes, increases, and penalties incurred on the project under titles 50, 51, and 82 RCW; and
5. Be accompanied by a power of attorney for the Surety's officer empowered to sign the bond; and
6. Be signed by an officer of the Contractor empowered to sign official statements (sole proprietor or partner). If the Contractor is a corporation, the bond must be signed by the president or vice president, unless accompanied by written proof of the authority of the individual signing the bond to bind the corporation (i.e., corporate resolution, power of attorney, or a letter to such effect signed by the president or vice president).

(City Contracts, January 2015 City of Auburn GSP)
Supplement this section with the following:

The "Contract Bond" shall remain in force for one year following the "Completion Date" of the Contract to insure Contract defects during the one-year guarantee period in compliance with Section 1-05.10 (Guarantees).

(City Contracts, May 17, 2018 APWA GSP)
Add the following new section:

1-03.4(1) Retainage in Lieu of Contract Bond

For contracts of $150,000 or less, the Contractor may, at the Contractor's option, authorize the Contracting Agency to retain 10% of the contract amount in lieu of furnishing a performance and/or payment bond. If the Contractor elects this option, the retainage shall be held for a period of thirty (30) days after the date of final acceptance, or until receipt of all necessary releases from the Departments of Revenue and of Labor and Industries and settlement of any liens filed under RCW 60.28, whichever is later. The Contractor must advise the Contracting Agency in writing of the Contractor's election to authorize retainage in lieu of a bond, at the time of execution of the Contract.

In choosing this option, the Contractor agrees that if the Contractor, its heirs, executors, administrators, successors, or assigns, shall in all things stand to and abide by, and well and truly keep and perform the covenants, conditions and agreements in the Contract, and shall faithfully perform all the provisions of such contract and shall also well and truly perform and fulfill all the undertakings, covenants, terms, conditions and agreements of any and all duly authorized modifications of the Contract that may hereafter be made, at the time and in the manner therein specified, and shall pay all laborers, mechanics, subcontractors, and material suppliers, and all persons who shall supply such person or persons, or subcontractors, with provisions and supplies for the carrying on of such work, on his or her part, and shall indemnify and save harmless the Contracting Agency, its officers and agents from any claim for such payment, then the funds retained in lieu of a performance bond shall be released at the time provided above; otherwise, the funds shall be retained until the Contractor fulfills the said obligations.

1-03.7 Judicial Review

(City Contracts, December 30, 2022 APWA GSP)
Revise this section to read:

All decisions made by the Contracting Agency regarding the Award and execution of the Contract or Bid rejection shall be conclusive subject to the scope of judicial review permitted under Washington Law. Such review, if any, shall be timely filed in the Superior Court of the county where the Contracting Agency headquarters is located, provided that where an action is asserted against a county, RCW 36.01.050 shall control venue and jurisdiction.

(City Contracts, August 2021 City of Auburn)
Add the following new section:

1-03.8 City Determination

The City reserves the right to determine the following:

1. Whether a proposal is irregular under the terms of Section 1-02.13, and
2. Whether a bidder is not responsible under Section 1-02.14.

1-04 Scope of the Work

1-04.2 Coordination of Contract Documents, Plans, Special Provisions, Specifications and Addenda

(Non-City Contracts, January 2023 City of Auburn GSP)
Revise the second paragraph to read:

Any inconsistency in the parts of the contract shall be resolved by following this order of precedence (e.g., 1 presiding over 2, 2 over 3, 3 over 4, and so forth):

1. Public Facility Extension Agreement (for public facility extension work)
2. City issued permit terms and conditions
3. Permit/FAC Plans
4. City of Auburn Engineering Construction Standards Part 1: Special Provisions
5. City of Auburn Engineering Construction Standards Part 2: Standard Details
6. Standard Specifications
7. WSDOT Standard Plans for Road, Bridge, and Municipal Construction

(City Contracts, January 2023 City of Auburn GSP)
Revise the second paragraph to read:

Any inconsistency in the parts of the contract shall be resolved by following this order of precedence (e.g., 1 presiding over 2, 2 over 3, 3 over 4, and so forth):

1. Addenda
2. Proposal Form
3. Project Specific Special Provisions
4. Contract Plans
5. City of Auburn Engineering Construction Standards Part 1: Special Provisions
6. City of Auburn Engineering Construction Standards Part 2: Standard Details
7. Standard Specifications
8. WSDOT Standard Plans for Road, Bridge, and Municipal Construction

(February 2023 City of Auburn GSP)
Supplement the section with the following:

The Contractor shall have the Contract Documents available at the job site during construction.

(January 2017 City of Auburn GSP)
Add the following new section:

1-04.3(1) Contractor-Discovered Discrepancies

The Contractor shall carefully study and compare all the components of the Contract Documents and other instructions, and check and verify all field measurements. The Contractor shall, prior to ordering material or performing work, report in writing to the Engineer any error, inconsistency, or omission in respect to design or mode of construction. If the Contractor, in the course of this study or in the accomplishment of the work, finds any discrepancy between the Plans and the physical condition of the locality as represented in the Plans, or any such errors or omissions in respect to the design or mode of construction in the Plans or in the layout as given by points and instructions, it shall be the Contractor's duty to inform the Engineer immediately in writing, and the Engineer will promptly do the same. Any work done after such discovery, until correction of the Plans or authorization of extra work is given, if the Engineer finds that extra work is involved, will be done at the Contractor's risk. If extra work is involved, the procedure shall be as provided in Section 1-04.4, Changes.

(Non-City Contracts, February 2023 City of Auburn GSP)
Delete Section 1-04.4 in its entirety and replace with the following:

1-04.4 Changes

Changes in Work shall be per Chapter 2 of the Engineering Design Standards.

1-04.4(1) Minor Changes

(City Contracts, May 30, 2019 APWA GSP)
Delete the first paragraph and replace it with the following:

Payments or credits for changes amounting to $25,000 or less may be made under the Bid item "Minor Change". At the discretion of the Contracting Agency, this procedure for Minor Changes may be used in lieu of the more formal procedure as outlined in Section 1-04.4, Changes. All "Minor Change" work will be within the scope of the Contract Work and will not change Contract Time.

(January 2017 City of Auburn GSP)
The first two sentences of the second paragraph are deleted.

1-04.5(1)A Disputes Review Board

(City Contracts, August 2021 City of Auburn GSP)
Delete this Section and its Subsections in their entirety.

1-04.6 Variation in Estimated Quantities

(City Contracts, December 30, 2022 APWA GSP, Option B)
Revise the first paragraph to read:

Payment to the Contractor will be made only for the actual quantities of Work performed and accepted in conformance with the Contract. When the accepted quantity of Work performed

under a unit item varies from the original Proposal quantity, payment will be at the unit Contract price for all Work unless the total accepted quantity of the Contract item, adjusted to exclude added or deleted amounts included in change orders accepted by both parties, increases or decreases by more than 25 percent from the original Proposal quantity, and if the total extended bid price for that item at time of award is equal to or greater than 10 percent of the total contract price at time of award. In that case, payment for contract work may be adjusted as described herein:

1-04.11 Final Cleanup

(February 2018 City of Auburn GSP)
The third sentence of the first paragraph is revised to read:

The City Right-of-Way, material sites, and all ground the Contractor occupied to do the Work shall be left neat and presentable.

(February 2018 City of Auburn GSP)
Supplement the section with the following:

Final cleanup shall also include cleaning out all newly installed storm drain pipe and structures and any ditches that may have been filled during the work, replacing damaged surfacing, and putting the site in a neat, orderly condition and, in respect to structures, cleaning all windows and leaving buildings broom clean.

1-05 Control of Work

1-05.1 Authority of the Engineer

1-05.1(1) Oral Orders

(August 2021 City of Auburn GSP)
Supplement this section with the following:

No oral agreement or conversation with any officer, agent, or employee of the City, either before or after execution of the Contract, shall affect or modify any of the terms or obligations contained in any of the documents comprising the Contract. Such oral agreement or conversation shall be considered as unofficial information and in no way binding upon the City, unless subsequently put in writing and signed by the City.

1-05.1(2) Request for Information (RFI)

(City Contracts, January 2023 City of Auburn GSP)
Supplement this section with the following:

Requests for Information (RFIs) shall be made electronically and shall be transmitted via email to PWSubmittals@auburnwa.gov. The email subject line of electronic RFIs shall include the following: Project Number, Project Name, and RFI Title. Each email shall be limited to 10 MB in size.

In the event the Contractor cannot meet the 10 MB size limit for a specific RFI, the Contractor may request to submit the individual RFI as a hardcopy. Hardcopy RFIs shall be either mailed to the City of Auburn Public Works Department at 25 West Main St, Auburn, WA 98001 or dropped off at the City of Auburn Customer Service Center located on the 2nd floor of the One East Main St, Auburn WA 98001 building.

All RFIs shall accompany the City of Auburn "CIP Construction Request for Information (RFI)" form as a cover letter with enough information provided for the Engineer to respond accordingly.

1-05.4 Conformity with and Deviations from Plans and Stakes

(September 2016 City of Auburn GSP)
Revise the second sentence of the second paragraph to read:

The allowable tolerance for the Contractor's work shall not exceed 0.02 feet from lines, grades, depths and cross-sections shown on the Plans unless otherwise specified in these contract documents.

(January 2023 City of Auburn GSP)
Delete the fourth through seventh paragraphs of this section.

(City Contracts, July 23, 2015 APWA GSP, Option 1)
Supplement this section with the following:

Roadway and Utility Surveys

The Engineer shall furnish to the Contractor one time only all principal lines, grades, and measurements the Engineer deems necessary for completion of the work. These shall generally consist of one initial set of:

1. Slope stakes for establishing grading;
2. Curb grade stakes;
3. Centerline finish grade stakes for pavement sections wider than 25 feet; and
4. Offset points to establish line and grade for underground utilities such as water, sewers, and storm drains.

On alley construction projects with minor grade changes, the Engineer shall provide only offset hubs on one side of the alley to establish the alignment and grade.

(City Contracts, April 2018 City of Auburn GSP)
Supplement this section with the following:

The Contractor shall establish all survey controls, both horizontal and vertical, as necessary to assure proper placement of all project elements based on the primary control points provided by the Engineer. Survey work shall be within the following tolerances:

Stationing	±0.01 foot
Alignment	±0.01 foot (between successive points)
Superstructure Elevations	±0.01 foot (from plan elevations)
Substructure Elevations	±0.05 foot (from plan elevations)

During the progress of the work, the Contractor shall make available to the Engineer all field books including survey information, footing elevations, cross sections and quantities.

The Contractor shall be fully responsible for the close coordination of field locations and measurements with appropriate dimensions of structural members being fabricated.

(City Contracts, September 2016 City of Auburn GSP)
The Contractor shall inform the Engineer at least 3 working days in advance where they intend to work, thus enabling the Engineer to set the engineering control point, lines, and

grades with a minimum of delay and interference. The Engineer may require additional advance notice dependent upon survey requirements and scheduling.

Delays caused by lack of stakes or as a result of the Contractor failing to be specific when requesting survey staking shall not be the basis for additional time or claims for additional compensation by the Contractor.

(City Contracts, July 23, 2015 APWA GSP, Option 2)
Supplement this section with the following:

Bridge and Structure Surveys

For all structural work such as bridges and retaining walls, the Contractor shall retain, as a part of Contractor's organization, an experienced team of surveyors.

The Contractor shall provide all surveys required to complete the structure, except the following primary survey control, which will be provided by the Engineer:

1. Centerline or offsets to centerline of the structure.
2. Stations of abutments and pier centerlines.
3. A sufficient number of bench marks for levels to enable the Contractor to set grades at reasonably short distances.
4. Monuments and control points as shown in the Plans.

The Contractor shall establish all secondary survey controls, both horizontal and vertical, as necessary to assure proper placement of all project elements based on the primary control points provided by the Engineer. Survey work shall be within the following tolerances:

Stationing	±0.01 foot
Alignment	±0.01 foot (between successive points)
Superstructure Elevations	±0.01 foot (from plan elevations)
Substructure Elevations	±0.05 foot (from plan elevations)

During the progress of the work, the Contractor shall make available to the Engineer all field books including survey information, footing elevations, cross sections and quantities.

The Contractor shall be fully responsible for the close coordination of field locations and measurements with appropriate dimensions of structural members being fabricated.

(Non-City Contracts, January 2023 City of Auburn GSP)
Supplement this section with the following:

Bridge and Structure Surveys

For all structural work such as bridges and retaining walls, the Contractor shall retain, as a part of Contractor's organization, an experienced team of surveyors.

The Contractor shall provide all surveys required to complete the structure, including the following primary survey control:

1. Centerline or offsets to centerline of the structure.
2. Stations of abutments and pier centerlines.
3. A sufficient number of bench marks for levels to enable the Contractor to set grades at reasonably short distances.
4. Monuments and control points as shown in the Plans.

The Contractor shall establish all secondary survey controls, both horizontal and vertical, as necessary to assure proper placement of all project elements based on the primary control points. Survey work shall be within the following tolerances:

Stationing	±0.01 foot
Alignment	±0.01 foot (between successive points)
Superstructure Elevations	±0.01 foot (from plan elevations)
Substructure Elevations	±0.05 foot (from plan elevations)

During the progress of the work, the Contractor shall make available to the Engineer all field books including survey information, footing elevations, cross sections and quantities.

The Contractor shall be fully responsible for the close coordination of field locations and measurements with appropriate dimensions of structural members being fabricated.

(Non-City Contracts, April 2018 City of Auburn GSP)
Supplement this section with the following:

The Contractor shall establish all survey controls, both horizontal and vertical, as necessary to assure proper placement of all project elements. Survey work shall be within the following tolerances:

Stationing	±0.01 foot
Alignment	±0.01 foot (between successive points)
Superstructure Elevations	±0.01 foot (from plan elevations)
Substructure Elevations	±0.05 foot (from plan elevations)

During the progress of the work, the Contractor shall make available to the Engineer all field books including survey information, footing elevations, cross sections and quantities.

The Contractor shall be fully responsible for the close coordination of field locations and measurements with appropriate dimensions of structural members being fabricated.

(February 2023 City of Auburn GSP)
Add the following new subsection to this section:

1-05.4(1) Monuments

The Contractor shall work to preserve the existing monumentation as provided in RCW 58.09.130 and WAC 332-120. The Contractor shall notify the Engineer immediately if it becomes apparent that a survey marker will be disturbed due to construction. The Contractor shall allow ample time for the Engineer and/or Contractor, as applicable, to acquire adequate information so that the monument may be replaced by the Contractor in its original position after construction.

(City Contracts, February 2023 City of Auburn GSP)
Add the following new subsection to this section:

1-05.4(2) Contracting Agency Provided Construction Staking

1-05.4(2)A General

As used in this Section 1-05.4, the words, “stake,” “mark,” “marker,” or “monument” will be deemed to include any kind of survey marking, whether or not set by the Contracting Agency.

1-05.4(2)B Control Stakes

The Engineer will supply construction stakes and marks establishing lines, slopes and grades in accordance with this Section of these Special Provisions. The Contractor shall assume full responsibility for detailed dimensions, elevations, and excavation slopes measured from these Engineer furnished stakes and marks.

A claim by the Contractor for extra compensation by reason of alterations or reconstruction work allegedly due to error in the Engineer's line and grade will not be allowed unless the original control points set by the Engineer still exist, or unless the Contractor can provide other satisfactory substantiating evidence to prove the error was caused by incorrect Engineer furnished survey data. Three consecutive points set on line or grade shall be the minimum points used to determine any variation from a straight line or grade. Any such variation shall, upon discovery, be reported to the Engineer.

The Contractor shall provide a work site clear of equipment, stockpiles and obstructions which has been prepared and maintained to permit construction staking to proceed in a safe and orderly manner. The Engineer will stake a finite amount of work in a single day in accordance with Section 1-05.4(1)C of these Special Provisions.

Stakes that constitute reference points for all construction work will be conspicuously marked with an appropriate color of flagging tape. It will be the responsibility of the Contractor to inform its employees and subcontractors of the importance and necessity to preserve the stakes.

1-05.4(2)C Survey Requests

It shall be the Contractor's responsibility to properly schedule survey work and coordinate staking requests with construction activities. The Engineer may be reasonably expected to stake any one of the following items, in the quantity shown, in a single day:

Roadway grading	+/-1500 lineal feet of centerline
Storm or sanitary sewer	Approximately 8-10 structures
Water main	+/-1500 lineal feet of pipe
Curb and gutter	+/-1300 lineal feet (one side only)
Base and top course	+/-1000 lineal feet of centerline
Slope staking	+/-800-1200 lineal feet (top and toe)
Illumination/signalization	Approximately 15-20 structures

Actual quantities may vary based on the complexity of the project, line of sight considerations, traffic interference, properly prepared work site, and other items that could affect production.

The Contractor shall be aware that length does not always translate directly into stationing. For example, a survey request for storm sewer pipe from Station 3+00 to 8+00 is 500 lineal feet in length. There may be 1000 lineal feet, or more, of storm sewer pipe, if the pipe is placed on both sides of the roadway and interconnected.

The Contractor shall provide staking requests at least three (3) working days before the Engineer needs to begin the staking operation. If the work site is obstructed so that survey work cannot be done, a new survey request shall be submitted by the Contractor so that the

survey work can be rescheduled once the site is properly prepared. An additional 3 working days may be required to complete the rescheduled work.

The Contractor shall work to preserve stakes and marks set by the Engineer. The Contracting Agency will deduct from payments due the Contractor all costs to replace such stakes, marks, carelessly or willfully damaged or destroyed by the Contractor's operation. A new survey request shall be submitted by the Contractor to replace the damaged or destroyed stakes. An additional 3 working days may be required to complete the request.

If the removal of a control stake or monument is required by the construction operations of the Contractor or its subcontractors, and advance notice of at least three (3) working days is given to the Engineer, the Engineer will reference, remove, and later replace the stakes at no cost to the Contractor.

The Contractor is not entitled to an extension of time, as provided for in Section 1-08.8 as a result of any replacement of control stakes.

1-05.4(2)D Staking Services

The Contractor shall determine appropriate construction stake offset distances to prevent damage to stakes by its construction equipment.

The Engineer shall furnish to the Contractor, one time only, all principal lines, grades and measurements the Engineer deems necessary for completion of the work. These shall generally consist of one initial set of:

1. Cut or fill stakes for establishing grade and embankments,
2. Curb or gutter grade stakes,
3. Centerline finish grade stakes for pavement sections wider than 25 feet as set forth in Section 1-05.5(5), subsection 2, and
4. Offset points to establish line and grade for underground utilities such as water, sewers, storm drains, illumination and signalization.

No intermediate stakes shall be provided between curb grade and centerline stakes.

The Contractor shall provide enough safe areas to permit the Engineer to set those points and elevations that are the responsibility of the Contracting Agency and to perform random checks of the surveying performed by the Contractor.

Roadway and Utility Surveys

The Engineer will furnish the following stakes and reference marks:

- Clearing Limits - One set of clearing limit stakes will be set at approximately 50-foot stations or as needed.
- Rough Grading - One set of rough grade stakes will be set along the construction centerline of streets at 50-foot stations as required. (If superelevations require intermediate stakes along vertical curves, the Engineer will provide staking at closer intervals.) One set of primary cut and fill stakes will be set for site work. One set of secondary final grade cut and fill stakes will be set where deemed applicable as determined by the Engineer.
- Storm Sewers - Two cut or fill stakes for each inlet, catch basin or manhole will be set at appropriate offsets to the center of the structure. After installation and backfill, inverts will be checked for correctness.
- Sanitary Sewers - Two cut or fill stakes for each manhole or cleanout location will be set at appropriate offsets to the center of the structure. After installation and backfill, inverts will be checked for correctness.

- Water Main - One set of line stakes will be furnished for water mains at 50-foot stations. Additionally, two reference stakes for each valve, hydrant, tee and angle point location will be set concurrently with these line stakes.
- Staking for Embankments - Catch points and one-line stake will be set in those cases where the vertical difference in elevation from the construction centerline to the toe or top of a cut or fill slope exceeds 3 feet. In all other areas, stakes shall be set at an appropriate offset to the street centerline to allow for the preservation of said offsets through the rough grading phase. In both cases the stakes shall be clearly marked with appropriate information necessary to complete the rough grading phase.
- Curb and Gutters - One set of curb and gutter stakes shall be set at an appropriate offset at 25-foot intervals, beginning and end points of curves and curb returns, wheelchair ramps, driveways, and sufficient mid-curve points to establish proper alignment.
- Base and Top Course – When deemed appropriate by the Engineer, one set of final construction centerline grade hubs will be set for each course, at not less than 50-foot stations. No intermediate stakes shall be provided unless superelevations require them. In those circumstances, one grade hub left and right of construction centerline at the transition stations will be set at an appropriate offset to centerline not less than 25-foot stations.
- Adjacent or Adjoining Wetlands - One set of stakes delineating adjacent wetland perimeters will be set at 25 to 50-foot stations as required.
- Illumination and Traffic Signals System - One set of stakes for luminaires and traffic signal pole foundations will be set as required. One set of stakes for vaults, junction boxes, and conduits will be set, only if curb and gutter is not in place at the time of the survey request. If curb and gutter is in place, staking for vaults, junction boxes, and conduits will be provided at an additional expense to the Contractor.

When deemed appropriate by the Engineer, cut sheets will be supplied for curb, storm, sanitary sewer and water lines. Cuts or fills may be marked on the surveyed points but should not be relied on as accurate until a completed cut sheet is supplied.

The Contractor is responsible for staking all other items deemed necessary to construct the project per the Plans and Specifications. All costs associated with Contractor staking shall be incidental to the Work and be included in the Contract unit prices.

1-05.7 Removal of Defective and Unauthorized Work

(January 2023, City of Auburn GSP)
Supplement this section with the following:

If the Contractor fails to remedy defective or unauthorized work within the time specified in a written notice from the Engineer, or fails to perform any part of the work required by the Contract Documents, the Engineer may correct and remedy such work as may be identified in the written notice, with Contracting Agency forces or by such other means as the Contracting Agency may deem necessary.

If the Contractor fails to comply with a written order to remedy what the Engineer determines to be an emergency situation, the Engineer may have the defective and unauthorized work corrected immediately, have the rejected work removed and replaced, or have work the Contractor refuses to perform completed by using Contracting Agency or other forces. An emergency situation is any situation when, in the opinion of the Engineer, a delay in its

remedy could be potentially unsafe, or might cause serious risk of loss or damage to the public.

Direct or indirect costs incurred by the Contracting Agency attributable to correcting and remedying defective or unauthorized work, or work the Contractor failed or refused to perform, shall be paid by the Contractor. Such direct costs shall include in particular, but without limitation, compensation for additional professional services required, and costs for repair and replacement of the Contractor's unauthorized work.

No adjustment in contract time will be allowed because of the delay in the performance of the work attributable to the exercise of the Contracting Agency's rights provided by this Section.

The rights exercised under the provisions of this Section shall not diminish the Contracting Agency's right to pursue any other avenue for additional remedy or damages with respect to the Contractor's failure to perform the work as required.

(City Contracts, January 2023 City of Auburn GSP)
Supplement this section with the following:

Payment will be deducted by the Engineer from monies due, or to become due, the Contractor for costs incurred by the Contracting Agency attributable to correcting and remedying defective or unauthorized work, the Contractor failed or refused to perform.

No adjustment in compensation will be allowed because of the delay in the performance of the work attributable to the exercise of the Contracting Agency's rights provided by this Section.

1-05.10 Guarantees

(September 2016 City of Auburn GSP)
Supplement this section with the following:

Unless otherwise indicated in the Contract, the work performed under these Contract Documents shall be guaranteed for a period of one year beyond the "Completion Date" thereof against defective materials, equipment, and workmanship and shall also include the landscape establishment required in the Contract per Section 8-02.3(13) (Plant Establishment). Upon receipt of notice from the City of failure of any part of the material, equipment or workmanship during the guarantee period, the affected part or parts shall be replaced with new materials or equipment by, and at the expense of, the Contractor. This guarantee shall be bonded in compliance with Section 1-03.4 (Contract Bond).

The Contractor shall be available approximately 60 calendar days prior to the expiration of the one-year guarantee period to tour the project, with the Engineer, in support of the Engineer's effort to establish a list of corrective work required under the one-year guarantee. Upon the receipt of written notice of such required corrective work, the Contractor shall pursue vigorously, diligently, and without unauthorized interruption of the City Facilities, the work necessary to correct the items listed.

1-05.11 Final Inspection

(Non-City Contracts, February 2023 City of Auburn GSP)
Replace this section with the following:

When the Contractor considers the work to be substantially complete, the Contractor shall request the Engineer to perform inspections and provide a punch list of any completed work requiring correction. The Contractor's request shall list the specific items of work that remain to be completed. After receiving the punch list and completing the corrections and outstanding work, the Contractor will request additional inspections as needed until the Engineer has determined that all Work is physically complete. This determination is one of the requirements associated with Final Acceptance.

In order for the Work to be considered physically complete, the Contractor must have completed all start-up and operational testing of systems such as machinery or other mechanical equipment; street lighting, electrical distribution or signal systems; irrigation systems; buildings; or other similar work, it may be desirable for the Engineer to have the Contractor operate and test the work for a period of time after final inspection but prior to the determining that the work is physically complete. Whenever items of work are listed in the Contract Provisions for operational testing, they shall be fully tested under operating conditions for the time period specified to ensure their acceptability. During and following the test period, the Contractor shall correct any items of workmanship, materials, or equipment which prove faulty, or that are not in first class operating condition. Equipment, electrical controls, meters, or other devices and equipment to be tested during this period shall be tested under the observation of the Engineer, so the Engineer may determine their suitability for the purpose for which they were installed. The Work is not considered physically complete until testing and corrections have been completed to the satisfaction of the Engineer.

(City Contracts, October 1, 2005 APWA GSP)
Delete the entire section and replace with the following, including subsections:

1-05.11 Final Inspections and Operational Testing

1-05.11(1) Substantial Completion Date

When the Contractor considers the work to be substantially complete, the Contractor shall so notify the Engineer and request the Engineer establish the Substantial Completion Date. The Contractor's request shall list the specific items of work that remain to be completed in order to reach physical completion. The Engineer will schedule an inspection of the work with the Contractor to determine the status of completion. The Engineer may also establish the Substantial Completion Date unilaterally.

If, after this inspection, the Engineer concurs with the Contractor that the work is substantially complete and ready for its intended use, the Engineer, by written notice to the Contractor, will set the Substantial Completion Date. If, after this inspection the Engineer does not consider the work substantially complete and ready for its intended use, the Engineer will, by written notice, so notify the Contractor giving the reasons therefore.

Upon receipt of written notice concurring in or denying substantial completion, whichever is applicable, the Contractor shall pursue vigorously, diligently and without unauthorized interruption, the work necessary to reach Substantial and Physical Completion. The Contractor shall provide the Engineer with a revised schedule indicating when the Contractor expects to reach substantial and physical completion of the work.

The above process shall be repeated until the Engineer establishes the Substantial Completion Date and the Contractor considers the work physically complete and ready for final inspection.

1-05.11(2) Final Inspection and Physical Completion Date

(City Contracts, October 1, 2005 APWA GSP)
When the Contractor considers the work physically complete and ready for final inspection, the Contractor by written notice, shall request the Engineer to schedule a final inspection. The Engineer will set a date for final inspection. The Engineer and the Contractor will then make a final inspection and the Engineer will notify the Contractor in writing of all particulars in which the final inspection reveals the work incomplete or unacceptable. The Contractor shall immediately take such corrective measures as are necessary to remedy the listed deficiencies. Corrective work shall be pursued vigorously, diligently, and without interruption until physical completion of the listed deficiencies. This process will continue until the Engineer is satisfied the listed deficiencies have been corrected.

If action to correct the listed deficiencies is not initiated within 7 days after receipt of the written notice listing the deficiencies, the Engineer may, upon written notice to the Contractor, take whatever steps are necessary to correct those deficiencies pursuant to Section 1-05.7. The Contractor will not be allowed an extension of contract time because of a delay in the performance of the work attributable to the exercise of the Engineer's right hereunder.

Upon correction of all deficiencies, the Engineer will notify the Contractor and the Contracting Agency, in writing, of the date upon which the work was considered physically complete. That date shall constitute the Physical Completion Date of the contract, but shall not imply acceptance of the work or that all the obligations of the Contractor under the contract have been fulfilled.

1-05.11(3) Operational Testing

(City Contracts, October 1, 2005 APWA GSP)
It is the intent of the Contracting Agency to have, at the Physical Completion Date, a complete and operable system. Therefore when the work involves the installation of machinery or other mechanical equipment; street lighting, electrical distribution or signal systems; irrigation systems; buildings; or other similar work, it may be desirable for the Engineer to have the Contractor operate and test the work for a period of time after final inspection but prior to the physical completion date. Whenever items of work are listed in the Contract Provisions for operational testing, they shall be fully tested under operating conditions for the time period specified to ensure their acceptability prior to the Physical Completion Date. During and following the test period, the Contractor shall correct any items of workmanship, materials, or equipment which prove faulty, or that are not in first class operating condition. Equipment, electrical controls, meters, or other devices and equipment to be tested during this period shall be tested under the observation of the Engineer, so the Engineer may determine their suitability for the purpose for which they were installed. The Physical Completion Date cannot be established until testing and corrections have been completed to the satisfaction of the Engineer.

The costs for power, gas, labor, material, supplies, and everything else needed to successfully complete operational testing, shall be included in the unit contract prices related to the system being tested, unless specifically set forth otherwise in the proposal.

Operational and test periods, when required by the Engineer, shall not affect a manufacturer's guaranties or warranties furnished under the terms of the contract.

1-05.12 Final Acceptance

(City Contracts, October 2021 City of Auburn GSP)
Revise the first paragraph to read:

The Contractor must perform all obligations under the Contract before a Completion Date and final acceptance can occur. Failure of the Contractor to perform all the obligations under the Contract shall not bar the Contracting Agency from unilaterally accepting the Contract as provided in Section 1-09.9. Progress estimates or payments shall not be construed as acceptance of any Work under the Contract.

1-05.13 Superintendents, Labor, and Equipment of Contractor

(City Contracts, September 2013 City of Auburn GSP)
Revise the seventh paragraph to read:

Whenever the Contracting Agency evaluates the Contractor's qualifications pursuant to Section 1-02.14, it will take these performance reports into account.

(August 2015 City of Auburn GSP)
Add the following new section:

1-05.14 Cooperation with Other Contractors

1-05.14(1) Cooperation with Others

Should the Engineer determine that a property owner, a utility company or the City has adequate reason to avoid access closure, sewer or water shutoff at the time scheduled, the Contractor shall reschedule their work to meet the new conditions.

(City Contracts, October 1, 2005 APWA GSP)
Add the following new section:

1-05.16 Water and Power

The Contractor shall make necessary arrangements and shall bear the costs for power and water necessary for the performance of the work, unless the contract includes power and water as a pay item, or unless provided for otherwise in these Special Provisions.

(Non-City Contracts, February 2023 City of Auburn GSP)
Add the following new section:

1-05.16 Water and Power

The Contractor shall make necessary arrangements, and shall bear the costs for power and water necessary for the performance of the work.

(January 2023 City of Auburn GSP)
Add the following new section:

1-05.17 Construction Record Drawings

The following requirements are intended to provide the project Contractor with the information necessary to furnish the City with satisfactory Construction Record Drawings:

1. The Contractor shall be responsible for tracking all relevant field changes to the approved construction drawings on a daily basis. These changes shall be clearly identified in red in a comprehensive manner on one set of full-size Plans to be known as the "Construction Record Drawings". The Construction

Record Drawings may be in electronic format (PDF); however, all requirements of this section shall be met.

2. The Construction Record Drawing set shall be used for this purpose alone, shall be kept separate from other Plan sheets, and shall be clearly marked as "Construction Record Drawings". The Construction Record Drawings, either hard copy version or electronic format, shall be accessible on site, and shall be available for review by the Contracting Agency at all times. The Contractor shall bring the hard copy Construction Record Drawings to each progress meeting or bring an accessible electronic version for review when such meetings are included in the Contract.

3. The quality of the Construction Record Drawings, in terms of accuracy, clarity, and completeness, shall be adequate to allow the Contracting Agency to modify the computer-aided drafting (CAD) Contract Drawings and electronic PDF drawings to produce a complete set of Construction As-builts for the Contracting Agency without further investigative effort by the Contracting Agency.

4. The Construction Record Drawings shall identify all existing or abandoned utilities that were encountered during construction that were not shown on the approved construction drawings.

5. The Construction Record Drawing markups shall document all changes in the Work, both concealed and visible. Items that must be shown on the markups include but are not limited to:

    - Actual dimensions, arrangement, and materials used when different than shown in the Plans.
    - Changes made by Change Order or Field Directive.
    - Changes made by the Contractor as approved by the Engineer.
    - Accurate locations of storm drainage, sanitary sewer, water mains and other water appurtenances, structures, conduits, light standards, vaults, width of roadways, sidewalks, landscaping areas, building footprints, channelization and pavement markings, etc. Include pipe invert elevations, top of castings (manholes, inlets, etc.).

The Construction Record Drawings shall identify all deviations from the approved construction drawings as follows:

Sanitary Sewer

Manholes:

- Type/size of structure
- Location to the nearest 1-foot horizontal
- Rim elevations to the nearest 0.1-foot vertical
- Invert elevations to the nearest 0.1-foot vertical
- Pipe sizes to the nearest 1-inch inside diameter

Pipes:

- Type of pipe
- Location to the nearest 1-foot horizontal
- Length between structures to the nearest 1 foot
- Slopes based on invert elevations
- Pipe sizes to the nearest 1-inch inside diameter

Side Sewers:

- Type of pipe
- Location from reference manhole to the nearest 1 foot horizontal and consistent with the TV report
- Location to the nearest 1-foot horizontal
- Length between structures to the nearest 1 foot
- Slopes based on the constructed invert elevations
- Invert elevations at right-of-way lines to the nearest 0.5-feet vertical

Storm Drainage

Manholes/Catch Basins:

- Type/size of structure
- Location to the nearest 1-foot horizontal
- Rim elevations to the nearest 0.1-foot vertical
- Invert elevations to the nearest 0.1-foot vertical
- Pipe sizes to the nearest 1-inch inside diameter

Pipes:

- Type of pipe
- Location to the nearest 1-foot horizontal
- Length between structures to the nearest 1-foot
- Slopes based on the constructed invert elevations
- Pipe sizes to the nearest 1-inch inside diameter

Water

Pipes:

- Type of pipe and joints
- Deflection of bends to the nearest 1 degree
- Location to the nearest 1-foot horizontal
- Location to the nearest 0.5-foot vertical between valves at 50-foot stations and intersection with other utilities
- Length between valves to the nearest 1 foot
- Pipe sizes to the nearest 1-inch inside diameter
- Valves, Hydrants, Blowoffs, Air Vacs, and PRV's:

- Type of facility
- Location to the nearest 1-foot horizontal

Water Meters and Services:

- Type of service material
- Location of service line to the nearest 1-foot horizontal
- Meter location to the nearest 1-foot horizontal
- Meter sizes to the nearest ¼-inch in diameter

Streets

Public Streets:

- Centerline elevations to the nearest 0.1-foot vertical at 100-foot stations
- Centerline slopes and vertical curve data based on the constructed centerline elevations
- Gutterline elevations to the nearest 0.1-foot vertical (if not a standard crown section)
- Gutterline slopes and vertical curve data based on the constructed gutterline elevations (if not a standard crown section)

Driveway and Sidewalk:

- Type of driveway (commercial or residential section)
- Centerline driveway location to the nearest 1-foot horizontal
- Driveway width to the nearest 1-foot horizontal
- Sidewalk width to the nearest 1-foot horizontal
- Curb ramp (steepest grade to the nearest 0.1% of the ramp, wings, and landing), (indication if curb ramp has associated Maximum Extents Feasible (MEF) documentation with date of MEF approval)

Channelization:

- Type of buttons, reflectors, and curbs
- General layout location to the nearest 1-foot horizontal

Signing:

- Type of signs
- Location of signs to the nearest 1-foot horizontal

Illumination:

- Location of luminaries, junction boxes and service cabinets to the nearest 1-foot horizontal
- Power meter number and address
- Fixture information (wattage, model number, AMI radio number)
- Davit arm length

Signalization:

- Location of signal poles, junction boxes, service cabinets, and controllers to the nearest 1-foot horizontal
- Power meter number and address

6. At the time the Contractor transmits the comprehensive redline Construction Record Drawings to the City, they shall certify that said drawings are in conformance to the above-referenced requirements and are an accurate depiction of built conditions;

7. The City shall receive and approve the Contractor's certified " Construction Record Drawings" as specified herein prior to achieving physical completion.

These Construction Record Drawings shall be kept current during the course of construction by the Contractor and be available for review upon request by the Engineer. The Contractor shall certify on the Construction Record Drawings that said drawings are an accurate depiction of built conditions, and in conformance with the requirements detailed above. The Contractor shall submit an electronic copy (PDF) of the final Construction Record Drawings to the Contracting Agency.

(City Contracts, January 2023 City of Auburn GSP)
Supplement this section with the following:

Contracting Agency acceptance of the Construction Record Drawings is one of the requirements for achieving Physical Completion.

Payment will be made for each of the following Bid items that are included in the Proposal:

"Construction Record Drawings (Minimum Bid $_____)", Lump Sum

Payment for this item will be made on a prorated monthly basis for work completed in accordance with this section up to 75% of the lump sum bid. The final 25% of the lump sum item will be paid upon submittal and approval of the completed Construction Record Drawings set prepared in conformance with these Special Provisions.

A minimum bid amount has been entered in the Bid Proposal for this item.

1-06 Control of Material

1-06.1 Approval of Materials Prior to Use

(City Contracts, October 2021 City of Auburn GSP)
Section 1-06.1 is supplemented with the following:

For each proposed material that is required to be submitted for approval using either the QPL or RAM process identified in Section 9-38.1(2) (Request for Submittal Approval (RSA) Form Instructions) the Contractor will be allowed to submit for approval two materials per material type at no cost. Additional materials may be submitted for approval and will be processed at a cost of $150.00 per material submitted by QPL submittal and $500.00 per material submitted by RAM. All costs for the processing additional materials will be deducted from

monies due or that may come due to the Contractor. Subject to a request by the Contractor and a determination by the Engineer the costs for processing may be waived.

1-06.1(2) Request for Approval of Material (RAM)

(February 2019 City of Auburn GSP)
The second sentence of the first paragraph is revised to read:

The RAM shall be prepared by the Contractor in accordance with the instructions identified in Section 9-38.1(2) (Request for Submittal Approval (RSA) Form Instructions) and be submitted to the Engineer for approval before the material is incorporated into the Work.

1-06.6 Recycled Materials

(City Contracts, January 4, 2016 APWA GSP)
Delete this section, including its subsections, and replace it with the following:

The Contractor shall make their best effort to utilize recycled materials in the construction of the project. Approval of such material use shall be as detailed elsewhere in the Standard Specifications.

Prior to Physical Completion the Contractor shall report the quantity of recycled materials that were utilized in the construction of the project for each of the items listed in Section 9-03.21. The report shall include hot mix asphalt, recycled concrete aggregate, recycled glass, steel furnace slag and other recycled materials (e.g. utilization of on-site material and aggregates from concrete returned to the supplier). The Contractor's report shall be provided on DOT form 350-075 Recycled Materials Reporting.

1-07 Legal Relations and Responsibilities to the Public

1-07.1 Laws to be Observed

(October 1, 2005 APWA GSP)
Supplement this section with the following:

In cases of conflict between different safety regulations, the more stringent regulation shall apply.

The Washington State Department of Labor and Industries shall be the sole and paramount administrative agency responsible for the administration of the provisions of the Washington Industrial Safety and Health Act of 1973 (WISHA).

The Contractor shall maintain at the project site office, or other well-known place at the project site, all articles necessary for providing first aid to the injured. The Contractor shall establish, publish, and make known to all employees, procedures for ensuring immediate removal to a hospital, or doctor's care, for persons, including employees, who may have been injured on the project site. Employees should not be permitted to work on the project site before the Contractor has established and made known procedures for removal of injured persons to a hospital or a doctor's care.

The Contractor shall have sole responsibility for the safety, efficiency, and adequacy of the Contractor's plant, appliances, and methods, and for any damage or injury resulting from their failure, or improper maintenance, use, or operation. The Contractor shall be solely and completely responsible for the conditions of the project site, including safety for all persons and property in the performance of the work. This requirement shall apply continuously, and not be limited to normal working hours. The required or implied duty of the Engineer to

conduct construction review of the Contractor's performance does not, and shall not, be intended to include review and adequacy of the Contractor's safety measures in, on, or near the project site.

1-07.2 State Taxes

(City Contracts, June 27, 2011 APWA GSP)
Delete this Section, including its sub-sections, in its entirety and replace it with the following:

1-07.2 State Taxes

The Washington State Department of Revenue has issued special rules on the State sales tax. Section 1-07.2(1) through 1-07.2(3) are meant to clarify those rules. The Contractor should contact the Washington State Department of Revenue for answers to questions in this area. The Contracting Agency will not adjust its payment if the Contractor bases a bid on a misunderstood tax liability.

The Contractor shall include all Contractor-paid taxes in the unit bid prices or other contract amounts. In some cases, however, state retail sales tax will not be included. Section 1-07.2(2) describes this exception.

The Contracting Agency will pay the retained percentage (or release the Contract Bond if a FHWA-funded Project) only if the Contractor has obtained from the Washington State Department of Revenue a certificate showing that all contract-related taxes have been paid (RCW 60.28.051). The Contracting Agency may deduct from its payments to the Contractor any amount the Contractor may owe the Washington State Department of Revenue, whether the amount owed relates to this contract or not. Any amount so deducted will be paid into the proper State fund.

1-07.2(1) State Sales Tax – Rule 171

WAC 458-20-171, and its related rules, apply to building, repairing, or improving streets, roads, etc., which are owned by a municipal corporation, or political subdivision of the state, or by the United States, and which are used primarily for foot or vehicular traffic. This includes storm or combined sewer systems within and included as a part of the street or road drainage system and power lines when such are part of the roadway lighting system. For work performed in such cases, the Contractor shall include Washington State Retail Sales Taxes in the various unit bid item prices, or other contract amounts, including those that the Contractor pays on the purchase of the materials, equipment, or supplies used or consumed in doing the work.

1-07.2(2) State Sales Tax – Rule 170

WAC 458-20-170, and its related rules, apply to the constructing and repairing of new or existing buildings, or other structures, upon real property. This includes, but is not limited to, the construction of streets, roads, highways, etc., owned by the state of Washington; water mains and their appurtenances; sanitary sewers and sewage disposal systems unless such sewers and disposal systems are within, and a part of, a street or road drainage system; telephone, telegraph, electrical power distribution lines, or other conduits or lines in or above streets or roads, unless such power lines become a part of a street or road lighting system; and installing or attaching of any article of tangible personal property in or to real property, whether or not such personal property becomes a part of the realty by virtue of installation.

For work performed in such cases, the Contractor shall collect from the Contracting Agency, retail sales tax on the full contract price. The Contracting Agency will automatically add this

sales tax to each payment to the Contractor. For this reason, the Contractor shall not include the retail sales tax in the unit bid item prices, or in any other contract amount subject to Rule 170, with the following exception.

Exception: The Contracting Agency will not add in sales tax for a payment the Contractor or a subcontractor makes on the purchase or rental of tools, machinery, equipment, or consumable supplies not integrated into the project. Such sales taxes shall be included in the unit bid item prices or in any other contract amount.

1-07.2(3) Services

The Contractor shall not collect retail sales tax from the Contracting Agency on any contract wholly for professional or other services (as defined in Washington State Department of Revenue Rules 138 and 244).

(January 2023 City of Auburn GSP)
Supplement this section with the following:

1-07.2(4) Location Code Number

The Location Code Number for projects located in King County is 1702, and for projects in Pierce County is 2724.

1-07.5 Environmental Regulations

(October 2021 City of Auburn GSP)
Add the following new subsection:

1-07.5(8) City of Auburn Requirements

The following list represents a portion of City of Auburn Code requirements dealing with the preservation of public natural resources that affect or are affected by the proposed work. Copies of applicable code are available in the City Clerk's office at City Hall, 25 West Main Street, Auburn, Washington 98001. The City recommends that bidders review such materials before submitting sealed proposals.

City of Auburn Code – Chapter 8.28: Defines general noise nuisances prohibited in the City of Auburn.

City of Auburn Code – Titles 14, 16, 17, 18: Reviews types of permits required for grading, landfills, mining, excavation, utility extension, building and all associated permits. Requirements of City Code and the most current edition of the Uniform Building Code adopted by the City apply in all cases. Permit applications are reviewed by the Planning Department, Building Division and/or Engineering Division.

City of Auburn Code – Chapter 18.62: Permitting required for all mine-related activities (including asphalt or concrete batching, rock crushing, and transportation to and from a mine). Permit applications are reviewed by the Planning Department.

1-07.6 Permits and Licenses

(June 2022 City of Auburn GSP)
The first sentence of the first paragraph is revised to read:

The Contractor shall become familiar with all permits and licenses obtained or to be obtained and shall be responsible for and ensure that all their requirements are met.

(City Contracts, January 2023 City of Auburn GSP)
Supplement this section with the following:

All required permits and licenses for this project shall be obtained and paid for by the Contractor. The cost associated with obtaining any permit(s) shall be included in the unit bid item prices.

(February 2023 City of Auburn GSP)
Supplement this section with the following:

Except as may be provided otherwise in the Contract, if the Contractor wishes to utilize private property for a construction staging yard, the Contractor may be required to obtain a Temporary Use Permit and other permits as may be applicable, for use of the property for those purposes.

1-07.11 Requirements for Nondiscrimination

1-07.11(2) Contractual Requirements

(December 2016 City of Auburn GSP)
Supplement this section with the following:

All contractors, subcontractors and vendors engaged in business with the City of Auburn shall comply with the following guidelines:

> All contractors, subcontractors and vendors who have 50 or more employees and have contracts with the City of Auburn totaling more than $50,000 annually shall comply with the provisions of Executive Order 11246, as amended, the implementing regulations of 41 CFR Chapter 60, and all other related federal and state laws.
>
> The City can provide language pertaining to its non-discrimination policy on purchase orders, contracts and other relevant information.

The City will not knowingly do business with any bidder, contractor, subcontractor, or vendor whose employment practices are discriminatory and not in compliance with applicable laws and regulations. The City reserves the right to determine the Contractor's, Subcontractor's, or Vendor's normal employment practices, and will take whatever action it considers appropriate should discriminatory employment practices be discovered.

1-07.13 Contractor's Responsibility for Work

1-07.13(2) Relief of Responsibility for Completed Work

(City Contracts, March 2018 City of Auburn GSP)
This section is deleted and replaced with the following:

Unless stated otherwise in the Contract, the Contractor shall bear the risk of loss or damage for all finished or partially finished work until Final Payment of the entire Contract. This includes all vandalism, theft, and acts of God or nature.

1-07.15 Temporary Water Pollution Prevention

(October 2021 City of Auburn GSP)
Supplement this section with the following:

The Contractor shall implement erosion and sediment control (ESC) measures as necessary to prevent erosion and to stop sediment-laden water from leaving the site and entering the storm drain system. Measures shall be in accordance with, and conform to, the City of Auburn Surface Water Management Manual and Section 8-01 (Erosion Control and Water Pollution Control) of the Contract Specifications.

1-07.16 Protection and Restoration of Property

(December 2016 City of Auburn GSP)
Supplement this section with the following:

The Contractor shall not trespass upon private property and shall be responsible for all injury or damage to persons or property, directly or indirectly, resulting from the Contractor's operations in completing this work. The Contractor shall comply with the laws and regulations of the City of Auburn, County, State, and Federal governments relating to the safety of persons and property and will be held responsible for, and required to make good, all injury and damage to persons or property caused by the Contractor's operations.

Sprinkler irrigation systems that encroach within the limits of improvements shall be modified as necessary to ensure operation "equal or better than" the original condition upon completion of the improvements. This work will include, but not be limited to, cutting and capping existing pipe, relocating existing risers and sprinkler heads, new pipe heads and connections, and testing of the system.

The Contractor shall give a minimum of 7 working days prior written notification to the owners of any ditches, landscaping, irrigation lines and appurtenances that interfere with the work. The Contractor shall be liable for any damage to irrigation facilities by the Contractor's operations and shall restore such damaged facilities to "equal or better than" original condition.

Asphalt concrete pavement or bituminous surfacing outside the project area that is disturbed by the work shall be restored to its original condition. Asphalt pavement restoration shall comply with the provisions of Section 5-02 (Bituminous Surface Treatment) and 5-04 (Hot Mix Asphalt) of the Contract Specifications.

Existing cement concrete curb, gutter and sidewalk structures disturbed by the Contractor's operations shall be replaced to match existing. Cement concrete shall be Class 3000 with entrained air in conformance with Section 6-02 (Concrete Structure) of the Contract Specifications.

Existing street shoulders disturbed by the Contractor's operation shall be resurfaced with 6 inches of compacted Gravel Borrow and 2 inches of compacted Crushed Surfacing Top Course sloped ½ inches per foot away from the paved street. Street shoulder restoration shall be in conformance with Section 4-04.3(11) (Shoulder Ballast) of the Contract Specifications.

All other surfaces, mailboxes, fences, signs, lawn irrigation systems, etc., disturbed by the project, shall be promptly replaced or relocated to original or better condition. Gravel driveways disturbed by the work shall be resurfaced with a compacted 2-inch layer of Crushed Surfacing Top Course. All ditches shall be reconstructed as indicated on the drawings.

The Contractor shall restore all disturbed landscaping in conformance with Section 8-02 (Roadside Restoration) of the Contract Specifications.

1-07.16(1) Private/Public Property

(December 2022 City of Auburn GSP)
Add the following new section:

1-07.16(1)D Protection and Restoration of Existing Markers and Monuments

All existing survey monuments and property corner markers shall be protected from movement by the Contractor. RCW 58.24.040(8) and WAC 332-120 and their rules shall apply to all existing survey markers and/or monuments that must be removed for construction purposes. When survey markers and/or monuments are disturbed, they are to be referenced by survey ties and then replaced by the Contractor. All existing property corner markers disturbed or removed by the Contractor's operations which, in the opinion of the Engineer, were not required to be removed for construction purposes shall be replaced, at the Contractor's own expense, by a Professional Land Surveyor registered in the State of Washington. This includes the City of Auburn benchmark system. Any damaged monuments must be reset to second order, first class specifications.

1-07.16(2) Vegetation Protection and Restoration

(August 2, 2010 WSDOT GSP)
Section 1-07.16(2) is supplemented with the following:

Vegetation and soil protection zones for trees shall extend out from the trunk to a distance of 1 foot radius for each inch of trunk diameter at breast height.

Vegetation and soil protection zones for shrubs shall extend out from the stems at ground level to twice the radius of the shrub.

Vegetation and soil protection zones for herbaceous vegetation shall extend to encompass the diameter of the plant as measured from the outer edge of the plant.

1-07.17 Utilities and Similar Facilities

(June 2018 City of Auburn GSP)
Supplement this section with the following.

For the purpose of determining vertical clearance requirements for overhead power and communication lines, all public and private streets within the City of Auburn shall be considered conventional highways and are subject to the requirements stated in WAC 468-34-290 unless otherwise determined by the City Engineer.

(February 2023 City of Auburn GSP)
Supplement this section with the following.

The Contractor is responsible for determining the exact location of existing underground utilities. The Contract Plans may show locations of various known existing above ground and underground amenities and obstructions. If shown, the location of known existing underground utilities are indicated based on available information and may not be exact.

A list of utilities and known contact persons will be available at the pre-construction conference for the Contractor's convenience.

The Contractor is responsible for any breakage of utilities or services resulting from their operations.

The Contractor is responsible for the complete repair (including materials) of any City-owned utility damaged by the work (including water services), whether or not shown on the Contract Plans. Copper water service lines, if damaged, must be replaced in kind by one continuous service line from the water main to the meter. Splicing will not be permitted. The Contractor shall repair any damage caused by broken water mains or services. The Contractor shall have sufficient materials and qualified personnel available to effect immediate repairs of water and sewer lines that may be damaged by the work.

The Contractor shall be responsible for securing private locate services where One-Number Locator Services do not cover (such as property outside the public right of way).

1-07.17(1) Utility Construction, Removal, or Relocation by the Contractor

(City Contracts, April 2017 City of Auburn GSP)
Supplement this section with the following:

The temporary removal, replacement, bracing or holding of any utility or structure, including power and telephone poles, required to accomplish the work, shall be included in the contract price(s) for the bid item(s) involved. Raising, lowering or horizontal relocation of existing water services not requiring additional material, where such relocation is required to accommodate other work, shall be included in the contract price(s) for the bid item(s) involved.

(February 2023 City of Auburn GSP)
Add the following new section:

1-07.17(1)A Disruptions to City Water Services

All water service shutdowns caused by construction activities shall be requested by the Contractor a minimum of 4 working days in advance of the proposed shutdown, shall be approved by the City a minimum of 2 working days before the shutdown, and shall be performed by City Water Utility staff. The Contractor shall schedule Work such that all water service disruptions are limited to 4 hours. The City does not guarantee a complete dry system following any water shutdown.

(City Contracts, February 2023 City of Auburn GSP)
Supplement this section with the following:

All costs for dewatering following a water shutdown shall be included in the unit bid prices of the work involved.

(November 2019 City of Auburn GSP)
Add the following new section:

1-07.17(1)B Utility Potholing

1-07.17(1)B(1)General

The Contractor shall physically locate, uncover, and document the location of underground utilities at the locations identified in the plans. The purpose of utility potholing is to allow sufficient time ahead of pipe laying operations to identify underground conflicts, allow ample time to make minor adjustments in pipe grade and/or alignment, and generally facilitate the Contractor's work schedule.

The Contractor shall submit a potholing plan/schedule to the Engineer for review and/or approval per Section 9-38 (Submittal Approval) prior to commencing potholing or pipe laying operations. The plan shall show the proposed location and clearly state the purpose for each proposed potholing location. The Engineer may add or delete potholing locations.

In no way shall the work described under Utility Potholing relieve the Contractor of any of the responsibilities described in Section 1-07.17 (Utilities and Similar Facilities) of the Standard Specifications and these Special Provisions.

(City Contracts, February 2017 City of Auburn GSP)
Add the following new section:

1-07.17(1)B(2)Measurement

(February 2023 City of Auburn GSP)
"Utility Potholing" will be measured per each pothole excavated that meets all of the following conditions:

1. The pothole was excavated at least 96 hours ahead of pipe laying or other contract work relevant to the pothole.
2. The pothole is shown on the pothole plan submittal approved by the Engineer.
3. The pothole data, including soil type, utility material and size, horizontal location within 1/2 foot, and vertical location within 1/10 foot, is provided in writing to the Engineer at least 72 hours ahead of pipe laying or other contract work relevant to the pothole.
4. Pothole is not within 10 feet of any other pothole. No adjustment shall be made for pothole depth or size. No measurement will be made for potholes that do not meet the above criteria.

(City Contracts, January 2017 City of Auburn GSP)
Add the following new section:

1-07.17(1)B(3)Payment

Payment will be made for each of the following Bid items that are included in the Proposal:

"Utility Potholing", Per Each

Payment for "Utility Potholing" will include all costs for locating, uncovering, and documenting the underground location of utilities, as well as all subsurface and surface restoration measures.

1-07.18 Public Liability and Property Damage Insurance

Delete this section in its entirety, and replace it with the following:

1-07.18 Insurance

(Non-City Contracts, February 2024City of Auburn GSP)
The Contractor will procure and maintain for the duration of this Agreement, insurance against claims for injuries to persons or damages to property which may arise from, or in connection with the performance of work by the Contractor, the Contractor's agents, representatives, employees, and subcontractors. The Contractor is responsible for the cost of insurance.

The Contractor's maintenance of insurance, its scope of coverage, and limits as required herein, will not be construed to limit the liability of the Contractor to the coverage provided by the insurance, or otherwise limit the City's recourse to any remedy available at law or in equity.

The Contractor's required insurance will be of the types and coverage as stated below:

A. Automobile Liability insurance covering all owned, non-owned, hired and leased vehicles. Coverage will be at least as broad as Insurance Services Office (ISO) form CA 00 01. Automobile Liability insurance will include a minimum combined single limit for bodily injury and property damage of $1,000,000 per accident.

B. Commercial General Liability insurance will be at least as broad as ISO occurrence form CG 00 01 and will cover liability arising from premises, operations, stop gap liability, independent contractors, products-completed operations, personal injury and advertising injury, and liability assumed under an insured contract. The Commercial General Liability insurance will be endorsed to provide a per project general aggregate limit, using ISO form CG 25 03 05 09 or an equivalent endorsement. There will be no exclusion for liability arising from explosion, collapse, or underground property damage. The City will be named as an additional insured under the Contractor's Commercial General Liability insurance policy with respect to the work performed for the City using ISO Additional Insured endorsement CG 20 10 10 01 and Additional Insured-Completed Operations endorsement CG 20 37 10 01, or substitute endorsements providing at least as broad coverage. The limits for the Commercial General Liability insurance policy will be no less than $1,000,000 each occurrence, $2,000,000 general aggregate, and a $2,000,000 products- completed operations aggregate limit.

C. Workers' Compensation coverage as required by the Industrial Insurance laws of the State of Washington.

D. Builders Risk insurance covering interests of the City, the Contractor, Subcontractors, and Sub-subcontractors in the work. Builders Risk insurance is only required for Work that includes public buildings or public structures with an estimated value of $1,000,000 or more, and as determined to be required by the City Engineer. Builders Risk insurance will be on a special perils policy form and will insure against the perils of fire and extended coverage and physical loss or damage including flood, earthquake, theft, vandalism, malicious mischief, and collapse. The Builders Risk insurance will include coverage for temporary buildings, debris removal, and damage to materials in transit or stored off-site. This Builders Risk insurance covering the work will have a deductible of $5,000 for each occurrence, which will be the responsibility of the Contractor. Higher deductibles for flood and earthquake perils may be accepted by the City based on a written request by the Contractor and written acceptance by the City. Any increased deductibles accepted by the City will remain the responsibility of the Contractor. The Builders Risk insurance will be maintained until the City has granted substantial completion of the project. Builder's Risk Insurance will be written in the amount of the completed value of the project with no coinsurance provisions.

The Contractor's Automobile Liability, Commercial General Liability, and Builders Risk (if required) insurance policies will be primary insurance as respect to the City. Any Insurance,

self-insurance, or self-insured pool coverage maintained by the City will be in excess of the Contractor's insurance.

The Contractor will assume full responsibility for all loss or damage from any cause whatsoever to any tools, Contractor's employee owned tools, machinery, equipment, or motor vehicles owned or rented by the Contractor or the Contractor's agents, suppliers, contractors, or subcontractors as well as to any temporary structures, scaffolding, and protective fences.

The Contractor and the City waive all rights against each other, any of their Subcontractors, Sub-subcontractors, agents, and employees, each of the other, for damages caused by fire or other perils to the extent covered by Builders Risk insurance or other property insurance obtained pursuant to the Insurance Requirements Section of this Contract or other property insurance applicable to the work.

Insurance is to be placed with insurers with a current A.M. Best rating of not less than A: VII.

Contractor will furnish the City with original certificates and a copy of the amendatory endorsements, including but not necessarily limited to the additional insured endorsements, evidencing the Automobile Liability and Commercial General Liability insurance before beginning work. Before any exposure to loss may occur, the Contractor will file with the City a copy of the Builders Risk insurance policy that includes all applicable conditions, exclusions, definitions, terms, and endorsements related to this project. The City may request that the Contractor furnish certified copies of all required insurance policies, including endorsements, required in this contract and evidence of all subcontractors' coverage.

The Contractor will cause each and every Subcontractor to provide insurance coverage that complies with all applicable requirements of the Contractor-provided insurance, except the Contractor will have sole responsibility for determining the limits of coverage required to be obtained by Subcontractors. The Contractor will ensure that the City is an additional insured on every Subcontractor's Commercial General liability insurance policy using an endorsement at least as broad as ISO Additional Insured endorsement CG 20 38 04 13.

The Contractor will provide the City and all Additional Insureds for this work with written notice of any policy cancellation within two business days of their receipt of that notice.

Should the Contractor fail to maintain the insurance as required the City may, after giving five business days' notice to the Contractor, take actions to protect the interests of the City, which may include, but are not limited to one or more of the following: order suspension of all construction activities, revoke permits issued to the Contractor and its contractors, pursue remedy through the Contractor's surety, and terminate the FAC Agreement associated with the work (if applicable).

1-07.18 Insurance

(City Contracts, January 4, 2024 APWA GSP)

1-07.18(1) General Requirements

A. The Contractor shall procure and maintain the insurance described in all subsections of section 1-07.18 of these Special Provisions, from insurers with a current A. M. Best rating of not less than A-: VII and licensed to do business in the State of Washington. The Contracting Agency reserves the right to approve or reject the insurance provided, based on the insurer's financial condition.

B. The Contractor shall keep this insurance in force without interruption from the commencement of the Contractor's Work through the term of the Contract and for thirty (30) days after the Physical Completion date, unless otherwise indicated below.

C. If any insurance policy is written on a claims-made form, its retroactive date, and that of all subsequent renewals, shall be no later than the effective date of this Contract. The policy shall state that coverage is claims made and state the retroactive date. Claims-made form coverage shall be maintained by the Contractor for a minimum of 36 months following the Completion Date or earlier termination of this Contract, and the Contractor shall annually provide the Contracting Agency with proof of renewal. If renewal of the claims made form of coverage becomes unavailable, or economically prohibitive, the Contractor shall purchase an extended reporting period ("tail") or execute another form of guarantee acceptable to the Contracting Agency to assure financial responsibility for liability for services performed.

D. The Contractor's Automobile Liability, Commercial General Liability and Excess or Umbrella Liability insurance policies shall be primary and non-contributory insurance as respects the Contracting Agency's insurance, self-insurance, or self-insured pool coverage. Any insurance, self-insurance, or self-insured pool coverage maintained by the Contracting Agency shall be excess of the Contractor's insurance and shall not contribute with it.

E. The Contractor shall provide the Contracting Agency and all additional insureds with written notice of any policy cancellation, within two business days of their receipt of such notice.

F. The Contractor shall not begin work under the Contract until the required insurance has been obtained and approved by the Contracting Agency

G. Failure on the part of the Contractor to maintain the insurance as required shall constitute a material breach of contract, upon which the Contracting Agency may, after giving five business days' notice to the Contractor to correct the breach, immediately terminate the Contract or, at its discretion, procure or renew such insurance and pay any and all premiums in connection therewith, with any sums so expended to be repaid to the Contracting Agency on demand, or at the sole discretion of the Contracting Agency, offset against funds due the Contractor from the Contracting Agency.

H. All costs for insurance shall be incidental to and included in the unit or lump sum prices of the Contract and no additional payment will be made.

I. Under no circumstances shall a wrap up policy be obtained, for either initiating or maintaining coverage, to satisfy insurance requirements for any policy required under this Section. A **"**wrap up policy**"** is defined as an insurance agreement or arrangement under which all the parties working on a specified or designated project are insured under one policy for liability arising out of that specified or designated project**.**

1-07.18(2) Additional Insured

All insurance policies, with the exception of Workers Compensation, and of Professional Liability and Builder's Risk (if required by this Contract) shall name the following listed entities as additional insured(s) using the forms or endorsements required herein:

- the Contracting Agency and its officers, elected officials, employees, agents, and volunteers

The above-listed entities shall be additional insured(s) for the full available limits of liability maintained by the Contractor, irrespective of whether such limits maintained by the Contractor are greater than those required by this Contract, and irrespective of whether the Certificate of Insurance provided by the Contractor pursuant to 1-07.18(4) describes limits lower than those maintained by the Contractor.

For Commercial General Liability insurance coverage, the required additional insured endorsements shall be at least as broad as ISO forms CG 20 10 10 01 for ongoing operations and CG 20 37 10 01 for completed operations.

1-07.18(3) Subcontractors

The Contractor shall cause each subcontractor of every tier to provide insurance coverage that complies with all applicable requirements of the Contractor-provided insurance as set forth herein, except the Contractor shall have sole responsibility for determining the limits of coverage required to be obtained by subcontractors.

The Contractor shall ensure that all subcontractors of every tier add all entities listed in 1-07.18(2) as additional insureds, and provide proof of such on the policies as required by that section as detailed in 1-07.18(2) using an endorsement as least as broad as ISO CG 20 10 10 01 for ongoing operations and CG 20 37 10 01 for completed operations.

Upon request by the Contracting Agency, the Contractor shall forward to the Contracting Agency evidence of insurance and copies of the additional insured endorsements of each subcontractor of every tier as required in 1-07.18(4) Verification of Coverage.

1-07.18(4) Verification of Coverage

The Contractor shall deliver to the Contracting Agency a Certificate(s) of Insurance and endorsements for each policy of insurance meeting the requirements set forth herein when the Contractor delivers the signed Contract for the work. Failure of Contracting Agency to demand such verification of coverage with these insurance requirements or failure of Contracting Agency to identify a deficiency from the insurance documentation provided shall not be construed as a waiver of Contractor's obligation to maintain such insurance.

Verification of coverage shall include:

1. An ACORD certificate or a form determined by the Contracting Agency to be equivalent.
2. Copies of all endorsements naming Contracting Agency and all other entities listed in 1-07.18(2) as additional insured(s), showing the policy number. The Contractor may submit a copy of any blanket additional insured clause from its policies instead of a separate endorsement.
3. Any other amendatory endorsements to show the coverage required herein.
4. A notation of coverage enhancements on the Certificate of Insurance shall not satisfy these requirements – actual endorsements must be submitted.

Upon request by the Contracting Agency, the Contractor shall forward to the Contracting Agency a full and certified copy of the insurance policy(s). If Builders Risk insurance is

required on this Project, a full and certified copy of that policy is required when the Contractor delivers the signed Contract for the work.

1-07.18(5) Coverages and Limits

The insurance shall provide the minimum coverages and limits set forth below. Contractor's maintenance of insurance, its scope of coverage, and limits as required herein shall not be construed to limit the liability of the Contractor to the coverage provided by such insurance, or otherwise limit the Contracting Agency's recourse to any remedy available at law or in equity.

All deductibles and self-insured retentions must be disclosed and are subject to approval by the Contracting Agency. The cost of any claim payments falling within the deductible or self-insured retention shall be the responsibility of the Contractor. In the event an additional insured incurs a liability subject to any policy's deductibles or self-insured retention, said deductibles or self-insured retention shall be the responsibility of the Contractor.

1-07.18(5)A Commercial General Liability

Commercial General Liability insurance shall be written on coverage forms at least as broad as ISO occurrence form CG 00 01, including but not limited to liability arising from premises, operations, stop gap liability, independent contractors, products-completed operations, personal and advertising injury, and liability assumed under an insured contract. There shall be no exclusion for liability arising from explosion, collapse or underground property damage.

The Commercial General Liability insurance shall be endorsed to provide a per project general aggregate limit, using ISO form CG 25 03 05 09 or an equivalent endorsement.

Contractor shall maintain Commercial General Liability Insurance arising out of the Contractor's completed operations for at least three years following Substantial Completion of the Work.

Such policy must provide the following minimum limits:

$2,000,000	Each Occurrence
$3,000,000	General Aggregate
$3,000,000	Products & Completed Operations Aggregate
$2,000,000	Personal & Advertising Injury each offence
$2,000,000	Stop Gap / Employers' Liability each accident

1-07.18(5)B Automobile Liability

Automobile Liability shall cover owned, non-owned, hired, and leased vehicles; and shall be written on a coverage form at least as broad as ISO form CA 00 01. If the work involves the transport of pollutants, the automobile liability policy shall include MCS 90 and CA 99 48 endorsements.

Such policy must provide the following minimum limit:

$1,000,000	Combined single limit each accident

1-07.18(5)C Workers' Compensation

The Contractor shall comply with Workers' Compensation coverage as required by the Industrial Insurance laws of the State of Washington.

1-07.18(5)D Excess or Umbrella Liability

(January 4, 2016 APWA GSP)
The Contractor shall provide Excess or Umbrella Liability insurance with limits of not less than $1 million each occurrence and annual aggregate. This excess or umbrella liability coverage shall be excess over and as least as broad in coverage as the Contractor's Commercial General and Auto Liability insurance

All entities listed under 1-07.18(2) of these Special Provisions shall be named as additional insureds on the Contractor's Excess or Umbrella Liability insurance policy.

This requirement may be satisfied instead through the Contractor's primary Commercial General and Automobile Liability coverages, or any combination thereof that achieves the overall required limits of insurance.

1-07.18(5)E LHWCA Insurance

(January 4, 2016 APWA GSP)
If this Contract involves work on or adjacent to Navigable Waters of the United States, the Contractor shall procure and maintain insurance coverage in compliance with the statutory requirements of the U.S. Longshore and Harbor Workers' Compensation Act (LHWCA).

Such policy must provide the following minimum limits:

$1,000,000	Bodily Injury by Accident – each accident
$1,000,000	Bodily Injury by Disease – each employee
$1,000,000	Bodily Injury by Disease – policy limits

1-07.18(5)J Pollution Liability

(January 4, 2016 APWA GSP)
The Contractor shall provide a Contractors Pollution Liability policy, providing coverage for claims involving bodily injury, property damage (including loss of use of tangible property that has not been physically injured), cleanup costs, remediation, disposal or other handling of pollutants, including costs and expenses incurred in the investigation, defense, or settlement of claims, arising out of any one or more of the following:

1. Contractor's operations related to this project.
2. Remediation, abatement, repair, maintenance or other work with lead-based paint or materials containing asbestos.
3. Transportation of hazardous materials away from any site related to this project.

All entities listed under 1-07.18(2) of these Special Provisions shall be named by endorsement as additional insureds on the Contractors Pollution Liability insurance policy.

Such Pollution Liability policy shall provide the following minimum limits:

$1,000,000 each loss and $2,000,000 annual aggregate

1-07.23 Public Convenience and Safety

(January 2023 City of Auburn GSP)

Supplement this section with the following:

The use of any project area by vehicles or pedestrians before project acceptance is not to be construed as utilization by the City of Auburn.

1-07.23(1) Construction Under Traffic

(January 2020 City of Auburn GSP)
Supplement this section with the following:

All unattended excavations shall be barricaded at all times.

Failure to provide proper barricading and lighting will be cause for the City to call in a barricading company to install proper barricades and lights and charge the Contractor for all costs incurred.

At the end of each working day, the Contractor shall place temporary patches or steel plates over unfinished portions of trenches crossing traveled ways. Material for temporary patches shall be hot or cold mix asphalt concrete. The cost for temporary patches or steel plates shall be included in the appropriate unit bid prices for the work involved.

Traffic control devices that are in conflict with required construction traffic devices or construction work shall be covered, removed and temporarily stored, or temporarily relocated by the Contractor.

Flagging, signs, and all other traffic control devices shall be in accordance with Section 1-10.3 (Traffic Control Labor, Procedures, and Devices).

Signal downtime will not be allowed Monday thru Friday between the hours of 6:00 AM and 9:00 AM and between 3:00 PM and 6:00 PM.

(October 2021 City of Auburn GSP)
Supplement this section with the following:

Temporary 'Traffic Signal Revision' signs and signal placards installed per Section 1-10.3(3)N (Temporary Signage for Roadway Traffic Revisions) shall remain in place at each site for a minimum of 6 weeks once work at each individual site is complete and the new signal revisions are operational. Once all physical work is complete at each site and all traffic signals have been deemed operational by the Engineer, the Contract will be placed into suspension until such time when the temporary traffic revision signage and placards can be removed.

(February 2023 City of Auburn GSP)
Add the following new section:

1-07.23(1)A Dust and Mud Control and Street Cleaning

The Contractor is responsible for controlling dust and mud within the project limits. All streets outside the project limits used by the Contractor during the execution of this Contract shall be kept clean. The Contractor shall be prepared to use the proper equipment necessary to render the streets free of all mud, debris, and foreign materials. Any damage caused by dust or mud accumulation on the streets and in the storm sewer system shall be the sole responsibility of the Contractor.

The Contractor's cleaning actions must comply with the City of Auburn's Surface Water Management Manual (SWMM). A copy of the City's SWMM manual can be found on the City's website at auburnwa.gov under publications and forms.

The Contractor shall provide for a clean surface on all surfaced roadways upon completion of each day's activities. Equipment required for this operation shall be on the job site or available at all times. Failure to have this equipment on the job site or available may necessitate a shutdown of the project.

(City Contracts, February 2023 City of Auburn GSP)
Supplement this section with the following:

Payment for dust and mud control and street cleaning shall be included in the unit contract prices for the bid items for which the dust, mud control, and street cleaning work is associated with, and no additional compensation will be made, except for "Water" per M gal., if shown as a bid item in the Proposal.

No compensation shall be made to the Contractor to implement additional erosion control measures that are caused by dust and mud control activities.

(February 2023 City of Auburn GSP)
Add the following new section:

1-07.23(1)B Daily Cleanup and Maintenance Items

The Contractor shall clean all roadways, streets and appurtenances, including sidewalks which are open for public use, of all material or debris that has been dropped or otherwise deposited thereon, as a result of Contractor's on- and off-site operations, at the conclusion of each working day, and at such other times as deemed necessary by the Engineer to ensure the safety of the traveling public and to prevent inconvenience to the public and owners of private property adjacent to the project.

If the Engineer determines that roadways, streets, sidewalks, and appurtenances are not properly cleaned to prevent public inconvenience, or the condition of the excavation or disposal sites so warrant, the Contractor shall provide facilities to remove clay or other deposits from tires, between wheels, and outside of truck beds before trucks and other equipment will be allowed to travel over paved streets.

Upon written notice written notice from the Engineer, any violation of the above requirements will be sufficient grounds for the Engineer to order the roadways, streets and appurtenances cleaned or sprinkled by others at the Contractor's costs.

(City Contracts, February 2023 City of Auburn GSP)
Supplement this section with the following:

The City may deduct all costs of such cleaning or sprinkling from any money due, or to become due, to the Contractor.

1-07.23(2) Construction and Maintenance of Detours

(February 2023 City of Auburn GSP)
Supplement this section with the following:

The Contractor shall submit a written procedure to the Engineer for approval per Section 9-38 (Submittal Approval) for routing and maintenance of traffic.

Streets may be closed to through traffic, unless otherwise specified in Section 1-07.23(1)C (Closure Restrictions), with Engineer approval. The Contractor shall obtain written approval from the Engineer at least 15 working days prior to an anticipated street closure. Street closures shall be such that they provide for maximum public safety and public convenience.

They shall be opened to through traffic at such time as the work has been completed, or as the Engineer may direct.

Street closures and detours shall provide for the following:

1. Reasonable access to, and egress from, the properties adjacent to the project at all times.
2. At least one-way traffic on all existing roadways within the project limits during working hours and at the end of each working day provisions for the safe passage of two-way traffic during the non-working hours.
3. If the Contractor requires delays or limited term street closure beyond that provided for herein, the request shall be submitted, in writing, for the approval of the Engineer before the anticipated delay or closure. The delay or closure request shall state the reason, the locations, the time and date, and the duration of the required delay or closure.
4. The Contractor is required, at its own expense, to remove all excess materials, debris, or other obstruction caused by their operation, from the streets or alleys as the work progresses, whether within the project limits or along haul routes. The Contractor shall repair or replace any streets, sidewalks, roads, or culverts damaged by their operations, to the satisfaction of the Engineer and other concerned parties.
5. The Contractor must maintain convenient access for local traffic to driveways, houses, and buildings along the work route. Such access shall be maintained as near as possible to that which existed before construction began. The Contractor shall provide 10 working days advance notice to all property owners and tenants of street and alley closures or other restrictions, which may interfere with their access. When the abutting owners' access across right-of-way lines is to be eliminated and replaced under the Contract by another access, the existing access shall not be closed until the replacement access facility is available.

The Contractor shall be responsible for making detailed notifications of detours and closures as follows:

1. The Contractor shall provide at least 10 working days advance written notification to the local public transportation organization(s), transit service organizations, Auburn School District Transportation Department, Valley Regional Fire Authority Fire Marshal's Office, and Auburn Police Department before the beginning of operations, so that these agencies may reroute their emergency vehicles around the construction zone. If the Fire Authority or Police Department determine that rerouting is not possible, the Contractor shall allow reasonable access through the construction zone at all times.

2. The Contractor shall notify all affected owners and agencies of all closures, detours and traffic interruptions at least 10 working days in advance of such closure. Notification shall be in writing and must include the beginning and ending times and dates of traffic disruption(s), names of streets or locations of alleys to be affected, detour routes, etc. The Contractor shall give the Engineer written certification of all notifications before all traffic disruptions. On large projects requiring extended traffic disruption, the Contractor shall make additional notifications, as conditions require.

(City Contracts, February 2023 City of Auburn GSP)

Supplement this section with the following:

If the Contractor neglects to remove materials or obstructions and return streets, sidewalks, driveways, and roads in suitable condition for traffic within 1 working day after having received written notice from the Engineer, the work may be done by the City of Auburn and the cost thereof charged to the Contractor and deducted from money due, or to become due, to the Contractor.

(City Contracts, August 2021 City of Auburn GSP)
Add the following new section:

1-07.23(4) Payment

Payment for all Contract requirements specified in Section 1-07.23 (Public Convenience and Safety) and subsections thereof, shall be included in the appropriate unit bid prices for the Work involved, unless otherwise specified.

1-07.24 Rights of Way

(City Contracts, September 2016 City of Auburn GSP)
Delete this section and replace it with the following:

Street right-of-way lines, limits of easements, and limits of construction permits are indicated in the Plans. The Contractor's activities shall be confined within these limits, unless arrangements for use of private property are made.

Whenever easements or rights of entry have not been acquired prior to advertising, these areas are so noted on the Plans. The Contractor shall not proceed with any portion of the work in areas where right-of-way, easements or rights of entry have not been acquired until the Engineer certifies to the Contractor that the right of way or easement is available or that the right of entry has been received. If the Contractor is delayed due to acts of omission on the part of the City in obtaining easements, rights of entry or right of way, the Contractor will be entitled to an extension of time. The Contractor agrees that such delay shall not be a breach of contract.

Whenever any of the work is accomplished on or through property other than public right of way, the Contractor shall meet and fulfill all covenants and stipulations of any easement agreements obtained by the City from the owner of the private property. If easement agreements were obtained by the City as part of this project, they are included in the Appendix. Copies of the easement agreements not obtained prior to advertising will be made available to the Contractor once obtained by the City.

The Contractor shall give 48 hours' notice to each property owner prior to entry of each property. This includes entry onto easements and private property where private improvements must be adjusted.

The Contractor shall be responsible for providing, without expense or liability to the City, any additional land and access thereto that the Contractor may desire for temporary construction staging facilities, Contractor's convenience, storage or materials, or other Contractor needs. However, before using any private property, whether adjoining the work or not, the Contractor shall submit to the City a completed "Property Owner Permission for Construction" form. The "Property Owner Permission for Construction" form is available at the City of Auburn Public Works Department. If the Contractor utilizes private property for temporary construction facilities, storage of materials and equipment, employee parking or other Contractor needs, a "Temporary Use Permit" shall be secured from the City of Auburn in accordance with Section 18.46A.070 of the Auburn City Code. The Contractor must file a written release with

the City from all private property owners upon whose property the Contractor's operations has encroached before completion, unless such work was specified in the Contract.

(January 2023 City of Auburn GSP)
Add the following new section:

1-07.29 Haul Routes

Prior to moving any materials or equipment on public streets, the Contractor shall submit a haul route plan to the Engineer for approval per Section 9-38 (Submittal Approval). The plan must be submitted 10 working days prior to hauling. The Engineer must approve the haul route plan before hauling begins.

If the Contractor hauls materials or equipment without an approved haul route plan or not in accordance with an approved haul route, the Contractor may be assessed penalties per Section 1-08.9(1) (Penalties). The assessment of penalties is at the sole discretion of the Engineer.

1-08 Prosecution and Progress

(Non-City Contracts, February 2023 City of Auburn GSP)
Add the following new section:

1-08.0 Preliminary Matters

1-08.0(1) Preconstruction Conference

(Non-City Contracts, December 2019 City of Auburn GSP)
Prior to beginning construction work a preconstruction conference will be scheduled between the Contractor, the Engineer and such other interested parties as may be invited.

The purpose of the preconstruction conference will be:

1. To review the initial progress schedule;
2. To establish a working understanding among the various parties associated or affected by the work;
3. To establish and review procedures for notifications, approvals, submittals, etc.;
4. To establish normal working hours for the work;
5. To review safety standards and traffic control; and
6. To discuss such other related items as may be pertinent to the work.

The Contractor shall prepare and submit electronically 1 working day prior to the preconstruction conference, the following, per Section 9-38 (Submittal Approval):

1. Preliminary progress schedule.
2. SPCC Plan per Section 1-07.15(1) of the Contract Documents.

In addition, the Contractor shall prepare and submit electronically 1 working day prior to the preconstruction conference:

1. Emergency Call List; and
2. A Preliminary Schedule of Submittals

1-08.0(2) Hours of Work

(Non-City Contracts, February 2023 City of Auburn GSP)
Except in the case of emergency or unless otherwise approved by the Engineer, normal working hours shall be from between 7:00 a.m. and 6:00 p.m. Monday through Friday. If the Contractor desires different than the normal working hours stated above, the request

All working hours and days are also subject to local permit and ordinance conditions (such as noise ordinances).

If the Contractor wishes to deviate from the established working hours, the Contractor shall submit a written request to the Engineer for consideration. This request shall state what hours are being requested, and why. Requests shall be submitted for review no later than 5 working days prior to the day(s) the Contractor is requesting to change the hours.

If the requested working hour deviation is approved by the Engineer, it may be revoked at any time the City receives complaints from the public or adjoining property owners regarding the noise from the Contractor's operations.

(City Contracts, December 2021 City of Auburn GSP)
Add the following new section:

1-08.0 Preliminary Matters

1-08.0(1) Preconstruction Conference

Following notice of award of the contract by the City, a preconstruction conference will be scheduled between the Contractor, the Engineer, and such other interested parties as may be invited.

The purpose of the preconstruction conference will be:

1. To review the initial progress schedule;
2. To establish a working understanding among the various parties associated or affected by the work;
3. To establish and review procedures for progress payments, notifications, approvals, submittals, etc.;
4. To establish normal working hours for the work;
5. To review safety standards and traffic control; and
6. To discuss such other related items as may be pertinent to the work.

The Contractor shall prepare and submit electronically 1 working day prior to the preconstruction conference, the following, per Section 9-38 (Submittal Approval):

1. A breakdown of all lump sum payment items, except for the lump sum payment items for:
    - Traffic Control Supervisor; and
    - Mobilization; and
    - Record Drawings
2. Preliminary progress schedule.
3. SPCC Plan per Section 1-07.15(1) of the Contract Documents.

In addition, the Contractor shall prepare and submit electronically 1 working day prior to the preconstruction conference:

1. Requests to Sublet for all remaining subcontractors not included in the bid submittal which must be approved prior to payment;
2. Emergency Call List; and
3. Schedule of equipment and labor rates for force account payment, as outlined in Section 1-09.6 (Force Account).

(City Contracts, December 8, 2014 APWA GSP)
Add the following new section:

1-08.0(2) Hours of Work

Except in the case of emergency or unless otherwise approved by the Engineer, the normal working hours for the Contract shall be any consecutive 8-hour period between 7:00 a.m. and 6:00 p.m. Monday through Friday, exclusive of a lunch break. If the Contractor desires different than the normal working hours stated above, the request must be submitted in writing prior to the preconstruction conference, subject to the provisions below. The working hours for the Contract shall be established at or prior to the preconstruction conference.

All working hours and days are also subject to local permit and ordinance conditions (such as noise ordinances).

If the Contractor wishes to deviate from the established working hours, the Contractor shall submit a written request to the Engineer for consideration. This request shall state what hours are being requested, and why. Requests shall be submitted for review no later than 5 working days prior to the day(s) the Contractor is requesting to change the hours.

If the Contracting Agency approves such a deviation, such approval may be subject to certain other conditions, which will be detailed in writing. For example:

1. On non-Federal aid projects, requiring the Contractor to reimburse the Contracting Agency for the costs in excess of straight-time costs for Contracting Agency representatives who worked during such times. (The Engineer may require designated representatives to be present during the work. Representatives who may be deemed necessary by the Engineer include, but are not limited to: survey crews; personnel from the Contracting Agency's material testing lab; inspectors; and other Contracting Agency employees or third party consultants when, in the opinion of the Engineer, such work necessitates their presence.)
2. Considering the work performed on Saturdays, Sundays, and holidays as working days with regard to the contract time.
3. Considering multiple work shifts as multiple working days with respect to contract time even though the multiple shifts occur in a single 24-hour period.
4. If a 4-10 work schedule is requested and approved the non working day for the week will be charged as a working day.
5. If Davis Bacon wage rates apply to this Contract, all requirements must be met and recorded properly on certified payroll.

(City Contracts, February 2016 City of Auburn GSP)

Supplement this section with the following:

If the requested working hour deviation is approved by the Engineer, it may be revoked at any time the City receives complaints from the public or adjoining property owners regarding the noise from the Contractor's operations. The Contractor shall have no claim for damages or delays should such permission be revoked for any reason.

Reimbursements by the Contractor to the Contracting Agency for overtime work will be deducted from amounts due, or to become due, to the Contractor. The Contractor by these specifications does hereby authorize the Engineer to deduct such costs from the amount due or to become due to the Contractor.

1-08.1 Subcontracting

(City Contracts, December 2016 City of Auburn GSP)
Supplement this section with the following:

Until the City has received and approved the "Request to Sublet" form provided by the City and filled out by the Contractor for a specific Subcontractor, said Subcontractor shall not begin any work within the project limits or within the City furnished sites. The Contractor and Subcontractor shall bear all risks for any work begun outside such areas and for any materials ordered by said Subcontractor before the "Request to Sublet" specific to said Subcontractor is approved.

1-08.3 Progress Schedule

1-08.3(1) Progress Schedule Types

(City Contracts, December 2016 City of Auburn GSP)
Supplement this section with the following:

The City requires the use of a Type A Progress Schedule as detailed in Section 1-08.3(2)A (Type A Progress Schedules) for this project.

1-08.3(2) General Requirements

(City Contracts, May 2020 City of Auburn GSP)
Supplement this section with the following:

The Contractor shall submit electronically a Preliminary Progress Schedule (first 30 working days) to the Engineer no later than 1 working day prior to the date of the Pre-construction Conference. This preliminary schedule shall show work to be performed during the first 30 working days of the Contract. Acceptance of the Preliminary Progress Schedule shall be required prior to the execution of the Contract by the City.

The Engineer will periodically check actual progress of the work against the progress schedule. If the proposed construction schedule cannot be met, the Engineer will require the Contractor to submit a revised schedule to the Engineer for acceptance. The approved revisions will thereafter, in all respects, apply in lieu of the original schedule.

Failure of the Contractor to follow the progress schedule submitted and accepted, including revisions thereof, shall relieve the City of any and all responsibility for furnishing and making available all or any portion of the project site from time to time, and will relieve the City of any responsibility for delays to the Contractor in the performance of the work.

1-08.3(2)A Type A Progress Schedules

(City Contracts, March 2018 City of Auburn GSP)

Replace this section with the following:

The Contractor shall submit a Type A Progress Schedule in accordance with Section 9-38 (Submittal Approval) of the Contract Specifications. The Progress Schedule shall show the total working days and shall be submitted prior to the first working day of the Contract. The schedule may be a critical path method (CPM) schedule, bar chart, or other standard schedule format. Regardless of which format is used, the schedule shall identify the critical path. The Engineer will evaluate the Type A Progress Schedule and approve or return the schedule for corrections within 10 calendar days of receiving the submittal.

1-08.3(5) Payment

(City Contracts, October 2021 City of Auburn GSP)
Replace this section with the following:

The cost of preparing the progress schedule, maintaining and submitting any supplementary progress schedules, and providing weekly schedules shall be included in the unit contract bid item prices for other work.

(City Contracts, January 2023 City of Auburn GSP)
Add the following new section:

1-08.3(7) Progress Meeting

At a minimum, weekly progress meetings will be conducted with the Contractor and City personnel. Additional meetings may be required for coordination of Contractor work with other contractors, agencies, or interested parties.

The determination of time, place, and frequency of required progress meetings will be established at the Preconstruction Conference for this contract.

1-08.4 Prosecution of the Work

(Non-City Contracts, February 2023 City of Auburn GSP)
Delete the first paragraph and replace it with the following:

The Contractor shall not commence with the work until the Engineer has given the Notice to Proceed. The Contractor shall give the City at least three (3) working days advance notice before beginning each phase of the work (such as excavation, street paving, etc.). The Contractor shall diligently pursue the work to be completed within the existing public Right-of-way in the agreed upon timeframe. This timeframe shall be established by the submittal and acceptance of a construction schedule addressing all items of work and their completion

(City Contracts, June 2020 City of Auburn GSP)
Delete this section in its entirety, including heading, and replace it with the following:

1-08.4 Notice to Proceed and Prosecution of the Work

The Notice to Proceed Date shall be within 10 working days of the execution of the Contract by the City. The City will send a dated and signed official “Notice to Proceed” to the Contractor. The Contract time shall begin on the first working day following the “Notice to Proceed Date.”

The Contractor shall not commence with the Work until the City has executed the Contract and the Engineer has given the Notice to Proceed. The Contractor shall give the City at least 3 working days advance notice before beginning each phase of the Work (such as

excavation, street paving, etc.). The Contractor shall commence construction activities within 10 calendar days of the Notice to Proceed Date, unless otherwise approved in writing. The Contractor shall diligently pursue the work to the physical completion date within the time specified in the contract. Voluntary shutdown or slowing of operations by the Contractor shall not relieve the Contractor of the responsibility to complete the work within the time(s) specified in the contract.

1-08.5 Time for Completion

(City Contracts, September 2016 City of Auburn GSP)
Revise the last sentence of the first paragraph to read:

The days between December 25th and January 1st will classified as non-working days, provided that the Contractor actually suspends work on the Project.

(City Contracts, January 2023 City of Auburn GSP)
Revise the third and fourth paragraphs to read:

Contract time shall begin on the first working day following the Notice to Proceed Date.

Each working day shall be charged to the contract as it occurs, until the contract work is physically complete. If substantial completion has been granted and all the authorized working days have been used, charging of working days will cease. Each week the Engineer will provide the Contractor a statement that shows the number of working days: (1) charged to the contract the week before; (2) specified for the physical completion of the contract; and (3) remaining for the physical completion of the contract. The statement will also show the nonworking days and any partial or whole day the Engineer declares as unworkable. The statement will be identified as a Written Determination by the Engineer. If the Contractor does not agree with the Written Determination of working days, the Contractor shall pursue the protest procedures in accordance with Section 1-04.5. By failing to follow the procedures of Section 1-04.5, the Contractor shall be deemed as having accepted the statement as correct.

(City Contracts, March 2022 City of Auburn GSP)
Revise the sixth paragraph to read:

The Engineer will give the Contractor written notice of the completion date of the contract after all the Contractor's obligations under the contract have been performed by the Contractor. The following events must occur before the Completion Date can be established:

1. The physical work on the project must be complete; and
2. The Contractor must furnish all documentation required by the contract and required by law, to allow the Contracting Agency to process final acceptance of the contract.

The following documents must be received by the Project Engineer prior to the City issuing final payment:

a. Material Acceptance Certification Documents
b. Property owner releases per Section 1-07.24

The following documents must be received by the Project Engineer prior to establishing a completion date:

a. Certified Payrolls (per Section 1-07.9(5)).
b. Monthly Reports of Amounts Credited as DBE Participation, as required by the Contract Provisions.

c. Copies of the approved "Affidavit of Prevailing Wages Paid" for the Contractor and all Subcontractors

(City Contracts, January 2023 City of Auburn GSP)
Supplement this section with the following:

The entire project, including cleanup, shall be physically completed within the Contract working days, beginning on the day after the "Notice to Proceed" date. The City, for justified reasons, may extend the contract time in accordance with Section 1-08.8 (Extensions of Time).

Late delivery of materials may be considered a justified reason for a time extension or Procurement Suspension per Section 1-08.6 (Suspension of Work), if the Contractor can show written evidence of a prompt order date after award of the Contract, demonstrate determined effort to acquire prompt delivery in the specified time, and comply with other requirements as specified in the Contract Documents.

1-08.6 Suspension of Work

(City Contracts, November 2019 City of Auburn GSP)
Supplement this section with the following:

Contract time may be suspended for procurement of critical materials (Procurement Suspension). In order to receive a Contract suspension, the Contractor shall, submit to the Engineer evidence of purchase orders made for all materials deemed critical by the Contracting Agency for physical completion of the contract. The Contractor shall provide copies of purchase orders and supplier invoices for the critical materials. Such supplier invoices and/or purchase orders shall indicate the purchase order date and estimated delivery date for the critical materials. Contractor's requests for Contract suspensions must be made in writing and shall include a progress schedule(s) that reflects the anticipated suspension.

1-08.9 Liquidated Damages

(City Contracts, March 3, 2021 APWA GSP, Option B)
Revise the second and third paragraphs to read:

Accordingly, the Contractor agrees:

1. To pay (according to the following formula) liquidated damages for each working day beyond the number of working days established for Physical Completion, and
2. To authorize the Engineer to deduct these liquidated damages from any money due or coming due to the Contractor.

Liquidated Damages Formula

LD=0.15C/T

Where:

LD = liquidated damages per working day (rounded to the nearest dollar)

C = original Contract amount

T = original time for Physical Completion

When the Contract Work has progressed to Substantial Completion as defined in the Contract, the Engineer may determine the Contract Work is Substantially Complete. The Engineer will notify the Contractor in writing of the Substantial Completion Date. For overruns in Contract time occurring after the date so established, the formula for liquidated damages shown above will not apply. For overruns in Contract time occurring after the Substantial Completion Date, liquidated damages shall be assessed on the basis of direct engineering and related costs assignable to the project until the actual Physical Completion Date of all the Contract Work. The Contractor shall complete the remaining Work as promptly as possible. Upon request by the Project Engineer, the Contractor shall furnish a written schedule for completing the physical Work on the Contract.

(City Contracts, October 2021 City of Auburn GSP)
Add the following new section:

1-08.9(1) Penalties

If the Contractor implements traffic control without an approved traffic control plan or is not in compliance with an approved traffic control plan per Section 1-10 (Temporary Traffic Control), or if the Contractor hauls materials without an approved haul route or does not follow an approved haul route per Section 1-07.28 (Haul Routes), the Contractor will be assessed penalties equal to 10% of the calculated Liquidated Damages per Section 1-08.9 (Liquidated Damages) per incident or $1,500 per day, whichever is greater. A Traffic Control incident is defined as, per day, per location. A Haul Route incident is defined as one truckload of materials or equipment.

(Non-City Contracts, February 2023 City of Auburn GSP)
Add the following new section:

1-08.9(1) Penalties

If the Contractor implements traffic control without an approved traffic control plan or is not in compliance with an approved traffic control plan per Section 1-10 (Temporary Traffic Control), or if the Contractor hauls materials without an approved haul route or does not follow an approved haul route per Section 1-07.28 (Haul Routes), the City may, take actions to protect the interests of the City, which may include, but are not limited to one or more of the following: order suspension of all construction activities, revoke permits issued to the Contractor and its contractors, pursue remedy through the Contractor's surety, terminate the FAC Agreement associated with the work (if applicable), and assess penalties as defined in Auburn City Code Section 9.90.030, as applicable.

1-09 Measurement and Payment

1-09.1 Measurement of Quantities

(City Contracts, December 2016 City of Auburn GSP)
Supplement this section with the following:

The quantities shown in the Proposal and Contract forms are estimates only, being given only as a basis for bid comparisons. The basis of payment for each bid item will be the actual work performed and measured in accordance with the Contract.

Where items are specified to be paid for by the ton, the Contractor is responsible for providing a certified weight ticket to the Project Inspector for each truckload delivered. Pay quantities

will be prepared on the basis of these weight tickets, and tickets not received by the Inspector will not be honored for payment.

1-09.2 Weighing Equipment

1-09.2(1) General Requirements for Weighing Equipment

(City Contracts, September 2021 City of Auburn GSP)
Supplement this section with the following:

Electronic Truck Tickets shall be made electronically and shall be transmitted via e-mail as a PDF to PWTruckTickets@auburnwa.gov. The e-mail subject line of electronic Truck Ticket's shall include the following: Project Number, Project Name, Truck Ticket Number.

Emailed truck tickets shall be grouped and combined into one email by delivery date when possible.

In the event the Contractor cannot provide electronic truck tickets, the Contractor may request to submit them as a hardcopy. Hardcopy truck tickets shall be submitted within 2 working days of when the materials were delivered to the project site to receive payment.

1-09.2(5) Measurement

(City Contracts, December 30, 2022 APWA GSP)
Revise the first paragraph to read:

Scale Verification Checks – At the Engineer's discretion, the Engineer may perform verification checks on the accuracy of each batch, hopper, or platform scale used in weighing contract items of Work.

1-09.3 Scope of Payment

(City Contracts, September 2021 City of Auburn GSP)
Supplement this section with the following:

A separate delivery ticket for each truckload of bulk material (gravel, crushed rock, etc.) shall be furnished to the City. Truck tickets that are not submitted within 2 working days of when the materials were delivered to the project site shall not be accepted for payment.

There will be no separate payment for "haul" for any bid item or portion thereof in this Contract, unless specified otherwise. All bid items dealing directly with or implying movement of any material to or from the project area or in the project area itself are hereby understood to include full payment for all movement of material.

1-09.4 Equitable Adjustment

(City Contracts, April 2006 City of Auburn GSP)
The first paragraph, Item 2b is revised to read as follows:

b. 1-09.6 (Force Account)

1-09.6 Force Account

(City Contracts, December 30, 2022 APWA GSP)
Supplement this section with the following:

The Contracting Agency has estimated and included in the Proposal, dollar amounts for all items to be paid per force account, only to provide a common proposal for Bidders. All such dollar amounts are to become a part of Contractor's total bid. However, the Contracting

Agency does not warrant expressly or by implication, that the actual amount of work will correspond with those estimates. Payment will be made on the basis of the amount of work actually authorized by the Engineer.

(City Contracts, February 2017 City of Auburn GSP)
Supplement this section with the following:

All force account work shall be accounted for daily and entered by the Contractor onto the City of Auburn 'Daily Report of Force Account Worked' form (Force Account form). The City Inspector will sign the Force Account form in the field, however compensation for the work indicated is subject to Engineer approval. The signature on the form from the Inspector does not constitute Engineer approval. The contractor shall provide labor and equipment details for force account work to the City before work begins.

1-09.8 Payment for Material on Hand

(City Contracts, April 2017 City of Auburn GSP)
Supplement this section with the following:

Payment for materials on hand shall only be considered if, in the sole opinion of the engineer, the material is stored in a safe, secure, and controlled environment.

1-09.9 Payments

(City Contracts, March 2022 City of Auburn GSP)
Delete this section and replace it with the following:

The basis of payment will be the actual quantities of Work performed according to the contract and as specified for payment.

The Contractor shall submit a breakdown of the cost of lump sum bid items per Section 1-08.0(1) (Preconstruction Conference), to enable the Project Engineer to determine the Work performed on a monthly basis. A breakdown is not required for lump sum items that include a basis for incremental payments as part of the respective Specification. Absent a lump sum breakdown, the Project Engineer will make a determination based on information available. The Project Engineer's determination of the cost of work shall be final.

Progress payments for completed work and material on hand will be based upon progress estimates prepared by the Engineer. A progress estimate cutoff date will be established at the preconstruction conference.

The initial progress estimate will be made not later than 30 days after the Contractor commences the work, and successive progress estimates will be made every month thereafter until the Completion Date. Progress estimates made during progress of the work are tentative, and made only for the purpose of determining progress payment. The progress estimates are subject to change at any time prior to the calculation of the Final Payment.

The value of the progress estimate will be the sum of the following:

1. Unit Price Items in the Bid Form — the approximate quantity of acceptable units of work completed multiplied by the unit price.
2. Lump Sum Items in the Bid Form — based on the approved Contractor's lump sum breakdown for that item, or absent such a breakdown, based on the Engineer's determination.
3. Materials on Hand — 100 percent of invoiced cost of material delivered to Job site or other storage area approved by the Engineer.

4. Change Orders — entitlement for approved extra cost or completed extra work as determined by the Engineer.

Progress payments will be made in accordance with the progress estimate less:

1. Retainage per Section 1-09.9(1); on non FHWA-funded projects
2. The amount of Progress Payments previously made; and
3. Funds withheld by the Contracting Agency for disbursement in accordance with the Contract Documents.

Progress payments for work performed shall not be evidence of acceptable performance or an admission by the Contracting Agency that any work has been satisfactorily completed. The determination of payments under the contract will be final in accordance with Section 1-05.1.

Failure to perform any of the obligations under the Contract by the Contractor may be decreed by the Contracting Agency to be adequate reason for withholding any payments until compliance is achieved.

The Contractor shall sign electronically using the software provided by the Contracting Agency and return the Final Pay Estimate as indicated in this section.

Upon completion of all Work and after final inspection (Section 1-05.11), the amount due the Contractor under the Contract will be paid based upon the final estimate made by the Engineer and presentation of a Final Pay Estimate to be signed by the Contractor. The Contractor's signature on such Final Pay Estimate shall be deemed a release of all claims of the Contractor unless a Certified Claim is filed in accordance with the requirements of Section 1-09.11 and is expressly excepted from the Contractor’s certification on the Final Pay Estimate.

If the Contractor fails, refuses, or is unable to sign and return the Final Pay Estimate or any other documentation required before Contract Completion and final acceptance can occur, the Contracting Agency reserves the right to establish a Completion Date (for the purpose of meeting the requirements of RCW 60.28) and unilaterally accept the Contract. Unilateral Contract Completion and final acceptance will occur only after the Contractor has been provided the opportunity, by written request from the Engineer, to voluntarily submit such documents. If voluntary compliance is not achieved, formal notification of the impending unilateral establishment of a Completion Date and final acceptance will be provided by certified letter or email with delivery confirmation from the Contracting Agency to the Contractor, which will provide 30 calendar days for the Contractor to submit the signed Final Pay Estimate. The 30 calendar day period will begin on the date the certified letter or email with delivery confirmation is received by the Contractor, whichever occurs first. The date the Contracting Agency unilaterally signs the Final Pay Estimate shall then constitute the Completion Date and the final acceptance date (Section 1-05.12). The reservation by the Contracting Agency to unilaterally accept the Contract will apply to Contracts that are Physically Completed in accordance with Section 1-08.5, or for Contracts that are terminated in accordance with Section 1-08.10. Unilateral final acceptance of the Contract by the Contracting Agency does not in any way relieve the Contractor of their responsibility to comply with all Federal, State, tribal, or local laws, ordinances, and regulations that affect the Work under the Contract.

Payment to the Contractor of partial estimates, final estimates, and retained percentages shall be subject to controlling laws.

The Contractor shall submit to the City, no later than 3 working days after the 20th day of each month, all documentation for payment for work completed during the previous period. All monthly pay requests are subject to approval and verification by the Engineer. Typical payment periods are from the 21st day to the 20th day of each month.

Errors, omissions, revisions or corrections in the original submittal for payment may result in delayed payment. The Contractor is responsible for maintaining adequate records of bid item quantities for the work completed for each monthly pay period. These quantities will be subject to approval and verification by the Engineer.

All progress payments will be mailed to the address designated in writing by the Contractor at the preconstruction conference.

Final payment does not constitute Final Acceptance of the Contract Work.

1-09.9(1) Retainage

(City Contracts, January 2023 City of Auburn GSP)
Supplement this section with the following:

In addition to the amount RCW 60.28 requires to be withheld from the progress or retained percentage payments to the Contractor, the City of Auburn may, at its sole discretion, withhold amounts sufficient to pay any property damage claim of which the City may have knowledge and regardless of the informalities of notice of such claim, arising out of the performance of this Contract, provided that the total amounts withheld for such purposes shall not exceed 3% of the Contract price. The term “property damage claim” shall not include any claim for personal injuries or any claim by persons furnishing supplies or materials or performing labor for the Contractor. The amount withheld will not be paid to the claimant by the City but will be held until either the Contractor secures a written release from the claimant, obtains a court decision that such claim is without merit, or satisfies any judgment in favor of the claimant on such claim.

1-09.11 Disputes and Claims

1-09.11(2) Claims

(City Contracts, August 2021 City of Auburn GSP)
Revise the first paragraph to read:

If the Contractor claims that additional payment is due and the Contractor has pursued and exhausted all the means provided in Sections 1-04.5 and 1-04.5(1) to resolve a dispute, the Contractor may file a claim as provided in this section. The Contractor shall submit to the Engineer written notification of intent to file a Certified Claim within 14 calendar days from the issuance of the Engineer’s determination on merit of the protest pursuant to Section 1-04.5. The Contractor agrees to waive any claim for additional payment if the written notifications provided in Section 1-04.5 are not given, or if the Engineer is not afforded reasonable access by the Contractor to complete records of actual cost and additional time incurred as required by Section 1-04.5, or if a claim is not filed as provided in this section. The fact that the Contractor has provided a proper notification, provided a properly filed claim, or provided the Engineer access to records of actual cost, shall not in any way be construed as proving or substantiating the validity of the Certified Claim.

1-09.11(3) Time Limitation and Jurisdiction

(City Contracts, September 2021 City of Auburn GSP)
Delete this section and replace it with the following:

For the convenience of the parties to the Contract it is mutually agreed by the parties that any claims or causes of action which the Contractor has against the Contracting Agency arising from the Contract shall be brought within 30 calendar days from the date the of Contract Completion and final acceptance as indicated in Section 1-09.9; and it is further agreed that any such claims or causes of action shall be brought only in the Superior Court of King County unless otherwise agreed in writing by the parties. The parties understand and agree that the Contractor's failure to bring suit within the time period provided, shall be a complete bar to any such claims or causes of action. It is further mutually agreed by the parties that when any claims or causes of action which the Contractor asserts against the Contracting Agency arising from the Contract are filed with the Contracting Agency or initiated in court, the Contractor shall permit the Contracting Agency to have timely access to any records deemed necessary by the Contracting Agency to assist in evaluating the claims or action.

1-09.13 Claims Resolution

(City Contracts, August 2021 City of Auburn GSP)
Section 1-09.13 (Claims Resolution) is deleted.

1-10 Temporary Traffic Control

1-10.1 General

(City Contracts, February 2023 City of Auburn GSP)
Supplement this section with the following:

The Contractor is responsible for distributing City provided informational flyers to affected property owners. The flyers shall be hand-delivered to these properties before the start of construction and shall include the name of the project, funding source, general contractor, approximate date for start and completion of construction activities. The Contractor shall provide traffic control for City provided inspection, testing, and survey as requested by the Engineer.

(Non-City Contracts, February 2023 City of Auburn GSP)
Supplement this section with the following:

When specified on the Plans, issued as a permit condition, or otherwise directed by the City, the Contractor is responsible for distributing informational flyers to affected property owners. The flyers shall be hand-delivered to these properties before the start of construction and shall include the name of the project, general contractor contact information, approximate date for start and completion of construction activities. The Contractor shall provide traffic control for City provided inspection, testing, and survey as requested by the Engineer.

1-10.2 Traffic Control Management

1-10.2(2) Traffic Control Plans

(City Contracts, February 2023, City of Auburn GSP)
Supplement this section with the following:

When traffic control Plans and/or pedestrian accommodation Plans are included with the Contract Documents, they have been furnished as a guide to be used by the Contractor and serve as a "starting point" for the Contractor's development of the traffic control Plans and pedestrian accommodation Plans for the project.

(February 2023, City of Auburn GSP)
Supplement this section with the following:

The Contractor shall prepare Traffic Control Plans that conform to the established standards for plan development as shown in the MUTCD, 2009 Edition, Part VI, and the WSDOT Work Zone Traffic Control Guidelines, latest edition. A separate pedestrian traffic control plan shall be required from the Contractor if normal pedestrian travel is affected by the Contractors actions. The Contractor shall submit the Traffic Control Plan and/or Pedestrian Accommodation Plan to the Engineer for review and approval at least 5 working days in advance of the time the traffic control devices, including signs, are scheduled to be installed and utilized. Traffic Control Plans and Pedestrian Accommodation Plans shall be submitted per Section 9-38.1 (Submittals) and shall include the City's Traffic Control Plan Checklist with each submittal. The Engineer must approve the Traffic Control Plan before any onsite work begins on the project. Any modifications or deviations from the approved Traffic Control Plan will require review and approval by the Engineer. The Contractor's failure to obtain approval on Traffic Control Plans may result in penalties being assessed per Section 1-08.9(1) (Penalties).

Outside edges of the traveled way may be delineated with traffic safety drums or tubular markers providing that the requirements of Section 1-07.23(1) (Construction Under Traffic) are met. Barricades shall be in accordance with the applicable Standard Plans.

1-10.3 Traffic Control Labor, Procedures, and Devices

1-10.3(1) Traffic Control Labor

1-10.3(1)B Other Traffic Control Labor

(February 2023 City of Auburn GSP)
Supplement this section with the following:

When working within signalized intersections, the Contractor shall schedule and coordinate the use of City provided uniformed police officers to control traffic. Contractor is responsible for all coordination with the City of Auburn Police Department to secure a uniformed police officer as required. This coordination shall be done a minimum of 3 working days in advance of the day a uniformed police officer is necessary. When the City of Auburn Police Department is not able to secure a uniformed police officer, the Contractor shall provide uniformed officers from outside police agencies and shall contract for those services directly. Contractor shall notify the Engineer prior to the use of outside agency police services.

(City Contracts, February 2023 City of Auburn GSP)
Supplement this section with the following:

When included in the Proposal, the City will reimburse the Contractor for the cost of uniformed police officers services as indicated in Section 1-10.5 (Payment) of these Special Provisions. If not included in the Proposal, cost of uniformed police services shall be incidental to the Contract and no additional payment shall be made.

1-10.3(3) Traffic Control Devices

1-10.3(3)A Construction Signs

(City Contracts, December 2016 City of Auburn GSP)
Supplement this section with the following:

When included in the Proposal, the Contractor shall provide and install "Construction Site Sign(s)" in accordance with the contract documents 2 working days in advance of any on site construction activities. Installation of the signs shall be in accordance with Section 1-10.3(3) (Construction Signs) and the applicable City of Auburn Standard Detail.

(April 2018 City of Auburn GSP)
Add the following new section:

1-10.3(3)N Temporary Signage for Roadway Traffic Revisions

Temporary "Traffic Revision Ahead" (W20-901) signs with two warning flags shall be installed in advance of roadway projects that include traffic revisions. Temporary "New Signal Ahead" (W20-902) signs with two warning flags shall be installed in advance of the intersection on all approaches to the new signal. Temporary "Traffic Signal Revision" (W20-903) signs with two warning flags shall be installed in advance of each intersection approach with signal modifications. A 12-inch x 12-inch warning placard shall be affixed to the top of each signal head being modified. Warning signs shall be mounted on 4"x 4" wooden posts and placed per plan and MUTCD requirements. The Contractor shall remove all temporary signs and posts no earlier than 3 months and no later than 6 months following completion of the traffic revisions. Posthole voids shall be restored with native material.

1-10.4 Measurement

1-10.4(2) Item Bids with Lump Sum for Incidentals

(City Contracts, January 2023 City of Auburn GSP)
Revise the fifth and sixth paragraphs to read:

"Sequential Arrow Sign" will be measured by the day for each 24-hour day or partial day in use. Signs not specifically approved for use will not be measured for separate payment.

"Portable Changeable Message Sign" will be measured by the day for each 24-hour day or partial day in use. Signs not specifically approved for use will not be measured for separate payment.

1-10.5 Payment

1-10.5(2) Item Bids With Lump Sum for Incidentals

(City Contracts, January 2023 City of Auburn GSP)
Supplement this section with the following:

Payment will be made for each of the following Bid items when included in the Proposal:

"Flaggers (Min. Bid _____ per hour)", Per Hour

"Traffic Control Labor (Min. Bid _____ per hour)", Per Hour

"Other Temporary Traffic Control", Per Lump Sum

"Sequential Arrow Sign", Per Day

"Portable Changeable Message Sign", Per Day

"Outside Agency Uniformed Police Flagging Labor", Estimate

"Construction Site Sign(s)", Per Each

Payment for "Traffic Control Supervisor" will be made on a prorated monthly basis for work completed.

The unit contract price bid per hour for "Flaggers (Min. Bid _____ per hour)" when applied to the number of units measured for this item in accordance with Section 1-10.4(2), shall be full compensation for all costs incurred by the Contractor in performing the Work defined in Section 1-10.3(1)A. Should the Contractor determine that the cost for this work is greater than the minimum price shown, the Contractor may bid a higher price. Should the Contractor write in a unit price less than the minimum price shown, the minimum unit price shown shall govern and become part of the bid.

The lump sum contract price for "Other Temporary Traffic Control" shall be full compensation for all costs incurred by the Contractor in performing the Work defined in Section 1-10, and which costs are not compensated by one of the items listed in this section.

The unit contract price bid per day for "Sequential Arrow Sign" shall be full compensation for all costs incurred by the Contractor in performing the contract work described in Section 1-10.3(3)B (Sequential Arrow Signs) and for procuring all Sequential Arrow Signs required for the project and for transporting these signs to and from the project.

The unit contract price bid per day for "Portable Changeable Message Sign" shall be full compensation for all costs incurred by the Contractor in performing the contract work described in Section 1-10.3(3)C (Portable Changeable Message Sign) and for procuring all portable changeable message signs required for the project and for transporting these signs to and from the project.

The unit contract price for "Construction Site Sign(s)" shall be full payment for all equipment, labor and materials needed to furnish, install, maintain, relocate (if required), and remove and dispose of at Physical Completion.

City of Auburn Uniformed Police Officers necessary for the project will be provided at no cost to the Contractor by the City of Auburn. Payment for use of "Outside Agency Uniformed Police Flagging Labor" will be per Section 1-09.4 (Equitable Adjustment) of the Standard Specifications.

Costs for scheduling and coordinating all uniformed police officers by the Contractor shall be included in the lump sum contract price for Traffic Control Supervisor and no additional compensation will be made.

END OF DIVISION 1

Water Operations
Cross-Connection Control Program

Purpose:

This document establishes minimum standards for the City of Auburn Cross-Connection Control Program to protect the public water system, as defined in WAC 246-290-010, from contamination via cross-connections. It describes minimum Cross-Connection Control Program operating policies, provides guidelines for installation, testing and maintenance of approved backflow prevention assemblies, permitting process, inspection and survey requirements for existing and new water service connections.

The City's proactive and ongoing Cross-Connection Control Program is an effort to protect the health of its consumers by preventing contaminants and pollutants from entering the public water supply. Washington State Department of Health, Division of Drinking Water requires all public water systems to implement a Cross-Connection Control Program. Elements of the city's Cross-Connection Control Program must be documented and included in the Comprehensive Water System Plan. Washington Administrative Code WAC 246.290.490 mandates Cross-Connection Control Programs contain the following minimum elements:

- Element 1: The purveyor shall adopt a local ordinance, resolution, code, bylaw, or other written legal instrument that:
  (i) Establishes the purveyor's legal authority to implement a cross-connection control program;
  (ii) Describes the operating policies and technical provisions of the purveyor's cross connection control program; and
  (iii) Describes the corrective actions used to ensure that consumers comply with the purveyor's cross-connection control requirements.

  The City of Auburn has adopted ordinance 5851 amending Auburn City Code Chapter 13.12 entitled "Protection of Water Supply" which establishes the City's authority for implementing the Cross-Connection Control Program.

The Federal Safe Drinking Water Act of 1974 and the statutes of the State of Washington, Title 43 RCW, require purveyors to protect the public water supply from contamination.

Enforcement of this Cross-Connection Control Program in the area(s) served by the City of Auburn Water will be in accordance with:

- *Washington Administrative Code WAC 246-290-490, Cross-Connection Control, effective April 9, 1999;*
- *Auburn City Code, ACC1.20.010 Right of entry for Inspection*
- *Auburn City Code, ACC13.06.260 Service Premises Isolation*
- *Auburn City Code, ACC13.12 Protection of Water Supply;*
- *City of Auburn Water Division, Cross-Connection Control Program;*

and/or any subsequent revisions, together with any future manuals of standard practice pertaining to Cross-Connection Control approved by Washington State Department of Health, Division of Drinking Water.

Consumers and/or premises violating any provisions of this document and/or subsequent revisions shall be subject to enforcement action such as, but not limited to, discontinuance (TURN OFF) of water service to the premises and/or a maximum penalty of $250.00 each day.

- Element 2: The purveyor shall develop and implement procedures and schedules for evaluating new and existing service connections to assess the degree of hazard posed by the consumer's premises to the purveyor's distribution system and notifying the consumer within a reasonable time frame of the hazard evaluation results. At a minimum, the program shall meet the following:
  (i) For connections made on or after April 9, 1999, procedures shall ensure that an initial evaluation is conducted before water service is provided;
  (ii) For all other connections, procedures shall ensure that an initial evaluation is conducted in accordance with a schedule acceptable to the department; and
  (iii) For all service connections, once an initial evaluation has been conducted, procedures shall ensure that periodic reevaluations are conducted in accordance with a schedule acceptable to the department and whenever there is a change in the use of the premises.

  The City's Cross-Connection Control Program evaluation of new and existing connections is as follows: New connections must comply with the City's Construction Standards for water, Design Standards 7.01.2.1 Domestic Service, 7.01.2.2 Other Services (Irrigation), and 7.01.5.2 Fire Sprinkler Systems, Backflow Assembly Installation Standards (Technical Memo), and evaluated by the City's Cross-Connection Control Specialist during the permit and plan review process and before service is provided. Water service connection(s) to new consumers and/or premises shall be locked off until the City's Cross-Connection Control Specialist has conducted a risk assessment, and determine if the backflow

protection is commensurate with the degree of hazard. Existing connections are given a risk assessment by the City's Cross-Connection Specialist to determine if the backflow protection is commensurate with the degree of hazard. A preliminary assessment (site survey) is conducted of all industrial, commercial, multi-family, private water systems consumers and/or non-residential premises for the purpose of determining the need for premises isolation. The City has identified possible Table 13 (high hazard) facilities within its jurisdiction and has a prioritize list for surveying each site. Consumers and/or premises identified as Table 13 (high hazard) facility require premises isolation with an Approved Air Gap and/or Reduced Pressure Backflow Assembly. Consumers and/or premises identified as a (low hazard) facility require premises isolation with an Approved Double Check Valve Assembly if the City's Cross-Connection Control Specialist (CCS) deems necessary. The consumer and/or premises have the option to install an Approved Air Gap and/or Reduced Pressure Backflow Assembly to avoid future plumbing changes of the premises isolation assembly if the City's Cross-Connection Control Specialist (CCS) deems necessary.

After the initial risk assessment of new and existing connections is conducted, a re-evaluation of the service connection is conducted every threee (3) years for Table 13 facilities and every five (5) years for industrial, commercial, multi-family, private water systems and/or non-residential premises.

The cost/fees of installation, initial and annual testing, maintenance, and repair or replacement of the backflow assembly shall be the responsibility of the consumer as a condition of water service.

- Element 3: The purveyor shall develop and implement procedures and schedules for ensuring that:
  (i) Cross-connections are eliminated whenever possible;
  (ii) When cross-connections cannot be eliminated, they are controlled by installation of approved backflow preventers commensurate with the degree of hazard; and
  (iii) Approved backflow preventers are installed in accordance with the requirements of subsection (6) of this section.

  The City's Cross-Connection Control Program endeavors to eliminate all actual or potential physical Cross-Connections where possible, and not allow any actual or potential physical Cross-Connections unless protected by an approved air gap or backflow prevention assembly. Consumers and/or premises shall be responsible for following the provisions of the City's Cross-Connection Control Program to eliminate and/or install approved backflow protection on all Cross-Connections within their premises. The City's Cross-Connection program will inventory and track all backflow prevention assemblies on the consumers' premises used for the protection of the public water supply, but it is the consumer and/or premises responsibility to test, maintain, repair, or replace all backflow prevention assemblies within their premises.

- Element 4: The purveyor shall ensure that personnel, including at least one person certified as a CCS, are provided to develop and implement the cross-connection control program.

  The City's Cross-Connection Control Program employs State Certified personnel. The program currently staffs (2) two full time employees certified as Cross-Connection Control Specialist, Backflow Assembly Tester, and Water Distribution Manager.

- Element 5: The purveyor shall develop and implement procedures to ensure that approved backflow preventers relied upon to protect the public water system are inspected and/or tested (as applicable) under subsection (7) of this section.
  Subsection (7) Approved backflow preventer inspection and testing.
  (a) For backflow preventers that protect the public water system, the purveyor shall ensure that:
  (i) A CCS inspects backflow preventer installations to ensure that protection is provided commensurate with the assessed degree of hazard;
  (ii) Either a BAT or CCS inspects:
  (A) Air gaps installed in lieu of approved backflow prevention assemblies for compliance with the approved air gap definition; and
  (B) Backflow prevention assemblies for correct installation and approval status.
  (iii) A BAT tests approved backflow prevention assemblies for proper operation.
  (b) The purveyor shall ensure that inspections and/or tests of approved air gaps and approved backflow assemblies that protect the public water system are conducted:
  (i) When any of the following occur:
  (A) Upon installation, repair, reinstallation, or relocation of an assembly;
  (B) Upon installation or replumbing of an air gap;
  (C) After a backflow incident involving the assembly or air gap; and
  (ii) Annually thereafter, unless the purveyor requires more frequent testing for high hazard premises or for assemblies that repeatedly fail.
  (c) The purveyor shall ensure that inspections of AVBs installed on irrigation systems are conducted:
  (i) At the time of installation;
  (ii) After a backflow incident; and
  (iii) After repair, reinstallation, or relocation.
  (d) The purveyor shall ensure that approved backflow prevention assemblies are tested using procedures acceptable to the department, such as those specified in the most recently published edition of the USC Manual. When circumstances, such as, but not limited to, configuration or location of the assembly, preclude the use of USC test procedures, the purveyor may allow, on a case-by-case basis, the use of alternate (non-USC) test procedures acceptable to the department.
  (e) The purveyor shall ensure that results of backflow prevention assembly inspections and tests are documented and reported in a manner acceptable to the purveyor.

(f) The purveyor shall ensure that an approved backflow prevention assembly or AVB, whenever found to be improperly installed, defective, not commensurate with the degree of hazard, or failing a test (if applicable) is properly reinstalled, repaired, overhauled, or replaced.
(g) The purveyor shall ensure that an approved air gap, whenever found to be altered or improperly installed, is properly replumbed or, if commensurate with the degree of hazard, is replaced by an approved RPBA.

The City's Cross-Connection Control Program requires all backflow prevention assemblies installed within the consumers and/or premises be tested and/or inspected at time of installation, annually (yearly anniversary date), after a backflow incident, repair, reinstallation, or relocation. Consumers and/or premises are responsible for all cost/fee to test, maintain, repair, or replace backflow prevention assemblies within their premises. Consumers and/or premises are also responsible for submitting all test reports for backflow prevention assemblies within their premises to the City's Cross-Connection Control Program within 30 days of testing the backflow preventions assemblies. Test reports received over the 30 days grace period may be returned to the consumer and/or premises for re-testing of the backflow prevention assemblies. Person testing the backflow prevention assemblies shall be a State Certified Backflow Assembly Tester on the City's Approved List, and only test reports approved by City of Auburn shall be accepted. Test reports not approved for use by the City of Auburn shall be returned to the consumer and/or premises. Test report forms shall be complete, accurate, and legible.

Procedures for inspection and/or testing of backflow prevention assemblies for existing consumers and/or premises are as follows:

Annual Testing
The City mails notices to existing consumers and/or premises of the annual testing or re-testing of the backflow prevention assemblies within their premises. The First Notice is mailed 30 days prior to anniversary test due date. If test reports are not received by anniversary test due date then a Second Notice is mailed giving the consumer and/or premises 30 days to test the backflow prevention assemblies. A Third Notice is mailed if the test reports are not received from the consumer and/or premises by date given on second notice. The third notice gives the consumer and/or premises 7 days to test the backflow prevention assemblies. The final notification before enforcement action is a Door Hanger hand carried to the consumer(s) and/or premises. The door hanger gives the consumer and/or premises 48 hours to have the backflow prevention assemblies tested and certified to be functioning correctly. Enforcement action includes, but is not limited to, a $250.00 fine each day and/or discontinuance (TURN OFF) of water service.

Repair, Reinstallation, or Relocation Testing
The City mails notices to existing consumers and/or premises of the repair, reinstallation, or relocation for the testing of the backflow prevention assemblies within their premises. Failure notices for backflow assemblies used for high health hazards are as follows: The First Notification is mailed after receiving

written notice from the backflow assembly tester identifying the failed test, reinstallation or relocation of the backflow assembly. A valid test report showing the repairs made with passing results, and/or initial testing of the reinstalled or relocated backflow assembly must be received within 7 days of the written notice. If a valid test report is not received within the 7 days, then a Second Notification is mailed giving the consumer and/or premises 5 days to submit a valid test report showing the repairs made with passing results, and/or initial testing of the reinstalled or relocated backflow assembly. If a valid test report is not received within the 5 days, then a Third Notification is mailed giving the consumer and/or premises 3 days to submit a valid test report showing the repairs made with passing results, and/or initial testing of the reinstalled or relocated backflow assembly. The final notification before enforcement action is a Door Hanger hand carried to the consumer(s) and/or premises. The door hanger gives the consumer and/or premises 48 hours to have the backflow prevention assemblies tested and certified to be functioning correctly. Enforcement action includes, but is not limited to, a $250.00 fine each day and/or discontinuance (TURN OFF) of water service. Failure notices for backflow assemblies used for low health hazards are as follows: The First Notification is mailed after receiving written notice from the backflow assembly tester identifying the failed test, reinstallation or relocation of the backflow assembly. A valid test report showing the repairs made with passing results, and/or initial testing of the reinstalled or relocated backflow assembly must be received within 15 days of the written notice. If a valid test report is not received within the 15 days, then a Second Notification is mailed giving the consumer and/or premises 10 days to submit a valid test report showing the repairs made with passing results, and/or initial testing of the reinstalled or relocated backflow assembly. If a valid test report is not received within the 10 days, then a Third Notification is mailed giving the consumer and/or premises 5 days to submit a valid test report showing the repairs made with passing results, and/or initial testing of the reinstalled or relocated backflow assembly. The final notification before enforcement action is a Door Hanger hand carried to the consumer(s) and/or premises. The door hanger gives the consumer and/or premises 48 hours to have the backflow prevention assemblies tested and certified to be functioning correctly. Enforcement action includes, but is not limited to, a $250.00 fine each day and/or discontinuance (TURN OFF) of water service.

Procedures for inspection and/or testing of backflow prevention assemblies for new consumers and/or premises are as follows:

Initial Testing & Inspection of Backflow Prevention Assemblies
The consumer, contractor, and/or premises is required to comply with the City's Construction Standards, Design Standards, Backflow Assembly Installation Standards (Technical Memo), and evaluated by the City's Cross-Connection Control Specialist during the permit and plan review process and before service is provided. A Backflow Assembly Plumbing Permit (BFL) shall be issued for all backflow prevention assemblies installed within the City's water distribution system. The backflow prevention assemblies shall be tested by a State Certified Backflow Assembly Tester, approved to test within the City's water distribution system. The City's Cross-Connection Control Specialist shall inspect the

installation on the backflow prevention assemblies and collect all valid test reports certifying the backflow prevention assemblies are functioning correctly. The Backflow Assembly Plumbing Permit (BFL) is then finalized in CRW. The City's Cross-Connection Control Specialist may require corrections and/or additions during the inspection process. If so, corrections and/or additions shall be completed to the satisfaction of the City's Cross-Connection Control Specialist before occupancy of the facility.

City Owned Backflow Assemblies:
The Cross-Connection Control Program currently test and maintain 160 backflow prevention assemblies within City owned facilities. The City employs (4) four Certified Backflow Assembly Testers, (2) two in the Parks Department and (2) two in Water Operations. The backflow prevention assemblies are tested and inspected annually , or more often if needed (type B hydrant meter carts are tested before being sent out with the contractor).

February 2005 Hydrant Meter Permit Regulations:
Water quality, accountability, safety, infrastructure reliability and security were the catalyst for creation of the Hydrant Meter Permit Regulations for private party customer withdrawal of water from fire hydrants. (See regulations for requirements)

- Element 6: The purveyor shall develop and implement a backflow prevention assembly testing quality control assurance program, including, but not limited to, documentation of BAT certification and test kit calibration, test report contents, and time frames for submitting completed test reports.

- ***CERTIFIED BACKFLOW ASSEMBLY TESTER***
  1. *Backflow Assembly Tester MUST be currently certified to test in Washington State and approved by the City's Cross-Connection Control Program prior to testing any backflow assemblies within the City's Water Distribution System.*

  2. *Certified Backflow Assembly Tester MUST submit the following information before any Test Report Forms will be accepted:*
     - *Copy of the (Current Year) BAT Validation Card issued by Washington State Department of Health.*
     - *Copy of the Current Calibration Certificate for all testing equipment clearly stating whom the testing equipment belongs to and/or is used by.*
     - ***Original Certified Backflow Assembly Tester Agreement Form*** *completed, signed and dated for the (Current Year). No copies or faxes of this form will be accepted.*
       By signing the Tester Agreement, the BAT Tester understands and will abide with the City's Tester Program Requirements.
     - *Contact information including company name, address, and phone number(s)*
     - *Auburn Business Registration Number*

3. *Tester demonstrating gross negligence or suspected of being fraudulent will be investigated and reported to Washington State Department of Health Certification Office. Test Report Forms from Backflow Assembly Tester under investigation will NOT be accepted and returned to the owner of the assembly.*

4. *Failure to comply with any part of the City's Tester Program Requirements will result in the Backflow Assembly Test Report Form being rejected and returned to the owner of the assembly, and/or Backflow Assembly testing privileges discontinued within the City's Water Distribution System.*

5. *Auburn Municipal Code requires business operating within the City limits to obtain a business registration number from the permit center located at city hall.*

- ***BACKFLOW ASSEMBLY TESTING EQUIPMENT***
  1. *Backflow assembly testing equipment MUST meet all requirements set by Washington State Department of Health.*
  2. *A copy of the Current Calibration Certificate of all testing equipment clearly stating whom the testing equipment belongs to and/or is used by MUST be submitted.*
  3. *Backflow assembly testing equipment suspected of being damaged, malfunctioning and/or fraudulent will require re-calibration and/or repair. The new Calibration Certificate MUST be submitted to the City's Cross Connection Control Program before any Test Report Forms will be accepted.*

- ***BACKFLOW ASSEMBLY TESTING/INSPECTION***
  1. *Tester MUST use current Backflow Prevention Assemblies Field Test Procedures Approved for Use in Washington State. No other test procedures will be accepted.*
  2. *The City's Cross-Connection Control Program MUST be notified of Initial Testing for all New Backflow Assemblies. Tester shall provide the Backflow Assembly Plumbing Permit Number (example BFL07-0000) when notifying of Initial Testing. Backflow Assembly installed within the City's Water Distribution System requires a Backflow Assembly Plumbing Permit.*
  3. *Initial Inspection of Backflow Assembly will NOT be conducted without a valid Backflow Assembly Plumbing Permit and Test Report Form. Backflow Assembly Plumbing Permit will NOT be finalized without a valid Test Report Form and site inspection of assembly installation.*
  4. *The City's Cross-Connection Control Program MUST be notified within 24hrs, if a Reduced Pressure Backflow Assembly (RPBA), used for High Hazard Protection, FAILS an initial, annual and/or repeat test.*
  5. *Backflow assemblies MUST have all test ports plugged in areas subject to flooding.*

- ***BACKFLOW ASSEMBLY TEST REPORT FORMS***
  1. *Private Test Report Form MUST use the same format as the City's Test Report Form. Test Report Form NOT approved will be returned to the owner of the assembly.*
  2. *Backflow Assembly Test Report Form MUST be submitted to the City's Cross Connection Control Program within 30 days of completing the test. Test Report Form over 30 days will NOT be accepted and returned to the owner of the assembly.*
  3. *Backflow Assembly Test Report Form MUST be **Complete, Accurate and Legible.***
  4. *Test Report Form MUST have documentation of any repairs, cleaning or flushing of backflow assembly.*
  5. *Test Report Form will be returned to the owner of the Backflow Assembly if the tester fails to comply with any part of the City's Tester Program Requirements.*
  6. *Test Report Form suspected of being fraudulent will be investigated and reported to Washington State Department of Health Certification Office.*
  7. *Test Report Form received from any BAT tester under investigation will be rejected and returned to the owner of the backflow assembly.*

- ***APPROVED BACKFLOW ASSEMBLY TESTER***
  1. *The City's Cross-Connection Control Program MUST mail BAT Requirement Letter to previously registered tester no later than December 31st of each year. Tester not previously registered with the City's Cross Connection Control Program will receive a BAT Requirement Letter upon request.*
  2. *Tester will NOT be allowed to test backflow assembly within the City's Water Distribution System until all required information is received.*
  3. *Tester NOT registered with the City's Cross-Connection Control Program by the Washington State Department of Health renewal cut-off date, will NOT be allowed to test backflow assembly within the City's Water Distribution System until all required information is received.*
  4. *Tester NOT registered with the City's Cross-Connection Control Program by the Washington State Department of Health renewal cut-off date, will NOT be listed on the City's Approved Tester List given to customers upon request.*
  5. *Tester NOT registered with the City's Cross-Connection Control Program by the Washington State Department of Health renewal cut-off date, will NOT have Test Report Form accepted by the City's Cross-Connection Control Program and returned to the owner of backflow assembly.*
  6. *The City's Cross-Connection Control Program will only list the testers Name, Phone Number(s), and BAT Certification Number on the City's Approved Tester List given to customers upon request.*
  7. *The City's Cross-Connection Control Program will list testers in the order received. Testers will NOT be listed until all information requested is submitted. The City's Approved Tester List does not indicate any preference, is completely at our discretion and subject to space availability.*
  8. *The City's Approved Tester List is updated on the 1st of every month.*
  9. *The City's Approved Tester List is available as a hard copy or on h-drive under Cross-Connection in electronic form.*

10. *Tester may request approval to test within the City's Water Distribution System and NOT listed on the City's Approved Tester List.*

- ***BACKFLOW ASSEMBLY TESTER RECORDS & RECORD KEEPING***
  1. *Information from paperwork MUST be recorded in Tokay.*
  2. *All certification paperwork received from Tester for the (Current Year) MUST be stapled together and placed into a file folder marked with the company name the Tester is employed by.*
  3. *All paperwork MUST be stapled in the following order:*
     - *Original Tester Agreement Form for the (Current Year)*
     - *Copy of the DOH/BAT Validation Card for the (Current Year)*
     - *Copy of the Test Equipment Calibration for the (Current Year)*
  4. *All certification paperwork received from Tester MUST be kept for a minimum of two years.*
  5. *Paperwork such as questionable Test Report Form, Annual Tester Requirement Letter and/or Department of Health Complaint Form MUST be kept on file for as long as the Tester is Currently Registered in Washington State. (Verify annually on WETRC website)*
  6. *The following information MUST be recorded in Tokay:*
     - *Assigned Code for new and existing Testers*
     - *Tester Status (active/inactive)*
     - *Company Name, Address and Phone Number(s)*
     - *BAT Certification Number issued by the Department of Health*
     -
     - *Expiration date for BAT Validation*
     - *Test equipment serial number and calibration date*
     - *Tester Agreement and Customer List Status*
     - *Certification Status*
  7. *When all required paperwork is received and recorded, then the Tester name, certification number and phone number(s) is placed on the "City's Approved Tester List distributed to customers upon request".* ***(This is only for Tester requesting to be on the City's Approved Tester List)***
  8. *Tester NOT requesting to be on the City's Approved Tester List will only be track by Tokay.*

- ***BACKFLOW ASSEMBLY TESTER INVESTIGATION/COMPLAINT***
  1. *Cross Connection Specialist MUST notify Supervisor(s) for approval before starting investigation.*
  2. *Send a Certified Letter to the Tester informing them of the intended investigation. (This letter will require the Tester to Stop Testing Backflow Assemblies within the City's Water Distribution System until the investigation is complete and the Tester has been cleared by the City's Cross Connection Control Program in writing (No time frame will be set for investigation).*
  3. *Remove the Tester name, certification number and phone number(s) from the City's Approved Tester List and place status in Tokay as Inactive.*

4. *Review all Test Report Forms received from Tester for the (Current Year) to look for other discrepancies.*
5. *Compare previous history of Test Report Forms for each backflow assembly in question.*
6. *Conduct an on-site investigation and test of each backflow assembly in question.*
7. *Take pictures and documentation of each backflow assembly in question.*
8. *Review current Backflow Prevention Assemblies Field Test Procedures Approved for Use in Washington State to verify test procedures.*
9. *Review current Backflow Prevention Assemblies Approved for Installation in Washington State to verify status of backflow assembly.*
10. *Review findings of investigation with Supervisor(s) and acquire approval to discuss with Tester and Washington State Department of Health*
11. *Review finding of investigation with Tester.*
12. *Tester may submit a written rebuttal to the finding of the investigation after the review with the City's Cross Connection Control Program.*
13. *Review finding of investigation with Washington State Department of Health Certification office. (Fill out State Complaint Form) The State will conduct its own investigation and deliver its finding in writing.*
14. *Review the States finding with Supervisor(s) to determine status of Tester.*
    - *Tester Cleared – Send Certified Letter reinstating testing privileges within the City's Water Distribution System.*
    - *Tester Not Cleared – Send Certified Letter revoking testing privileges within the City's Water Distribution System for as long as the Tester is Currently Registered in Washington State.*
15. *All paperwork from the investigation MUST be kept on file for as long as the Tester is Currently Registered in Washington State*

Tester(s) not complying with any part of the aforementioned requirements shall be removed from the City's Approved Tester List. Test report forms shall be returned to the consumer and/or premises of the backflow prevention assemblies tested. The City reserves the right to deny a Backflow Assembly Tester from performing testing within the City's water distribution system. Tester(s) are responsible for obtaining all certifications needed to perform duties and responsibilities for testing and maintaining backflow prevention assemblies.

- Element 7: Develop and implement (when appropriate) procedures for responding to backflow incidents.
  The City's Cross-Connection Control Program has outlined a Backflow Incident Response Procedure to be followed if the City's water supply becomes contaminated or polluted due to a backflow incident.

BACKFLOW INCIDENT RESPONSE PLAN
(Supplement to the Emergency Plan)

General:

This backflow incident response plan is a supplement to the City's Response Emergency Plan. The City of Auburn Water Division is hereinafter referred to as the Purveyor.

- *Whenever the initial evaluation of a water quality complaint indicates that a backflow incident has occurred (potable water supply has been contaminated/polluted), may have occurred, or the reason for the complaint can not be explained as a "normal" aesthetic problem, a backflow incident investigation should be immediately initiated. Whenever a water main break or power outage (pumped systems) causes a widespread loss of water pressure (backsiphonage conditions) it is prudent to initiate a check of distribution water quality as a precursor to the need for a backflow incident investigation. It is wise to be conservative when dealing with public health matters.*

- *Within 24 hours of knowledge of any incident of possible contamination of the potable water supply, both in the distribution system and/or in the customer's plumbing system, the state and local county personnel should be notified (see list of emergency telephone numbers in the Public Works Emergency Response M. & O. Manual).*

- *A backflow incident investigation is often a team effort. The investigation should be made or (initially) led by a Certified Cross-Connection Control Specialist employed by the Purveyor. The investigation team should include local health and plumbing inspectors.*

General guidance on how to respond to a backflow incident may be obtained from the manual BACKFLOW INCIDENT INVESTIGATION PROCEDURES, First Edition, 1996, published by the Pacific Northwest Section, American Water Works Association, P. O. Box 19581, Portland, Oregon, 97280, telephone (877) 767-2992 (toll free).

Short-List of Tasks:
The following points are included for initial guidance for dealing with a backflow incident; the above referenced manual BACKFLOW INCIDENT INVESTIGATION PROCEDURES should be consulted as soon as possible, along with the completion of DOH form 331-457-F (see attached).

1. *As soon as possible, notify customers not to consume or use water. Start the notification with the customers nearest the assumed source of contamination (usually the customer(s) making the water quality complaint).*

   The customer should be informed about the reason for the backflow incident investigation, and the Purveyor's efforts to restore water quality as soon as possible. State that the customer will be informed when he may use water, the

need to boil water used for consumption until a satisfactory bacteriological test result is obtained from the lab, etc.

Where a customer cannot be contacted immediately, the Purveyor shall place a written notice on the front door handle, and a follow-up visit will be made to confirm that the customer received notice about the break and possible contamination of the water supply.

2. *Give consideration to the distribution system as a potential source of the contaminant (e.g., air valve inlet below ground).*

3. *Do not start flushing the distribution system until the source of contamination is identified. Flushing may aggravate the backflow situation and will likely remove the contaminant before a water sample can be collected to fully identify the contaminant.*

4. *Conduct a house-to-house survey to search for the source of contamination and the extent that the contaminant has spread through the distribution system. A check of water meters may show a return of water (meter running backward).*

5. *Isolate the portions of the system that are suspected of being contaminated by closing isolating valves; leave one valve open to ensure that positive water pressure is maintained throughout the isolated system.*

6. *Be sure to notify all affected customers in the isolated area, then the other customers in the system.*

7. *The public health and plumbing authorities should deal with all customers that may have consumed the contaminant, or had their plumbing systems contaminated.*

8. *Develop and implement a program for cleaning the contaminated distribution system.*

9. *For the customer where a cross-connection responsible for the system contamination is located, the Purveyor should discontinue water service until the Purveyor ordered corrective action is completed by the customer.*

Identification of the source and type of contaminant, and cleaning of a distribution system could take several days.

Most chemical or physical contaminants can be flushed from the water distribution system or customer's plumbing system with adequate flushing velocity. This may not be the case where scale and corrosion deposits (e.g., tuberculation on old cast iron mains) provides a restriction to obtaining adequate flushing velocity, or a chemical deposit or bacteriological slime (biofilm) on which the chemical contaminant may adhere.

To remove a chemical or physical contaminant, it may be necessary to provide a physical cleaning, using foam swabs (pigs), and/or to alter the form or the chemical contaminant, e.g., through oxidation using chlorination, or addition of detergents.

When adding any chemical (including chlorine) to remove a contaminant, it is essential that the chemistry of the contaminant is-fully understood. The wrong chemical reaction could make the contaminant more toxic, more difficult to remove, or both.

Where both a chemical and bacteriological contamination has occurred, disinfection should follow the removal of the chemical contaminant.

Where any bacteriological contamination is suspected, field disinfection should be done. To disinfect water mains using the "slug" or "continuous flow" method, a field unit should be used for chlorine injection, such as a chemical feed - metering or proportioning pump for sodium hypochlorite.

NOTE: Refer to the City's Backflow Incident Response Manual for additional information.

- Element 8: The purveyor shall include information on cross-connection control in the purveyor's existing program for educating consumers about water system operation. The public education program may include periodic bill inserts, public service announcements, pamphlet distribution, notification of new consumers and consumer confidence reports.

Public education is a key part of the City's Cross-Connection Control Program. Through public education, the City informs consumers of:

1. *The public health impacts of actual or potential Cross-Connection hazards.*
2. *The consumer's responsibility to protect the public water supply from contamination.*
3. *The City's requirement to comply with Washington State Department of Health regulations.*
4. *The City's policies on Cross-Connection Control.*

The following educational material is provided to the City's water consumers and available at City Hall, Maintenance & Operations, and by mail if requested.

- *Annual Consumer Confidence Report CCR*
- *City of Auburn internet home page, Water Quality*
- *Brochure – AWWA Caution Your Hose May Be Hazardous To Your Health*
- *Brochure – USC Working Together For Safe Water*
- *Brochure – AWWA Residential Fire Sprinkler Systems And Backflow Prevention*
- *Brochure – AWWA Lawn Irrigation Systems And Backflow Prevention*
- *Brochure – AWWA Help Protect Your Drinking Water From Contamination (Household Hazards)*
- *Brochure – AWWA Protect Your Water Heater From Thermal Expansion*
- *Brochure – AWWA Cross-Connections Can Create Health Hazards*

- *Comic Books – ABPA Buster Backflow, book 1 & 2*

The Cross-Connection Control Program annually participates at "Kids Day" where displays and information are presented to the City's water consumers.

- Element 9: The purveyor shall develop and maintain cross-connection control Records including, but not limited to, the following:
  (i) A master list of service connections and/or consumer's premises where the purveyor relies upon approved backflow preventers to protect the public water system from contamination, the assessed hazard level of each, and the required backflow preventer(s);
  (ii) Inventory information on backflow preventers that protect the public water system including:
  (A) Approved air gaps installed in lieu of approved assemblies including exact air gap location, assessed degree of hazard, installation date, history of inspections, inspection results, and person conducting inspections;
  (B) Approved backflow assemblies including exact assembly location, assembly description (type, manufacturer, model, size, and serial number), assessed degree of hazard, installation date, history of inspections, tests and repairs, test results, and person performing tests; and
  (C) Approved AVBs used for irrigation system applications including location, description (manufacturer, model, and size), installation date, history of inspection(s), and person performing inspection(s).
  (iii) Cross-connection program summary reports and backflow incident reports required under subsection (8) of this section.
  Subsection 8 – Recordkeeping and reporting
  (a) Purveyors shall keep cross-connection records for the following time frames:
    (ii) Records pertaining to the master list of service connections and/or consumer's premises required in subsection (3)(j)(i) of the section shall be kept as long as the premises pose a cross-connection hazard to the purveyor's distribution system;
    (iii) Records regarding inventory information required in subsection (3)(j)(ii) of this section shall be kept for five years or for the life of the approved backflow preventer whichever is shorter: and
    (iv) Records regarding backflow incidents and annual summary reports required in subsection (3) (j) (iii) of this section shall be kept for five years.
  (b) Purveyors may maintain cross-connection control records in original form or transfer data to tabular summaries.
  (c) Purveyor may maintain records or data in any media, such as paper, film, or electronic format.
  (d) The purveyor shall complete the cross-connection control program summary report annually. Report forms and guidance on completing the report are available from the department.

(e) The purveyor shall make all records and reports required in subsection (3) (j) of this section available to the department or its representative upon request.

The City's Cross-Connection Control Program currently uses electronic software to track all private, and city owned assemblies within Auburn Water's jurisdiction, including city owned assemblies fed by other water jurisdictions. Identifying level of hazard, location, installation date, inspection history, test and repair history, test results, and inspecting personnel on backflow prevention assemblies used for the protection of the City's water supply and/or backflow prevention assemblies used on fixtures in lieu of premises isolation.

Annual summary report:

WAC 246.290.490, part 8d – The purveyor shall complete the cross-connection control program summary report annually.

- *The annual summary report is reviewed and signed by the Water Operations Manager, and submitted to the Department of Health via mail, or secured web site.*
- *Copies of the annual summary report are available in the Cross-Connection Program Manual.*

Records & Reports:

Purveyors must develop and maintain records of their Cross-Connection Control program, as mandated by WAC 246.290.490. At a minimum, purveyors must maintain the following records:

- *Master list of service connections and/or premises where backflow prevention assemblies are installed to protection the public water system.*
- *Assessed hazard level of each backflow prevention assembly.*
- *Inventory information on approved air gaps, including location, degree of hazard, installation date, inspection history & results, and personnel conducting inspection.*
- *Backflow prevention assembly inventory information including location, assembly description, installation date & history, test & repair history, test results, and personnel conducting inspection.*
- *Program summary and backflow incident reports.*

- Element 10: Purveyors who distribute and/or have facilities that receive reclaimed water within their water service area shall meet any additional cross-connection control requirements imposed by the department in a permit issued under chapter 90.46 RCW.

No reclaimed water within the purveyor's water system.

General Program Requirements:

WAC246-290-490(1) (c): The purpose of the purveyor's cross-connection program shall be to protect the public water system, as defined in WAC 246-290-010, from contamination via cross-connections.

This is covered under Element 1 of the City's Cross Connection Control Program.

WAC 246-290-490(1) (d): The purveyor's responsibility for cross-connection control shall begin at the water supply source, include all the public water treatment, storage, and distribution facilities, and end at the point of delivery to the consumer's water system, which begins at the downstream end of the service connection or water meter located on the public right-of-way or utility-held easement.

The City's Cross Connection Control Program is not responsible for Cross Connection Control inside the consumer's building and/or property. The jurisdiction falls under the Local Administrative Authority as per the Uniform Plumbing Code for Cross Connection Control 603.0

WAC 246-290-490(1) (e): Under this section, purveyors are not responsible for eliminating or controlling cross-connections within the consumer's water system. Under chapter 19.27 RCW, the responsibility for cross-connection control within the consumer's water system, i.e., within the property lines of the consumer's premises, lies with the authority having jurisdiction.

The City's Cross Connection Control Program is responsible for eliminating and/or controlling Cross Connections from the consumer's water system to the public water system. Service connections from the water main shall have backflow protection that is commensurate with the degree of hazard as accessed by the City's Cross Connection Control Specialist. Examples of service connections include but are not limited to, domestic water, irrigation water and fire protection water.

WAC 246-290-490(2) (a) The purveyor shall develop and implement a cross-connection control program that meets the requirements of this section, but may establish a more stringent program through local ordinances, resolutions, codes, bylaws, or operating rules.

This is covered under Element 1 of the City's Cross Connection Control Program.

WAC 246-290-490(2) (b) Purveyors shall ensure the good engineering and public health protection practices are used in the development and implementation of cross-connection control programs. Department publications and the most recently published editions of references, such as, but not limited to, those listed

below, may be used as guidance for cross-connection program development and implementation:

(i) Manual of Cross-Connection Control published by the Foundation for Cross-Connection Control and Hydraulic Research, University of Southern California (USC Manual); or

(ii) Cross-Connection Control Manual, Accepted Procedure and Practice published by the Pacific Northwest Section of the American Water Works Association (PNWS-AWWA Manual)

(iii) Guidance document: *Cross-Connection Control for Small Water Systems* published by the department.

The following reference guides and publications were used in the development of the City's Cross-Connection Control Program;

- *Washington Administrative Code WAC 246-290, Group A Public Water Systems, effective April 27, 2003*
- *Cross-Connection Control Manual Accepted Procedures ad Practice 6th Edition, December 1995*
- *Cross-Connection Control Manual Supplement 1st Edition, December 1995*
- *Cross-Connection Control for Small water Systems Guidance Document, September 2003*
- *Backflow Incident Investigation Procedures 1st Edition, December 1996*
- *Environmental Protection Agency Cross-Connection Control Manual, revised February 2003*
- *American Society of Sanitary Engineering, Performance Requirements for Outdoor Enclosures for Backflow Prevention Assemblies*
- *Backflow Prevention Assemblies Field Test Procedures Approved for use in Washington State, July 1998*
- *Uniform Plumbing Code 2000 Edition, September 1999*
- *Backflow Prevention Assemblies Approved for Installation in Washington State, published annually*
- *University of Southern California Manual of Cross-Connection Control 9th Edition, December 1993*
- *American Water Works Association Recommended Practice for Backflow Prevention and Cross-Connection Control M14 3rd Edition, 2004*
- *American water Works Association Distribution System Requirements for Fire Protection M31 3rd Edition, 1998*

WAC 246-290-490(2) (c) The purveyor may implement the cross-connection control program, or any portion thereof, directly or by means of a contract with another agency or party acceptable to the department.

The City's Water Division implements the Cross-Connection Control Program

WAC 246-290-490(2) (d) The purveyor shall coordinate with the authority having jurisdiction in all matters concerning cross-connection control. The purveyor shall document and describe the coordination, including delineation of responsibilities, in the written cross-connection control program required in (e) of this subsection.

- *The Local Administrative Authority shall enforce the Uniform Plumbing Code and Uniform Plumbing Code Standards for Cross-Connection Control, or subsequent revisions:*

    1. *603.0 Cross-Connection Control*
    2. *603.1 Approval of Devices or Assemblies*
    3. *603.2 Backflow Prevention Devices, Assemblies, and Methods*
    4. *603.3 General Requirements*
    5. *603.4 Specific Requirements*

    Amended 2000 UPC, effective July 1, 2002

The control of Cross-Connections requires cooperation between the water purveyor, local administrative authority, health officer and the consumer.

The City of Auburn Water Division shall make available to all Local Administrative agencies the information maintained in the purveyors Cross-Connection Control program files, which may include, but is not limited to:

1. *A master list of all premises that have been isolated from the purveyor water system in accordance with the purveyors' cross-connection control program.*

2. *Information concerning any internal cross-connections that come to the attention of the purveyor during risk assessment evaluations of premises.*

3. *Notification of any termination of water service for failure to comply with the requirements of WAC 246-290-490, Auburn City Code 13.12, and/or the City of Auburn Water Department Cross-Connection Control Program and/or any subsequent revisions.*

UPC 603.3.3 For devices and assemblies other than those regulated by the Washington Department of health in conjunction with the local water purveyor for the protection of the public water systems, the Administrative Authority shall ensure that the owner or responsible person shall have the backflow prevention assembly tested by a Washington State Department of Health certified backflow assembly tester:

- *At the time of installation, repair, or relocation; and*
- *At least on an annual schedule thereafter, unless more frequent testing is required by the Administrative Authority.*

WAC 246-290-490(2) (e) The purveyor shall include a written description of the cross-connection control program in the water system plan required under WAC

246-290-100 or the small water system management program required under WAC246-290-105. The cross-connection control program shall include the minimum program elements described in subsection (3) Minimum elements of a cross-connection control program

The city's cross connection control program is included in the Water system plan

WAC 246-290-490(2) (f) The purveyor shall ensure that cross-connection between the distribution system and a consumer's water system are eliminated or controlled by the installation of an approved backflow preventer commensurate with the degree of hazard. This can be accomplished by implementation of a cross-connection program that relies on:

(i) Premises isolation as defined in WAC 246-290-010; or

(ii) Premises isolation and in-premises protection as defined in WAC 246-290-010

The City's Cross Connection Control Program relies on premises isolation to protect the public water system. All domestic water service with the exception of single family residential shall be required to install a Reduced Pressure Backflow Assembly (RPBA). Fire protection systems and landscape irrigation system with chemical addition or injection shall be required to install a Reduced Pressure Backflow Assembly (RPBA). Backflow assembly type may be reduced to a lesser by submitting plumbing, irrigation and fire protection plans for the City's Cross Connection Specialist to review and conduct a hazard evaluation and risk assessment posed on the public water system. All changes shall be approved by the City's Cross Connection Specialist in writing.

WAC 246-290-490(2) (g) Purveyor with cross-connection control programs that rely both on premises isolation and in-premises protection:

(i) Shall comply with the premises isolation requirements specified in subsection (4) (b) of this section; and

(ii) May reduce premises isolation requirements and rely on in-premises protection for premises other than the type not addressed in subsection (4) (b) of this sections, if the conditions in (h) of this subsection are met:
(A) The in-premises backflow preventers provide a level of protection commensurate with the purveyor's assessed degree of hazard;
(B) Backflow preventers which provide the in-premises backflow protection meet the definition of approved backflow preventers as described in WAC 246-290-010;
(C) The approved backflow preventers are installed, inspected, tested (if applicable), maintained, and repaired in accordance with subsections (6) and (7) of this section;
(D) Records of the backflow preventers are maintained in accordance with subsections (3)(j) and (8) of this section; and
(E) The purveyor has reasonable access to the consumer's premises to conduct an initial hazard evaluation and periodic reevaluations to determine whether the in-premises protection is adequate to protect the purveyor's distribution system.

The City's Cross-Connection Control Program CAN NOT rely on in-premises protection to protect the distribution system for the following reasons:

- *Consumer can make plumbing changes at any time without notifying the city.*
- *Backflow preventers installed inside consumers buildings and/or premises are under the control of the Authority having Jurisdiction.*
- *Not enough staff to conduct initial inspections and re-inspections of consumer's premises.*

WAC 246-290-490(2) (h) The purveyor shall take appropriate corrective action as authorized by the legal instrument required by subsection (3)(b) of this section, when:
(i) A cross-connection exists that is not controlled commensurate to the degree of hazard assessed by the purveyor; or
(ii) A consumer fails to comply with the purveyor's requirements regarding the installation, inspection, testing, maintenance or repair of approved backflow preventers required by this chapter.

The City's Cross-Connection Control Program enforcement action includes, but is not limited to, a $250.00 fine each day and/or discontinuance (TURN OFF) of water service.

WAC 246-290-490(2) (i) The purveyor's corrective action may include, but is not limited to:
(i) Denying or discontinuing water service to a consumer's premises until the cross connection hazard is eliminated or controlled to the satisfaction of the purveyor;
(ii) Requiring the consumer to install an approved backflow preventer for premises isolation commensurate with the degree of hazard; or
(iii) The purveyor installing an approved backflow preventer for premises isolation commensurate with the degree of hazard.

The City's Cross-Connection Control Program enforcement action includes, but is not limited to, a $250.00 fine each day and/or discontinuance (TURN OFF) of water service.

WAC 246-290-490(2) (j) Except in the event of an emergency, purveyors shall notify the authority having jurisdiction prior to denying or discontinuing water service to a consumer's premises for one or more of the reasons listed in (h) of this subsection.

The City's Cross-Connection Control Program shall notify the Local Administrative Authority prior to denying and/or discontinuing water service except in the event of an emergency and/or backflow incident.

WAC 246-290-490(2) (k) The purveyor shall prohibit the intentional return of used water to the purveyor's distribution system. Used water includes, but is not

limited to, water used for heating,cooling, or other purposes within the consumer's water system.

The City's Cross Connection Control Program relies on premises isolation to protect the public water system. All domestic water service with the exception of single family residential shall be required to install a Reduced Pressure Backflow Assembly (RPBA). Fire protection systems and landscape irrigation system with chemical addition or injection shall be required to install a Reduced Pressure Backflow Assembly (RPBA). Backflow assembly type may be reduced to a lesser by submitting plumbing, irrigation and fire protection plans for the City's Cross Connection Specialist to review and conduct a hazard evaluation and risk assessment posed on the public water system. All changes shall be approved by the City's Cross Connection Specialist in writing.

WAC 246-290-490(3) (a) To be acceptable to the department, the purveyor's cross-connection control program shall include the minimum elements identified in the subsection.

The City's Cross Connection Control Program includes the Ten Elements as required by the WAC.

WAC 246-290-490(4) (a) The purveyor shall ensure that a Cross Connection Control Specialist:

(i) Assesses the degree of hazard posed by the consumer's water system upon the purveyor's distribution system; and

(ii) Determines the appropriate method of backflow protection for premises isolation in accordance with Table 8

Table 12
Appropriate Methods of Backflow Protection for Premises Isolation

Degree of Hazard	*Application Condition*	*Appropriate Approved Backflow Preventer*
High health cross-connection hazard	*Backsiphonage or backpressure backflow*	*AG, RPBA or RPDA*
Low health cross-connection hazard	*Backsiphonage or backpressure backflow*	*AG, RPBA, RPDA, DCVA or DCDA*

WAC246-290-490(4) (b) Premises isolation requirements.
(i) The purveyor shall ensure that an approved air gap, RPBA, or RPDA is installed for premises isolation for service connections to premises posing a high health cross-connection hazard including, but not limited to, those premises listed in Table 9, except those premises identified as severe in (b)(ii) of this subsection.
(ii) For service connections to premises posing a severe health cross-connection hazard including wastewater treatment plants, radioactive material processing plants, and nuclear reactors, the purveyor shall ensure that either an:
(A) Approved air gap is installed for premises isolation; or
(B) Approved RPBA or RPDA is installed for premises isolation in

combination with an in-plant approved air gap.
(iii) If the purveyor's CCS determines that no hazard exists for a connection serving premises of the type listed in Table 9, the purveyor may grant an exception to the facility

The city's cross connection control specialist will not grant exemptions to facility's recognized by the state as a table 13.

(iv) The purveyor shall document, on a case-by-case basis, the reasons for granting an exception under (b)(i) of this subsection and include the documentation in the cross-connection control program annual summary report required in subsection (8) of this section.

Table 13

High Health Cross-Connection Hazard Premises Requiring Premises Isolation by AG or RPBA/RPDA

- *Agricultural (farms and dairies)*
- *Beverage bottling plants*
- *Car washes*
- *Chemical plants*
- *Commercial laundries and dry cleaners*
- *Premises where both reclaimed water and potable water are provided*
- *Film processing facilities*
- *Food processing plants*
- *Hospitals, medical centers, nursing homes, veterinary, medical and dental clinics, and blood plasma centers;*
    1. *Hospitals (include psychiatric hospitals and alcohol and drug treatment centers)*
    2. *Same day surgery centers*
    3. *Out-patient clinics and offices*
    4. *Alternative health out-patient clinics and offices*
    5. *Psychiatric out-patient clinics and offices*
    6. *Chiropractors*
    7. *Hospice care centers*
    8. *Kidney dialysis centers*
    9. *Blood centers*
    10. *Dental clinics and offices*
    11. *Nursing homes*
    12. *Boarding homes*
    13. *Residential treatment centers*
    14. *Mortuaries*
    15. *Morgues and autopsy (not in hospitals)*
    16. *Veterinarian offices, clinics, and hospitals*
- *Premises with separate irrigation systems using the purveyor's water supply and with chemical addition*

- *Laboratories*
- *Metal plating industries*
- *Mortuaries*
- *Petroleum processing or storage plants*
- *Piers and docks*
- *Radioactive material processing plants or nuclear reactors**
- *Survey access denied or restricted*
- *Wastewater lift stations and pumping stations*
- *Wastewater treatment plants**
- *Premises with an unapproved auxiliary water supply interconnected with the potable water supply (private well, pond, tanks, etc.)*

WAC 246-290-490(4) (c) Backflow protection for single-family residences.

(i) For single-family residential service connections, the purveyor shall comply with the requirements of (b) of this subsection when applicable.

(ii) If the requirements of (b) of this subsection do not apply and the requirements specified in subsection (2)(g)(ii) of this section are met, the purveyor may rely on backflow protection provided at the point of hazard in accordance with WAC 51-56-0600 of the UPC for hazards such as, but not limited to:
(A) Irrigation systems;
(B) Swimming pools or spas;
(C) Ponds; and
(D) Boilers.
For example, the purveyor may accept an approved AVB on a residential irrigation system, if the AVB is properly installed under the UPC.

The City's Cross Connection Control Program is not responsible for Cross Connection Control inside the consumer's property. The jurisdiction falls under the Local Administrative Authority as per the Uniform Plumbing Code for Cross Connection Control 603.0

WAC 246-290-490(4) (d) Backflow protection for fire protection systems.
(i) Backflow protection is not required for residential flow-through or combination fire protection systems constructed of potable water piping and materials.
(ii) For service connections with fire protection systems other than flow-through or combination systems, the purveyor shall ensure that backflow protection consistent with WAC 51-56-0600 of the UPC is installed. The UPC requires minimum protection as follows:
(A) An RPBA or RPDA for fire protection systems with chemical addition or using unapproved auxiliary water supply; and
(B) A DCVA or DCDA for all other fire protection systems.
(iii) For connections made on or after April 9, 1999, the purveyor shall ensure that backflow protection is installed before water service is provided.
(iv) For existing fire protection systems:
(A) With chemical addition or using unapproved auxiliary supplies, the

purveyor shall ensure that backflow protection is installed within ninety days of the purveyor notifying the consumer of the high health cross connection hazard or in accordance with an alternate schedule acceptable
(B) Without chemical addition, without on-site storage, and using only the purveyor's water (i.e., no unapproved auxiliary supplies on or available to the premises), the purveyor shall ensure that backflow protection is installed in accordance with a schedule acceptable to the purveyor or at an earlier date if required by the code official administering the State Building Code as defined in chapter 51-04 WAC.
(C) When establishing backflow protection retrofitting schedules for fire protection systems that have the characteristics listed in (d)(iv)(B) of this subsection, the purveyor may consider factors such as, but not limited to, impacts of assembly installation on sprinkler performance, costs of *retrofitting, and difficulty of assembly installation.*

The City's Cross-Connection Control Program evaluation of new and existing fire protection system connections is as follows: New connections must comply with the City's Construction Standards for water, Design Standards 7.01.5.2 Fire Sprinkler Systems, Backflow Assembly Installation Standards (Technical Memo), along with any additional requirements by the Fire Authority and Authority having Jurisdiction and evaluated by the City's Cross-Connection Control Specialist during the permit and plan review process and before service is provided. Fire Sprinkler System service connection(s) to new consumers and/or premises shall have a risk assessment conducted by the City's Cross-Connection Control Specialist to determine if the backflow protection is commensurate with the degree of hazard, the backflow assembly is correctly installed and a valid test of the backflow assembly is conducted before the BFL permit is finaled.
Existing Fire Sprinkler System service connections are given a risk assessment by the City's Cross-Connection Specialist to determine if the backflow protection is commensurate with the degree of hazard. If the Fire Sprinkler System has the characteristics of WAC 246-290-490 (d) (iv) (a) – i.e. chemical addition or unapproved auxiliary supplies – the consumers and/or premises shall install backflow protection commensurate with the degree of hazard within (90) ninety days of the City notifying the consumes and/or premises or within an alternate schedule acceptable to the City's Cross-Connection Control Program. If the Fire Sprinkler System does not have chemical addition or unapproved auxiliary supplies, the consumer and/or premises shall install backflow protection commensurate with the degree of hazard within (90) ninety days of the City notifying the consumers and/or premises or within an alternate schedule acceptable to the City's Cross-Connection Control Program. Factors such as, but not limited to, impact of the backflow assembly installation on the fire sprinklers performance, costs of retrofitting, and difficulty of installation are consideration for an alternate schedule.

The cost/fees of installation, initial and annual testing, maintenance, and repair or replacement of the backflow assembly shall be the responsibility of the consumer as a condition of water service.

WAC 246-290-490(4) (e) Purveyors may require backflow preventers commensurate with the degree of hazard determines by the purveyor to be installed for premises isolation for connections serving premises that have characteristics such as, but not limited to, the following:

(i) Complex plumbing arrangements or plumbing potentially subject to frequent changes that make it impracticable to assess whether cross-connection hazards exist;
(ii) A repeated history of cross-connections being established or reestablished; or
(iii) Cross-connection hazard are unavoidable or not correctable, such as, but not limited to, tall buildings.

The City's Cross-Connection Control Program requires commensurate backflow protection for consumers and/or premises with the following defined characteristics:

- *Complex plumbing arrangements –*
- *Plumbing subject to frequent changes –*
- *Repeat history of cross-connections –*
- *Unavoidable cross-connection hazards –*
- *Non-correctable cross-connection hazards –*

WAC 246-290-490(5) (a) The purveyor shall ensure that all backflow prevention assemblies relied upon by the purveyor are models included on the current list of backflow prevention assemblies approved for use in Washington state.

The City's Cross-Connection Control Program verifies new backflow assemblies installed within the distribution system are on the current DOH Approved Assemblies List.

WAC 246-290-490(5) (b) The purveyor may rely on testable backflow prevention assemblies that are not currently approved by the department, if the assemblies:

(i) Were included on the department and/or USC list of approved backflow prevention assemblies at the time of installation;
(ii) Have been properly maintained;
(iii) Are commensurate with the purveyor's assessed degree of hazard; and
(iv) Have been inspected and tested at least annually and have successfully passed the annual test

The City's Cross-Connection Control Program archives DOH Approved Assemblies List for verification.

WAC 246-290-490(5) (c) The purveyor shall ensure that an unlisted backflow prevention assembly is replaced by an approved assembly commensurate with the degree of hazard, when the unlisted assembly:

(i) Does not meet the conditions specified in (b) (i) through (iv) of this subsection;
(ii) Is moved; or
(iii) Cannot be repaired using spare parts from the original manufacturer.

This is covered under Element 5 of the City's Cross Connection Control Program.

WAC 246.290.490(6) (a) The purveyor shall ensure that approved backflow preventers are installed in the orientation for which they are approved (if applicable).

The City's Cross-Connection Control Program requires all approved backflow assemblies to be installed in the orientation for which they are approved and provides installation standards for assembly size and type. Reduced Pressure Backflow Assemblies (RPBA) installed inside of a building shall be engineered by the plumbing contractor to meet the following: "The plumbing system needs to have adequate capacity to carry continuous discharge from relief valve of RPBA".

WAC 246.290.490(6) (b) The purveyor shall ensure that approved backflow preventers are installed in a manner that:

(i) Facilitates their proper operation, maintenance, inspection, and/or in-line testing (as applicable) using standard installation procedures acceptable to the department such as those in the USC Manual or PNWS-AWWA Manual;

(ii) Ensures that the assembly will not become submerged due to weather-related conditions such as flooding; and

(iii) Ensures compliance with all applicable safety regulations.

The City's Cross-Connection Control Program requires all approved backflow assemblies to be installed in the orientation for which they are approved and meets all the City's standards, USC Manual and PNWS-AWWA Manual. Backflow assemblies under the jurisdiction of the water purveyor shall not be installed in areas subject to flooding and shall meet all applicable safety regulations.

WAC 246.290.490(6) (c) The purveyor shall ensure that approved backflow assemblies for premises isolation are installed at a location adjacent to the meter or property line or an alternate location acceptable to the purveyor.
WAC 246.290.490(6) (d) When premises isolation assemblies are installed at an alternate location acceptable to the purveyor, the purveyor shall ensure that there are no connections between the point of delivery from the public water system and the approved backflow assembly, unless the installation of such a connection meets the purveyor's cross-connection control requirements and is specifically approved by the purveyor.

The City's Cross-Connection Control Program requires all approved backflow assemblies used for premises isolation be installed at a location adjacent to the meter or property line, however if the location is not feasible then the facilities property owner and/or representative shall submit a set of plans for approval by the City's Cross-Connection Control Specialist showing the new location of the backflow assembly and the piping from the meter.

WAC 246.290.490(6) (e) The purveyor shall ensure that approved backflow preventers are installed in accordance with the following time frames:

(i) For connections made on or after April 9, 1999, the following conditions shall be met before service is provided:
(A) The provisions of subsection (3)(d)(ii) of this section; and
(B) Satisfactory completion of the requirements of subsection (7) of this section.

(ii) For existing connections where the purveyor identifies a high health cross connection hazard, the provisions of (3)(d)(ii) of this section shall be met:
(A) Within ninety days of the purveyor notifying the consumer of the high health cross-connection hazard; or
(B) In accordance with an alternate schedule acceptable to the purveyor.

(iii) For existing connections where the purveyor identifies a low cross-connection hazard, the provisions of subsection (3)(d)(ii) of this section shall be met in accordance with a schedule acceptable to the purveyor.

This is covered under Element 2 of the City's Cross Connection Control Program.

WAC 246.290.490(6) (f) The purveyor shall ensure that bypass piping installed around any approved backflow preventer is equipped with an approved backflow preventer that:

(i) Affords at least the same level of protection as the approved backflow preventer that is being bypassed; and

(ii) Complies with all applicable requirements of this section.

The City's Cross-Connection Control Program requires all bypass piping and/or parallel connections to have the same level of protection as required by the City's Cross Connection Specialist.

WAC 246.290.490(8) (f) The purveyor shall notify the department, local administrative authority, and local health jurisdiction as soon as possible, but no later than the end of the next business day, when a backflow incident is known by the purveyor to have:

(i) Contaminated the public water system; or

(ii) Occurred within the premises of a consumer served by the purveyor.

This is covered under Element 7 of the City's Cross Connection Control Program.

WAC 246.290.490(8) (g) – The purveyor shall:

- Document details of backflow incidents on a form acceptable to the department such as the backflow incident report form included in the most recent edition of the PNWS-AWWA Manual: and
- Include all backflow incident report(s) in the annual cross0connection program summary report.

This is covered under Element 7 of the City's Cross Connection Control Program.

Definitions:

"Accessible" means reference to the installation of backflow preventers; accessible shall mean that such backflow preventers shall be placed so that they can be reached for testing and/or maintenance safely.

"Approval/approved" means authorized in writing by the health authority, department, purveyor, or other agency having jurisdiction.

"Approved air gap," means a physical separation between the free-flowing end of a potable water supply pipeline and the overflow rim of an open or non-pressurized receiving vessel.

To be an air gap approved by the department, the separation must be at least:

- Twice the diameter of the supply piping measured vertically from the overflow rim of the receiving vessel, and in no case be less than one inch, when unaffected by vertical surfaces (sidewalls); and:

- Three times the diameter of the supply piping, if the horizontal distance between the supply pipe and a vertical surface (sidewall) is less than or equal to three times the diameter of the supply pipe, or if the horizontal distance between the supply pipe and intersecting vertical surfaces (sidewalls) is less than or equal to four times the diameter of the supply pipe and in no case less than one and one-half inches.

"Approved atmospheric vacuum breaker" means an AVB of make, model, and size that is approved by the department. AVBs that appear on the current approved backflow prevention assemblies list developed by the University of Southern California Foundation for Cross-Connection Control and Hydraulic Research or that are listed or approved by other nationally recognized testing agencies (such as IAPMO, ANSI, or UL) acceptable to the local administrative authority are considered approved by the department.

"Approved backflow preventer" means an approved air gap, an approved backflow prevention assembly, or an approved AVB. The terms "approved backflow preventer," "approved air gap," or "approved backflow prevention assembly" refer only to those approved backflow preventers relied upon by the purveyor for the protection of the public water system. The requirements of WAC 246-290-490 do not apply to backflow preventers installed for other purposes.

"Approved backflow prevention assembly" means an RPBA, RPDA, DCVA, DCDA, PVBA, or SVBA of make, model, and size that is approved by the department. Assemblies that appear on the current approved backflow prevention assemblies list developed by the University of Southern California Foundation for Cross-Connection Control and Hydraulic Research or other entity acceptable to the department are considered approved by the department.

"As-built drawing" means the drawing created by an engineer from the collection of the original design plans, including changes made to the design or to the system that reflects the actual constructed condition of the water system.

"Assessment of risk" shall express the results of an evaluation (site survey) of a health, system, or plumbing hazard. The evaluation (site survey) required in making a determination of the type of backflow preventer needed to isolate a specific cross-connection (e.g., a plumbing fixture), or a group of cross-connections contained within a facility or complex of facilities (e.g. a shopping mall) is comprised of the following steps:

- Determine the degree of potential health hazard risk to the public water system. (In assessing the purveyor's risk of contamination of the public water system, if knowledge of the degree of hazard posed by a substance is not known, the purveyor must assume that it is high. Generally, almost all substance other than potable water is considered a health hazard of some degree).
- Determine the high or low probability that a cross-connection may occur.
    1. The probability increases that an existing cross-connection will go undetected as the complexity of a piping system increases.
    2. Piping changes will create new cross-connections, or change the operating conditions from backsiphonage to backpressure conditions.
    3. A backflow preventer could be by-passed or removed from service.
    4. A substance could be changed or increased in strength.
    5. A substance may deteriorate, and thus become a health hazard.
    6. A substance, when combined with the chemicals in the potable water supply, or when exposed to certain piping material, may react and form a compound that poses a health hazard, such as CO2 mixing with water to from carbolic acid that leaches copper from a service pipe.
    7. A substance, if it contains a bacteriological contaminant, could become a health hazard long after it enters the potable water supply, though bacteria re-growth.
- Determine the risk level acceptable to the purveyor, and
- Determine the reliability required of the backflow preventer.

"Auxiliary water supply" means any water supply on, or available to, a premise in addition to the purveyor's approved public potable water supply.

"Auxiliary water supply – approved" means an auxiliary water supply which has been investigated and approved by the health authority, meets water quality regulations, and is accepted by the water purveyor.

"Auxiliary water supply – unapproved" means an auxiliary water supply, which is not approved by the health authority and the water purveyor.

"Backflow" means the undesirable reversal of flow of water or other substances through a cross-connection into the public water system or consumer's potable water system.

"Backflow assembly tester" means a person holding a valid BAT certificate issued in accordance with chapter 246-292 WAC.

"Backflow prevention assembly" means the nomenclature "assembly" refers to a backflow preventer which are designed to be in-line tested and repaired, and to meet the head loss and flow requirements of the recognized approval authority. The "assembly" consists of the backflow prevention unit, two resilient seated shutoff valves, and test cock(s).

"Backflow prevention device" means the nomenclature "device" refers to a backflow preventer that is not designed for in-line testing.

"Backpressure" means a pressure (caused by a pump, elevated tank or piping, boiler, or other means) on the consumer's side of the service connection that is greater than the pressure provided by the public water system and which may cause backflow.

"Backsiphonage" means backflow due to a negative or reduced pressure within the purveyor's potable water supply.

"Combination fire protection system" means a fire sprinkler system that:

- Is supplied only by the purveyor's water.
- Does not have a fire department pumper connection; and
- Is constructed of approved potable water piping and materials that serve both the fire sprinkler system and the consumer's potable water system.

"Consumer" means any person receiving water from a public water system from either the meter, or the point where the service line connects with the distribution system if no meter is present. For purposes of cross-connection control, "consumer" means the owner or operator of a water system connected to a public water system through a service connection.

"Consumer's water system" as used in WAC 246-290-490, means any potable and/or industrial water system that begins at the public water system point of delivery; that is, at the immediate downstream side of the water meter, and is located on the consumer's premises. The consumer's water system includes all auxiliary sources of supply, storage, treatment, and distribution facilities, piping, plumbing, and fixtures under the control of the consumer.

"Contaminant" means a substance present in drinking water that may adversely affect the health of the consumer or the aesthetic qualities of the water.

"Cross-connection" means any actual or potential physical connection between a public water system or the consumer's water system and any source of non-potable liquid, solid, or gas that could contaminate the potable water supply by backflow.

"Cross-connection control program" means the administrative and technical procedures the purveyor implements to protect the public water system from contamination via cross-connections as required in WAC 246-290-490.

"Cross-connection control specialist" means a person holding a valid Washington State Cross-Connection Control Specialist certificate issued in accordance with Chapter 246-292 WAC.

"Cross-connection control summary report" means the annual report required by the department that describes the status of the purveyor's cross-connection control program.

"Check valve" the term "check valve" is a generic term used for a variety of valves that specifically allow flow in one direction only. The variety of such valves includes slanting disc checks, silent check, (wafer or globe), automatic control checks, rubber flapper checks, double disc swing checks, swing checks (internally or externally weighted), and a spring-loaded check. A check valve in an approved assembly must be an approved check valve (components of double check valve assemblies, reduced pressure backflow assemblies, pressure vacuum breakers, and spill resistant vacuum breaker) that is drip-tight in the normal direction of flow when the inlet pressure is at least one p.s.i.

"Confined space," means any space having a limited means of egress and not intended for continuous occupancy, which is subject to the accumulation of toxic or flammable contaminants or an oxygen deficient atmosphere.

"Containment" means to restrict or limit the flow of contaminated or polluted water to the meter or service connection where the public water enters the private (consumer's) water system. The two systems are separated by a backflow preventer commensurate with the degree of hazard.

"Contamination" means an impairment of the quality of the potable water, which creates an actual hazard to the public health through poisoning or through the spread of diseases by sewage, industrial fluids or waste. Also defined as severe or high hazard. The term "contamination" used in EPA and drinking water regulations "maximum contamination level" bestows a different meaning than that used in describing a cross-connection hazard.

"Department" means the Washington State Department of Health or health officer as identified in a joint plan of operation in accordance with WAC 246-290-030 (1).

"Design and construction standards" means department design guidance and other peer reviewed documents generally accepted by the engineering profession as containing fundamental criteria for design and construction of water facility projects. Design and construction standards are comprised of performance and sizing criteria and reference general construction materials and methods.

"Direct service connection," means a service hookup to a property that is contiguous to a water distribution main and where additional mains or extensions are not needed to provide service.

"Distribution system" means all piping components of a public water system that serve to convey water from transmission mains linked to source, storage and treatment facilities to the consumer excluding individual services.

"Dual distribution system" means a facility with two water systems, one potable and the other non-potable. The purpose of the non-potable water system is to reduce the cost of the potable water supply.

"Double check detector assembly" (DCDA) means an approved assembly consisting of two approved double check valve assemblies, set in parallel, equipped with a meter on the bypass line to detect small amounts of water leakage or use.

"Double check valve assembly" (DCVA) means an approved assembly consisting of two independently operating check valves, loaded to the closed position by springs or weights, and installed as a unit with, and between, two resilient seated shutoff valves and having suitable connections for testing.

"Emergency" means an unforeseen event that causes damage or disrupts normal operations and requires immediate action to protect public health and safety.

"Fire Flow" means the maximum rate and duration of water flow needed to suppress a fire under WAC246.293.640 or as required under local fire protection authority standards.

"Fire Suppression Storage" means the volume of stored water available during fire suppression activities to satisfy minimum pressure requirements per WAC 246.290.230.

"First Consumer" means the first service connection associated with any source (i.e., the point where water is first withdrawn for human consumption, excluding connections where water is delivered to another water system covered by these regulations).

"Flow-through fire protection system" means a fire sprinkler system that:

- Is supplied only by the purveyor's water;
- Does not have a fire department pumper connection;
- Is constructed of approved potable water piping and materials to which sprinkler heads are attached; and
- Terminates at a connection to a toilet or other plumbing fixture to prevent the water from becoming stagnant.

"Guideline" means a department document assisting the purveyor in meeting a rule requirement.

"Health officer" means the health officer of the city, county, city-county health department or district, or an authorized representative.

"High health cross-connection hazard" means a cross-connection, which could impair the quality of potable water and create an actual public health hazard through poisoning or spread of disease by sewage, industrial liquids or waste.

"High health hazard" means a physical or toxic hazard, which could be detrimental to ones, health.

"Human Consumption" means the use of water for drinking, bathing or showering, hand washing, food preparation, cooking, or oral hygiene.

"Internally-loaded check valve" means a check valve which is internally loaded, either by springs or weights, to the extent it will be drip tight with a 1 p.s.i. differential in the direction of flow.

"Industrial piping system" refers to that piping system that transmits, confines, or stores any fluids that are not approved potable water. Such a system would include all pipes, tanks, fixtures, equipment and other extensions of the non-potable water system.

"In-premises protection" means a method of protecting the health of consumers served by the consumer's potable water system, located within the property lines of the consumer's premises by the installation of an approved air gap or backflow prevention assembly at the point of hazard, which is generally a plumbing fixture.

"Local administrative authority" means the local official, board, department, or agency authorized to administer and enforce the provisions of the Uniform Plumbing Code as adopted under chapter 19.27 RCW.

"Low health cross-connection hazard" means a cross-connection that could cause an impairment of the quality of potable water to a degree that dose not create a hazard to the public health, but does adversely and unreasonably affect the aesthetic qualities of such potable waters for domestic use.

"Non-potable fluid" means any water, other liquid, gas, or other substance, which is not safe for human consumption, or is not a part of the public potable water supply as described by the health authority.

"Non-potable piping system" means a piping system, which is made of non-potable material. Such materials are to be considered non-potable if they can affect either the aesthetics or degradation of the healthfulness of the water. Examples of such pipe are black iron and certain plastics.

"Plumbing hazard" is a cross-connection in a consumer's potable water system.

"Potable water" means water, which is safe for human consumption, free from harmful or objectionable materials, as described by the health authority/department.

"Premises isolation" means a method of protecting a public water system by installation of approved air gap or approved backflow prevention assemblies at or near the service connection or alternative location acceptable to the purveyor (at the point where the water

purveyor no longer has legal jurisdiction and/or authority to control the water system) to isolate the consumer's water system from the purveyor's distribution system.

"Pressure vacuum breaker assembly" (PVBA) means an approved assembly consisting of a spring loaded check valve loaded to the closed position, an independently operating air inlet valve loaded to the open position and installed as a unit with and between two resilient seated shutoff valves and with suitable connections for testing. It is designed to protect against backsiphonage only.

"Private hydrant" means any hydrant, which is not owned, operated or maintained by the local water purveyor or his agent.

"Process water" means water that is directly connected to, or could come in contact with, an extreme high hazard situation, and must never be consumed by humans.

"Public health hazard" means a condition, device or practice which is conducive to the introduction of waterborne disease organisms, or harmful chemical, physical, or radioactive substance into a potable water system and which presents an unreasonable risk to health.

"Public water system" is defined and referenced under WAC 246-290-020.

"Purchased source," means water a purveyor purchases from a public water system not under the control of the purveyor for distribution to the purveyor's consumers.

"Purveyor" means an agency, subdivision of the state, municipal corporation, firm, company, mutual or cooperative association, institution, partnership, or person or other entity owning or operating a public water system. Purveyor also means the authorized agents of such entities.

"Reasonable risk" means the amount of risk acceptable to a prudent and reasonable water purveyor using reasonable diligence.

"Reclaimed water," means wastewater that has been treated for non-potable water use within the same facility or premise. Examples of use would be irrigation and industrial use.

"Reduced pressure backflow assembly" (RPBA) means an approved assembly consisting of two independently operating check valves, spring loaded to the closed position, separated by a spring loaded differential pressure relief valve loaded to the open position, and installed as a unit with and between two resilient seated shutoff valves and having four suitable test cocks for checking the water tightness of the check valves and the operation of the relief valve.

"Reduced pressure detector assembly" (RPDA) means an approved assembly consisting of two approved reduced pressure backflow assemblies, set in parallel, equipped with a meter on the bypass line to detect small amounts of water leakage or use. This unit must

be purchased as a complete assembly. The assembly may be allowed on fire line water services in place of an approved reduced pressure backflow assembly upon approval by the local water purveyor.

"Regional public water supplier" means a water system that provides drinking water to one, or more, other public water systems.

"Resident" means an individual living in a dwelling unit served by a public water system.

"Safe drinking water act" was legislation that was enacted by the United States Congress in 1974 to ensure that the public is provided with safe drinking water, thereby protecting the public welfare.

"Safe drinking water" means water which has sufficiently low concentrations of microbiological, inorganic chemical, organic chemical, radiological or physical substance so that individuals drinking such water at normal levels of consumption will not be exposed to disease organisms or other substances which may produce harmful physiological effects.

"Service connection" means a connection to a public water system designed to provide potable water to a single-family residence, or other residential or non-residential population.

"Toxicity" means the degree to which a substance is toxic that is poisonous, in relating to affecting the potability of the water supply.

"Unapproved auxiliary water supply" means a water supply (other than the purveyor's water supply) on or available to the consumer's premises that is either not approved for human consumption by the health agency having jurisdiction or is not otherwise acceptable to the purveyor.

"Unreasonable risk to health" means a risk to health, which is not necessary or acceptable to the water purveyor and/or consumer; a term used to distinguish what type of backflow prevention should be required.

"Uniform Plumbing Code" means the code adopted under RCW 19.27.031(4) and amended under chapter 51-46 WAC. This code establishes statewide minimum plumbing standards applicable within the property lines of the consumer's premises.

"USC FCCCHR" is the abbreviation for the University of Southern California Foundation for Cross Connection Control and Hydraulic Research. It is an agency, which test and approves backflow prevention assemblies by approved standards.

"Used water," means water which has left the control of the purveyor. In most cases, the potable water has moved past (downstream of) the water meter and/or the property line.

Application Form—CCC Program

Backflow Incident Report Form

331-457-F • June 2024

Note: Use this form to comply with WAC 246-290-490(8)(g).

Part 1: Public Water System (PWS) Information					
PWS ID		PWS Name		County	Choose an item.

Part 2: Backflow Incident Information					
A. Incident Identification					
Incident Date	Date	Incident Time	Enter Time	*Incident ID (ODW Use Only)*	Internal ID#

Backflow Type	Backsiphonage ☐	Backpressure ☐
Typical distribution system pressure in vicinity of incident (if range, enter lower end of range)	Click or tap here to enter text. psi	

Main/pressure status at time of incident (Check all that apply.)

Normal	☐	Source/plant outage	☐
Main break	☐	Scheduled water shutoff by PWS	☐
Firefighting	☐	Unscheduled/emergency shutoff	☐
Other high usage	☐	Unknown	☐
Power outage	☐	Other (specify)	Click or tap here to enter text.

Describe causes and circumstances leading to backflow incident.

Click or tap here to enter text.

C. Backflow Preventer Information/Installation/Approval Status at Site of Backflow

Complete the tables in C and D for the premises isolation preventer for either of the following situations:

- If a premises isolation backflow preventer is installed and the contaminant entered the PWS distribution system.
- If the premises isolation assembly is the only backflow preventer at the site.

In all other cases, complete tables in C and D for the in-premises backflow preventer installed at the fixture. If more than one backflow preventer was involved in the backflow incident, copy tables C and D and complete them for the additional preventer(s

If no backflow preventer was installed at the time the incident occurred, check this box ☐ and go directly to Part 4. Don't fill out the tables below (C and D).

Backflow Preventer Information	Type Installed	Click or tap here to enter text.
	Installed For	Click or tap here to enter text.
	Make	Click or tap here to enter text.
	Model	Click or tap here to enter text.
	Size	Click or tap here to enter text.
	Serial Number	Click or tap here to enter text.
	Date Installed	Click or tap to enter a date.

Installation Status. Check all that Apply.	Properly installed/plumbed	☐
	Improperly installed/plumbed	☐
	Improperly protected bypass present	☐
	If so, explain	Click or tap here to enter text.

Commensurate with assessed degree of hazard?	Yes ☐ No ☐	If not, explain. Click or tap here to enter text.
DOH/USC-approved at time of backflow incident?	Yes ☐ No ☐	If not, approved when installed? Yes ☐ No ☐

D. Backflow Preventer Inspection/Testing Information at Site of Backflow

Most recent inspection/test information prior to backflow incident. Attach test report(s), if available.	Not test report on record.	☐
	Date tested/inspected.	Click or tap to enter a date.
	Passed test/inspection *without* repairs.	☐
	Failed initial test/inspection, passed *after* repair.	☐
	Failed test/inspection, no repairs made.	☐
Inspection/test information after backflow incident [per WAC 246-290-490(7)(b)]. Attach test report.	Not tested/inspected.	☐
	Date tested/inspected.	Click or tap to enter a date.
	Passed test/inspection *without* repairs.	☐
	Failed initial test/inspection, passed *after* repair.	☐
	Failed test/inspection, no repairs made.	☐

Backflow Preventer failure information, if applicable. Check all that apply.	Fouled check	☐
	Debris	☐
	Weather-related damage	☐
	Damaged seat	☐
	Other	Click or tap here to enter text.

If preventer failed inspection/test, did failure allow backflow?	Yes ☐ No ☐	If yes, explain. Click or tap here to enter text.

Part 4: Corrective Action/Notification

Action *taken* by PWS to restore water quality. Check all that apply.	None	☐
	Flushed/cleaned mains	☐
	Flushed/cleaned plumbing	☐
	Disinfected mains	☐
	Disinfected plumbing	☐
	Other treatment (describe)	Click or tap here to enter text.
	Replaced mains	☐
	Replaced plumbing	☐
	Other	Click or tap here to enter text.

Action *ordered* by PWS to correct cross-connection. Check all that apply.	None	☐
	Eliminate cross-connection	☐
	Remove by-pass	☐
	Install new preventer For premises isolation For fixture protection	☐ ☐ ☐
	Change existing preventer Repair/replumb ..... Reinstall correctly ..... Replace with same type Upgrade type	☐ ☐ ☐ ☐ ☐
	Other	Click or tap here to enter text.

Action ordered accomplished?	Yes	☐	Date	Click or tap to enter a date.
	No	☐	Explain	Click or tap here to enter text.

Agency notifications per WAC 246-290-490(8)(f). Check all that apply.	DOH	☐
	Local Health Agency	☐
	Local Administrative Authority	☐
	Issued by end of next business day	Click or tap here to enter text.

Notifications of consumers in area of incident (check all that apply)	Population at risk	☐
	Public Notification (PN per DOH regs)	☐
	Boil Water Advisory	☐
	Other (describe)	Click or tap here to enter text.
Other enforcement/corrective actions (describe).	Click or tap here to enter text.

AUBURN WATER UTILITY
WATER SHORTAGE CONTINGENCY PLAN

Introduction

This Water Shortage Contingency Plan (WSCP) describes the actions and procedures for implementing Auburn City Code (ACC) 13.14 during impending or actual water shortages or emergencies caused by drought conditions, city water utility damage or destruction, or any other cause threatening to disrupt or diminish the city's water supply below its ability to meet normal water demands.

Causes of Water Shortage

Water supply in Auburn is sourced from a series of wells and springs, rendering the city less susceptible to short-term droughts compared to other regions however, unforeseen circumstances may still arise that could lead to water scarcity and challenge the city's ability to meet demand. These challenges include:

- Drought conditions resulting from below-average fall/winter precipitation, which may gradually impact local aquifers; and
- Extended periods of unusually warm and dry weather during the summer months could exacerbate water supply issues, particularly if the peak demand period is prolonged beyond the norm; and
- Unexpected events such as infrastructure failures, natural disasters, vandalism, or contamination incidents could create water supply issues.

Objective

The WSCP objective is to guide the City of Auburn Public Works Department in implementing water use restrictions and/or conservation measures necessary in response to a current or threatened water supply disruption or diminution.

This plan addresses both progressive situations, such as those that are weather-related, and more drastic and immediate situations such as facility emergencies (e.g., a pipeline break) to maintain levels of service essential for public health and safety, minimize adverse impacts on economic activity, and protect our customer's lifestyle.

Phased Curtailment Plan

This WSCP provides five stages of response to water shortages. The first three stages of the WSCP are intended for response to seasonal or long-term supply shortages. The fourth stage will be used in response to a sudden loss of distribution capability, such as a pipeline break or well failure. The fifth stage is to be implemented in response to regional emergencies. The five stages include a variety of communications, internal operations, and supply and demand management strategies as appropriate, and are characterized as follows:

- **Stage I. Anticipated Water Shortage. Voluntary Curtailment** – If a shortage appears imminent, the Public Works Department will enact Stage 1 of the Phased Curtailment Plan and conduct outreach and messaging regarding the benefits and necessity of water curtailment.

- **Stage II. Serious Water Shortage. Restricting Certain Activities** – If the voluntary curtailment messaging of Stage 1 does not result in the reduction needed, the Public Works Department will enact Stage II, following the Mayor issuing a proclamation of water shortage per Auburn City Code 13.14.020, and conduct outreach and messaging restricting certain activities for both residential and commercial customers.

- **Stage III. Critical Water Shortage. Mandatory Restrictions** – If the required curtailment of certain activities of Stage II does not result in the reduction needed, the Public Works Department will enact Stage III and conduct outreach and messaging prohibiting certain activities for both residential and commercial customers. This stage would be accompanied by an enforcement plan, which could include fines for repeated violation.

- **Stage IV. Emergency Water Shortage.** – In the event that immediate curtailment is required to maintain supply for human consumption, medical uses, sanitation, and fire protection, the Public Works Department will enact Stage IV, and conduct outreach and messaging prohibiting all non-essential uses. This stage would be accompanied by an enforcement plan, which includes fines for violations.

- **Stage V. Regional Disaster. Water rationing** – In the event of a regional disaster or water shortage, the Public Works Department will enact Stage V, would require rationing water by Auburn's customers.

Stage I. Anticipated Water Shortage. Voluntary Curtailment.

Objectives

- To prepare the City, relevant agencies, and water users for potential water shortage, thereby allowing all parties adequate planning and coordination time.
- To undertake supply management actions that forestall or minimize the need later for more stringent demand or supply management actions.

Triggers

Declining source levels and/or increased demand impacting source capacity, and no indication of trend reversal in the immediate future.

Stage I Actions

Coordinate monitoring and tracking of supply and demand conditions. Monitoring and tracking activities will be increased during this phase beyond normal intervals that would otherwise occur during typical work activities.

Public Messaging

The following is a typical public message response used during Stage I activities:

"The potential exists for lower-than-normal water supply if the water use trends the City is observing continue. At this time, the City is asking all customers to consider reducing your water use, where feasible. As water supply conditions are better understood, additional information and any potential request for action will be provided. Suggested activities for reducing water use are included below. If we all work together we can reduce the potential for the City needing to enact more significant enforcement steps to assure we have the available water supply for all our customers."

Suggested Water Use Reduction Activities

The following are some possible approaches to water reductions:

- Do not water outdoor plants and landscaping between 11:00 AM and 7:00 PM.
- Install Drip lines for watering plants and trees.
- During the Spring, water no more than 3 days per week, if needed.
- During the Summer, water no more than 6 days per week.
- Do not water on Sunday.
- Turn off irrigation on rainy days.
- Install water smart landscaping.
- Install Water Smart toilets, shower heads, and faucets.

Bill inserts, social media posts as well as website updates, indicating declining source levels and/or increased demand impacting sources, will be considered during Stage 1 messaging.

Stage II. Serious Water Shortage. Restricting Certain Activities.

Objectives

- To maintain or reduce demand to meet target consumption levels by customers through voluntary actions.
- To prevent or minimize the need for later prohibiting activities.
- To minimize the disruption to customers' lives and businesses while meeting target consumption goals.
- To maintain the highest water quality standards throughout the shortage.

Triggers

Public Works Director determines:

1. Decreasing static or pumping levels at city sources.
2. Source water levels are significantly below historical "normals" for the current time of year, and historic use patterns indicate that expected demands may not be met if this trend continues or worsens.

Stage II Actions

Staff will frequently monitor demand and supply and re-evaluate the situation based on current and projected water supply conditions, taking into considerations the time of year, and determine the appropriate actions and strategies. Staff will determine target consumption goals to be achieved, which may be revised as necessary.

Public Messaging

The Mayor issues a proclamation of water shortage per Auburn City Code 13.14.020.

The following is a typical public message response used during Stage II activities:

Due to … we are experiencing lower-than-normal water supply, creating a citywide water shortage. We are relying on the support and cooperation of all water users to stretch the available water supply to ensure that everyone has water to meet their required and basic needs. At this time, your demand needs to be reduced by ___%. To meet that reduction, the City is limiting certain activities, which is included in the list below. If everyone cooperates, we may avoid imposing more stringent restrictions.

Required Water Use Reduction Activities

The following are required actions to reduce water use:

- Do not water outdoor plants and landscaping between 11:00 AM and 7:00 PM.
- During the Spring, water no more than 2 days per week, if needed.
- During the Summer, water no more than 6 days per week.
- Do not water on Sunday.
- Turn off irrigation on rainy days.

Social media posts as well as website updates and notices with monthly billings will be used during Stage 2 messaging. More detailed information on messaging identified in Communications Actions section below.

Communication Actions

- Staff communicates the nature and scope of measures and strategy to the Mayor/Council and wholesale customers.
- Evaluate whether targeted consumption levels and supply conditions warrant a rate surcharge to reinforce voluntary actions and/or to recover revenue losses.
- Prepare appropriate legislation regarding emergency surcharges, if required.
- Initiate major public information, media and advertising campaign:
    - Promote consumption goals for typical households, and a percentage reduction goal for commercial customers.
    - Develop and implement a marketing plan, potentially including paid advertising, to 1) keep customers informed about supply and demand conditions, 2) reinforce desired customer actions; recommend customer actions to reduce demand, and 3) depending on conditions, remind customers that if goals are not achieved, restrictions may be necessary.
    - Identify what potential next steps will be used to reduce demand including timing, what type of restrictions and/or surcharges will be imposed.
    - Include water quality information in public information so that if flushing is necessary, the public understands that it is essential for water quality maintenance.
- Publicize water supply conditions on the City web page, update regularly. Ensure the information provided covers the needs of all key interests: the public, news media and purveyors.
- Contact largest customers (including wholesale customers) (refer to Attachment A) to request percentage reduction and conservation messaging be the same as the City. Contact other public agencies to inform them of conditions and request their cooperation.
- Provide direct messaging to City employees on requirements and restrictions for City water usage at City Facilities.
- Contact nurseries and landscape contractors to inform them of conditions and request their cooperation.
- Establish regular communication mechanism to keep City employees, especially utility account representatives, up to date on goals, conditions, and actions.
- Initiate remaining planning and preparation for Stage III.

Auburn Internal Operating Actions

- Continue appropriate actions from Stage I.
- Intensify data collection actions and monitoring of weather forecasts.
- Intensify supply side management techniques to optimize existing sources.
- Assess current water main flushing and reservoir cleaning activities to determine whether they should be accelerated for completion prior to the peak season or postponed to conserve supply.
- Assess water quality in reservoirs and distribution system to target for correction areas that may be predicted to experience severe degradation with reduced consumption.
- Increase water quality monitoring actions.
- Communicate flushing and reservoir cleaning policy to wholesale customers.
- Review current wholesale customer agreements regarding curtailment actions.
- Implement staffing reassignments as needed, and plan staging changes, which may be needed for the Stage III, including staff to enforce mandatory restrictions.

Supply and Demand Management Actions

- Restrict hydrant meter assembly permits to essential purposes.
- Activate any existing interties unless they are also under curtailment of use to increase supply availability.
- Request that Fire Department limit training exercises that use water.
- Request that City departments eliminate washing fleet vehicles unless recycling car washes are used.
- Request that City of Auburn spray parks reduce or eliminate hours of operation.
- Request that hosing sidewalks, driveways, parking lots, etc. be limited to situations that require it for public health and safety.
- Have Auburn field personnel “tag” observed obvious water waste such as hoses without shutoff nozzles, irrigation overspray, etc. with notice that informs customer about the supply conditions and need to reduce consumption.
- Evaluate ability to accelerate or enhance or expand long-term curtailment programs; implement as appropriate.
- Request that wholesale customers who have alternative sources use them.

Stage III. Critical Water Shortage. Mandatory Restrictions.

Objectives

- To achieve targeted consumption reduction goals by restricting defined water uses.
- To ensure that adequate water supply will be available during the duration of the situation to protect public health and safety.
- To minimize the disruption to customers' lives and businesses while meeting target consumption goals.
- To maintain the highest water quality standards throughout the shortage.
- To promote equity among customers by establishing clear restrictions that affect all customers.

Triggers

The Public Works Director determines that progression to this stage is required due to the goals established in Stage II have not been met and additional action is needed.

Stage III Actions

If not already implemented, activate interties and any other alternative sources of supply that are also not curtailed.

Public Message

The following is a typical public message response used during stage III activities:

"Due to … we are experiencing a serious water shortage. The previous water use reduction messaging did not provide the results to achieve the water savings necessary, it is now necessary to impose mandatory restrictions to reduce the demand on our water supply. We are continuing to rely on the support and cooperation of the public to comply with these restrictions but need the certainty and predictability of restricting certain water uses in order to ensure that throughout the duration of this shortage an adequate supply of water is maintained for public health and safety.

Mandatory Activities

The following actions are mandatory activities required actions to reduce water use:

- Do not water outdoor plants and landscaping between 11:00 AM and 7:00 PM.
- During the Spring, water no more than 2 days per week, if needed.
- During the Summer, water no more than 6 days per week.
- Do not water on Sunday.
- Irrigation must be turned off on rainy days.
- Do not leave hoses untended hoses without shut-off nozzles, including obvious leaks and water running to waste such as gutter flooding and sprinklers/irrigation whose spray pattern unnecessarily and significantly hits impervious areas.
- Do not water landscape strips with grass only.
- Car washing must be conducted at commercial car wash facilities that recycle water.
- Filling or refilling of pools is prohibited.

- Filling or refilling of ponds or ornamental lakes is prohibited, unless they provide for aquatic life.

Communication Actions

- The Public Works Director recommends moving to Stage III and other appropriate actions.
- Mayor and Council briefing.
- The Council adopts legislation on emergency surcharges, if needed.
- The public is informed about the nature and scope of the mandatory restrictions through a press conference, code red, social media, paid advertising and other means, including direct mail. The enforcement mechanisms, rate surcharges, target consumption goals, projections for how long restrictions will be in place and the reasons for imposing restrictions will also be identified, as will the possible consequences if goals are not met.
- Any exemptions from restrictions will be clearly identified.
- In communicating mandatory restrictions to the public, a clear distinction will be made between lawn/turf watering and watering gardens and ornamental plantings. The type and amount of watering allowed will be clearly defined.
- A "Customer Hotline" will be set up to report violations of restrictions.
- Customers with private wells that are conducting activities prohibited by the city during this stage, will be urged to install signs to let the public know that private well water is being used.
- Communication actions from Stages I and II will be continued and expanded upon as needed.

Auburn Internal Operating Actions

- Continue appropriate actions from Stages I and II.
- Evaluate options for using seasonal sources of supply.
- Finalize and implement procedures for exemptions from restrictions and/or emergency surcharges.
- Finalize and implement enforcement procedures for restrictions including highly visible "Water Watchers." (See Attachment B)
- Increase water quality monitoring actions at storage reservoirs.

Supply and Demand Management Actions

The Public Works Director will consider current supply and demand conditions before recommending mandatory restrictions. The specific restrictions imposed during Stage III would be determined based on the season of the year, targeted demand levels, and other considerations previously mentioned. Variations of the specific restrictions may be applied based on water supply conditions.

Other Restrictions

- Prohibit use of any ornamental fountain using drinking water for operation or make-up (turn off City Hall Fountain).
- Close City of Auburn spray park(s).
- Rescind hydrant permits.
- Prohibit washing of sidewalks, streets, decks or driveways except as necessary for public health and safety.
- Limit washing of buildings to situations that require it as part of scheduled building rehabilitation project (e.g., painting or staining).

Exemptions from Water Use Restrictions

Lawn watering ban exemption- The City may exempt newly installed lawns from a watering ban. Those wishing to request this exemption would need to contact the Public Works Director in writing and request a variance. The Public Works Director would consider the size of lawn and type of watering system to determine is an exemption is granted and if so to quantify the amount of water to be used under the exemption. Public Works staff will spot check for compliance.

The procedures relating to the exemption and the requirements of the exemption would be clearly outlined at the time of the ban. The following procedures are subject to change:

- Each person requesting a variance would be mailed a packet stating the requirements.
- Once the requirements are met, an authorization packet would be mailed to the customer including a sign to be posted indicating that utility requirements are being complied with.
- New lawns must be properly installed, meaning that two inches of organic soil amendment, such as composted yard waste, is cultivated into the top six inches of existing soil, at a minimum.
- New lawns must be watered according to guidelines to be provided in the packet mentioned above.
- For purposes of this exemption, “new lawn” refers to a lawn newly installed during the current year only. Over seeded or otherwise renovated lawns would not be exempt.
- If the shortage continues to worsen, this exemption would be revoked. It would also be revoked on a case-by-case basis if the rules stated above are not followed, or in the case of a water system emergency.

Monitoring and enforcement are at the discretion of the utility. The existence of an exemption to a watering ban would be announced early in the response process, for example, when the Stage II is invoked.

Other Exemptions –
For purposes of dust control, water may be applied to construction areas or other areas needing to comply with air quality requirements. Ball fields and playfields may be watered at the minimum rate necessary for dust control and safety purposes. The city will exempt customers with special medical needs such as home dialysis from any emergency surcharge provided individual customers notify the utility of such a need.

Stage IV. Emergency Water Shortage.

Objectives

- To maximize consumption reduction by restricting defined water uses.
- To ensure that adequate water supply will be available during the duration of the emergency to protect public health and safety.
- To minimize the disruption to customer's lives and businesses while meeting target consumption goals.
- To maintain the highest water quality standards throughout the shortage.
- To promote equity among customers by establishing clear restrictions that affect all customers.

Triggers

The Public Works Director enacts implementation of this stage in the event of a sudden disruption within the City's water system, or to a source of supply, which prevents the City from providing the usual level of service to our customers.

Stage IV Actions

If not already implemented, activate interties and any other alternative sources of supply that are available.

Public Message

The following is a typical public message response used during stage IV activities:

"Due to failure (break) in the water supply system (or source), it is necessary to impose mandatory restrictions to reduce water use. We are requesting the support and cooperation of our customers (within this defined geographic area) to immediately reduce their use of water to ensure that, throughout the duration of this emergency, an adequate supply of water is maintained for public health and safety."

Communication Actions

- The Public Works Director enacts Stage IV and other appropriate actions.
- Mayor and Council Briefing, when practical.
- The public is informed about the nature and scope of the emergency and mandatory restrictions through a press conference, door hangers, code red, social media, paid advertising and other means, including direct mail.
- Any exemptions from restrictions will be clearly identified.

Auburn Internal Operating Actions

- Assess options for supplying emergency water to affected customers. And if appropriate develop implementation plan and execute.
- Monitor water quality as required.

Supply and Demand Management Actions

The City will consider current supply and demand conditions before recommending restrictions. The specific restrictions imposed during Stage IV would be determined based on water supply conditions and the expected duration of the emergency.

Other Restrictions

- Prohibit hydrant permit withdrawals from within the affected water service area.
- Consider appropriate water use restrictions from Stage III depending on the type of shortage the City is experiencing.

Exemptions from Water Use Restrictions

The Public Works Director will exempt customers with special medical needs, such as home dialysis from any emergency surcharge, provided individual customers notify the utility of such a need.

Stage V. Regional Disaster

Introduction

Although many of the demand reduction measures employed would be like those used during a progressive, weather-related shortage, short term emergencies are unique because of a lack of preparation time and the urgency of immediate, large-scale demand reductions. Each emergency scenario is different, but most of them require major curtailment actions by customers.

Unlike drought, some emergencies would be localized, requiring demand reduction for only a limited geographic area.

There are several criteria by which to decide which demand management measures are appropriate to initially reduce demand during an emergency:

- Timing: can the measure(s) or action(s) deliver the necessary water savings in the necessary timeframe, i.e., are immediate savings needed or can the system support a gradual reduction in demand.
- Magnitude of savings: will the measure produce enough savings to make a meaningful difference i.e., reduce demand to the level the impaired water system can handle.
- Season: does the action make any impact at the time of year that the emergency occurs, i.e., banning lawn watering will have little impact in November.
- Costs: How severe are the cost implications of the measure to the customer, including local business and industry.

Supply and Demand Management During Emergencies

No single strategy can be created which will meet the needs of the department for all emergency scenarios. The criteria listed above create a framework for decision making. Emergencies initially require quick and immediate response. Once an assessment is made as to how long it will take to restore the system, the immediate response strategy may change if it appears that the repair process will be lengthy. The strategy for most emergencies can be narrowed to measures having the most immediate impact on water supply and consumption. All needed and available back up supplies would be activated during an emergency: interties, well-fields, off-loading wholesale customers who have other sources, etc.

Attachment A

Auburn Water Shortage Contingency Plan

CONTACT LIST

A working list of contacts for easy reference in case of a drought or emergency should be developed and regularly updated by the Water Utility Engineer in consultation with others in the Department. In addition to the communication elements contained in the WSCP, the following will be contacted directly in the event of a drought or emergency to inform them and ask for their support and cooperation in reducing demand.

Customers
List of large irrigators, including those using alternate sources.
List of large commercial and industrial customers.

City of Auburn Contacts
Department Directors

Other public agencies with high visibility water use

Business Groups

Attachment B

Auburn Water Shortage Contingency Plan

Enforcement Procedural Check List

MANDATORY RESTRICTIONS

- ✓ Determine number of warnings before surcharges applied
- ✓ Self-duplicating "Notice of Violation" forms printed; one to record violation with billing
- ✓ Staff with customer service and communication experience or training assigned to "Water Watch"
- ✓ Establish procedure for "Water Watchers" to record warnings and penalties on customer accounts
- ✓ Establish "hotline" for customers to report violations
- ✓ Vehicles for "Water Watch" made available; vehicles that are signed as "Water Watchers" will increase visibility and effectiveness of enforcement
- ✓ High priority routes established, e.g. areas with large lawns
- ✓ All field and customer service staff provided "fact sheets", Question and Answer sheets; briefed on restrictions, enforcement procedures; field staff trained on tagging obvious violations

Executive Summary

The key points of the City of Auburn's Conceptual Mitigation Plan (CMP) for Water Right Application G1-28404 are provided below. Please refer to the main report for additional details.

- The Washington State Department of Ecology (Ecology) issued a Preliminary Permit in May 2021 to the City of Auburn (City) for Application G1-28404 (filed in January 2006), that requires the City to evaluate and identify options for mitigation due to the potential for impairment of surface waters that are subject to instream flow regulations.
- Application G1-28404 requests 13,443 acre-feet per year (afy) and 12,500 gallons per minute (Qi) from two existing supply wells (Well 6 and 7) and one potential new well (Well 8). Wells 6 and 7 are authorized as additional points of withdrawal under four of the City's existing water rights. The location of future Well 8 has not been determined but it is assumed Well 8 will be located near Wells 6 and 7, potentially in the Fulmer Wellfield area, with similar completion details.
- Wells 6 and 7 are completed in the lower alluvial aquifer in the Auburn Valley (also known as the Qvrd or Production Aquifer), which is known to be a highly productive aquifer capable of well yields in excess of 5,000 gallons per minute (gpm). A low permeability confining layer may provide some degree of hydraulic separation from shallow groundwater and surface water but, in general, the withdrawals from Wells 6 and 7 appear to be hydraulically connected to the Green River, and potentially the White River and Mill Creek.
- Washington Administrative Code (WAC) Chapter 173-509 established minimum instream flows in the Green River and closed tributaries to the Green River to further appropriations. The White River is closed to new appropriations under WAC Chapter 173-510. Water use under G1-28404 will likely require mitigation to offset potential impacts to the Green River when instream flows are not met. Potential impacts to the White River may also require mitigation.
- The City has various potential strategies for mitigation and water use under G1-28404 that include timing the withdrawals to occur during periods when instream flows are met. Mitigation would be used to offset lag time effects on the Green River after pumping stops (and to fully mitigate potential impacts to the White River and tributaries). Mitigation sources include:
    - Using existing City wells (and associated water rights) located in the White River drainage to augment flows in the Green River (and potentially tributaries including Mill Creek), or mitigation water from the 2010 Lake Tapps Area Water Resources Agreement with Cascade Water Alliance (CWA).

  - Offsetting streamflow impacts by changing the operation of certain wells to reduce impacts.
  - Purchasing water from Tacoma Public Utilities from Howard Hansen Reservoir to maintain streamflows in the Green River.
  - Purchasing water from CWA to maintain streamflows in the White River (for potential White River mitigation).
  - Using the City's existing water rights from West Hill Springs (for potential Mill Creek mitigation).1
  - Using infiltration basins, fed by either City water sources or reclaimed water, to provide delayed discharge to surface water.
- The potential impacts to streamflows and potential mitigation requirements under the projected use of G1-28404 will be evaluated in the Phase 2 (Testing and Analysis) portion of the Preliminary Permit.

[1] We note that under RCW 90.03.550(1), a water right for municipal water supply purposes may be utilized to benefit fish and wildlife, water quality, or other instream resources or related habitat values – i.e., for mitigation purposes – without changing the purpose of use. The City would request technical assistance from Ecology's Northwest Regional Office regarding an appropriate mechanism for documenting such mitigation.

1 Introduction

The City of Auburn (City) filed water right permit application G1-28404 in January 2006. The application requested 13,443 acre-feet per year (Qa; afy) and 12,500 gallons per minute (Qi; gpm) from two existing supply wells (Wells 6 and 7) and one future well to be developed (Well 8) in the Auburn/Duwamish Valley. In May 2021, the Washington State Department of Ecology (Ecology) issued a Preliminary Permit for Application G1-28404 that required the development of a mitigation and compliance plan before the water right could be authorized. This memorandum is intended to fulfill the reporting requirements for the Conceptual Mitigation Plan (CMP), Phase 1 of the work required under the Preliminary Permit.

Aspect Consulting, LLC (Aspect) developed this CMP to describe the features and processes relevant to the project, determine if the proposed use will impact Instream Flows (ISFs) or senior water users in the basin, and identify conceptual mitigation sources to offset potential impacts. Wells 6 and 7 are located in the Green-Duwamish Basin, which is part of Water Resources Inventory Area (WRIA) 9. Surface water in the Green-Duwamish Basin is subject to ISF regulations (WAC 173-509-030). Mitigation is required for new groundwater appropriations if the proposed use could impair streamflows in the Green River. Mitigation may also be required to offset impacts to the White River and one or more tributaries to the Green River. This evaluation assesses the potential impact to the surface water sources and the need for mitigation, identifies potential mitigation sources, and provides estimates of potential mitigation quantities.

This report is organized as follows:

- The Project background and an overview of the City's water system and water demand is described in Section 2.
- The Project setting and geologic and hydrogeologic conditions at the proposed points of withdrawal are presented in Section 3.
- The regulatory setting, including applicable ISF regulations and senior water rights, are presented in Section 4.
- The Conceptual Mitigation Plan that includes estimates of mitigation quantities and potential mitigation sources is presented in Section 5.
- Project next steps are summarized in Section 6.

2 Project Background

This section summarizes the City's existing water supply infrastructure and water rights portfolio, the Retail Water Service Area (RWSA), and the current and projected water use in the RWSA.

2.1 Summary of City's Water System

The City uses a combination of production wells and springs for its municipal water supply. The City's existing water right portfolio includes claims, permits and certificates that total an annual maximum quantity (Qa) of approximately 21,000 acre-feet per year (afy) and a maximum instantaneous quantity (Qi) of approximately 19,000 gallons per minute (gpm; Table 1). The City also has the opportunity to purchase water from Tacoma's wholesale water supply. The City's current and recent water usage from the various sources is presented in Section 2.3.

In 1995 Ecology issued a Change Authorization, which authorized two additional points of withdrawal to four of the City's primary water rights, in order to provide redundancy to the City's water system in the event of well or equipment failure (see Table 1). This authorization allowed for the construction of Wells 6 and 7. In 2009 Ecology issued a Superseding Certificate for G1-00277C to include Wells 6 and 7, and authorize an additional non-additive quantity of 2,480 afy to this water right.

Ecology noted that Wells 6 and 7 are completed in the same body of groundwater as Wells 1 through 4, even though the various wells are located in different drainages. Wells 1, 3, and 4 are located in the White River Drainage. Wells 2, 6 and 7 are located in the Green River drainage. The Green River is part of WRIA 9 and the White River is part of WRIA 10 (White River/Puyallup River). As detailed in Section 3.3, a portion of the alluvial groundwater in the White River drainage discharges into the Green River.

Table 1. Summary of Auburn's Existing Water Rights

Water Right Number	Sources	Annual Quantity, Additive (Acre-Feet)	Instantaneous Maximum Quantity (gpm)	Non-Additive Quantity (Acre-Feet)	WRIA/Drainage Basin Location
857	Coal Creek Springs	9,410	6,730		10 (White River)
S1-049354CL	West Hill Springs	1,010	625		9 (Green River)
3560-A	Well 1, 6, & 7	1,120	2,200		Well 1: 10 (White River) Wells 6/7: 9 (Green River)
G1-00277C[1]	Well 2, 6, & 7	1,360	2,400	2,480	9 (Green River)
G1-23629C	Well 3A & 3B, 6, & 7	3,600	2,800		Well 3: 10 (White River) Wells 6/7: 9 (Green River)
G1-20391C	Well 4, 6, & 7	3,600	2,800		Well 4: 10 (White River) Wells 6/7: 9 (Green River)
G1-23633C	Well 5, 5A, 5B, and 5C	720	1,000		10 (White River)
G1-25518C	Well 5A	0	167	187	10 (White River)
G1-22769C	Algona Well 1	175	500		10 (White River)
G1-25173C	Braunwood Well	6.5	20		10 (White River)
Total		**21,002**	**19,242**		

Notes:
1. An additional 2,480 afy is available under this authorization for non-additive withdrawals, which allows the City to pump water from other rights.

2.2 Proposed Points of Withdrawal and Place of Use

Application G1-28404 lists three proposed points of withdrawal that includes two existing City production wells (Wells 6 and 7) and a future well (Well 8). Wells 6 and 7 are located northeast of downtown Auburn, in the Green River valley in WRIA 9 (Figure 1). Well 6 is situated adjacent (within approximately 30 feet) of City Well 2 in Frank Fulmer Park. Well 7 is approximately 0.3 miles west-southwest of the Fulmer Park in the City's Veterans Memorial Park. Collectively, Wells 2, 6, and 7 are referred to as the

Fulmer Wellfield, and all are completed in unconsolidated glacial and alluvial sediments that are part of the Green River Valley. Additional details on Wells 6 and 7 are provided in Section 3.3.2.

The proposed location for future Well 8 was not specified in the application. For the purposes of this CMP and to facilitate its long-term water supply planning, the City assumes that Well 8 will be located in the same general vicinity of Wells 6 and 7 (i.e., Green River Valley and WRIA 9) and will be completed in the same groundwater source. The City has identified a potential location in the Fulmer wellfield (i.e., near Wells 6 and 2) for Well 8 but the precise location has not been determined or finalized.

The assumed location of Well 8 enables the development of a common mitigation strategy for all three proposed points of withdrawal. The CMP and eventual final mitigation plan may require modifications and/or additional evaluations if the final location and well completion for Well 8 differs significantly from Wells 6 and 7.

The proposed place of use for G1-28404 includes all of the City's Retail Water Service Area, as shown on Figure 1. Aspect completed a site visit on August 19, 2021, to visit the proposed points of withdrawal and place of use. All applicable site features were observed. A meeting with City personnel, including Lisa Tobin (Utilities Engineering Manager), Susan Fenhaus (Water Utility Engineer), and Josh Flanders (Water Distribution Supervisor) was conducted to discuss and detail all processes associated with the planned water use.

2.3 Current Water Use

As of 2018, the City's municipal water supply served approximately 24,000 connections for a population of approximately61,000. The City's total annual water use over the five most recent complete years on record (2016 through 2020) has ranged from approximately 7,000 to 7,800 afy (Figure 2). The average annual use from 2016 through 2020 translates to an average daily use of 6.6 million gallons per day (MGD). Over this same time period (2016-2020), the maximum daily use ranged from 11.3 to 14.5 MGD or 7,900 to 10,100 gpm (daily average)

Figure 2 shows the annual totals and maximum daily use from each of the City's existing water sources. The total production from Well 6 between 2018 and 2020 (Well 6 was not used in 2016 and 2017 while it was being rehabilitated and new pump controls installed) ranged from 1,100 and 1,400 afy and the annual maximum daily use ranged from 5.1 to 5.8 MGD (3,600 to 7,200 gpm). Well 7 was not used between 2016 and 2020 due to high levels of manganese (treatment facilities will be required before use).

The average annual quantities withdrawn from the City's other water sources between 2016 and 2020 include:

- Coal Creek Springs: 4,200 afy
- West Hill Springs: 460 afy
- Well 1: 540 afy
- Well 2: 820 afy (from 2018 through 2020; Well 2 was not used in 2016 and 2017)

- Well 3: Not used between 2016 and 2020 due to high levels of manganese (treatment facilities will be required before use)
- Well 4: 710 afy
- Braunwood Well: 5 afy

As noted in Section 2.1, withdrawals from Wells 6 and 7 are authorized under the City's existing water rights for Wells 1 through 4. The annual combined use from Wells 1 through 4 and Well 6 ranged from 1,900 to 3,000 afy between 2016 and 2020, or approximately 20 to 31 percent of the combined annual quantity (9,680 afy) that is currently authorized.

2.4 Future Demand

The City's 2015 Water System Plan (WSP) projected an average daily demand of up to approximately 12 MGD (13,000 afy) and a maximum daily demand of 19 MGD (13,000 gpm) by 2030 (Carollo, 2015). Recent updates to the WSP indicate that the City's annual water demand between 2014 and 2020 has been less than the projected demand in the City's 2015 WSP. This is attributed to the City's conservation program, low distribution system leakage, and Lake Meridian Water District having secured an alternate wholesale source instead of utilizing wholesale water from Auburn (City of Auburn, 2021).

The City expects to remain below the demand projected in the 2015 WSP through 2025. The City's future demand beyond 2025 is somewhat uncertain for various reasons, including an agreement to provide water to the Muckleshoot Indian Tribe, which could potentially involve substantial quantities. The City is currently re-evaluating its growth projections as part of its 2024 Comprehensive Plan update to meet the state's Growth Management Act requirements. This evaluation is expected to be completed by mid-2022. Updated demand projections will be incorporated into Phase 2 (Testing and Analysis Plan) of the Preliminary Permit.

2.5 Projected Water Use Under G1-28404

The City is pursuing the application for G1-28404 to provide additional supply for future demand and operational flexibility for its existing water rights. If authorized, the City could maximize the capacities at Wells 1, 2, and 4 and pump the surplus of the currently authorized quantities from Wells 6 and 7. Based on the pumping capacities of the existing wells, the following hypothetical scenario is:

- Well 1
  - Use entire quantity of 3560-A (1,120 afy Qa; 2,200 gpm Qi)
- Well 2
  - Current capacity is 1600 gpm
  - G1-00277C authorizes 2400 gpm (Qi)
  - Remaining 800 gpm (Qi) pumped from Well 6
- Well 3
  - No current pumping capacity from Well 3A/3B

    - G1-23629C authorizes 2800 gpm (Qi) – see below for strategy to use this water right
- Well 4
    - Use entire quantity of G1-20391C (3,600 afy Qa; 2,800 gpm Qi)

Based on these projections, pumping from Wells 6, 7, and future Well 8 could be used as follows:

- Well 6
    - Current capacity is 2400 gpm
    - Hypothetical future operations: 2,400 gpm
        - 800 gpm from G1-00277C (Well 2) and 1600 gpm from G1-23629C (Well 3)
- Well 7
    - Past observed capacity: 4,000 gpm
    - Hypothetical future operations: 4000 gpm
        - 1200 gpm from G1-23629C (Well 3)
        - 2800 gpm from new water right (G1-28404)
- Future Well 8
    - Authorized withdrawals under G1-28404

The future use from Wells 1 through 4 could be increased, particularly once the manganese treatment facilities are constructed for Wells 3A/3B. This could increase the City's use of G1-28404. As noted in Section 2.4, the City is currently re-evaluating their projected future demand. The proposed withdrawals from Wells 6, 7, and 8 will be refined in Phase 2 of the Preliminary Permit.

3 Site Description

3.1 Project Setting

The City is centrally located between Seattle and Tacoma in both King County and Pierce County, Washington and encompasses approximately 30 square miles. The City's RWSA generally follows or is located within the City's administrative City Limits (Figure 1). Several other public and private water systems provide water service within the City Limits.

The topographic setting was largely formed by glacial processes (Section 3.2) and generally consists of an alluvial valley surrounded by uplifted plateaus. There are two major river systems that flow through the lower valley. The Green River flows north

through the eastern part of the City and flows north to Puget Sound[2]. Mill Creek is a tributary of the Green River that flows northerly through the western portion of the City and flows into the Green River north of the City Limits.

The White River flows westerly through the southern part of the City before turning south to join the Puyallup River. The White River historically flowed into the Green River until a flood event in 1906 formed a large debris jam that diverted the course of the White River south into the Puyallup River. The historic course of the White River likely remains an influence on the regional hydrogeologic system, as alluvial groundwater in portions of the White River valley flows north into the Green River system (Section 3.3).

Ground elevations in the valley areas range between 50 to 100 feet. The terrain rises sharply to elevations of 400 to 500 feet on either side of the valley as well as in the southern portion of the City, south of the White River and between the White and Green Rivers. The topographic features influence the City's water distribution system and resulted in the division of the RWSA into four major service areas (Carollo, 2015).

3.2 Regional Geology

The City completed an extensive study of the geology and hydrogeology within the City's RWSA. The study results are documented in several volumes: 1996 Preliminary Hydrogeologic Characterization, Summary of 1997 Hydrogeologic Investigations, the 1997-1998 Test Well Drilling and Installation Program, and the 1999 Hydrogeologic Characterization Report. This Section and Section 3.2 use the key findings of these investigations (PGG, 1999) and a regional USGS study of the Puyallup and Green River drainages (USGS, 2015) to summarize the geologic and hydrogeologic conditions in the Project vicinity. The surficial geology of the project area is shown on Figure 3 and geologic cross-sections of the area developed by PGG (1999) are provided on Figures 4a and 4b.

The geologic setting is dominated by thick sequences of unconsolidated glacial and more recent alluvial sediments. The geologic sequences are differentiated between the upland areas and the Green and White River valleys, as detailed below.

The stratigraphy of the upland areas includes sequences of recessional and advance outwash sand and gravel, glacial till (compacted and poorly sorted mix of clay, silt, sand, and gravel), and fine-grained ice-contact material. More localized sequences of lacustrine, bog, and marsh deposits containing clay, silt, peat, and lenses of sand and gravel that were deposited during inter-glacial periods are also present in the upland areas. Bedrock in the upland areas is present at depths of several hundred feet or more.

The Green and White River valleys were largely excavated by subglacial meltwater. The valleys began to fill with sediment as glaciation ended and have continued to fill during the more recent Holocene period. Sediment thicknesses in the valleys exceed 1,000 feet in places. The deposition occurred through marine, lacustrine, fluvial, and deltaic processes resulting in a mix of fine and coarse-grained sediments. Volcanic mudflow deposits from Mount Rainier are also present, most notably the Osceola Mudflow

[2] The lower-most 12 miles of the Green River, within Seattle's city limits, is called the Duwamish River, also known as the Duwamish waterway.

deposit, which are present at depths of approximately 30 feet bgs in the vicinity of Wells 6 and 7 and may act as groundwater flow barriers (i.e., aquitards) in some areas (Section 3.3).

The primary geologic units in the vicinity of Wells 6 and 7 are recent and Quaternary age alluvial deposits (Qa); the Osceola Mudflow deposit (Qom), and Vashon-age recessional deltaic deposits (Qvrd).

3.3 Hydrogeologic Setting

Groundwater is present in both the upland and valley areas. There are multiple hydrogeologic units (aquifers) in the upland areas, including recessional and advance outwash deposits and older glacial deposits that underlie the outwash deposits. Multiple confining layers are present in portions of the upland areas. Groundwater in the outwash deposits in the upland areas generally discharge to the valley aquifers. Groundwater elevations and flow paths in the deeper aquifers vary but generally flows toward or in the same direction as the valley aquifer (USGS, 2015).

The hydrogeologic conditions of the valley aquifers are relevant to this CMP as Wells 6 and 7 are completed in the valley aquifers. We assume that potential future Well 8 will also be completed in the valley aquifer (Section 2.2). There are two primary alluvial aquifers in the Green River Valley: upper and lower with a confining layer separating the two in most portions of the valley. Wells 6 and 7 are completed in the lower alluvial aquifer (termed the Qvrd or production aquifer by PGG and the AL2 aquifer by the USGS). The PGG and USGS studies provide similar descriptions although the terminology differs.

The surficial hydrogeologic units developed by the USGS (2015) are provided on Figure 5 and two of the hydrogeologic cross-sections developed by the USGS (2015) that are applicable to the Well 6 and 7 vicinity are provided on Figure 6. The hydrogeologic units in the vicinity of Wells 6 and 7 are detailed below.

- **Upper Alluvial Aquifer**: A shallow unconfined aquifer is present in recent alluvial deposits termed the Qal aquifer by PGG and the AL1 aquifer by the USGS. This unit is generally less than 100 feet thick and groundwater is present as shallow as 10 to 15 feet bgs.
- **Confining Unit**: The Qal is underlain by a confining layer that is present throughout most of the Green River valley in the vicinity of Auburn. The confining layer is not present in the White River Valley. The USGS attributes the confining layer (termed the MFL confining layer) to the Osceola mudflow deposits while PGG states that the confining layer (termed Qal/Qud/Qom aquitard system) is a combination of mudflow and finer-grained glacial and alluvial deposits.

  The confining layer is approximately 10 feet thick in the vicinity of Wells 6 and 7 (PGG). In portions of the valley where the confining layer is not present, the upper and lower aquifers essentially form a single aquifer although the permeability varies laterally and vertically.

- **Lower Alluvial Aquifer/Production Aquifer**: Wells 6 and 7, along with the other City production wells, are completed in the lower alluvial aquifer, which is the Qvrd unit, also termed the production aquifer in PGG's studies, and termed the AL2 aquifer in the USGS report. The lithologic character of this unit is quite heterogeneous and varies greatly with depth. The thickness of the unit exceeds 250 ft within the Auburn Valley (Figures 4 and 6).

  Groundwater in this aquifer generally is confined; however, unconfined conditions may occur in areas where the overlying MFL confining unit is locally thin or absent. The lower alluvial aquifer is highly productive with transmissivities ranging from approximately 50,000 to more than 2,000,000 gallons per day per foot (gpd/ft). The USGS estimated the average hydraulic conductivity of this unit to be approximately 300 feet per day (USGS, 2015).

3.3.1 Groundwater Recharge and Discharge

Groundwater discharge from the upland aquifers is the primary source of recharge to the lower alluvial aquifer. The upland aquifers are primarily recharged by precipitation and leakage from Lake Tapps. Alluvial groundwater from the White River also discharges into the Green River alluvial aquifer (Section 3.3.2), and effectively serves as an additional source of recharge.

Groundwater in the vicinity of Wells 6 and 7 discharges into Puget Sound via the Green River and Duwamish River valley. Groundwater may also discharge into the Green River in gaining portions of the Green River.

3.3.2 Groundwater Elevations and Flow Directions

Groundwater elevations in the lower alluvial aquifer occur at elevations between approximately 60 and 70 feet above sea level (asl) in the vicinity of Wells 6 and 7. Groundwater in both the upper and lower valley aquifers flows northerly and generally parallel to the path of the Green River. Groundwater from the upland aquifers generally flows toward the valley aquifers and groundwater generally moves upward in the valley alluvial aquifers. PGG estimated horizontal groundwater flow velocities of approximately 1 to 4 feet per day in the lower alluvial aquifer. A generalized groundwater contour map taken from PGG (1999) is shown on Figure 7.

Water level data and previous studies indicate there is a groundwater divide in the alluvial aquifer where the White River enters the Valley. Alluvial groundwater flow in the White River where it enters the valley (southeast and upgradient of Wells 6 and 7) does not match the current path of the White River but instead flows north into the Green River. Groundwater in this vicinity appears to follow the historic course of the White River, which flowed into the Green River until the early 1900s (Section 3.1). The approximate location of the groundwater divide for the Qa aquifer is shown on Figure 7. Groundwater north of the divide flows into the Green River system while groundwater south of the divide flows south into the White River system. A similar groundwater divide exists in the lower alluvial aquifer (Qvrd aquifer) and may be slightly south of the Qa aquifer groundwater divide (PGG, 1999).

Based on this information, it appears that the City's water sources may capture water that would otherwise discharge into both the Green River and White River drainages as shown on Figure 7 and detailed below:

- City water sources in Green River System:
  - Well 2 is located in the Green River and it is widely understood that groundwater in this vicinity (including the vicinity of Wells 6 and 7) flows north and eventually discharges into Puget Sound or the Duwamish waterway.
  - West Hill Springs discharges into Mill Creek, which flows into the Green River.
  - Wells 1 and 4 are located in the White River watershed but groundwater in the vicinity of these wells discharges into the Green River.
- City water sources in the White River system:
  - Wells 5A/5B/5C are located south of the groundwater divide; groundwater in this vicinity discharges into the White River system.
  - The Algona Well is located south of the groundwater divide.
  - Coal Creek Springs drains into the White River; as noted below, a portion of the flow in the White River below Coal Creek Springs may infiltrate into the alluvial groundwater system and flow into the Green River.
- City water sources with uncertain discharge locations:
  - Wells 3A/3B are located in the White River drainage and very close to the Qa aquifer groundwater divide (Figure 7). Because the precise location of the groundwater divide in the lower alluvial aquifer (Qvrd aquifer) is uncertain, groundwater in the vicinity of Wells 3A/3B may flow into either the Green River or White River systems.[3]
  - A portion of the discharge from Coal Creek Springs (i.e., spring water that does not discharge into the White River or that infiltrates from the White River to groundwater) may also flow into the Green River.

The location of the groundwater divide has two significant implications for the CMP. First, a portion of the groundwater in the vicinity of Wells 6 and 7 may originate in the White River drainage. Second, the groundwater captured by Wells 6 and 7 may discharge entirely to the Green River even if the radius of influence from pumping extends into the White River surface water (topographic) drainage. The radius of influence of the two wells has not been fully established.

3.3.3 Hydraulic Connection between the Lower Alluvial Aquifer and Surface Water

Wells 6 and 7 are completed in the lower alluvial aquifer and a low-permeability confining layer separates the upper and lower alluvial aquifers (Section 3.2). The

[3] It is possible that the groundwater divide may shift slightly in response to seasonal water level fluctuations, meaning groundwater in the vicinity of Wells 3A/3B may discharge into both the Green River and White River systems depending on the time of year.

confining layer creates some degree of hydraulic separation between the lower alluvial aquifer and the Green River. The upper alluvial aquifer is believed to be directly connected to the Green River. The confining layer is not present throughout the Green River valley. In areas where the confining layer is not present, the lower alluvial aquifer is hydraulically connected to the shallow aquifer and the Green River, although lower permeability zones that are present in the alluvial deposits can limit the degree of connectivity.

Pump testing of Well 6 in 2016 produced a drawdown response in a monitoring well completed in the shallow aquifer (TW-6S) that is approximately 1,800 feet northeast of Well 6, indicating some degree of hydraulic connection through the confining layer. The response at TW-6S, however, was delayed and muted when compared to the adjacent monitoring well completed in the lower alluvial aquifer (TW-6D).

3.4 Project Well Details

Wells 6 and 7 are completed in unconsolidated glacial and alluvial sediments that are part of the Green River lower alluvial aquifer. Well completion details are provided in Table 2.

Well 6 was drilled in 1998, completed to a depth of 390 feet below ground surface (bgs) and screened from 320 feet to 380 feet bgs with a 20-inch diameter, 80-slot (0.08-inch openings) stainless steel well screen.

Well 7 was drilled in 1997, completed to a depth of 303 feet bgs and screened from 235 feet to 295 feet bgs with a 10-inch diameter, 100-slot (0.1-inch openings) stainless steel well screen.

Well logs for both wells are included in Appendix A. Both wells are highly productive.

Table 2. Project Well Completion Details

Attribute	Well 6	Well 7
Ground Elevation (elevation, ft)	74	80*
Depth, ft bgs (elevation, ft)	390 (-226)	300 (-220)
Screen Interval ft bgs (elevation, ft)	320 to 380 (-246 to -206)	235 to 295 (-155 to -215)
Approximate Static Water Level ft bgs (elevation, ft)	14 (60)	12 (68)
Approximate Capacity (gpm)	2,400 (current capacity)	4,000 (past observed capacity)

Note:
*Well 7 surface elevation is approximate.

Golder Associates produced a technical memo on Well 6 and 7 in 2013 describing the rehabilitation progress for the two production wells (Golder, 2016). Since it was drilled in 1999, the capacity of Well 6 had decreased by about 75 to 79 percent. It was restored to

production capacity of 2,400 gpm following rehabilitation in 2017. Well 7 had showed a specific capacity decrease of about 6 to 7 percent compared to when it was drilled in 1997.

Well 7 is currently not in use due to high levels of manganese. The City plans to install a manganese treatment system for Well 7, which would allow for the ongoing use of Well 7. A phased implementation of the treatment system is proposed. The initial phase is planned for the medium-term planning horizon and will treat half of the well's capacity, and phase 2 in the long-term planning horizon will treat the entire well capacity (Carollo, 2015).

4 Regulatory Setting

4.1 Instream Flow Regulations

4.1.1 Overview of WAC Chapter 173-509

New appropriations in the Green-Duwamish Basin are subject to instream flow regulations (WAC Chapter 173-509) that were adopted in 1980 and are senior to the City's water right application (G1-28404). The Green River instream flow regulations (WAC 173-509-030) are based on the measured streamflows at two U.S. Geological Survey (USGS) gauging stations on the Green River: the Green River near Palmer (12.1067.00) and the Green River near Auburn (12.1130.00). The Palmer gauge is approximately 20 miles upstream of Auburn and the Auburn gauge is located approximately ½ mile east of Wells 6 and 7 just upstream of the 8th Street NE bridge.

Per WAC 173-509-030(1), the Auburn gauge will be used to condition future water right appropriations downstream from the Palmer gauge. Therefore, the withdrawals from Wells 6 and 7 associated with G1-28404 will be subject to the instream flow regulations as measured at the Auburn gauge. In addition to establishing instream flows, WAC Chapter 173-509 incorporated the 1953 administrative closure of all tributaries to the Green River.

WAC Chapter 173-509 effectively requires mitigation (offsets) for any potential impacts to the Green River when instream flows are not met. Further, under the *Postema* decision, potential impacts to closed tributary streams may affect the availability of water for a new groundwater appropriation. WAC 173-509-050 provides: "Future groundwater withdrawal permits will not be affected by this chapter unless such withdrawal would clearly have an adverse impact upon the surface water system contrary to the intent and objectives of [WAC Chapter 173-509]."

With respect to Green River mitigation, relevant considerations include predicting precisely when streamflows will drop below the ISFs, and the lag time associated with impacts to instream flows from groundwater withdrawals.

4.1.2 Summary of Instream Flow Statistics

A review of historical streamflow data indicates that on average streamflows are below the ISFs at the Auburn gauge approximately 20 percent of the time (Table 3). Streamflows are generally more often below the minimum ISFs during the summer months, falling below the minimum ISFs 35 percent to 61 percent of the time between June and September. The flows are frequently above the minimum ISFs during the spring and winter months but can drop to below ISFs at any time of the year. For example, in April, streamflow falls below the minimum ISFs approximately 3 percent of the time.

ISFs are not met more frequently during dry years and less frequently during wet years. For example, in Water Year 1992 (dry year) instream flows were not met on 54 percent of the days (196 days), while in Water Year 2014 (wet year) instream flows were not met on only 2 percent of the days (7 days). Figure 8 shows that streamflows at the Green River gauge near Auburn have been below ISFs in only 8 years (20%) of the 40-year

period of record (Water year 1981 through Water Year 2020) between the months of February to April.

Table 3. Average Percent of Days Below Minimum Instream Flows (1981-2020)

Month	Green River Near Auburn, WA (USGS 1214900)	Green River at Purification Plan Near Palmer, WA (USGS 12106700)
January	5%	2%
February	5%	3%
March	5%	6%
April	3%	3%
May	8%	5%
June	35%	26%
July	44%	45%
August	61%	56%
September	43%	31%
October	23%	25%
November	16%	11%
December	10%	4%
Average	20%	18%

Notes:

1. Minimum instream flows from WAC 173-509-030; withdrawals from G1-28404 will be subject to instream flows at the Auburn gauge.

2. The period of record is for Water Year 1981 (October 1990) through Water Year 2020 (September 2020), which represents the full (complete year) period of record since the Green-Duwamish Basin instream flow regulations became effective.

The historical data show that there have been long consecutive periods when streamflows have remained above instream levels. For example, streamflows at the Auburn gauge remained above instream flows from October 14, 2009, to August 11, 2011, a period of 680 consecutive days. The difficulty, however, is predicting when interruptions will occur, particularly during the summer and early fall when streamflows are low and relatively close to instream flow levels.

Interruptions are more predictable during the winter months. The data show that interruptions will not occur for relatively long periods of time after high flow events in the winter months because streamflows recede relatively slowly in the Green River in the winter. For example, when streamflows exceed 4,000 cfs between January and April, the historic data show that streamflows will remain above instream flow levels for at least 25

days. Table 3 shows the minimum, average, and maximum number of days before an interruption occurred in the Green River at various high flow levels. The predictability of interruptions not occurring during these periods may provide some operational flexibility in the pumping of Wells 6 and 7, depending on the rate of streamflow depletion after pumping stops.

Table 4. Consecutive Days without Interruptions during Winter Months (January through April)

Range of Green River Streamflow (Auburn Gauge), January to April	Minimum Number of Days before interruption	Average Number of Days before interruption	Maximum Number of Days before interruption
0 - 999	0	66	601
1,000 – 1,999	2	116	600
2.000 – 2,999	5	133	595
3.000 – 3,999	13	167	597
4,000 – 4,999	25	162	596
5,000 – 5,999	25	170	525
6,000 – 6,999	26	141	528
7,000 – 7,999	27	158	527
8,000 – 8,999	28	168	503
9,000 – 9,999	97	154	502
10,000 +	98	156	219

Note:
The period of record is for Water Year 1981 (October 1990) through Water Year 2020 (September 2020), which represents the full (complete year) period of record since the Green-Duwamish Basin instream flow regulations became effective.

4.2 Existing Water Rights in Project Vicinity

Existing senior water rights in the vicinity of Wells 6 and 7 are shown on Figure 9. The following senior water rights within an approximately 1-mile radius of the Project were identified in Ecology's database:

- Surface water rights include 22 certificated rights and 1 water right claim, as well as 1 permit that is not a certificated right.
- Groundwater rights records include 14 certificated rights and 6 water right claims, as well as 6 permits that are not certificated rights.

The instream flow regulations and required mitigation elements associated with G1-28404 effectively eliminates the potential for impairment to senior surface water rights. The closest existing groundwater right is located approximately one-half mile northeast

from Well 6 and 3/4 mile northeast from Well 7. Impairment to existing senior groundwater rights associated with G1-28404 is unlikely considering the productivity of the aquifer and minimal radial drawdown response measured during previous aquifer testing in the lower alluvial aquifer (Golder, 2016).

A specific requirement in Phase 2 of the Preliminary Permit (Testing and Analysis) is to conduct a pumping test on the Supply Well and a more thorough assessment of potential impairment to senior rights will be included in that analysis.

4.3 Competing Applications in Project Vicinity

Geomatrix (2006) reviewed water right applications with priority dates senior to G1-28404 in the project vicinity in 2006. That review identified 14 senior applications in WRIA 9 (Green-Duwamish) that were determined to involve withdrawal from the same water source as G1-28404. The applications were filed from five different applicants: King County Water District 111, Lakehaven Utility District, City of Kent, City of Seatac, and Mariani Water Systems. Ecology has rejected all fourteen applications since 2006 and none are currently active. Several new applications have been filed in WRIA 9 since 2006 that remain active but those applications are junior to G1-28404 and cannot impair any potential use associated with G1-28404.

Geomatrix (2006) also identified four senior applications in the White River basin that could potentially involve withdrawal from the same water source as G1-28404. Since 2006, Ecology has processed three of the four applications as part of the Lake Tapps project and only one application remains active:

- **Henry Flatt (G2-30254)**. Application for domestic and irrigation use with a May 13, 2005 priority date. The application requests 150 gpm of groundwater to irrigate 2.5 acres. The place of use is southwest (upgradient) of Lake Tapps (T20N, R5E, S36) and approximately 8 miles from Wells 6 and 7. Ecology's WRATS database lists the application as active. No other documentation beyond the application form is available. The potential withdrawal under G1-28404 is unlikely to impair use associated with this application.

4.4 Preliminary Mitigation Sources

The proposed withdrawals from Wells 6 and 7, and/or a new well location will require mitigation of impacts to the Green River, and potentially the White River and/or other tributaries including Mill Creek. Conceptual mitigation sources to address potential impacts to streamflows in the Green River, White River and Mill Creek are provided in the following sub-sections. Additionally, general mitigation measures are provided that could be used to provide additional mitigation if warranted after Phase 2 testing and analysis.

4.4.1 Potential Sources for Green River Mitigation

Managed Use of Existing Authorizations: This option would involve the managed use of the City's existing water rights portfolio to minimize authorized withdrawals under G1-28404 during periods when Green River streamflows are below or near the ISFs. This option requires additional analysis of the timing and location of streamflow impacts associated with the pumping of Wells 6 and 7. If the timing, and specifically the stream

depletion lag times after pumping stops can be sufficiently characterized, the City could cease withdrawing under G1-28404 at predefined streamflow levels and then provide mitigation (using the potential options listed below) to offset small impacts associated with stream depletion lag times that may persist for longer durations after pumping stops.

The City could utilize its other existing points of withdrawal when ISFs are not met, including the preferential use of withdrawals from its sources in the White River drainage (Algona Well, Coal Creek Springs, and potentially Well 3A/3B).

The specific operational elements are to be determined and would utilize estimates of groundwater travel times, stream depletion lag times, and the City's water demand projections. This analysis would be developed and performed as part of Phase 2 (Testing and Analysis) of the Preliminary Permit.

Non-Use of Existing Municipal Water Right Authorizations: This option would entail cessation of authorized withdrawals under the City's various senior water rights to offset impacts to instream flows. Conceptually, this measure would be combined with the City withdrawing water under G1-28404 only during periods when instream flows are met; any impacts to the Green River would be offset by a commensurate level of non-use of other senior water rights.

Diversions from White River Sources: This option is the most conventional form of mitigation: diversion of water from a separate watershed to augment streamflows in a different watershed. Potential scenarios include diversion of both surface and/or groundwater. Surface water from the Cascade Water Alliance as discussed in Section 4.3.2 could be pumped into the Green River and/or into infiltration basins to facilitate delayed recharge to the Green River. The use of infiltration basins is described in Section 5.1.4.

Use of Water from Howard Hansen Dam: This option entails purchasing water from Tacoma Public Utilities (Tacoma) that is stored in Howard Hansen Dam. The City would purchase water from Tacoma under its existing agreement with Tacoma for purchasing water from Pipeline 5. Instead of the City withdrawing the chlorinated and fluoridated water from Pipeline 5 and discharging it after de-chlorination into the Green River, Tacoma would release the purchased water from Howard Hansen Dam into the Green River to mitigate potential impacts.

4.4.2 Potential Sources for White River Mitigation

2010 Water Resources Agreement with Cascade Water Alliance (CWA). The Cities of Auburn, Bonney Lake, Buckley, and Sumner entered into the 2010 Lake Tapps Area Water Resources Agreement with CWA (February 5, 2010), in consideration of CWA's purchase of Lake Tapps for water supply from Puget Sound Energy. This Agreement is intended to offset the impact of CWA's future water supply withdrawals from Lake Tapps on the water resources of the four cities. The Agreement provides for CWA to set aside Regional Reserved Water for use by the four cities to mitigate loss of water supply, in the amounts of 7 cfs for average daily demand and 10 cfs for peak demand. Auburn's share of the Regional Reserved Water is 1.3 million gallons per day (mgd) average daily demand and 2.5 mgd peak demand (3.88 cfs). Auburn would use this mitigation water by

keeping the water in the White River rather than diverting it, by having CWA release water into the White River from the Lake Tapps tailrace.

Use of the Algona Well. The municipal water right associated with the City's Algona Well (G1-22769C) could be allocated to preserve groundwater resources or support instream flows on an annual and continuous basis. The water right for the Algona Well authorizes instantaneous withdrawals up to 500 gpm (1.1 cfs) and an annual quantity of 75 afy.

4.4.3 Potential Sources for Mill Creek Mitigation

Use of West Hill Springs. The municipal water right associated with the West Hill Springs (S1-049354CL) could be allocated to support instream flows on an annual and continuous basis. The water right for West Hill Springs authorizes instantaneous withdrawals up to 625 gpm (1.4 cfs) and an annual quantity of 1,010 afy. West Hill Springs discharges into Mill Creek to the northwest of Wells 6 and 7 at River Mile 4.25 on Mill Creek.

Direct discharge of City Water. This option would entail discharge of City water directly into Mill Creek. The water that is discharged could be sourced from any of the City's authorized sources that do not adversely impact Mill Creek (i.e., anywhere except Wells 2, 6, and 7). The City has identified a potential point of discharge downstream of West Hill Springs at approximately River Mile 6.2.

4.4.4 Additional Mitigation Options

Additional mitigation options could be utilized to offset potential impacts at various locations and drainages. The conceptual element is to utilize infiltration basins that are hydraulically connected to surface water such that water will infiltrate to the shallow groundwater system and eventually discharge to surface water. The lag time response to the surface water is a function of the location of the infiltration basins relative to the target surface water location and the shallow groundwater travel times. The infiltration basins could be operated on a continuous or near-continuous basis to provide a relatively constant surface water benefit during periods of use from G1-28404. The source water introduced into the infiltrations could be obtained from multiple sources but would be operated in a similar conceptual manner, as detailed below.

Infiltration of Reclaimed Water: The use of infiltration basins to benefit streamflows is a potential reuse opportunity for wastewater or reclaimed water. Wastewater from the City is currently sent to the King County Wastewater Treatment Division's regional sewer system.

Managed Aquifer Recharge: Water could be diverted from other drainages into infiltration basins. Alternatively, water could be captured from the same drainage as the target surface water body during seasonally wet periods when ISFs are met, and then allowed to infiltrate slowly to provide streamflow benefits during periods when ISFs are potentially not met. This type of system is conventionally known as managed aquifer recharge.

4.5 Preliminary Mitigation Estimates

The City's water right application (G1-28404) requests 13,443 acre-feet per year (Qa; afy) and 12,500 gallons per minute (Qi; gpm). However, based on their current water rights and future demand projections (Section 2.2 and 2.3), the full quantity will likely not be needed to meet the projected future water demand. As noted in Section 2.4, the City is currently re-evaluating its demand projections. The mitigation requirements will be a function of the updated demand projections and the projected use from G1-28404 to meet the projected demand.

Quantification of the projected use under G1-28404 and the potential impacts to streamflows from that use will be evaluated in Phase 2 (Testing and Analysis). The City plans to utilize a detailed regional groundwater flow model being developed by the USGS to predict the potential impacts to surface water and associated lag times. The USGS has been developing the model for a number of years and it is currently in its final phase of testing and validation. Per recent communication with USGS staff, we anticipate the model will be ready for use by early- to mid-2022.

Mitigation offsets would be quantified based on the amounts necessary to address impacts of pumping under G1-28404 to surface water bodies that are subject to ISFs and closures in WAC Chapter 173-509. Because groundwater withdrawn from Wells 6 and 7 is hydraulically connected to surface water, a 1:1 offset would be needed unless the authorized pumping under G1-28404 can be managed such that the pumping will occur during periods when ISFs are met. Under this managed pumping scenario, mitigation offsets would be identified to address the delayed impacts to surface water after pumping stops.

The City anticipates utilizing the various mitigation strategies presented in Section 5.1 to develop a mitigation program meeting the requirements of RCW 90.03.290 and WAC Chapter 173-509.

5 Project Next Steps

We understand that Ecology has a 60-day period upon submittal of this CMP to review and provide comments. The City will address comments, as needed, based on the nature and extent of the comments. The City may request a meeting with Ecology to discuss the CMP and the potential scope of work for Phase 2 following Ecology's review and comment period for this report.

Per the Preliminary Permit, the Testing and Analysis Plan (Phase 2) is due to Ecology on October 15, 2022, and the Final Mitigation and Compliance Plan (Phase 3) is due October 15, 2023. The City plans to utilize a USGS groundwater flow model as part of Phase 2 (Section 5.2). The model is expected to be ready for use by early- to mid-2022. The City may request a reasonable extension to the remaining Preliminary Permit schedule to facilitate the use of the USGS model.

KEY TO LITHOLOGIC UNITS ON HYDROGEOLOGIC CROSS SECTIONS

- Qal_f — Modern alluvium, fine-grained facies: Fine sand, silt, and clay deposited by the Green and White Rivers and their tributaries
- Qal_c — Modern alluvium, coarse-grained facies: Sand and gravel deposited by the Green and White Rivers and their tributaries; includes the Green and White River Fans
- Qom — Osceola Mudflow: Poorly-sorted sand, gravel, silt and/or clay with boulders and organic debris
- Qud — Ancient undifferentiated deltas: Mostly fine sand, silt, and clays of the Ancient Auburn and Ancient Green River Deltas; contains shells
- Qm — Mass wasting deposits: Landslide debris and colluvium
- Qvrd_d — Vashon recessional outwash distal delta deposits: Fine sand, silt, and clay deposited in the distal reaches of the Vashon recessional delta
- Qvrd_p — Vashon recessional outwash proximal delta deposits: Coarse sand and gravel deposited in the proximal reaches of the Vashon recessional delta
- Qvr — Vashon recessional outwash: Sand and gravel deposited by the ancient Wilderness River
- Qvt — Vashon till: Poorly-sorted, unstratified, hard, silt, sand, gravel, and boulders deposited under the bottom of the Vashon glacier
- Qva — Vashon advance outwash: Sand and gravel deposited by glacial outwash streams
- Q(A)f — Upper fine-grained unit: Mostly clay, silt, and fine sand of interglacial origin, but may include some till and unsorted glacial drift
- Q(A)c — Upper coarse-grained unit: Sand and gravel with interbedded till sheets and clay lenses; probable glacial drift sequence
- Q(B)f — Lower fine-grained unit: Mostly clay with silt and fine sand; interglacial in origin
- Q(B)c — Lower coarse-grained unit: Probable glacial drift sequence
- Q(C)u — Undifferentiated and unconsolidated deposits: Unconsolidated sediments of interglacial and glacial origin
- # — Bedrock: Cemented sandstone, shale, and some volcanic and intrusive igneous rocks

KEY TO LITHOLOGIC DESCRIPTIONS ON HYDROGEOLOGIC CROSS SECTIONS

1 = GRAVEL
2 = SAND
3 = SILT/CLAY
4 = TILL
"," = and
"." = modifier

b = brown
g = gray
y = yellow
or = orange
w = with

v = very
f = fine
m = medium
c = coarse

loos = loose
hd = hard
cem = cemented
heav = heaving

wd = wood
pt = peat
sh = shale, shells
orgs = organics

wb, WB = water bearing
z = zones
lbd = interbedded
ss = sandstone
occ = occasional

EXAMPLES:

1,2cemb = Brown cemented SAND and GRAVEL
2mcb w 1 = Brown, medium to coarse SAND with GRAVEL
2.3f occ wd = Silty fine SAND with occasional wood
lbd 1,2 WB = Interbedded water-bearing SAND and GRAVEL

KEY TO WELL LOGS

- 7E01 — Well identifier
- Water level at time of drilling
- Geologic contacts
- Screened interval
- # — Pumping rate (gpm)
- # — Specific capacity (gpm/ft)

WATER WELL REPORT
STATE OF WASHINGTON

Start Card No. W074235
UNIQUE WELL I.D. # ABB 106
Water Right Permit No. 21-5E-18B

(1) OWNER: Name City of Auburn Address

(2) LOCATION OF WELL: County King NW 1/4 NE 1/4 Sec 18 T 21 N, R 5 E WM.

(2a) STREET ADDRESS OF WELL (or nearest address) 8th st NE + K st NE

(3) PROPOSED USE: ☐ Domestic ☐ Industrial ☐ Municipal ☒ ☐ Irrigation ☐ Test Well ☐ Other ☐ ☐ DeWater

(4) TYPE OF WORK: Owner's number of well (if more than one) Well #6
Abandoned ☐ New well ☒ Method: Dug ☐ Bored ☐ Deepened ☐ Cable ☒ Driven ☐ Reconditioned ☐ Rotary ☐ Jetted ☐

(5) DIMENSIONS: Diameter of well 24" inches. Drilled 400 feet. Depth of completed well 390 ft.

(6) CONSTRUCTION DETAILS:
Casing installed: 24" Diam. from +2 ft. to 322 ft.
Welded ☒ " Diam. from ft. to ft.
Liner installed ☐ " Diam. from ft. to ft.
Threaded ☐

Perforations: Yes ☐ No ☒
Type of perforator used
SIZE of perforations in. by in.
perforations from ft. to ft.
perforations from ft. to ft.
perforations from ft. to ft.

Screens: Yes ☒ No ☐
Manufacturer's Name Johnson
Type 304 Stainless Model No.
Diam. 20 Slot size 80 from 320 ft. to 380 ft.
Diam. Slot size from ft. to ft.

Gravel packed: Yes ☒ No ☐ Size of gravel 4X6
Gravel placed from 390 ft. to 300 ft.

Surface seal: Yes ☒ No ☐ To what depth? 111' ft.
Material used in seal Bentonite
Did any strata contain unusable water? Yes ☐ No ☒
Type of water? Depth of strata
Method of sealing strata off

(7) PUMP: Manufacturer's Name
Type: H.P.

(8) WATER LEVELS: Land-surface elevation above mean sea level ft.
Static level Approx 14' ft. below top of well Date
Artesian pressure lbs. per square inch Date
Artesian water is controlled by (Cap, valve, etc.)

(9) WELL TESTS: Drawdown is amount water level is lowered below static level
Was a pump test made? Yes ☒ No ☐ If yes, by whom? Driller
Yield: 2500 gal./min. with 201 ft. drawdown after 72 hrs.
" " " "
" " " "

Recovery data (time taken as zero when pump turned off) (water level measured from well top to water level)

Time	Water Level	Time	Water Level	Time	Water Level

Date of test
Bailer test gal./min. with ft. drawdown after hrs.
Airtest gal./min. with stem set at ft. for hrs.
Artesian flow g.p.m. Date
Temperature of water Was a chemical analysis made? Yes ☒ No ☐

City of Auburn
Wellhead Protection Plan Update
November 2014

Introduction

Under the Washington Administrative Code (WAC), public water systems have primary responsibility for developing and implementing local wellhead protection programs. Due to the limited jurisdictional and regulatory authority afforded most purveyors, it is essential they work with other local, state, and federal agencies possessing the appropriate authority. The Washington State Department of Health (Health) oversees the wellhead protection program.

The City of Auburn (City) developed a Wellhead Protection Plan to identify and protect the groundwater resources which supply the Well 1, 2, 3A, 3B, 4, 5, 5A, 5B, 6, and 7 wellfields; West Hill Springs; and Coal Creek Springs. The initial plan was created in 2000 by Pacific Groundwater Group (PGG). Robinson Noble provided a plan update in 2008 (Robinson, Noble & Saltbush, 2008). This report largely replaces that work. The study area, physiographic setting, and wellhead protection zones were defined in several works by PGG (1996, 1999 and 2000). Those reports remain valid for use in this project.

The plan meets the requirements of the Federal Safe Drinking Water Act and conforms to the wellhead protection measures directed by Washington State Department of Health. The study is divided into three primary areas of interest: 1) Wellhead Protection Area Delineation, 2) Existing and Potential Contamination Hazard Identification, and 3) Protection Strategies and Implementation Tasks.

The City is located in the Green River Valley between the City of Kent and the southern boundary of King County. Figure 1 shows the location of the City's wells and the approximate study area. The majority of the City is located in the valley, separated from the City of Kent to the north by the Green River. To the west is the Federal Way upland; to the east are the outlets of the upper Green and White River valleys. The City of Pacific resides to the south of the City along with the neighboring Lake Tapps upland. Ten production wells and two spring collection facilities are currently used to supply the City's needs. At the present time and into the near future, the use of groundwater constitutes the City's primary and most economical source of water.

Wellhead Protection Area Definition

A wellhead protection area (WHPA) defines the area surrounding a public water supply well where the well may be at risk from contaminants. It is based upon capture zones, which describe the area of the well's source aquifer (and all overlying material) that can contribute water to the well in a given period of time. Capture zones are typically defined for time-of-travel periods of one-half, one, five, and ten years. These four zones are defined by regulation as a management tool; actual contaminants reaching the source aquifer may move faster or slower than the calculated times-of-travel.

Typically, a "zone of contribution" is determined for the study area. The zone of contribution is the aquifer area which contributes groundwater to the wellfields independent of travel time. However, a zone of contribution was not determined in previous models. Therefore, for this

WHPA, we have defined a fifth zone which we label as the area of investigation. The area of investigation includes areas where potential surface water and stormwater runoff and surface water bodies may contribute to the groundwater in the WHPAs. However, the area of investigation we have delineated is likely much smaller than the actual zone of contribution would be. Based upon the existing WHPA zones and the generalized water flow directions of the shallow aquifer system, we delineated an area of investigation, which covers approximately 42 square miles, inside the zone of contribution. Stormwater runoff is considered in our area of investigation because it runs over the surface of the ground, picking up and dissolving potential contaminants, and may eventually discharge these contaminants to groundwater via infiltration through ditches or ponds designed to percolate water or from surface-water bodies which receive the runoff.

Travel-time boundaries can be determined by either technical or non-technical methods, although technical methods are preferred so that the Wellhead Protection Plan (WHPP) better protects the actual capture zones of protected wells. In general, there are four delineation methods available. They are, from generally least to generally most accurate: the calculated fixed-radius method, analytical modeling, hydrogeologic mapping, and numerical modeling. The particular method employed (and the accuracy of that method) depends largely on the availability of hydrogeologic data. Numerical modeling, for example, can be highly accurate but also typically requires a relatively large amount of data. For areas with typical data availability, time-travel boundaries are often delineated using a combination of analytical modeling and hydrogeologic mapping, which provides a reasonably technical level of delineation.

Pacific Groundwater Group initially delineated the City's wellhead protection areas in 1997 by using a two-dimensional analytical model. Later, in 2000, PGG re-delineated capture zones for the City utilizing MODPATH Version 2, a three-dimensional particle-tracking program that utilizes steady-state head distribution created by a numerical model to calculate time-related capture zones. Numerical models are typically highly detailed, three-dimensional representations of water flow through identified hydrogeologic layers and are considered the most accurate approach for delineating wellhead protection areas by the Washington State Department of Health.

In 2008, Robinson, Noble, & Saltbush, Inc. used the modeled capture zones from 2000 to perform a hazard assessment within the wellhead protection area. The wellhead protection area includes ten wellfields and two springs that are related by overlapping geographical areas and represent three aquifer systems. We then provided the City with implementation tasks and strategies to help effectively implement the WHP plan. This current report is intended to provide a single effort that will suffice to update WHPAs for all ten wellfields and both springs, and the WHPAs have been mapped together for this updated wellhead protection plan.

The US Geological Survey is currently completing groundwater flow modeling of the Puyallup River Watershed, and the model area will cover the WHPP study area. The resulting numerical computer model will likely refine aquifer characteristics, groundwater flow patterns, and the location of aquitard-deposits. During the next update of the WHP plan, we recommend using the USGS model to re-define the WHPAs as the new model will represent an expansion of and improvement over the older PGG work.

Of particular interest to the WHPAs is the Osceola Mudflow (Qom), which originated on Mt. Rainier approximately 5,700 years ago, and consists of poorly sorted clay, silt, sand, gravel, boulders, and wood debris. It functions as an important aquitard in the valley. However, a 1999 hydrogeologic characterization report by PGG states that the mudflow does not occur beneath the confluence of the White River and Auburn-Kent valleys or near Auburn's Production Well 1, Wells T-4S/D, CW-2S/D, WR-2, and TW-9S/D. The USGS reports the thickness of the mudflow

ranges from approximately 0 to 60 feet in the study area (Dragovich and others, 1994). In the area defined by PGG where the mudflow is missing, it was likely not deposited or removed by erosional processes. The area where Osceola Mudflow aquitard is not present in the study area is shown on Figure 1.

Existing and Potential Contamination Hazard Identification

The inventory of potential contamination sources within the WHPA was performed according to the Washington State Department of Health 1993 publication "Inventory of Potential Contaminant Sources in Washington's Wellhead Protection Areas." As part of this inventory, a search of contamination-related databases was made by EDR Inc., an environmental database research company. They reviewed 27 federal and state databases for any known or potential contaminant sites within a 5-mile radius of the center of the City's service area. The sites in this radial search were narrowed further by Robinson Noble based on the sites' locations in relation to WHPAs.

We also performed an evaluation of various land-use categories in the study area and ranked them according to the likely activities occurring within those zones. Each land use zone was included as a specific entry (representing all of the area covered by that zone) in the contamination source inventory. The land-use zones, in order of relative risk, include: 1) rural areas, 2) commercial sites, 3) industrial, 4) mixed-use areas, 5) medium-density urban residential, 6) high-density urban residential, 7) mining and transportation corridors, 8) pipeline corridors, 9) and low-density urban residential. The ranking and types of potential risks for each zone are discussed below.

The results of the contamination source inventory include a list of potential and known environmental hazards in proximity to the City's water system. From this process, 513 sites or categories of land-use activities were identified as known or potential hazards to the City's groundwater sources. These sites and land-use activities were prioritized and ranked such that the wellhead protection implementation process can address each site or land use in a systematic manner. Each site was ranked according to three factors: proximity of potential hazard to the WHPA, type of contamination, and distance from the groundwater source to the potential hazard.

Protection Strategies and Implementation Tasks

The completion of wellhead protection planning provides no safeguards unless effective management strategies are implemented to prevent potential contamination of groundwater sources. With the hazards identified, the Wellhead Protection Plan provides for six strategies and 12 specific tasks for the City to undertake to complete the process. Also included is a detailed review of the State spill-response plan and a contingency plan to address the possible loss of one or more water sources. The plan is based a great deal upon monitoring of the existing system, active data collection and management by the City, and cooperation with those state and local agencies which regulate potential contaminants.

Contaminant Source Inventory Methodology

A summary of potential contaminant sources presented in the Health 1993 guidance is reproduced in Table 1. These sources were considered when performing the contaminant inventory for the City.

Table 1: Potential Contaminant Source Listed by Type

Category I

Sources Designed to Discharge Substances

Subsurface Percolation (e.g. septic systems and cesspools)
Injection Wells
- Hazardous waste
- Non-hazardous waste (e.g. brine disposal and drainage)
- Non-waste (e.g. enhanced recovery, artificial recharge solution mining, and *in-situ* mining)

Land Application
- Wastewater (e.g. spray irrigation)
- Wastewater by-products (e.g. sludge)
- Hazardous waste
- Non-hazardous waste

Category II

Sources Designed to Store, Treat, and/or Dispose of Substances; Discharge through Unplanned Release

Landfills
- Industrial hazardous waste
- Industrial non-hazardous waste
- Municipal sanitary

Open Dumps, Including Illegal Dumping (Waste)
Residential (or Local) Disposal (Waste)
Surface Impoundments
- Hazardous waste
- Non-hazardous waste

Waste Tailings
Waste Piles
- Hazardous waste
- Non-hazardous waste

Materials Stockpiles (Non-waste)
Graveyards or Animal Burial
Above-ground Storage Tanks
- Hazardous waste
- Non-hazardous waste
- Non-waste

Underground Storage Tanks
- Hazardous waste
- Non-hazardous waste
- Non-waste

Containers
- Hazardous waste
- Non-hazardous waste
- Non-waste

Open Burning Sites
Detonation Sites

Category III

Sources Designed to Retain Substances during Transport or Transmission

Pipelines
- Hazardous waste
- Non-hazardous waste
- Non-waste

Materials Transport and Transfer Operations
- Hazardous waste
- Non-hazardous waste
- Non-waste

Category IV

Sources Discharging Substances as a Consequence of Other Planned Activities

Irrigation Practices (e.g. return flow)
Pesticide Applications
Fertilizer Applications
Animal Feeding Operations
De-icing Salt Applications
Urban Runoff
Percolation of Atmospheric Pollutants
Mining and Mine Drainage
- Surface mine-related
- Underground mine-related

Category V

Sources Providing Conduit or Inducing Discharge through Altered Flow Patterns

Production Wells
- Oil (and gas) wells
- Geothermal and heat recovery wells
- Water supply wells

Other Wells (non-waste)
- Monitoring wells
- Exploration wells

Construction Excavation

Category VI

Naturally Occurring Sources whose Discharge is Created and/or Exacerbated by Human Activity

Ground Water - Surface Water Interactions
Natural Leaching
Saltwater Intrusion/Brackish Water
- Upconing (or intrusion of other poor-quality natural water)

Radioactive Disposal Sites

The initial part of the contaminant inventory was a search of contaminant-related databases completed by EDR, Inc. EDR is a third-party environmental database research company that

reviews federal and state environmental databases for known or potential contaminated sites within a designated area. Table 2 lists the primary federal and state databases (in alphabetical order according to the database abbreviations used by EDR) reviewed by EDR in order to locate sites of known or potential soil and groundwater contamination.

Table 2: Federal and State Databases

- Washington Emissions Data System (AIRS)
- Ecology Facility/Site Identification System (ALLSITES)
- Clandestine Drug Lab (CDL, Hist CDL, and US CDL)
- Comprehensive Environmental Response, Compensation, and Liability Information System (CERCLIS)
- CERCLIS No Further Remedial Action Planned (CERL NFRAP)
- Confirmed and Suspected Contaminate Sites (CSCSL)
- Confirmed and Suspected Contaminants Sites List No Further Action (CSCSL NFA)
- Department of Transportation, Office of Pipeline Safety (DOT OPS)
- Department of Defense sites (DOD)
- Drycleaners and Inactive Drycleaners (DRYCLEANERS and INACTIVE DRYCLEANERS)
- Emergency Response Notification Systems (ERNS)
- Financial Assurance Information listing (FINANCIAL ASSURANCE)
- Facility Index System (FINDS)
- FIFRA/TSCA Tracking System (FTTS and Hist FTTS)
- Formerly-used DOD sites (FUDS)
- Hazardous Waste Information System – CA Dept. of Toxic Substances (HAZNET)
- Hazardous Materials Information Reporting System (HMIRS)
- Hazardous Site List (HSL)
- Integrated Compliance Information System (ICIS)
- Independent Clean-up Report (ICR)
- Indian Leaking Underground Storage Tank (Indian LUST)
- Indian Underground Storage Tank (Indian UST)
- Institutional and Engineering Controls (INST CONTROL, US ENG CONTROLS, and US INST CONTROL)
- Leaking Underground Storage Tank (LUST)
- Hazardous waste manifest data (MANIFEST)
- Mines master index file (MINES)
- National Pollutant Discharge Elimination System permits (NDPES)
- National Priority List (NPL)
- PCB Activity Database System (PADS)
- RCRA Conditionally Exempt Small Quantity Generator (RCRA CESQG)
- RCRA Large Quantity Generator (RCRA LQG)
- RCRA non-Generator (RCRA NonGen)
- RCRA Small Quantity Generator (RCRA SQG)
- Records of Decision (ROD)
- Reported spills (SPILLS)
- Solid Waste Facilities Database (SWF/LF)
- Recycling Facility List (SWRCY)
- Solid Waste Tire Facilities (SWTIRE)
- Toxic Chemical Release Inventory (TRIS)
- US Aerometric Information Retrieval System (AIRS)
- Underground Injection Controls (UIC)
- Brownfields Grant Sites (US Brownfields)
- Underground Storage Tank (UST)
- US Mines Master Index File (MINES)
- Voluntary Cleanup Program (VCP)

EDR also searches additional non-federal and state databases, including some that are proprietary. The full list of databases researched is included in the EDR report, an electronic copy of which is included as Appendix A on the attached CD.

When EDR identifies a site during the database search, it lists the site with a unique site identification data key. However, since many sites are included on multiple databases and may have

different identifying information on the separate databases, some individual sites end up with more than one listing and identification key. In cases where there are several apparent sites in close proximity or at the same location, EDR attempts to group such listings in "clusters" having related data keys that allow for easy identification of all the listings for that general location.

We have condensed the initial listings from EDR into a final list of sites, attempting to combine all related listings for each site into a single entry on the potential hazard list. For those sites with multiple EDR listings, one of the unique data keys for each listing is retained as the combined site ID on the final hazard list (Table 10 in Appendix B). This should allow for identification of associated listings in the EDR report. Figures 3 through 7 show the locations of each site with their final ranking as an identifier.

Field Survey

A field verification or "windshield survey" was performed by City staff based on guidance provided by Robinson Noble. The purpose of the windshield survey was to verify that listed sites are appropriately located and to identify and describe any additional sites of concern that were not included from the database search. The sites provided by the EDR report were organized and plotted onto maps by their respective database listings. A windshield survey checklist was also designed based on the Health publication, "Wellhead Protection Program Guidance Document – Sample Inventory Form." Once the survey checklist, EDR database list, and map of database sites were produced, they were given to the City to allow field staff to confirm the presence/condition of the sites. City employees performed this task because they are familiar with the businesses and land uses within the service area and because field staff are routinely deployed in the field on other tasks. The findings of the field survey were incorporated into the potential hazards listing and ranking discussed below.

New sites beyond the EDR listings were not identified through the field survey, though the field verification process identified the current uses of each property visited. This allowed us to cross-check the database listings and then add current uses or business names that EDR did not identify.

Methodology for Establishing Risk Priority

The methodology for prioritizing risks in the WHPA was partially based on the EPA guidance document entitled "Managing Ground Water Contamination Sources in Wellhead Protection Areas: a Priority Setting Approach" (EPA, 1991). The ranking effort was also based on the level of confidence in data and information that is currently available for known and potential contamination sites.

Each site was ranked according to three decision levels. The decision levels are listed below in Table 3 (Level I represents the highest hazard risk criteria; Level III is the lowest).

Table 3: Overall Risk Prioritization

Decision Level	Available Data and Information
I	Proximity of potential hazard to the WHPA
II	Type of contamination
III	Straight-line distance from the wells to the potential hazard

Each known or potential hazard was first scored and then ranked using decision level one. Sites with equal level one rankings were then further scored and ranked using decision level two. If sites were still equal in priority, they were further sub-prioritized under decision level three. Once sites were all differentiated in priority (i.e., no ties in scoring), no further ranking was nec-

essary. For this project, ranking beyond decision level III was unnecessary. The criteria for scoring sites within each level are discussed below.

Decision Level I – Proximity to WHPA

For the first decision level, the sub-prioritization of contaminated sites was based on their location in the WHPA zones; the shorter the travel time, the higher the priority. Scores for each site and hazard category are summarized in Table 4.

Table 4: Proximity to Source

Sub-Priority Score	Proximity to Source
1	½-year time-of-travel to the source (Zone 1)
2	1-year time-of-travel to the source (Zone 2)
3	5-year time-of-travel to the source (Zone 3)
4	10-year time-of-travel to the source (Zone 4)
5	Area of investigation outside Zone 4 (Zone 5)

Decision Level II – Type of Contamination

For the second decision level, the sites were ranked as either known or potential sites of contamination. Known contamination sites were defined as those with known releases of contaminants according to the environmental database survey results. Sites of potential contamination are areas or locations that are used in ways that could pose a risk to the groundwater. This category's scoring is summarized in Table 5.

Table 5: Type of Contamination

Sub-Priority Score	Known or Suspected Contamination	Type of Site	Assumptions
1	Known	CSCSL, HSL, ICR, RGA HWS, RGA LUST, Indian LUST, SPILLS, SPILLS 90, US BROWNFIELDS	As a worst case scenario, contamination is assumed to be comprised of the most toxic chemical identified for the site based on information contained in the Ecology and EPA databases.
2	Known or Suspected	Inactive Drycleaners, Drycleaners, RGA LF, SWF/LF, US Hist Cleaners [1],	Contamination is known or suspected to exist at the site, but may be partially controlled.
3	Known	VCP sites; CDL, historic CDL	Voluntary cleanup sites (VCP) are sites where contamination has occurred, but the contamination has been at least partially controlled or cleaned up. Clandestine drug labs (CDL) can cause toxic fumes, spills, explosions, fires, and can create large amounts of toxic waste.
4	Potential	Financial Assurance; Indian UST, UST; , rural zoned areas; pipeline corridors	It is assumed that petroleum products are stored in USTs, but contamination is not imminent. Rural areas use septic systems. Nitrates and bacterial contamination from septic systems are assumed to be health risks, along with potential chemical hazards, but it is not known what the likelihood is for systems to contaminate the wells.
5	Potential	ERNS, Haznet, Hist Auto, Manifest, RCRA-CESQG, RCRA-NonGen, RCRA-NLR, TRIS; commercial or industrial zoned areas	Hazardous chemicals may be stored on RCRA sites, but contamination has not necessarily occurred. Commercial/industrial uses at this level assume that they are served by sewer systems.
6	Potential	FINDS, US MINES, mining land uses and transportation corridors	This category also includes highways and railroad tracks where accidental spills can occur (with the risk based on the possibility of hazardous material spill; for example, gasoline).

Sub-Priority Score	Known or Suspected Contamination	Type of Site	Assumptions
7	Potential	ALLSITES, urban residential zoned areas	Urban residential uses within areas served by sewer systems are generally lower risk than those served by septic systems.
8	Potential	FTTS, HIST FTTS, open space/recreational/forest zoned areas	Non-residential insecticide, fungicide, and rodenticide uses. Herbicide and pesticide use along transportation corridors, power lines, and in open spaces/recreational uses,
9	Potential	CERC NFRAP, NPDES	This category includes the potential release of lead, petroleum products, and/or solvents via a stormwater system.
10	Potential	CSCSL NFA	Sites achieving a NFA ranking are presumed to have been cleaned up sufficiently to no longer pose a threat. Therefore, this ranking will take precedence over other categories listed for the same site.

[1] Existing and historic drycleaners, landfills (LF), and solid waste facilities (SWF) all have, or had, contaminants present, but the contaminants were not necessarily released to the environment. However, particularly for older sites, the chances of release due to use practices and facility designs is particularly high for these sites. Therefore, contamination is suspected. Additionally, the types of contamination typically found at these sites are particularly mobile in groundwater. These factors combine to rank these sites high although contamination is not known for certain.

Decision Level III – Distance from Wells

For potentially hazardous sites with similar characteristics for prioritization decision levels I and II, the direct distance from the site to the well was used to further rank the sites. In some cases, the nearest wellfield to a hazard site is not a reasonable path (i.e., groundwater moving up gradient). Therefore, we determined the most direct distance based on pathways that are reasonably achievable. Those sites closest to the wells or springs were given a higher priority.

As noted above, a portion of the valley was defined by PGG as lacking deposits of the Osceola mudflow. If correct, the absence of this aquitard will allow for water and/or contaminants to travel vertically through the substrate and into the aquifer faster than it would otherwise.[1] This translates into a shorter travel time to the wellfield. Travel-time calculations were performed based on porosity of the material, averaged thickness of the mudflow deposits, hydraulic conductivity, and difference groundwater elevation above and below the unit. Using average values, we determined that water and/or contaminants could travel vertically through the mudflow unit in an estimated 135 days. Therefore, where the mudflow unit is not present, flow toward the well can be assumed to be 135 days faster. Over a similar period, water and/or contaminants already in the source aquifer would travel approximately 520 feet horizontally toward the wellfield. To account for this quicker time of travel, we subtracted 520 feet from the calculated straight-line distance measured between the nearest source well and the site in question for areas where the mudflow deposit is not present. Where a site had a distance that is less than 520 feet from a source well, we assumed a minimum travel time of one month or 245 feet and used this value for the distance.

Land Use

Land use zones are added to the hazard ranking process in order to include the more general, non-point-source activities that each zone represents. Since the land use activities vary with the zoning, it is reasonable to use the zone classifications as a proxy for trying to identify individual activities within a zone. So rather than call out each commercial business as a possible handler of hazardous materials (a paint store for example), the commercial zone can be given a suitable

[1] The USGS Puyallup River Watershed model will likely refine the areas where mudflow deposits are present. The assumptions used here should be revisited during the next WHPP update using the USGS model as a guide to better define the vertical relationships, flow directions, and times of travel.

ranking level and the nearest instance of that zone to a source well is ranked in the hazard inventory process.

Land use and zoning within the study area include (in general order of prevalence) medium density urban residential industrial, mixed use, commercial, rural area (large lots, 2.5 acres or larger), low density urban residential, mining, and high density urban residential. These land-use categories are discussed below in relation to the potential hazards they represent. Figure 8 shows the locations of zoning categories within the Auburn City limits.

Residential Land Uses

Residential zoning generally falls into four categories across the study area: rural; low density, medium density, and high density urban residential. Table 6 lists the residential land categories.

Table 6: Residential-use Designations

Land Use/Zoning	Description	Hazard Ranking
Rural (2.5, 5, and 10 acre)	Large lot residential (includes non-residential rural uses such as churches and some schools) 1 dwelling unit per 4 acres	7
Urban residential, low	Small lot single- and multi-family residential mixed. Low – 1- 3 dwelling units per acre	274
Urban residential, medium	medium – 4 - 10 dwelling units per acre	18
Urban residential, high	High – 11 or more dwelling units per acre	19

Three rural-zoning categories are present representing allowed minimum lot sizes of 2.5, 5, and 10 acres. As each of these variations on rural zoning present essentially the same basic risk to the City's sources; they are combined into a single category for this ranking process. Contaminant sources related to rural land use include chemical fertilizer, herbicide, and pesticide application; petroleum hydrocarbons; household chemicals; and household sewage. Petroleum hydrocarbons from home heating-oil tanks and farm equipment fuel tanks, as both aboveground and underground storage tanks (USTs), are a potential threat with this land use.

The risk is higher from rural zones for two reasons. First, rural zones in general, because of the potential for agricultural uses, have a larger potential for high, more concentrated use of fertilizers, pesticides, and herbicides. Second, because rural zones are not sewered, risk is elevated due to the use of septic systems, which have the potential to deposit contaminants directly into the subsurface. So, while urban area densities are greater than rural zones, the potential pathways for contamination are often better controlled (sewers, stormwater handling systems, more impervious cover, etc.). However, it is worth remembering that typically risk from septic systems is dominated by the gradual loading of contaminants (i.e., nitrates) from many systems together over a large area rather than inputs of a hazardous material to a specific septic system. In general, single-source contamination is not only uncommon but also rarely travels significant distances beyond the septic drain field because most household chemicals are not highly mobile nor are used in significant enough volumes to cause extended contamination.

Commercial Land Uses

Commercial land use makes up approximately 2,353 acres of the study area and is ranked as the seventh highest risk to the WHPA because of its proximity and subsurface pathways for contamination.

The most likely potential contaminants related to commercial land uses are, but are not limited to, petroleum hydrocarbons and metals. These potential contaminants are generally due to the presence of fuel in USTs, parking lots, and listings of businesses potentially as RCRA small-quantity generators of hazardous materials.

Industrial Land Uses

Like commercial zones, industrial areas can host a range of activities with potential to cause contamination. The most likely contaminants related to industrial uses are petroleum hydrocarbons and metals. Contaminants are generally due to the potential for large spills, presence of aboveground and underground storage tanks, parking lots, and potentially small or large quantity generators of hazardous materials.

Mining & Transportation

Major transportation routes are included as potential hazards due to the transport of potential contaminants by road or rail and the potential use of herbicides and pesticides along the routes. Two Burlington Northern Santa Fe (BNSF) and one Union Pacific railroad corridors extend through WHPA and study area. Heavily trafficked roads determined to be significant transportation corridors through the WHPA and study area include Highway 18, A Street East, and Auburn Way.

The main consideration for transportation corridors is for large spills, typically involving petroleum hydrocarbons or hazardous materials. Smaller streets and roads are not listed separately in the potential hazards list because there is less chance for large spills and small spills (i.e., leaks, over application of de-icing salt, etc.) that might occur only on non-highways are less of a concern. Hazards related to smaller streets and roads are included within the other land-use categories (specifically the rural and urban planning development categories).

Multiple sand and gravel mining operations are located in the study area. Openwork mining allows a direct route for potential contaminants to enter the groundwater system. While it is assumed that the mines operate under best-management practices and conform to all appropriate state regulations, the lack of vegetated cover and continued disturbance of mining pits when in operation makes mines potential sites for contamination. Contaminants of particular concern associated with mining are petroleum based fuels and hydraulic fluid.

Mixed Uses

The final category of land-use categories is mixed use. This category includes a mixture of residential, commercial, and public land uses. Public land use includes hospitals, public swimming pools and athletic facilities, libraries, parks, etc. Potential contaminants include the use of herbicides and pesticides, as well as other chemicals for public swimming pools and hospitals, etc.

Pipeline Corridors

The Olympic Pipeline, owned by BP, is located in the study area and is within the West Hill Springs WHPA 5- and 10-year zones. The pipeline transports gasoline, diesel, and jet fuel from refineries at Cherry Point and Anacortes, Washington to as far south as Portland, Oregon. Hazards associated with the pipeline corridor include potential for leaking and spills of petroleum products from the pipeline, as well as the potential use of herbicides and pesticides along the routes.

Table 7, below, shows the relative ranking for the non-residential land use categories.

Table 7: Other Land-use Zoning Designations

Land Use/Zoning	Description	Hazard Ranking
Mixed Use	Mix of residential, public properties including swimming pools and athletic facilities, libraries, and parks, hospitals, and some commercial uses.	10
Mining &Transportation Corridors	Highway 18, Auburn Way, and A Street. Active and abandoned sand and gravel mines.	54
Industrial	Safeway Distribution Center, Oldcastle Precast Concrete Manufacturing, Northwest Aviation Service Group, and many others	16
Commercial	neighborhood business, shopping malls, and strip malls, etc.	11
Pipeline Corridors	BP's Olympic petroleum pipeline	125

Identified Contaminant Sources

In the federal and state databases reviewed by EDR, 992 sites are identified within the WHPP study area. These sites are scattered among all four of the WHPA zones and the area of investigation, as well as outside the WHPAs. However, based on the locations, types of listings, the field verification effort, and review of additional on-line database information where available, we reduced the final list of sites to be ranked to 504. Adding in the nine land-use categories discussed above brings the total number of ranked hazards to 513. The five highest ranked sites are shown below in Table 8. The City should do additional due diligence on the highest ranked sites to evaluate to risk to the WHPAs. The hazard sites are mapped on Figures 2 through Figure 7 and shown in Table 10, attached as Appendix B.

Table 8: EDR Identified Contaminant and Potential Sources

Hazard Ranking	EDR ID Numbers	EDR Site Name	Address	Database
1	CU 950, CU 949, CU 953, CU 952, CU 951	The Church of Jesus Christ of Latter Day Saints	331 4th St. NE	ICS, RGA HWS, FINDS, ALLSITES, CSCL
2	DP1003	No Name Provided	634 M Street NE	SPILLS
3	DP 975	No Name Provided	1207 6th St NE	SPILLS
4	CW 849	No Name Provided (residence-duplex)	1208 4th St NE	EDR US Historic Cleaners
5	DN 962, DN 969, DN 968	B and G One Hour Cleaners	420 N Auburn Way	ALLSITES, Inactive Cleaners, RCRA NLR, FINDS, Historic Cleaners

Potential Groundwater Concerns

For wellhead protection planning, it is important to understand the potential sources and types of contamination that threaten the City's WHPAs. It is also important to understand the potential pathways for contaminant migration since these contaminant pathways can increase the vulnerability of an aquifer by decreasing travel time from a source to a wellhead or spring. The following section briefly summarizes the main mechanisms for transport of contaminants to the subsurface.

Discharge onto the Ground Surface

Direct discharge to the ground surface occurs when products or waste materials are spilled onto the ground. With the help of rainfall infiltration, the materials percolate into the subsurface, and if a sufficient volume of material is released, they eventually reach the water table and migrate down gradient within the shallow aquifer. In large enough quantities, spills can impact deeper aquifers where water supply wells are completed.

Direct Discharge to the Subsurface

Discharge to the subsurface occurs from septic systems and dry wells (UICs). Discharge into the subsurface is a more direct mechanism for transport because contaminants are discharged closer to the water table and because subsurface discharge bypasses the upper layers of soil, which have the ability to absorb and disperse many types of contaminants.

Abandoned Wells

Old, improperly constructed or improperly abandoned wells[2] can act as direct conduits for contaminant transport to an aquifer. In such wells, transport can occur between the ground surface and aquifer zones because of a lack of a well seal or an inadequately constructed seal.

Stormwater Runoff

Rainfall onto the ground either induces infiltration into the subsurface or becomes runoff. The quality of the water which infiltrates or runs off is dependent on the type of land use and the potential presence of contaminants which may be located on the ground surface. Stormwater infiltration issues are similar to those of discharge to the ground surface. Stormwater runoff is considered differently because it runs over the surface of the ground, picking up and dissolving potential contaminants, and may eventually discharge these contaminants to groundwater via infiltration through ditches or ponds designed to percolate water or from surface-water bodies which receive the runoff.

The potential concerns due to water infiltration or runoff are diverse and reflect the land-use activities in the area of interest. Paved roadways, parking areas, and residential developments can contribute heavy metals and petroleum hydrocarbons which originate primarily from vehicle-related emissions. Industrial and commercial operations commonly process and release a variety of organic pollutants (e.g., solvents, paints, and dry cleaning solutions) as well as petroleum products.

Management Strategies

This WHP program is designed to be an on-going management activity to meet the City's future planning needs and to adapt to changes in the City's use of the aquifer system. As such, the management strategies and practices outlined within this study provide a general direction but will periodically need to be refined to fit specific conditions. Additional adaptations may be needed to address future activities and regulations or changes in current regulations that may affect the WHPAs. The following sections detail proposed strategies to protect the integrity of the City's water sources.

Land Management Activities

The City should encourage owners or agencies responsible for large land parcels and developments to use and monitor best management practices (BMP) for control, reduction, and restriction of potential contaminants into the WHPAs.

[2] Washington State has standards for construction and abandonment of wells, WAC 173-160.

WHP Land-use Strategies

The City of Auburn has no authority to directly control land use for those areas of the WHPAs that are outside the city limits. Therefore, the City must develop a cooperative relationship with those state and local agencies that administer land use programs. At the present time, the best strategy for the City is to seek special designations for the WHPAs from pertinent agencies. The City should evaluate and seek the different designations that may be most beneficial.

Possible Special Protection Area Designations

- A Special Protection Area designation under the state groundwater quality standards (WAC-173-200)
- A Special Use Area by the Department of Agriculture
- An Environmentally Sensitive Area under various County-level programs

WHP Regulatory Strategies

This WHPP is designed to use the existing statutory rules and regulations to protect groundwater quality. The City, in coordination with state and local agencies having statutory authority in the area, could monitor regulated activities within the WHPA. The following regulatory strategies are recommended.

Well Drilling Inspections inside the WHPA

The City should support continuation of the delegation by the Department of Ecology (Ecology) of well construction inspection authority to the King and Pierce County Health Departments. Regardless of the responsible agency, the City should encourage more frequent well construction inspection than currently occurs.

Washington State Environmental Policy Act/Hydrogeologic Evaluations

The City should request that the King County Department of Development and Environmental Services (DDES) and the Pierce County Planning and Land Services (PALS) to require hydrogeologic evaluations that specifically address impacts to groundwater quality and quantity parameters for any development within the WHPAs which requires SEPA action or seeks a Determination of Non-Significance (DNS) designation. Additionally, the City should enter into a Memorandum of Understanding (MOU) with DDES and PALS seeking City comment on the effects such developments will have on the groundwater system. Designation of the area as a Special Protection Area will be the first step toward gaining such an agreement.

Septic Tanks

The City should request King County and Pierce County to require as-builts drafted by septic design professionals be recorded with property deeds for new septic systems. Additionally, the City should support the implementation of laws and regulations requiring proper inspection and maintenance of septic systems. The City currently has an active sewer system throughout the majority of the City; however, septic systems still exist in many areas. In areas that are sewered, septic tanks are not allowed for new construction as everything must be connected to the sewer.

Planning Strategies

A substantial degree of future protection for the WHPAs will be achieved through present-day planning and coordination. In order to accomplish the required level of future protection, the following strategies are recommended.

Sewers

The City, in coordination with the managers of neighboring local sewer systems, should develop emergency plans to be implemented in the advent of sewage leaks or spills. The City could encourage the County to require all industrial and commercial facilities within the WHPAs to connect to sanitary sewers if such services are reasonably available.

Stormwater Management

The City should conduct or promote research on the impact of stormwater discharge on water quantity and quality. Additionally, the City, in coordination with the responsible agencies, should evaluate the adequacy of stormwater facilities including proper routing, retention, and detention. In the upland areas, a balance should be found that allows optimum recharge of stormwater to groundwater systems while adequately protecting the water quality of the aquifers. Generally in the valley areas, aquifer recharge of stormwater is less of a concern and stormwater management should focus more solely on water quality protection.

Petroleum Pipelines

The City should document the location and use of petroleum pipelines and establish emergency response plans for pipeline failure. These efforts should be coordinated with the pipeline companies and the federal, state, and county agencies responsible for emergency, petroleum-product spill response.

Hazardous Material Transport

The City should investigate the feasibility of re-routing the transport of hazardous materials away from the half-year and one-year WHPA zones and the area where the Osceola mudflow aquitard is not present. However, it may be necessary for this option to exclude Highway 18 and SR 164 (Auburn Way South) since they represent major regional transportation routes. While Highway 18 does not travel directly through the 6-month or 1-year zones, it does pass through Zone 1A, an area with no confining layer above the main aquifer utilized by the City. A stronger emphasis on emergency response for this area could be an alternative to the rerouting of hazardous material transportation.

Spill Response

The City has established formal communication protocols with first-response emergency units of the Valley Regional Fire Authority. Notification of the location of the WHPAs should also be given to emergency response organizations outside of the City boundaries as appropriate. The City also has an Emergency Response procedure (600-02) to help it respond to minor spill events within City limits. However, creation of a formal Spill Response Plan that brings together City and first-responder agencies under the incident command system is recommended. Such a plan describes the proper response procedures to a major spill event that might threaten City water supplies and can prove valuable in cases where a first responder's perspective differs from the City's desire for protection of water resources by pre-establishing command and control roles and identifying proper contacts to ensure good decision making in the field.

Data Management Strategies

One of the principal goals of the WHPP is the development of a data collection network and analysis plan capable of providing the City with advance warning of contamination to the City's water supply. The following data management strategies seek to establish and maintain scientific data upon which future WHPP actions can be based.

Groundwater Monitoring Plan

The City should actively participate in the collection and analysis of regional and local groundwater information. The development of a proper groundwater-monitoring plan will be crucial to the City's capability to protect their water sources. This can be accomplished in cooperation with Health, the Regional Water Associations of South King County, Seattle-King County Health Department, the Department of Natural Resources (DNR), Ecology, and other entities seeking to monitor the groundwater resources of the region.

Abandoned Well Inventory

The City should locate and inventory decommissioned, abandoned, and unused wells. Owners of these wells could be notified of the potential liability such wells cause and be educated on the benefits of well decommissioning.

Herbicide and Pesticide Survey

The City should inventory and monitor major herbicide and pesticide use within the WHPAs. This inventory may be used to guide future groundwater monitoring and WHP-related education programs. In addition, the City could encourage county, state, and private land managers to use vegetation-management practices that protect groundwater quality.

Underground Storage Tanks Inventory

The City should inventory and locate underground storage tanks. Besides those presently identified by the current hazard inventory, this inventory should include new tanks placed after the hazard inventory was finished, residential home heating-oil USTs, and other tanks that have not been previously identified.

Drywell Monitoring

The City should encourage stormwater management agencies to develop an evaluation and monitoring plan for drywells within the WHPAs.

Education Strategies

Education of the public and industrial/commercial occupants of the WHPAs concerning groundwater protection is a critical portion of the WHPP. Through proper education, the degree and potential for future contamination can be greatly reduced; therefore, the following recommendations are made.

- If not already begun, the City should begin groundwater educational programs to educate WHPA residents, particularly on groundwater quality issues. The WHPAs could be targeted for distribution of literature regarding septic tank maintenance; fuel-oil storage tank maintenance and abandonment; residential use of herbicides and pesticides; and hazardous material use, disposal, and storage
- In addition to City-run programs, the City should participate in and support small-quantity waste disposal programs and actively work with state and local government in developing and creating public education programs concerning groundwater.

Wellhead Protection Implementation Tasks

In order to accomplish the protection of the WHPA, we recommend that the City adopt the WHP Implementation Tasks listed below. Twenty-six tasks were initially proposed during the 2008 WHPP update (Robinson, Noble, & Saltbush 2008). Two tasks have been completed, four have been removed as redundant, and eight tasks are currently being completed by the City as shown in the Table 9 below.

Table 9: 2008 Implementation Tasks Currently in Progress

2008 Task Number	Task goal
3	Notify county health and planning departments
11	Participate in a regional groundwater data development and management program
13	Ensure SEPA evaluations include WHP considerations
14	Document the type and amount of herbicide and pesticide application
17	Promote and coordinate public education programs on WHP concerns
20	Encourage development and use of best management practices in developments covering groundwater protection
22	Encourage thorough analysis of groundwater impacts for siting, operation, and reclamation of gravel quarries and mines
26	Work with responsible parties to assess adequacy of stormwater systems

The remaining tasks are listed in their recommended priority of implementation. Task numbers from the 2008 update have been retained. The City may institute all or a portion of these tasks, depending upon available funding, time, or other concerns.

Task 2

The City should establish formal communication with first responders and educate them about the needs for wellhead protection. As an example, Tacoma-Pierce County Health Department collected the WHPAs defined by each Group A water purveyor in Pierce County and created a GIS-based map. This map layer was then shared with all Pierce County fire departments to help inform their responses to fires or hazardous material spills in proximity to vulnerable water supplies.

Task 4

Consideration should be given to seeking designation of the WHPAs as a special protection area. As mentioned previously, there are numerous special designations the City may wish to seek in order to protect the WHPAs. The City should evaluate the protection offered by these designations and seek those most appropriate for the WHPAs.

Task 5

The City should create awareness of the wellhead protection area by posting metal "WATER SUPPLY PROTECTION AREA" signs along major arterial roads at the borders of the WHPAs.

Task 7

Increasing public awareness of homeowners who are connected to the City's water system through notification letters to customers within the WHPAs should be accomplished by the City. This notification letter should be given to homeowners either at the time of service hook up or as part of property escrow.

The City should deliver a copy of the WHPP to the King County and Pierce County library systems. This will allow interested residents to learn more about the wellhead protection program of the water system.

In addition, the City should inform local residents of the WHPA through a press release sent to Auburn Reporter, Tacoma News Tribune, and the Seattle Times for publication in the local or "Your Town" sections of each paper.

Task 8

The City should coordinate with King and Pierce Counties to require engineering as-builts of new septic systems be recorded with property deeds. These as-builts should be drawn and

submitted by septic-tank designers who are registered professional designers licensed by Washington State. The City should support the implementation of state laws and regulations regarding septic system inspection and maintenance programs and promote and coordinate public education programs concerning proper septic tank maintenance and proper hazardous waste disposal.

Task 9 and Task 24 (combined)

City public works staff should review routine leak detection procedures for sewer lines, request the use of "leak-proof" piping for new sewer construction, and replace older lines. There are currently multiple sewer force mains located throughout the City. The City currently has contingency plans in place for pump and line failure; however, the City should develop an emergency response procedure for sewer force main breaks within the half-year and 1-year WHPA zones. The City could seek to have appropriate agencies require sewer hook-up for all industrial-commercial facilities within the WHPAs if sewer service is reasonably available.

Task 12

The City could encourage King and Pierce Counties to maintain their delegated authority of well-drilling inspection and should coordinate with this program to gain advance notice of drilling in or near the City's WHPAs. The contacts for the appropriate programs are Tacoma-Pierce County Health Department's Drinking Water and Wells program at 253-798-6470 and Public Health – Seattle & King County Department's Drinking Water program at 206-296-4932. For information on the delegated authority, contact the Department of Ecology's Well Construction and Licensing program at 360-407-6650 (see also: http://www.ecy.wa.gov/programs/wr/wells/wellhome.html).

Task 15 and 16 (combined)

The City should annually review the CSCSL, LUST, and other significant environmental database listings within the WHPAs. Also, the City could monitor Ecology's progress in the cleanup of contaminated sites within the WHPAs and encourage Ecology and county inspection of RCRA hazardous waste generator facilities.

Additionally, review of annual Superfund Amendments and Re-authorization Act (SARA) Title III reports, in order to document and inventory the chemicals used in the WHPAs, is recommended. This review could be used to guide groundwater monitoring and WHP-related education programs.

Task 18

The City should develop data on the number and size of exempt underground tanks within the half-year and one-year WHPA zones. Also, the City should promote and coordinate public education programs concerning underground tank hazards, leak detection methods, and proper removal and closure procedures. These programs should target owners of exempt underground tanks. Such owners should be encouraged to contact the Pollution Liability insurance Agency (PLIA) to receive no-cost coverage of up to $60,000 at http://www.plia.wa.gov/.

Task 19

The City could seek to have Ecology prioritize the investigation of contaminated and potentially-contaminated sites within the WHPAs. This could assure that those areas with existing contamination and any subsequent contamination events within the WHPAs are given highest priority in relation to the amount and type of contamination in clean-up activities and budgets.

Task 23

An inventory of abandoned or unused wells in the six-month, one-, and five- year zones should be made. The owners of these wells should be informed about proper well decommissioning procedures.

Task 25

The City should investigate the need and feasibility for re-routing transport of hazardous materials through the WHPAs. Also, the City should create a formal Spill Response Plan to describe the City's responsibilities and responses to a major spill event under the State's Incident Command System.

MM/DD/2024

LETTER OF NOTIFICATION – SITE WITHIN AN AUBURN WELLHEAD PROTECTION AREA

To whom it may concern,

The City of Auburn (City) relies on groundwater for our drinking water source, and a Wellhead Protection Plan (Plan) has been developed to help maintain drinking water quality for City residents. The Plan is based on the Washington Department of Health (DOH) Washington Administrative Code (WAC) 246-290-135(3) regulations. As part of that Plan, maps were prepared that show the Wellhead Protection Areas (WHPA), which are the areas around each well where chemical spills or other sources of contamination may contaminate the water source.

The City has approximately 15,000 service connections and serves approximately 64,000 residents. There are several sources within our system that were rated as highly susceptible to contamination by DOH. This means that surface spills could potentially infiltrate into the aquifer, placing our water sources at risk.

The City of Auburn's WHPAs are shown on the enclosed maps. Our records indicate that your property is located within the City's WHPAs and that activities on the property may include the generation, use, or storage of chemicals or hazardous substances. This notice is a reminder that your business, or the business on your property, can help protect our drinking water by preventing the release of chemicals and hazardous substances onto the ground, to stormwater systems, and to septic systems. Prevention methods include the following:

- Providing proper storage of chemicals on site, and regular inspection of storage areas and containers, to ensure that containers or tanks are not leaking.
- Verifying that the site has up-to-date spill plans and training for staff so that on-site staff know what to do if a spill does occur.

As the potential exists that a contaminant spill on your facility property may adversely impact the City's drinking water supply, please notify the City immediately in the event of a contaminant spill at 253-931-3048 on weekdays between 6:00AM and 3:30PM or call 911 if outside these timeframes. All spills in King County should be reported to the Department of Ecology by dialing 206-594-0000.

Thank you for assisting us in protecting our water supply. If you have any questions, please contact me at 256-931-3086 or via email at rvondrak@auburnwa.gov.

Sincerely,

Ryan L. Vondrak, P.E.

Utilities Engineering Manager

City of Auburn

MM/DD/2024

LETTER OF NOTIFICATION – AUBURN CONTAMINANT SOURCE INVENTORY UPDATE

To [Agency/Local Government],

The City of Auburn (City) relies on groundwater for our drinking water source, and a Wellhead Protection Plan (Plan) has been developed to help maintain drinking water quality for City residents. The Plan is based on the Washington Department of Health (DOH) Washington Administrative Code (WAC) 246-290-135(3) regulations. As part of that Plan, maps were prepared that show the Wellhead Protection Areas (WHPA), which are the areas around each well where chemical spills or other sources of contamination may contaminate the water source. Per DOH, the City must coordinate with agencies responsible for incident/spill response procedures.

The City has approximately 15,000 service connections and serves approximately 64,000 residents. There are several sources within our system that were rated as highly susceptible to contamination by DOH. The enclosed maps show the 6-month, 1-year, 5-year, and 10-year time-of-travel boundaries for our WHPAs. We're also sending you a list of facilities or activities of concern.

The findings of the Plan indicate that, due to geologic setting, there is only limited protection for the City's aquifer from low-permeability materials at the ground surface. Therefore, surface spills could quickly infiltrate into the groundwater, placing our water sources at risk. Regardless of the apparent surface material conditions, care should still be exercised because the geologic conditions can vary substantially over short distances.

The City asks that you consider the protection of our sources when responding to chemical spills or other sources of contamination. If you are responding to a chemical spill or other hazard that is located within the WHPA, and there may be a risk of contamination of City sources, please take a moment and include us in your spill response plan by contacting the City at 256-931-3048, on weekdays between 6:00AM and 3:30PM, or call 911 if outside these timeframes.

Thank you for your support in protecting the City's drinking water supply. If you have any questions, please contact me at 253-931-3086 or via email at rvondrak@auburnwa.gov.

Sincerely,

Ryan L. Vondrak, P.E.

Utilities Engineering Manager

City of Auburn

2024 Water Source Loss Mitigation Plan

SOP 5.2.1
Water Source Loss Mitigation Plan

Potential threats applicable for all sources: Contamination, Earthquake, and Physical Assault.

Coal Creek Springs – Capacity 3,500 gpm
Additional potential threats: Flood, Landslide, Wildfire, Volcano/Lahar
If no water is available from Coal Creek Springs, Well No. 4 and Well No.1 will continue to supply water to Reservoir 1. Operators may have to lower the operating position of the 16 inch pressure reducing valve (PRV) at Howard Road Treatment Facility to maintain adequate water supply in Reservoir 1. More reliance will be placed on Well No. 4, Well No. 1, Well No. 2 and Well No. 6. Perhaps not critical to normal operation, getting this facility back online is of high priority.

Notify Parks Department that Game Farm Wilderness will not have water until this source is returned to operation.

16 Inch PRV at Howard Road Treatment Facility
Should auto-control of the 16 inch PRV be lost, this valve may be opened or closed locally by the control panel located in the vault. If the PRV is completely out of service, Valley Service Area pressure can still be controlled by use of a stand-by 8 inch PRV located adjacent to the 16 inch valve. The 8 inch valve is a strictly manual valve. Control is adjusted by manipulation of the pilot control valve (CRD).

A supplemental PRV to the 8 inch PRV is located at 25th & K Street SE. This is a 12 inch PRV and is manually adjusted by manipulation of the pilot control valve (CRD).

25th St SE and K St SE PRV
If the water produced by Well No. 4 is not needed or cannot reach Reservoir 1, the water can be sent directly into the Valley Service Area by changing valving and making use of this PRV.

- Valve off Well No. 4 discharges to Reservoir 1 (valve # 2151), open valve 2152 to valley zone.
- Turn on Well No. 4.
- Set operation setpoint for Reservoir 1 level to unobtainable level to keep Well No. 4 running in Auto. If Reservoir 1 level signal is not available, Well No. 4 will need to be run in “Manual Mode” locally.
- If Well No. 4 flow is not needed, force it to shut down by changing Res 1 level setpoint.

Well No. 1 – Capacity 2,100 gpm
Additional potential threats: Flood, Volcano/Lahar
Loss of Well No. 1 is not critical for maintaining domestic use and fire protection, however it would be important to restore it as soon as possible. Should this station be out of service, Wells 4, 2, and 6, as well as Coal Creek Springs will continue to provide water to the valley. Operators may have to lower the operating position of the 16 inch PRV at Howard Road Treatment Facility to maintain adequate water supply in Reservoir 1.

Well No. 4 – Capacity 2,600 gpm
Additional potential threats: Flood, Volcano/Lahar
Water from Well No. 4 is not critical for maintaining domestic use and fire protection. If no water is available from Well No. 4, water from Coal Creek Springs and Well No. 1 will continue to supply the Valley Service Area. Operators may have to lower the operating position of the 16 inch PRV at Howard Road Treatment Facility to maintain adequate water supply in Reservoir 1. Significantly more reliance will be placed on Coal Creek Springs, Wells 1, 2, and 6.

The operation of Well No. 4 is normally controlled by the water level in Reservoir 1. However, there is the option of controlling Well No. 4 by Reservoir 2 through the SCADA telemetry page for Well No. 4. On/off levels for the well will have to be changed to that of Well No. 2 and No. 6.

Well No. 2 and Well No. 6 – Capacity 1,115 gpm and 1,200 gpm
Additional potential threats: Flood
Water from this facility is critical for maintaining domestic use and fire protection. If no water is available from one of these two wells (if one well is out of service), changes to the normal operation of the water system will be required. The 16 inch PRV at Howard Road Treatment Facility may need to be opened moderately to maintain sufficient water supply in Reservoir 2. More reliance will need to be placed on the operation of Well No. 1 and No. 4, as well as Coal Creek Springs. The B Street Tacoma intertie may need to be opened as well.

However, because these two wells are so close to each other, and because they share power and telemetry, loss of both wells should be considered. If no water is available from either well, a greater reliance will be placed on all sources, especially Well No. 1 and No. 4, as well as Coal Creek Springs. The B Street Tacoma intertie may need to be opened as well. The 16 inch PRV at Howard Road Treatment Facility will have to be opened to maintain sufficient water supply in Reservoir 2.

Well No. 5 – Capacity 760 gpm
Water from Well No. 5 is not critical for maintaining domestic use and fire protection. If no water is available from Well No. 5, water will continue to be supplied by Well No. 5A. Water will also continue to be supplied by Terrace View Booster Pump Station (PS). Water may have to be procured from Bonney Lake Water Utility to meet demand via the emergency intertie. As a last option, water may be supplied by means of the portable pump.

Well No. 5A – Capacity 180 gpm
If no water is available from Well No. 5A, water will be supplied by Well No. 5 and Terrace View Booster PS. During peak demand summer months, it may be necessary to procure water from Bonney Lake Water Utility through the emergency intertie to supplement water from Well No. 5. Perhaps not critical to normal operation, getting this facility back online is of high priority.

West Hill Springs – Capacity 600 gpm
Additional potential threats: Landslide
Water from West Hill Springs is not critical for maintaining domestic use and fire protection. If no water is available from West Hill Springs, no modifications to the operation of the water system will be needed. Water will continue to be supplied from other sources.

Well No. 3A and Well No. 3B - Capacity 0 gpm
Additional potential threats: Flood
Wells No. 3A and No. 3B are not in service due to high manganese and iron levels and have no impact on water supply. However, it should be noted that both wells are operational and can be utilized, if necessary, during emergency scenarios. Wells No. 3A and No. 3B each have a capacity of 1,650 gpm (3,300 gpm total). These wells do not have chlorine or operational chlorine equipment on site, and complaints regarding color and staining may be received should the wells be put into operation.

Well No. 5B – Capacity 0 gpm
Well No. 5B is not in service and has no impact on water supply.

Well No. 7 – Capacity 0 gpm
Additional potential threats: Flood
Well No. 7 is not in service and has no impact on water supply.

Ground Water Contamination
Susceptibility Assessment Survey Form
Version 2.1

IMPORTANT! Please complete one form for each ground water source (well, wellfield, spring) used in your water system. Photocopy as necessary.

PART I: System Information

Well owner/manager : CITY OF AUBURN

Water system name : AUBURN WATER DIVISION

County: KING

Water system number: 03350V Source number: S01

Well depth: _____ (ft.) (*From WFI form*)

Source name: SPRING #1 COAL CREEK

WA well identification tag number: ___ ___ ___-___ ___ ___

X well not tagged

Number of connections: 13,000 Population served: 40,000

Township: 21N Range: 05E

Section: 28 1/4 1/4 Section: SE/SW

Latitude/longitude (if available): N 47 16' 19.95 / W 127 10' 22.55

How was lat./long. determined?

_____ global positioning device X survey _____ topographic map
____other: _____

* Please refer to Assistance Packet for details and explanations of all questions in Parts II through V.

PART II: Well Construction and Source Information

1) Date well originally constructed: ___ / ___ / 1925 month/day/year

last reconstruction: ___ / ___ / 1965 month/day/year

_____ information unavailable

2) Well driller: SPRING

___ well driller unknown

3) Type of well:

___Drilled: ___ rotary ___ bored ___ cable (percussion) __ Dug

___ Other: X spring(s) ___ lateral collector (Ranney)

___ driven ___ jetted ___ other: _____

Additional comments: CONSTRUCTED UNDERGROUND COLLECTION SYSTEM IN CONTROLED WATERSHED AREA.

4) Well report available? ___ YES (attach copy to form) ___ NO

If no well log is available, please attach any other records documenting well construction; e.g. boring logs, "as built" sheets, engineering reports, well reconstruction logs.

5) Average pumping rate: 4,500 (gallons/min)

Source of information: WF1/LOGS/ MONTHLY REPORTS

If not documented, how was pumping rate determined? _____

__ Pumping rate unknown

6) Is this source treated? YES

If so, what type of treatment:

X disinfection ___ filtration ___ carbon filter ___ air stripper ___ other

Purpose of treatment (describe materials to be removed or controlled by treatment):

BACTERIAL

7) If source is chlorinated, is a chlorine residual maintained: X YES ___ NO

Residual level: 0.8 MG/L (*At the point closest to the source.*)

PART III: Hydrogeologic Information

1) Depth to top of open interval: [check one]

X < 20 ft ___ 20-50 ft ___ 50-100 ft ___ 100-200 ft ___ >200 ft

___ information unavailable (*'<' means less than; '>' means greater than*)

2) Depth to ground water (static water level):

X < 20 ft ___ 20-50 ft ___ 50-100 ft ___ >100 ft

___ flowing well/spring (artesian)

How was water level determined?

___ well log X other: DIRECT MEASUREMENT ON UNDERGROUND COLLECTION SYSTEM

___ depth to ground water unknown

3) If source is a flowing well or spring, what is the confining pressure:

12 psi (pounds per square inch)
or
_____ feet above wellhead

4) If source is a flowing well or spring, is there a surface impoundment, reservoir, or catchment associated with this source: X YES ___ NO UNDERGROUND CATCHMENT NETWORK OF PIPING

5) Wellhead elevation (height above mean sea level): 100 (ft)

How was elevation determined? X topographic map ___ Drilling/Well Log ___ altimeter

___ other: _____

___ information unavailable

6) Confining layers: (This can be completed only for those sources with a drilling log, well log or geologic report describing subsurface conditions. Please refer to assistance package for example.) NA

___ evidence of a confining layer in well log

___ no evidence of a confining layer in well log

If there is evidence of a confining layer, is the depth to ground water more than 20 feet above the top of the open interval? ___ YES ___ NO

___ information unavailable

7) Sanitary setback:

___ < 100 ft* ___ 100–120 ft ___ 120–200 ft X > 200 ft
* if less than 100 ft describe the site conditions:

8) Wellhead construction:

___ wellhead enclosed in a wellhouse

X controlled access (describe): FENCED; CONTROLLED ACCESS FULL SECTION OF LAND WITH MULTIPLY LOCKED ACCESS GATES AND UNDERGROUND INTAKE OF SPRING.

___ other uses for wellhouse (describe): _____

___ no wellhead control

9) Surface seal: NA

___ 18 ft

___ < 18 ft (no Department of Ecology approval) ('< ' *means less than*)

___ < 18 ft (Approved by Ecology, include documentation) ('< ' *means less than*)

___ > 18 ft ('> ' *means greater than*)

___ depth of seal unknown

___ no surface seal

10) Annual rainfall (inches per year):

___ < 10 in/yr ___ 10–25 in/yr X > 25 in/yr

PART IV: Mapping Your Ground Water Resource

1) Annual volume of water pumped: 75,140,000 (gallons) 1993

How was this determined?

X meter

___ estimated: ___ pumping rate (_____)

___ pump capacity (_____)

___ other: _____

2) "Calculated Fixed Radius" estimate of ground water movement:
(see Instruction Packet)

6 month ground water travel time : SEE ATTACHED (ft)

1 year ground water travel time : CRITICAL WELL DEVELOPMENT AREA MAP (ft)

5 year ground water travel time: _____(ft)

10 year ground water travel time: _____(ft)

Information available on length of screened/open interval?

__ YES __ NO

Length of screened/open interval: _____(ft)

3) Is there a river, lake, pond, stream, or other obvious surface water body within the 6 month time of travel boundary? ___ YES X NO (mark and identify on map).

4) Is there a stormwater and/or wastewater facility, treatment lagoon, or holding pond located within the 6 month time of travel boundary? ___ YES ___ NO (mark and identify on map).

Comments: _____

_____

_____

_____

_____

PART V: Assessment of Water Quality

1) Regional sources of risk to ground water:

Please indicate if any of the following are present within a circular area around your water source having a radius up to and including the five year ground water travel time:

	6 month	1 year	5 year	unknown
likely pesticide application				
stormwater injection wells				
other injection wells				
abandoned ground water well				
landfills, dumps, disposal areas				
known hazardous materials clean-up site				
water system(s) with known quality problems				
population density > 1 house/acre		X	X	
residences commonly have septic tanks			X	
Wastewater treatment lagoons				
sites used for land application of waste				

Mark and identify on map any of the risks listed above which are located within the 6 month time of travel boundary? (*Please include a map of the wellhead and time of travel areas with this form. Please locate and mark any of the following.*)

If other recorded or potential sources of ground water contamination exist within the ten year time of travel circular zone around your water supply, please describe:

NONE

2) Source specific water quality records:

Please indicate the occurrence of any test results since 1986 that meet the following conditions: (Unless listed on assessment, MCLs are listed in assistance package.)

A. Nitrate: (Nitrate MCL = 10 mg/l)	YES	NO
Results greater than MCL	___	x
< 2 mg/liter nitrate	x	___
2-5 mg/liter nitrate	___	x
> 5 mg/liter nitrate	___	x

___ Nitrate sampling records unavailable

B. VOCs: (VOC detection level 0.5 ug/l or 0.0005 mg/l.)	YES	NO
Results greater than MCL or SAL	___	x
VOCs detected at least once	___	x
VOCs never detected	x	___

___ VOC sampling records unavailable

C. EDB/DBCP:	YES	NO
(EDB MCL = 0.05 ug/l or 0.00005 mg/l. DBCP MCL = 0.2 ug/l or 0.0002 mg/l.)		
EDB/DBCP detected below MCL at least once	___	___
EDB/DBCP detected above MCL at least once	___	___
EDB/DBCP never detected	___	___

___ EDB/DBCP tests required but not yet completed

x EDB/DBCP tests not required

D. Other SOCs (Pesticides):	YES	NO
Other SOCs detected	___	___
(pesticides and other synthetic organic chemicals)		

___ Other SOC tests performed but none detected
(list test methods in comments

x Other SOC tests not performed

If any SOCs in addition to EDB/DBCP were detected, please identify and date. If other SOC tests were performed, but no SOCs detected, list test methods here: _____

_____

_____

_____

E. Bacterial contamination:

	YES	NO
Any bacterial detection(s) in the past 3 years in samples taken from the source (not distribution sampling records).	____	x
Has source (in past 3 years) had a bacteriological contamination problem found in distribution samples that was attributed to the source.	____	x

___ Source sampling records for bacteria unavailable

Part VI: Geographic or Hydrologic Factors Contributing to a Non-Circular Zone of Contribution

The following questions will help identify those ground water systems which may not be accurately represented by the calculated fixed radius (CFR) method described in Part IV. For these sources, the CFR areas should be used as a preliminary delineation of the critical time of travel zones for that source. As a system develops its Wellhead Protection Plan for theses sources, a more detailed delineation method should be considered.

1) Is there evidence of obvious hydrologic boundaries within the 10 year time of travel zone of the CFR? (Does the largest circle extend over a stream, river, lake, up a steep hillside, and/or over a mountain or ridge?)

x YES ___ NO

Describe with references to map produced in Part IV:

_____

_____

2) Aquifer Material:

A) Does the drilling log, well log or other geologic/engineering reports identify that the well is located in an area where the underground conditions are identified as fractured rock and/or basalt terrain?

___ YES x NO

B) Does the drilling log, well log or other geologic/engineering reports indicate that the well is located in an area where the underground conditions are primarily identified as coarse sand and gravel?

x YES ___ NO

3) Is the source located in an aquifer with a high horizontal flow rate? (These can include sources located on flood plains of large rivers, artesian wells with high water pressure, and/or shallow flowing wells and springs.)

X YES ___ NO

4) Are there other high capacity wells (agricultural, municipal and/or industrial) located within the CFRs?

a) Presence of ground water extraction wells removing more than approximately 500 gal/min within...

	YES	NO	unknown
< 6 month travel time	___	X	___
6 month–1 year travel time	___	X	___
1–5 year travel time	___	X	___
5–10 year travel time	___	___	X

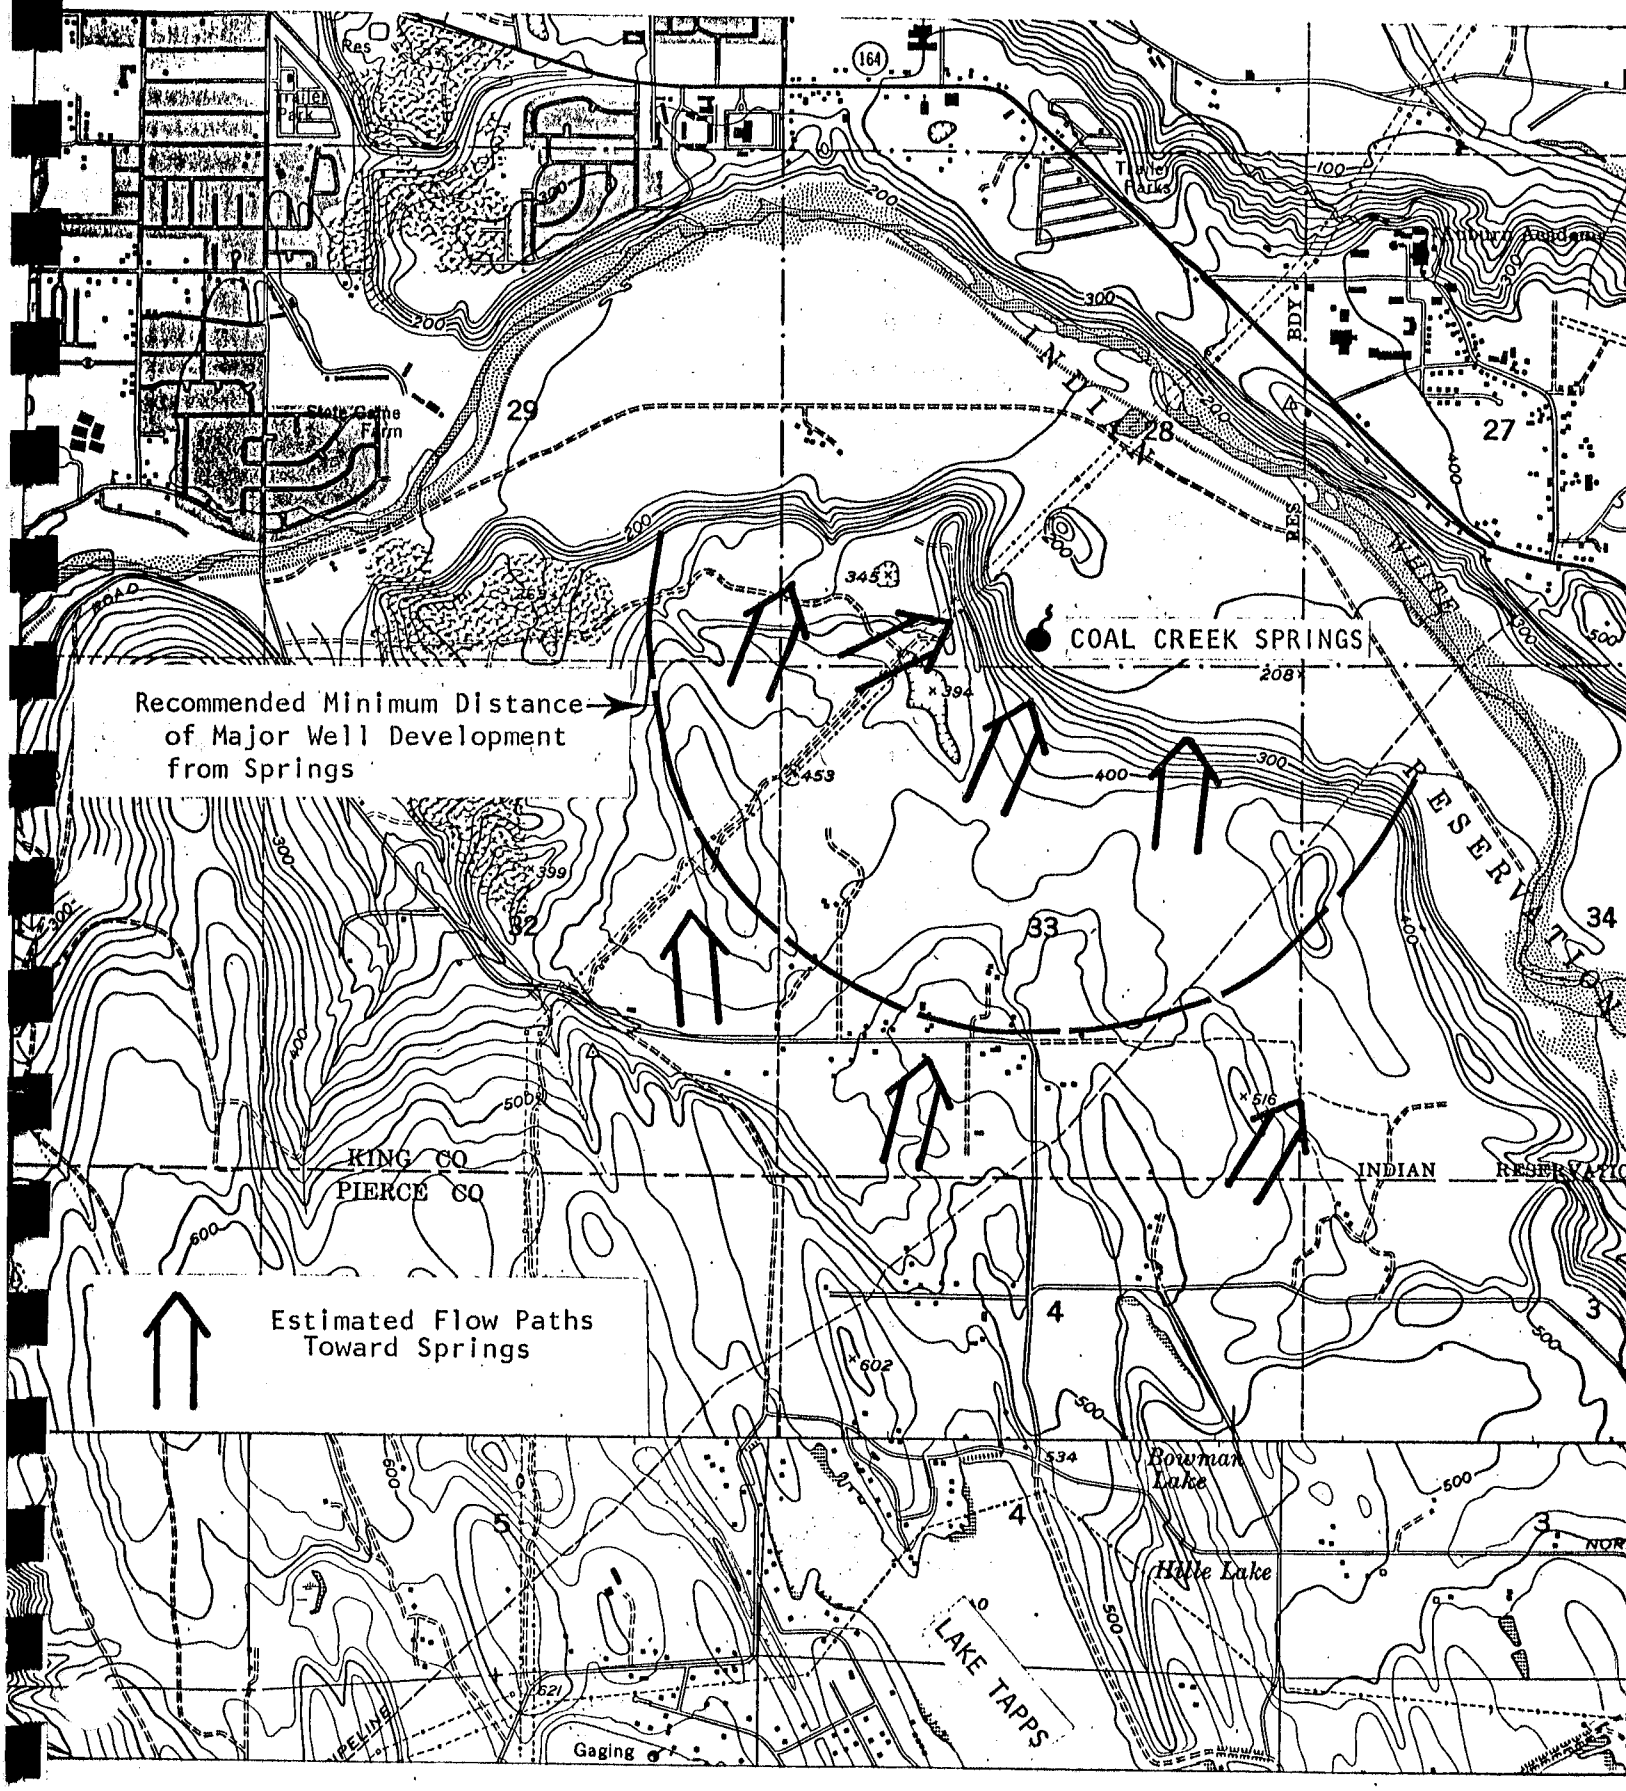
b) Presence of ground water recharge wells (dry wells) or heavy irrigation within...

	YES	NO	unknown
< 1 year travel time	___	X	___
1–5 year travel time	___	X	___
5–10 year travel time	___	X	___

Please identify or describe additional hydrologic or geographic conditions that you believe may affect the shape of the zone of contribution for this source. Where possible, reference them to locations on the map produced in Part IV.

WATER APPEARS TO BE FLOWING FROM THE UPLANDS AREA TO THE SOUTH AND EAST OF THE SPRING SITE. HYDROLOGIC STUDIES BY HART CROUSER IN 1980 SUGGEST THAT THE SPRINGS MAY ORIGINATE IN THE MT. RAINIER OR ENUMCLAW AREA.

Suggestions and Comments



Did you attend one of the susceptibility workshops? ___ YES X NO

Did you find it useful? ___ YES ___ NO

Did you seek outside assistance to complete the assessment? ___ YES X NO

This form and instruction packet are still in the process of development. Your comments, suggestions and questions will help us upgrade and improve this assessment form. If you found particular sections confusing or problematic please let us know. How could this susceptibility assessment be improved or made clearer? Did the instruction package help you find the information needed to complete the assessment? How much time did it take you to complete the form? Were you able to complete the assessment without additional/outside expertise? Do you feel the assessment was valuable as a learning experience? Any other comments or constructive criticisms you have would be appreciated.

___ wellhead enclosed in a wellhouse

_X_ controlled access (describe): FENCED LOCKED ACCESS GATES

_____

___ other uses for wellhouse (describe): _____

_____

___ no wellhead control

9) Surface seal: NA

___ 18 ft

___ < 18 ft (no Department of Ecology approval) ('< ' *means less than*)

___ < 18 ft (Approved by Ecology, include documentation) ('< ' *means less than*)

___ > 18 ft ('> ' *means greater than*)

___ depth of seal unknown

___ no surface seal

10) Annual rainfall (inches per year):

___ < 10 in/yr ___ 10–25 in/yr _X_ > 25 in/yr

PART IV: Mapping Your Ground Water Resource

1) Annual volume of water pumped: 1,052,019,000 (gallons) 1993

How was this determined?

X meter

___ estimated: ___ pumping rate (_____)

___ pump capacity (_____)

___ other: _____

2) "Calculated Fixed Radius" estimate of ground water movement:
(see Instruction Packet)

6 month ground water travel time : _____(ft)

1 year ground water travel time : _____(ft)

5 year ground water travel time: _____(ft)

10 year ground water travel time: _____(ft)

Information available on length of screened/open interval?

__ YES __ NO

Length of screened/open interval: _____(ft)

3) Is there a river, lake, pond, stream, or other obvious surface water body within the 6 month time of travel boundary? ___ YES X NO (mark and identify on map).

4) Is there a stormwater and/or wastewater facility, treatment lagoon, or holding pond located within the 6 month time of travel boundary? ___ YES X NO (mark and identify on map).

Comments: _____

_____

_____

_____

_____

PART V: Assessment of Water Quality

1) Regional sources of risk to ground water:

Please indicate if any of the following are present within a circular area around your water source having a radius up to and including the five year ground water travel time:

	6 month	1 year	5 year	unknown
likely pesticide application		X		
stormwater injection wells				
other injection wells				X
abandoned ground water well				X
landfills, dumps, disposal areas				X
known hazardous materials clean-up site				
water system(s) with known quality problems				
population density > 1 house/acre		X	X	
residences commonly have septic tanks				
Wastewater treatment lagoons				
sites used for land application of waste				

Mark and identify on map any of the risks listed above which are located within the 6 month time of travel boundary? (*Please include a map of the wellhead and time of travel areas with this form. Please locate and mark any of the following.*)

If other recorded or potential sources of ground water contamination exist within the ten year time of travel circular zone around your water supply, please describe:

NONE KNOWN OF

2) Source specific water quality records:

Please indicate the occurrence of any test results since 1986 that meet the following conditions: (Unless listed on assessment, MCLs are listed in assistance package.)

A. Nitrate: (Nitrate MCL = 10 mg/l)	YES	NO
Results greater than MCL	___	x
< 2 mg/liter nitrate	___	x
2-5 mg/liter nitrate	x	___
> 5 mg/liter nitrate	___	x
___ Nitrate sampling records unavailable		

B. VOCs: (VOC detection level 0.5 ug/l or 0.0005 mg/l.)	YES	NO
Results greater than MCL or SAL	___	x
VOCs detected at least once	___	x
VOCs never detected	x	___
___ VOC sampling records unavailable		

C. EDB/DBCP:	YES	NO
(EDB MCL = 0.05 ug/l or 0.00005 mg/l. DBCP MCL = 0.2 ug/l or 0.0002 mg/l.)		
EDB/DBCP detected below MCL at least once	___	___
EDB/DBCP detected above MCL at least once	___	___
EDB/DBCP never detected	___	___
___ EDB/DBCP tests required but not yet completed		
x EDB/DBCP tests not required		

D. Other SOCs (Pesticides):	YES	NO
Other SOCs detected	___	___
(pesticides and other synthetic organic chemicals)		
___ Other SOC tests performed but none detected		
(list test methods in comments		
x Other SOC tests not performed		

If any SOCs in addition to EDB/DBCP were detected, please identify and date. If other SOC tests were performed, but no SOCs detected, list test methods here: _____

_____

_____

_____

E. Bacterial contamination:

	YES	NO
Any bacterial detection(s) in the past 3 years in samples taken from the source (not distribution sampling records).	X	
Has source (in past 3 years) had a bacteriological contamination problem found in distribution samples that was attributed to the source.		X

___ Source sampling records for bacteria unavailable

Part VI: Geographic or Hydrologic Factors Contributing to a Non-Circular Zone of Contribution

The following questions will help identify those ground water systems which may not be accurately represented by the calculated fixed radius (CFR) method described in Part IV. For these sources, the CFR areas should be used as a preliminary delineation of the critical time of travel zones for that source. As a system develops its Wellhead Protection Plan for theses sources, a more detailed delineation method should be considered.

1) Is there evidence of obvious hydrologic boundaries within the 10 year time of travel zone of the CFR? (Does the largest circle extend over a stream, river, lake, up a steep hillside, and/or over a mountain or ridge?)

X YES ___ NO

Describe with references to map produced in Part IV:

SPRING ORIGINATES FROM SIDE OF HILL ON WEST SIDE OF AUBURN

APP. 200 ft. HIGHER THAN VALLEY ZONE IT IS FLOWING INTO.

2) Aquifer Material:

A) Does the drilling log, well log or other geologic/engineering reports identify that the well is located in an area where the underground conditions are identified as fractured rock and/or basalt terrain?

___ YES X NO

B) Does the drilling log, well log or other geologic/engineering reports indicate that the well is located in an area where the underground conditions are primarily identified as coarse sand and gravel?

X YES ___ NO

3) Is the source located in an aquifer with a high horizontal flow rate? (These can include sources located on flood plains of large rivers, artesian wells with high water pressure, and/or shallow flowing wells and springs.)

___ YES ___ NO

4) Are there other high capacity wells (agricultural, municipal and/or industrial) located within the CFRs?

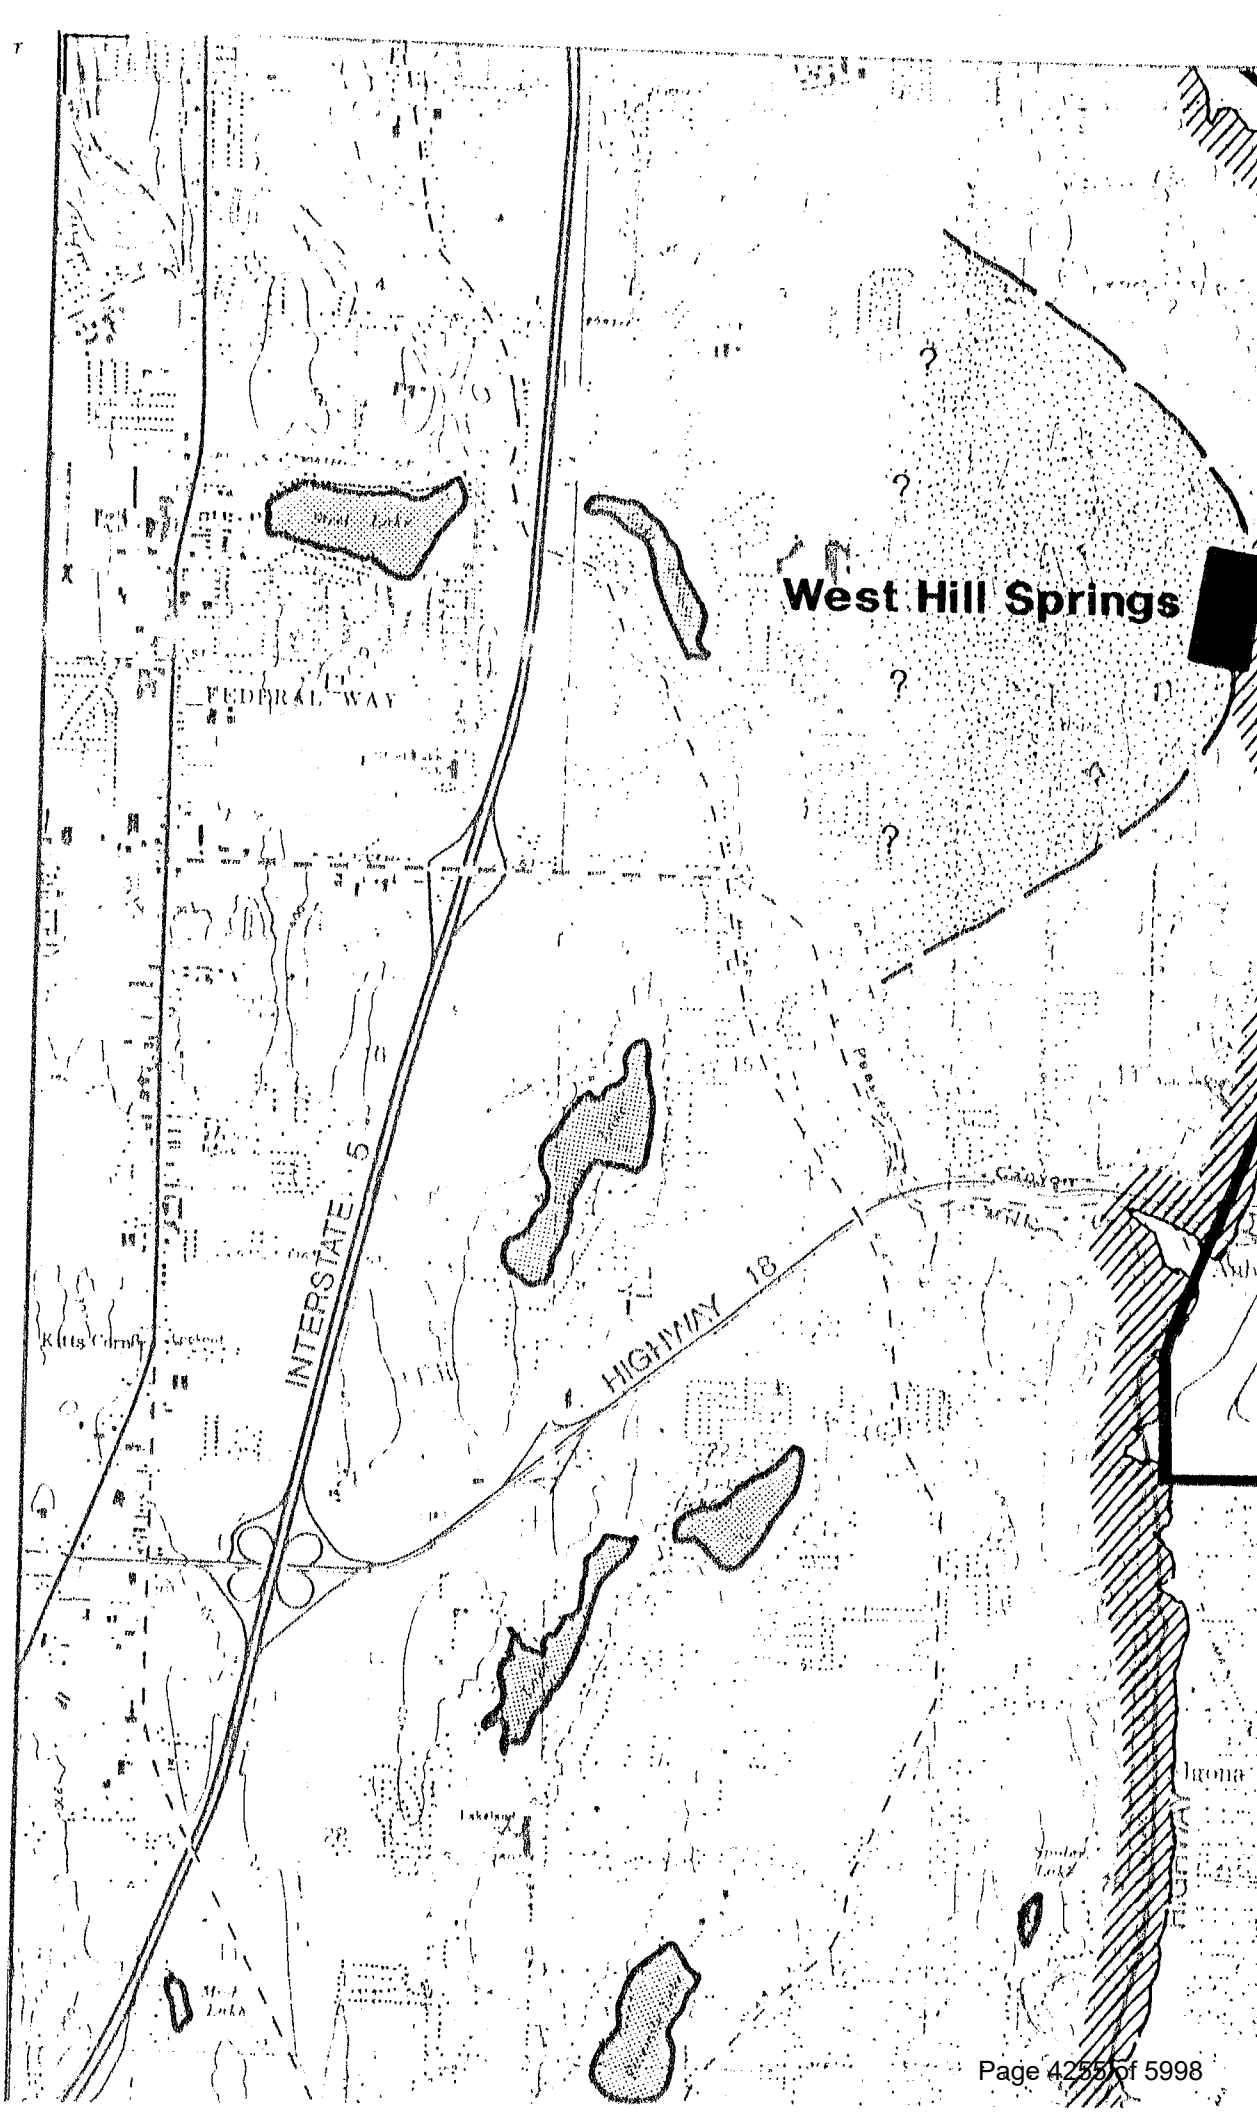
a) Presence of ground water extraction wells removing more than approximately 500 gal/min within...

	YES	NO	unknown
< 6 month travel time	___	X	___
6 month–1 year travel time	___	X	___
1–5 year travel time	___	___	X
5–10 year travel time	___	___	X

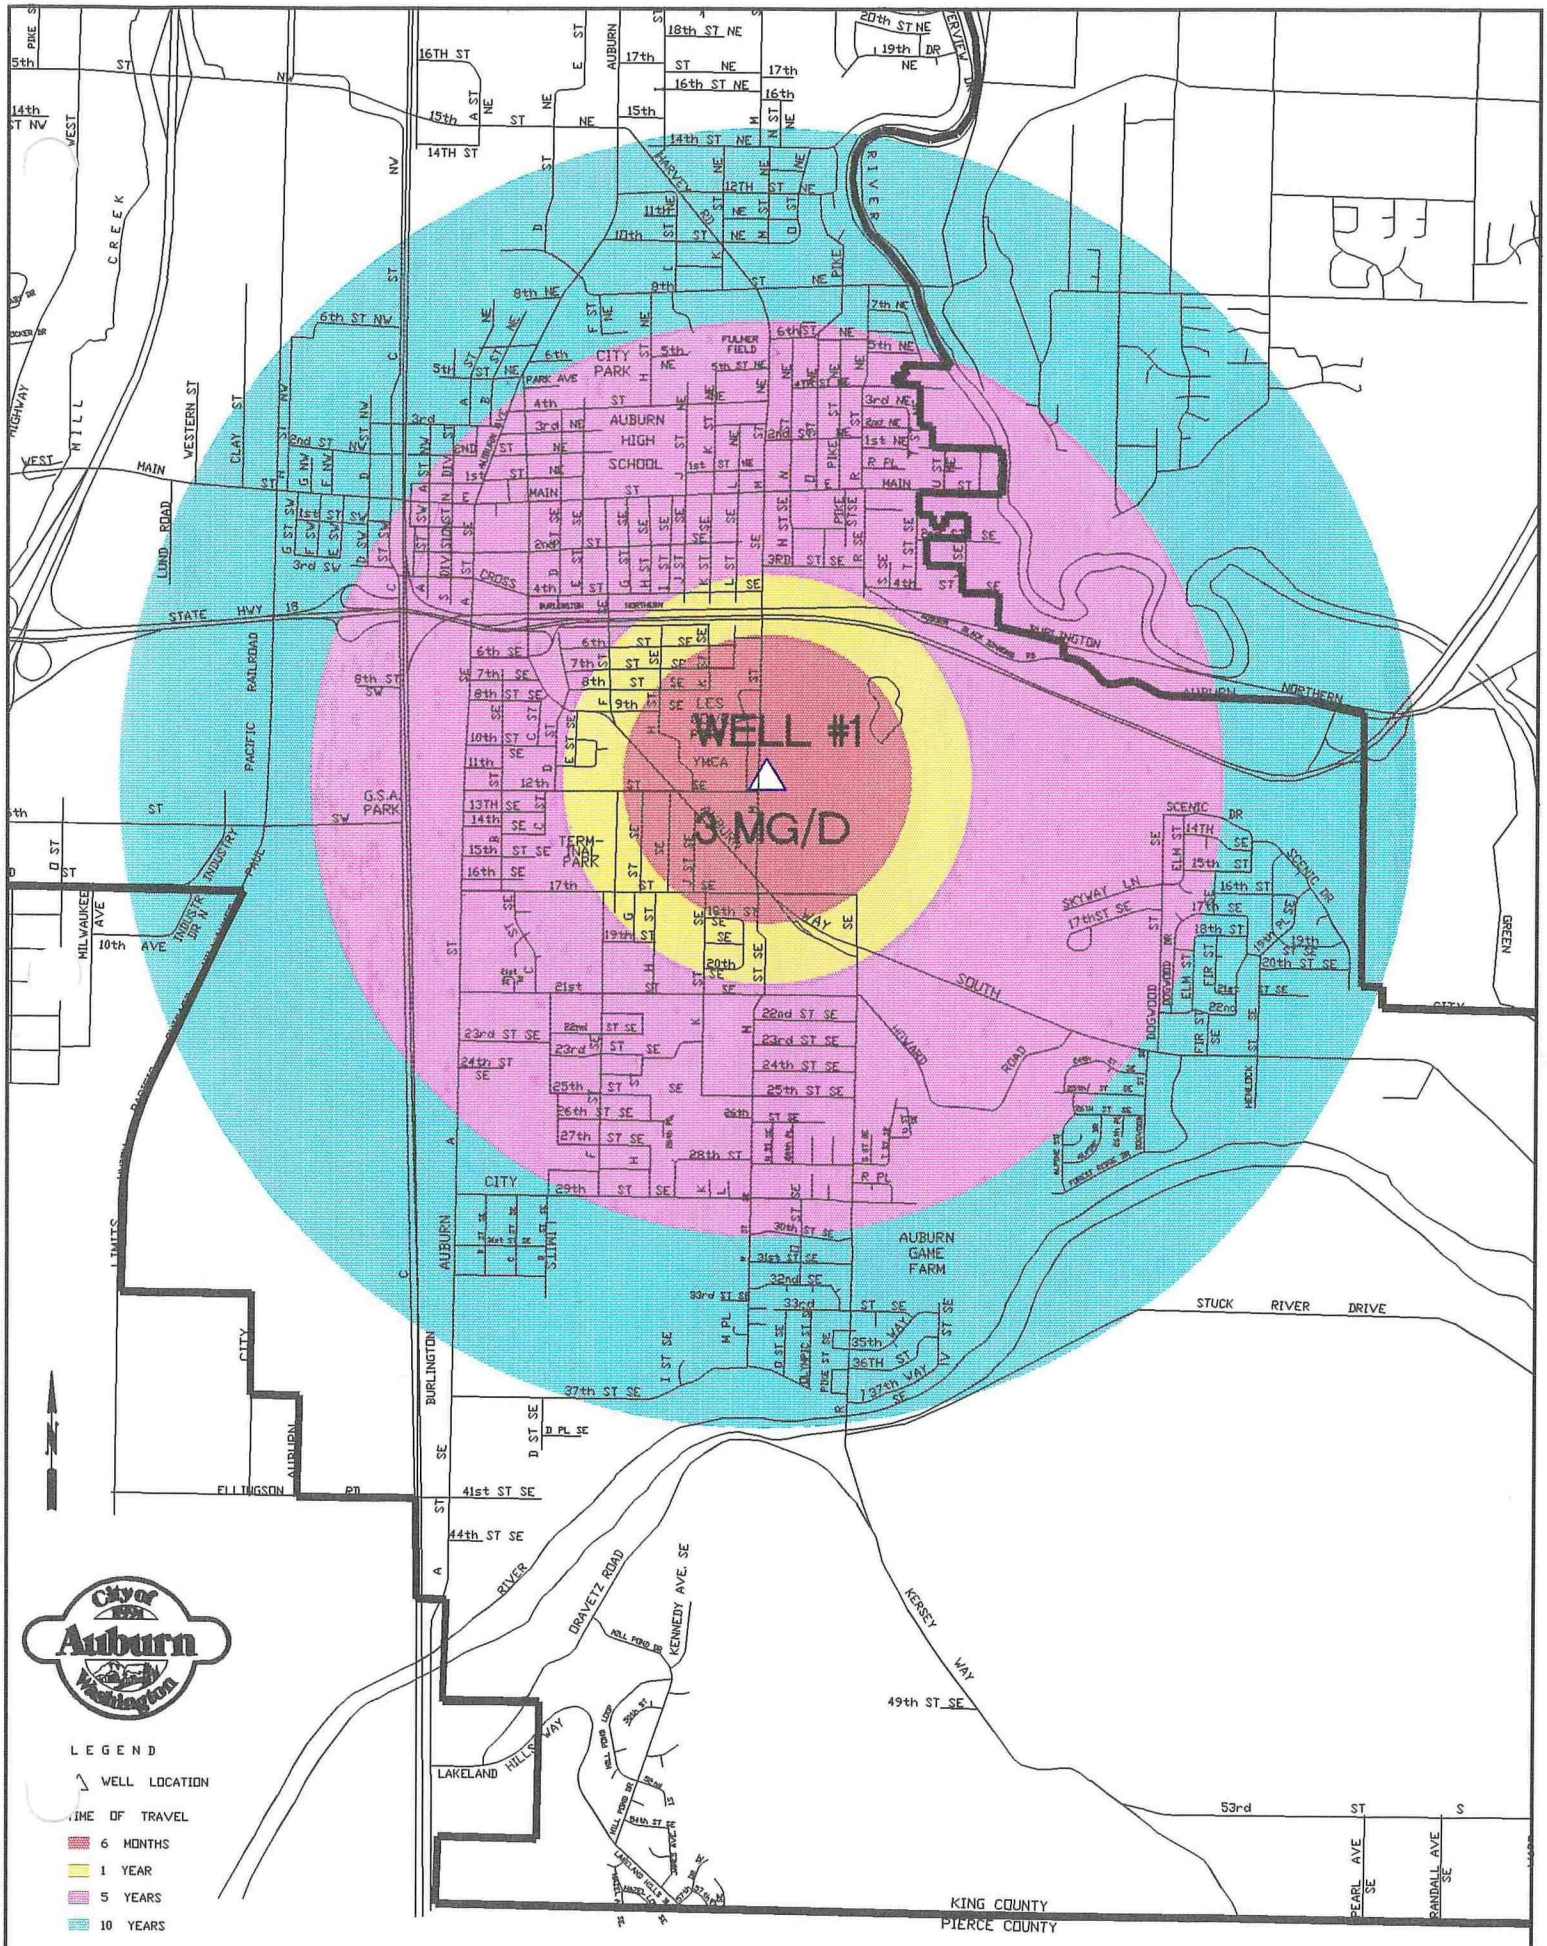
b) Presence of ground water recharge wells (dry wells) or heavy irrigation within...

	YES	NO	unknown
< 1 year travel time	___	X	___
1–5 year travel time	___	X	___
5–10 year travel time	___	X	___

Please identify or describe additional hydrologic or geographic conditions that you believe may affect the shape of the zone of contribution for this source. Where possible, reference them to locations on the map produced in Part IV.



Suggestions and Comments



Did you attend one of the susceptibility workshops? ___ YES X NO

Did you find it useful? ___ YES ___ NO

Did you seek outside assistance to complete the assessment? ___ YES X NO

This form and instruction packet are still in the process of development. Your comments, suggestions and questions will help us upgrade and improve this assessment form. If you found particular sections confusing or problematic please let us know. How could this susceptibility assessment be improved or made clearer? Did the instruction package help you find the information needed to complete the assessment? How much time did it take you to complete the form? Were you able to complete the assessment without additional/outside expertise? Do you feel the assessment was valuable as a learning experience? Any other comments or constructive criticisms you have would be appreciated.

Ground Water Contamination Susceptibility Assessment Survey Form

Version 2.1

IMPORTANT! Please complete one form for each ground water source (well, wellfield, spring) used in your water system. Photocopy as necessary.

PART I: System Information

Well owner/manager : CITY OF AUBURN

Water system name : AUBURN WATER DIVISION

County: KING

Water system number: 03350V Source number: S03

Well depth: 134 (ft.) (*From WFI form*)

Source name: WELL # 1

WA well identification tag number: ___ ___ ___-___ ___ ___

X well not tagged

Number of connections: 13,000 Population served: 40,000

Township: 21N Range: 05E

Section: 19 1/4 1/4 Section: NE/NE

Latitude/longitude (if available): N 47 17' 52.72 / W 122 12' 42.16"

How was lat./long. determined?

___ global positioning device X survey ___ topographic map
___ other: ___

* Please refer to Assistance Packet for details and explanations of all questions in Parts II through V.

PART II: Well Construction and Source Information

1) Date well originally constructed: ___ / ___ / 1925 month/day/year

last reconstruction: ___ / ___ / 1965 month/day/year

___ information unavailable

2) Well driller: _____

_____

_____

__X__ well driller unknown

3) Type of well:

__X__ Drilled: ___ rotary ___ bored ___ cable (percussion) ___ Dug

___ Other: ___ spring(s) ___ lateral collector (Ranney)

___ driven ___ jetted ___ other: _____

Additional comments: _____

_____

4) Well report available? __X__ YES (attach copy to form) ___ NO

If no well log is available, please attach any other records documenting well construction; e.g. boring logs, "as built" sheets, engineering reports, well reconstruction logs.

5) Average pumping rate: 2100 (gallons/min)

Source of information: WF1/DAILY RECORDS/ DATA ACQUISATION SYSTEM

If not documented, how was pumping rate determined? _____

_____

___ Pumping rate unknown

6) Is this source treated? NO

If so, what type of treatment:

___ disinfection ___ filtration ___ carbon filter ___ air stripper ___ other

Purpose of treatment (describe materials to be removed or controlled by treatment):

_____

_____

7) If source is chlorinated, is a chlorine residual maintained: ___ YES ___ NO

Residual level: _____ (*At the point closest to the source.*)

PART III: Hydrogeologic Information

) Depth to top of open interval: [check one]

___ < 20 ft ___ 20-50 ft ___ 50-100 ft X 100-200 ft ___ >200 ft

___ information unavailable (*'<' means less than; '>' means greater than*)

2) Depth to ground water (static water level):

___ < 20 ft X 20-50 ft ___ 50-100 ft ___ >100 ft

___ flowing well/spring (artesian)

How was water level determined?

X well log X other: LEVEL SOUNDING ON ROUTINE BASIS

___ depth to ground water unknown

3) If source is a flowing well or spring, what is the confining pressure:

_____ psi (pounds per square inch)
or
_____ feet above wellhead

4) If source is a flowing well or spring, is there a surface impoundment, reservoir, or catchment associated with this source: ___ YES ___ NO NA

5) Wellhead elevation (height above mean sea level): 70 (ft)

How was elevation determined? ___ topographic map X Drilling/Well Log ___ altimeter

___ other: _____

___ information unavailable

6) Confining layers: (This can be completed only for those sources with a drilling log, well log or geologic report describing subsurface conditions. Please refer to assistance package for example.)

X evidence of a confining layer in well log

___ no evidence of a confining layer in well log

If there is evidence of a confining layer, is the depth to ground water more than 20 feet above the top of the open interval? X YES ___ NO

___ information unavailable

7) Sanitary setback:

___ < 100 ft* _X_ 100-120 ft ___ 120-200 ft ___ > 200 ft
* if less than 100 ft describe the site conditions:

_____

_____

_____

_____

8) Wellhead construction:

_X_ wellhead enclosed in a wellhouse

_X_ controlled access (describe): FENCED

_____

___ other uses for wellhouse (describe): NONE

_____

___ no wellhead control

9) Surface seal:

___ 18 ft

___ < 18 ft (no Department of Ecology approval) ('< ' *means less than*)

___ < 18 ft (Approved by Ecology, include documentation) ('< ' *means less than*)

_X_ > 18 ft ('> ' *means greater than*)

___ depth of seal unknown

___ no surface seal

10) Annual rainfall (inches per year):

___ < 10 in/yr ___ 10-25 in/yr _X_ > 25 in/yr

PART IV: Mapping Your Ground Water Resource

1) Annual volume of water pumped: 663,989,000 (gallons)

How was this determined?

X meter

___ estimated: ___ pumping rate (_____)

___ pump capacity (_____)

___ other: _____

2) "Calculated Fixed Radius" estimate of ground water movement:
(see Instruction Packet)

6 month ground water travel time : 1887 (ft)

1 year ground water travel time : 2668 (ft)

5 year ground water travel time: 5967 (ft)

10 year ground water travel time: 8438 (ft)

Information available on length of screened/open interval?

X YES ___ NO

Length of screened/open interval: 30 (ft)

3) Is there a river, lake, pond, stream, or other obvious surface water body within the 6 month time of travel boundary? X YES ___ NO (mark and identify on map).

4) Is there a stormwater and/or wastewater facility, treatment lagoon, or holding pond located within the 6 month time of travel boundary? ___ YES X NO (mark and identify on map).

Comments: _____

PART V: Assessment of Water Quality

1) Regional sources of risk to ground water:

Please indicate if any of the following are present within a circular area around your water source having a radius up to and including the five year ground water travel time:

	6 month	1 year	5 year	unknown
likely pesticide application RESIDENTIAL	X	X	X	
stormwater injection wells				
other injection wells				
abandoned ground water well			X	
landfills, dumps, disposal areas				
known hazardous materials clean-up site				
water system(s) with known quality problems				
population density > 1 house/acre	X	X	X	
residences commonly have septic tanks				
Wastewater treatment lagoons				
sites used for land application of waste				

Mark and identify on map any of the risks listed above which are located within the 6 month time of travel boundary? (*Please include a map of the wellhead and time of travel areas with this form. Please locate and mark any of the following.*)

If other recorded or potential sources of ground water contamination exist within the ten year time of travel circular zone around your water supply, please describe:

DRYCLEANERS

SERVICE STATIONS - LOW POTENTIAL FOR CONTAMINATION

AUTO REPAIRS

2) Source specific water quality records:

Please indicate the occurrence of any test results since 1986 that meet the following conditions: (Unless listed on assessment, MCLs are listed in assistance package.)

A. Nitrate: (Nitrate MCL = 10 mg/l)

Results greater than MCL	YES	NO
< 2 mg/liter nitrate	___	X
2-5 mg/liter nitrate	X	___
> 5 mg/liter nitrate	___	X
___ Nitrate sampling records unavailable	___	X

B. VOCs: (VOC detection level 0.5 ug/l or 0.0005 mg/l.)

Results greater than MCL or SAL	YES	NO
VOCs detected at least once	___	X
VOCs never detected	___	X
___ VOC sampling records unavailable	X	___

C. EDB/DBCP:

(EDB MCL = 0.05 ug/l or 0.00005 mg/l. DBCP MCL = 0.2 ug/l or 0.0002 mg/l.)	YES	NO
EDB/DBCP detected below MCL at least once	___	___
EDB/DBCP detected above MCL at least once	___	___
EDB/DBCP never detected	___	___

___ EDB/DBCP tests required but not yet completed

X EDB/DBCP tests not required

D. Other SOCs (Pesticides):

Other SOCs detected (pesticides and other synthetic organic chemicals)	YES	NO
	___	X

___ Other SOC tests performed but none detected
(list test methods in comments

X Other SOC tests not performed

If any SOCs in addition to EDB/DBCP were detected, please identify and date. If other SOC tests were performed, but no SOCs detected, list test methods here: _____

E. Bacterial contamination:

	YES	NO
Any bacterial detection(s) in the past 3 years in samples taken from the source (not distribution sampling records).	___	X
Has source (in past 3 years) had a bacteriological contamination problem found in distribution samples that was attributed to the source.	___	X

___ Source sampling records for bacteria unavailable

Part VI: Geographic or Hydrologic Factors Contributing to a Non-Circular Zone of Contribution

The following questions will help identify those ground water systems which may not be accurately represented by the calculated fixed radius (CFR) method described in Part IV. For these sources, the CFR areas should be used as a preliminary delineation of the critical time of travel zones for that source. As a system develops its Wellhead Protection Plan for theses sources, a more detailed delineation method should be considered.

1) Is there evidence of obvious hydrologic boundaries within the 10 year time of travel zone of the CFR? (Does the largest circle extend over a stream, river, lake, up a steep hillside, and/or over a mountain or ridge?)

X YES ___ NO

Describe with references to map produced in Part IV:

HIGHER ELEVATION TO WEST & EAST OF VALLEY - FLOW SOUTH TO NORTH IN VALLEY.

2) Aquifer Material:

A) Does the drilling log, well log or other geologic/engineering reports identify that the well is located in an area where the underground conditions are identified as fractured rock and/or basalt terrain?

___ YES X NO

B) Does the drilling log, well log or other geologic/engineering reports indicate that the well is located in an area where the underground conditions are primarily identified as coarse sand and gravel?

X YES ___ NO

3) Is the source located in an aquifer with a high horizontal flow rate? (These can include sources located on flood plains of large rivers, artesian wells with high water pressure, and/or shallow flowing wells and springs.)

___ YES X NO

4) Are there other high capacity wells (agricultural, municipal and/or industrial) located within the CFRs?

a) Presence of ground water extraction wells removing more than approximately 500 gal/min within...

	YES	NO	unknown
< 6 month travel time	___	X	___
6 month–1 year travel time	___	X	___
1–5 year travel time	X	___	___
5–10 year travel time	X	___	___

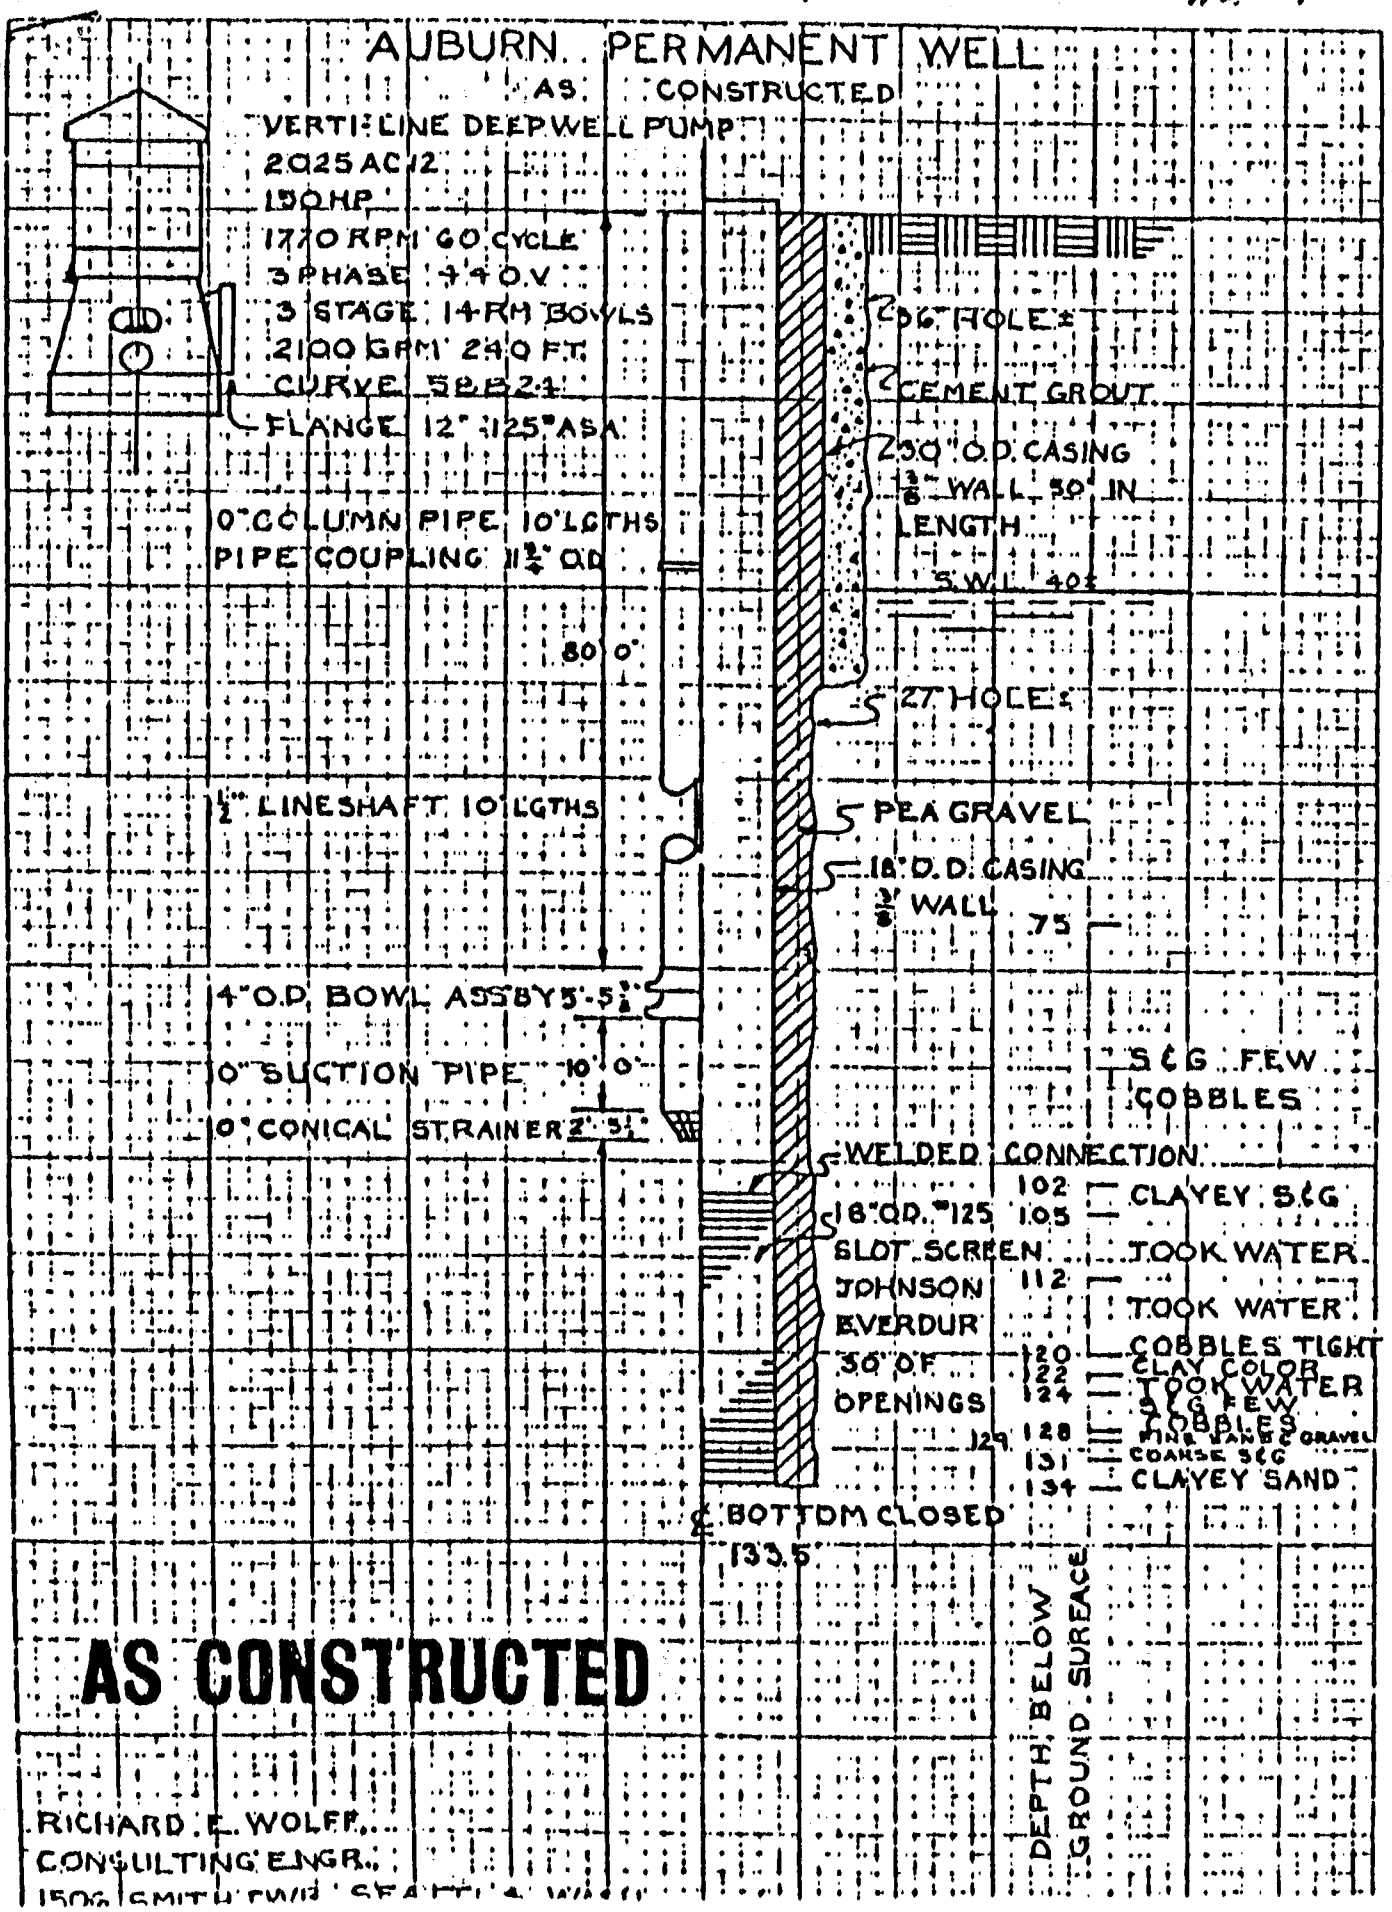
b) Presence of ground water recharge wells (dry wells) or heavy irrigation within...

	YES	NO	unknown
< 1 year travel time	___	X	___
1–5 year travel time	___	X	___
5–10 year travel time	X	___	___

Please identify or describe additional hydrologic or geographic conditions that you believe may affect the shape of the zone of contribution for this source. Where possible, reference them to locations on the map produced in Part IV.

AQIFER APPEARS TO FLOW SOUTH TO NORTH ACCORDING TO A GROUND WATER SUPPLY STUDY BY POOL ENG. INC. IN SEPTEMBER OF 1982. HYDROLOGY DONE BY HART CROUSER FOR REPORT.

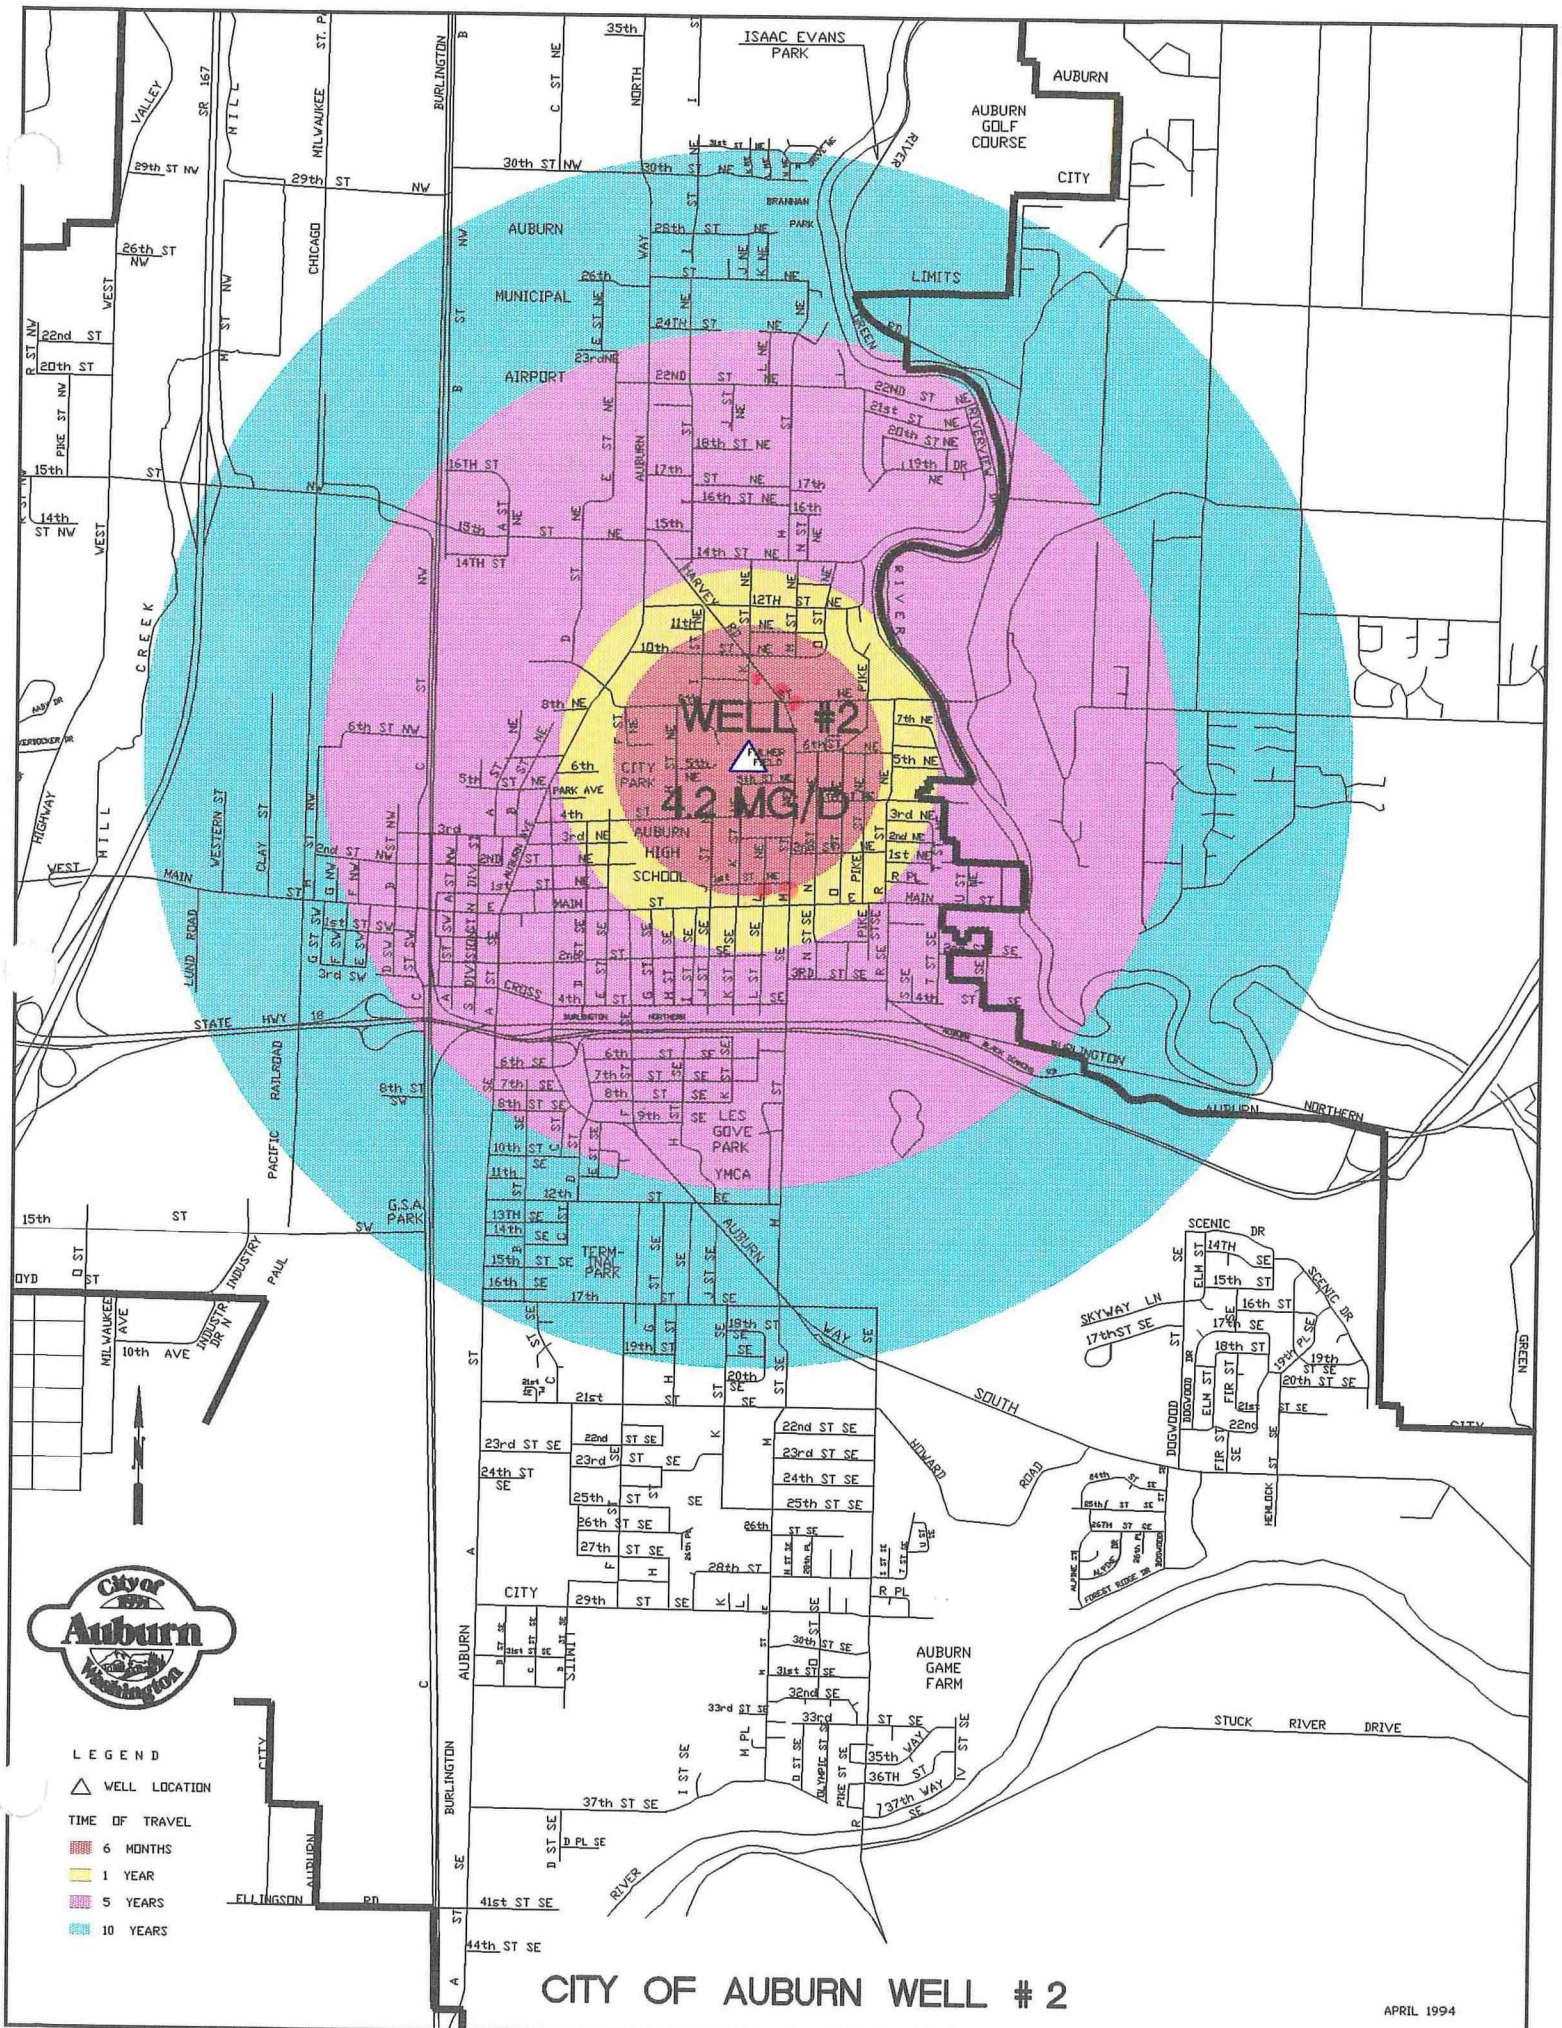
Suggestions and Comments



Did you attend one of the susceptibility workshops? ___ YES __X__ NO

Did you find it useful? ___ YES ___ NO

Did you seek outside assistance to complete the assessment? ___ YES __X__ NO



This form and instruction packet are still in the process of development. Your comments, suggestions and questions will help us upgrade and improve this assessment form. If you found particular sections confusing or problematic please let us know. How could this susceptibility assessment be improved or made clearer? Did the instruction package help you find the information needed to complete the assessment? How much time did it take you to complete the form? Ground Water Contamination
Susceptibility Assessment Survey Form
Version 2.1

IMPORTANT! Please complete one form for each ground water source (well, wellfield, spring) used in your water system. Photocopy as necessary.

PART I: System Information

Well owner/manager : CITY OF AUBURN

Water system name : AUBURN WATER DIVISION

County: KING

Water system number: 03350V Source number: S04

Well depth: 290 (ft.) (*From WFI form*)

Source name: WELL #2

WA well identification tag number: ___ ___ ___ - ___ ___ ___

X well not tagged

Number of connections: 13,000 Population served: 40,000

Township: 21N Range: 05F

Section: 18 1/4 1/4 Section: NW/NE

Latitude/longitude (if available): N 47 18' 47.64" / W 122 12' 52.29"

How was lat./long. determined?

_____ global positioning device X survey _____ topographic map
____other: _____

* Please refer to Assistance Packet for details and explanations of all questions in Parts II through V.

PART II: Well Construction and Source Information

1) Date well originally constructed: 11 / 21 / 68 month/day/year

last reconstruction: ___ / ___ / ___ month/day/year

_____ information unavailable

2) Well driller: R.E. DeREMER

RICHARDSON WELL DRILLING CO.

___ well driller unknown

3) Type of well:

X Drilled: ___ rotary ___ bored X cable (percussion) ___ Dug

___ Other: ___ spring(s) ___ lateral collector (Ranney)

___ driven ___ jetted ___ other: _____

Additional comments: _____

4) Well report available? X YES (attach copy to form) ___ NO

If no well log is available, please attach any other records documenting well construction; e.g. boring logs, "as built" sheets, engineering reports, well reconstruction logs.

5) Average pumping rate: 3000 (gallons/min)

Source of information: WF1/ DAILY LOGS/DATA/ ACQUISATION SYSTEM

If not documented, how was pumping rate determined? _____

___ Pumping rate unknown

6) Is this source treated? NO

If so, what type of treatment:

___ disinfection ___ filtration ___ carbon filter ___ air stripper ___ other

Purpose of treatment (describe materials to be removed or controlled by treatment):

7) If source is chlorinated, is a chlorine residual maintained: ___ YES ___ NO NA

Residual level: _____ (*At the point closest to the source.*)

PART III: Hydrogeologic Information

1) Depth to top of open interval: [check one]

___ < 20 ft ___ 20-50 ft ___ 50-100 ft ___ 100-200 ft X > 200 ft

___ information unavailable (*'< ' means less than; '> ' means greater than*)

2) Depth to ground water (static water level):

X < 20 ft ___ 20-50 ft ___ 50-100 ft ___ > 100 ft

___ flowing well/spring (artesian)

How was water level determined?

X well log X other: WELL PROB SOUNDING ON REGULAR BASIS

___ depth to ground water unknown

3) If source is a flowing well or spring, what is the confining pressure:

NA psi (pounds per square inch)
or
_____ feet above wellhead

4) If source is a flowing well or spring, is there a surface impoundment, reservoir, or catchment associated with this source: ___ YES ___ NO

5) Wellhead elevation (height above mean sea level): 64 (ft)

How was elevation determined? ___ topographic map X Drilling/Well Log ___ altimeter

___ other: _____

___ information unavailable

6) Confining layers: (This can be completed only for those sources with a drilling log, well log or geologic report describing subsurface conditions. Please refer to assistance package for example.)

X evidence of a confining layer in well log

___ no evidence of a confining layer in well log

If there is evidence of a confining layer, is the depth to ground water more than 20 feet above the top of the open interval? X YES ___ NO

___ information unavailable

7) Sanitary setback:

___ < 100 ft* X 100-120 ft ___ 120-200 ft ___ > 200 ft
* if less than 100 ft describe the site conditions:

8) Wellhead construction:

X wellhead enclosed in a wellhouse

X controlled access (describe): FENCED

___ other uses for wellhouse (describe): _____

___ no wellhead control

9) Surface seal:

___ 18 ft

___ < 18 ft (no Department of Ecology approval) ('< ' *means less than*)

___ < 18 ft (Approved by Ecology, include documentation) ('< ' *means less than*)

X > 18 ft ('> ' *means greater than*)

___ depth of seal unknown

___ no surface seal

10) Annual rainfall (inches per year):

___ < 10 in/yr ___ 10-25 in/yr X > 25 in/yr

PART IV: Mapping Your Ground Water Resource

1) Annual volume of water pumped: 259,913,000 (gallons) 1993

How was this determined?

X meter

___ estimated: ___ pumping rate (_____)

___ pump capacity (_____)

___ other: _____

2) "Calculated Fixed Radius" estimate of ground water movement:
(see Instruction Packet)

6 month ground water travel time : 1765 (ft)

1 year ground water travel time : 2496 (ft)

5 year ground water travel time: 5580 (ft)

10 year ground water travel time: 7892 (ft)

Information available on length of screened/open interval?

X YES ___ NO

Length of screened/open interval: 49 (ft)

3) Is there a river, lake, pond, stream, or other obvious surface water body within the 6 month time of travel boundary? ___ YES X NO (mark and identify on map).

4) Is there a stormwater and/or wastewater facility, treatment lagoon, or holding pond located within the 6 month time of travel boundary? ___ YES X NO (mark and identify on map).

Comments: _____

PART V: Assessment of Water Quality

1) Regional sources of risk to ground water:

Please indicate if any of the following are present within a circular area around your water source having a radius up to and including the five year ground water travel time:

	6 month	1 year	5 year	unknown
likely pesticide application RESIDENTIAL	x	X	X	
stormwater injection wells				
other injection wells				
abandoned ground water well				
landfills, dumps, disposal areas				
known hazardous materials clean-up site				
water system(s) with known quality problems				
population density > 1 house/acre	X	X	X	
residences commonly have septic tanks				
Wastewater treatment lagoons				
sites used for land application of waste				

Mark and identify on map any of the risks listed above which are located within the 6 month time of travel boundary? (*Please include a map of the wellhead and time of travel areas with this form. Please locate and mark any of the following.*)

If other recorded or potential sources of ground water contamination exist within the ten year time of travel circular zone around your water supply, please describe:

AUTO REPAIR

DRY CLEANERS - LOW POTENTIAL

SERVICE STATIONS

PLASTICS MANUFACTURE

2) Source specific water quality records:

Please indicate the occurrence of any test results since 1986 that meet the following conditions: (Unless listed on assessment, MCLs are listed in assistance package.)

A. Nitrate: (Nitrate MCL = 10 mg/l)

Results greater than MCL	YES	NO
< 2 mg/liter nitrate	___	X
2-5 mg/liter nitrate	X	___
> 5 mg/liter nitrate	___	X
___ Nitrate sampling records unavailable	___	X

B. VOCs: (VOC detection level 0.5 ug/l or 0.0005 mg/l.)

Results greater than MCL or SAL	YES	NO
VOCs detected at least once	___	X
VOCs never detected	X	___
___ VOC sampling records unavailable	___	___

C. EDB/DBCP:

(EDB MCL = 0.05 ug/l or 0.00005 mg/l. DBCP MCL = 0.2 ug/l or 0.0002 mg/l.)

	YES	NO
EDB/DBCP detected below MCL at least once	___	___
EDB/DBCP detected above MCL at least once	___	___
EDB/DBCP never detected	___	___

___ EDB/DBCP tests required but not yet completed

X EDB/DBCP tests not required

D. Other SOCs (Pesticides):

	YES	NO
Other SOCs detected (pesticides and other synthetic organic chemicals)	___	___

___ Other SOC tests performed but none detected
(list test methods in comments

X Other SOC tests not performed

If any SOCs in addition to EDB/DBCP were detected, please identify and date. If other SOC tests were performed, but no SOCs detected, list test methods here: _____

E. Bacterial contamination:

	YES	NO
Any bacterial detection(s) in the past 3 years in samples taken from the source (not distribution sampling records).	___	X
Has source (in past 3 years) had a bacteriological contamination problem found in distribution samples that was attributed to the source.	___	X

___ Source sampling records for bacteria unavailable

Part VI: Geographic or Hydrologic Factors Contributing to a Non-Circular Zone of Contribution

The following questions will help identify those ground water systems which may not be accurately represented by the calculated fixed radius (CFR) method described in Part IV. For these sources, the CFR areas should be used as a preliminary delineation of the critical time of travel zones for that source. As a system develops its Wellhead Protection Plan for theses sources, a more detailed delineation method should be considered.

1) Is there evidence of obvious hydrologic boundaries within the 10 year time of travel zone of the CFR? (Does the largest circle extend over a stream, river, lake, up a steep hillside, and/or over a mountain or ridge?)

X YES ___ NO

Describe with references to map produced in Part IV:

HIGHER ELEVATION WEST & EAST OF VALLEY FLOW SOUTH TO NORTH UP VALLEY.

2) Aquifer Material:

A) Does the drilling log, well log or other geologic/engineering reports identify that the well is located in an area where the underground conditions are identified as fractured rock and/or basalt terrain?

___ YES X NO

B) Does the drilling log, well log or other geologic/engineering reports indicate that the well is located in an area where the underground conditions are primarily identified as coarse sand and gravel?

X YES ___ NO

3) Is the source located in an aquifer with a high horizontal flow rate? (These can include sources located on flood plains of large rivers, artesian wells with high water pressure, and/or shallow flowing wells and springs.)

___ YES X NO

4) Are there other high capacity wells (agricultural, municipal and/or industrial) located within the CFRs?

a) Presence of ground water extraction wells removing more than approximately 500 gal/min within...

	YES	NO	unknown
< 6 month travel time	___	X	___
6 month–1 year travel time	___	X	___
1–5 year travel time	X	___	___
5–10 year travel time	X	___	___

b) Presence of ground water recharge wells (dry wells) or heavy irrigation within...

	YES	NO	unknown
< 1 year travel time	___	X	___
1–5 year travel time	___	X	___
5–10 year travel time	___	X	___

Please identify or describe additional hydrologic or geographic conditions that you believe may affect the shape of the zone of contribution for this source. Where possible, reference them to locations on the map produced in Part IV.

AQUIFER FLOW APPEARS TO BE FROM SOUTH TO NORTH ACCORDING TO A GROUND WATER SUPPLY STUDY BY POOL ENGINEERING, INC. IN SEPTEMBER, 1982. HYDROLOGY DONE BY HART CROUSER FOR REPORT.

Suggestions and Comments

Did you attend one of the susceptibility workshops? ___ YES X NO

Did you find it useful? ___ YES ___ NO

Did you seek outside assistance to complete the assessment? ___ YES X NO

This form and instruction packet are still in the process of development. Your comments, suggestions and questions will help us upgrade and improve this assessment form. If you found particular sections confusing or problematic please let us know. How could this susceptibility assessment be improved or made clearer? Did the instruction package help you find the information needed to complete the assessment? How much time did it take you to complete the form? Were you able to complete the assessment without additional/outside expertise? Do you feel the assessment was valuable as a learning experience? Any other comments or constructive criticisms you have would be appreciated.

WATER WELL REPORT well #2

STATE OF WASHINGTON

Application No. 9229
Permit No. 8732

(1) OWNER: Name City of Auburn Address 20 "A" St. N.W. Auburn, Wash. 98002

(2) LOCATION OF WELL: County King NW. ¼ NE. ¼ Sec. 18 T. 21 N., R. 5 W.M.
Bearing and distance from section or subdivision corner 610' east, 685' south from N¼ corner Sect. 18

(3) PROPOSED USE: Domestic ☐ Industrial ☐ Municipal ☒
Irrigation ☐ Test Well ☐ Other ☐

(4) TYPE OF WORK: Owner's number of well (if more than one) 2
New well ☒ Method: Dug ☐ Bored ☒
Deepened ☐ Cable ☒ Driven ☐
Reconditioned ☐ Rotary ☐ Jetted ☐

(5) DIMENSIONS: Diameter of well 24 inches.
Drilled 293 ft. Depth of completed well 293 ft.

(6) CONSTRUCTION DETAILS:
Casing installed: 24" Diam. from 0 ft. to ft.
Threaded ☐ 30" Diam. from 0 ft. to 90 ft.
Welded ☒ " Diam. from ft. to ft.

Perforations: Yes ☐ No ☒
Type of perforator used
SIZE of perforations in. by in.
perforations from ft. to ft.
perforations from ft. to ft.
perforations from ft. to ft.

Screens: Yes ☒ No ☐
Manufacturer's Name Johnson
Type Stainless Model No.
Diam. 24 Slot size 80 from 242 ft. to 282 ft.
Diam. 24 Slot size 40 from 282 ft. to 291 ft.
24 Blank 239 242

Gravel packed: Yes ☐ No ☒ Size of gravel:
Gravel placed from ft. to ft.

Surface seal: Yes ☒ No ☐ To what depth? 90 ft.
Material used to seal 30" csg. / casing
Did any strata contain unusable water? Yes ☒ No ☐
Type of water? high iron Depth of strata to 85'
Method of sealing strata off 30" casing driven into imp. strata

(7) PUMP: Manufacturer's Name None installed
Type: H.P.

(8) WATER LEVELS: Land-surface elevation above mean sea level USGS 64 ft.
Static level 7' 6" ft. below top of well Date 11-20-68
Artesian pressure lbs. per square inch Date
Artesian water controlled by (Cap, valve, etc.)

(9) WELL TESTS: Drawdown is amount water level is lowered below static level
Was a pump test made? Yes ☒ No ☐ If yes, by whom? driller
Yield: 2000 gal./min. with 60' ft. drawdown after 24 hrs.
" " " "
" " " "

Recovery data (time taken as zero when pump turned off) (water level measured from well top to water level)

Time	Water Level	Time	Water Level	Time	Water Level
30	9'-0"				
3-00	8'-6"				
10-00	7'-6"				

Date of test 11-20, 11-21-'68
Bailer test gal./min. with ft. drawdown after hrs.
Artesian flow g.p.m. Date
Temperature of water Was a chemical analysis made? Yes ☒ No ☐

(10) WELL LOG:
Formation: Describe by color, character, size of material and structure, and show thickness of aquifers and the kind and nature of the material in each stratum penetrated, with at least one entry for each change of formation.

MATERIAL	FROM	TO
sand & gravel	0	20'
sand & gravel - hard streaks	20	37'
fine & coarse sand & grv.	37	52'
" " " & " - brown clay, hard streaks	52	71'
fine to med. sand w/yel. clay	71	78'
coarse grv. sand layers	78	84'
cemented sand & gravel	84	98'
blue & gray clay-large grv.-silty sand	98	105'
large grv. sand & blue clay	105	117
hard packed yellow & brown snd. & grv.	117	138
loose snd. & grv., brown	138	146
cemented snd. & grv. brwn silt	146	150
med. brown peat, sand, silt	150	160
gray, coarse sand, some grv. silty	160	166
hard packed sand & gravel	166	178
cemented sand & gravel	178	196
fine & coarse sand & gravel	196	198
yellow clay, snd & grv, hard	198	210
varigated clay, snd. & grv.	210	213
hard packed sand & gravel	213	225
cemented sand & gravel in-layers, med. & coarse sand	225	238
varigated clay, sand & coarse gravel, hard	238	264
hard packed sand & gravel-cemented slightly	264	270
Yellow clay, sand & gravel-hard streaks	270	279
fine & coarse snd., med to coas. grv. cemented layers	279	290
varigated clay, fine & coas. sand & gravel	290	291
hard packed snd. & grv.	291	293

Work started 11-21-68 Completed 11-21-68

Ground Water Contamination
Susceptibility Assessment Survey Form
Version 2.1

IMPORTANT! Please complete one form for each ground water source (well, wellfield, spring) used in your water system. Photocopy as necessary.

PART I: System Information

Well owner/manager : CITY OF AUBURN

Water system name : AUBURN WATER DIVISION

County: KING

Water system number: 03350V Source number: S05

Well depth: 310 (ft.) (*From WFI form*)

Source name: WELL 3A

WA well identification tag number: ___ ___ ___ - ___ ___ ___

X well not tagged

Number of connections: 13,000 Population served: 40,000

Township: 21N Range: 05E

Section: 30 1/4 1/4 Section: NE/SW

Latitude/longitude (if available): N 47 16' 42.71" / 122 13' 13.54"

How was lat./long. determined?

___ global positioning device X survey ___ topographic map
___other: ___

* Please refer to Assistance Packet for details and explanations of all questions in Parts II through V.

PART II: Well Construction and Source Information

1) Date well originally constructed: ___ / ___ / 83 month/day/year

last reconstruction: ___ / ___ / ___ month/day/year

___ information unavailable

2) Well driller: RICHARDSON DRILLING

___ well driller unknown

3) Type of well:

X Drilled: ___ rotary ___ bored X cable (percussion) ___ Dug

___ Other: ___ spring(s) ___ lateral collector (Ranney)

___ driven ___ jetted ___ other: _____

Additional comments: _____

4) Well report available? X YES (attach copy to form) ___ NO

If no well log is available, please attach any other records documenting well construction; e.g. boring logs, "as built" sheets, engineering reports, well reconstruction logs.

5) Average pumping rate: 1600 (gallons/min)

Source of information: WF1/DAILY LOGS/ DATA SYSTEM

If not documented, how was pumping rate determined? _____

___ Pumping rate unknown

6) Is this source treated? YES

If so, what type of treatment:

X disinfection ___ filtration ___ carbon filter ___ air stripper ___ other

Purpose of treatment (describe materials to be removed or controlled by treatment):

7) If source is chlorinated, is a chlorine residual maintained: X YES ___ NO

Residual level: 0.8 (*At the point closest to the source.*)

PART III: Hydrogeologic Information

1) Depth to top of open interval: [check one]

___ < 20 ft ___ 20-50 ft ___ 50-100 ft ___ 100-200 ft _X_ > 200 ft

___ information unavailable (*'< ' means less than; '> ' means greater than*)

2) Depth to ground water (static water level):

___ < 20 ft _X_ 20-50 ft ___ 50-100 ft ___ > 100 ft

___ flowing well/spring (artesian)

How was water level determined?

_X_ well log ___ other: _____

___ depth to ground water unknown

3) If source is a flowing well or spring, what is the confining pressure:

_____ psi (pounds per square inch)
or
_____ feet above wellhead

4) If source is a flowing well or spring, is there a surface impoundment, reservoir, or catchment associated with this source: ___ YES ___ NO

5) Wellhead elevation (height above mean sea level): 112 (ft)

How was elevation determined? ___ topographic map _X_ Drilling/Well Log ___ altimeter

___ other: _____

___ information unavailable

6) Confining layers: (This can be completed only for those sources with a drilling log, well log or geologic report describing subsurface conditions. Please refer to assistance package for example.)

_X_ evidence of a confining layer in well log

___ no evidence of a confining layer in well log

If there is evidence of a confining layer, is the depth to ground water more than 20 feet above the top of the open interval? _X_ YES ___ NO

___ information unavailable

7) Sanitary setback:

___ < 100 ft* ___ 100–120 ft _x_ 120–200 ft ___ > 200 ft
* if less than 100 ft describe the site conditions:

_____

_____

_____

_____

8) Wellhead construction:

_x_ wellhead enclosed in a wellhouse

_x_ controlled access (describe): FENCED

_____

___ other uses for wellhouse (describe): _____

_____

___ no wellhead control

9) Surface seal:

___ 18 ft

___ < 18 ft (no Department of Ecology approval) ('< ' *means less than*)

___ < 18 ft (Approved by Ecology, include documentation) ('< ' *means less than*)

_x_ > 18 ft ('> ' *means greater than*)

___ depth of seal unknown

___ no surface seal

10) Annual rainfall (inches per year):

___ < 10 in/yr ___ 10–25 in/yr _x_ > 25 in/yr

PART IV: Mapping Your Ground Water Resource

1) Annual volume of water pumped: 0 (gallons) 1993

How was this determined?

X meter

___ estimated: ___ pumping rate (_____)

___ pump capacity (_____)

___ other: _____

2) "Calculated Fixed Radius" estimate of ground water movement:
(see Instruction Packet)

6 month ground water travel time : 1595 (ft)

1 year ground water travel time : 2255 (ft)

5 year ground water travel time: 5043 (ft)

10 year ground water travel time: 7132 (ft)

Information available on length of screened/open interval?

X YES ___ NO

Length of screened/open interval: 60 (ft)

3) Is there a river, lake, pond, stream, or other obvious surface water body within the 6 month time of travel boundary? ___ YES X NO (mark and identify on map).

4) Is there a stormwater and/or wastewater facility, treatment lagoon, or holding pond located within the 6 month time of travel boundary? ___ YES X NO (mark and identify on map).

Comments: _____

_____

_____

_____

_____

PART V: Assessment of Water Quality

1) Regional sources of risk to ground water:

Please indicate if any of the following are present within a circular area around your water source having a radius up to and including the five year ground water travel time:

		6 month	1 year	5 year	unknown
likely pesticide application	RESIDENTIAL	X	X	X	
stormwater injection wells					
other injection wells					
abandoned ground water well					
landfills, dumps, disposal areas					
known hazardous materials clean-up site					
water system(s) with known quality problems					
population density > 1 house/acre		X	X	X	
residences commonly have septic tanks					
Wastewater treatment lagoons					
sites used for land application of waste					

Mark and identify on map any of the risks listed above which are located within the 6 month time of travel boundary? (*Please include a map of the wellhead and time of travel areas with this form. Please locate and mark any of the following.*)

If other recorded or potential sources of ground water contamination exist within the ten year time of travel circular zone around your water supply, please describe:

DRY CLEANERS

AUTO REPAIR — LOW POTENTIAL

SERVICE STATION

PLASTICS MANUFACTURE

SALVAGE & RECYCLING

2) Source specific water quality records:

Please indicate the occurrence of any test results since 1986 that meet the following conditions: (Unless listed on assessment, MCLs are listed in assistance package.)

A. Nitrate: (Nitrate MCL = 10 mg/l)	YES	NO
Results greater than MCL	___	X
< 2 mg/liter nitrate	X	___
2-5 mg/liter nitrate	___	X
> 5 mg/liter nitrate	___	X
___ Nitrate sampling records unavailable		

B. VOCs: (VOC detection level 0.5 ug/l or 0.0005 mg/l.)	YES	NO
Results greater than MCL or SAL	___	X
VOCs detected at least once	___	X
VOCs never detected	X	___
___ VOC sampling records unavailable		

C. EDB/DBCP:	YES	NO
(EDB MCL = 0.05 ug/l or 0.00005 mg/l. DBCP MCL = 0.2 ug/l or 0.0002 mg/l.)		
EDB/DBCP detected below MCL at least once	___	___
EDB/DBCP detected above MCL at least once	___	___
EDB/DBCP never detected	___	___
___ EDB/DBCP tests required but not yet completed		
X EDB/DBCP tests not required		

D. Other SOCs (Pesticides):	YES	NO
Other SOCs detected	___	___
(pesticides and other synthetic organic chemicals)		
___ Other SOC tests performed but none detected		
(list test methods in comments		
X Other SOC tests not performed		

If any SOCs in addition to EDB/DBCP were detected, please identify and date. If other SOC tests were performed, but no SOCs detected, list test methods here: NA

E. Bacterial contamination:

	YES	NO
Any bacterial detection(s) in the past 3 years in samples taken from the source (not distribution sampling records).	___	X
Has source (in past 3 years) had a bacteriological contamination problem found in distribution samples that was attributed to the source.	___	X

___ Source sampling records for bacteria unavailable

Part VI: Geographic or Hydrologic Factors Contributing to a Non-Circular Zone of Contribution

The following questions will help identify those ground water systems which may not be accurately represented by the calculated fixed radius (CFR) method described in Part IV. For these sources, the CFR areas should be used as a preliminary delineation of the critical time of travel zones for that source. As a system develops its Wellhead Protection Plan for theses sources, a more detailed delineation method should be considered.

1) Is there evidence of obvious hydrologic boundaries within the 10 year time of travel zone of the CFR? (Does the largest circle extend over a stream, river, lake, up a steep hillside, and/or over a mountain or ridge?)

X YES ___ NO

Describe with references to map produced in Part IV:

HIGHER TERRAIN TO EAST & WEST OF VALLEY FLOW IS SOUTH TO NORTH.

2) Aquifer Material:

A) Does the drilling log, well log or other geologic/engineering reports identify that the well is located in an area where the underground conditions are identified as fractured rock and/or basalt terrain?

___ YES X NO

B) Does the drilling log, well log or other geologic/engineering reports indicate that the well is located in an area where the underground conditions are primarily identified as coarse sand and gravel?

X YES ___ NO

3) Is the source located in an aquifer with a high horizontal flow rate? (These can include sources located on flood plains of large rivers, artesian wells with high water pressure, and/or shallow flowing wells and springs.)

___ YES ___ NO

4) Are there other high capacity wells (agricultural, municipal and/or industrial) located within the CFRs?

a) Presence of ground water extraction wells removing more than approximately 500 gal/min within...

	YES	NO	unknown
< 6 month travel time	___	X	___
6 month–1 year travel time	___	X	___
1–5 year travel time	X	___	___
5–10 year travel time	X	___	___

b) Presence of ground water recharge wells (dry wells) or heavy irrigation within...

	YES	NO	unknown
< 1 year travel time	___	X	___
1–5 year travel time	___	X	___
5–10 year travel time	___	X	___

Please identify or describe additional hydrologic or geographic conditions that you believe may affect the shape of the zone of contribution for this source. Where possible, reference them to locations on the map produced in Part IV.

AQUIFER FLOW IS FROM SOUTH TO NORTH ACCORDING TO A GROUND WATER STUDY DONE BY POOL ENGINEERING IN SEPTEMBER 1982 . HART CROUSER DID THE HYDROLOGY WORK FOR THIS STUDY.

Suggestions and Comments

Did you attend one of the susceptibility workshops? ___ YES ___ NO

Did you find it useful? ___ YES ___ NO

Did you seek outside assistance to complete the assessment? ___ YES ___ NO

This form and instruction packet are still in the process of development. Your comments, suggestions and questions will help us upgrade and improve this assessment form. If you found particular sections confusing or problematic please let us know. How could this susceptibility assessment be improved or made clearer? Did the instruction package help you find the information needed to complete the assessment? How much time did it take you to complete the form? Were you able to complete the assessment without additional/outside expertise? Do you feel the assessment was valuable as a learning experience? Any other comments or constructive criticisms you have would be appreciated.

Gravel packed: Yes ☐ No ☒ Size of gravel:
Gravel placed from ____ ft. to ____ ft.

Surface seal: Yes ☒ No ☐ To what depth? 20 ft.
Material used in seal cement grout
Did any strata contain unusable water? Yes ☐ No ☒
Type of water? Depth of strata
Method of sealing strata off

(7) PUMP: Manufacturer's Name Test Pump
Type: Turbon H.P. 320

(8) WATER LEVELS: Land-surface elevation above mean sea level 112 ft.
Static level 39.1 ft. below top of well Date 11-29-82
Artesian pressure ____ lbs. per square inch Date
Artesian water is controlled by (Cap, valve, etc.)

(9) WELL TESTS: Drawdown is amount water lowered below static level Hart
Was a pump test made? Yes ☒ No ☐ If yes, by whom? Crowser
Yield: 1650 gal./min. with 35.87 ft. drawdown after 10 min.
" 1650 " 41.94 " 100 "
" 1650 " 49.82 " 1000 "

Recovery data (time taken as zero when pump turned off) (water level measured from well top to water level)

Time	Water Level	Time	Water Level	Time	Water Level
0 min	52.11'	4 min	51.42'	14min	49.86'
172 min	43.32'				

Date of test 11-30-82
Bailer test ____ gal./min. with ____ ft. drawdown after ____ hrs.
Artesian flow ____ g.p.m. Date
Temperature of water ____ Was a chemical analysis made? Yes ☒ No ☐

(10) WELL LOG:

Formation: *Describe by color, character, size of material and structure, and show thickness of aquifers and the kind and nature of the material in each stratum penetrated, with at least one entry for each change of formation.*

MATERIAL	FROM	TO
Topsoil	0	11
Clay bound sand & gravel with cobbles	11	49
Tight brown sand, gravel little water	49	56
Sand - gravel (water)	56	91
Large gravel, fine sand	91	109
Grey silty - sandy clay	109	165
Sand - gravel, some wood little water	165	175
Green sandy - silty clay	175	182
Water bearing greenish brown clay bound sand &gravel some wood	182	188
sandy clay	188	200
Clay, pet, wood, sand & graveel	200	222
Sand & gravel, some wood	222	236
Sandy clay, small layer sand & gravel water bearing	236	251
Brown sand & gravel	251	278
Clay bound sand &greavel	278	279
Gravel, wood. layer of silty clay	279	307
Loose gravel with wood	307	309
Brown sand & gravel little layers of silt & wood	309	391
Clay bound sand & gravel	391	394

Work started 9-25, 19 82 Completed 12-1-, 1982

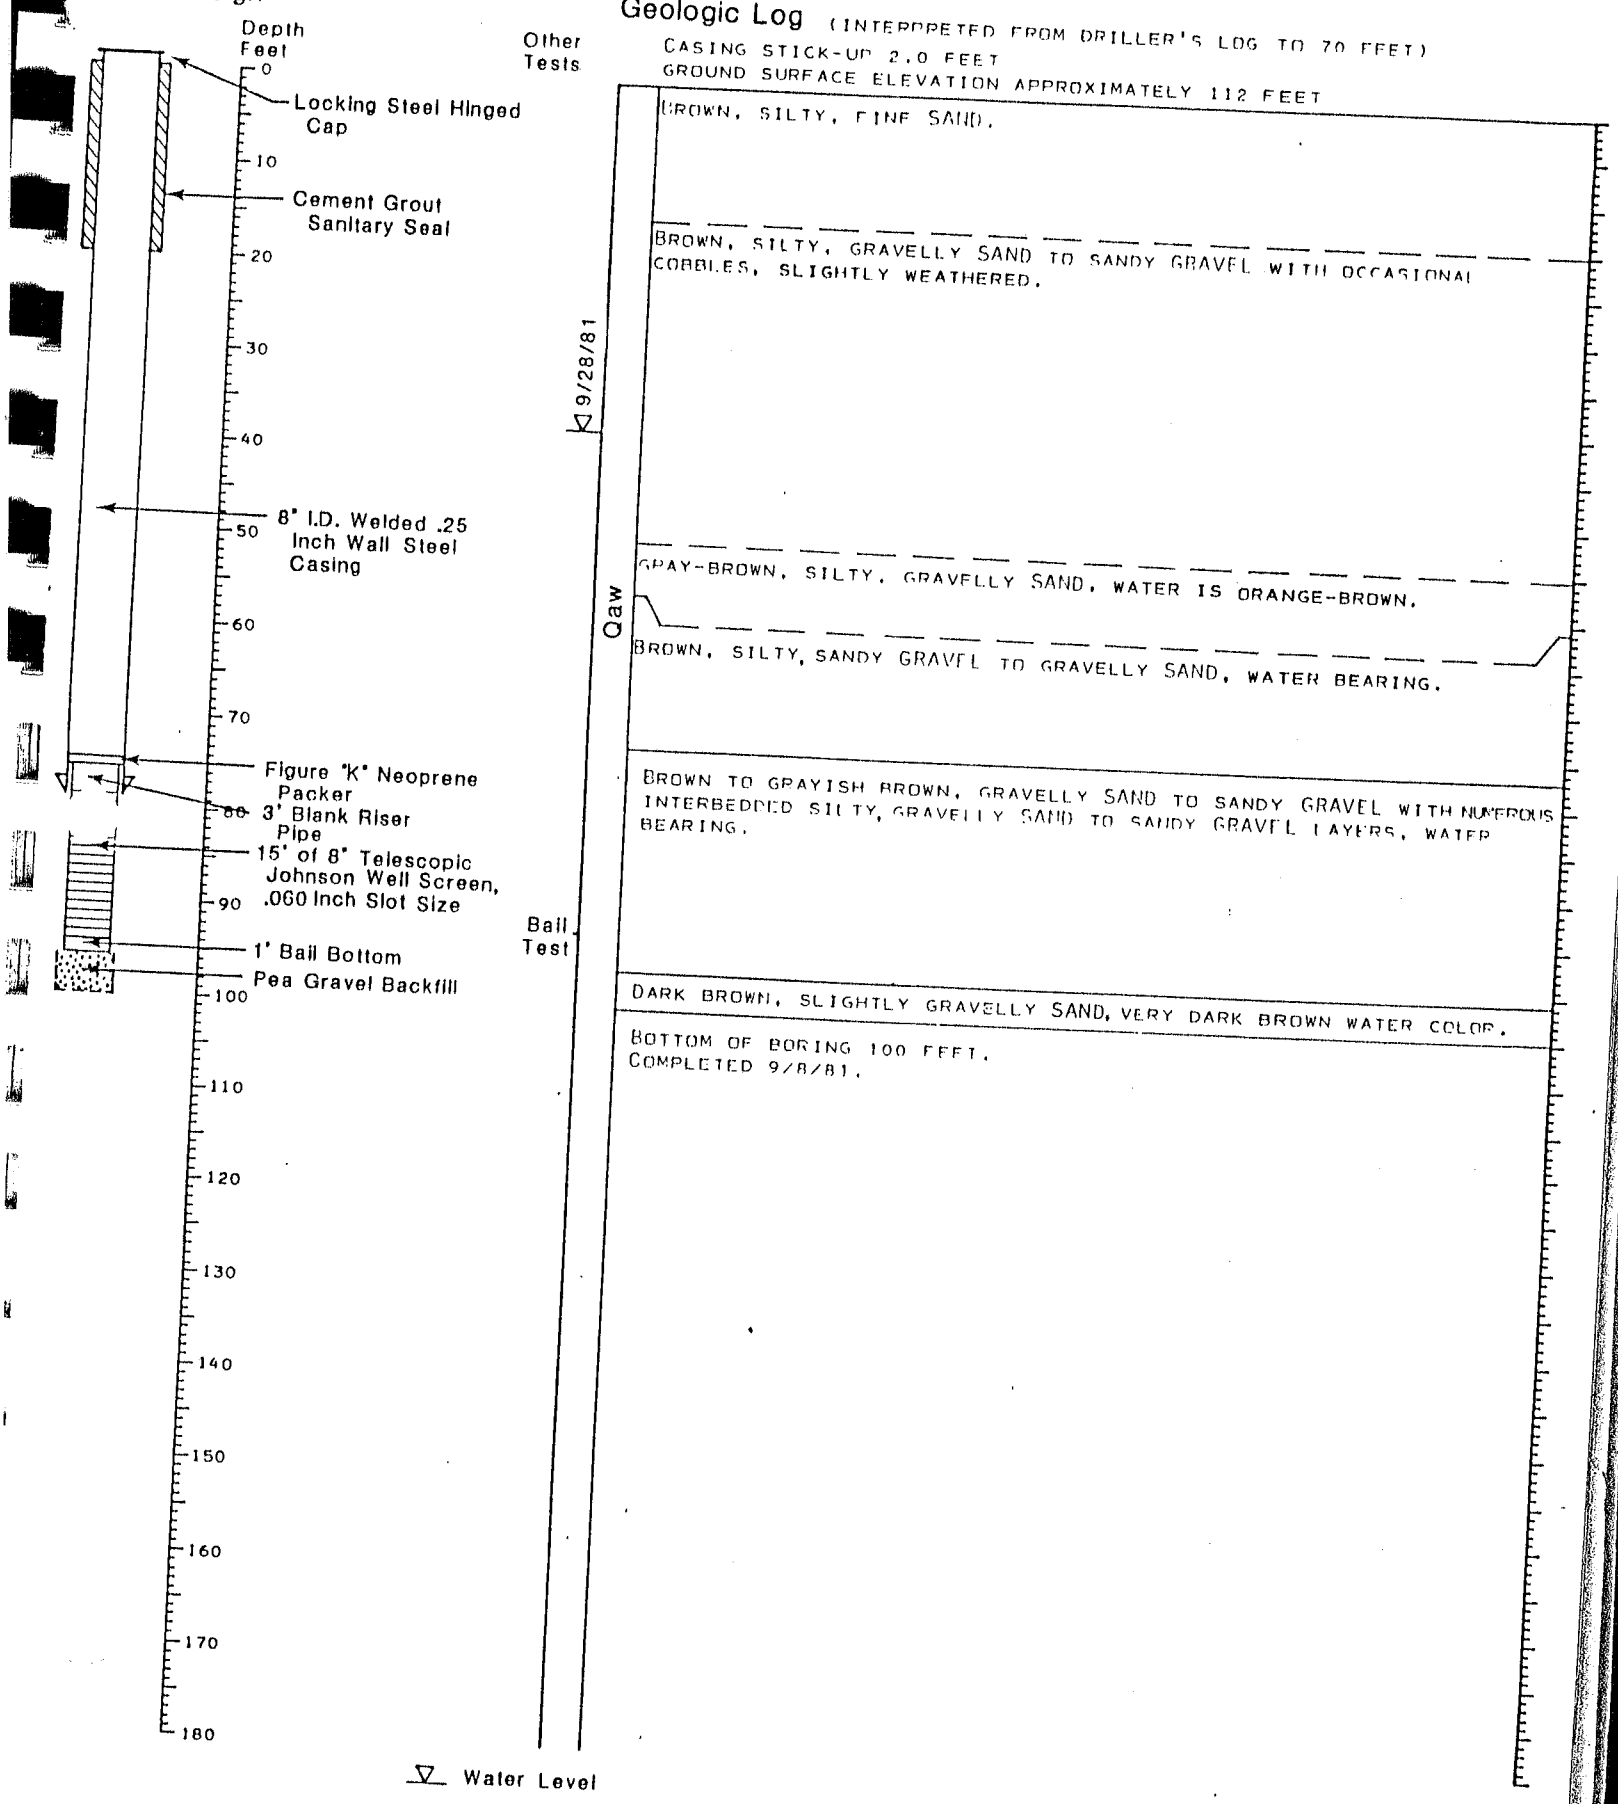
WELL DRILLER'S STATEMENT:

This well was drilled under my jurisdiction and this report is true to the best of my knowledge and belief.

NAME Armstrong Drilling, Inc.
(Person, firm, or corporation) (Type or print)

Address 10715 - 66th Ave. E.

[Signed] John E. Armstrong (Well Driller)



License No. 0012 Date 12-22, 1982

Note: This is first of two wells planned for construction at this location.

(USE ADDITIONAL SHEETS IF NECESSARY)

S. F. No. 7336—OS—(Rev. 4-71).

Figure A-1

Ground Water Contamination
Susceptibility Assessment Survey Form
Version 2.1

IMPORTANT! Please complete one form for each ground water source (well, wellfield, spring) used in your water system. Photocopy as necessary.

PART I: System Information

Well owner/manager : CITY OF AUBURN

Water system name : AUBURN WATER DIVISION

County: KING

Water system number: 03350V Source number: S02

Well depth: 310 (ft.) (*From WFI form*)

Source name: WELL 3 B

WA well identification tag number:___ ___ ___-___ ___ ___

___X___ well not tagged

Number of connections: 13,000 Population served: 40,000

Township: 21N Range: 055

Section: 30 1/4 1/4 Section: NE/ SW

Latitude/longitude (if available): N 47 16' 42.71" / W 122 13' 13.54"

How was lat./long. determined?

_____ global positioning device ___X___ survey _____ topographic map
____other: _____

* Please refer to Assistance Packet for details and explanations of all questions in Parts II through V.

PART II: Well Construction and Source Information

1) Date well originally constructed: ___ / ___ /83 month/day/year

last reconstruction: ___ / ___ /___ month/day/year

_____ information unavailable

2) Well driller: RICHARDSON WELL DRILLING

___ well driller unknown

3) Type of well:

X Drilled: ___ rotary ___ bored X cable (percussion) ___ Dug

___ Other: ___ spring(s) ___ lateral collector (Ranney)

___ driven ___ jetted ___ other: _____

Additional comments: _____

4) Well report available? ___ YES (attach copy to form) ___ NO SEE WELL LOG 3A DRILLED 50FT APART

If no well log is available, please attach any other records documenting well construction; e.g. boring logs, "as built" sheets, engineering reports, well reconstruction logs.

5) Average pumping rate: 1500 (gallons/min)

Source of information: WF1/ DAILY LOGS/DATA ACQUISITION SYSTEM

If not documented, how was pumping rate determined? _____

___ Pumping rate unknown

6) Is this source treated? YES

If so, what type of treatment:

X disinfection ___ filtration ___ carbon filter ___ air stripper ___ other

Purpose of treatment (describe materials to be removed or controlled by treatment):

7) If source is chlorinated, is a chlorine residual maintained: X YES ___ NO

Residual level: 0.8 *(At the point closest to the source.)*

PART III: Hydrogeologic Information

1) Depth to top of open interval: [check one]

___ < 20 ft ___ 20–50 ft ___ 50–100 ft ___ 100–200 ft _X_ >200 ft

___ information unavailable (*'< ' means less than; '> ' means greater than*)

2) Depth to ground water (static water level):

___ < 20 ft _X_ 20–50 ft ___ 50–100 ft ___ >100 ft

___ flowing well/spring (artesian)

How was water level determined?

_X_ well log ___ other: _____

___ depth to ground water unknown

3) If source is a flowing well or spring, what is the confining pressure:

_____ psi (pounds per square inch)
or
_____ feet above wellhead

4) If source is a flowing well or spring, is there a surface impoundment, reservoir, or catchment associated with this source: ___ YES ___ NO

5) Wellhead elevation (height above mean sea level): _112_ (ft)

How was elevation determined? _X_ topographic map _X_ Drilling/Well Log ___ altimeter

___ other: _____

___ information unavailable

6) Confining layers: (This can be completed only for those sources with a drilling log, well log or geologic report describing subsurface conditions. Please refer to assistance package for example.)

_X_ evidence of a confining layer in well log

___ no evidence of a confining layer in well log

If there is evidence of a confining layer, is the depth to ground water more than 20 feet above the top of the open interval? _X_ YES ___ NO

___ information unavailable

7) Sanitary setback:

___ < 100 ft* ___ 100–120 ft _x_ 120–200 ft ___ > 200 ft
* if less than 100 ft describe the site conditions:

_____

_____

_____

_____

8) Wellhead construction:

_x_ wellhead enclosed in a wellhouse

_x_ controlled access (describe): _____

_____

___ other uses for wellhouse (describe): _____

_____

___ no wellhead control

9) Surface seal:

___ 18 ft

___ < 18 ft (no Department of Ecology approval) (*'<' means less than*)

___ < 18 ft (Approved by Ecology, include documentation) (*'<' means less than*)

_x_ > 18 ft (*'>' means greater than*)

___ depth of seal unknown

___ no surface seal

10) Annual rainfall (inches per year):

___ < 10 in/yr ___ 10–25 in/yr _x_ > 25 in/yr

PART IV: Mapping Your Ground Water Resource

1) Annual volume of water pumped: 866,000 (gallons) 1993

How was this determined?

X meter

___ estimated: ___ pumping rate (_____)

___ pump capacity (_____)

___ other: _____

2) "Calculated Fixed Radius" estimate of ground water movement:
(see Instruction Packet)

6 month ground water travel time : 1595 (ft)

1 year ground water travel time : 2255 (ft)

5 year ground water travel time: 5043 (ft)

10 year ground water travel time: 7132 (ft)

Information available on length of screened/open interval?

X YES ___ NO

Length of screened/open interval: _____(ft)

3) Is there a river, lake, pond, stream, or other obvious surface water body within the 6 month time of travel boundary? ___ YES X NO (mark and identify on map).

4) Is there a stormwater and/or wastewater facility, treatment lagoon, or holding pond located within the 6 month time of travel boundary? ___ YES X NO (mark and identify on map).

Comments: _____

_____

_____

_____

_____

PART V: Assessment of Water Quality

1) Regional sources of risk to ground water:

Please indicate if any of the following are present within a circular area around your water source having a radius up to and including the five year ground water travel time:

	6 month	1 year	5 year	unknown
likely pesticide application RESIDENTIAL	X	X	X	
stormwater injection wells				
other injection wells				
abandoned ground water well				
landfills, dumps, disposal areas				
known hazardous materials clean-up site				
water system(s) with known quality problems				
population density > 1 house/acre	X	X	X	
residences commonly have septic tanks				
Wastewater treatment lagoons				
sites used for land application of waste				

Mark and identify on map any of the risks listed above which are located within the 6 month time of travel boundary? (*Please include a map of the wellhead and time of travel areas with this form. Please locate and mark any of the following.*)

If other recorded or potential sources of ground water contamination exist within the ten year time of travel circular zone around your water supply, please describe:

DRY CLEANERS

AUTO REPAIR

SERVICE STATION LOW POTENTIAL

PLASTICS MANUFACTURE

HOSE MAT

SALVAGE & RECYCLING

2) Source specific water quality records:

Please indicate the occurrence of any test results since 1986 that meet the following conditions: (Unless listed on assessment, MCLs are listed in assistance package.)

A. Nitrate: (Nitrate MCL = 10 mg/l)	YES	NO
Results greater than MCL	___	X
< 2 mg/liter nitrate	X	___
2-5 mg/liter nitrate	___	X
> 5 mg/liter nitrate	___	X
___ Nitrate sampling records unavailable		

B. VOCs: (VOC detection level 0.5 ug/l or 0.0005 mg/l.)	YES	NO
Results greater than MCL or SAL	___	X
VOCs detected at least once	___	X
VOCs never detected	X	___
___ VOC sampling records unavailable		

C. EDB/DBCP:	YES	NO
(EDB MCL = 0.05 ug/l or 0.00005 mg/l. DBCP MCL = 0.2 ug/l or 0.0002 mg/l.)		
EDB/DBCP detected below MCL at least once	___	___
EDB/DBCP detected above MCL at least once	___	___
EDB/DBCP never detected	___	___
___ EDB/DBCP tests required but not yet completed		
X EDB/DBCP tests not required		

D. Other SOCs (Pesticides):	YES	NO
Other SOCs detected	___	___
(pesticides and other synthetic organic chemicals)		
___ Other SOC tests performed but none detected (list test methods in comments		
X Other SOC tests not performed		

If any SOCs in addition to EDB/DBCP were detected, please identify and date. If other SOC tests were performed, but no SOCs detected, list test methods here: _____

_____

_____

_____

E. Bacterial contamination:

	YES	NO
Any bacterial detection(s) in the past 3 years in samples taken from the source (not distribution sampling records).	___	X
Has source (in past 3 years) had a bacteriological contamination problem found in distribution samples that was attributed to the source.	___	X

___ Source sampling records for bacteria unavailable

Part VI: Geographic or Hydrologic Factors Contributing to a Non-Circular Zone of Contribution

The following questions will help identify those ground water systems which may not be accurately represented by the calculated fixed radius (CFR) method described in Part IV. For these sources, the CFR areas should be used as a preliminary delineation of the critical time of travel zones for that source. As a system develops its Wellhead Protection Plan for theses sources, a more detailed delineation method should be considered.

1) Is there evidence of obvious hydrologic boundaries within the 10 year time of travel zone of the CFR? (Does the largest circle extend over a stream, river, lake, up a steep hillside, and/or over a mountain or ridge?)

X YES ___ NO

Describe with references to map produced in Part IV:

HIGHER TERRAIN TO EAST & WEST OF VALLEY FLOW IS SOUTH TO NORTH UP VALLEY.

2) Aquifer Material:

A) Does the drilling log, well log or other geologic/engineering reports identify that the well is located in an area where the underground conditions are identified as fractured rock and/or basalt terrain?

___ YES X NO

B) Does the drilling log, well log or other geologic/engineering reports indicate that the well is located in an area where the underground conditions are primarily identified as coarse sand and gravel?

X YES ___ NO

3) Is the source located in an aquifer with a high horizontal flow rate? (These can include sources located on flood plains of large rivers, artesian wells with high water pressure, and/or shallow flowing wells and springs.)

___ YES ___ NO

4) Are there other high capacity wells (agricultural, municipal and/or industrial) located within the CFRs?

a) Presence of ground water extraction wells removing more than approximately 500 gal/min within...

	YES	NO	unknown
< 6 month travel time	___	X	___
6 month–1 year travel time	___	X	___
1–5 year travel time	X	___	___
5–10 year travel time	X	___	___

b) Presence of ground water recharge wells (dry wells) or heavy irrigation within...

	YES	NO	unknown
< 1 year travel time	___	X	___
1–5 year travel time	___	X	___
5–10 year travel time	___	X	___

Please identify or describe additional hydrologic or geographic conditions that you believe may affect the shape of the zone of contribution for this source. Where possible, reference them to locations on the map produced in Part IV.

AQUIFER FLOW IS FROM SOUTH TO NORTH ACCORDING TO A GROUND WATER STUDY BY POOL ENGINEERING, INC. IN SEPTEMBER 1982. HART CROUSER DID THE HYDROLOGICAL STUDY FOR THIS REPORT.

Suggestions and Comments

Did you attend one of the susceptibility workshops? ___ YES __x__ NO

Did you find it useful? ___ YES ___ NO

Did you seek outside assistance to complete the assessment? ___ YES __x__ NO

This form and instruction packet are still in the process of development. Your comments, suggestions and questions will help us upgrade and improve this assessment form. If you found particular sections confusing or problematic please let us know. How could this susceptibility assessment be improved or made clearer? Did the instruction package help you find the information needed to complete the assessment? How much time did it take you to complete the form? Were you able to complete the assessment without additional/outside expertise? Do you feel the assessment was valuable as a learning experience? Any other comments or constructive criticisms you have would be appreciated.

WATER WELL REPORT

STATE OF WASHINGTON well 3A

Application No G1-23629

Permit No G1-23628P

OWNER: Name City of Auburn Address 25 West Main, Abubrn WA 98002

LOCATION OF WELL: County King NE ¼ SW ¼ Sec 30 T. 21 N., R. 5 W.M.

ng and distance from section or subdivision corner 762' West & 267' south of center section 30

PROPOSED USE: Domestic ☐ Industrial ☐ Municipal ☒
Irrigation ☐ Test Well ☐ Other ☐

TYPE OF WORK: Owner's number of well (If more than one) #3A
New well ☒ Method: Dug ☐ Bored ☐
Deepened ☐ Cable ☒ Driven ☐
Reconditioned ☐ Rotary ☐ Jetted ☐

DIMENSIONS: Diameter of well 16 inches.
Drilled 394.5 ft. Depth of completed well 365 ft.

CONSTRUCTION DETAILS:

Casing installed: 16" Diam. from +2.5 ft. to 255 ft.
Threaded ☐ 12" Diam. from 255 ft. to 365 ft.
Welded ☒ ____" Diam. from ____ ft. to ____ ft.

Perforations: Yes ☐ No ☒
Type of perforator used
SIZE of perforations ____ in. by ____ in.
____ perforations from ____ ft. to ____ ft.
____ perforations from ____ ft. to ____ ft.
____ perforations from ____ ft. to ____ ft.

Screens: Yes ☒ No ☐
Manufacturer's Name Johnson
Type Stainless steel Pipe Size Model No. 304
Diam. 12" Slot size 80 from 285 ft. to 295 ft.
Diam. 12" Slot size 100 from 320 ft. to 360 ft.

Gravel packed: Yes ☐ No ☒ Size of gravel:
Gravel placed from ____ ft. to ____ ft.

Surface seal: Yes ☒ No ☐ To what depth? 20 ft.
Material used in seal cement grout
Did any strata contain unusable water? Yes ☐ No ☒
Type of water? Depth of strata
Method of sealing strata off

PUMP: Manufacturer's Name Test Pump
Type: Turbon H.P. 320

WATER LEVELS: Land-surface elevation above mean sea level 112 ft.
level 39.1 ft. below top of well Date 11-29-82
ian pressure ____ lbs. per square inch Date
Artesian water is controlled by (Cap, valve, etc.)

WELL TESTS: Drawdown is amount water lowered below static level
a pump test made? Yes ☒ No ☐ If yes, by whom? Crowser
d: 1650 gal./min. with 35.87 ft. drawdown after 10 min
1650 " 41.94 " 100 "
1650 " 49.82 " 1000 "

very data (time taken as zero when pump turned off) (water level meas d from well top to water level)

Time	Water Level	Time	Water Level	Time	Water Level
in	52.11'	4 min	51.42'	14min	49.86'
nin	43.32'				

Date of test 11-30-82
er test ____ gal./min. with ____ ft. drawdown after ____ hrs.
sian flow ____ g.p.m. Date
perature of water ____ Was a chemical analysis made? Yes ☒ No ☐

(10) WELL LOG:

Formation: Describe by color, character, size of material and structure, and show thickness of aquifers and the kind and nature of the material in each stratum penetrated, with at least one entry for each change of formation.

MATERIAL	FROM	TO
Topsoil	0	11
Clay bound sand & gravel with cobbles	11	49
Tight brown sand, gravel little water	49	56
Sand - gravel (water)	56	91
Large gravel, fine sand	91	109
Grey silty - sandy clay	109	165
Sand - gravel, some wood little water	165	175
Green sandy - silty clay	175	182
Water bearing greenish brown clay boundsand &gravel some wood	182	188
