Administrative Recommendation:
For discussion only.

Background for Motion:

Background Summary:
In 2023, the City of Auburn requested analysis of Municipal Court Service options by the National Center for State Courts (NCSC) – Phase I. In 2024, the City requested updated case filings and financials from comparable Washington municipal courts (through 2024), updated financials, and an updated report and presentation to Council for Phase II.

Councilmember: Cheryl Rakes

Staff: Candis Martinson

MUNICIPAL COURT STUDY – PHASE II

CITY OF AUBURN, WASHINGTON

JOHN BELLO,

DEPUTY MANAGING DIRECTOR

NATIONAL CENTER FOR STATE COURTS

Photo credit: Auburn, WA City Hall | photo by John Huguley for the Auburn Examiner

PROJECT OVERVIEW

- Auburn, like all Washington municipalities, statutorily bears responsibility for providing criminal justice services for misdemeanor and gross misdemeanor offenses committed by adults within the City.

- These services include:
  - ✓Prosecution
  - ✓Indigent Defense
  - ✓Adjudication
  - ✓Sentencing
  - ✓Incarceration

Photo credit: The Verge – www.thevergeauburn.com

PROJECT OVERVIEW

- 2012 – City disbanded its municipal court and contracted with King County District Court (KCDC) to provide municipal court services from the courthouse in Auburn.

- In 2023, the City of Auburn requested analysis of municipal court service options by the National Center for State Courts (NCSC) – Phase I.

  Options evaluated included:

  - Maintaining the current interlocal agreement with the King County District Court; and
  - Re-establishing the Auburn Municipal Court administered by the City.

Photo credit: City of Auburn – www.auburnwa.gov/city_hall/court

INTERLOCAL AGREEMENT

- January 1, 2022 – December 31, 2026 (four-year terms)
- Written notice must be provided by February 1, 2025 for termination December 31, 2026.
- Next opportunity for termination would be December 31, 2030 with notice provided by February 1, 2029.
- Recommendations for provisions of the ILA that need further review and/or negotiation were included in Final Report of Phase I.

STUDY METHODOLOGY – PHASE I

- Reviewed and analyzed court data provided by the City of Auburn
- Conducted Site Visit to Auburn (Feb 2023);
- Reviewed case filings and financials from comparable Washington municipal courts (Feb – April 2023);
- Assessed alternatives of securing municipal court services (Feb – May 2023); and
- Prepared & presented a report to the City (June 2023).

STUDY METHODOLOGY – PHASE II

- Updated case filings and financials from comparable Washington municipal courts (through 2024);
- Presented updated financials to the City of Auburn (December 2024); and
- Prepared & presented a report to the City (December 2024).

HISTORICAL INFORMATION & NCSC STUDY OVERVIEW – PHASE I

HISTORICAL INFORMATION

City contracted with KCDC in 2012 to operate the municipal court for Auburn for several reasons.

- ✓ Financial cost to the City was cost prohibitive because defendants were sentenced to long jail terms, paid for by the City at a per-day rate;
- ✓ Perception that the presiding judge at the time was too harsh;
- ✓ Appeared the court was not functioning in a manner the City leadership envisioned.

The NCSC was asked to review key questions to evaluate two municipal court service options. Key questions centered around:

- ✓ Projected net cost of court operations, associated services, including SCORE Jail expenses and any offsetting revenue;
- ✓ Recommended service hours
- ✓ Anticipated efficiencies related to justice outcomes and local control;
- ✓ Expected impacts on associated services;
- ✓ Transition and ongoing operational issues of maintaining an Auburn Municipal Court; and
- ✓ Project effects on City residents and the community.

NCSC STUDY OVERVIEW

INITIAL REVIEW & ANALYSIS

NOV 2022 – FEB 2023

- Reviewed current Interlocal Agreement (ILA) with KCDC
- Analyzed case filings, financials, revenues, and incarceration costs provided by the City of Auburn and KCDC
- Researched state statutes concerning fees that may be charged to municipalities for court-related services
- Conducted follow-up meeting with various City departments for clarification on the data and information

SITE VISIT

FEB 2023

- Interviewed 25 various stakeholders
  - ✓ City of Auburn representatives
  - ✓ King County District Court representatives
  - ✓ Prosecutor's Office
  - ✓ Public Defense
  - ✓ Conflict Attorney
  - ✓ SCORE Jail
  - ✓ Law Enforcement
- Goal was to gain the perspective of each stakeholder group regarding the municipal court operations, any areas where improvements could be realized, and explore whether the ILA could be re-negotiated or should be terminated.

STAKEHOLDER INTERVIEW LIST

- Conni Rhodes, KCDC Court Clerk
- Mark Caillier, Chief of Police, City of Auburn
- Sam Betz, Assistant Chief of Police, City of Auburn
- Jamie Thomas, Finance Director, City of Auburn
- Gloria Cody, Paralegal, City Attorney's Office
- Tricia Grove, Public Defender
- Robin Hartle, Legal Assistant, City Attorney's Office
- Nancy Backus, Mayor, City of Auburn
- Kendra Comeau, City Attorney, City of Auburn
- Harry Boesche, Deputy City Attorney, City of Auburn
- Megan Stockdale, Paralegal, City Attorney's Office
- Damita Beleford, Auburn Court Manager, KCDC
- Yanna Fillipidis, KCDC Operations Manager
- Rebecca Wood, Deputy City Clerk, City of Auburn
- Sara Anderson, Prosecutor, City of Auburn
- Judge Matthew York, KCDC Presiding Judge
- Judge Leah Taguba, KCDC Judge (Auburn)
- Callista Welbaum, KCDC Therapeutic Courts Manager
- Devon Schrum, SCORE Jail Administrator
- Othniel Palomino, KCDC Court Administrator
- Heather Dean, Budget Director, KCDC
- Tina Gill, KCDC Deputy Court Administrator
- Clair Kintinar, Primary Conflict Attorney
- Brenda Goodson-Moore, Chief Equity and Inclusion Officer, City of Auburn

COMPARISON COURT ANALYSIS

FEB – APRIL 2023 – PHASE I

COMPARISON COURTS

City officials helped to identify four municipalities that currently have city-operated municipal courts.

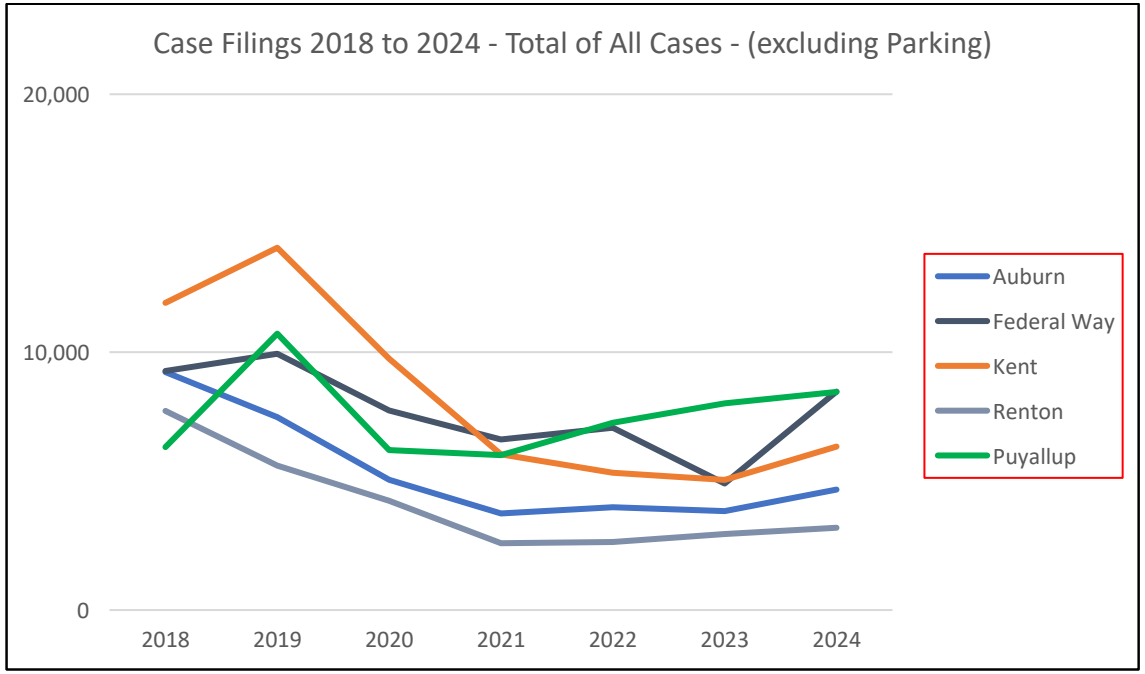
- ✓ Federal Way
- ✓ Kent
- ✓ Puyallup
- ✓ Renton

COMPARISON COURT OVERVIEW

NCSC Consulting Team contacted the court administrators in each comparison municipality to obtain data that could be used to estimate the organizational requirements and financial cost of establishing a city-operated court in Auburn.

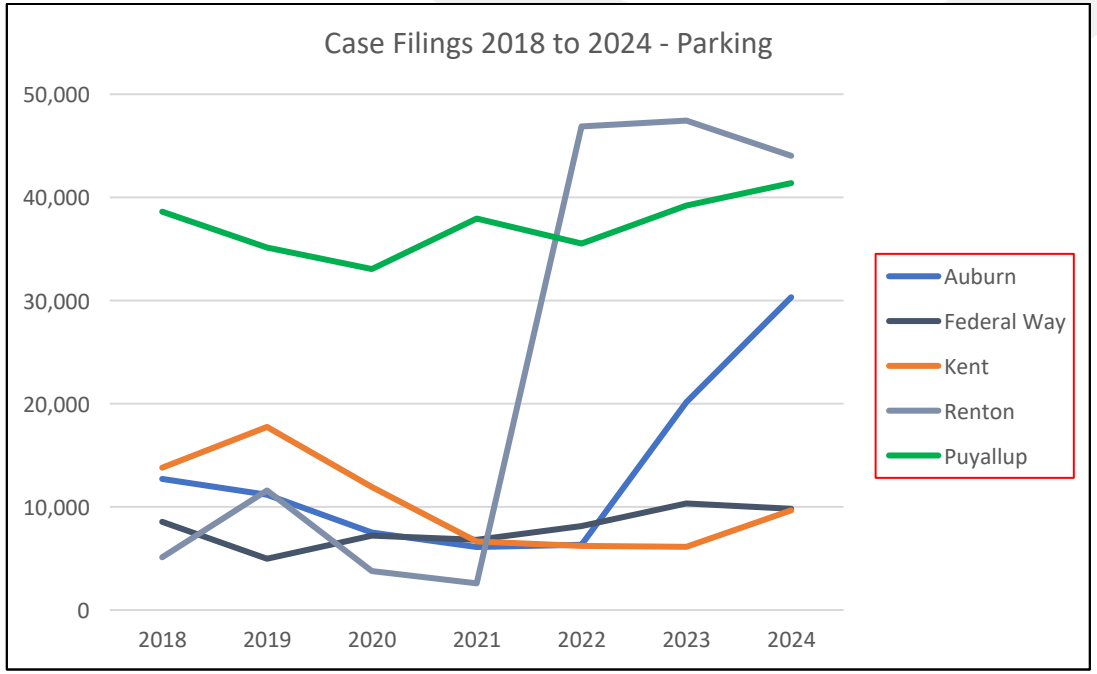
- ✓ Caseload
- ✓ Staffing
- ✓ Financials

Data was also obtained from the Washington Courts statistical website: www.courts.wa.gov/caseload/



COSTS PAID TO KCDC THROUGH ILA (2018-2024)

2018	$2,000,666
2019	$1,684,129
2020	$1,473,781
2021	$1,289,534
2022	$1,396,682
2023	$2,065,735



CASE FILING OVERVIEW

2018 to 2024 Case Filings – Infractions & Misdemeanors

2018 to 2024 Case Filings - Parking

CASE FILING SUMMARY

INFRACTION & MISDEMEANOR

- Case filings in Auburn as well as each of the comparative courts declined significantly during the pandemic years of 2020 and 2021. This was in line with statistics for courts nationwide.

- Both Auburn and Renton were already experiencing declining case filings from 2018 to 2019.

- In four of these five courts, infraction and misdemeanor filings remained generally flat while Federal Way continued to decline through 2023 but rebounded in 2024 based on annualized YTD data.

CASE FILING SUMMARY

INFRACTION & MISDEMEANOR

- All the courts incoming case filings are increasing in 2024, based on annualized figures.
- However, infraction and misdemeanor filings in all five courts remain substantially below the pre-pandemic years.
- Auburn's case filings are consistently higher than Renton's, the trend lines between the two are similar.
- The trend lines for Kent and Auburn are remarkably similar from 2021 – 2024.

CASE FILING SUMMARY

PARKING

- Parking filings generally declined from 2018 to 2021.
- The Federal Way and Kent Municipal Cours saw a modest rebound in parking filings from 2021 to 2024.
- More substantial increases occurred in the Puyallup, Renton, and Auburn courts; in large part due to photo enforcement citations.

COURT STAFFING OVERVIEW – 2023 & 2024

		Federal Way	Kent	Renton	Puyallup
Judicial Need - Estimate	***2023***	2.26	3.59	1.86	2.51
Judicial Officers - Actual	***2023***	2.0	2.0	2.0	1.0
	2024	2.0	2.0	2.0	1.0
Court Administrator	***2023***	1.0	1.0	1.0	1.0
	2024	1.0	1.0	1.0	1.0

Total Staff & Judicial Officers	***2023***	18.25	22.75	17.0	12.13
	2024	18.25	22.0	18.0	12.87

ANNUAL EXPENDITURES OVERVIEW – 2018 – 2024 (YTD)

		Federal Way	Kent	Renton	Puyallup
2018	Salaries & Benefits	N/A	N/A	1,678,704	N/A
	Total Expenses	N/A	N/A	2,225,221	N/A
2019	Salaries & Benefits	N/A	2,077,803	1,804,867	1,111,362
	Total Expenses	N/A	2,935,496	2,397,554	1,605,762
2020	Salaries & Benefits	N/A	2,107,837	1,958,429	1,142,474
	Total Expenses	N/A	2,835,460	2,436,927	1,603,763
2021	Salaries & Benefits	N/A	1,979,096	2,064,879	1,204,839
	Total Expenses	N/A	2,808,701	2,632,080	1,685,168
2022	Salaries & Benefits	1,381,745	1,675,404	2,251,424	1,301,903
	Total Expenses	1,801,321	2,843,622	3,089,584	1,808,590
2023	Salaries & Benefits	N/A	2,897,249	2,263,436	1,521,703
	Total Expenses	1,858,311	3,978,040	3,068,900	2,120,546
2024	Salaries & Benefits	N/A	3,111,460	2,445,441	1,320,773
	Total Expenses	2,582,228	4,094,235	3,326,343	1,830,572

ANNUAL EXPENDITURES OVERVIEW

- As a percentage of total expenses, salaries and benefits costs in virtually all trial courts typically comprise between 70% to 80% of total court operating expenditures.
- Among the four comparison courts, salary and benefit expenditures represented 73.6% of the total expenditures, using the data for years in which were available.
- Kent had the highest total operating expenditures in each year except 2022.
- Renton had the second-highest annual operating expenditures throughout the 7 years.
- These two courts also have the largest court-operated probation departments in terms of staffing levels which would contribute to higher expenditures.

ESTIMATED COST OVERVIEW

- NCSC Team considered caseloads, staffing structures, and financial reports from the comparative courts.
- Two comparative courts most similar to Auburn for case filings were Federal Way and Renton.
- Salary & benefit costs varied widely between Federal Way and Renton.

Because the current Interlocal Agreement with KCDC runs through 2024, NCSC estimated operating costs beginning in 2025.

ESTIMATED ANNUAL OPERATING COSTS - AUBURN

	2022 Baseline	2025	2026	2027	2028
Salary & Benefits	$1,816,584	$2,102,923	$2,208,069	$2,318,473	$2,434,396
Other Operating Expenses	$628,868	$727,993	$764,393	$802,612	$842,743
Total	$2,445,453	$2,830,916	$2,972,462	$3,121,085	$3,277,140

- In addition to the annual operating costs beginning in 2025, the City may incur significant start-up costs prior to commencing operations such as:
  - Furniture and Fixtures
  - Information Technology – Hardware
  - Information Technology – Software
  - Website Development
  - Facility Redesign & Remodeling

PROS & CONS TO RE-ESTABLISHING A CITY-OPERATED MUNICIPAL COURT

PROS

- Attention and focus on Auburn issues
- Ability to collect local data and establish performance measures
- Manage a full-service criminal justice system
- Opportunities to develop unique sentencing options and problem-solving courts
- Local court administrator and staff

CONS

- Lose ability to offer name changes, small claims courts, and protection orders in Auburn
- Increased cost in comparison to current ILA agreement
- Auburn judge will be elected; City has no control over those running for position and or election
- Staffing challenges nationwide for courts

AGENDA BILL APPROVAL FORM

Agenda Subject:
3rd Quarter 2024 Financial Report (Thomas) (20 Minutes)

Meeting Date:
December 9, 2024

Department:
Finance

Attachments:
Financial Report through September 2024, YTD Permit Fee Analysis, 2024 Q3 Financial Update

Budget Impact:

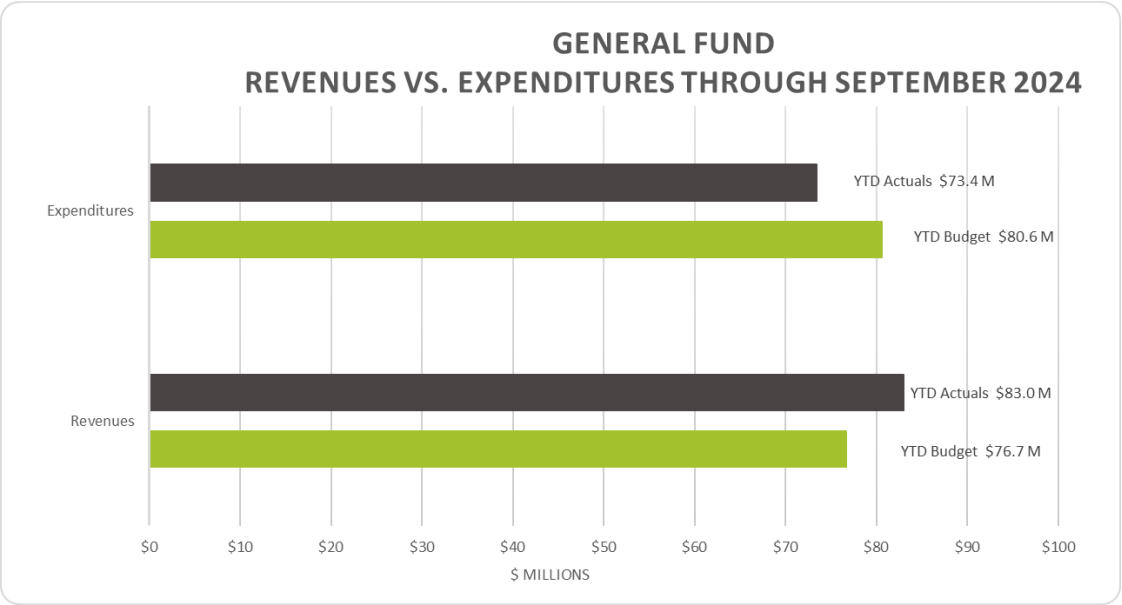
Administrative Recommendation:
For discussion only.

Background for Motion:

Background Summary:
The Financial Report summarizes the general state of Citywide financial affairs and highlights significant items or trends that the City Council should be aware of. The attachment provides year-to-date financial activity through September 30, 2024, based on financial data available as of October 31, 2024.

Councilmember: Kate Baldwin

Staff: Jamie Thomas



This report provides an overview of the City's overall cash-basis financial position for the fiscal period ending September 30, 2024, reflecting data available as of October 31, 2024. References to budget, actual and prior year amounts reflect year-to-date numbers, unless otherwise stated. Year-to-date budget expectations are generally based on the two prior years of data.

General Fund Overview

The City has entered 2024 on the heels of a solid financial performance in 2023 and is in the final steps of developing the biennial budget for the fiscal years of 2025-2026. General Fund revenues have generally exceeded budget expectations and largely recovered from the impact of COVID-19. With the adoption of Ordinance #6945 in August 2024, the annual budget consists of $108.1 million in revenues and $113.6 million in expenditures - a planned decrease in General Fund balance of $5.5 million.

Through the third quarter of 2024, the General Fund outperformed revenue expectations. Comparing year-to-date 2024 revenues versus year-to-date 2023 revenues, the City collected $4.8 million or 6.2% more. A large contributor to this outcome was Business and Occupation (B&O) tax revenue; through the third quarter the City collected $8.9 million in B&O taxes, which includes back dated collections. However, the City anticipates that B&O revenues will decline from a high point of $10.6 million in 2023, as payments related to prior periods decrease. The City also implemented a new photo enforcement program during the second half of 2023, which generated $2.0 million of new revenue through the third quarter of 2024. Mitigating the increases in General Fund revenues, the City also saw expenditures increase from the same period last year by $5.1 million or 7.4%. This is due to planned increases in overhead costs, professional services (citywide projects and improvements), and insurance premiums.

Overall, General Fund revenues collected through Q3-2024 totaled $83.0 million as compared to the year-to-date budget of $76.7 million, and were $6.3 million, or **8.2% above** budget expectations. General Fund expenditures through Q3-2024 totaled $73.4 million compared to the year-to-date budget of $80.6 million; resulting in a $7.2 million or **8.9% underspend**.

Revenue: The following factors had the most significant impacts on the budget vs. actual revenue collected:

- Business and Occupation Tax: Revenues collected throughout Q3-2024 totaled $8.9 million, exceeding the year-to-date budget by $3.6 million. Some of this favorable variance is due to the collection of tax obligations incurred in prior years, which is not expected to continue at the same level in the future. **[*page 8*]**

- Fines and Penalties: Collections through the third quarter of 2024 were $2.8 million in total and $2.0 million favorable to budget. Higher than expected revenues from a new photo enforcement program implemented by the City during the second quarter of 2023 contributed $1.5 million toward the favorable variance. Other non-court fines and penalties are $399,000 favorable versus budget expectations, mainly due to interest and penalties on B&O tax collection. Criminal traffic and criminal costs had an unfavorable variance, slightly reducing the overall favorable variance. **[*pages 18-19*]**

- Retail Sales Tax: The sales tax report for distributions through September 2024 (provided as an attachment to this report) reflects amounts remitted to the City of Auburn based on sales between November 2023 and July 2024. Collections totaled $17.1 million, which is generally on par from last year, driven by lower collections particularly in the construction and retail trade sectors. However, compared to the year-to-date budget, sales tax has a favorable variance of $1.8 million or 11.6%. **[*pages 6-8*]**

- Interest and Investment Earnings: Throughout Q3-2024, interest and investment earnings have totaled $1.7 million in collections and hold a $1.4 million favorable variance to budget. This is largely due to current investments outperforming expectations throughout the year. Multiple investments mature during the remainder of the year, which may reduce the rate of collections to close out the year. **[pages 19-20]**

- Intergovernmental revenue: Q3-2024 revenues collected totaled $5.9 million, which was $1.1 million favorable to the year-to-date budget. The variance is mainly due to the timing of collections from the approved MIT compact request. The 2023 request is fully collected and 75% of the 2024 request have been collected. Furthermore, collections from state and interlocal grants covering prior-year projects have also contributed to the favorable variance. **[*pages 14-15*]**

Expenditures: Most departments operated within their year-to-date budgets through the third quarter of 2024, with some variances due to the timing of professional services payments, as well as expenses related to projects facilitated by ARPA funding. Overall, the favorable variance to the year-to-date expense budget is $7.2 million. Contributing to the favorable variance was a savings in salaries and benefits expenses of roughly $2.7 million; as of the compilation of this report, there were 25 vacant regular full-time positions in the City. Conversely, services and charges were above budget expectations through the third quarter by roughly $2.9 million. This is partially due to the timing of spend on projects in-progress within the City.

Enterprise Funds Overview

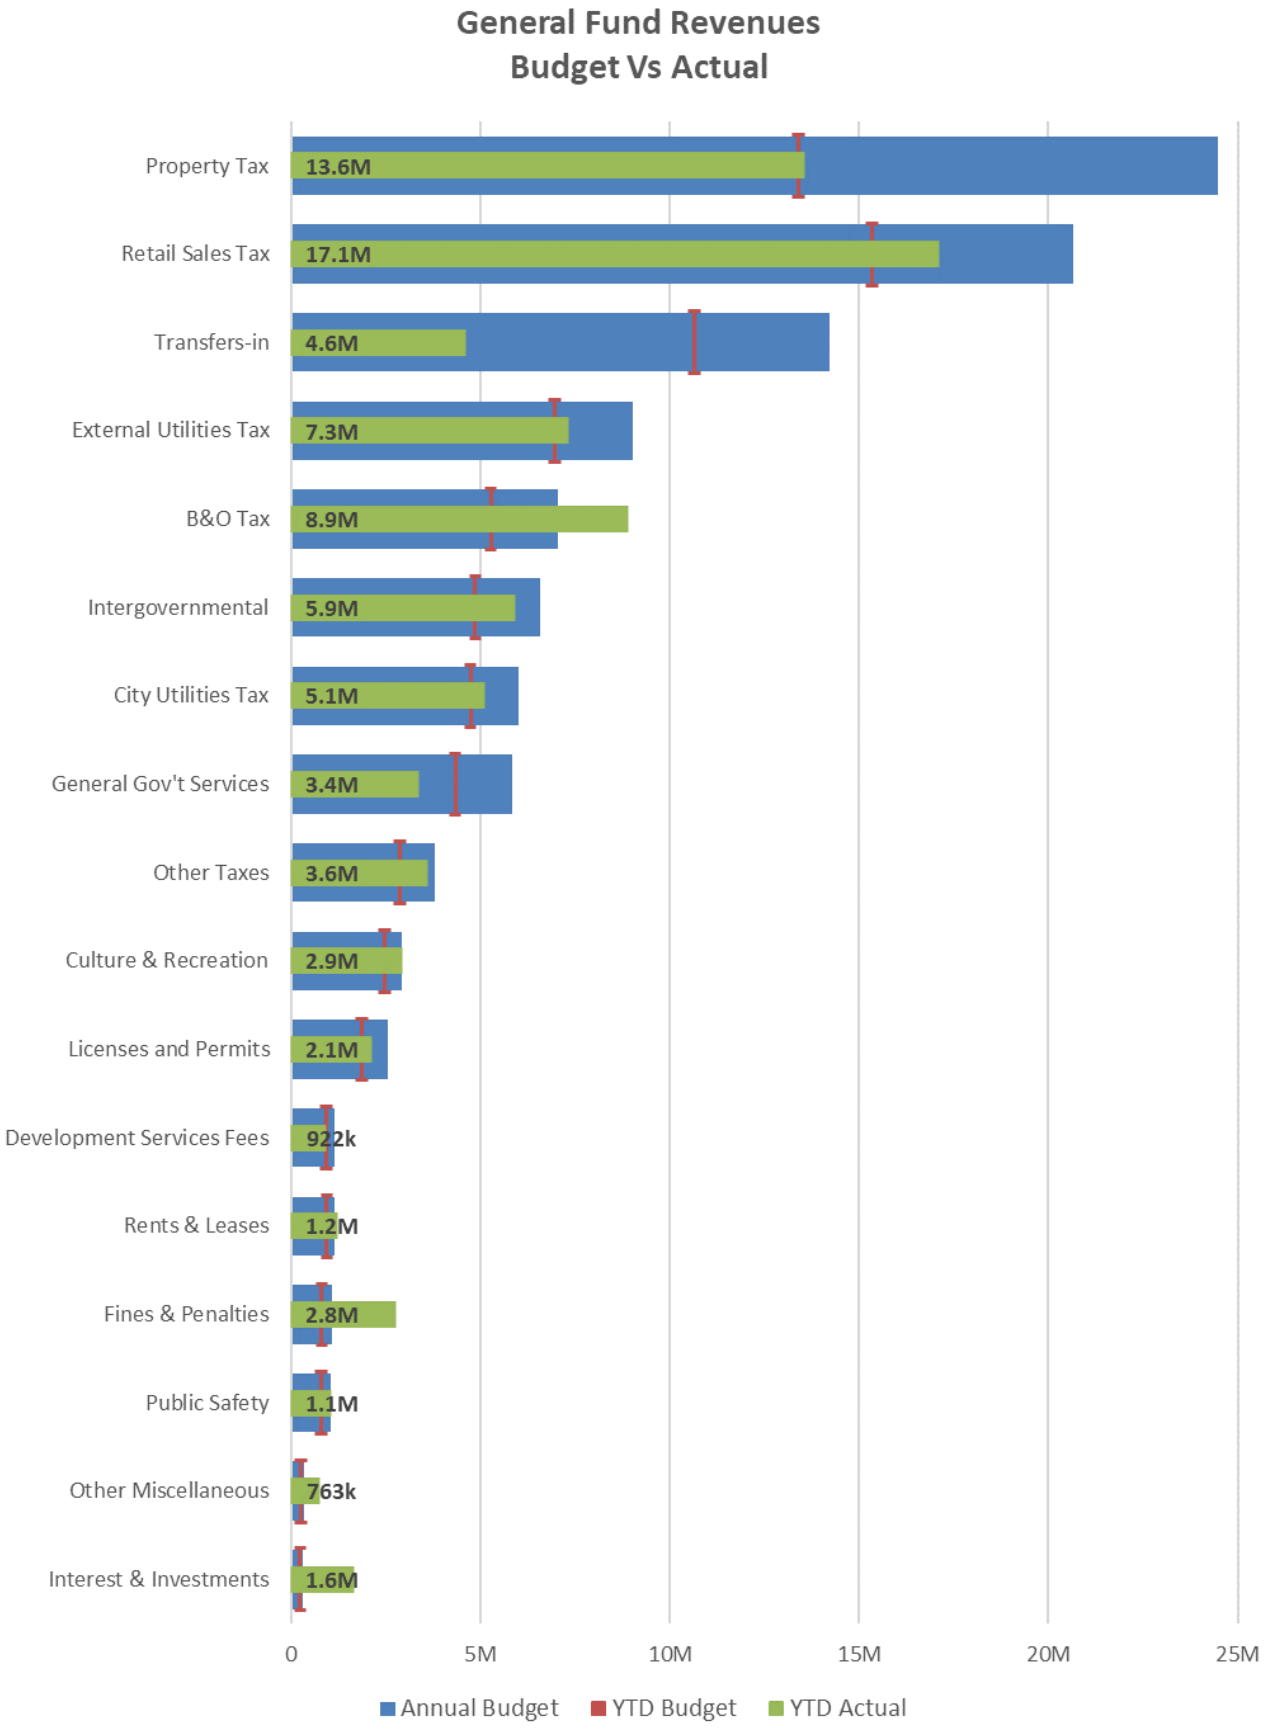
The City's enterprise funds account for operations with revenues primarily provided from user fees, charges, or contracts for services. In the prior year, we noted that the City's cash and investment balances had increased significantly, due to increased interest rates and yields to maturity for the City's investment accounts. In 2024, the maturation of certain investments means the enterprise funds which previously saw significant year-over-year increases in interest earnings are continuing to see higher interest income, albeit at a lower growth rate. Through Q3-2024, interest earnings for the City's enterprise funds were $2.4 million, a $396,000 increase from Q3-2023.

The **Water Utility Fund** ended Q3-2024 with operating income of $5.5 million, an increase of $183,000 compared to the same period last year. This variance is due primarily to increased water sales (+$467,000) and interest earnings (+$61,000), offset by an increase of $336,000 in operating expenditures. Operating revenues through Q3-2024 were higher than expected compared to our budget projections (+$1.1 million), which was driven in part by interest earnings (+$502,000 over budget expectations). Operating expenditures were lower than budget expectations (-$960,000) due to lower than anticipated personnel costs and external utility costs, as well as timing differences for anticipated professional services contracts. **[pages 24-25]**

The **Sewer Utility Fund** ended Q3-2024 with operating income approximately $407,000 higher than Q3-2023, at $3.6 million. Drivers of this change include increased service charges (+$431,000) and interest earnings (+$272,000), offset by increases in operating expenditures (+$296,000), compared to the prior year. In total, operating revenues for this fund were $3.8 million higher compared to our budget projections, due to favorable variances in both operating revenues (+$1.6 million) and operating expenses (-$2.2 million). **[page 25]**

The **Stormwater Utility Fund** ended Q3-2024 with operating income of $2.3 million, which is 0.3% (+$7,600) higher than operating income through Q3-2023. Operating revenues increased $471,000 compared to the prior year, due to an increase in charges for storm service (+$597,000) and decreases in interest earnings (-$81,000) and other miscellaneous revenue sources (-$45,000). Operating expenditures in this fund also increased compared to the prior year (+464,000), due mainly to increased personnel costs as well and utility tax expense. This fund outperformed operating revenue budget projections by $1.5 million through Q3-2024, with favorable variances to budget in operating revenues (+$1.4 million) and operating expenses (-$142,000). **[page 25-26]**

The **Solid Waste Utility Fund** ended Q3-2024 with operating income of $346,000, a $379,000 decrease compared to the same period last year. Operating revenues increased $1.6 million from Q3-2023 to Q3-2024, due primarily to an increase in 2024 solid waste rates adopted in November 2023 (Ordinance #6920). Year-to-date operating expenditures increased $2.0 million compared to the prior year, driven primarily by timing differences. It is expected that increases to charges for service in this fund will have corresponding increases in payments to the City's solid waste vendor. **[page 26]**



Internal Service Funds Overview

Internal service funds provide services to other City departments and include functions such as Insurance, Worker's Compensation, Facilities, Innovation & Technology, and Equipment Rental. No significant variances were reported in these funds during Q3-2024. **[page 26]**

General Fund Details

The following chart is a detailed breakdown of the General Fund's different sources of revenue and expenditures, broken down by department:

General Fund Summary of Sources and Uses	2024 Annual Budget	2024 YTD Budget	2024 YTD Actual	2024 YTD Budget vs. Actual Favorable (Unfavorable) Amount	Percentage	2023 YTD Actual	2024 YTD Actual vs. 2023 Actual Favorable (Unfavorable) Amount	Percentage

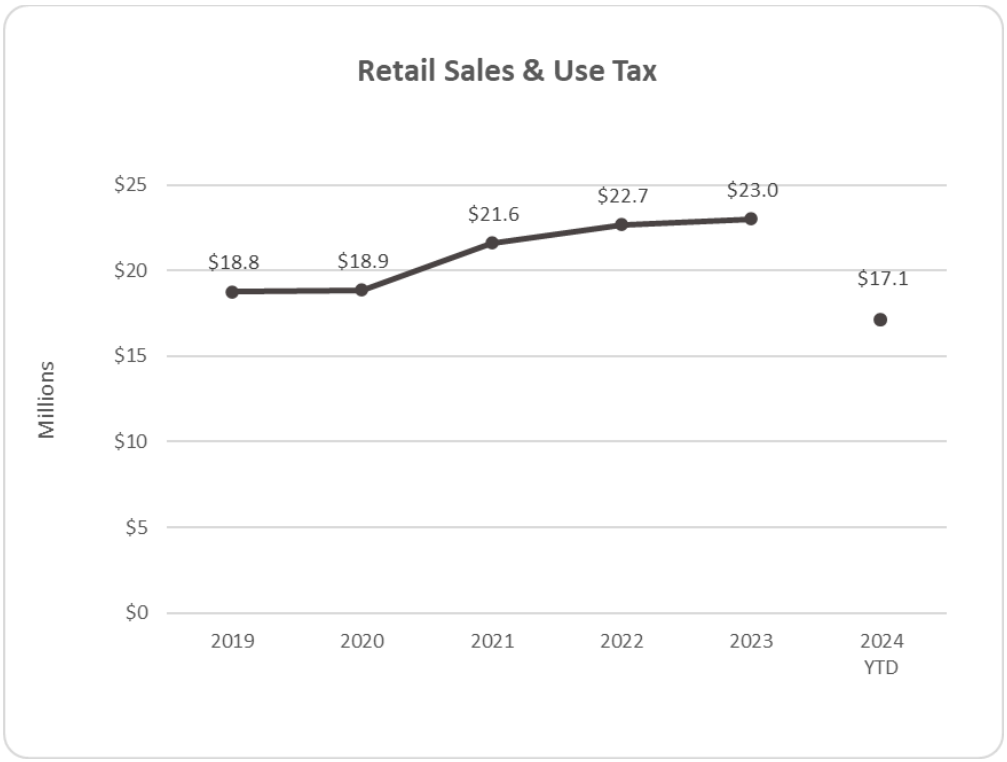
Revenue

Tax revenues, including property, sales/use, utility, business & occupation, gambling, and admissions taxes provides over 65% of all resources supporting general governmental activities. Licenses, charges for services, intergovernmental revenue (grants, state shared revenue, etc.) and fines contribute a further 20% of total revenue to the General Fund. The remaining 15% is comprised of a combination of different sources that are considered to be one-time resources. The following section provides additional information on the most significant tax resource streams.

Property Tax collections through the third quarter totaled roughly $13.6 million, approximately $173,000 or 1.3% above budget projections. However, as depicted in the graphic below, the majority of property taxes are collected during the months of April and October, coinciding with the due dates for county property tax billings.



Retail Sales Tax collections through Q3-2024 totaled $17.1 million, representing taxes remitted to the City of Auburn based on sales from November 2023 through July 2024. Overall, these revenues increased slightly by $13,000, or 0.1%, from Q3-2023 collections due to lower performances in the construction (-$223,074), retail (-$49,886), and manufacturing (-$38,831) industries. Offsetting the slight decreases, increases in the services (+$247,277) and transportation (+$72,434) industries helped mitigate the year-to-date decrease from prior year totals. In comparison to the year-to-date budget, these revenues are favorable by nearly $1.8 million or 11.6% through the third quarter. Historically, the City collects more sales tax revenues during the second half of the year, mainly due to the upcoming holiday seasons.

The City set a retail sales tax budget of $20.6 million for the fiscal year of 2024; based on year-to-date performance, collections may exceed this by year-end. King County estimates[1] that sales tax revenues will have an annual growth of 3.9% from 2023 actuals. By comparison, the City budgeted conservative annual growth of sales tax revenues of 1.5%. The City has seen consistent growth in recent years, but the rate of growth is volatile and has generally been in decline since 2019.

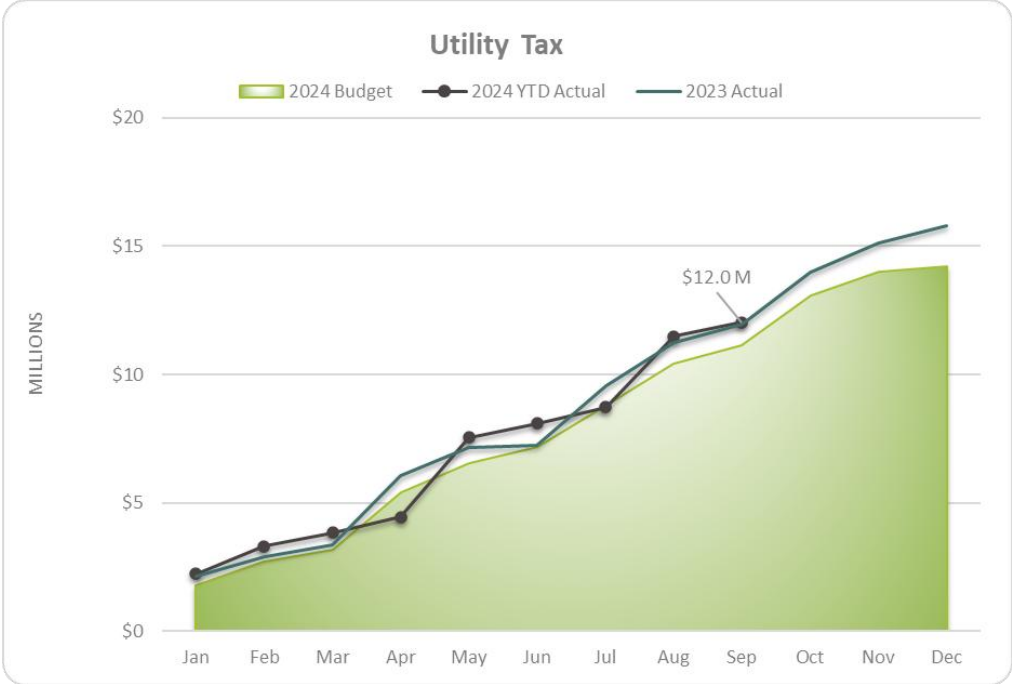
YTD Total	$ 17,105,944	$ 17,118,815	$ 12,872	0.1 %

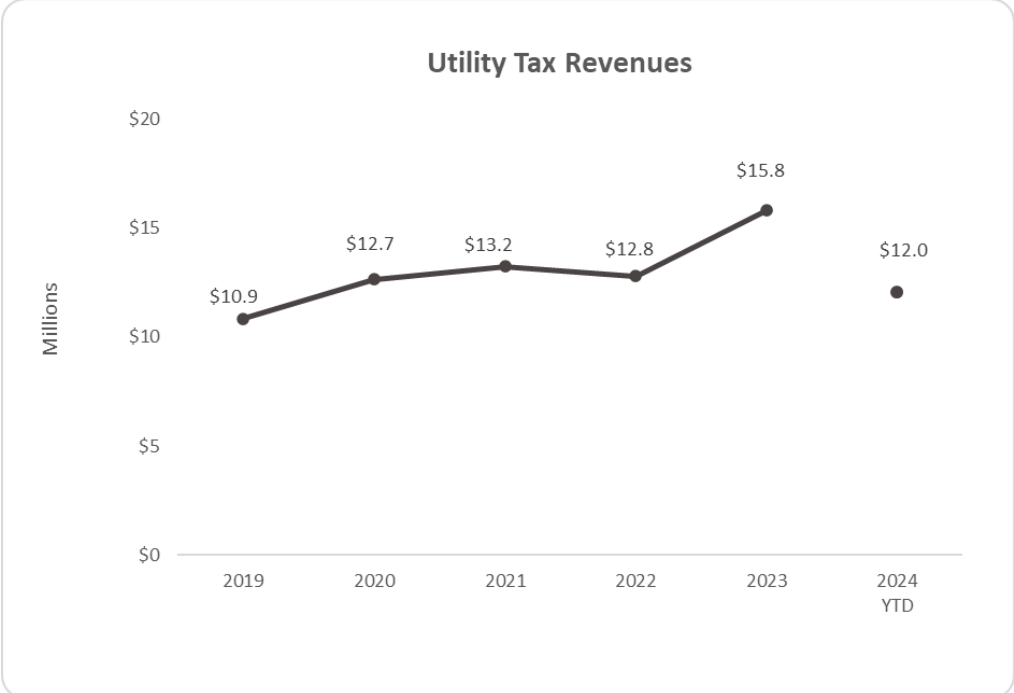
Business & Occupation (B&O) Taxes were implemented by the City at the beginning of 2022. These taxes are collected from businesses based on either the value of gross receipts or square footage of occupied warehousing space, subject to certain constraints. While the City receives collections throughout the year, B&O taxes are generally received on a quarterly basis.

By reconciling against the State's Business Licensing System, the City has been able to identify taxes collectable from prior periods, significantly contributing to the performance of this revenue. Overall collection through the third quarter of the year totaled $8.9 million versus a year-to-date budget of $5.3 million. Current 2024 collections outpace 2023 collections through the same period by $380,000 (4.5%), although recovery of back taxes is anticipated to decrease over time.

Utility Taxes consist of an 11.5% tax on the gross revenues of water, sewer, storm drainage and solid waste utilities and a 6.0% tax on electric, natural gas, and telephone utilities operating within the City. Of those utilities taxed at 11.5%, the General Fund receives 9.0% while the remaining 2.5% is dedicated to funding City streets projects. The utilities taxed at 6.0% contribute 5.0% to the General Fund and 1.0% to City streets projects.



Overall, utility taxes increased by $220,400 or 1.9% from Q3-2023 and are $920,700 favorable to budget. Roughly 72% of the utility taxes collected by the City are represented by the city interfund utility taxes and electric utility taxes. These two revenue sources accounted for $8.7 million of the collected $12.0 million throughout the third quarter of 2024.



Furthermore, telephone taxes have increased from Q3-2023 by $201,500, which was mainly due to the timing of collections from prior year activity. Telephone taxes are collected in arrears on a quarterly basis, which causes the timing variance from prior year and quarters. Currently, the largest portion of the overall favorable variance to budget occurs within the external utility taxes category due to the City collecting backdated utility taxes from solid waste haulers. The City anticipates this level of collection to slow as more utility taxes become current, since the collection of backdated taxes are assumed as a one-time collection and should not expect back taxes to contribute a material amount in the future.

The table and graphics below demonstrate the various utility tax revenues and show actual revenues compared to budget. Note that these amounts represent only the General Fund portion of revenues, and do not contain those revenues allocated for funding City streets projects.

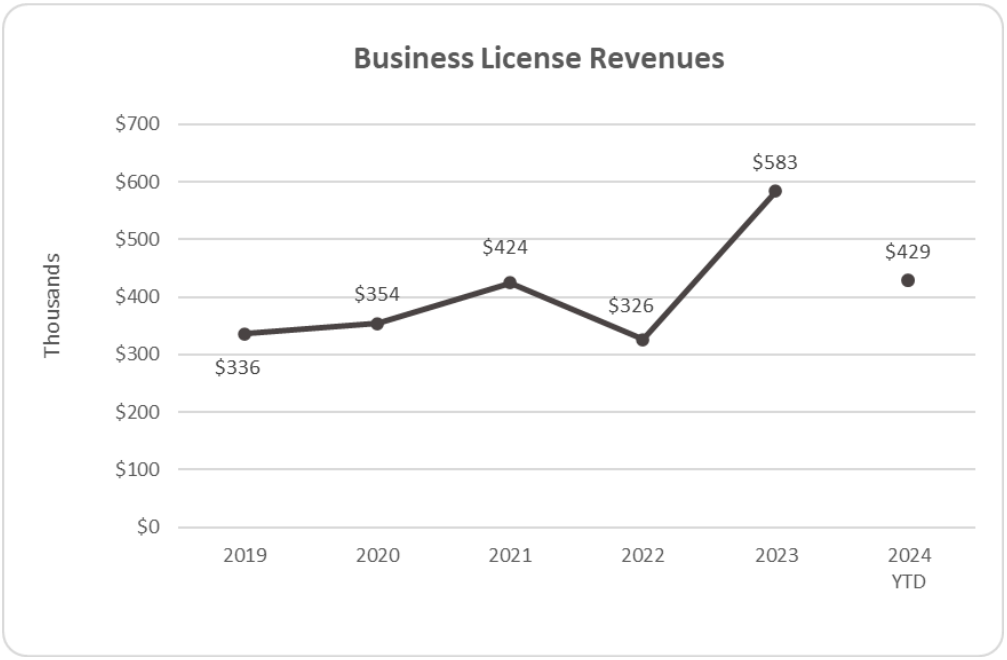
Utility Tax by Type (General Fund Portion)
Through September 2024

	2024			Favorable (Unfavorable		2023	2024 YTD Actual vs. 2023 Actual	
Revenue	Annual Budget	YTD Budget	YTD Actual	Amount	Percentage	YTD Actual	Amount	Percentage
City Interfund Utility Taxes	$ 5,989,667	$ 4,737,000	$ 5,104,647	$ 367,647	7.8%	$ 4,709,841	$ 394,807	8.4%
Electric	4,426,743	3,517,200	3,569,944	52,744	1.5%	3,380,170	189,774	5.6%
Natural Gas	1,658,523	1,304,000	1,124,464	(179,536)	-13.8%	1,297,025	(172,561)	-13.3%
Telephone	435,847	308,709	538,112	229,403	74.3%	336,654	201,458	59.8%
External Utility Taxes	621,973	432,858	892,508	459,649	106.2%	1,136,453	(243,946)	-21.5%
Brokered Natural Gas	150,000	121,400	200,182	78,782	64.9%	267,471	(67,289)	-25.2%
Cable	931,981	698,986	610,963	(88,023)	-12.6%	692,837	(81,874)	-11.8%
Total	$ 14,214,734	$ 11,120,153	$ 12,040,820	$ 920,667	8.3%	$ 11,820,451	$ 220,368	1.9%

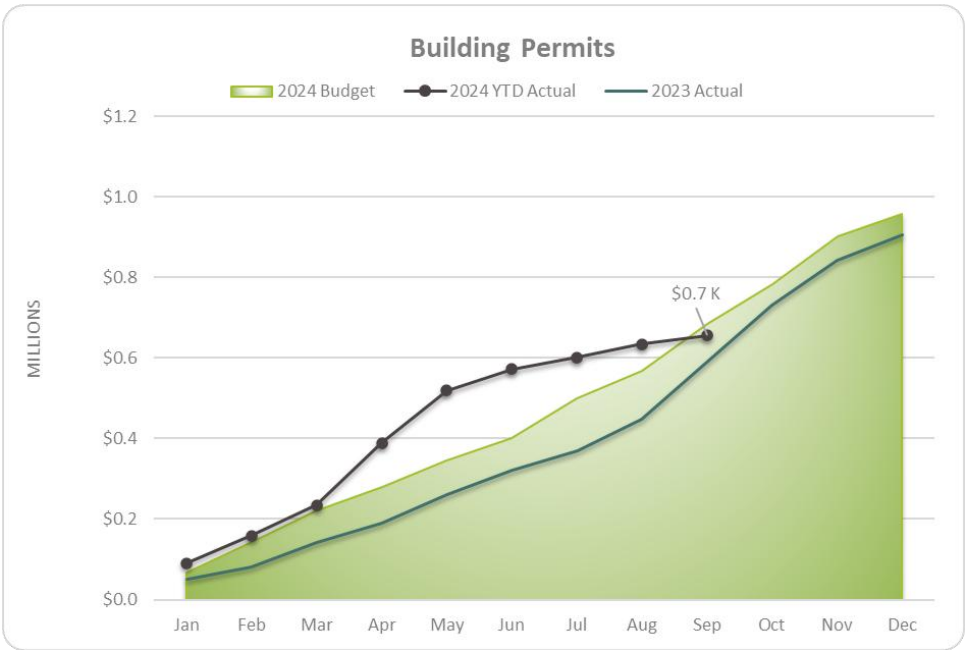
Note: *The large increase from 2019 ($10.9 million) to 2020 ($12.7 million) is attributed to the City's decision mid-2020 to reallocate 1.0% previously dedicated to the Arterial Street Preservation Fund to support General Fund operations due to the uncertainty of the economic impacts of COVID-19. The Arterial Street Preservation Fund's 1.0% was reinstated in 2021, but 2021 collections continued to increase due to an increase in the City's internal utility tax rate from 7.0% to 10.0%. The significant jump from 2022 ($12.8 million) to 2023 ($15.4 million) is largely due to higher service revenue following a rate increase effective in 2023, combined with higher service usage and the collection of B&O taxes on businesses that provide utility services.*

An **Admission Tax** of 5.0% is placed on charges for general admission, season tickets, cover charges, etc. which are generally collected on a quarterly basis. Admission tax revenues of approximately $543,000 collected through September 2024 were significantly higher (91.1%) than Q3-2023, and favorable variance to budget by $290,400. The large increase in collections in March was due to a one-time payment as part of an agreement. Controlling for this non-recurring payment, admission taxes are still reporting a favorable variance to budget by roughly $183,800.

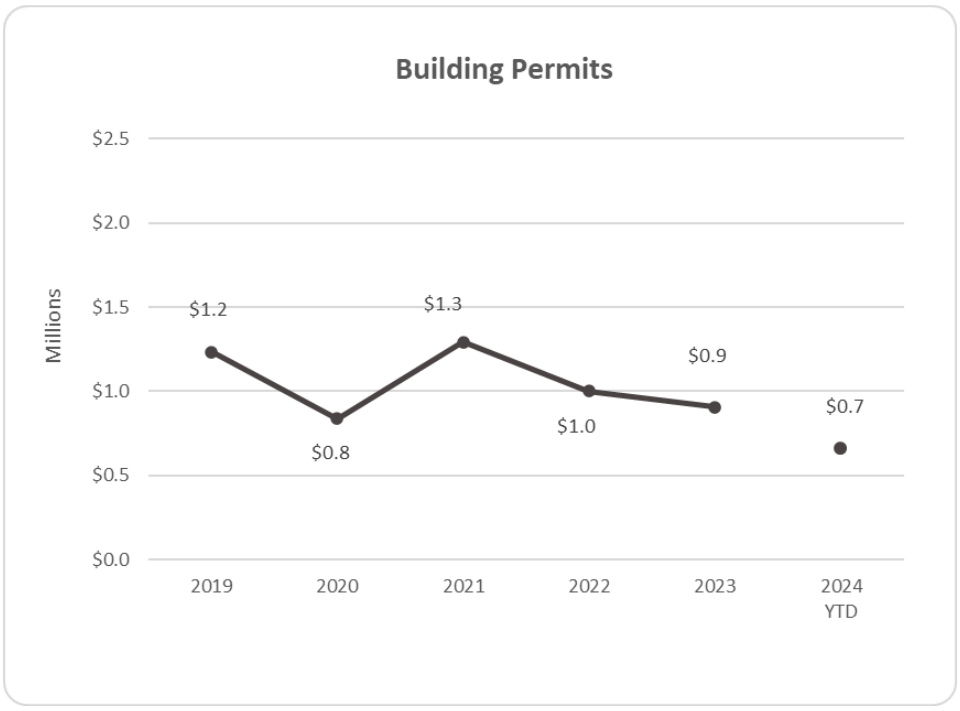
Gambling Tax applies to all card games, punch board games, pull tabs, bingo games, raffles and amusement games played within City limits. The majority of gambling tax revenues are collected from amusement games (63.0%) and card games (21.6%). At $126,400 through the third quarter, collections are $117,300 lower than 2023 year-to-date totals and report a $88,900, or 41.3%, unfavorable variance to budget. The primary driver for the unfavorable variance minimal collections for card games. The City believes this may not be mitigated by the end of the year due to the timing of collecting backdated taxes, resulting in potential higher collections in the beginning of 2025. Gambling tax revenues historically have high volatility both month-over-month and year-over-year: excluding 2021 (due to COVID-19 restrictions), recent revenues through three quarters of the year average about $223,000 but have been as high as $313,800 (2018) and as low as $75,000 (2020). Lower performance in gambling taxes combined with lower retail sales tax collections potentially indicates a decrease in disposable cash in the area.



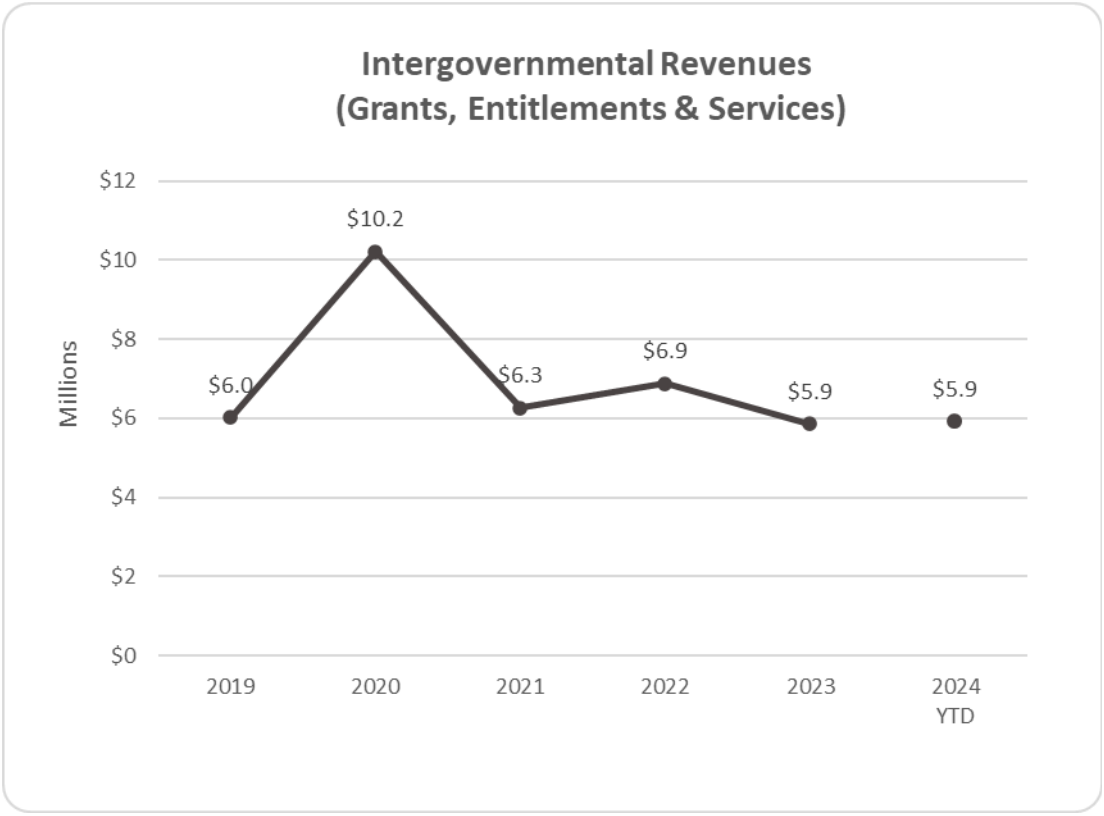
Licenses and Permits include business licenses, building permits, plumbing, electric and other licenses and permit fees. Building permit fees (approximately 60%) and business licenses (approximately 15%) typically comprise most of the budgeted revenue in this category.



The annual **Business License** renewal fee for each business located within the City is $103, with the renewal cycle for each business beginning on the date the business was originally granted a license. Until September 2022 businesses had been on a calendar year renewal cycle, with most revenue being collected in November and December.



The updated renewal cycle has smoothed revenue collection throughout the year, which can be seen in the chart below as a relatively linear progression of year-to-date collections totaling $429,000 compared to $413,500 in Q3-2023, a 3.7% increase. Historically, business license collections have been a highly volatile revenue source, though collections in 2024 are projected to be comparable to 2023 totals due to increased discovery through B&O tax collections due to use of the State's Business Licensing System and a revamped collection schedule of these revenues.



Building Permit revenues collected through September 2024 totaled $655,800. Building permits are approximately $65,250 higher than 2023 collections year-to-date, although there is an unfavorable variance against the budget of $28,600 (-4.2%). A large contributing factor for this favorable variance versus 2023 totals is the increased valuation of construction permits on mixed use and subdivision builds. The number of permits submitted through the third quarter have also increased by 17.4% over the same period last year, representing an increased workload of construction throughout the City. This increase is mainly from one large project within City limits.

Intergovernmental revenues include grants and stimulus monies (direct and indirect federal, state, and local), revenue from the Muckleshoot Indian Tribe (MIT) compact as well as state shared revenues. Collections through Q3-2024 totaled $5.9 million and were $1.4 million favorable to budget expectations. Much of this favorable variance is due to the collection of the approved 2024 Muckleshoot Casino compact request. The City received the final payment of the 2023 request in the beginning of the year and have since collected roughly 75% of the 2024 request. The current trend of the payments received from Muckleshoot Casino indicates we should expect the final 2024 payment to be made in the beginning of 2025. Furthermore, federal and interlocal grant reimbursements for projects like the police body-worn camera program have also contributed to the favorable variance.

Intergovernmental Revenues (Grants, Entitlements & Services) Through September 2024								
	2024			Favorable (Unfavorable		2023	2024 YTD Actual vs. 2023 Actual

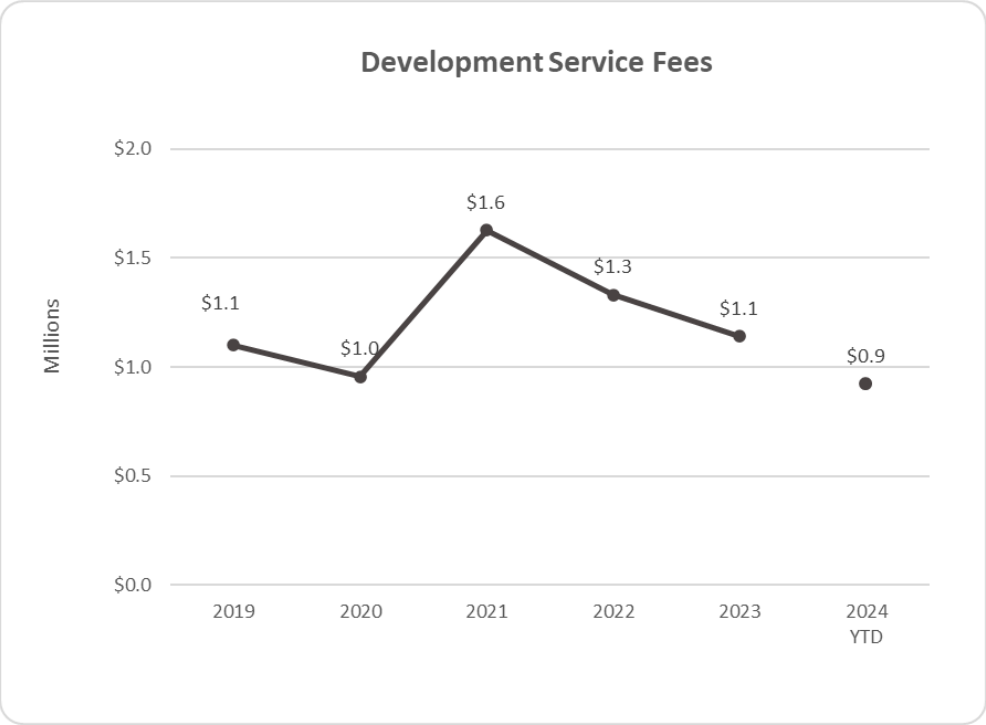
Total State Shared:	3,645,459	2,775,081	2,721,841	(53,240)	-1.9%	3,028,823	(306,983)	-10.1%
YTD Total	$ 6,561,349	$ 4,863,963	$ 5,914,344	$ 1,050,381	21.6%	$ 4,494,687	$ 1,419,657	31.6%

Note: *2020 revenue was higher than normal due to the receipt of $3.8 million in federal CARES grant money from the Department of Treasury*.

Charges for Services consist of general governmental service charges, public safety charges, development service fees, and culture and recreation fees. Total charges for services collected through September 2024 totaled $8.3 million and were $217,600, or 2.6%, less than expected to date. This was mainly due to general government revenues (specifically SKHHP reimbursements) being lower than anticipated due to the timing of projects associated with these reimbursements.



Charges for Services by Type
Through September 2024

	2024			Favorable (Unfavorable		2023	2024 YTD Actual vs. 2023 Actual	
Revenue	Annual Budget	YTD Budget	YTD Actual	Amount	Percentage	YTD Actual	Amount	Percentage
General Government	$ 5,824,577	$ 4,339,666	$ 3,378,097	$ (961,569)	-22.2%	$ 3,346,174	$ 31,923	1.0%
Public Safety	1,057,000	792,750	1,072,059	279,309	35.2%	773,804	298,255	38.5%
Development Services	1,158,080	922,300	921,591	(709)	-0.1%	832,887	88,704	10.7%
Culture & Recreation	2,915,485	2,467,946	2,933,340	465,394	18.9%	2,740,415	192,925	7.0%
Total	$ 10,955,142	$ 8,522,662	$ 8,305,087	$ (217,575)	-2.6%	$ 7,693,280	$ 611,807	8.0%

The *General government* revenue category primarily includes the interfund assessment for support departments (Finance, Human Resources and Legal). Operating costs for these departments are charged to the respective General Fund home department and the portion of those costs that provide citywide benefit are recouped from other funds via interfund charges. General government revenues also include fees for passport services, reimbursement for expenses related to South King Housing and Homelessness Partners (SKHHP), as well as transportation projects. The unfavorable variance of $961,500 to budget is due to the timing of SKHHP revenues, which are received on a reimbursement basis. Based on current schedules, most of the budgeted expenses are for projects budget to occur in 2024, but which are likely to be moved to the 2025 fiscal year.

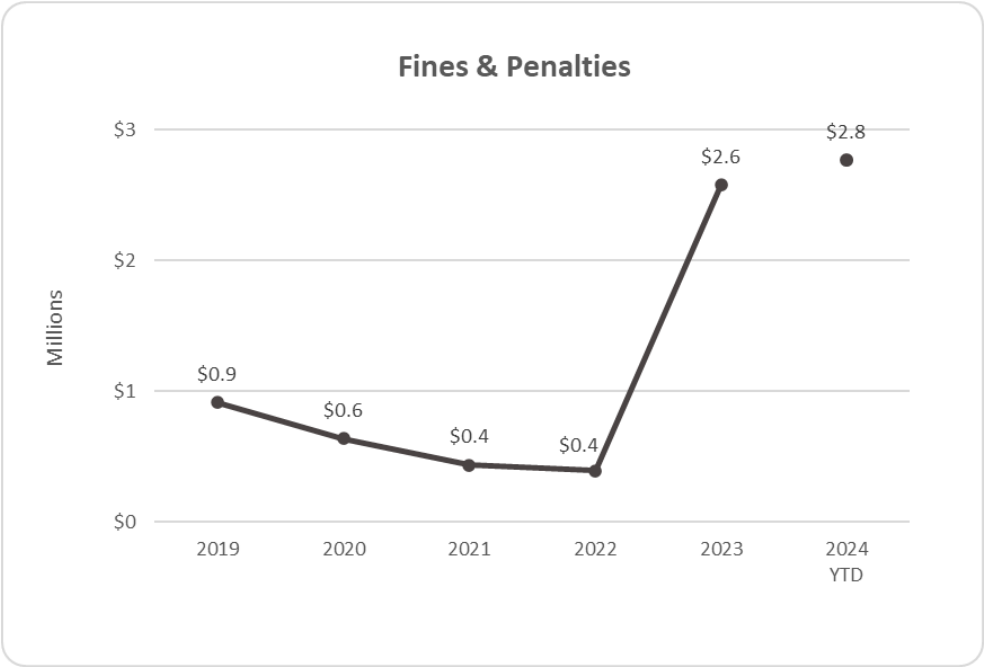
Public safety revenues mainly consist of collections for law enforcement services, which are extra duty security services whereby police officers are contracted for, and reimbursement is made by the hiring agency. This category also includes reimbursements from the Muckleshoot Indian Tribe (MIT) for a full-time dedicated police officer and associated expenditures, as well as monies collected from the Auburn School District for services rendered. Public safety revenues collected through the third quarter of 2024 totaled $1.1 million and saw a $298,300 increase from 2023 third quarter totals. This is largely attributable to higher-than-expected law enforcement services collected. Comparing 2023 vs 2024, law enforcement services have increased by $362,300. Somewhat mitigating the overall favorable variance versus prior year, DUI emergency response fees collected have decreased by $57,500.. Overall, public safety collections hold a favorable variance to year-to-date budget expectations by $279,300.

Development services fee collections consist primarily of plan check fees, facility extension charges, and zoning and subdivision fees. Through Q3-2024, development service fees collected totaled $921,600, on par with budget expectations. Within this category, unfavorable variances to year-to-date budget existed in plan check fees, where construction documents require review per Section 106.3 of the Construction Administrative Code (-$13,100) and environmental services (-$21,400). These were offset by favorable variances in fees assessed on projects that require extension of public facilities (+$20,300) and zoning and subdivision fees (+$13,500). This is an effect of the revenue regressing to the mean after an exceptional two-year period of high collections from 2021 through 2022. Although overall collections through the first three quarters of 2024 are lower than the same periods in 2021 and 2022, they are still higher than any other third quarter year-to-date collections dating back to 2009.

Most *Culture and Recreation* revenues are derived from green fees and pro shop sales at the Auburn Golf Course, recreational classes, ticket sales at the Auburn Avenue Theater, senior programs, and special events. Overall, this category of revenues outperformed budget expectations by $465,400, or 18.9%.

Nearly 65% of the year-to-date Culture and Recreation revenues have come from the Auburn Golf Course. Green fee revenues have increased by $122,000 or 8.6% from the same period last year and are favorable to budget by $187,250 year-to-date. The City projects that green fees collections will slowly decrease through the remainder of the year, as the peak season for golfers have passed. Since 2018, green fee revenues have increased annually, seeing a large spike in 2020 through 2021, followed by modest increases in 2022 and 2023. The City anticipates continued modest growth in 2024 based on updated green fee rates.

Recreation classes represent 21% of year-to-date culture and recreation collections through the third quarter, and have generally remained consistent from prior year-to-date totals with $614,000 in collections. Ticket sales for performances held at local school venues (previously held at the Auburn Avenue Theater) have decreased by $22,100 or 23.2% from prior year totals but carry a favorable variance to budget by $39,300. This is mainly due to the Performing Arts Center decreasing to two shows year-to-date in 2024 compared to three shows in 2023. with continued community participation in recreational classes through the remainder of the year.



Fines & Penalties include civil penalties (such as code compliance fines), parking and traffic infraction penalties, criminal fines (including criminal traffic, criminal non-traffic, and other criminal offenses) as well as non-court fines such as false alarm fines. The table below shows a detailed breakdown of the different types of fines and penalties collected by the City.

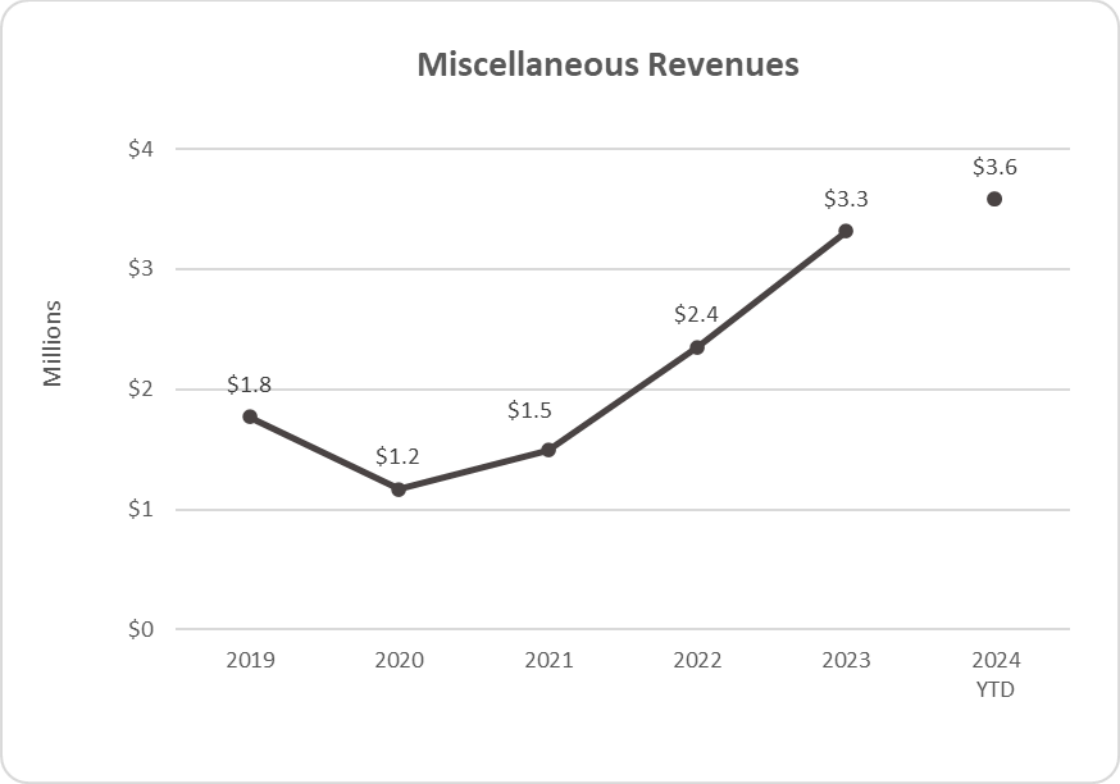
Fines & Penalties by Type
Through September 2024

	2024			Favorable (Unfavorable		2023	2024 YTD Actual vs. 2023 Actual	
Revenue	Annual Budget	YTD Budget	YTD Actual	Amount	Percentage	YTD Actual	Amount	Percentage
Civil Penalties	$ 10,000	$ 7,970	$ 8,783	$ 813	10.2%	$ 1,543	$ 7,240	469.3%
Civil Infraction Penalties	138,313	98,900	132,674	33,774	34.1%	110,098	22,576	20.5%
Photo Enforcement	3,000	1,900	157	(1,743)	-91.7%	1,067	(910)	-85.3%
Parking Infractions	733,506	550,130	2,078,436	1,528,306	277.8%	372,412	1,706,023	458.1%
Criminal Traffic Misdemeanor	40,000	28,600	25,847	(2,753)	-9.6%	20,950	4,897	23.4%
Criminal Non-Traffic Fines	41,000	32,400	56,679	24,279	74.9%	41,770	14,908	35.7%
Criminal Costs	30,000	25,600	7,314	(18,286)	-71.4%	9,667	(2,354)	-24.3%
Non-Court Fines & Penalties	76,000	56,800	455,806	399,006	702.5%	822,487	(366,681)	-44.6%
Total	$ 1,071,819	$ 802,300	$ 2,765,694	$ 1,963,395	244.7%	$ 1,379,994	$ 1,385,700	100.4%

Total revenues collected through September 2024 totaled $2.8 million as compared to a budget of $802,000 and were 244.7% above budget expectations. This is primarily due to collections of the photo enforcement program implemented in 2023, which are classified as parking infractions. Furthermore, the City received an influx of non-court fines & penalties through the first half of the year due to back-pay of B&O taxes.

The City contracts with the King County Court to operate its municipal court services. The number of hearings, judgments, and collections activity began decreasing in 2019 and has continued to decline since that time. Although the graph below shows a large spike in revenue in 2023 and strong performance in 2024, this is almost entirely due to photo enforcement and B&O-related collections. Excluding these sources, the remaining court-related collections have declined to $231,500, approximately one-third of their third quarter average for the period of 2015-2019, prior to contracting with King County. The City is currently conducting a feasibility study of alternatives to contracting with King County.

Miscellaneous Revenues consist of investment earnings, income from facility rentals, revenue collected for golf cart rentals at the Auburn Golf Course, contributions and donations, and other income including the quarterly purchasing card (P-card) rebate monies. The most significant miscellaneous revenue categories are listed in the table below.



Miscellaneous Revenues by Type
Through September 2024

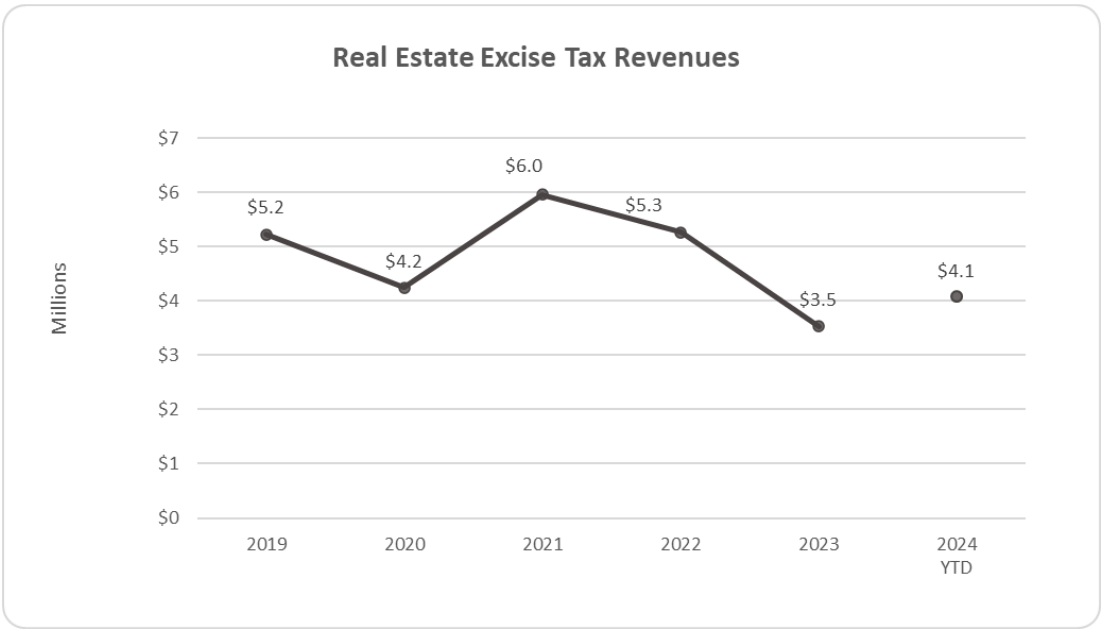
	2024			Favorable (Unfavorable		2023	2024 YTD Actual vs. 2023 Actual	
Revenue	Annual Budget	YTD Budget	YTD Actual	Amount	Percentage	YTD Actual	Amount	Percentage
Interest & Investments	$ 315,000	$ 236,250	$ 1,648,748	$ 1,412,498	597.9%	$ 891,832	$ 756,916	84.9%
Rents & Leases	1,142,948	940,900	1,214,999	274,099	29.1%	1,029,401	185,597	18.0%
Contributions & Donations	42,000	33,202	18,889	(14,313)	-43.1%	25,421	(6,533)	-25.7%
Other Miscellaneous Revenue	258,000	208,213	701,042	492,829	236.7%	371,846	329,196	88.5%
Total	$ 1,757,948	$ 1,418,564	$ 3,583,677	$ 2,165,113	152.6%	$ 2,318,500	$ 1,265,177	54.6%

Revenues collected year-to-date 2024 in this category totaled $3.6 million and were $2.2 million or 152.6% favorable to budget. Of the favorable variance to budget, 65.0% was comprised of interest and investment collections, far exceeding budget expectations due to higher-than-expected interest rates and the maturation of multiple investments during the third quarter.

The rents and leases category includes payments for facility rentals, golf cart rentals, and restaurant lease at the golf course. Rents and leases were favorable by $274,100 against year-to-date budget expectations, with a temporary easement of City property contributing significantly to the variance. Golf carts and other rentals were also favorable to expectations by $72,800, resulting in a favorable balance of budget to actual for the category. The rents and leases category generally exhibits seasonality, with the peak being in the spring and summer months. To date, rents and leases are $185,500 above 2023 collections through the same period, as the City has seen increased numbers of events that request the use of City facilities.

The “Other Miscellaneous Revenue” sub-category reported $329,200 more than the same timeframe last year and was favorable to the year-to-date budget by $493,000. This category includes $406,500 in revenue related to a national opioid settlement distribution program.

OTHER FUNDS



Real Estate Excise Tax (REET) revenues are taxes on the sale of both commercial properties and single-family residences. These collections are receipted into the Capital Improvement Projects Fund and used for governmental capital projects.

REET revenues collected year-to-date in 2024 total $4.1 million which is $2.4 million or 58.7% favorable to budget expectations. According to King County assessed valuations of property taxes, the City has increased in property value by 2.3%. Accompanied with lower interest rates currently, the current climate for real estate sales is favorable for citizens within the State of Washington.

Year-to-date REET collections in 2024 are significantly outpacing those of last year, and have only been exceeded in the last ten years by 2015 and 2022 year-to-date collections. This is a sign of recovery after two years of declining annual REET revenues. Collections peaked in 2021 following two years of historic low interest rates maintained by the Federal Reserve in response to COVID-19. However, interest rates were increased throughout 2022 and 2023 to address severe inflation, cooling the market and lowering REET collections in those years. The federal funds rate decreased in September and is expected to change again in October. With an expected reduction later this year, REET collections appear to be improving. Generally, REET revenues have reflected the overall market volatility in recent years, with a standard deviation of $960,400 or 29.0% of the average annual collections over the time period of 2017 to 2023.

Real Estate Excise Tax Revenues Through September 2024

American Rescue Plan Act (ARPA) Fund

In March 2021, the American Rescue Plan Act (ARPA) was signed into law, with the intent of mitigating the economic impacts related to COVID-19. Through ARPA's State and Local Government Fiscal Recovery Fund program, the City was allocated $14.75 million in funding. Council approved the City's acceptance of ARPA funds in Resolution #5608, and the general spending categories of those funds (as determined by a Council ad hoc committee) in Ordinance #6832.

The City's plan for using ARPA funding is to mitigate the cost of providing public safety services throughout the City. Since receiving the funding, the City has used all $14.8 million to offset public safety expenditures, as shown in the table below and reported to the Department of the Treasury.

ARPA FUNDING STATUS	
Total ARPA Funding Received	14,751,231
ARPA Funding Used to Mitigate Public Safety Costs	14,751,231
ARPA Funding Remaining	-

As a result of the cost mitigation provided by the ARPA funding, the City has been able to allocate General Fund funding toward projects approved by the Council ad hoc committee. As of September 30, 2024, the City has been able to spend $900,693 year-to-date and $5.3 million since 2021 on the following projects:

Title	Budget	2024 Q3 Spend	Lifetime Spend (includes this quarter)	Remaining
Completed Projects	**2,041,659**	-	2,041,658	-
Body Cameras	**586,400**	-	550,325	36,075

Total:	**14,751,231**	**553,670**	**5,254,408**	**9,496,822**

The project *Downtown Sidewalk Replacement on Main Street and B Street Plaza Surface Replacement* will construct infrastructure improvements in Downtown Auburn along Auburn Ave. from East Main St. N to 1st St. NE and on East Main St. from Auburn Ave to B St. NE, including B

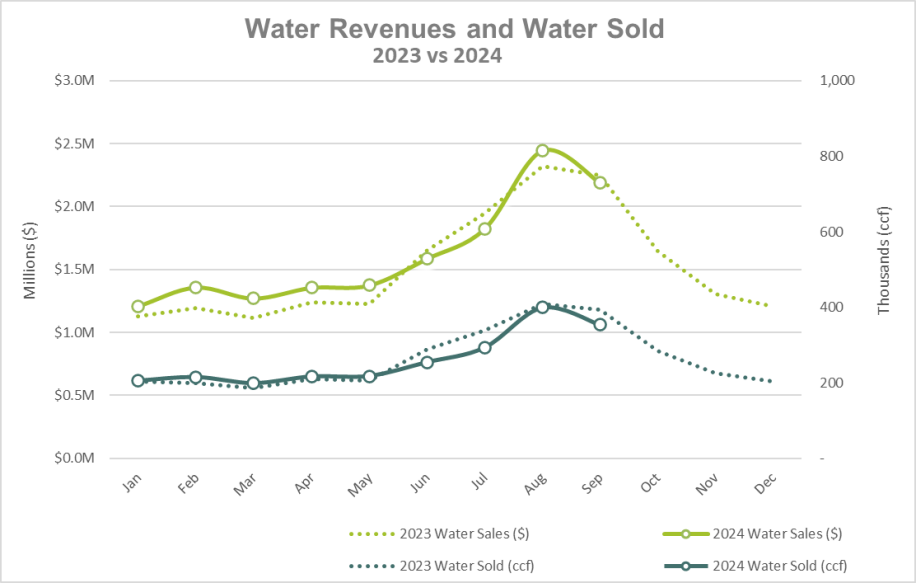
St. Plaza. The improvements will support existing and future re-development activities and replace infrastructure that is at or near the end of its useful service life. The project team is designing the improvements and anticipates completing the design by the end of the year with construction to begin in early 2025. Total spend of this project so far is $354,034 with $292,306 spent in the third quarter.

The *DEI Dashboard* project entered into a contract with an outside consultant firm for development of the City's DEI data strategy. The purpose of this plan is to outline and roadmap of the City's data practices, aimed at tracking and monitoring key organizational DEI objectives. The consultant is working with the Office of Equity to complete Phase 1. Overall spend of this project is $92,805 which was all spent in the third quarter of 2024.

Beginning in 2023, the *Emergency Housing Voucher Program* is budgeted at $2 million over the life of the program. This program assists residents of Auburn who are experiencing homelessness and drug addiction who are willing to enroll in and complete inpatient treatment. The program will cover the costs of clean and sober housing of participants for up to three years if the participant follows the clean and sober housing agreement. Life-to-date project spend is $492,780, with $92,681 occurring in Q3-2024.

Beginning in 2024, the *Auburn Avenue Theater Demolition* project is budgeted at $300,000. The project will demolish the existing Auburn Avenue Theater building, provide support to the shared wall with the adjacent building, and disconnect existing utilities. The Auburn Ave Theater building demolition is complete, and the contractor is performing the final site cleanup. A proposed in-fund transfer of ARPA funds of $190,000 increased the total budget to $490,000 as the total project estimated costs are $364,550. The lifetime project cost through Q3-2024 is $31,700.

Enterprise Funds



Utility activities are divided between operating funds and capital sub-funds. Operating funds house all the operating costs along with debt service and financing obligations. Capital funds show costs associated with capital acquisition and construction. Both the operating and capital funds have a working capital balance, which is equivalent to current assets minus current liabilities. This approach isolates those funds available for capital and cash flow needs for daily operations and provides project managers information on the availability of working capital for current and planned projects.

Through September 2024, the **Water Utility Fund** had operating income of $5.5 million (operating revenues less operating expenditures), approximately $183,000 higher than the same period last year. Most of this increase is due to higher revenues from water sales due to increased rates and consumption; charges for service revenues were $14.8 million through Q3-2024 compared to $14.3 million through Q3-2023. In addition to increased water sales, the fund also saw higher expenses in personnel costs (+$42,000), supplies (+$17,000) and other service charges (+$222,000), which includes utility taxes. Utility and excise taxes are proportional to revenue; therefore, when a fund experiences increased revenue growth, it is expected that utility and excise taxes will also increase over the same period.

Q3-2024 activity is consistent with the seasonality of this revenue stream, where revenues remain relatively low early in the year and then increase in Q2 and Q3 as the weather grows warmer. In total, operating income for this fund was $2.0 million favorable to the year-to-date budget.

Operating revenues were $1.1 million higher than expected through Q3-2024, with interest earnings outperforming budget expectations by $501,000 and charges for service $552,000 higher than projected. Operating expenditures had a $960,000 favorable variance to budget, driven by lower-than-expected personnel costs (-$227,000), as well as timing differences in public utility payments (-$265,000), and professional service charges (-$289,000).

Billable water consumption through Q3-2024 totaled 2.4 million ccf (hundred cubic feet), approximately 82,000 ccf or 3.0% lower than consumption volume through Q3-2023. Decreases in consumption were seen primarily in irrigation, school, and single-family customer classes compared to the prior year, while consumption increased in the manufacturing and commercial customer classes.

Compared to the same period last year, the **Sewer Utility Fund** experienced marginal growth, finishing Q3-2024 with $3.6 million in operating income, $407,000 higher than Q3-2023. Operating revenues were up $703,000 or 8.6% from the same period last year due to stronger performance in charges for City sewer service (+$431,000) and higher interest earnings (+$272,000).

Operating expenses increased $296,000 from the prior year, due primarily to increased personnel costs (+$44,000), supply costs (+$13,000), as well as other service charges (+$221,000), which includes utility tax expense.

Through Q3-2024, this fund performed better than budget expectations with a $1.6 million favorable variance in operating revenues, both in charges for service (+$980,000) and interest earnings (+$633,000). Additionally, operating expenditures had a $2.2 million favorable variance compared to budget expectations, driven primarily by the elimination of utility tax charges on pass-through revenues for King County Metro Sewer service.

The **Stormwater Utility Fund** had operating income of $2.3 million through Q3-2024, an insignificant increase (+0.3%, or +$7,600) from the same period last year. This is consistent with the historical activity of this fund; as most Stormwater service charges are based on a flat rate, there are not typically seasonal fluctuations in Stormwater revenue.

While operating revenues were higher through Q3-2024 compared to Q3-2023 (+$471,000), operating expenses for this fund were also higher during this same period (+$464,000). Primary

drivers for the increase in operating expenditures were increased personnel costs (+$351,000) and other service charges (+$124,000). These increases were partially offset by underspend in supplies (-$13,000).

This fund also outperformed budget expectations, with a $1.5 million favorable to budget variance in operating income, driven by higher than anticipated revenues (+$1.4 million) and a favorable to budget variance in operating expenditures (-$142,000) through Q3-2024.

The **Solid Waste Utility Fund** finished Q3-2024 with operating income of $346,000, which is $379,000 lower than operating income reported through same period last year. The primary driver of this variance is the timing differences of payments for solid waste service. Operating revenues increased $1.6 million, due primarily to increased service rates adopted for 2024. However, operating expenditures also increased approximately $2.0 million, due primarily to timing differences of payments for solid waste service as well as utility and excise taxes.

Compared to budget expectations, operating revenues saw a favorable variance (+$490,000) due to higher than anticipated charges for service and interest earnings. The fund also saw a $345,000 favorable variance to budget in operating expenditures, in part due to cost savings from the dissolution of the City's solid waste team after the full transition to third-party solid waste services earlier in the year (+$142,000). Further, other charges for service had a $160,000 favorable variance, due to slight timing differences in payments to the City's solid waste provider and utility tax payments. We expect these timing differences to be resolved by year-end.

Internal Service Funds

Operating expenditures within the **Insurance** Fund represent the premium cost pool that is allocated to other City funds on an annual basis. Historically, the total premium cost was allocated to the other City funds monthly, which resulted in the balance in this fund being paid down gradually over a twelve-month period. Earlier in 2024, the full annual cost was paid by City funds rather than being allocated on a monthly basis. As such, there is a timing difference that results in a variance when comparing current period and prior period costs. In all, activity within this fund is consistent with expectations and no other significant activity was reported during Q3-2024.

No significant variances are reported in the **Workers' Compensation, Facilities, Innovation & Technology**, or **Equipment Rental** Funds.

City of Auburn 3rd Quarter 2024 Financial Report

CITY COUNCIL STUDY SESSION

DECEMBER 9, 2024

General Fund Revenue Overview

Summary

- Collected 8% more revenue YTD compared to budget and 6% more than YTD last year
- Underspent the YTD budgeted expenditures by 9% and have spent 7% more compared to YTD last year

Revenue	2023 YTD Actual	2024 YTD Budget	2024 YTD Actual	Variance to Budget Favorable (Unfavorable)	%	Variance to 2023 Favorable (Unfavorable)	%
Property Tax	$ 13,312,970	$ 13,396,400	$ 13,569,223	$ 172,823		$ 256,253	
Sales Tax	17,105,897	15,337,500	17,118,816	1,781,316		12,919	
Utility Tax	11,552,980	11,431,611	11,840,638	409,027		287,658	
B&O Tax*	8,521,897	5,272,313	8,902,069	3,629,756		380,172	
Other Tax	4,262,719	3,133,748	4,223,650	1,089,902		(39,069)	
Licenses and Permits	2,056,117	1,861,000	2,132,099	271,099		75,982	
Intergovernmental	4,494,687	4,863,963	5,914,344	1,050,381		1,419,657	
Charges for Services	7,693,280	8,522,662	8,305,087	(217,575)		611,807	
Other	3,944,806	2,239,614	6,392,059	4,152,445		2,447,253	
Transfers In	5,232,897	10,652,291	4,619,961	(6,032,330)		(612,936)	
Total Revenue	**$ 78,178,250**	**$ 76,711,102**	**$ 83,017,946**	**$ 6,306,844**	**8%**	**$ 4,839,696**	**6%**
Total Expenditures	**$ 68,344,155**	**$ 80,629,874**	**$ 73,433,344**	**$ 7,196,530**	**9%**	**$ (5,089,189)**	**-7%**

Tax Revenue

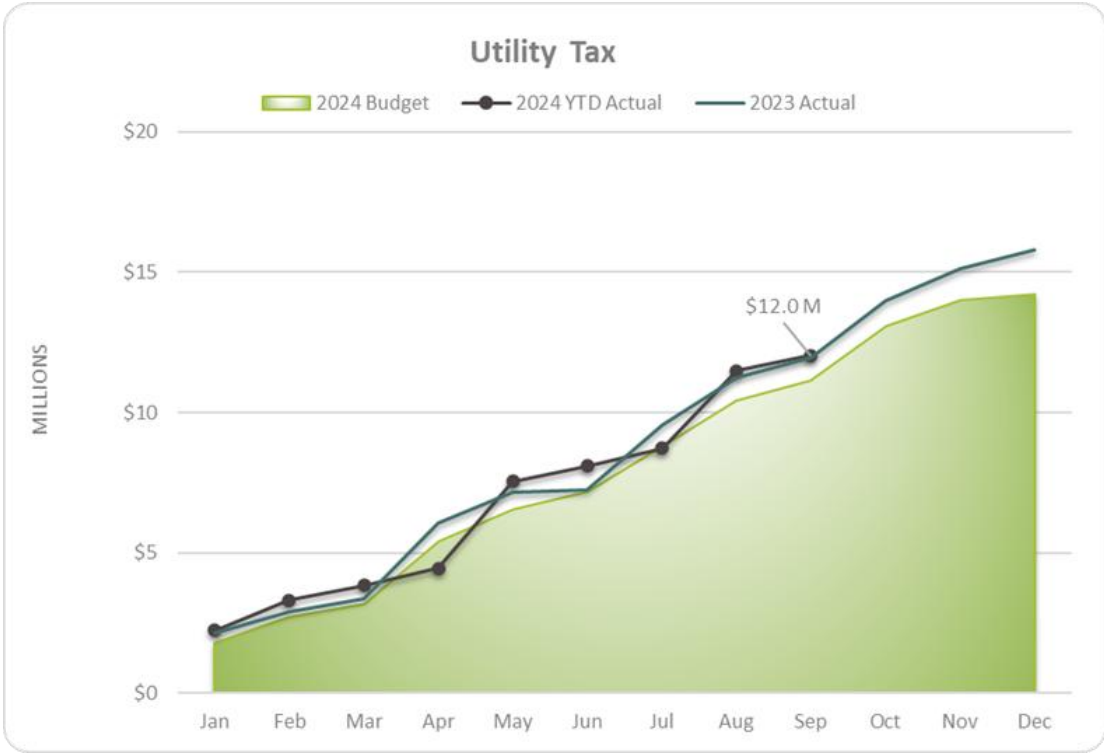
2024 budgeted taxes account for $70.96 million, or 67% of the General Fund budget

Property Tax (34% of taxes)

- $24.4 million 2024 budget
- Collected 100% at year-end

Retail Sales and Use Tax (29% of taxes)

- $20.6 million 2024 budget
- $13,000 (.1%) over prior YTD actual
- $1.8 million (12%) over YTD budget



Tax Revenue

Comparison of Retail Sales Tax Collections by Group Through September 2024				
Component Group	2023 YTD Actual	2024 YTD Actual	Change from 2023 Amount	Change from 2023 Percentage
Construction	$ 2,164,791	$ 1,941,716	$ (223,074)	(10.3) %
Manufacturing	407,396	368,565	(38,831)	(9.5) %
Transportation & Warehousing	169,788	242,222	72,434	42.7 %
Wholesale Trade	1,241,726	1,217,938	(23,788)	(1.9) %
Automotive	3,703,016	3,716,556	13,540	0.4 %
Retail Trade	4,946,384	4,896,498	(49,886)	(1.0) %
Services	4,193,701	4,440,978	247,277	5.9 %
Miscellaneous	279,142	294,342	15,200	5.4 %
YTD Total	$ 17,105,944	$ 17,118,815	$ 12,872	0.1 %

Tax Revenue

Utility Tax (20% of taxes)

- $14.1 million 2024 budget
  - Water, Sewer, Storm, Solid Waste Utility Tax rate 9% ($6.8 million of total budget)
  - Electric, Natural Gas, Cable, and Telephone Utility Tax rate 5% ($7.6 million of total budget)
- $409,000 (4%) over budget
  - Higher than expected water, sewer, storm collections
- $288,000 (2%) over prior year
  - Higher than expected water, sewer, storm collections

Tax Revenue

Business and Occupation Tax (B&O) (10% of total taxes)

- $7.0 million 2024 budget
- $8.9 million collected YTD
  - $4.97 million in gross receipts tax (55%)
  - $3.93 million in square foot tax (45%)
  - Includes Q4 2023, Q1 2024, Q2, 2024, 2023 Annual Filings
- $3.6 million (35%) over YTD budget

Other Taxes (7% of total taxes)

- $4.7 million 2024 budget
- Criminal justice sales tax, admissions tax, gambling tax, leasehold excise tax, franchise fees
- $1.1 million (35%) over 2024 YTD budget
- $39,000 (1%) below 2023 YTD collections
- Both variances are mostly due to higher sales tax collection and admission tax collection (delinquent taxes received), Leasehold Excise Tax, and Gambling Tax

Licenses and Permits

Accounts for 2% of the total General Fund Resources

$2.6 million budgeted in 2024

- Half of this ($1.0 million building permit revenue)

$271,000 (15%) over budget

$76,000 (4%) over prior year

- Both variances are attributed to slightly higher collections for various permit fees and business license collections
- Building permit revenue is right on track with budget expectations

Intergovernmental

Revenues include: Federal/State/Interlocal Grants, Muckleshoot Indian Tribe (MIT) Compact, State Shared Revenue

- State Shared Revenue:
  - Streamlined Sales Tax, Motor Vehicle Excise Tax (MVET), Marijuana/Liquor excise taxes, Criminal Justice Sales Tax

$1 million (22%) over 2024 YTD budget

- Timing of contribution payment from the MIT compact, higher collection of grants

$1.4 million (32%) over 2023 YTD collections

- Timing of contribution payment from the MIT compact, higher collection of grants and reduced state shared revenue contributions

Charges for Services

General Government - $962,000 below budget (22%)

- Timing of SKHHP Payments – Reimbursement basis

Public Safety - $279,000 above budget (35%)

- Extra duty services

Development Services - $709 below budget (.01%)

Culture and Recreation - $465,000 above budget (19%)

- Green fees and pro shop sales are slightly higher than budget, but below prior year collections by 10%

Other

Fines and Penalties

- $1.96 million over 2024 YTD budget (244%)
- School zone speed enforcement ($1.5 million) and B&O fines and penalties ($400,000)

Interest and Investment Earnings

- $1.4 million over 2024 YTD budget (597%)

Non-General Fund Highlights – Capital

Real Estate Excise Tax (REET)

- YTD Collections: $4.1 million
- $1.4 million over prior year
- $2.4 million over YTD budget

Questions

CITY OF AUBURN WASHINGTON

AGENDA BILL APPROVAL FORM

Agenda Subject:
Comprehensive Water Plan (Gaub) (45 Minutes)

Meeting Date:
December 9, 2024

Department:
Public Works

Attachments:
Presentation, AMENDED 2024 Comprehensive Water Plan, AMENDED 2024 Comprehensive Water Plan Appendices

Budget Impact:

Administrative Recommendation:
For discussion only.

Background for Motion:

Background Summary:
The Water Utility has completed an update to the City's Comprehensive Water Plan (CWP), a State-mandated update required by the Washington State Department of Health (DOH) to ensure compliance with water system regulations and planning standards. The CWP was previously updated and adopted in 2015 and provides a roadmap for the City's water utility operations, maintenance, and future infrastructure investments.

The Plan incorporates updated system data, population and employment projections, and a future water demand analysis over 10- and 20-year planning horizons. It also identifies key capital improvement projects to address system deficiencies, enhance water quality, and improve service reliability. These include storage tank rehabilitation, well capacity upgrades, and water main replacements.

In addition, the CWP emphasizes water use efficiency, climate resilience, and source water protection while integrating with the City's update to the City Comprehensive Plan to support citywide growth and development goals.

Council was first introduced to elements of the CWP at the April 10, 2023, Study Session in conjunction with a general overview of the City Comprehensive Plan Update. The draft policies contained within the CWP were then discussed with Council at the Study Session held on July 10, 2023, and a general overview of the CWP contents was discussed with Council at the Study Session held on April 1, 2024.

Staff also presented the CWP to the Planning Commission on July 2, 2024. Following public comments on the CWP, staff then presented certain updates made to the CWP to the Planning

Commission on December 3, 2024, which also served as the Public Hearing for the CWP. On December 3, 2024, the Planning Commission also recommended forwarding the Plan to the City Council for approval.

The next phase involves final adoption of the Plan by the City Council, scheduled for December 16, 2024. Following adoption, the Plan will be submitted to regulatory agencies, including DOH, King County, and Pierce County, for final approval.

The purpose of this discussion is to present the City Council with an overview of the CWP prior to the anticipated adoption of the Plan in conjunction with adoption of the 2024 City Comprehensive Plan.

Councilmember: Tracy Taylor **Staff:** Ingrid Gaub

2024 COMPREHENSIVE WATER PLAN OVERVIEW AND UPDATE

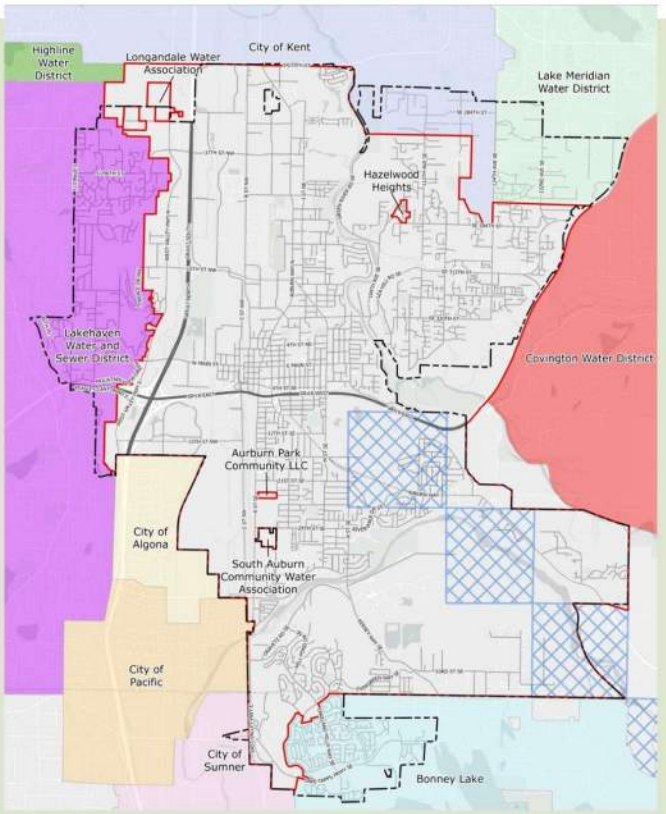
- **Auburn Comprehensive Plan Elements**
  - Core Plan (Community Development)
  - Land Use Element (Community Development)
  - Housing Element (Community Development)
  - Historic Preservation (Community Development)
  - Climate Change – NEW (Community Development)
  - Economic Development (Community Development)
  - Capital Facilities Element (Public Works)
  - Transportation Element (Public Works)
  - **Utilities Element (Public Works)**
  - Parks and Recreation (Parks)

Citywide effort involving all departments coordinating together to create a cohesive, consistent, and forward-thinking Plan covering range of subject areas

PLAN DEVELOPMENT PROGRESS/MILESTONES

2024 WATER UTILITY INTRODUCTION

4 Water Service Areas



Academy, Lakeland Hills, Lea Hill & Valley

Sources of Water

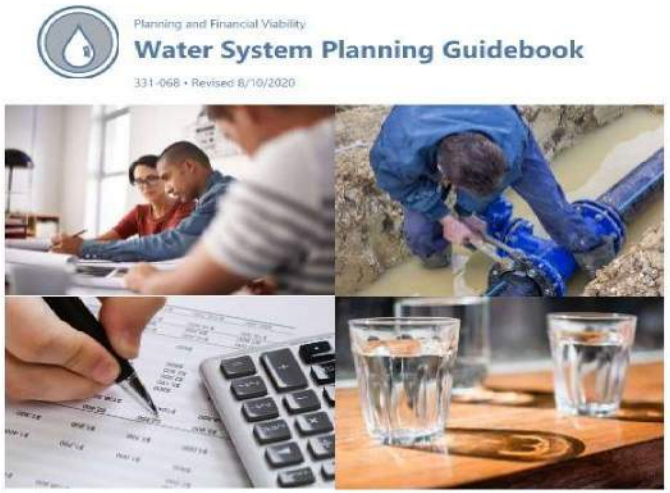
6 active Wells, 2 Springs & 2 Interties (Tacoma)

≈ 306 miles Water Main

Over 15,000 Service Connections

Service Area & Adjacent Purveyors

2024 WATER UTILITY INTRODUCTION



Fulmer Treatment Facility

Academy Pump Station

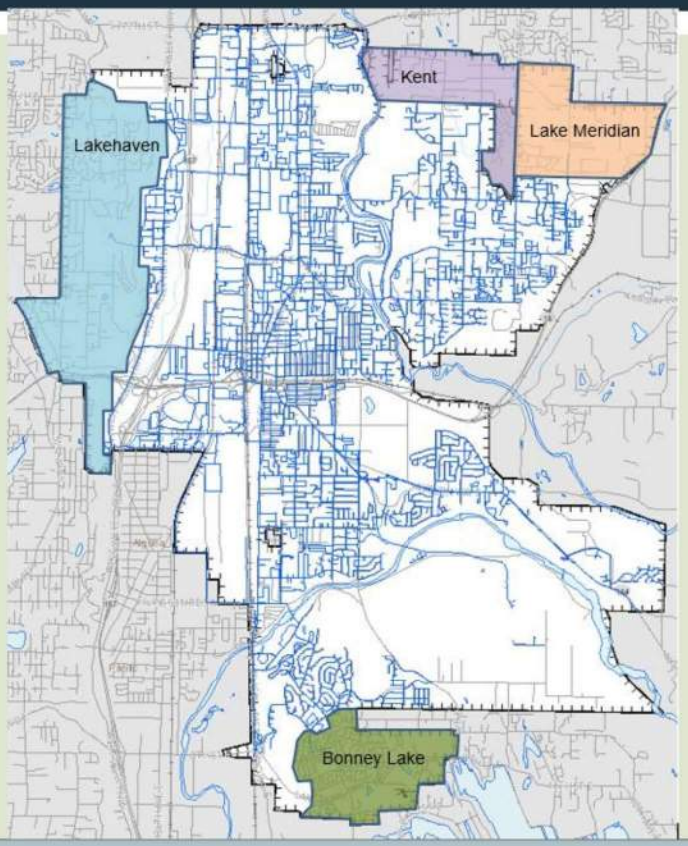
- 8 Pump Stations
  - 2 Treatment Facilities
- 8 Reservoirs
- Operate 1 Satellite System
- Provide Wholesale Water to Algona
- Produce ≈ 2.5 billion gallons of water per year

2024 WATER COMPREHENSIVE PLAN

Key Elements

- Format updated to follow Department of Health (DOH) Guidebook
- Planning & Infrastructure sizing per DOH Design Manual
- 10-yr and 20-yr Planning Periods

Water System Design Manual



Washington State Department of Health

DOH Pub 331-123
Revised June 2020

CHAPTER 1: DESCRIPTION OF THE WATER SYSTEM

- Ownership & Management
- System History & Background
- Service Areas, Maps, & Land Uses
- System Policies
- Consistency

CHAPTER 1: DESCRIPTION OF THE WATER SYSTEM

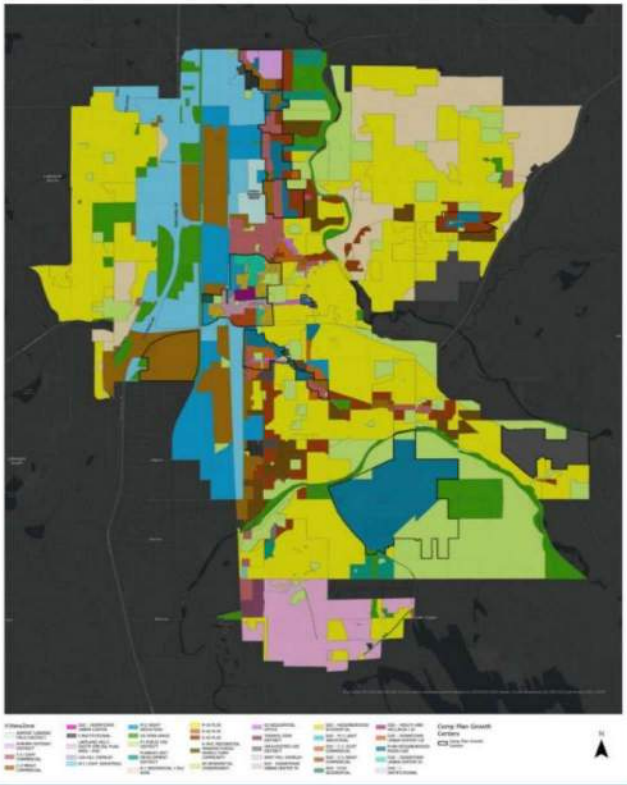
Policies

- Business Practice
- Service Area
- Operations & Maintenance
- Financial
- Planning
- Environmental Stewardship
- Design & Construction

Goals

Broad statements indicating a general aim or purpose to be achieved.

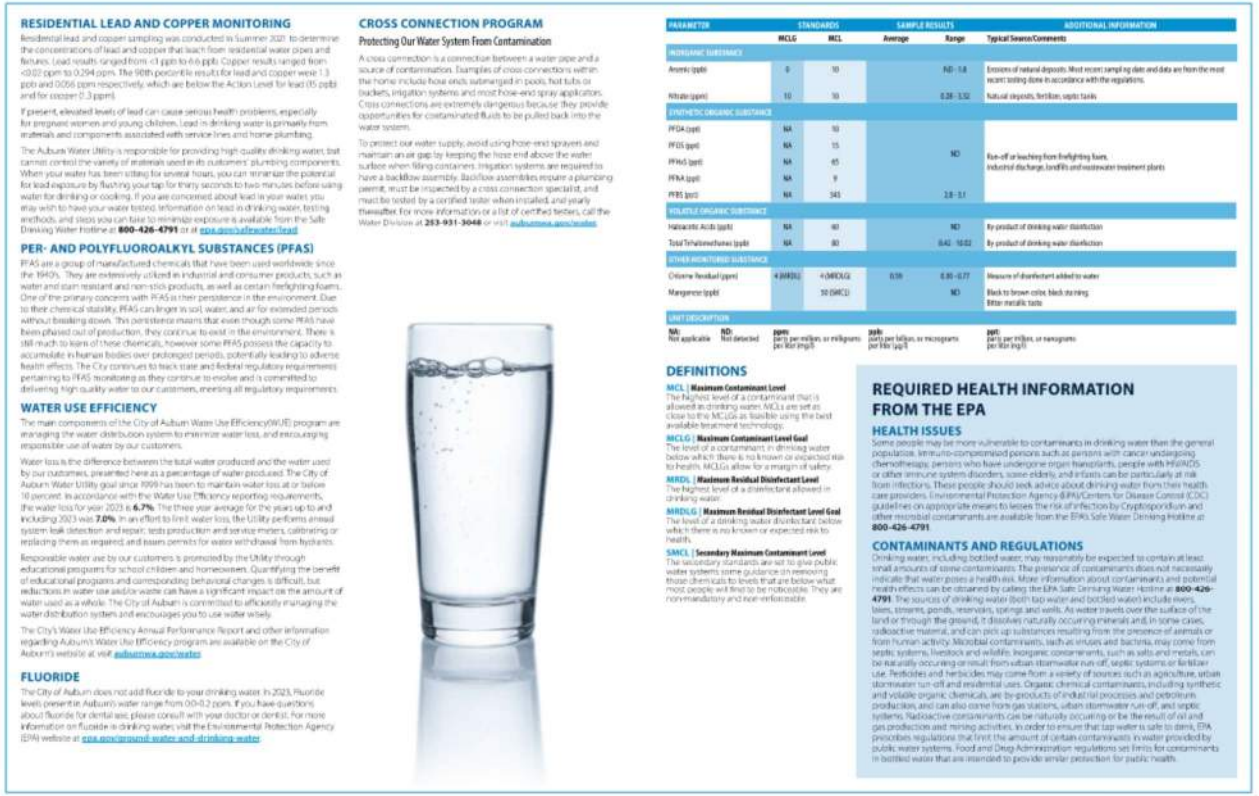
Policies



Topic-specific statement providing guidelines for current & future decision-making.

Indicates a clear commitment of the local legislative body.

CHAPTER 2: BASIC PLANNING DATA



- Water Service Area Population
- Water Service Connections and Usage
- Water Supply and Production
- Distribution System Leakage
- Water Supply Characteristics
- Water Supply Reliability Evaluation
- Future Population Projections & Land Use
- Future Water Demand

Figure 2-5 | Comprehensive Future Land Use and Zoning Map

CHAPTER 3:
SYSTEM ANALYSIS & ASSET MANAGEMENT

- Asset Management – Inventory & Analysis
- Water Quality
- Design Standards
- Capacity Analysis
- Identify Deficiencies

RESIDENTIAL LEAD AND COPPER MONITORING

Residential lead and copper sampling was conducted in Summer 2021 to determine the concentrations of lead and copper that leach from residential water pipes and fixtures. Lead results ranged from <1 ppb to 6.6 ppb. Copper results ranged from <0.02 ppm to 0.294 ppm. The 90th percentile results for lead and copper were 1.3 ppb and 0.056 ppm respectively, which are below the Action Level for lead (15 ppb) and for copper (1.3 ppm).

If present, elevated levels of lead can cause serious health problems, especially for pregnant women and young children. Lead in drinking water is primarily from materials and components associated with service lines and home plumbing.

The Auburn Water Utility is responsible for providing high quality drinking water, but cannot control the variety of materials used in its customers' plumbing components. When your water has been sitting for several hours, you can minimize the potential for lead exposure by flushing your tap for thirty seconds to two minutes before using water for drinking or cooking. If you are concerned about lead in your water you may wish to have your water tested. Information on lead in drinking water, testing methods, and steps you can take to minimize exposure is available from the Safe Drinking Water Hotline at **800-426-4791** or at epa.gov/safewater/lead.

PER- AND POLYFLUOROALKYL SUBSTANCES (PFAS)

PFAS are a group of manufactured chemicals that have been used worldwide since the 1940's. They are extensively utilized in industrial and consumer products, such as water and stain resistant and non-stick products, as well as certain firefighting foams. One of the primary concerns with PFAS is their persistence in the environment. Due to their chemical stability, PFAS can linger in soil, water, and air for extended periods without breaking down. This persistence means that even though some PFAS have been phased out of production, they continue to exist in the environment. There is still much to learn of these chemicals, however some PFAS possess the capacity to accumulate in human bodies over prolonged periods, potentially leading to adverse health effects. The City continues to track state and federal regulatory requirements pertaining to PFAS. Monitoring as they continue to evolve and is committed to delivering high quality water to our customers, meeting all regulatory requirements.

WATER USE EFFICIENCY

The main components of the City of Auburn Water Use Efficiency(WUE) program are managing the water distribution system to minimize water loss, and encouraging responsible use of water by our customers.

Water loss is the difference between the total water produced and the water used by our customers, presented here as a percentage of water produced. The City of Auburn Water Utility goal since 1999 has been to maintain water loss at or below 10 percent. In accordance with the Water Use Efficiency reporting requirements, the water loss for year 2023 is **6.7%**. The three year average for the years up to and including 2023 was **7.0%**. In an effort to limit water loss, the Utility performs annual system leak detection and repair; tests production and service meters, calibrating or replacing them as required; and issues permits for water withdrawal from hydrants.

Responsible water use by our customers is promoted by the Utility through educational programs for school children and homeowners. Quantifying the benefit of educational programs and corresponding behavioral changes is difficult, but reductions in water use and/or waste can have a significant impact on the amount of water used as a whole. The City of Auburn is committed to efficiently managing the water distribution system and encourages you to use water wisely.

The City's Water Use Efficiency Annual Performance Report and other information regarding Auburn's Water Use Efficiency program are available on the City of Auburn's website at visit auburnwa.gov/water.

FLUORIDE

The City of Auburn does not add fluoride to your drinking water. In 2023, fluoride levels present in Auburn's water range from 0.0-0.2 ppm. If you have questions about fluoride for dental use, please consult with your doctor or dentist. For more information on fluoride in drinking water, visit the Environmental Protection Agency (EPA) website at epa.gov/ground-water-and-drinking-water.

CROSS CONNECTION PROGRAM

Protecting Our Water System From Contamination

A cross connection is a connection between a water pipe and a source of contamination. Examples of cross connections within the home include hose ends submerged in pools, hot tubs or buckets, irrigation systems and most hose-end spray applicators. Cross connections are extremely dangerous because they provide opportunities for contaminated fluids to be pulled back into the water system.

To protect our water supply, avoid using hose-end sprayers and maintain an air gap by keeping the hose end above the water surface when filling containers. Irrigation systems are required to have a backflow assembly. Backflow assemblies require a plumbing permit, must be inspected by a cross connection specialist, and must be tested by a certified tester when installed, and yearly thereafter. For more information or a list of certified testers, call the Water Division at **253-931-3048** or visit auburnwa.gov/water.

PARAMETER	STANDARDS MCLG	STANDARDS MCL	SAMPLE RESULTS Average	SAMPLE RESULTS Range	ADDITIONAL INFORMATION Typical Source/Comments
INORGANIC SUBSTANCE					
Arsenic (ppb)	0	10		ND - 1.6	Erosion of natural deposits. Most recent sampling date and data are from the most recent testing done in accordance with the regulations.
Nitrate (ppm)	10	10		0.28 - 3.52	Natural deposits, fertilizer, septic tanks
SYNTHETIC ORGANIC SUBSTANCE					
PFOA (ppt)	NA	10			
PFOS (ppt)	NA	15			
PFHxS (ppt)	NA	65		ND	Run-off or leaching from firefighting foam, industrial discharge, landfills and wastewater treatment plants
PFNA (ppt)	NA	9			
PFBS (ppt)	NA	345		2.0 - 3.1	
VOLATILE ORGANIC SUBSTANCE					
Haloacetic Acids (ppb)	NA	60		ND	By-product of drinking water disinfection
Total Trihalomethanes (ppb)	NA	80		0.42 - 10.02	By-product of drinking water disinfection
OTHER MONITORED SUBSTANCE					
Chlorine Residual (ppm)	4 (MRDL)	4 (MRDLG)	0.59	0.35 - 0.77	Measure of disinfectant added to water
Manganese (ppb)		50 (SMCL)		ND	Black to brown color, black staining. Bitter metallic taste

UNIT DESCRIPTION

NA: Not applicable **ND:** Not detected **ppm:** parts per million, or milligrams per liter (mg/l) **ppb:** parts per billion, or micrograms per liter (µg/l) **ppt:** parts per trillion, or nanograms per liter (ng/l)

DEFINITIONS

MCL | Maximum Contaminant Level
The highest level of a contaminant that is allowed in drinking water. MCLs are set as close to the MCLGs as feasible using the best available treatment technology.

MCLG | Maximum Contaminant Level Goal
The level of a contaminant in drinking water below which there is no known or expected risk to health. MCLGs allow for a margin of safety.

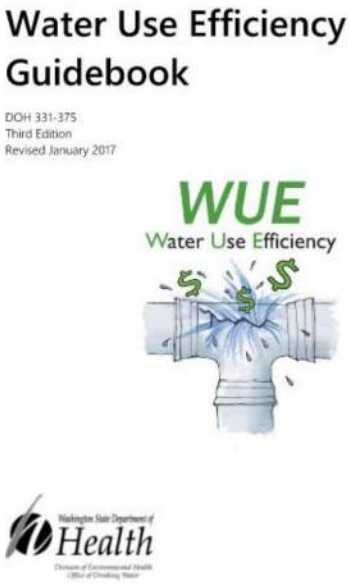
MRDL | Maximum Residual Disinfectant Level
The highest level of a disinfectant allowed in drinking water.

MRDLG | Maximum Residual Disinfectant Level Goal
The level of a drinking water disinfectant below which there is no known or expected risk to health.

SMCL | Secondary Maximum Contaminant Level
The secondary standards are set to give public water systems some guidance on removing those chemicals to levels that are below what most people will find to be noticeable. They are non-mandatory and non-enforceable.

REQUIRED HEALTH INFORMATION FROM THE EPA

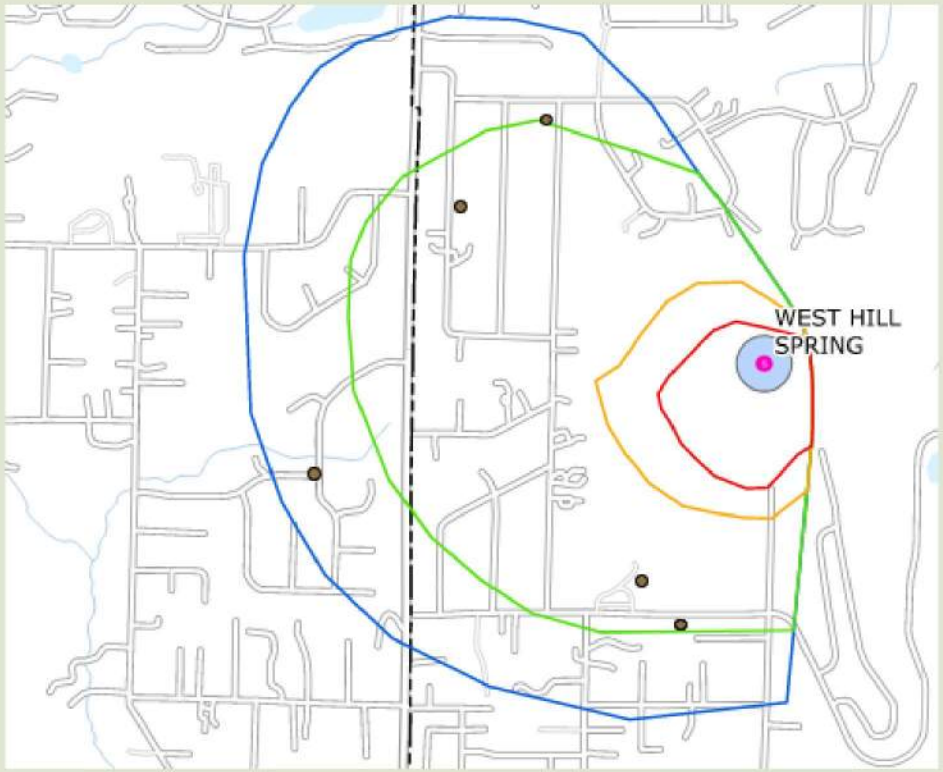
HEALTH ISSUES



Some people may be more vulnerable to contaminants in drinking water than the general population. Immuno-compromised persons such as persons with cancer undergoing chemotherapy, persons who have undergone organ transplants, people with HIV/AIDS or other immune system disorders, some elderly, and infants can be particularly at risk from infections. These people should seek advice about drinking water from their health care providers. Environmental Protection Agency (EPA)/Centers for Disease Control (CDC) guidelines on appropriate means to lessen the risk of infection by Cryptosporidium and other microbial contaminants are available from the EPA's Safe Water Drinking Hotline at **800-426-4791**.

CONTAMINANTS AND REGULATIONS

Drinking water, including bottled water, may reasonably be expected to contain at least small amounts of some contaminants. The presence of contaminants does not necessarily indicate that water poses a health risk. More information about contaminants and potential health effects can be obtained by calling the EPA Safe Drinking Water Hotline at **800-426-4791**. The sources of drinking water (both tap water and bottled water) include rivers, lakes, streams, ponds, reservoirs, springs and wells. As water travels over the surface of the land or through the ground, it dissolves naturally occurring minerals and, in some cases, radioactive material, and can pick up substances resulting from the presence of animals or from human activity. Microbial contaminants, such as viruses and bacteria, may come from septic systems, livestock and wildlife. Inorganic contaminants, such as salts and metals, can be naturally occurring or result from urban stormwater run-off, septic systems or fertilizer use. Pesticides and herbicides may come from a variety of sources such as agriculture, urban stormwater run-off and residential uses. Organic chemical contaminants, including synthetic and volatile organic chemicals, are by-products of industrial processes and petroleum production, and can also come from gas stations, urban stormwater run-off, and septic systems. Radioactive contaminants can be naturally occurring or be the result of oil and gas production and mining activities. In order to ensure that tap water is safe to drink, EPA prescribes regulations that limit the amount of certain contaminants in water provided by public water systems. Food and Drug Administration regulations set limits for contaminants in bottled water that are intended to provide similar protection for public health.

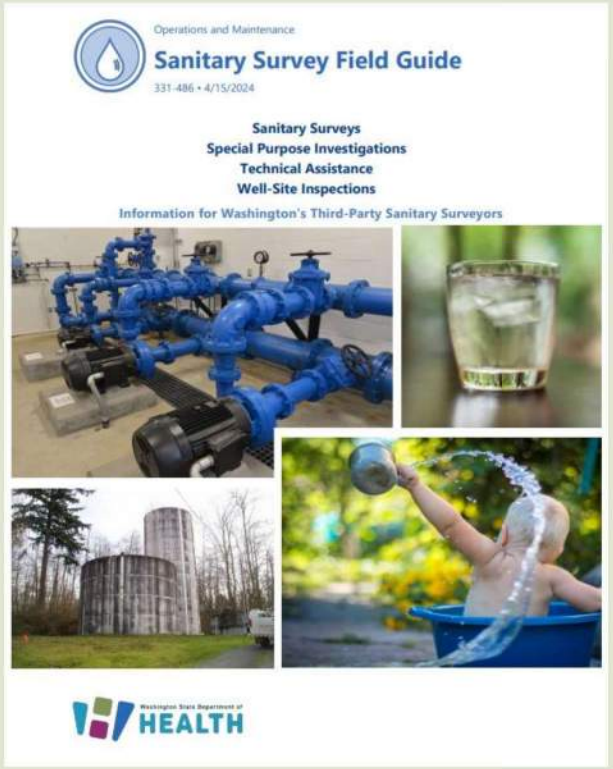


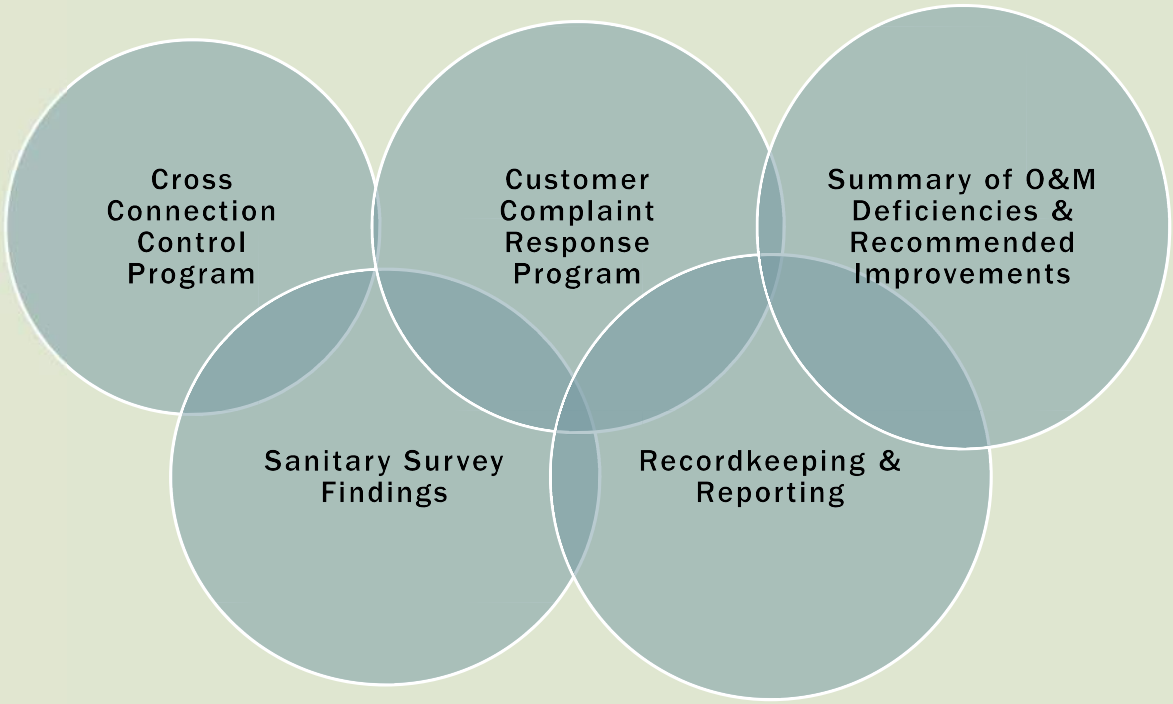
CHAPTER 4: WATER USE EFFICIENCY

- Source and Service Metering
- Distribution System Leakage
- Water Use Efficiency Program
- Water Use Efficiency Savings
- Climate Change Resiliency

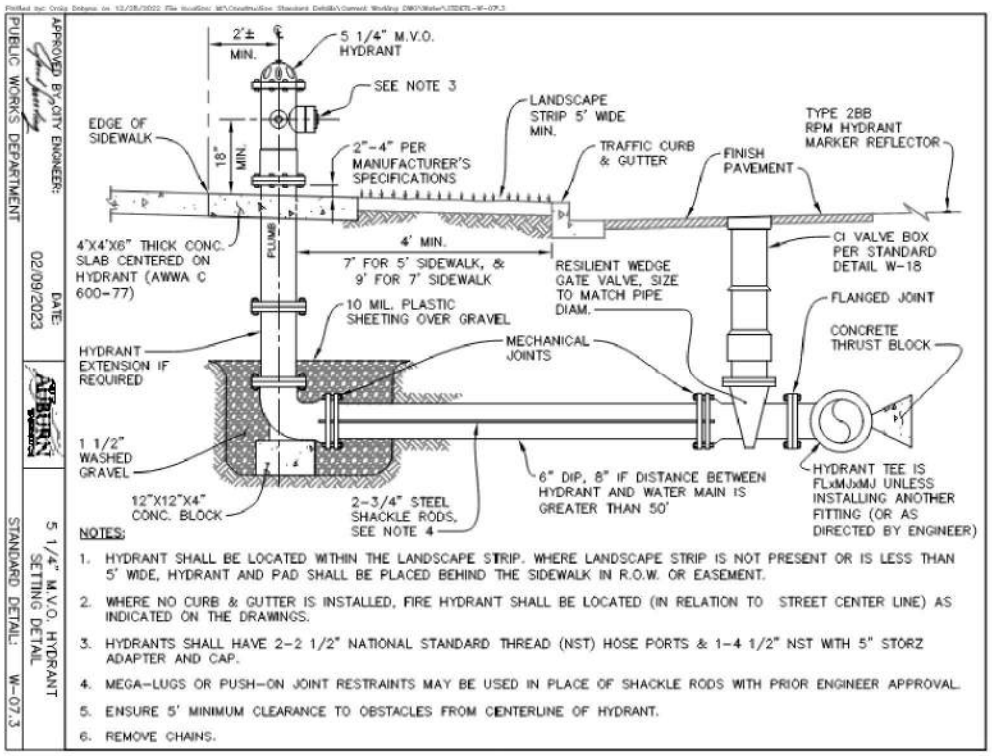
CHAPTER 5: SOURCE WATER PROTECTION

- Sanitary Control Area
- Wellhead Protection Program





CHAPTER 6: OPERATION & MAINTENANCE PROGRAM



- Water System Management & Personnel
- Operations & Preventive Maintenance
- Comprehensive Water Quality Monitoring
- Emergency Preparedness & Response
- Safety Procedures

CHAPTER 6: OPERATION & MAINTENANCE PROGRAM

CHAPTER 7: DESIGN & CONSTRUCTION STANDARDS

- Project Review Procedures
- Policies and Requirements for Outside Parties
- Design and Construction Standards
- Construction Certification

CHAPTER 8: CAPITAL IMPROVEMENTS PLAN

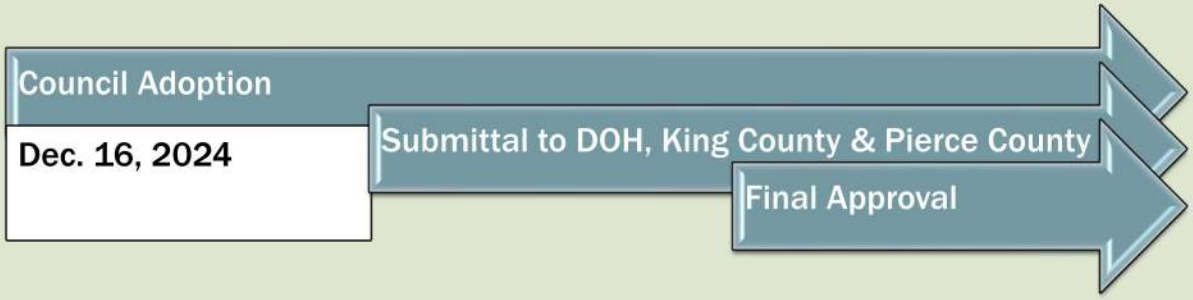
Prioritization

Capital Improvement Program

Capital Improvement Summary and Schedule

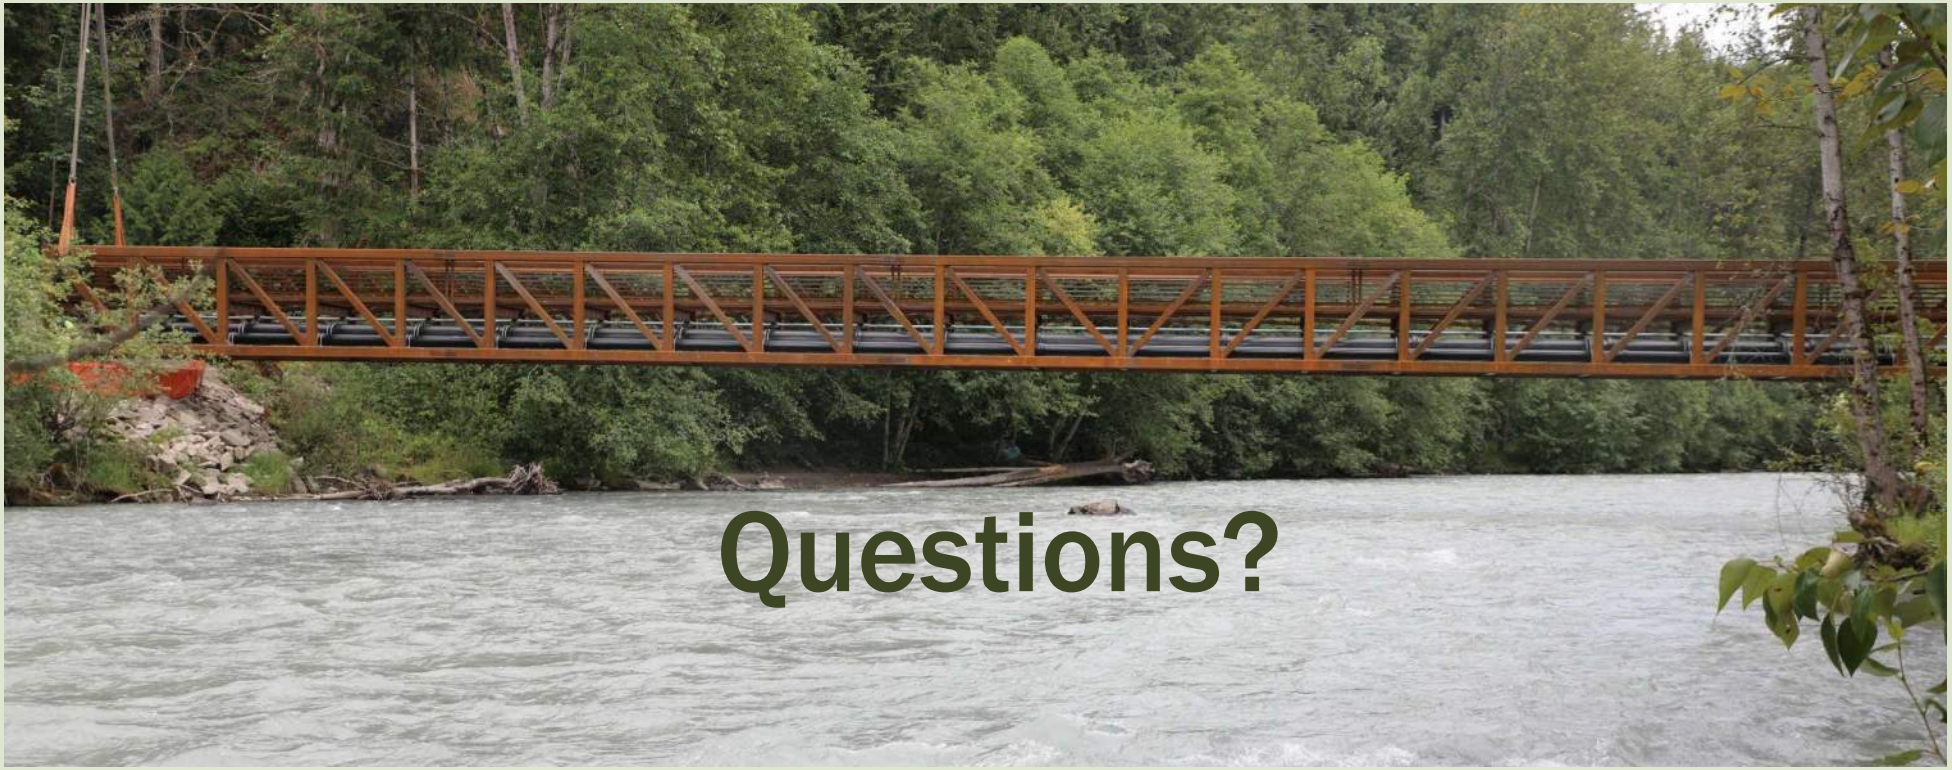
Table 8-9 | Total CIP Cost by Project Category from 2024 through 2044

Category	Total CIP Cost Summary 2024 – 2044 (2024 USD)
Supply	$60,416,013
Storage	$21,579,621
Pump Stations	$9,230,000
Distribution	$121,858,681
General	$1,750,000
TOTAL	**$214,834,315**



CHAPTER 9: FINANCIAL ANALYSIS

- Costs of Service
- Capital Improvement Funding Plan
- Maintaining Reserves
- Rate Evaluation



NEXT STEPS

Council Adoption
Dec. 16, 2024
Submittal to DOH, King County & Pierce County
Final Approval

Executive Summary

Introduction ES-1

ES.1 Description of Water System ES-1

ES.2 Basic Planning Data ES-5

Water Service Connections and Usage *ES-5*

Water Supply and Production *ES-5*

Future Population and Demand Projections *ES-5*

ES.3 System Analysis and Asset Management ES-7

Asset Management *ES-7*

Water Quality *ES-7*

Design Standards *ES-7*

Capacity Analysis *ES-8*

ES.4 Water Use Efficiency Program ES-9

Source and Service Metering *ES-9*

Distribution System Leakage *ES-10*

Water Use Efficiency Program *ES-10*

Climate Change Resiliency *ES-11*

ES.5 Source Water Protection ES-11

ES.6 Operations and Maintenance Program ES-12

ES.7 Distribution Facilities Design and Construction Standards ES-14

ES.8 Capital Improvement Program ES-14

ES.9 Financial Program ES-15

Chapter 1 Description of Water System

1.1 Objective 1-1

1.2 Plan Content 1-1

1.3 Ownership and Management 1-1

1.4 System History and Background 1-4

1.4.1 Geography *1-4*

1.4.2 Existing System Overview *1-5*

1.4.3 History *1-5*
1.5 Related Plans and Studies 1-13
1.6 Service Area, Maps, and Land Use 1-16
1.6.1 Wholesale Interties *1-16*
1.6.2 Emergency Interties *1-21*
1.7 System Policies 1-22
1.8 Duty of Service 1-23
1.9 Local Government Consistency 1-24
1.10 Watershed Plan Consistency 1-24

Chapter 2 Basic Planning Data

2.1 Water Service Area Population 2-1
2.2 Water Service Connection and Usage 2-2
2.2.1 Historical Accounts *2-2*
2.2.2 Historical Consumption *2-4*
2.2.3 Water Use Per Connection and Equivalent Residential Units *2-6*
2.2.4 Largest Water Users *2-7*
2.3 Water Supply and Production 2-10
2.3.1 Historical Water Supply *2-10*
2.3.2 Average Day Demands and Maximum Day Demands *2-11*
2.3.3 Peak Hour Demand *2-12*
2.3.4 Seasonal Variations *2-13*
2.4 Distribution System Leakage 2-13
2.5 Water Supply Characteristics 2-14
2.6 Water Supply Reliability Evaluation 2-15
2.6.1 Use Impacts on Instream Flows *2-17*
2.6.2 Whole Interties *2-17*
2.6.3 Emergency Interties *2-18*
2.6.4 Potential Interties *2-18*
2.7 Future Population Projections and Land Use 2-18
2.7.1 Demographic Forecast *2-18*
2.7.2 Future Land Use and Zoning *2-19*
2.7.3 Projected Demographic Growth *2-23*
2.8 Future Water Demand 2-29

2.8.1 Projected Number of Connections *2-29*
2.8.2 Projected Water Demand *2-31*
2.8.3 Large User Demand Forecast *2-32*
2.8.4 Projected Retail ERUs *2-32*
2.8.5 Projected Retail Average Day and Maximum Day Demands *2-34*
2.8.6 Wholesale Demands *2-37*
2.8.7 Total Demands *2-38*

Chapter 3 System Analysis and Asset Management

3.1 Asset Management – Asset Inventory and Analysis 3-1
3.1.1 Distribution Facilities *3-6*
3.1.2 Water Source Facilities *3-14*
3.1.3 Water Treatment Facilities *3-17*
3.1.4 Storage Facilities *3-20*
3.1.5 Pump Station Facilities *3-22*
3.1.6 Facility Back-Up Power *3-23*
3.1.7 Facility Monitoring and Control *3-24*
3.1.8 2022 Sanitary Survey Findings *3-24*
3.2 Water Quality 3-25
3.2.1 Water Quality Treatment and Objectives *3-26*
3.2.2 Analysis of Source Water Quality *3-26*
3.2.3 Analysis of Distribution System Water Quality *3-28*
3.2.4 Recent Regulatory Changes *3-30*
3.3 Design Standards 3-33
3.4 Capacity Analysis 3-35
3.4.1 Water Rights *3-35*
3.4.2 Physical Capacity Analysis *3-37*
3.4.3 New Source of Supply Analysis *3-59*
3.5 Summary of System Deficiencies 3-59

Chapter 4 Water Use Efficiency Program

4.1 Source and Service Metering 4-2
4.1.1 Source Meters *4-2*
4.1.2 Service Meters *4-3*

4.2 Distribution System Leakage 4-4
4.2.1 Water Audits *4-5*
4.3 Water Use Efficiency Program 4-5
4.3.1 Program Requirements *4-6*
4.3.2 Mandatory Measures *4-7*
4.3.3 Program Goals *4-7*
4.3.4 2024-2034 Demand-Side Program Measures *4-8*
4.3.5 Reclaimed Water *4-10*
4.3.6 WUE Budget *4-10*
4.4 Water Use Efficiency Savings 4-11
4.5 Climate Change Resiliency 4-11
4.5.1 Expected Climate Changes for the City of Auburn *4-12*
4.5.2 Extreme Weather Events and Significant Challenges *4-12*
4.5.3 Assessment of Actions to Protect System *4-13*

Chapter 5 Source Water Protection

5.1 Sanitary Control Area 5-1
5.2 Wellhead Protection Program 5-1
5.2.1 Susceptibility Assessment *5-2*
5.2.2 Wellhead Protection Area Delineation *5-2*
5.2.3 Contaminant Source Inventory and Notification of Findings *5-4*
5.2.4 Contingency Plan *5-4*

Chapter 6 Operations and Maintenance Program

6.1 Water System Management and Personnel 6-1
6.1.1 Mission Statement *6-1*
6.1.2 Department Overview *6-1*
6.1.3 Internal and External Factors *6-1*
6.1.4 Water Utility Division Organization *6-2*
6.1.5 Communication System *6-4*
6.1.6 Operator Certification Program *6-5*
6.1.7 Education and Training Program *6-6*
6.2 Operations and Preventive Maintenance 6-6
6.2.1 Inspections, Preventive Maintenance, Repairs, and Replacement *6-7*

6.2.2 Reservoir Maintenance *6-9*
6.2.3 Pump Station Maintenance *6-9*
6.2.4 Treatment Facility Maintenance *6-10*
6.2.5 Pressure Reducing Valve Stations *6-10*
6.2.6 Utility Locating Service *6-10*
6.2.7 Fire Hydrant Inspection *6-10*
6.2.8 Dead-end Flushing *6-10*
6.2.9 Valve Exercising *6-11*
6.2.10 Unidirectional Flushing *6-11*
6.2.11 System Loss Program *6-12*
6.2.12 Distribution System Corrosion Inspection *6-13*
6.3 Comprehensive Water Quality Monitoring 6-14
6.4 Emergency Preparedness and Response 6-15
6.4.1 Vulnerability Assessment *6-16*
6.4.2 Wellhead Protection Program *6-16*
6.4.3 Water Shortage Contingency Plan *6-16*
6.5 Safety Procedures 6-16
6.6 Cross Connection Control Program 6-18
6.7 Sanitary Survey Findings 6-18
6.8 Customer Complaint Response Program 6-19
6.8.1 Customer Request Response Program *6-20*
6.9 Recordkeeping and Reporting 6-20
6.9.1 Cross Connection Control Program *6-21*
6.9.2 Water Meter Consumption *6-21*
6.9.3 Supervisory Control and Data Acquisition (SCADA) *6-21*
6.9.4 Water Meter Reading *6-21*
6.10 Summary of O&M Deficiencies and Recommended Improvements 6-22
6.10.1 Water Facilities Evaluation Study *6-22*
6.10.2 Recommended Improvements *6-22*

Chapter 7 Distribution Facilities Design and Construction Standards

7.1 Project Review Procedures 7-1
7.2 Policies and Requirements for Outside Parties 7-2

7.3 Design and Construction Standards 7-2
7.4 Construction Certification 7-4

Chapter 8 Capital Improvements Program

8.1 Prioritization 8-1
8.1.1 Project Identification 8-1
8.1.2 Prioritization Factors 8-2
8.1.3 Estimated Costs 8-2
8.2 Capital Improvement Program Summary and Schedule 8-4
8.2.1 Completed Projects 8-4
8.2.2 Active Projects 8-5
8.2.3 Capital Improvement Projects 8-8
8.3 CIP Summary and Schedule 8-18

Chapter 9 Financial Program

9.1 Introduction 9-1
9.2 Past Financial Performance 9-1
9.2.1 Comparative Financial Statements 9-1
9.3 Financial Plan 9-4
9.3.1 Capital Funding Plan 9-5
9.4 Available Funding Assistance and Financing Resources 9-6
9.4.1 City Resources 9-6
9.4.2 Outside Resources 9-8
9.4.3 Capital Financing Strategy 9-9
9.5 Financial Forecast 9-9
9.5.1 Current Financial Structure 9-10
9.6 Current and Projected Rates 9-14
9.6.1 Current Rates 9-14
9.6.2 Projected Rates 9-15
9.6.3 Conservation Based Rates 9-15
9.7 Affordability 9-15
9.8 Conclusion 9-16

Executive Summary

Introduction

This Water System Plan (WSP) has been developed in accordance with Chapter 426-290 of the Washington Administrative Code (WAC), as presented in the Washington State Department of Health (DOH) regulations for Group A Public Water Systems. This WSP supersedes the City of Auburn's (City) 2015 WSP, approved by DOH on May 11, 2016, and the 2021 Limited WSP Update approved by DOH on December 16, 2021. The City's water system identification number is 03350V.

Th purpose of this WSP is to develop a long-term planning strategy for the City's Retail Water Service Area (RWSA). Updated every ten years per DOH, the WSP evaluates the existing system and its ability to meet the anticipated requirements for water source, treatment, transmission, storage, and distribution over a 20-year planning period. Historical data through the year 2022 were used for the analyses throughout the WSP. The ten-year planning period is 2024-2034. The long-term planning period is 2034-2044. Water system improvement projects have been developed to meet the changing demands of regulatory impacts, population growth, and necessary infrastructure repair and replacement. The WSP also identifies planning-level costs of the improvement projects and provides a financial plan for funding the projects.

ES.1 Description of Water System

The City limits are within both King County and Pierce County in the Puget Sound Region of Washington. Figure ES-1 shows the City's RWSA which encompasses approximately 30 square miles. Several water purveyors adjoin the City's RWSA, including the cities of Algona, Bonney Lake, Federal Way, Kent, Pacific, and Sumner. Also included are the Covington Water District (CWD), Lakehaven Water and Sewer District (LWSD), Lake Meridian Water District (LMWD) (formerly known as King County Water District #111), Highline Water District (HWD), and the Muckleshoot Indian Tribe (MIT). The City also provides internal staffing for the management, operations, and maintenance of the Braunwood Estates satellite system.

The City's water system consists of groundwater wells, springs, and interties with adjacent purveyors as water sources, chlorination and corrosion control treatment facilities, pump stations, pressure reducing valve stations, steel and concrete enclosed reservoirs for storage, and transmission and distribution pipelines to provide potable water to customers. The RWSA is further divided into four service areas (Valley, Lea Hill, Lakeland, and Academy) that include a total of 28 pressure zones. The City's four service areas and the location of key components of the water system are shown in Figure ES-2.

Interties provide a tool that water utilities use to move water between systems to meet supply needs, to increase reliability and respond to emergencies. The City maintains wholesale supply interties with three water systems: City of Tacoma (Tacoma), Algona, and LMWD. The City also has a supply contract with the MIT and the Indian Health Service, dating from 1972, for services along a pipeline at SE 368th PL extending from the City limits into the reservation. The City has emergency interties with seven water systems, Algona, Bonney Lake, Kent, Pacific, LWSD, LMWD and Tacoma.

A hydraulic profile of the City's water system is presented in Figure ES-3, showing all service areas, pressure zones, supplies, interties, reservoirs, and pump stations.

ES.2 Basic Planning Data

Water Service Connections and Usage

The City's current and future water demand requirements were projected for each customer class (single-family residential/duplex, multifamily residential, commercial, manufacturing/industrial, schools, city accounts, irrigation, and wholesale). The water consumption, or demand, of each customer classification can be expressed in terms of equivalent residential units (ERUs) for forecasting and planning purposes. One ERU is defined as the average quantity of water used by one average, full-time, single-family residence per day. The quantity of water used by other customer classes, or by the entire system, can be expressed in terms of equivalent ERUs. The historical average and maximum water demands are important parameters when performing system and supply analyses. The Average Day Demand (ADD) is typically used in operational evaluations. The Maximum Day Demand (MDD) represents the single largest day water demand during the year and is a key parameter for infrastructure sizing.

The City provided water to approximately 63,450 customers through 15,046 connections as of the end of 2022. Between 2015 and 2022 the ADD ranged from 6.32 million gallons per day (mgd) on the low end in 2020 to 7.67 mgd on the high end in 2016. The MDD has ranged from 11.25 mgd in 2019 to 12.43 mgd in 2020. The total number of connections increased by approximately three percent between 2015 and 2022. The City has two active wholesale water agreements, one with the City of Algona and the other with LMWD that is interruptible.

Water Supply and Production

The City has a diverse water supply consisting of two springs, ten wells and an intertie with the City of Tacoma. Wells 1, 2, 3A, 3B, 4, 6, and 7 are in the lower alluvial aquifer in the Auburn Valley, referred to as the Valley Wellfield. Wells 3A, 3B and 7 are currently offline due to high manganese concentrations. Wells 5, 5A, and 5B are in the Upland Wellfield within the Lakeland Service Area. Once Well 5B came online, the City discovered that the aquifer was not recovering and Well 5B has been offline since 2006. The safe yield of Wells 5 and 5A have been decreased from their design capacity due to a drop in the aquifer's capacity. The City has sufficient water rights to meet current demands as well as 10- and 20-year demand projections, as shown in the Water Rights Self-Assessment Form provided in Appendix I. Additional information on the City meeting future demands is mentioned in the Capacity Analysis Section under ES.3 (System Analysis and Asset Management).

West Hill Springs draws from an unnamed confined aquifer. The spring source water flows by gravity into the Valley Service Area, although flows vary depending on aquifer conditions. Coal Creek Springs is the largest active water supply for the City and draws from a confined aquifer, however its flow varies depending on aquifer conditions. The City also owns two additional wells: the Algona Well 1, which is not operational and the Braunwood Well which serves the Braunwood satellite system.

Future Population and Demand Projections

Demographic projections are based on the Puget Sound Regional Council's (PSRC) 2044 forecasts for population and employment within the City's RWSA. Total population is projected to increase by 1.5 percent annually from 2021 to 2044 and total employment is projected to increase by 1.9 percent annually over the same period. Overall, the City is planning for an additional 24,987 residents and 20,525 employed people by 2044 within the RWSA. The Valley Service Area is projected to represent 64 percent of the system's population and 93 percent of the system's employment in 2044.

The projected ADD and MDD, along with wholesale demands, are summarized in **Table ES-1.** To be conservative, an ERU planning value higher than the average was used for demand forecasting. The 75th percentile of the historical ADD per ERU between 2015 and 2022 was used to select the planning ERU value of 182 gpd. The peak demands can be expressed as an MDD/ADD peaking factor, which is the relative magnitude of MDD compared to ADD. The City's MDD/ADD peaking factor was 1.77. Distribution system leakage and authorized unbilled consumption are accounted for in the projections.

Table ES-1 | ADD, MDD, and ERUs Summarized by Service Area with Wholesale Included

	2024	2034	2044
Lea Hill			
Average Day Demand (mgd)	1.00	1.04	1.09
Maximum Day Demand (mgd)	1.77	1.84	1.92
Equivalent Residential Units	5,506	5,729	5,966
Valley			
Average Day Demand (mgd)	5.11	5.84	6.72
Maximum Day Demand (mgd)	9.02	10.31	11.88
Equivalent Residential Units	28,034	32,037	36,920
Lakeland			
Average Day Demand (mgd)	0.51	0.59	0.67
Maximum Day Demand (mgd)	0.91	1.04	1.19
Equivalent Residential Units	2,815	3,217	3,684
Academy			
Average Day Demand (mgd)	0.43	0.48	0.54
Maximum Day Demand (mgd)	0.76	0.85	0.95
Equivalent Residential Units	2,375	2,642	2,946
Total Retail Customers			
Average Day Demand (mgd)	7.05	7.95	9.02
Maximum Day Demand (mgd)	12.47	14.04	15.94
Equivalent Residential Units	38,731	43,626	49,515
Algona (Firm Wholesale)			
Total Average Day Demand (mgd)	0.365	0.386	0.409
Total Equivalent Residential Units, ADD	2,005	2,120	2,246
Total Maximum Day Demand (mgd)	0.692	0.732	0.775
Total Equivalent Residential Units, MDD	3,800	4,018	4,256
Retail with Algona			
Total Average Day Demand (mgd)	7.42	8.33	9.43
Total Maximum Day Demand (mgd)	13.16	14.77	16.71
Retail with Firm Wholesale (Algona and MIT)			
Average Day Demand (mgd)	9.92	10.83	11.93
Maximum Day Demand (mgd)	14.66	16.27	18.21
Retail with Firm & Interruptible Wholesale (Algona, MIT, and LMWD)			
Average Day Demand (mgd)	12.42	13.33	14.43
Maximum Day Demand (mgd)	17.16	18.77	20.71

ES.3 System Analysis and Asset Management

Asset Management

The City actively assesses and plans for the maintenance, repair, and replacement of its assets while preventive maintenance practices keep assets in good condition, thereby extending their useful life. For asset management, the City utilizes CarteGraph in conjunction with the geographic information system (GIS). GIS is updated using as-builts as projects are completed and CarteGraph is auto-populated from this information. CarteGraph is used to track and schedule maintenance activities and track material and labor costs and project timelines.

An inventory of the City's existing water system assets including distribution system components, treatment, reservoirs, supply facilities, pump stations, backup power, and the telemetry system is presented in Chapter 3.

Water Quality

The DOH requires that source water be monitored for primary and secondary contaminants. Primary contaminant levels are not to be exceeded for health reasons and secondary contaminants should not be exceeded for aesthetic reasons. Distribution system water quality testing requirements include monitoring of many contaminants for which the DOH determines maximum contaminant levels.

Historically, the City has relied on groundwater supplies from wells and springs, which have been determined are not under the direct influence of surface waters. For these water sources, the City is required to meet the United States Environmental Protection Agency's (EPA's) Groundwater Rule. The treatment objectives of the City are to treat source water to contaminant concentrations below the maximum contaminant levels (MCLs) established by the EPA and WAC. All constituents are currently below their respective MCLs.

The required frequency of monitoring of inorganic chemical and physical parameters varies by source, however, the City typically monitors these constituents every 12 months. Within the study period, the maximum detected concentrations of these parameters did not exceed the MCLs published by the EPA.

All active sources are disinfected with chlorine prior to entering the distribution system except for Well 5. The City has a capital project discussed in Chapter 8 that will include the addition of a chlorination facility to Well 5. Corrosion control treatment is required on the water produced by Coal Creek Springs, Well 1, Well 2, Well 6, and Well 7 to limit the corrosion of lead and copper in the system. Since the corrosion control treatment facilities were constructed, the lead and copper levels in the City's system have been well below the action level. There were no water quality violations in the distribution system between 2015 and 2022.

Design Standards

The City's most recent Engineering Design and Construction Standards are available on the City's website and are provided as Appendix P.

The City's water quality design standards follow the design standards set forth by the EPA and the Washington DOH.

Capacity Analysis

The City's water supply (production) capacity compared with demand projections and DOH and City criteria indicate that the City has the supply facilities necessary to meet demand projections under current and future projections for all required criteria.

The City's Water Rights Self-Assessment Form is provided in **Appendix I** and was used to assess the City's water rights and includes supply that is available to the City through firm wholesale interties with Tacoma. The form includes a comparison of the available water rights to the existing, 10-year and 20-year demand projections for the "High Demand Scenario" provided in **Chapter 2**. The calculations presented in the Water Rights Self-Assessment Form conclude that the City's existing water rights are anticipated to be adequate to meet the current, 10-year, and 20-year projections for Qi and Qa.

The City does not currently have the infrastructure necessary to withdraw from all water rights (i.e., Wells 3A, 3B, 5B, and 7 are not currently operational). Additionally, some sources have underlying aquifer or infrastructure restrictions that limit the capacity of the source (i.e., Well 2, Well 6, and Coal Creek Springs). Several facility improvement projects are necessary for the City to maximize water production capacity to meet future demands, and planned supply related capital projects to meet this need are discussed further in **Chapter 8**.

Table ES-2 provides an overview of pump station supply analysis results expressed as either having a capacity surplus or deficit for open and closed zones. Open zones are pressure zones that are fed by gravity from a reservoir. Pressure zones that do not include a storage facility are analyzed as a closed zone. A closed zone in the Lea Hill Service Area and the Game Farm Park closed zone have a BPS capacity deficit identified in all planning scenarios. The City has planned a capital project to resolve the deficiency at the Intertie Pump Station/Lea Hill BPS. The Game Farm Park Pump Station only provides service to a recreational area with no residential or commercial property connections supplied by this facility. The City has reviewed the deficit with the Fire Marshal and the deficiency is not critical to address, therefore no actions are currently planned to resolve the deficiency at the Game Farm Park Pump Station. As further development progresses in and around the Game Farm Park Pump Station, modifications will be considered to address the deficiency.

Table ES-2 | Summary of Pump Station Capacity Results

	2024	2034	2044
Valley Open Zone Pump Station Capacity	Surplus	Surplus	Surplus
Lea Hill Open Zone Pump Station Capacity	Surplus	Surplus	Surplus
Lakeland Open Zone Pump Station Capacity	Surplus	Surplus	Surplus
Academy Open Zone Pump Station Capacity	Surplus	Surplus	Surplus
Lakeland Closed Zone BPS Capacity	Surplus	Surplus	Surplus
Academy Closed Zone BPS Capacity	Surplus	Surplus	Surplus
Lea Hill Closed Zone BPS Capacity	**Deficit**	**Deficit**	**Deficit**
Game Farm Park Closed Zone BPS Capacity	**Deficit**	**Deficit**	**Deficit**

The City's water storage facilities were analyzed to determine if they have sufficient capacity to meet the existing and future storage requirements. A summary of the results is provided in **Table ES-3**. New sources and pump stations allow for reliable and redundant operation of the system as an interconnected whole, rather than separate Service Areas. As such, excess storage in one service area can be used to

offset a deficit in another area of the system. The results of the storage analysis indicate that there is sufficient capacity to meet the projected 2024 and 2034 storage requirements, however additional storage is projected to be necessary in 2044. The City has a planned capital project to add a new reservoir in the Valley Service Area to address this deficiency.

Table ES-3 | Summary Storage Capacity Analysis

	Total Usable Storage	2024		2034		2044	
		Total Required Storage (MG)	Surplus/ (Deficit) (MG)	Total Required Storage (MG)	Surplus/ (Deficit) (MG)	Total Required Storage (MG)	Surplus/ (Deficit) (MG)
Academy	2.66	1.54	1.12	1.60	1.06	1.68	0.98
Lakeland	1.34	1.24	0.10	1.36	(0.02)	1.49	(0.15)
Lea Hill	2.12	2.29	(0.17)	2.34	(0.22)	2.40	(0.28)
Valley	7.96	7.72	0.24	8.68	(0.72)	9.86	(1.89)
RWSA	**14.08**	**12.79**	**1.29**	**13.98**	**0.10**	**15.42**	**(1.34)**

The City's existing distribution system was analyzed to determine if they have sufficient capacity to meet the existing and future demands and fire flow requirements using an updated and calibrated version of the City's hydraulic model. A low-pressure analysis was performed in the hydraulic model to confirm that pressures throughout the system were above 30 psi during under peak hour demand (PHD) conditions for 2024, 2034, and 2044. The results of this analysis indicated that all areas of existing and future system have pressures meeting this condition and were compliant with requirements.

An individual fire flow analysis was performed for each hydrant node in the hydraulic model to determine the available fire flow during MDD plus fire flow (FF) conditions, while maintaining a minimum residual pressure of 20 psi. The results of this analysis indicate that multiple pipeline improvement projects are necessary to address the distribution system deficiencies.

An analysis of the water system's overall physical capacity in terms of ERU using DOH Worksheet 4-1 is provided in Appendix V. The analysis indicates that the existing system has sufficient capacity to serve the current and projected water demands through 2034 (10-year planning horizon). Under 2024 and 2034 demand conditions, storage is the limiting system component for growth and development. In 2044 (20-year planning horizon) storage is deficient, which is consistent with the other analysis findings.

ES.4 Water Use Efficiency Program

Source and Service Metering

Each of the City's sources are metered to measure the amount of water produced. The meters are calibrated annually. If a meter cannot be calibrated properly, it is replaced with a new one. Propeller source meters are being replaced with electromagnetic (MAG) meters as part of on-going operation and maintenance (O&M) improvements.

Service meters are installed on every service line to measure the quantity of water used by a customer per WAC 246-290-496 and City Code Chapter 13.06.320. In 2015, the City began installing an Automated Metering Infrastructure (AMI) system, as a part of the Water Meter and Billing System Improvements project, which was completed in 2018. With the new AMI system, the City automatically receives meter reads via radio transmission and can integrate the data into the billing software.

Distribution System Leakage

Distribution System Leakage (DSL) represents the difference between production and documented water use (retail, wholesale, and authorized unmetered). The City's historical DSL performance complies with the DOH requirement that the three-year average DSL be under ten percent to minimize water waste. To further reduce DSL, the City has ongoing leak detection, meter calibration, and an active repair and replacement program for water system infrastructure.

Water Use Efficiency Program

The City's Water Use Efficiency (WUE) Program provides for efficient water use and supports stewardship of the City's resources. The selected program measures are interrelated and will help the City achieve its goals to both reduce average water use and peak water use per customer. Per the WUE requirements, the following measures implemented as part of the 2024-2034 WUE program:

- Install production (source) meters.
- Install consumption (service) meters.
- Perform meter calibration.
- Implement a water loss control action plan to control leakage if the three-year rolling average exceeds ten percent.
- Educate customers about water use efficiency practices.

Additionally, the following measures that must be evaluated are:

- Rates that encourage water demand efficiency (discussed in Chapter 9).
- Reclamation opportunities (discussed in detail in Chapter 4).

The DOH requires that the City estimate the amount of water saved through implementation of the system's WUE program over the last six years. Water use per-capita dropped from 112 gpd per capita in 2017 to 105 gpd per capita in 2022. The net water savings over this period equates to approximately 148 million gallons or 29.6 million gallons of savings per year.

The City has chosen to focus on implementing voluntary measures to decrease both the average and peak water usage. The City's goals are as follows:

- Decrease the planning ERU value (gpd/ERU) one percent annually from the current planning ERU value of 182 gpd/ERU,
- Decrease the planning peaking factor from the current 1.77 to 1.68, or less, and
- Maintain three-year average DSL under ten percent.

The City is committed to wastewater reuse and rainwater reclamation, as stated in its official water system policies summarized in Appendix A. Currently, there are no reclaimed water users in the City.

Climate Change Resiliency

To estimate the impact of climate change on the City's water demands, results from the Water Supply Forum's 2009 Regional Water Supply Outlook (WSF 2009 Outlook) were used. The impacts of climate change on sources that rely on groundwater are mostly unknown due to the variability between aquifers and site-specific effects. No changes to demand projections were made for the 20-year planning period to account for potential climate change due to the uncertain magnitude and timing of local effects. However, it is recognized that demand has the potential to increase in the future given these changes. In the event the City experiences such an increase, the City will use a model to compute firm yield from streamflow data, replacing historic inflows with projected inflows from three climate change scenarios as described by the WSF 2009 Outlook.

This WSP discusses short and long-term actions the City can take to improve the resiliency of the water system from the impacts of climate change. The short-term measures can improve resiliency within three to five years while the long-term measures may require decades to be fully implemented.

ES.5 Source Water Protection

Sanitary Control Areas (SCAs) have been established for each of the City's water sources per WAC 246-290-135(2). The standard SCA for wells has a minimum radius of 100 feet from the wellhead. The standard SCA for spring sources has a minimum radius of 200 feet from the spring head. All City water sources have SCAs that were established and approved by DOH, and are documented in the susceptibility forms provided in Appendix T.

The DOH has developed regulations that require Group A water systems using groundwater sources to develop and implement a Wellhead Protection Program (WHPP) in accordance with WAC 246-290-135. The City maintains its WHPP for 12 groundwater sources. A WHPP was prepared in 2014 for the City's 2015 WSP; this remains the current WHPP for the City.

Susceptibility Assessment Forms have been completed by the City and submitted to the DOH. The DOH's susceptibility assessment rating for each source is summarized in Table ES-4

Table ES-4 | Source Susceptibility Assessment Ratings

Source	DOH Issued Susceptibility Rating
Coal Creek Springs	High
West Hill Springs	High
Well 1	Moderate
Well 2	High
Well 3A	Low (Off-line)
Well 3B	Low (Off-line)
Well 4	Low
Well 5	Low
Well 5A	Low
Well 5B	Low (Off-line)
Well 6	High
Well 7	High (Off-line)

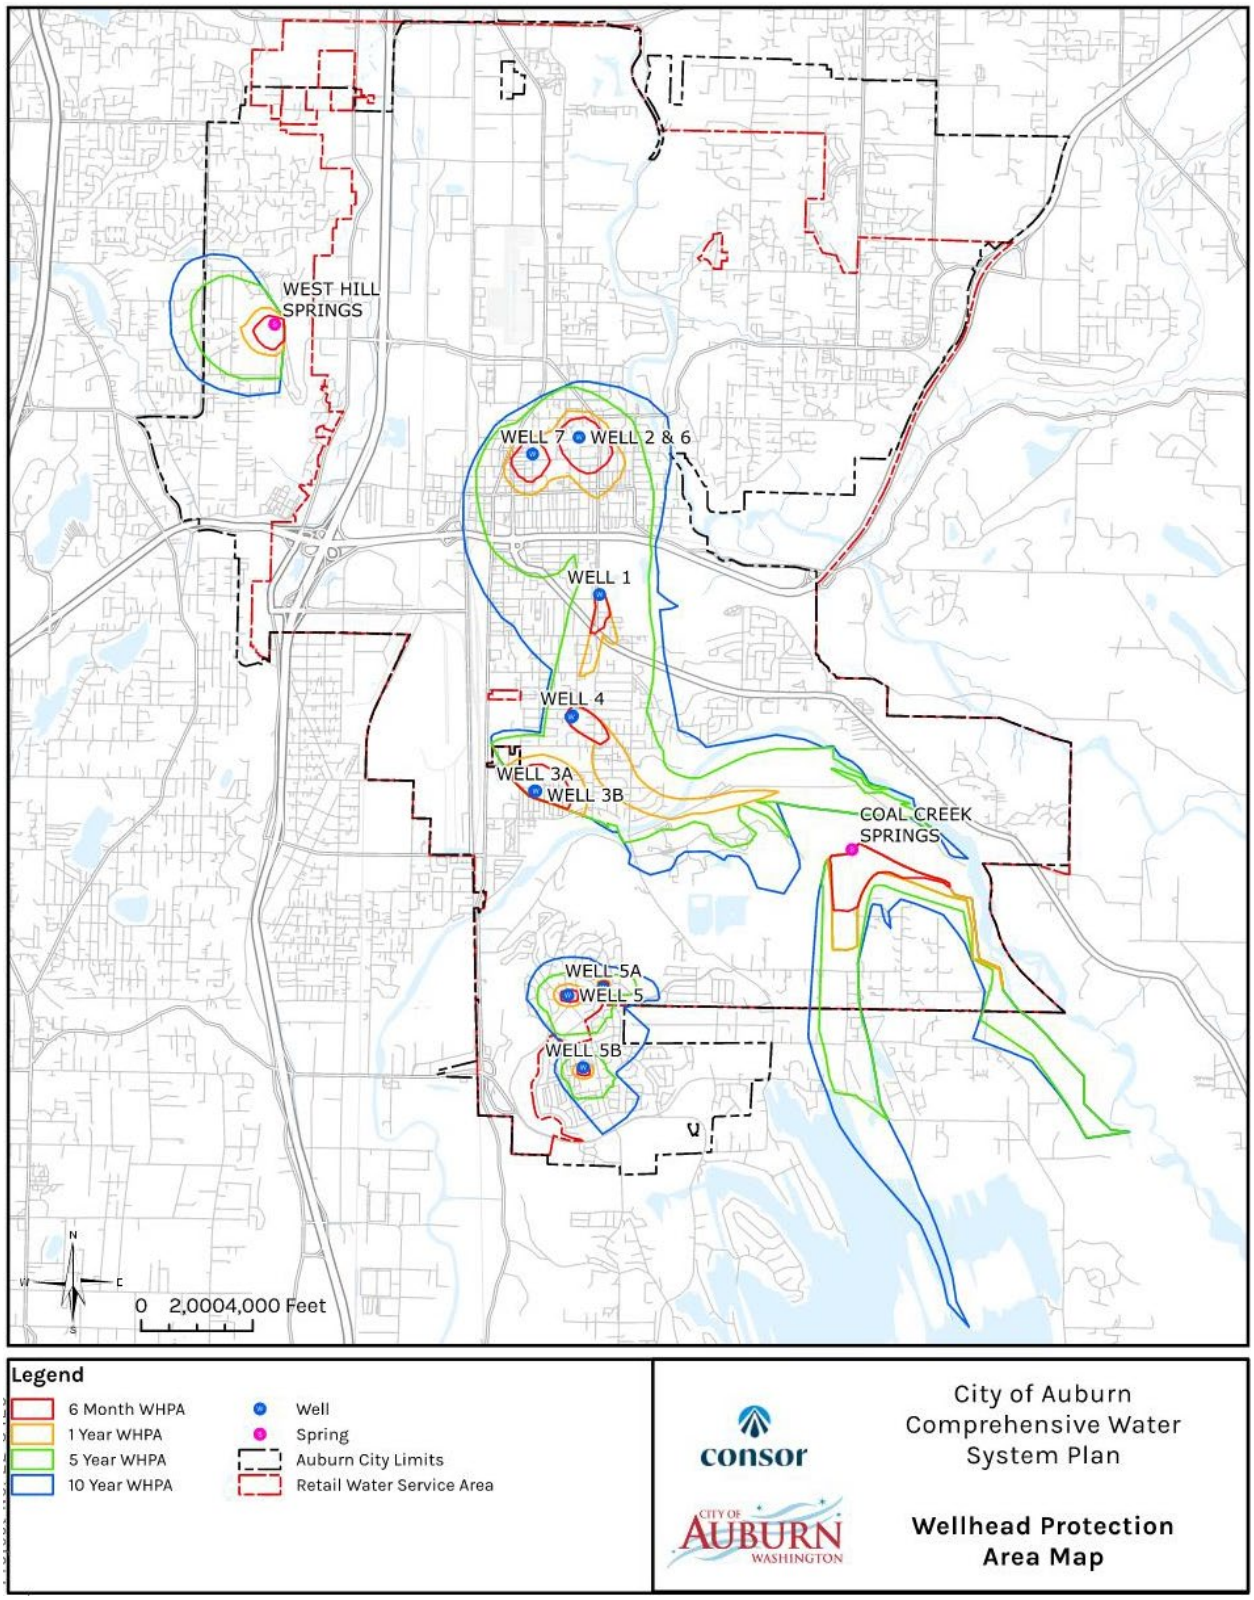
The Wellhead Protection Area (WHPA) defines the area around a groundwater source that has the potential to contaminate the source. This area is based on the source's capture zones, which are the zones of the source aquifer and ground surface that can contribute water to the source in six months, one year, five years, or ten years of time of travel. The established WHPAs are shown in Figure ES-4.

A summary of potential contaminant sources for the City's water sources was updated in July 2024 and is included in Appendix T.

ES.6 Operations and Maintenance Program

The Auburn Water Utility is operated as a utility enterprise under the direction of the Public Works (PW) Director. Specific water utility management responsibilities within the PW Department fall under either the Utilities-Water Section of Engineering Services or the Water Division of Maintenance and Operations Services. The Utilities-Water Section of Engineering Services is responsible for comprehensive water system planning, development of a Capital Improvement Program (CIP), as well as programming the design, construction, and inspection of projects related to the water system. The Water Division of Maintenance and Operations Services is responsible for operating and maintaining the water system, performing daily operation and inspection, water quality monitoring as required by DOH, and line management of the Water Utility.

The mission statement of the City's Water Utility is to provide for the efficient, environmentally sound, and safe management of the existing and future water system within the City's service area. Operations staff provide daily O&M of wells, corrosion control treatment facilities, pump stations, and reservoirs. They also implement the cross connection control program and provide locating services for all City utilities. Distribution staff maintains the complete distribution system including water mains, valves, hydrants, pressure reducing stations, and meters.



Primary operation of the water system is maintained via the Supervisory Control And Data Acquisition (SCADA) computerized control system. Wonderware software works in association with SCADA to provide real time graphical display of system data for staff interpretation and control.

The Water Operations staff maintains an active and ongoing program of water quality monitoring and reporting to ensure a safe, high quality water supply. Two staff members are responsible for water quality monitoring, sampling, control, and record keeping as outlined in the City's Water Quality Monitoring Plan provided in Appendix O.

The City has prepared an electronic Public Works Emergency Response Manual (Manual) as a guide for management of emergency situations, with the objective of protecting life and property and restoration of essential services, such as providing clean water, as quickly as possible. The Emergency Response Plan is updated annually at the first of the year. The master response program for the entire City is documented in the Comprehensive Emergency Management Plan (CEMP), which provides guidance to the Emergency Management Organization for mitigation, preparedness, responsibilities, recovery operations, training, and community education activities. The CEMP also describes the functions of local government and incorporation of essential non-governmental organizations into the Emergency Management Organization.

The City has a comprehensive safety program that meets Occupational Safety and Health Administration (OSHA) and Washington Industrial Safety and Health Act (WISHA) regulations. The safety policies and procedures for the water department are documented in this WSP and cover the full range of hazards staff may experience while operating the water system.

Figure ES-4 | Wellhead Protection Area Map

The City's Cross Connection Control Program (provided in **Appendix Q**) protects the public water system from contamination via cross connection hazards. It describes minimum operating policies, provides guidelines for installation, testing, and maintenance of approved backflow prevention assemblies, permitting process, inspection, and survey requirements for existing and new water service connections. The findings of the 2022 Sanitary Survey are also summarized in this WSP, along with the actions completed or in progress to address the deficiencies. The next DOH sanitary survey is scheduled for 2027.

ES.7 Distribution Facilities Design and Construction Standards

The Engineering Design and Construction Standards (EDCS) encompass policies and procedures governing project review and approval. To ensure the highest level of water system reliability, integration of the EDCS into the broader City infrastructure is essential. The integration of the EDCS in this WSP empowers the City to employ an alternative review process for distribution main projects, through the submittal exception process, which permits the City to approve project reports and construction documents without written approval from the DOH.

The City's Utilities-Water Section of Engineering Services reviews plans, including calculations, reports, and AutoCAD files, to verify conformity with development requirements, City standards, City policies, as well as other federal, state, and local requirements. Compliance with Washington State Department of Transportation (WSDOT) "Standard Specifications for Road, Bridge, and Municipal Construction," and relevant City, State, and Federal regulations is also evaluated during the review process.

ES.8 Capital Improvement Program

The CIP was developed to identify system improvements needed to meet customer demands throughout the 20-year planning horizon. The capital projects identified are categorized as water supply (S), storage (R), pump stations (PS), distribution (D), and general improvements (G). Planning-level cost estimates were developed for each of the recommended projects for budgeting purposes.

The capital projects for the facilities improvements were prioritized based on existing capacity deficiencies, safety concerns, maintenance or capacity requirements, and regulatory requirements. A summary of the total planned CIP cost is provided in **Table ES-5.** All costs are presented as total project costs in March 2024 dollars. For future budgeting purposes, the latest Engineering News Record (ENR) Construction Cost Index (CCI) can be used to project current estimates to the year of implementation. The cost estimates for the Auburn area used the ENR Seattle CCI. The March 2024 CCI is 15,477. Overall, the City anticipates total projects costs of $214M over the next 20 years, with more than 50 percent of the cost being for distribution system improvements.

Table ES-5 | Water System Capital Improvement Program Budget 2024-2044

Capital Improvement Category	Total for 20-Year Period From 2024-2044 (2024 USD)
Distribution	$121,858,681
Supply	$60,416,013
Storage	$21,579,621
Pump Station	$9,230,000
General	$1,750,000
TOTAL	**$214,834,315**

ES.9 Financial Program

Chapter 9 was prepared by FCS GROUP to provide a financial program that allows the City to remain financially viable during the 20-year planning horizon. This viability analysis considers the financial condition of the utility of the past six-year period (2017-2022), current and identified future financial and policy obligations, O&M needs, and the financial impacts of the capital projects identified in Chapter 8. A review of the water utility's current rate structure with respect to rate adequacy and customer affordability is also included.

The City's water charges for services increased from $14.8M in 2017 to $16.5M in 2022, averaging an annual increase of approximately 2.2 percent per year. Operating expenditures increased by $1.7M across the six years with an average annual increase of 2.8 percent. Despite total operating expenses outpacing growth in operating revenues, operating income has been positive in all years observed.

The financial forecast indicates that at existing rate levels the utility will become deficient in 2025 as growth in expenses outpaces growth in revenues and the utility takes on additional debt obligations to fund capital infrastructure investments. The City has adopted a 7.50 percent increase for 2025 to resolve the remaining projected deficiency. Rates will need to potentially increase by 9.50 percent annually from 2026 through 2030, before decreasing to 3.00 percent annually through 2033. A detailed rate study is planned for completion in 2025. It is recommended that the City regularly review and update the key underlying assumptions that compose the multi-year financial plan to confirm that adequate revenues are collected to meet the City's total financial obligations.

THIS PAGE INTENTIONALLY LEFT BLANK

CHAPTER 1

Description of the Water System

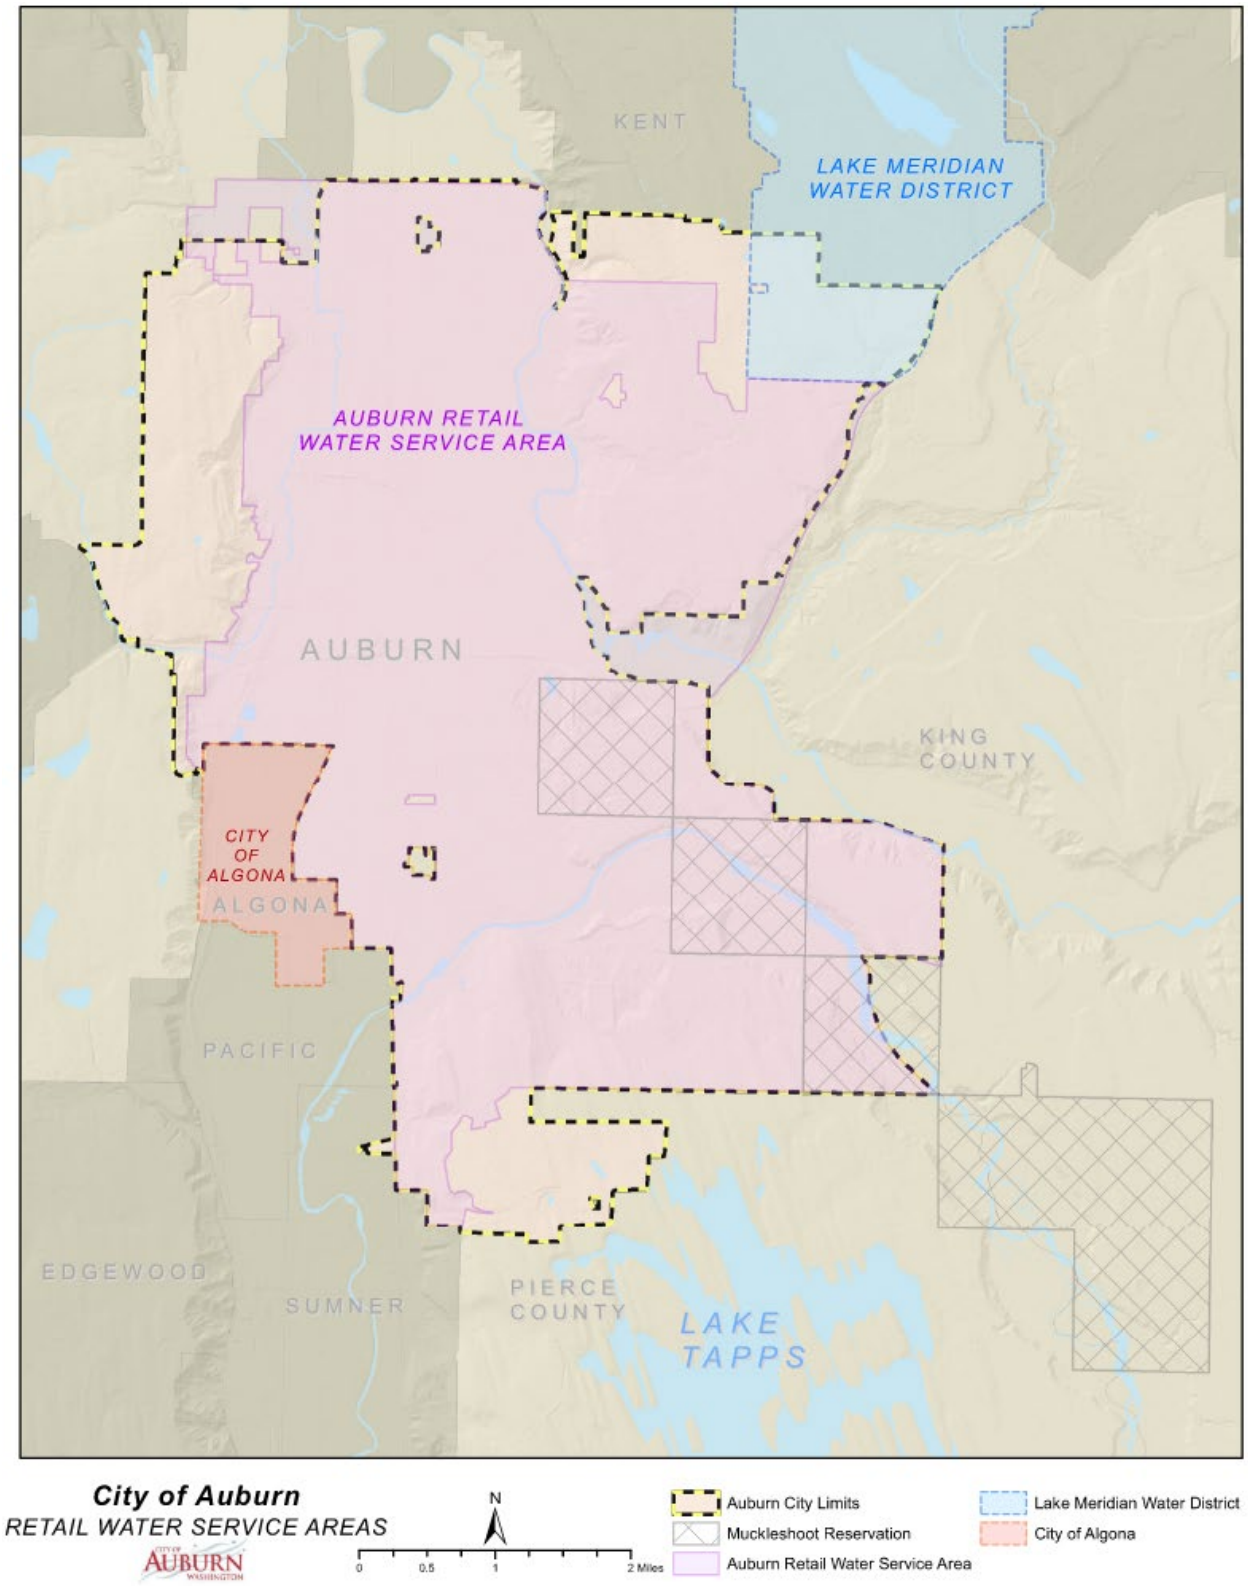
1.1 Objective

This Water System Plan (Plan) for the City of Auburn (City) has been prepared to serve as a guide for planning and designing future water system infrastructure and to assist the City in the efficient use of its water resources. The Plan identifies system improvements intended to meet the anticipated growth and changing needs of the City while maintaining reliable and quality water service to customers.

The Plan is designed to meet state, county, and local requirements. It complies with the requirements of the Washington State Department of Health (DOH) as set forth in the Washington Administrative Code (WAC) 246-290-100, Water System Plan. This Plan supersedes the City's 2015 Water System Plan, approved by DOH on May 11, 2016, and the 2021 Limited Water System Plan Update approved by DOH on December 16, 2021.

A 10-year approval period is desired for this Plan, and therefore the Plan analyzes the 10-year and 20-year planning periods. This Plan contains a framework for future funding decisions and capital projects. However, the timeframes are estimates and do not represent actual commitments by the City, which may depend on funding, resources availability, and/or other unidentified factors.

1.2 Plan Content



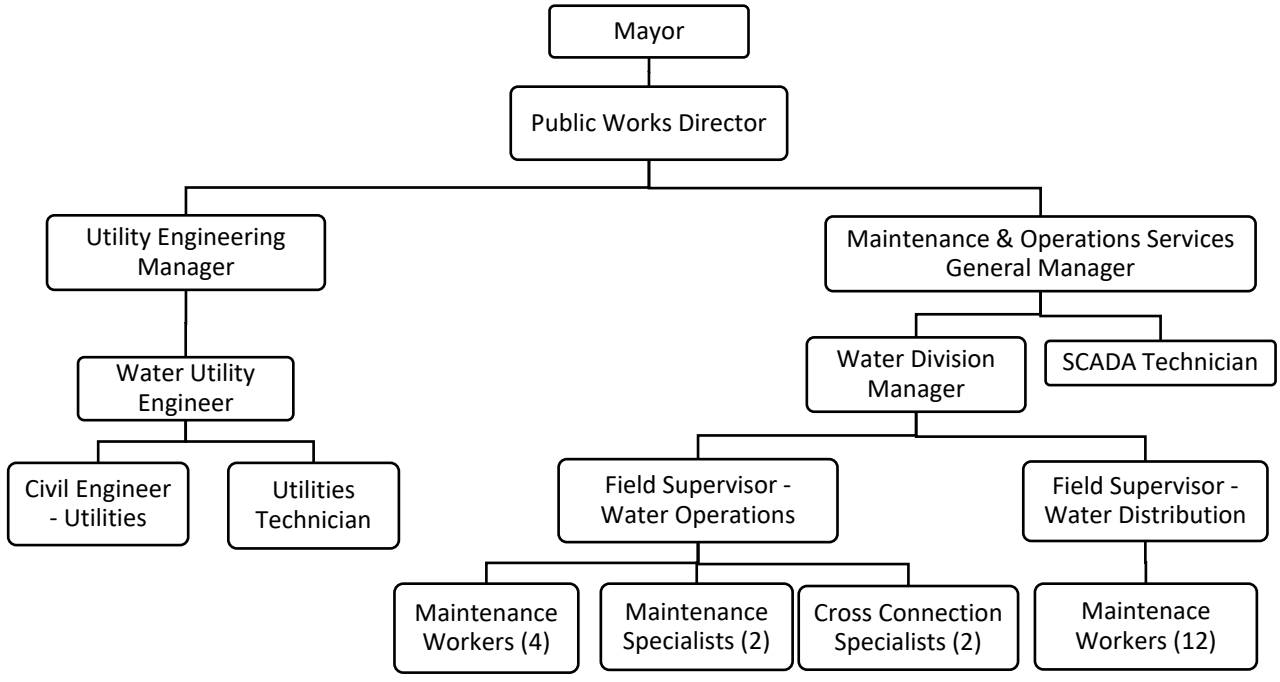
This chapter addresses the following topics:

1.3 Ownership and Management
1.4 System History and Background
1.5 Related Plans and Studies
1.6 Service Areas, Maps, and Land Uses
1.7 System Policies
1.8 Duty to Serve
1.9 Local Government Consistency
1.10 Watershed Consistency

1.3 Ownership and Management

The City owns and operates its water system and serves most of the City as delineated by the Retail Water Service Area (RWSA). The City also provides firm wholesale water supply to the City of Algona (Algona), and interruptible wholesale water supply to Lake Meridian Water District (LMWD) (formally known as King County Water District #111). The City RWSA boundary is further described in Section 1.4 and Figure 1-1 shows the City RWSA with wholesale customers.

Figure 1-1 | RWSA Vicinity Map



The City provides internal staffing for the management, operations, and maintenance of the water system and the Braunwood Estates satellite system. The DOH's data on these water systems, managed by the City, is presented in **Table 1-1**. The water management structure is presented in **Figure 1-2** and further elaborated in **Chapter 6**.

Chapter 3 provides details on the existing water facilities, while **Appendix H** includes a copy of the current Water Facility Inventory (WFI) form.

Table 1-1 | Water System Ownership Management

Information Type	Description
System Names	City of Auburn Braunwood Estates (Satellite System)
System Type	Group A - Community Public Water System
County	King County and Pierce County
City of Auburn System ID Number	03350V
Braunwood Estates System ID Number (Satellite System)	03336E
Address	25 W Main St Auburn, WA 98001
Primary Contact	Josh Flanders, Water Division Manager
Owner Contact	(253) 876-1998

Figure 1-2 | Water Utility – Organizational Chart

The City's water system is publicly owned, under the jurisdiction of the local government. As a result, it is exempt from regulation by the Washington Utilities and Transportation Commission (UTC), which is

responsible for overseeing some private water companies. There are no plans to bring the City's water utility service under UTC's regulatory authority during this planning period.

1.4 System History and Background

1.4.1 Geography

The City is centrally located between Seattle and Tacoma in both King and Pierce Counties, Washington. It encompasses approximately 30 square miles. Adjacent cities include Pacific, Algona, Bonney Lake, Federal Way, Kent, Sumner, and Covington.

1.4.1.1 Topography

The City's RWSA is dominated by a broad valley surrounded by uplifted plateaus. The Green River enters from the eastern City limit and then runs north cutting through the center of the City. Mill Creek, a tributary of the Green River, parallels the western corporate limits. The White River flows through the southern part of the City before turning south to join the Puyallup River. The topography of the service area is a result, in part, of the glaciation of the region.

Most of the City lies on a two to three-mile wide plain bound by Mill Creek on the west and the Green River on the east. Ground elevations in the area range between 50 to 100 feet and slope upward generally to the north. The terrain rises sharply to elevations of 400 to 500 feet on either side of the valley as well as in the southern portion of the City, south of the White River and between the White and Green Rivers.

The topographic features of the RWSA provide for a necessary divide of the water system into four major service areas serving the valley and the surrounding plateaus. The following are the major service areas and associated elevations:

- Valley Service Area (service elevation from 39 to 235 feet)
- Lea Hill Service Area (service elevation from 129 to 513 feet)
- Academy Service Area (service elevation from 171 to 444 feet)
- Lakeland Service Area (service elevation from 122 to 578 feet)

Each service area is further subdivided into smaller hydraulic operating areas based on topographic elevations, called pressure zones. Additional details on the City's major service areas are provided in Chapter 2.

1.4.1.2 Climate

The RWSA has a West Coast, marine-type climate caused by the influence of air masses coming from the Pacific Ocean. In late fall and winter, orographic lifting, and cooling cause moist air masses to create clouds and precipitation throughout the area. The average annual rainfall is approximately 40 inches, generally occurring between October and March. The average annual snowfall is 8.6 inches. The temperatures typically range from mid-70 degrees Fahrenheit in the summer to 38 degrees Fahrenheit during the winter, with an overall average of 54 degrees Fahrenheit.

Water consumption is notably impacted by climate conditions, as customers adjust their usage based on weather patterns. In periods of hot and dry weather, consumption rises, driven by activities such as lawn watering and outdoor water use. Conversely, consumption tends to decrease during wet weather.

1.4.1.3 Geology

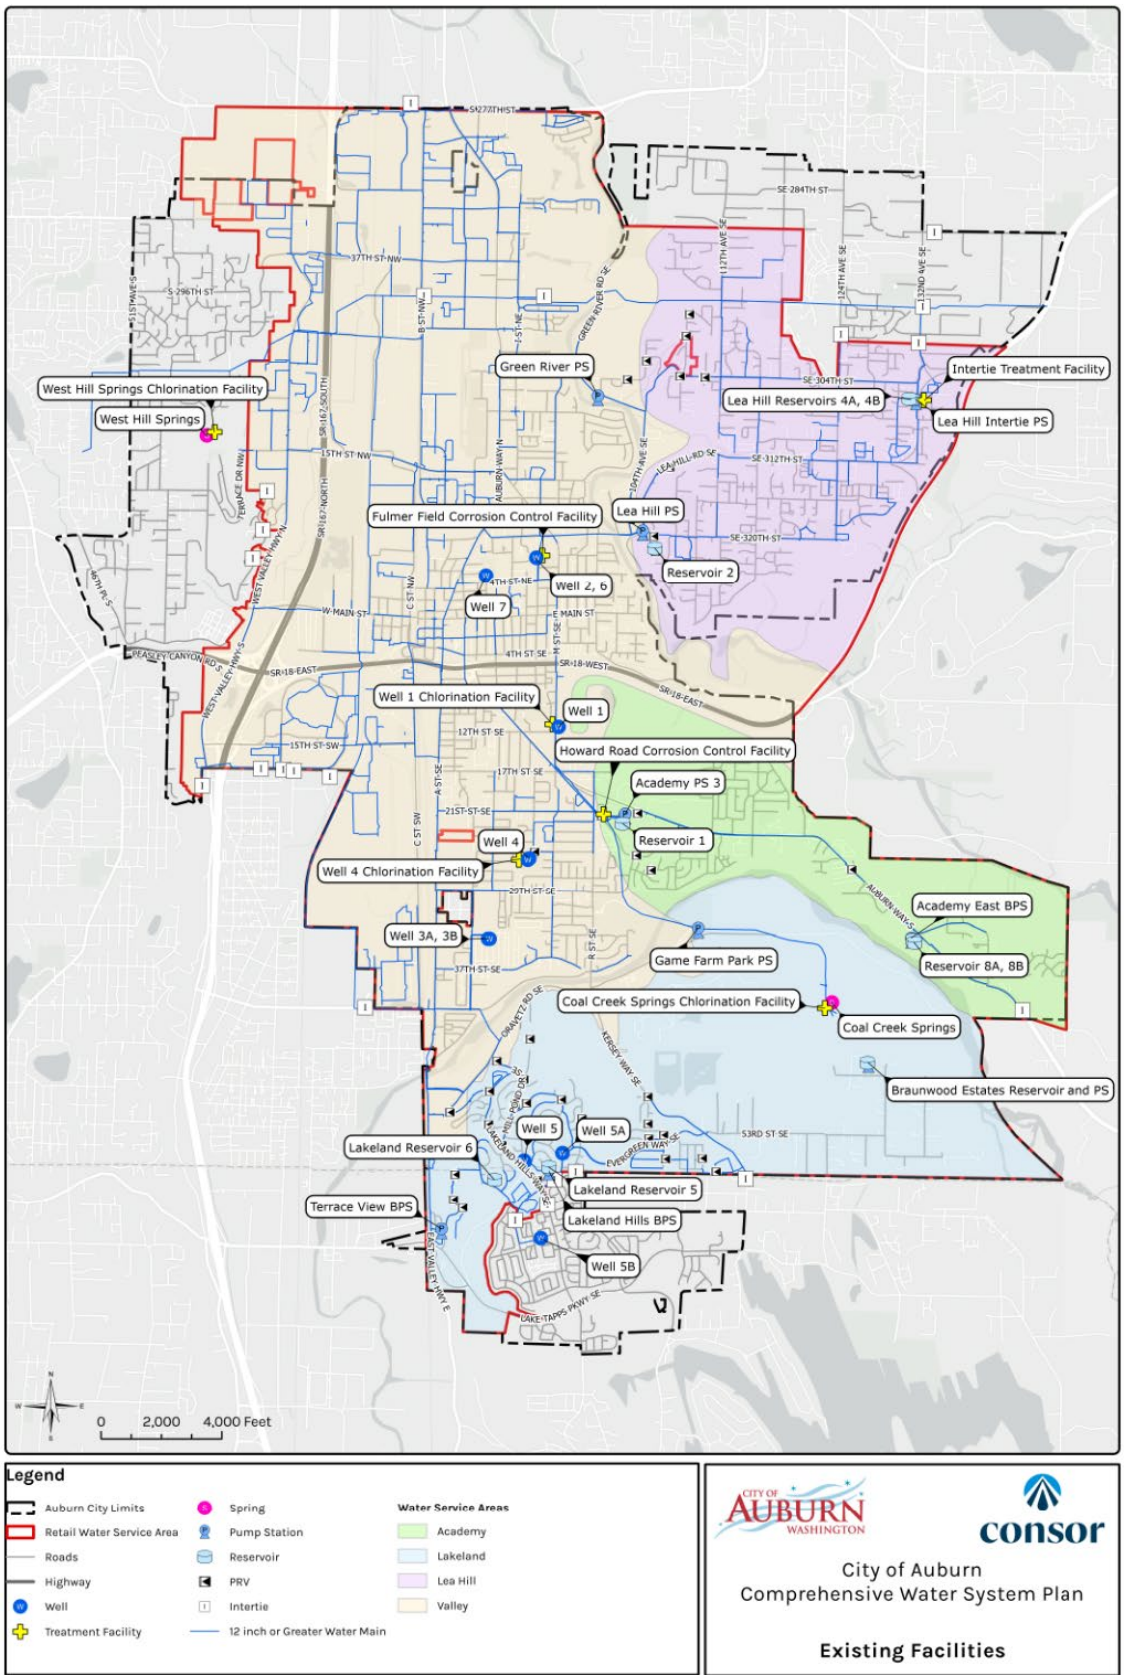
The geology of the City is the result of glacial and interglacial processes acting over millions of years. During the periods when large continental glaciers, not rivers nor lakes, occupied the Puget Sound area, landslides created deposits and erosion through glacial and interglacial deposits. Generally, the uplands surrounding the City are composed of glacial and interglacial deposits and the valleys are filled with more recent deposits overlying older ones.

Five major geologic units lie within the White and Green River Valleys: White River Alluvium (Qaw), Osceola Mudflow (Qom), Undifferentiated Alluvium (Qua), Vashon Recessional Deltaic Deposits (Qd) and Undifferentiated Glacial and Interglacial Deposits (Qu). Bedrock is known to lie approximately 1,280 feet beneath the valley floors.

The Pacific Groundwater Group (PGG) completed an extensive geological and hydrogeological study within the City's RWSA, known as the Auburn Water Resources Program Study, and the results are documented in several volumes:

- 1996 Preliminary Hydrogeologic Characterization
- Summary of 1997 Hydrogeologic Investigations
- The 1997-1998 Test Well Drilling and Installation Program
- The 1999 Hydrogeologic Characterization Report and Appendices

The general groundwater flow system in the City's vicinity is characterized by recharge within uplands and discharge to the rivers in the lowland valleys. Precipitation and Lake Tapps are sources of groundwater recharge. Lake water flows from the lake bottom into the groundwater system. Contrary to recharge in other upland areas, recharge from Lake Tapps is not totally dependent upon precipitation because water is routed to the lake from outside the area. The main discharge zone for the City's area is the Green River Valley. Some groundwater discharges into the river in the City's vicinity and further downstream.



1.4.2 Existing System Overview

The City's water system consists of wells, springs and interties as water sources, chlorination stations and corrosion control facilities for water treatment, pump stations, pressure reducing stations, steel and concrete enclosed reservoirs for storage, and transmission and distribution pipelines to provide potable water to customers. Service is provided to four major service areas (Valley, Lea Hill, Lakeland, and Academy). Each major service area is further divided into pressure zones as required by local topography. The City's four major service areas and the location of key elements of the water system are shown in **Figure 1-3**. A more detailed inventory of assets and system hydraulic profile is presented in **Chapter 3**.

1.4.3 History

The earliest record of a potable water system for the City of Auburn traces back to 1884 with the establishment of the Peasley Canyon supply. Initially serving the City, then called Slaughter, a 4-inch wood-stave pipe connected Peasley Canyon Reservoir to deliver surface water. The year 1907 marked a pivotal moment as the City acquired West Hill Springs for $2,000, a source that continues to yield approximately 1 million gallons of water per day (600 gpm) and remains active.

Figure 1-3 | Existing Facilities

As the City's population grew to a few thousand by 1922, the demand for water prompted the introduction of groundwater wells alongside the existing West Hill Springs. These wells, strategically drilled in the downtown area, were complemented by pump stations, with one situated at the present site of City Hall. Despite their longstanding service, these early wells and pump stations have since been decommissioned.

The evolution of Auburn's water distribution system saw a transition from wooden pipes to the installation of the first recorded steel water main in 1924 - a 10-inch pipeline connecting West Hill Springs to the valley floor. The Coal Creek Springs water collection system, which included a 24-inch steel main under the White River was constructed in 1925, along with the construction of Reservoir 1 (later replaced in 1975), to meet the escalating water needs of the growing City.

By 1946, the population had increased, prompting construction of the Coal Creek Pump Station, to pump water from Coal Creek Springs to the distribution system.

In 1960, the City embarked on further enhancements by supplementing its two springs with a well system, beginning with Well 1 and then Well 2 in 1969.

In 1961, water system facilities were constructed in the Academy Service Area.

Expansion into the Lea Hill Service Area occurred between 1964 and 1965, coinciding with extensive modifications to the Coal Creek supply system and the implementation of a Supervisory Control and Data Acquisition (SCADA) system.

The early 1980s saw the extension of the water system into Lakeland Service Area.

A key development occurred in 1991 with the acceptance of Braunwood Estates (now called Hidden Valley) as a satellite water system operating independently outside the City's distribution network.

The late 1990s marked significant construction under the Interlocal Agreement 2 (IA2) project, a water supply project between LMWD, Covington Water District (CWD) and the City to provide LMWD and CWD with wholesale water supply, and as a result expanding the water system. Expansion into Pierce County and service agreement modifications characterized the late 1990s and early 2000s.

Table 1-2 summarizes key construction and enhancements related to the City's wells, springs, reservoirs, pump stations, treatment, water pipelines, and system upgrades. Notably, the water pipelines improvements focus on transmission mains, excluding distribution mains installation and replacements (due to the extensive list), with exceptions for distribution improvements mandated by environmental (water quality) regulations. The table provides a documented history of the water system, recognizing occasional gaps.

Table 1-2 | Water Facilities History

Springs	
West Hill Springs	• Before 1907: Established as a potable water supply for the City. • 1915: Construction of 210,000-gallon concrete reservoir to store water from West Hill Springs. • 1924: Installation of the first recorded steel water main (10" pipeline from West Hill Springs to the valley floor). • 1960: Ongoing use, with a replacement of collection boxes. • 1988: Removal of reservoir. West Hill Springs water flows continuously into the system.

	• 2000: Partial fencing of the watershed carried out according to the 2000 Water Comprehensive Plan. • 2017: Flow Control Improvements, including installation of an electromagnetic meter and flow control valve for automatic shutdown. • Current: The spring has a capacity of 600-gpm, with varying supply based on aquifer conditions. Equipped with chlorination station.
Coal Creek Springs	• 1925: Construction of Collection system. • 1925: Installation of 24" wood-stave supply pipeline connecting the Coal Creek Springs collection system to a booster pump station (present Howard Road site) and 14" transmission main to Reservoir 1, including installation of 24" steel pipe under the White River • 1964: Construction of south and middle collectors in the system. • 1964: Replacement of the 24" wood-stave supply pipeline connecting the Coal Creek Springs collection system to a booster pump station (present Howard Road site) with 24-inch concrete pipe. • 1998: Addition of the north collector for enhanced system performance. • 2023: Coal Creek Springs Transmission Main Replacement underway to install a new transmission main suspended from a utility/pedestrian bridge over the white river to replace a portion of the old main crossing the river. • Current: Flows by gravity to Howard Road Corrosion Control Treatment Facility (CCTF) and pumped into Reservoir 1, with typical production capacity of 3,000-gpm. Equipped with chlorination station.
Wells	
Well 1	• 1960: Construction of Well 1, within Valley Service Area. • 1998: Shutdown due to reduced well output and water levels. • 2010: The well was brought back into service temporarily to meet summer demands. • 2015: Phase 1 improvements to bring the facility back online. Construction of transmission main in M St SE, 17th St SE, R St SE & Howard Road SE to convey supplies from Well 1 to Howard Road CCTF. • 2016: Phase 2 improvements to bring the facility back online. Improvements included new well house, pumping system (2,200-gpm), disinfection with sodium hypochlorite, on-site emergency power, and upgraded electrical and SCADA controls. • Current: Operational and pumps to Howard Road CCTF, then boosted to Reservoir 1.
Well 2	• 1969: Construction of Well 2 (3,000-gpm capacity), within Valley Service Area. • 2000: Replacement with a new masonry building, pump (1,600-gpm) and associated equipment. • 2014: Installation of Variable-frequency Drive (VFD). • 2023: Rehabilitation and replacement of well pump and motor. • Current: Operational with the Fulmer Field CCTF, providing chlorination and emergency power.
Well 3A	• 1983: Construction of Well 3A (1,650-gpm) with automatic standby generator, pumps directly into Valley Service Area. • 1984: Installation of chlorination system. • Current: Inactive since mid-1990's (Est. 1995 – 1997) due to elevated manganese levels.
Well 3B	• 1984: Construction of Well 3B (1,650-gpm) adjacent to Well 3A, with chlorination system. • Current: Inactive since mid-1990's (Est. 1995 – 1997) due to elevated manganese levels.
Well 4	• 1985: Construction of Well 4 (2,600-gpm), to pump directly into Reservoir 1 and capable of feeding south end of Valley distribution system through pressure-reducing station. • 2016: Emergency Power Improvements project added a diesel-fueled generator and hypochlorite chlorination equipment.

	• 2018: Upgrade of Well soft starter. • 2023 (ongoing): Well 4 Facility Improvements project underway to replace aging mechanical equipment and electrical improvements. • Current: Pumps directly to Reservoir 1 and to south end of Valley Service Area through PRVs.
Well 5	• 1983: Construction of Well 5 (1,000-gpm) to serve the Lakeland Hills Development. • Current: Maximum production capacity of 650-gpm, not chlorinated and pumps directly into Lakeland Service Area and supplies Reservoirs 5 and 6.
Well 5A	• 1990: Construction of Well 5A (180-gpm) to supplement Well 5. • Current: Equipped with chlorination facilities and a manual transfer switch. Pumps directly into Lakeland Service Area and supplies Reservoirs 5 and 6.
Well 5B	• 2005: Construction of Well 5B (600-gpm) with hypochlorite generation and ATEC media filters, to remove iron and manganese prior to disinfection. • Current: Removed from service in 2006 due to irrecoverable aquifer.
Well 6	• 1998-2000: Construction of Well 6 (3,500-gpm) within Valley Service Area. • 2014: Replacement of pump bowl and installation of VFD. • 2000: Rehabilitation with a new masonry building, well pump (1,600-gpm), and associated equipment. • Current: Operational with the Fulmer Field CCTF, providing chlorination and emergency power.
Well 7	• 1997: Construction of Well 7 (3,500-gpm) within Valley Service Area. • Current: Inactive as of 2012, due to elevated manganese levels.
Reservoirs	
West Hill Springs Reservoir	• 1915: Construction of 210,000-gallon concrete reservoir to store water from West Hill Springs. • Current: Reservoir removal (1988). West Hill Springs water flows continuously into the system.
Academy Reservoir	• 1961: 500,000 gallons steel reservoir, supplied by Academy Pump Station. • Current: Reservoir removed (1978-1980) when Reservoir 8B was constructed.
Reservoir 1	• Est. 1925: Construction of 3.0 million gallons to store water from Coal Creek Springs. • 1975: Replacement of uncovered reservoir with covered 5-MG concrete reservoir. • 2019: Seismic isolation control valve installed on outlet piping. • Current: Primary storage for Coal Creek Springs and can also be filled with water from Well 4. Serves as water supply for the Academy Pump Station and Valley Service Area.
Reservoir 2	• 1975: Construction of a 3.6-MG pre-stressed concrete underground reservoir (dual-purpose facility with tennis court on top) in Lea Hill. • Current: Supplied with several City sources and Reservoir 1. Serves as water supply for Valley Service Area. Design for the addition of a seismic isolation control valve in 2024 with construction expected in 2025.
Reservoir 4A	• 1965: Construction of 1.0-MG steel reservoir in Lea Hill. • 1965: Installation of 12-inch ductile iron pipeline from Porter (8th St NE) Bridge to Reservoir 4A. • 1998: Replacement of exterior and interior protective coatings. • Current: Supplied by Valley Service Area through Lea Hill & Green River Pump Stations. Serves as water supply for Lea Hill Service Area. Addition of a seismic isolation control valve underway with construction anticipated in 2024.
Reservoir 4B	• 1983: Construction of 1.5-MG steel reservoir in Lea Hill. • 1998: Replacement of exterior protective coatings. • 2002-2003: Replacement of interior protective coatings

	• Current: Supplied by Valley Service Area through Lea Hill & Green River Pump Stations. Serves as water supply for Lea Hill Service Area. Addition of a seismic isolation control valve underway with construction anticipated in 2024.
Reservoir 5	• 1981: Construction of 1.0-MG steel reservoir for Lakeland Service Area. • 2015: Painting of the Interior and exterior, installation of seismic isolation control valve and addition of ladder. • Current: Supplied with wells 5, 5A and Terrace View Booster Pump Station. Serves as water supply for Lakeland Service Area.
Reservoir 6	• 2012: Construction of 1.0-MG reservoir in Lakeland Service Area (also provides storage for City of Algona). • Current: Supplied with wells 5, 5A and Terrace View Booster Pump Station. Serves as water supply for Lakeland Service Area and City of Algona.
Reservoir 8A	• 1973: Construction of 1.2-MG steel reservoir in Academy Service Area. • 2002-2003: Recoating of the reservoir's exterior and interior. • Current: Supplied with Reservoir 1 through the Academy Pump Station. Serves as water supply for Academy Service Area. Addition of a seismic isolation control valve underway with construction anticipated in 2024.
Reservoir 8B	• 1980: Construction of 1.5-MG steel reservoir in Academy Service Area. • 2002-2003: Recoating of the reservoir's exterior and interior. • Current: Supplied with Reservoir 1 through the Academy Pump Station. Serves as water supply for Academy Service Area. Addition of a seismic isolation control valve underway with construction anticipated in 2024.
Pump Stations	
Howard Road Site Pump Station	• 1925: Construction of Howard Road Site Pump Station with 5 hydraulic ram-type pumps to move water from coal creek springs to Reservoir 1 & distribution system. • Current: (1962) Operation of ram-type pumps ended.
Coal Creek Springs Pump Station	• 1946: Construction Coal Creek Springs Pump Station to pump water to Reservoir 1 and distribution system (consisted of pump house and an electric pump). • 1947-1952 (exact year unknown): Addition of second pump (2,000-gpm). • 1953: Addition of third pump (3,000-gpm) • 1964: Replacement of two pumps with new 1,500-gpm and 2,500-gpm pumps. • 1999: Replacement of Diesel fuel storage tanks for emergency generators with above-ground, double-walled fuel tanks (easier to inspect for fuel leakage). • Current: Pump station removed in 2003 to make way for Howard CCTF.
Academy Pump Station	• 1960: Construction of Academy Pump Station 1, housing Pumps 1 and 2 (300-gpm and 500-gpm capacity). • 1961: Installation of 2 miles 10" cast iron transmission main from Academy Pump station 1 to Academy reservoir. • 1980: Construction of Academy Pump Station 2, housing Pumps 3 and 4 (750-gpm capacity each), with emergency power generator. • 1980: Installation of 2 miles 14" ductile iron transmission main, connecting Academy Pump Station 2 to Reservoirs 8A & 8B. • 1999: Replacement of Diesel fuel storage tanks for emergency generators with above-ground, double-walled fuel tanks (easier to inspect for fuel leakage). • 2022: Academy Pump Stations 1 and 2 replaced with a single pump station, Academy Pump Station 3, that consists of 4 vertical turbines, variable speed drive pumps with firm pumping capacity of 2,100-gpm. • Current: Pumps water to the Academy Reservoirs (Reservoirs 8A & 8B)
Green River Pump Station	• 1999: Construction of the Green River Pump Station, equipped with 4 pumps (1,170-gpm capacity each), as part of the Interlocal Agreement 2 (IA2) to supply water to CWD & LMWD.

	• 2020: Facility improvements for emergency generator and associated electrical equipment. • Current: Pumps water to the Lea Hill Reservoirs (Reservoirs 4A & 4B).
Game Farm Park Pump Station	• 1988: Construction of the Game Farm Wilderness Park Pump station for water supply and fire protection of the park. • 1992: Installation of 60-gpm domestic pump. • 1993: Installation of 1,000-gpm fire pump. • Current: Pumps water to the Game Farm Wilderness Park from the Coal Creek gravity supply line.
(Lea Hill) Intertie/Booster Pump Station	• 1998-2000: Construction of Intertie Pump Station near Lea Hill Reservoirs, designed to operate in conjunction with Green River Pump Station to serve IA2 partners (using 4 pumps) and to also serve small area at the top of Lea Hill using a "package type" booster-pump station. • Current: Pumps water to small higher elevation service area in Lea Hill. Equipped with a hypochlorite chlorination system.
Lea Hill Pump Station	• 1965: Construction of Lea Hill Pump station with two 600-gpm and one 800-gpm pumps, to boost water from Valley Service Area to Lea Hill Service Area. • 1999: Replacement of Diesel fuel storage tanks for emergency generators with above-ground, double-walled fuel tanks (easier to inspect for fuel leakage). • Current: Pumps water to the Lea Hill Service Area.
Lakeland Hills Booster Pump Station	• 1990: Construction of Lakeland Hills Booster Pump Station, consisting of a three-pump pressure sustaining package system and two large-capacity fire pumps, to pump water from Lakeland Hills Reservoir to Lakeland Service Area. • 2013: Replaced for improved service to boosted Lakeland Service Area, using three low flow pumps (720-gpm capacity each) and two fire flow pumps (3,125-gpm capacity each). • Current: Pumps water to higher elevation service area in Lakeland.
Terrace View Booster Pump Station	• 2010: Construction of Terrace View Booster Pump Station with firm capacity of 1,100-gpm, to supply water from Valley 242 to Lakeland 630 pressure zone. • Current: Pumps Valley Service Area water to Lakeland Service Area. Equipped with hypochlorite feed pump.
Academy East Booster Pump Station	• 2014: Construction of the Academy East Booster Pump Station replaced the single pump Janssen's Addition Pump Station, equipped with three domestic pumps with firm capacity ranging from 750 to 1,250-gpm. • Current: Pumps water from Reservoirs 8A and 8B into Academy Service Area.
Treatment	
Howard Road Corrosion Control Treatment Facility (CCTF)	• 2004: Construction of the Howard Road CCTF (6,300-gpm capacity), to treat water from Coal Creek Springs and Well 1 and boost to Reservoir 1, using three 2,100-gpm booster pumps. • Current: Pumps water to Reservoir 1.
Fulmer Field CCTF	• 2004: Construction of the Fulmer Field CCTF (9,600-gpm capacity), to treat water from Well 2, 6 and 7 and boost to Reservoir 2 and distribution system, using four 3,200-gpm booster pumps. • 2013-2018: Evaluation of Fulmer Field CCTF (along with Wells 2, 6 and 7) to identify improvements to increase the supply and treatment capacity of the existing facilities and infrastructure. • Current: Pumps water to Reservoir 2 and the Valley Service Area.
Distribution Main Improvements (mandated by Environmental Regulations) & Interties	
Intertie with City of Algona	• After 1996: Construction of wholesale interties (combined 1.1-mgd capacity) at: ○ 1149 Industry Drive SW ○ Boundary Boulevard and Milwaukee Ave

	○ Iowa Drive and West Valley Highway ○ 1st Avenue • Emergency Interties at ○ Boundary Boulevard and Celery Ave ○ Boundary Boulevard and O Street
Intertie with City of Bonney Lake	• 2002: Construction of 8" emergency intertie at Evergreen Way, southwest of Lakeland Hills Way • After 2010: Construction of emergency interties at ○ Lakeland Hills Way & 59th Avenue ○ Evergreen Way and Nathan Avenue ○ Olive Avenue, south of Evergreen Loop
Intertie with City of Pacific	• After 2003: Construction of emergency interties at ○ Ellingson Road near Pacific Ave ○ A St SE, north of White River
Intertie with City of Kent	• After 2001: Construction of emergency intertie with 78th Avenue S and S 277th Street
Intertie with LMWD	• Est. 1996 – Construction of 12" wholesale intertie at 30502 132nd Avenue SE (5-mgd capacity) • 1996 – 2002: Construction of emergency interties in ○ 127th Place SE, south of SE 299th Place ○ 124th Avenue SE and SE 300th Way ○ SE 300th & 132nd Ave SE ○ 1998-2000 at SE 288th St & 132nd Ave SE
Intertie with Lakehaven Water & Sewer District (LWSD)	• Est. 1995: Construction of the Aaby Dr. emergency intertie with LWSD at R St. NW (named Intertie #2). • 2004: Transfer of Aaby Dr. pump station and service from City to LWSD. • 2006: Emergency intertie with LWSD at R St. NW (Intertie #2) was removed from service • After 2010: Installation of water meter and control valve vault for 6" emergency intertie at Aaby Dr. and Knickerbocker Dr. (reinstating Intertie #2)
Intertie with City of Tacoma	• Est. 2012: Construction of wholesale interties at: ○ 3240 B St NW (2,200-gpm max. instantaneous flow rate) ○ 29598 132nd Ave SE (4,500-gpm max. instantaneous flow rate) ○ Combined max. flow rate of 5.12 MGD (3,555 gpm) in a 24 hour period (the interties could flow at a higher rate for a portion of the day so long as the 24-hour average meets the contractual peak period flow)
Distribution Main Improvements (mandated by environmental (water quality) regulation)	• 2015: Replacement of 2,760 linear feet of Asbestos Cement (AC) water main with ductile iron main. • 2022: Removal and replacement of approximately 186 service lines with lead goosenecks and approximately 7,075 linear feet of distribution water main with ductile iron main.
System Upgrades	
Supervisory Control and Data Acquisition (SCADA) system	• 1975: Addition of SCADA/telemetry, to control all reservoirs, wells and pumps from the Maintenance and Operations building. • 2015: Extensive upgrade of the SCADA/telemetry system, to improve control of the water utility facilities and replace obsolete components. • 2024: Updated System Platform to AVEVA. Major components and new hardware were replaced to provide more reliable service.
Metering	• 2016: Installation of two master meters for Muckleshoot Indian Tribe (MIT) Casino, to facilitate City and MIT account administration.

	• 2017-2018: Installation of Advanced Metering Infrastructure (AMI) for all customers. The AMI allowed for more accurate meter reads, daily information for quicker detection of leaks, and improved efficiency of billing operations. • 2020 - 2022: Replacement of deduct meters used for irrigation purposes with separate water service tap on the city's main.

1.5 Related Plans and Studies

In preparing this Plan, related studies and plans were reviewed to ensure coordination with adopted documents that affect system planning and operations. The related plans are categorized into two groups for clarity: Internal Studies/Plans Specific to the City and External Plans Influencing City-Wide Water Management. A brief synopsis of these studies and plans are presented below.

Internal Studies/Plans Specific to the City:

Wellhead Protection Plan, City of Auburn, 2014: The City developed a Wellhead Protection Plan to identify and protect groundwater sources. The initial plan was created in 2000 by Pacific Groundwater Group (PGG) and subsequently updated by Robinson Noble in 2008 and 2014. The plan maintains existing wellhead protection areas (WHPAs) and contributes to hazard assessments within these zones. It aligns with county ordinances, impacting land use planning and reflecting in critical aquifer recharge areas as outlined in the King County Comprehensive Plan. Additionally, the plan developed a monitoring system for groundwater sampling, which enhanced operational readiness by providing early warnings of potential contaminations.

City of Auburn Water Resources Program, Pacific Groundwater Group, Inc., 1995-1999: Pacific Groundwater Group conducted a comprehensive groundwater study in response to recommendations of the 1995 Comprehensive Water Plan. The study was documented in a series of reports (listed below), collectively known as the Auburn Water Resources Program Study. The Auburn Water Resources Program assessed the long-term potential for the City's continued use of groundwater for its water supply. The study confirmed substantial quantities of groundwater underlying the valley area and provided the basis for the water supply conclusions for this Plan. This comprehensive program, spanning several years, strategically addresses water rights acquisition by delving into technical studies of the local groundwater system. Two key elements of the program were the installation of monitoring wells and river gauges, and the assessment of the existing City wells in the deep aquifer. The installation of monitoring wells and river gauges not only aids in system planning by understanding groundwater dynamics but also enhances operational efficiency through real-time data collection. The program also included the development of a regional ground-water model (MODFLOW), using the United States Geological Survey (USGS) model program. This provided a tool for analyzing potential withdrawal scenarios, offering valuable insights into optimizing water system operations.

- 1996 Existing Data Hydrogeologic Characterization
- 1996 Preliminary Hydrogeologic Characterization
- Summary of 1997 Hydrogeologic Investigations
- 1997-1998 Test Well Drilling and Installation Program
- 1999 Hydrogeologic Characterization Report and Appendices
- Regional Groundwater Model Report

Bilateral Compliance Agreement (BCA), 1996: This agreement, entered with the Department of Health (DOH) due to copper levels that exceeded the action levels in samples collected in 1993, outlined treatment options and schedules for corrosion control facilities. As a result, new corrosion facilities at the Howard Road/Coal Creek Springs Pump Station and Fulmer Field Park were completed in 2004. The completion of

these facilities in 2002 directly impacts operational efficiency, ensuring compliance with health standards and safeguarding water quality in the long term.

City of Auburn – Public Works Emergency Response Manual, 2022: This electronic manual is only one element of the City's overall Emergency Response Plan, which serves as a guide for management of emergency situations. It was first developed in 1999 in response to the potential impact of Y2K and it is updated annually at the first of the year. The manual is not all-inclusive for every type of disaster that could occur, but it is a valuable tool for dealing with many of the emergency situations that most water utilities could face.

City of Auburn Comprehensive Plan, 2015 and Amendments: This current plan, originally adopted in 2015 in accordance with the State Growth Management Act (GMA) is the City's comprehensive land use plan and policy document. It consists of goals, land use policies, and the Comprehensive Plan maps. The plan may be amended annually as needed. The update of the comprehensive plan is taking place concurrently with the revision of this water system plan.

City of Auburn 2015 Comprehensive Water Plan, City of Auburn Public Works, 2015: The previous Comprehensive Water Plan provided evaluation of needs and recommended improvements to the City system for 2015-2022. In 2021, DOH extended the approval period for the 2015 WSP until May 11, 2026. The plan adopted in 2015 constitutes the basis for this Plan.

Capital Facilities Plan (2023-2028), City of Auburn Finance Department, 2022: Adopted in 2022, this plan is instrumental in both planning and operations. It outlines goals, policies, and implementation programs mandated by the State GMA, providing a roadmap for capital improvements. This directly influences the operational landscape by defining necessary infrastructure enhancements and improvements, aligning with the city's capital improvements program.

Engineering Design and Construction Standards, City of Auburn, 2024: The City updates its Design and Construction Standards as needed, typically on an annual or bi-annual basis. These standards not only guide the planning of new infrastructure but also enhance day-to-day operations by ensuring adherence to the latest industry practices and regulations. The City of Auburn Design and Construction Standards are attached in Appendix P.

Water Shortage Contingency Plan, City of Auburn, 2024: The plan establishes actions and procedures for implementing Auburn City Code (ACC) 13.14 during impending or actual water shortages, to maintain levels of service essential for public health and safety, minimize adverse impacts on economic activity, and protect customer's lifestyle; refer to Appendix R.

Water Cost of Service Rate Update Study, City of Auburn, 2022: This study informs strategic decisions related to water rates and influences the operational budget.

System Development Charge Study, City of Auburn, 2014: Completed in 2014, this study examines system development charges, offering insights for future infrastructure development. Its findings directly influence the planning of new systems and infrastructure projects and provide a financial basis for expansion.

External Plans Influencing City-Wide Water Management:

King County 2016 Comprehensive Plan, King County Department of Local Services, 2016: The King County Comprehensive Plan establishes land use zoning for areas outside the City limits, but within the RWSA. Additionally, King County provides critical area ordinances and critical aquifer recharge areas that support

the City's wellhead protection efforts. The current King County Comprehensive Plan was first adopted on December 5, 2016, and was later amended in 2020.

Pierce County Comprehensive Plan, 2015 and Amendments: This is a comprehensive plan and policy document for Pierce County. The plan was developed in accordance with the GMA and is amended every two years. This plan influences planning by offering insights into regional policies.

Pierce County Coordinated Water System Plan, 2021: In 1983, all of Pierce County was declared a Critical Water Supply Service Area. In response to this declaration, Pierce County established the first Coordinated Water System Plan to coordinate planning and establish water service areas. The current Coordinated Water System Plan, adopted in 2021 through Ordinance 2018-39s2, influences both regional water planning and City's operational coordination with other systems in the county.

Pierce County White River Basin Plan, 2013: This plan provides a comprehensive guide to storm drainage and surface water management in portions of the White River Basin. Given that the City of Auburn utilizes this basin, the plan significantly influences operational considerations and emergency response strategies during storm events.

South King County Coordinated Water System Plan (CWSP), 1989: This plan, adopted in 1989, defined the initial service area boundaries for the water systems within the Critical Water Supply Area of South King County. The City of Auburn Comprehensive Water Plan, upon adoption, becomes an element of the CWSP.

South King County Ground Water Management Plan (GWMP), 2003: The GWMP was initiated by Ecology with the intent to develop methods to protect the quality and quantity of ground water, meet future resource needs while recognizing existing water rights and provide effective and coordinated management of ground-water resources. This plan is considered in planning for and operation of the City's water system.

Tribal Land Use Plan, Muckleshoot Indian Tribe, 1978: The adoption of the MIT's Zoning Ordinance in 1979, which influences land use within the Muckleshoot Indian Tribe, affects water-related considerations. This plan plays a crucial role in ensuring collaborative water management efforts that respect tribal land use.

USGS Hydrogeologic Framework, Groundwater Movement, and Water Budget in the Puyallup River Watershed and Vicinity, Pierce and King Counties, Washington: Scientific Investigations Report 2015-5068: A collaborative effort involving various entities (Cities of Auburn, Milton, Puyallup, Sumner, and Tacoma; Pierce Conservation District; DOH; Cascade Water Alliance; Lakehaven Utility District; Summit Water & Supply Company; Mt. View-Edgewood Water Company; and The Russell Family Foundation), this report contributes valuable insights into the hydrogeologic framework, groundwater movement, and water budget in the Puyallup River Watershed. It significantly influences both regional water planning and operational considerations, providing a scientific basis for understanding the water dynamics in the watershed.

Other Plans

In addition to the studies listed above, the current Water Comprehensive Plans from the following neighboring water systems (City of Algona, Bonney Lake, Kent, Pacific, CWD, LWSD, LMWD and Highline Water District (HWD)) were considered during the preparation of this Plan.

1.6 Service Area, Maps, and Land Use

The City's RWSA boundaries were initially defined and documented through the South King County CWSP in 1989. The boundaries of the RWSA have been adjusted since 1989. An area of Pierce County was incorporated into the RWSA through the Pierce County Coordinated Water System Planning process (1997) and interlocal agreements with Bonney Lake (1998 and 2016), LWSD (2004), Kent (2006), and LMWD (2006). Copies of the Water Service Area Agreements are provided in **Appendix G.** The RWSA covers a total area of 16,193 acres; 15,877 acres are in King County and the remaining 316 acres are in Pierce County within Auburn City Limits. A total of 700 acres (4.3 percent) of the RWSA is in unincorporated King County urban and rural areas.

Several water purveyors adjoin the City of Auburn RWSA, as shown in **Figure 1-4**. These include the cities of Algona, Bonney Lake, Kent, Pacific, and Sumner. Also included are the CWD, LWSD, LMWD, HWD, and MIT. Purveyors with wholesale water agreements and interties are discussed in **Section 1.6.1**.

The City currently does not plan to update its service area boundaries unless the need arises in the future. The City will continue to evaluate its service area boundaries and will consider updates if future needs or circumstances warrant changes.

Figure 1-5 reflects the City's current land use designations. The City includes a wide range of residential, commercial, institutional, and industrial land uses. Public and quasi-public land uses include parks, open space, and public recreation as well as institutional uses such as schools. Commercial and industrial uses occur primarily in the valley; however, large areas of residential land use and the Downtown Urban Center (DUC) also exist in the valley area.

The Academy and Lakeland Service Areas are primarily residential, although some commercial development is located along Auburn Way South (SR 164) in the Academy Service Area. The Lea Hill Service Area is also primarily residential although other uses include small amounts of commercial and open spaces, and Green River College.

Areas within the RWSA, but outside the City limits, are governed by unincorporated King County land uses which include agricultural, rural and residential land use types as shown in **Figure 1-5**. The unincorporated King County land uses shown in **Figure 1-5** were obtained from King County's open data portal which reflects the current adopted land use designations established in the Comprehensive Plan. Those land use designations reflect the intended long-range use of land of the 20-year planning horizon of the plan.

Figure 1-6 shows the Urban Growth Area (UGA), which is comprised of both the current City limits and potential annexation areas (PAA).

1.6.1 Wholesale Interties

Interties provide a tool that water utilities use to move water between systems to meet supply needs, to increase reliability and respond to emergencies. The City maintains wholesale supply interties with three water systems: City of Tacoma, Algona, and LMWD. The City also has a supply contract with the MIT and the Indian Health Service, dating from 1972, for services along a pipeline at SE 368th PL extending from the City limits into the reservation.

1.6.1.1 City of Tacoma

In 2012, Tacoma agreed to provide water to the City in the quantity of up to 1.0 mgd average day use, 1.8 mgd peak day use, and 1.62 mgd four-day peak use. Two interties were constructed to supply the City: located at 3200 B Street NW and 29600 132nd Avenue SE in Auburn. This agreement will remain in force as long as Tacoma (or its successors in interest of its water system) remains in the business of providing water, and as long as the City meets the terms and conditions of the agreement.

In 2014, Tacoma amended and restated the 2012 agreement with the City to provide a total of 3.5 mgd (2,430 gpm) of average use and 5.12 mgd (3,555 gpm) of peak use combined from the interties. The B Street NW Intertie is limited to a maximum flowrate of 2,200 gpm and the 132nd Avenue SE Intertie is limited to a maximum flowrate of 4,500 gpm. However, the combined use of the interties cannot exceed 5.12 mgd (3,555 gpm) in a 24 hour period.

Figure 1-4 | Adjacent Water Systems

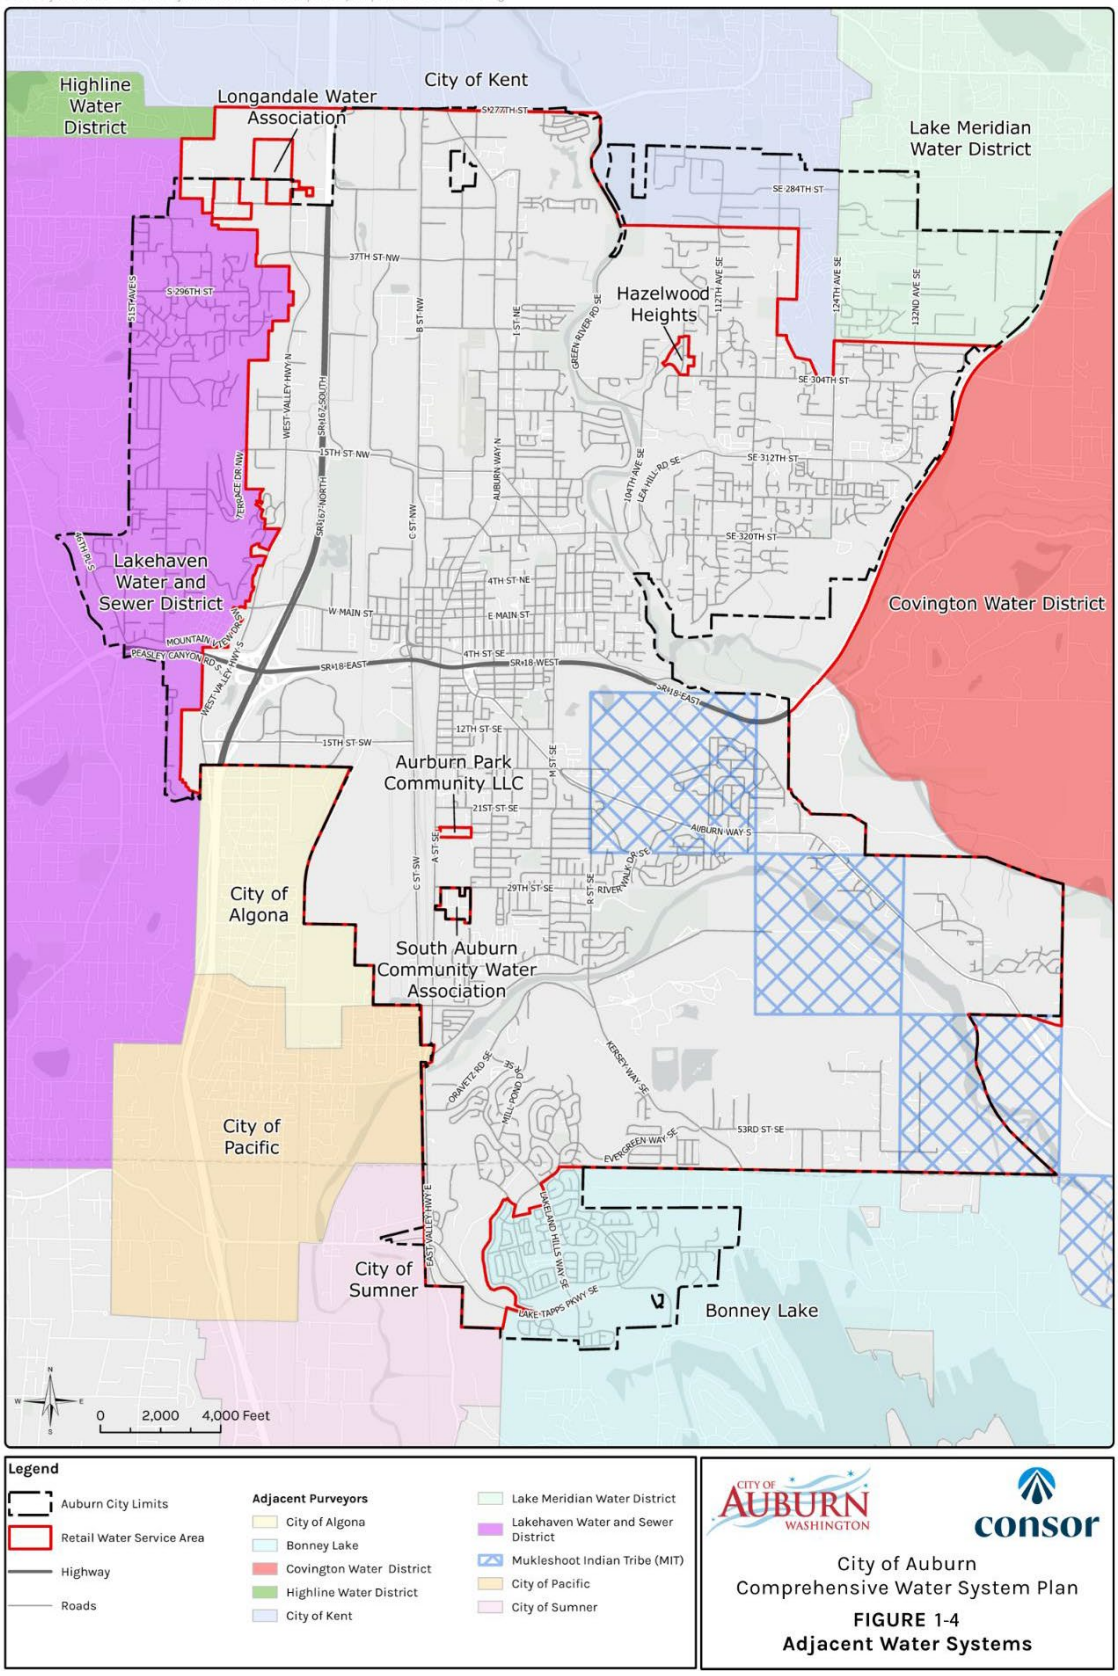


Figure 1-5 | Existing Land Use

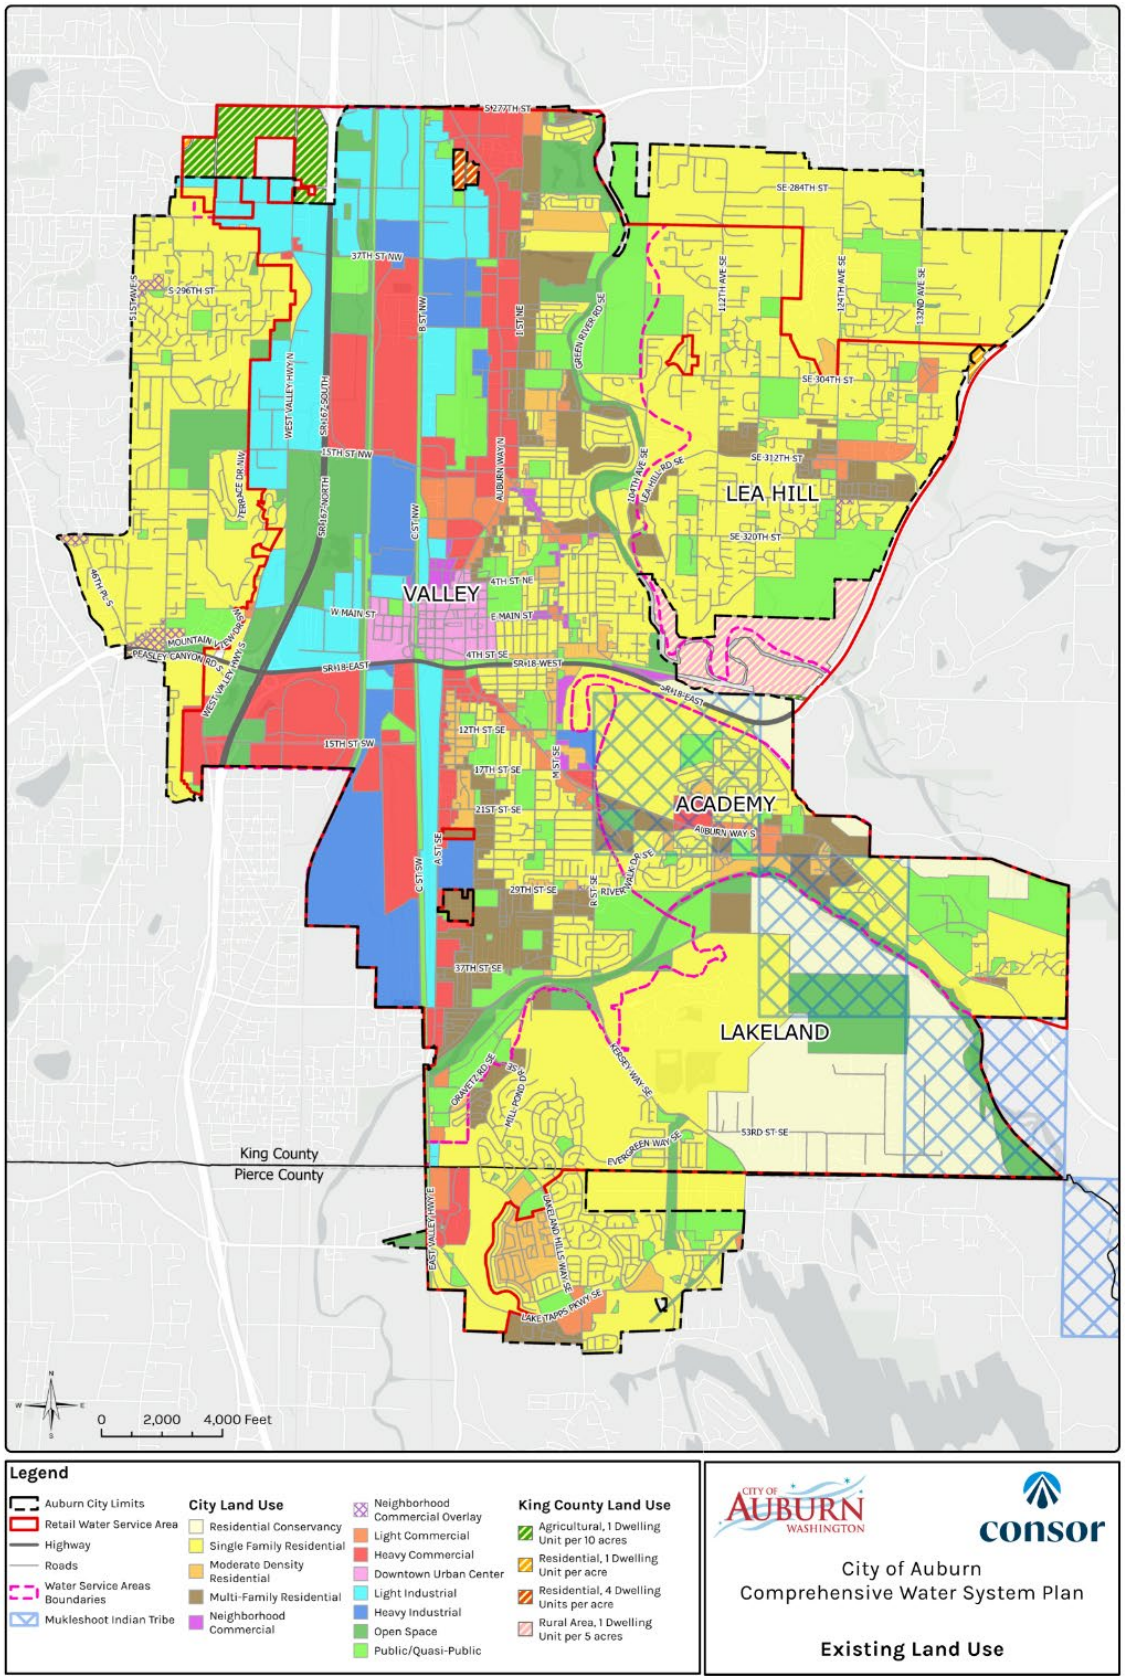

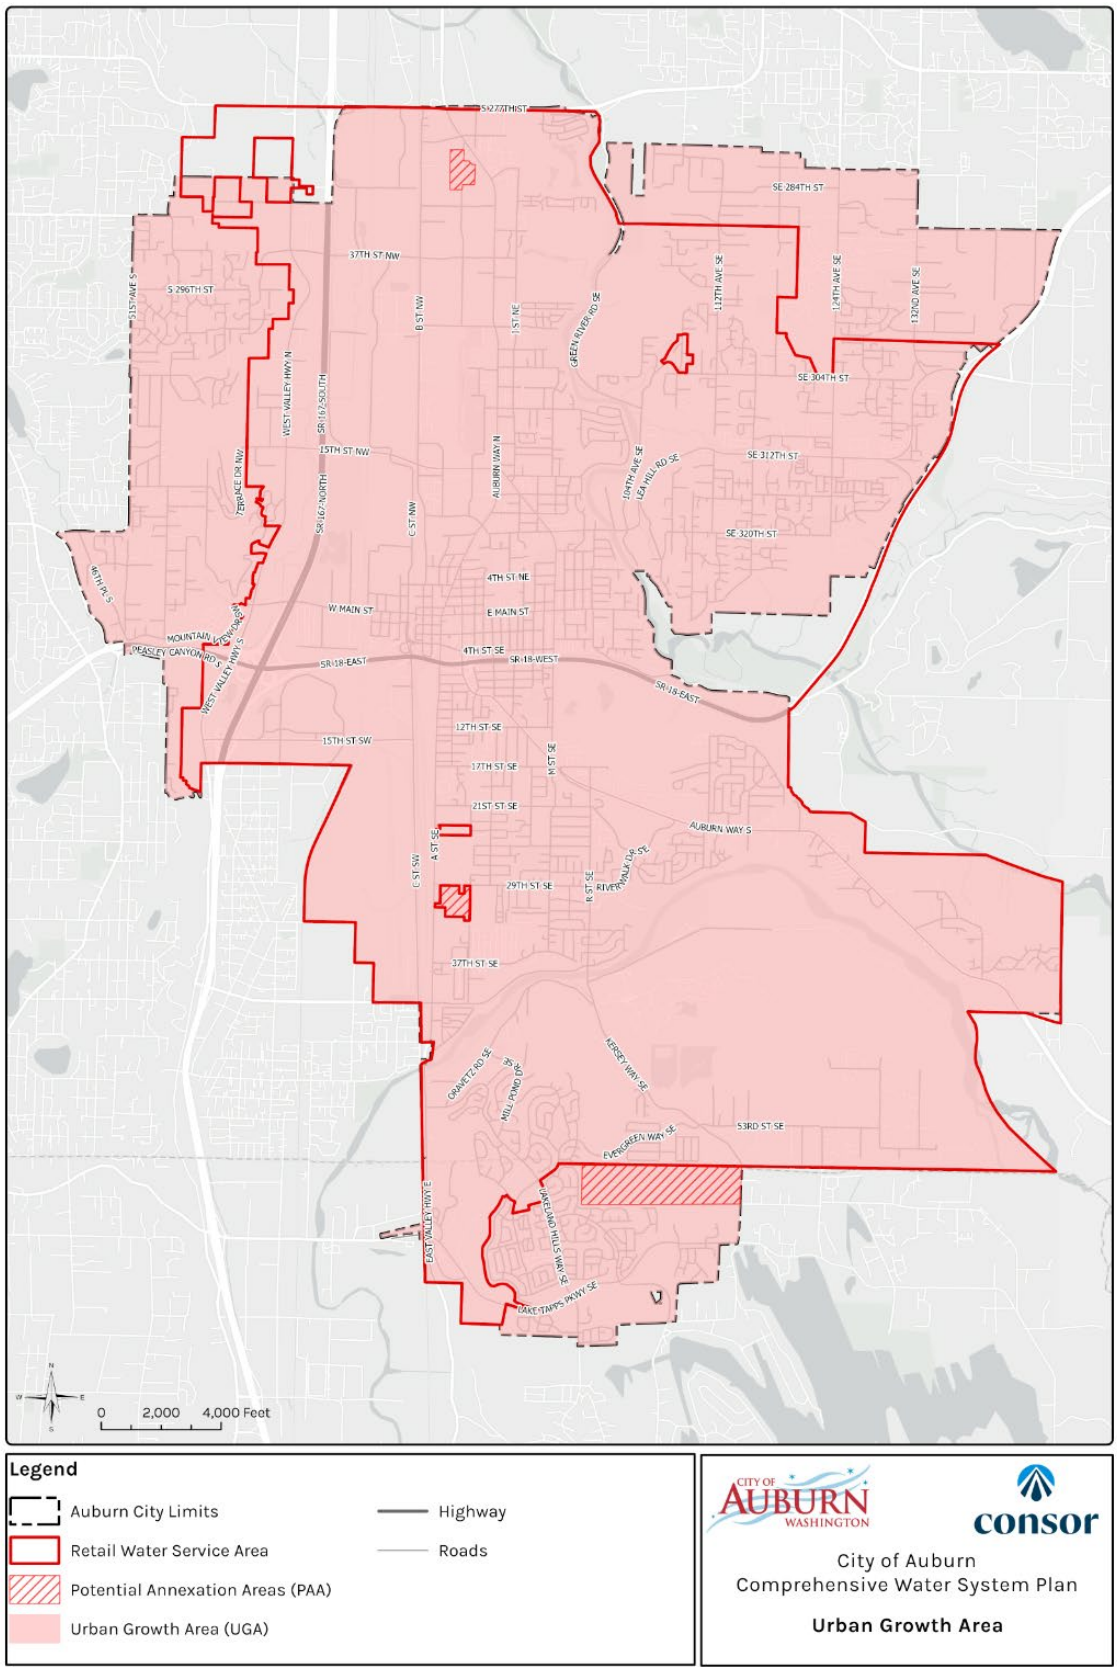

Figure 1-6 | Urban Growth Area

1.6.1.2 City of Algona (Algona)

In 1996, the City and Algona entered into a water supply interlocal agreement (IA3) for the City to provide wholesale water supply to Algona. In 2002, the agreement was superseded with Interlocal Agreement 3A (IA3A). IA3A called for the City to provide for a firm quantified (uninterruptible) wholesale water supply and Algona would provide the City its groundwater rights from the failed well located at the intersection of 3rd Avenue and Washington Boulevard. Per IA3A, Algona also agreed to maintain its 100,000 gallons of system storage and financially participate in an additional 180,000-gallon share of the City's Reservoir 6 storage capacity. Per request in 2016, Algona elected to increase its participation in Reservoir 6 by 100,000 gallons, which accounted for a total share of 280,000-gallon storage capacity. If the City experiences any failure or decreased capacity, the supply of water to Algona may be decreased by the same percentage that is experienced by the City.

Algona is served (per agreement IA3A) through 8-inch meter located at 1st Avenue and by two 8-inch intertie meter stations located at 1149 Industry Drive SW, and at Boundary Boulevard and Milwaukee Avenue. A fourth 8-inch master meter is located near Iowa Drive and West Valley Highway. All the interties are connected to the City's 242 zone.

1.6.1.3 Lake Meridian Water District (LMWD)

An intertie between the City and LMWD was constructed in 1996 as part of Interlocal Agreement 2 (IA2), to enable the District to purchase water from the City. The intertie also allows the City to provide an emergency supply to Kent's East Hill Service Area through LMWD. A provision of the IA2 agreement calls for the district to provide an emergency supply to the City when needed for the Lea Hill Service Area. As part of the IA2, the City agrees to provide up to 2.5 mgd of MDD to LMWD (total maximum day demand of 5.0 mgd).

Per the 2017 Amendment to the IA2, LMWD discontinued regular purchase of water from the City and instead switched their primary supply to CWD. The amendment maintained the intertie with LMWD but modified the conditions of service to interruptible.

1.6.2 Emergency Interties

The City has emergency interties with seven water systems as summarized in **Table 1-3.**

Table 1-3 | Emergency Interties

Water System	Receiver	Location	Auburn Pressure Zone	Mode of Operation	Meter Size	Operated by
City of Algona	City of Algona	Boundary Boulevard and Celery Ave	Valley 242	Manual	N/A	City of Auburn
City of Algona	City of Algona	Boundary Boulevard and O Street	Valley 242	Manual	8"	City of Auburn
City of Bonney Lake	City of Bonney Lake	Evergreen Way SE (southwest of Lakeland Hills Way)	Lakeland 697	Manual	8"	City of Bonney Lake
City of Bonney Lake	Two-way	Lakeland Hills Way & 59th Avenue	Lakeland 697	Manual	N/A	City of Auburn/ Bonney Lake
City of Bonney Lake	Two-way	Evergreen Way and Nathan Avenue	Lakeland 697	Manual	N/A	City of Auburn/ Bonney Lake
City of Bonney Lake	Two-way	Olive Avenue, south of Evergreen Loop	Lakeland 697	Manual	N/A	City of Auburn/ Bonney Lake

Water System	Receiver	Location	Auburn Pressure Zone	Mode of Operation	Meter Size	Operated by
City of Kent	Two-way	78th Avenue S and S 277th Street	Valley 242	Manual	6"	City of Auburn/ Kent
City of Pacific	City of Pacific	Ellingson Road near Pacific Ave	Valley 242	Manual	4"	City of Pacific
City of Pacific	City of Pacific	A St SE (north of White River)	Valley 242	Manual	N/A	City of Pacific
Lakehaven Water & Sewer District (LWSD)	City of Auburn	Aaby Drive and Knickerbocker Drive	Valley 242	Manual	6”	LWSD
LMWD	Two-way	127th Place SE, south of SE 299th Place	Lea Hill 648	Manual	N/A	City of Auburn
LMWD	Two-way	124th Avenue SE and SE 300th Way	Lea Hill 648	Manual	N/A	City of Auburn

LMWD	LMWD	SE 288th St & 132nd Ave SE	Lea Hill 648	Manual	8”	City of Auburn

1.7 System Policies

The City manages the water utility in accordance with established water system policies that govern various facets of utility operations. The water system policies are established to support a vision or mission and to provide a framework for the design, operation, and ongoing wellbeing of the City’s water utility. The policies establish consistency and ensure that adequate levels of service are provided throughout the system. The policies also provide documentation to current water-system customers, as well as those considering service from the City.

The City’s Water Comprehensive Plan is based upon the following mission statement for the water utility:

“The City will provide for the efficient, environmentally sound and safe management of the existing and future water system within Auburn’s service area.”

For areas outside its municipal boundaries, the City maintains water franchises that allow for construction, operation, and maintenance of its facilities. Water system design and construction in the franchise areas are consistent with franchise requirements and the design and construction standards included in this Plan.

The City’s water system policies and criteria, provided in Appendix A, are grouped within goal statements that are headlined under seven categories: Business Practices, Service Area, Operations and Maintenance, Financial, Planning, Environmental Stewardship, and Design and Construction.

1.8 Duty to Serve

The City recognizes its duty to serve all new service connections within its RWSA when the following thresholds are met per WAC 246-290-106.

- The water system has sufficient capacity to serve water in a safe and reliable manner.
    - To ensure the water system's capacity for safe water delivery, hydraulic analysis is conducted. This involves assessment of peak demand patterns, pressure requirements, and potential system expansions. The goal is to establish and maintain a water supply infrastructure that can reliably and securely accommodate the needs of new connections.
- The service request is consistent with adopted local plans and development regulations.
    - Service requests undergo a comprehensive review to ascertain their alignment with local plans, including the City's Design and Construction Standards.
- The water system has sufficient water rights to provide service.
    - Assessment of water production data is performed for all sources to confirm the water system's capacity and compliance with available water rights.
- The water system can provide service in a timely and reasonable manner.
    - The assessment of the water system's capability to provide service promptly and reasonably encompasses evaluating infrastructure readiness, adherence to construction timelines, and minimizing disruption to existing customers. The City incorporates Washington State DOH recommendations for timely and reasonable service, which is defined as providing water service within 120 days of receiving a complete application, barring any extenuating circumstances.
    - If a customer or applicant is dissatisfied with a decision made by the City Engineer concerning water service, they may file a written objection with the Public Works Director within 15 working days of receiving the decision. The Director will respond within 15 working days. If the response is unsatisfactory, the appellant may request a hearing with the City's hearing examiner within 30 days.
    - The hearing examiner's decision is final, but can be appealed in superior court following RCW 34.05.510 through 34.05.598.
    - For customers in the city's RWSA located within unincorporated areas of King County, if all city-level appeals are exhausted and unresolved, the dispute may be escalated to the King County Utilities Technical Review Committee (UTRC) in accordance with King County Code (KCC) 13.24.080.

The City will plan to provide water service to all customers within its RWSA, in accordance with the WAC requirements and City Code. Revisions to the City's RWSA will be made only by written agreement and in accordance with local, county and state regulations.

1.9 Local Government Consistency

The City has submitted this plan to DOH, King and Pierce Counties, adjacent utilities, and local governments as part of the Agency Review process. Local government consistency review is completed in accordance with WAC 246-290-100(7) and WAC 246-290-108 to confirm consistency between the water system plan and local comprehensive plans, development regulations, and other local codes.

The consistency review also supports planning and development, minimizing conflicts and legal entanglements. The completed and signed Local Government Consistency Determination forms (DOH 331-568) are provided in Appendix C.

1.10 Watershed Plan Consistency

The City is in the Duwamish-Green (WRIA 9) and Puyallup-White Watershed (WRIA 10). The City currently has no plans to expand water rights place of use to include any portion of the service area that was not previously within the place of use for the water right when documented in an approved planning or engineering document and as identified in this Plan.

If the City expands water rights place of use, the new area within the water rights place of use service area will be formed in compliance with the terms of WAC 246-290-107 and consistent with the Watershed Plan approved for WRIA 9 or WRIA 10, under RCW 90.54.040(1).

CHAPTER 2

Basic Planning Data

This chapter's objective is to meet the requirements of WAC 246-290-100 (4)(b), incorporating basic planning data into this 2024 Water System Plan (WSP). It provides current population and water demand information; estimates future population and water demand; validates data; and compares future population and water demand estimates with locally adopted plans.

Projecting realistic future water requirements, or demand, is necessary for planning infrastructure projects and securing adequate water supply to meet future growth. Future water demands are a key component of the water system analyses presented in this WSP and in the City's Capital Improvement Program (CIP). Accurate demand projections require a thorough review of historical water use, predicting where and how much growth will occur, and estimating the future water use for existing and new customers.

The following topics are addressed in this chapter:

2.1 Water Service Area Population
2.2 Water Service Connections and Usage
2.3 Water Supply and Production
2.4 Distribution System Leakage
2.5 Water Supply Characteristics
2.6 Water Supply Reliability Evaluation
2.7 Future Population Projections and Land Use
2.8 Future Water Demand

2.1 Water Service Area Population

The City's current area within the RWSA boundary is smaller than its City limits, with adjacent purveyors serving the portion of the City's population that is outside its RWSA boundary, as shown in **Figure 1-1** presented in **Chapter 1**. As a result, historical City population data does not accurately represent the population served by the City's water system. To calculate the RWSA population, the Housing Unit Method was used, which is presented as an acceptable option for population determination in the Washington State Department of Health's (DOH) Water System Planning Guidebook 2020 Revision. The Housing Unit Method calculates the population based on the number of residential units and the area's average person's per household ratio.

The historical population data for the water system, as calculated using the Housing Unit Method, is presented in **Table 2-1**. These calculated populations are consistent with the numbers the City has reported on its Water Facilities Inventory (WFI), included in **Appendix H.**

Table 2-1 | Historical Population

	2015	2016	2017	2018	2019	2020	2021	2022
Persons per household[1]	2.73	2.75	2.76	2.77	2.79	2.80	2.81	2.82
Single-Family Residential Connections[2,3]	11,600	12,128	11,852	11,857	11,883	11,894	11,985	11,980
Multi-Family Residential Connections[2]	1,045	1,070	1,035	1,044	1,054	1,054	1,064	1,052
Calculated Multi-Family Units[4]	10,450	10,700	10,350	10,440	10,540	10,540	10,640	10,520
Calculated Population Served[5]	60,259	62,704	61,294	61,872	62,535	62,876	63,576	63,450
City Population[6]	78,210	80,362	82,058	84,352	86,353	87,256	88,080	88,750
City Employment (Non-Residential Population)[7]	37,298	39,466	29,487	40,855	41,985	39,092	37,871	N/A

Notes:

1. Persons per household per Washington State Office of Financial Management (OFM). 2021 and 2022 values are projected since OFM data is only available for the census period of 2010-2020.
2. Single and Multi-Family connections per City's water system billing records.
3. Single-Family Residential connections include duplexes per the City's design standards.
4. Assumed units per multi-family connection is 10 per the City's WFI, updated on 3/15/2022.
5. Calculated Population Served is calculated as the number of single-family connections plus the number of multi-family units multiplied by the persons per household.
6. City population per the Washington State OFM records.
7. Employment data is from the United States Census OnTheMap data source using a City-defined selection area.

Based on the calculated historical water system population presented in **Table 2-1**, the City's water system has seen growth in population between 2015 and 2022 averaging a one percent increase annually. The number of connections peaked in 2016 (along with the calculated population), however this was during the time when the City was transferring services to AMI metering, resulting in some apparent fluctuations of reported connections during the switchover that could not be easily rectified. The last row in **Table 2-1** provides the City population as reported by the Office of Financial Management (OFM). The City population has had a similar, steady growth to the calculated water system population, with an average annual growth rate of 1.8 percent annually. The City population as reported by the OFM is larger than the calculated water system population because the RWSA is smaller than the City limits as shown in the Water System Map (**Figure 1-3**). Additionally, growth in parts of the City beyond the RWSA has been greater than the rate of growth experienced within the RWSA. The OFM City population information is provided for reference; the calculated population served will be used for the purposes of this WSP.

2.2 Water Service Connections and Usage

Historical water use, or consumption, data was obtained from City records to characterize the demands of the City's customers. Annual water use data for the years 2015 to 2022 was used to develop historical demand patterns and parameters, which represent current and likely future water use. Two key demand parameters were generated from the data: typical water use per customer classification, and typical water use per equivalent residential unit. These parameters were used as the basis of future demand projections.

2.2.1 Historical Accounts

The City's water customers are divided into eight customer classifications, which are:

- Single-family Residential (SFR).
- Multi-family Residential (MFR).
- Commercial.

- Manufacturing and Industrial.
- Schools.
- Municipal (City Accounts).
- Irrigation.
- Wholesale.

The number of connections for each customer classification is summarized in Table 2-2. Unmetered, also referred to as non-revenue water, also accounts for a portion of the City's water use, however, this classification is not included in Table 2-2. Please note that per the City's standards, SRF connections include duplexes.

Table 2-2 | Historical Number of Connections per Customer Classification

	2015	2016	2017	2018	2019	2020	2021	2022
Single-Family Residential	11,600	12,128	11,852	11,857	11,883	11,894	11,985	11,980
Multi-Family Residential	1,045	1,070	1,035	1,044	1,054	1,054	1,064	1,052
Commercial	1,317	1,386	1,340	1,339	1,333	1,328	1,284	1,244
Manufacturing & Industrial	50	4	4	3	2	2	2	2
Schools	70	64	60	60	60	60	58	55
Municipal (City Accounts)	32	34	33	33	33	33	33	33
Irrigation	459	499	484	499	514	514	620	675
Wholesale	8	8	8	7	5	5	5	5
Number of Connections, Total	**14,581**	**15,193**	**14,816**	**14,842**	**14,884**	**14,890**	**15,051**	**15,046**

As summarized in Table 2-2, SFR connections make up approximately 80 percent of all accounts. The total number of connections has increased by approximately three percent between 2015 and 2022. Variation in the total number of water service connections in 2016 is linked to the rollout of AMI technology from 2016 to 2017. Throughout this transitional phase, there may have been instances of double counting meters in 2016, leading to an inflated number of connections. Subsequently, there was a notable decrease in 2017 as the number of connections were normalized.

A significant change in manufacturing and industrial accounts occurred between 2015 and 2016 due to some meters being reclassified as commercial connections. Manufacturing and industrial services are classified as businesses engaging in the manufacture of products, materials, equipment, machinery, and supplies with a meter size of two inches or larger and a monthly annual average water consumption equal to or greater than 30,000 cubic feet. There were several accounts that did not meet the criteria for this classification and were changed to Commercial classification rate following 2015. The total number of connections from 2016 to 2017 decreased due to low and high flow meters (two meters) being replaced with one meter; this impacted Commercial, Manufacturing and Industrial, and School connections.

The number of SFR, MFR, and commercial connections peaked in 2016, however, as mentioned in the opening paragraph, this is likely due to the fluctuations in the City's transition to AMI metering. Municipal connections remained constant over this period.

Wholesale connections were reduced in 2019 when Covington Water District (CWD) and Lake Meridian Water District (LMWD), formerly known as King County Water District # 111, discontinued regular purchase of water from the City.

2.2.2 Historical Consumption

The City's historical annual water consumption based on City billing data for each customer classification is presented in **Table 2-3** in million gallons (MG); the table does not include non-revenue (unmetered) water.

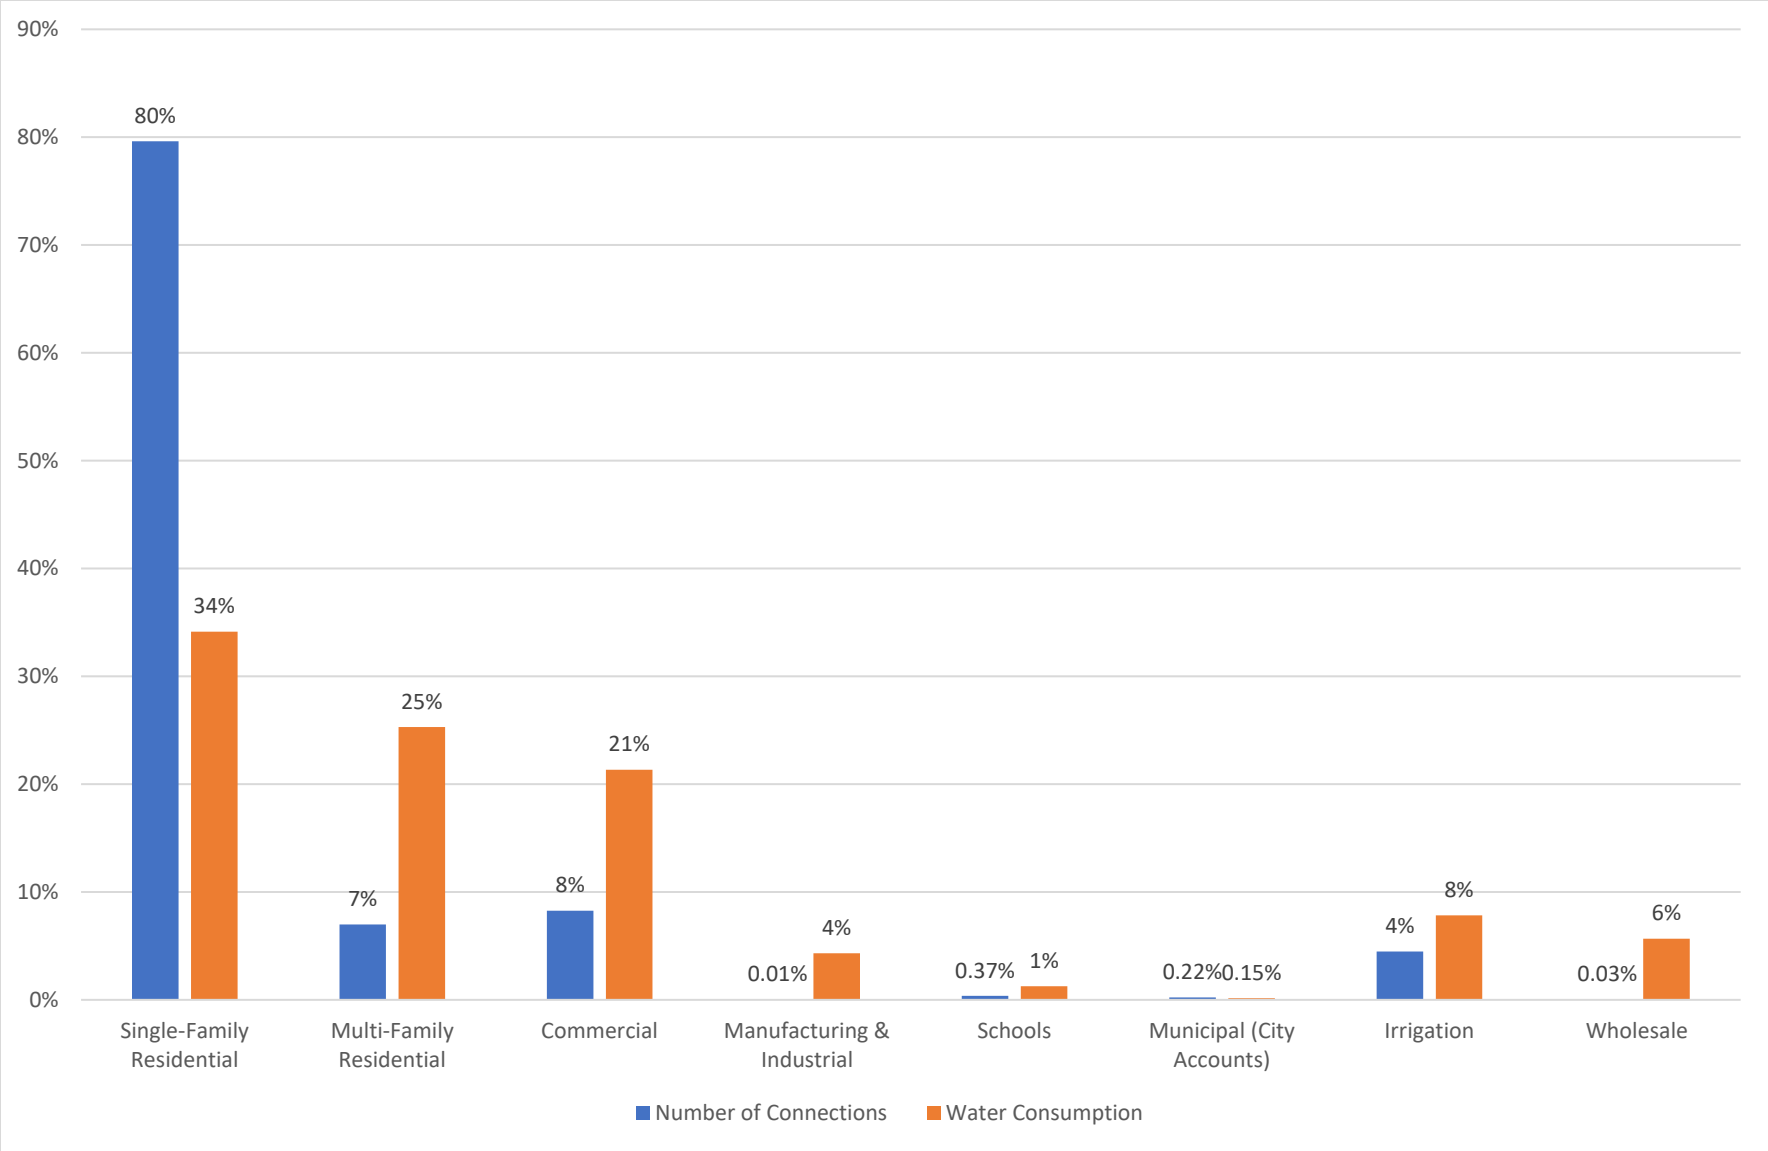

Table 2-3 | Historical Consumption in Million Gallons (MG) by Customer Classification

	2015	2016	2017	2018	2019	2020	2021	2022
Single-Family Residential	774	753	759	836	729	777	796	755
Multi-Family Residential	537	546	523	587	536	553	559	559
Commercial	501	581	595	594	585	461	470	472
Manufacturing & Industrial	170	153	123	124	121	101	94	96
Schools	41	49	56	49	42	30	33	28
Municipal (City Accounts)	5	4	5	5	5	4	4	3
Irrigation	163	162	160	102	102	118	173	173
Wholesale	425	428	153	137	130	131	128	125
Total Consumption, MG	**2,616**	**2,676**	**2,374**	**2,433**	**2,251**	**2,175**	**2,257**	**2,211**

Consumption has slightly declined over the period of record. While SFR and MFR consumption varied from year to year, it generally saw a slight increase during the study period which is correlated to the steady increase in the number of connections presented in **Table 2-2**. SFR and MFR consumption peaked in 2018, which is likely due to AMI meters implementation. Manufacturing and industrial demands decreased between 2015 and 2022 which is attributed to the reduced number of connections (reclassification) presented in **Table 2-2** as well as reduced consumption from Boeing which is the City's only current manufacturing and industrial customer. Commercial and school consumption decreased in 2020 through 2022 which is likely correlated with remote working and schooling that resulted during the COVID-19 pandemic. Wholesale demands also decreased over the planning period since LMWD and CWD discontinued purchase of water from the City. Additionally, no wholesale water was supplied to the Muckleshoot Indian Tribe (MIT) for the future fish hatchery; refer to **Section 2.8** for additional information.

Figure 2-1 presents the percentage of customer connections and annual billed water consumption by customer classification in 2022. Comparing the number of connections and water consumption illustrates the differences in water consumption between the different customer classifications. For example, SFR customers represent 80 percent of the connections, yet only 34 percent of the total consumption in 2022. Conversely, MFR customers represent seven percent of the connections, but 25 percent of the total consumption in 2022. Wholesale customers have six accounts in 2022 (0.04 percent of the total connections), but account for six percent of the total consumption in 2022. Similarly, manufacturing and industrial have two connections in 2022 (0.01 percent of the total connections), but account for four percent of the total consumption in 2022.

Figure 2-1 | Comparison of Number of Connections to Annual Water Consumption per Customer Classification in 2022

2.2.2.1 Historical Wholesale Consumption

Wholesale consumption decreased between 2015 and 2022. From 2015 to 2016 wholesale consumption represented 16 percent of the City's annual water consumption. In 2017 wholesale consumption decreased to six percent and remained relatively constant through 2022.

The City has two wholesale water agreements, one with the City of Algona and the other with LMWD. These agreements are described below, and copies of the agreements are included in **Appendix G**.

The City of Algona relies on the City of Auburn for water supply under the Water System Intertie Agreement, Algona/Auburn Intertie Agreement No. 3A (Agreement 3A). Agreement 3A was amended in 2002 to continue the agreement for the City of Auburn to provide a portion of the City of Algona's long-term water supply needs. Additionally, in 2016 the City of Algona purchased 100,000 gallons of additional storage in Lakeland Reservoir 6, bringing their total storage capacity to 280,000 gallons. Algona's consumption increased in 2018. Water consumption averaged 0.33 mgd between 2015 and 2017, and 0.36 mgd between 2018 and 2022. See **Table 2-6** for annual usage totals.

The City's Interlocal Agreement 2 (IA2) outlines the agreement with LMWD. The City's agreement with LMWD is on an interruptible basis and allows sales up to 2.5 mgd. This agreement was executed in October of 1996 and amended as Resolution 5332 in 2017. The agreement will remain in full force unless terminated by mutual agreement of the participants. LMWD did not purchase wholesale water during the planning period since they discontinued regular purchase of water from the City of Auburn in 2017 per the amendment to IA2. Instead, LMWD switched their primary supply to CWD, however, LMWD still maintains intertie with the City to use as a wholesale water supply on an as-needed basis.

The first amendment to IA2 also included the termination of CWD's wholesale agreement with the City; CWD did not purchase wholesale water during the planning period.

2.2.3 Water Use Per Connection and Equivalent Residential Units

The water use, or demand, of each customer classification can be expressed in terms of equivalent residential units (ERUs) for forecasting and planning purposes. One ERU is defined as the average quantity of water beneficially used by one average, full-time, SFR per day. The ERU calculation does not include non-revenue water or distribution leakage. **Table 2-4** summarizes the annual demand per ERU from 2015 to 2022 in gpd.

Table 2-4 | Historical Annual Demand per ERU (gpd per ERU)

	2015	2016	2017	2018	2019	2020	2021	2022
SFR Consumption (MG)[1]	774	753	759	836	729	777	796	755
Number of SFR Connections[2]	11,600	12,128	11,852	11,857	11,883	11,894	11,985	11,980
ERU_{ADD} (gpd)[3]	**183**	**170**	**176**	**193**	**168**	**179**	**182**	**173**

Notes:
1. Per annual residential consumption from **Table 2-3.**
2. Per residential connections from **Table 2-2.**
3. Calculated as annual consumption divided by number of connections.

To be conservative, an ERU planning value higher than the average was used by the City for demand forecasting. The 75th percentile of all the eight-year values was used to select the planning ERU value of 182 gpd. This methodology is consistent with the City's 2015 Plan. The ERU value of 182 gpd is seven percent lower than the 2015 Plan's ERU planning value of 195 gpd per ERU.

The conversion of total water consumption to ERUs provides a means to express water consumption by non-residential customers as an equivalent number of SFR accounts. The number of ERUs per account is obtained by dividing the water consumption per account by the water use per ERU (182 gpd for this planning period). Table 2-5 presents the number of ERUs per account for each customer classification based on the planning value of 182 gallons per ERU.

Table 2-5 | Historical Demand as Equivalent ERUs per Customer Classification

	2015	2016	2017	2018	2019	2020	2021	2022
Single-Family Residential(ERUs)[1]	11,600	12,128	11,852	11,857	11,883	11,894	11,985	11,980
Multi-Family Residential (ERUs)	8,078	8,194	7,864	8,832	8,067	8,295	8,403	8,411
Commercial (ERUs)	7,542	8,709	8,947	8,933	8,806	6,920	7,066	7,096
Manufacturing & Industrial (ERUs)	2,561	2,298	1,857	1,864	1,817	1,510	1,412	1,437
Schools (ERUs)	614	730	842	742	624	448	497	420
Municipal (City Accounts) (ERUs)	69	62	69	72	82	56	67	49
Irrigation (ERUs)	2,454	2,431	2,412	1,528	1,534	1,775	2,608	2,603
Wholesale (ERUs)	6,395	6,414	2,299	2,057	1,949	1,966	1,925	1,884
Annual Demand Equivalent (ERUs)	**39,314**	**40,967**	**36,141**	**35,884**	**34,762**	**32,863**	**33,963**	**33,881**

Note:

1. The number of Single-Family Residential ERUs is equivalent to the actual number of connections. For all other customer classifications, the planning value of one ERU is equivalent to 182 gpd.

2.2.4 Largest Water Users

The top 20 largest water users for the City's water system are summarized in Table 2-6 and Figure 2-2 with rank assignments based on 2022 consumption. Total consumption values are presented in MG. This list, in conjunction with the information above, provides information on where water is consumed in the system. It is important to note the type of customer classification, because the top 20 water users consume a significant percentage of the total consumption. As mentioned above, SFR connections make up most of the total connections and water consumption for the system, but no individual SFR connections are listed within the top 20 largest water users. Though the City of Algona is comprised of individual SFR's, the City of Algona is one of the top 20 largest water users because it is a wholesale customer supplied via a limited number of connections.

The top 20 water users in the City's water system accounted for approximately 24 percent of the total water system consumption in 2022. LMWD was the largest water user in 2015 and 2016, purchasing over 300 MG per year, but discontinued regular purchase of consumed water from the City in 2017. Copper Gate, Promenade Apartments, and Villas/Reserve are developments that were constructed after 2015, which pushed Tall Cedars and Leisure Manor multi-family users out of the top 20. Boeing and the City of Algona make up almost 50 percent of the top 20 water users' consumption.

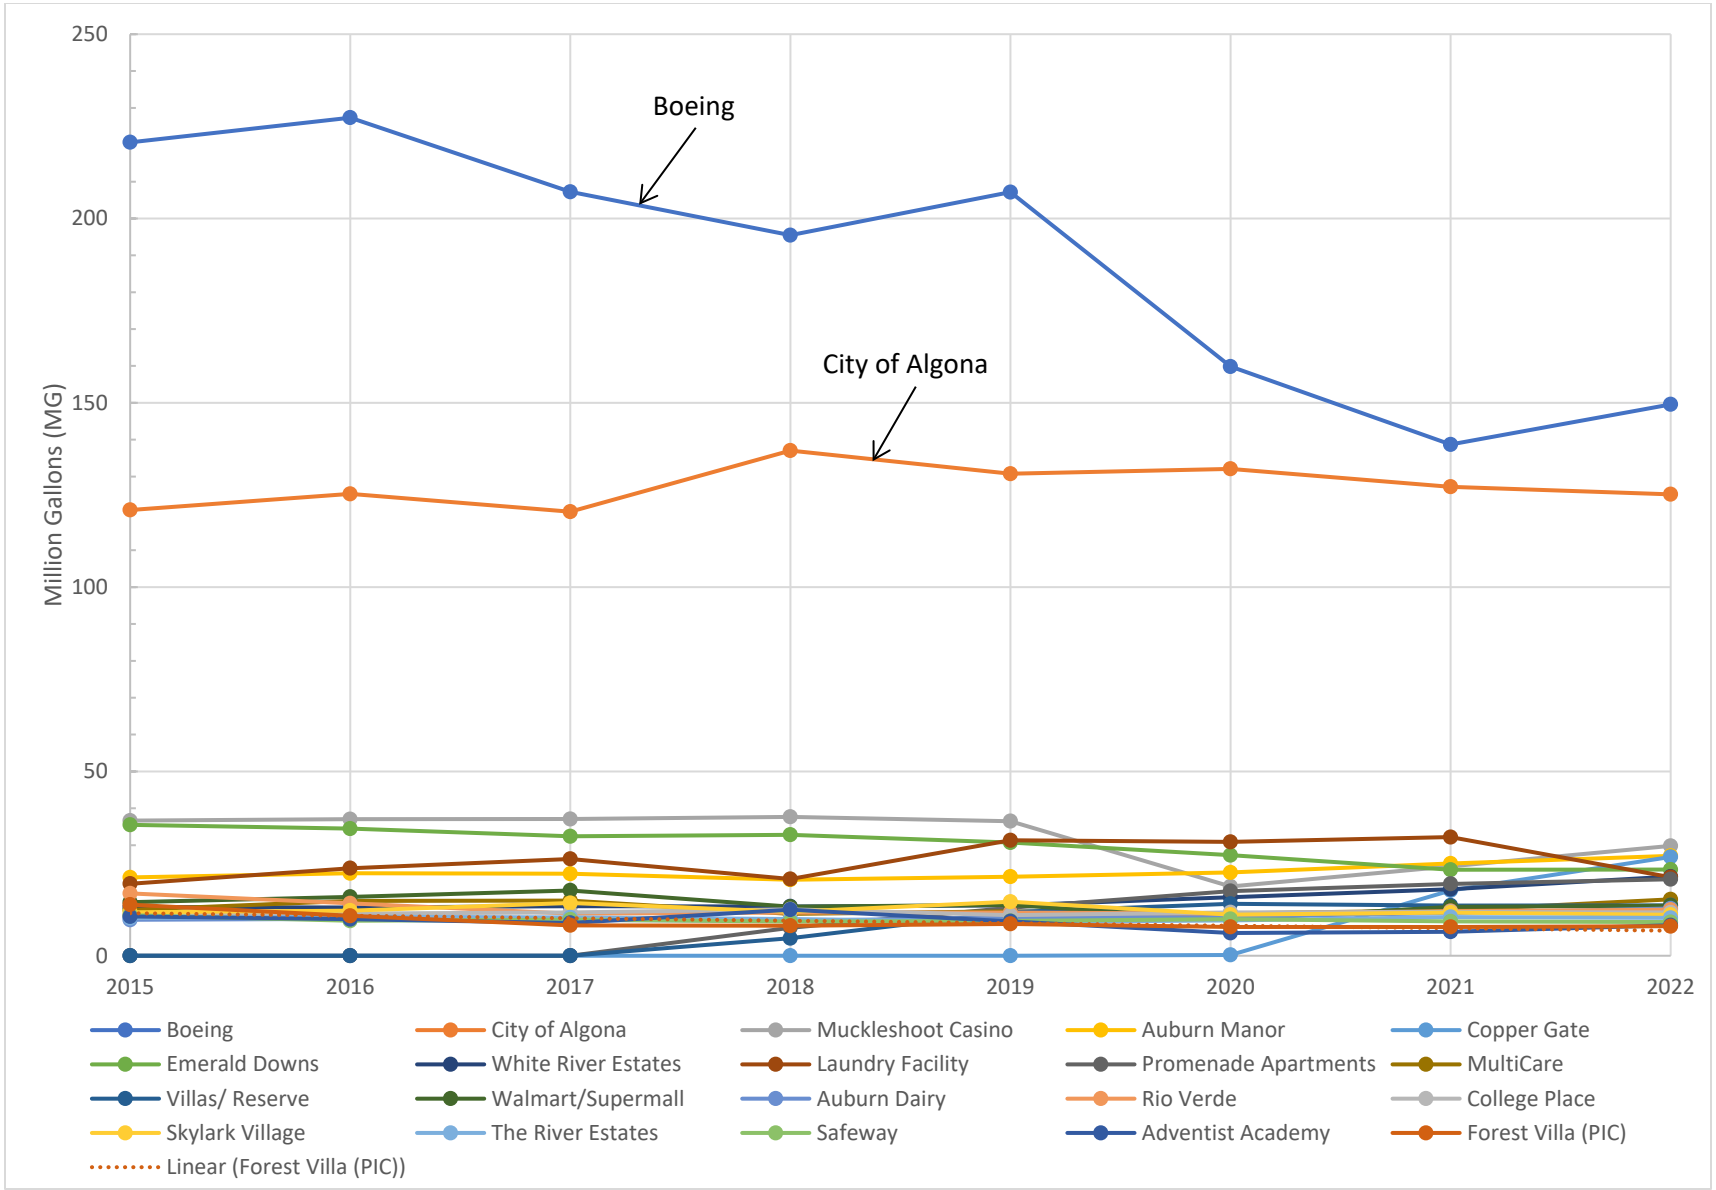

Table 2-6 | Historical Annual Consumption of the Top 20 Largest Water Users in Million Gallons (MG)

Rank[1]	Customer Name	Classification	Service Area	2015	2016	2017	2018	2019	2020	2021	2022
1	Boeing	Manufacturing/Commercial	Valley	220.67	227.34	207.23	195.48	207.15	159.83	138.70	149.57
2	City of Algona	Wholesale	Valley	120.93	125.29	120.46	137.04	130.75	132.07	127.22	125.18

20	Forest Villa (PIC)	Multi-Family	Academy	13.86	10.83	8.24	8.13	8.63	7.80	7.82	8.00
-	LMWD[3]	Wholesale	Lea Hill	302.89	303.02	29.40	-	-	-	-	-
		TOTAL CONSUMPTION (MG)[3]		**905.86**	**918.45**	**618.85**	**588.28**	**613.31**	**545.32**	**546.66**	**571.67**

Notes:

1. Rank assignments are based on 2022 consumption data.
2. Service location was constructed after 2015 WSP was published.
3. LMWD was the largest water user in 2015 and 2016 but discontinued purchase of water from the City in 2017. Included to contribute to the total consumption.
4. The annual total is the sum of the top 20 largest users from each year; Tall Cedars and Leisure Manor consumption data is not shown but is included in the total.

Figure 2-2 | Historical Annual Consumption of the Top 20 Largest Water Users in Million Gallons (MG)

2.3 Water Supply and Production

The historical average and maximum water demands are important parameters when performing system and supply analyses. The term "water demand" refers to all the water requirements of a system including metered customers, unmetered water use, and unaccounted for water loss such as leakage and theft. For this reason, the City's supply data, which accounts for all water demand, was used to calculate the Average Day Demand (ADD) and Maximum Day Demand (MDD) for each year.

2.3.1 Historical Water Supply

The City produces water through its springs, wells, and, when needed, wholesale water purchases. **Table 2-7** summarizes the amount of water produced and purchased by the City between 2015 and 2022 as MG. The City has not purchased water from the City of Tacoma since 2016.

Table 2-7 | Historical Annual Water Supply by Source in Million Gallons (MG)

	2015	2016	2017	2018	2019	2020	2021	2022
Lakeland Well 5	4.9	0.1	0.2	0.5	1.0	0.9	1.2	3.3
Lakeland Well 5A	54	45	64	76	68	65	72	59

West Hill Springs	173	198	114	176	136	133	140	157
Algona Well 1	-	-	-	-	-	-	-	-
Total Production (MG)[1]	2,033	2,487	2,506	2,464	2,410	2,313	2,443	2,395
Total Purchased (MG)	732	321	-	-	-	-	-	-
Total Supply (MG)	**2,765**	**2,808**	**2,506**	**2,464**	**2,410**	**2,313**	**2,443**	**2,395**

Note:

1. Small differences exist between the total production value and the sum of individual production values by source. This is due to the use of raw unprocessed data for individual sources, which was subsequently processed to identify and remove outliers, correct data entry errors and account for anomalies that could distort the overall results. These adjustments ensure that the . Total Production values presented depict the most accurate information available.

Table 2-8 | 2022 Monthly Water Production by Source (MG)

2.3.2 Average Day Demands and Maximum Day Demands

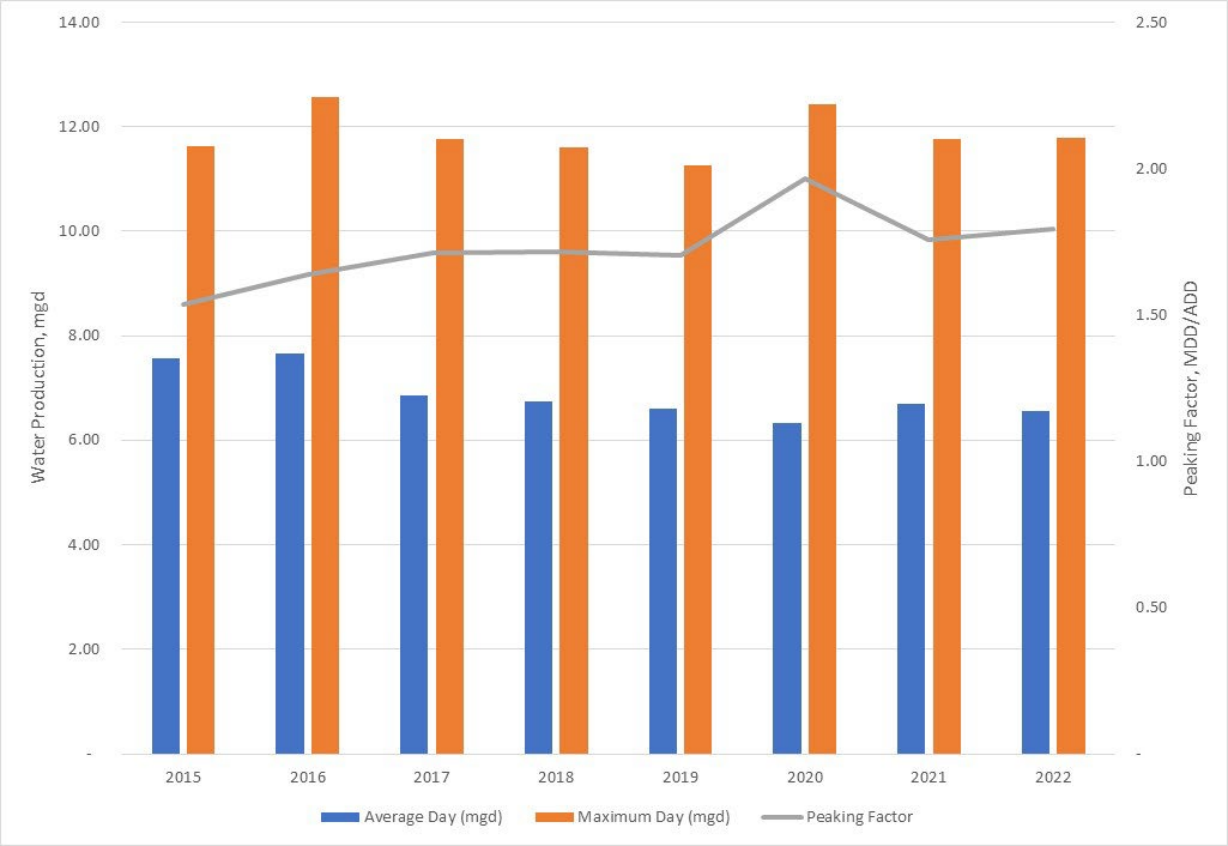
Table 2-9 summarizes the historical ADD and MDD based on production from 2015 through 2022.

To calculate the ADD, the total annual supply was divided by the number of days in the year.

Historical values of MDD are equivalent to the highest production and purchase in one day each year, usually during the summer when irrigation use is highest. The MDD is a key parameter used for supply capacity, pump station discharge rates, reservoir capacity, and pump sizes. The peaking factor is also a key parameter in developing the future MDD projections.

Table 2-9 | Historical Annual ADD, MDD, Peak Day, and Peaking Factor

	2015	2016	2017	2018	2019	2020	2021	2022
Annual Supply (MG)[1]	2,765	2,808	2,506	2,464	2,410	2,313	2,443	2,395
Average Day Demand (mgd)	7.57	7.67	6.87	6.75	6.60	6.32	6.69	6.56
Maximum Day Demand (mgd)	11.62	12.56	11.76	11.60	11.25	12.43	11.77	11.78
Max Day Date (month/day)	6/28	8/25	8/22	7/27	8/1	7/29	7/27	7/29
MDD/ADD Peaking Factor	1.53	1.64	1.71	1.72	1.70	1.97	1.76	1.80



Note:
1. Value is from **Table 2-7.**

The last row of **Table 2-9** presents the historical MDD to ADD peaking factor, which normalizes the historical data to compare between years. The minimum MDD factor was 1.53 in 2015, and the maximum MDD was 1.97 in 2020.

Due to variability of the peaking factor, the City has chosen to use the 75th percentile of the historical peaking factors in demand projections, which is 1.77. This factor provides a better representation of the peaking factors observed historically for water supply predictions.

Figure 2-3 shows that from 2015 to 2022 the ADD has decreased, which is correlated with improved water use efficiency, but the MDD and MDD/ADD peaking factor have increased. This is likely due to warmer and drier summer months and a reduction in the ADD after CWD opted out of their original agreement with the City, terminating their purchase of water, and LMWD stopped regular purchase of consumed water from the City, switching to interruptible supply.

Figure 2-3 | Historical Water Production with Peaking Factor

2.3.3 Peak Hour Demand

Peak Hour Demand (PHD) is the amount of water used, excluding fire flow, during the largest use hour of the year. Because the City does not track hourly production data, PHD was estimated based on Equation 3-1 from the DOH Water Design Manual, which is as follows:

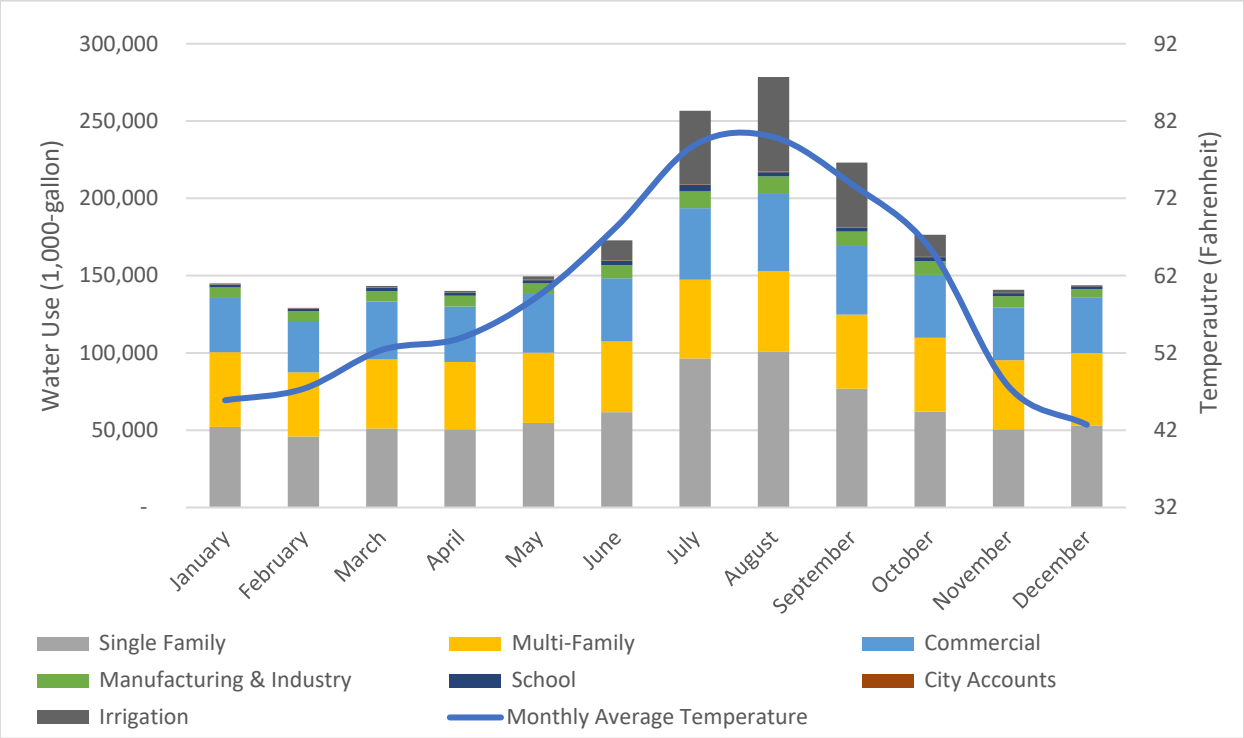
$PHD = (ERU_{MDD}/1440)\ [(C \times N) + F] + 18$

Where **PHD =** Peak Hourly Demand, total system (gpm)
C = Coefficient Associated with Ranges of ERUs (1.6 for systems with more than 500 ERUs)
N = Number of ERUs based on MDD
F = Factor Associated with Ranges of ERUs (225 for systems with more than 500 ERUs)
ERU_{MDD} = Maximum Day Demand per ERU (gpd)

The calculated annual PHD for the system is summarized in **Table 2-10**.

Table 2-10 | Historical Peak Hour Demand

	2015	2016	2017	2018	2019	2020	2021	2022
ERU_{MDD} (gpd)	279	298	312	313	310	358	320	327
Number of ERUs based on MDD	41,586	42,115	37,692	37,068	36,253	34,696	36,747	36,025
PHD (gpm)	12,973	14,019	13,135	12,950	12,567	13,881	13,140	13,159
PHD to MDD Factor	1.61	1.61	1.61	1.61	1.61	1.61	1.61	1.61



The last row of **Table 2-10** provides the calculated PHD to MDD factor, which normalizes the historical data to compare between years. The calculated PHD factor remained consistent at 1.61 between 2015-2022. Due to this consistency, the City has elected to use the PHD factor of 1.61 in future demand projections.

2.3.4 Seasonal Variations

The pattern of water consumption differs between the customer classifications. Water use increases significantly during the summer when daylight hours are longer, and lawn and landscape watering is prominent. Other outdoor uses, including car washing, pools, and recreation, are also at their highest during summer months.

Figure 2-4 presents the effect that temperature has on water usage by comparing 2022 monthly consumption data per customer classification to the average monthly temperature.

Figure 2-4 | Temperature Effects on Water Usage in 2022

As seen in **Figure 2-4**, SFR and irrigation customers show a significant peak in total consumption during the summer months. Other customer classifications show a smaller similar peak during these months. MFR customers do not show a significant peak during summer monthly because City's policy dictates the use of separate irrigation accounts for all non-SFR accounts. These monthly variations can be used to target water use efficiency efforts and/or to project future water-use patterns for planning purposes.

2.4 Distribution System Leakage

Distribution System Leakage (DSL) represents the difference between production and documented water use (retail, wholesale, and authorized unmetered). It may include inaccurate master and service connection meters, unaccounted-for non-revenue water use, pipeline leakage, and unauthorized use. DSL does not include authorized water usage such as water used for fire protection, flushing, construction, and other

maintenance and operations practices. However, to be credited, this must be accounted for by metering or estimating using credible means.

DSL is calculated as the difference between the total amount of water produced and the sum of water sold and authorized unbilled water usage. DOH requires the three-year average DSL to be under 10 percent to minimize water waste.

The City's estimated DSL for 2015 through 2022 is presented in **Table 2-11**. Revised DSL values have been provided to DOH for 2020, 2021 and 2022 that are lower than the values presented in **Table 2-11**. However, the revised values are not utilized for projections, as the revisions were made after the demand projections and system analysis were completed. Since the values used for demand projections and system analysis are slightly higher than the revised values, the projections are slightly more conservative than would have been necessary otherwise.

Table 2-11 | Historical Distribution System Leakage

	2015	2016	2017	2018	2019	2020	2021	2022
Total Water Supply[1] (MG)	2,765	2,808	2,506	2,464	2,410	2,313	2,443	2,395
Billed Consumption[2] (MG)	2,616	2,676	2,374	2,433	2,251	2,175	2,266	2,214
Authorized Non-Billed Consumption (MG)	7	4	6	13	7	4	5	5
Total Authorized Consumption (MG)	2,623	2,679	2,380	2,446	2,257	2,179	2,271	2,219
DSL (MG)	142	128	126	18	153	133	172	176
Annual Percent DSL	5.1%	4.6%	5.0%	0.7%	6.3%	5.8%	7.1%	7.4%
3-Year Rolling Average (Percent)	6.8%	5.1%	4.9%	3.4%	4.0%	4.3%	6.4%	6.7%
3-Year Rolling Average (MG)	183	139	132	91	99	101	153	161

Notes:
1. From **Table 2-7.**
2. From **Table 2-3.**

For the City's water system, the total three-year rolling average DSL ranged from 3.4 percent to 6.8 percent of the total production meeting DOH requirements and the City's goal. The City's annual average DSL over the period was 5.2 percent. During this period the City maintained a DSL below 10 percent on an annual basis, which is an improvement from the last planning period. Abnormally high authorized non-billed consumption was recorded in 2018 due to unidirectional flushing for the Valley Service Area. Starting in 2021, the billed consumption was updated to track hydrant water used during construction.

The City is committed to maintaining a 3-year rolling average DSL below 10 percent and actively works to identify and eliminate DSL throughout the system through its ongoing leak detection, meter calibration, and repair and replacement programs for water system infrastructure, as detailed in **Chapter 6 – Operations and Maintenance**. Additionally, the City has maintained efforts to reduce non-payment bills and water theft.

2.5 Water Supply Characteristics

The City has a diverse water supply consisting of two springs, ten wells and an emergency intertie with the City of Tacoma; refer to the Existing Facilities Figure provided in **Chapter 1** (**Figure 1-3**). The City's aquifer characteristics are described in several sources; this section draws mainly from the Conceptual Mitigation Plan (CMP) for Water Right Application G1-28404, provided in **Appendix S**.

Wells 1, 2, 3A, 3B, 4, 6, and 7 are in the lower alluvial aquifer in the Auburn Valley, referred to as the Valley Wellfield. This wellfield is mostly confined by the Osceola Mudflow, an important aquitard in the Auburn Valley depicted in Figure 4 of the CMP. Groundwater discharge from the upland aquifers is the primary source of recharge to the lower alluvial aquifer, which hosts all the City's wells. Groundwater generally moves upward in the valley aquifers and moves horizontally at approximately one to four feet per day. Alluvial groundwater from the White River also recharges the Green River alluvial aquifer. Groundwater in the vicinity of Wells 2, 6, and 7 discharges into the Puget Sound via the Green River and the Duwamish River valley. Wells 2, 6, and 7 are located northeast of downtown Auburn and collectively referred to as the Fulmer Wellfield. Wells 1, 3A, 3B, and 4 are in the White River Drainage Basin and Wells 2, 6, 7 and West Hill Springs are in the Green River Drainage Basin.

Wells 3A, 3B and 7 are not currently in use due to high manganese concentrations, however the City plans to install manganese treatment at each of these facilities to bring them back online. The City has a pending water right application for 13,443 acre-feet per year from the existing Wells 6 and 7 and a future Well 8. The City has sufficient water rights to meet current demands, 10-year, and 20-year demand projections, as shown in the Water Rights Self-Assessment Form provided in Appendix I. Mitigation obligations due to the proposed water right for Wells 6, 7, and 8 are listed below and are described in detail in the CMP:

- Mitigation of impacts to Green River,
- Mitigation of impacts to White River, and
- Mitigation of impacts to Mill Creek.

Wells 5, 5A, and 5B are in the Upland Wellfield and constructed within the Lakeland Service Area. The upland aquifers are recharged through precipitation and leakage from Lake Tapps and discharge into the White River system. Once Well 5B came online, the City discovered that the aquifer was not recovering. Well 5B has been offline since 2006. The safe yield of Wells 5 and 5A have been decreased from their design capacity due to a drop in the aquifer's capacity. Specific information on the individual wells and their associated water rights are provided in Section 3.4.1.

West Hill Springs draws from an unnamed confined aquifer. The spring source water flows by gravity into the Valley Service Area, although flows vary depending on aquifer conditions, and discharges into Mill Creek, which flows into the Green River.

Coal Creek Springs is the largest active water supply for the City and draws from a confined aquifer, however its flow varies depending on aquifer conditions. Coal Creek Springs collection system is located at the base of Lake Tapps Upland and is in the White River Drainage Basin. Further aquifer details are provided within the Wellhead Protection Program (WHPP) provided as Appendix T.

The City also owns two additional wells: the Algona Well 1 and the Braunwood Well. Algona Well 1 was acquired by the City in 1996 but has since been taken offline due to operational issues.

The City plans to use a groundwater flow model being developed by the USGS to predict potential impacts to surface water.

2.6 Water Supply Reliability Evaluation

The City's active water sources have maintained current production capacities and are deemed reliable, as they have back-up power sources available. The production of some water sources is limited by pump or intake capacity, as mentioned in Section 2.5, however all production is managed to be within available water rights and is managed by the physical capacity of each facility as summarized in Table 2-12.

Table 2-12 | Summary of Source Water Pumping or Production Capacity Compared to 2022 Maximum Daily Production

Source	Service Area	Pumping/Production Capacity (gpm)	Maximum Daily Production[1] (gpm)
Well 5	Lakeland	760	640
Well 5A	Lakeland	180	180
Well 5B	Lakeland	--[2]	--
Well 1	Valley	2,100	2,100
Well 2	Valley	1,600[4]	1,470
Well 3A	Valley	--[2]	--
Well 3B	Valley	--[2]	--
Well 4	Valley	2,600	1,796
Well 6	Valley	1,800	1,777
Well 7	Valley	--[2]	--
Coal Creek Springs	Valley	3,500[3]	4,383
West Hill Springs	Valley	600	563
Algona Well 1	--	--[2]	--
TOTAL		**13,140**	**12,909**

Notes:

1. Maximum daily production per source is the maximum production rate recorded in 2022.
2. The facility is currently offline. No production capacity is available without facility improvements.
3. Water rights for Coal Creek Springs allow for a Qi of 6,732 gpm. 3,500 gpm is the typical historical production capacity limitation experienced. The City is currently investigating the possible factors influencing the feasible withdrawal from this source.
4. The pump at Well 2 was replaced in 2023 and now has a capacity of 1,115 gpm.

Calculations presented in the Water Rights Self-Assessment Form (**Appendix I**) conclude that the City's existing water rights are anticipated to be adequate to meet the current, 10-year, and 20-year projections for maximum instantaneous flows (Qi) and total annual withdrawal (Qa).

However, the City does not have the infrastructure required to withdraw from all water sources, and some sources have underlying production restrictions that require further evaluation. Several facility improvement projects are required to maximize production and obtain the full water rights. Furthermore, potential demand from LMWD was not included in the assessment, as they have an interruptible wholesale agreement with the City which is a secondary priority to the City's demand. Currently, the City's interties with the City of Tacoma provide additional wholesale water for purchase if necessary to meet demands, however the City has not purchased water from Tacoma since 2016.

The City has established a policy of maintaining the capability to supply the MDD while the largest water source is out of service. The system analysis documented in **Chapter 3** confirms that with projected demands over the 20-year planning period, the City will maintain the capability to meet MDD if the largest pumping source is out of service. This evaluation includes the Tacoma interties as available sources to meet this need and excludes the capacity of facilities that are offline or not operational.

Of the twelve sources, only Wells 5 and 7 are currently without a standby power source. Standby power will be added to Wells 5 and 7 as part of CIP projects discussed in **Chapter 8.** The Fulmer Field Corrosion Control Treatment Facility has backup power.

The Game Farm Park Pump Station, Lea Hill BPS, and Intertie Pump Station are the only pump stations without a standby power source or connection. Backup power will be added to the Lea Hill BPS and the Intertie Pump Station as part of a capital projects discussed further in **Chapter 8**. The Game Farm Park Pump

Station is a small facility that serves a recreational area and does not serve residential or commercial properties, therefore back-up power is not a critical element.

2.6.1 Use Impacts on Instream Flows

New water right appropriations in the Green-Duwamish Basin are subject to instream flow (ISF) regulations as described in the CMP and WAC 173-509. These ISF are senior to the City's recent water rights application G1-28404. This requires mitigation for potential impacts to the Green River when instream flows are not met, such as predicting when streamflow will drop below ISFs as well as determining the lag time associated with impacts to instream flows from groundwater withdrawals. The CMP includes the following detailed description of the streamflow characteristics:

> "A review of historical streamflow data indicates that on average streamflow's are below the ISFs at the Auburn gauge approximately 20 percent of the time (Table 3). Streamflow's are generally more often below the minimum ISFs during the summer months, falling below the minimum ISFs 35 percent to 61 percent of the time between June and September. The flows are frequently above the minimum ISFs during the spring and winter months but can drop to below ISFs at any time of the year. For example, in April, streamflow falls below the minimum ISFs approximately 3 percent of the time (4.1.2)."

The City's current rights are senior to the instream rights and therefore not effected by the instream flow limitations, however as stewards of the watershed, the City has an aggressive water use efficiency program described in Chapter 4 meant to limit the volume of withdrawals, especially during the dry season. The City has a minor surplus of both annual volume withdrawn (Qa) and maximum instantaneous flow rate withdrawn (Qi) to meet MDD through the 20-year planning period. However, several facility improvements are required to make the withdrawals feasible.

2.6.2 Wholesale Interties

The City has three wholesale interties, described below and in further detail in Section 1.6.2.

City of Algona

The City has supplied water to Algona on a regular basis since 1996, when interlocal agreement IA3 was negotiated. A superseded agreement, IA3A, was negotiated in October 2002 which reflects the current status. The agreement will remain unless terminated by mutual agreement of the City and Algona. Currently, Algona is served through the metered Boeing Welded Duct Intertie and by two eight-inch, manually operated meter stations located at Boundary Boulevard and Industry Drive North, and at Boundary Boulevard and Milwaukee Avenue.

LMWD

An intertie between the City and LMWD was constructed in 1996 as part of IA2 to enable LMWD to purchase water from the City. The manually operated intertie also allows the City to provide an emergency supply to Kent's East Hill Service Area. The City agreed to provide up to 2.5 MGD average day and 5.0 MGD maximum day use. A provision of the agreement calls for LMWD to send an emergency supply of water to

the City when needed for the Lea Hill Service Area. The IA2 agreement also included several improvements to allow delivery of water:

- The Green River Pump Station and pipelines to deliver additional water into the Lea Hill Service Area
- The Intertie Pump Station and pipelines to deliver water from the Lea Hill Service Area to LMWD
- Construction of two additional wells (Wells 6 and 7).

LMWD discontinued regular purchase of water from the City in 2017 per the amendment to IA2, however LMWD still maintains the intertie with the City to use as a wholesale water supply on an as-needed basis. This interlocal agreement has a term of sixty years, commencing in 2017.

City of Tacoma

In 2012, Tacoma agreed to provide water to the City in the quantity of up to 1.0 MGD average day use, 1.8 MGD peak day use, and 1.62 MGD four-day peak use. Two interties were constructed to supply the City's Valley pressure zone: located at 3200 B Street NW and 29600 132nd Avenue SE in Auburn. In 2014, Tacoma amended and restated the 2012 agreement with the City to provide a total of 3.5 mgd (2,430 gpm) of average use and 5.12 mgd (3,555 gpm) of peak use from the interties. The B Street NW remotely operated intertie is limited to a maximum flowrate of 2,200 gpm and the 132nd Avenue SE Intertie is limited to a maximum flowrate of 4,500 gpm. However, the combined use of the interties cannot exceed 5.12 mgd (3,555 gpm) in a 24 hour period. This agreement will remain in force as long as the City of Tacoma remains in the business of providing water, however the City has not purchased water for consumption from the City of Tacoma since 2016.

2.6.3 Emergency Interties

Emergency interties are an important tool that helps water utilities increase reliability and respond to emergencies. The City has emergency interties with seven water systems, as described in Section 1.6.2 and summarized in Table 1-3.

2.6.4 Potential Interties

The City has an interest in acquiring additional interties that would enhance the reliability of water service in the City and among adjacent purveyors. Tacoma Public Utilities constructed the Second Supply Pipeline Project, which runs through the north end of the City's RWSA between 30th and 37th Streets NE. In addition to the B Street NW and 132nd Avenue SE interties, a third turnout was constructed as part of the pipeline project in the Valley Service Area. The City does not currently plan to develop this turnout but may do so in the future.

2.7 Future Population Projections and Land Use

2.7.1 Demographic Forecast

Demographic forecasts provide an estimate of future population and employment. The City is a member of the Puget Sound Regional Council (PSRC), which develops demographic analyses for the central Puget Sound region (King County, Kitsap County, Pierce County, and Snohomish County). The demographic projections are developed based on local planned development capacities and regional policies adopted by the PSRC Vision 2050. Vision 2050 established the region's strategy for accommodating population and employment growth to maintain the high quality of living, economic prosperity, and a healthy environment

through the year 2050. Through this planning process, the City is required to plan for a specific number of additional housing units and jobs.

Consistent with the Washington State Growth Management Act (GMA), the City uses the Vision 2050 growth values as the basis of the demographic projections.

Demographic projections are based on the PSRC's 2044 forecasts for housing, population, and employment for each Transportation Analysis Zone (TAZ) within the City's RWSA, as the City's policy is to serve all customers within its RWSA. Additional information on the City's existing land use, future zoning, demographic projections, and corresponding rates of growth are detailed in this Section.

2.7.2 Future Land Use and Zoning

Land use and zoning regulations provide important information in determining future water requirements. Land use and zoning determines the area available for various types of development including both SFR and MFR development, as well as commercial and other types of land use that provide the economic base necessary to support residential development. The housing, population and employment projections developed for the 2024 Periodic Comprehensive Plan are based on the employment and housing targets provided by King and Pierce counties that the City must accommodate over the 20-year planning horizon. This consistent approach is encouraged by the Washington State GMA and should result in predictable and stable land uses over longer planning periods.

Future land use and zoning designations for the City's RWSA are shown on the Comprehensive Zoning Map provided as Figure 2-5. Land uses in unincorporated King County which are part of the RWSA, but beyond City limits are anticipated to remain consistent with current designations, as the current land use designations reflect the intended long-range use of land for the 20-year planning horizon in the current Comprehensive Plan; additional data for future land use designation for unincorporated King County are not currently available. Zoning designations implement the land use identified in the City's Comprehensive Plan; therefore, the current land use reflects the City's historical zoning. House Bill 1337 and House Bill 1110, both effective as of July 2023, are geared at expanding housing options. As such, the City has adopted future zoning to allow for accessory dwelling units within areas previously dedicated to single-family detached housing. Table 2-13 summarizes the updating zoning designations and fire flow requirements. Note that the required fire flow in some zoning designations will be determined on a case-by-case basis pending development or re-development type. Fire flow requirements for portions of the RWSA located in unincorporated King County are also captured in Table 2-13.

Three of the updated residential zoning designations presented in Table 2-13 allow for Accessory Dwelling Units (ADUs). Policies related to ADU water service metering and connection fees are included in Appendix A. The demographic population projections are expected to be sufficient to account for growth that is realized by the additional ADUs within the service area. The demographic population projections are discussed in Section 2.7.3 and demand projections are discussed in Section 2.8.2. Required fire flow for ADUs will be determined on a case-by-case basis pending development or re-development type.

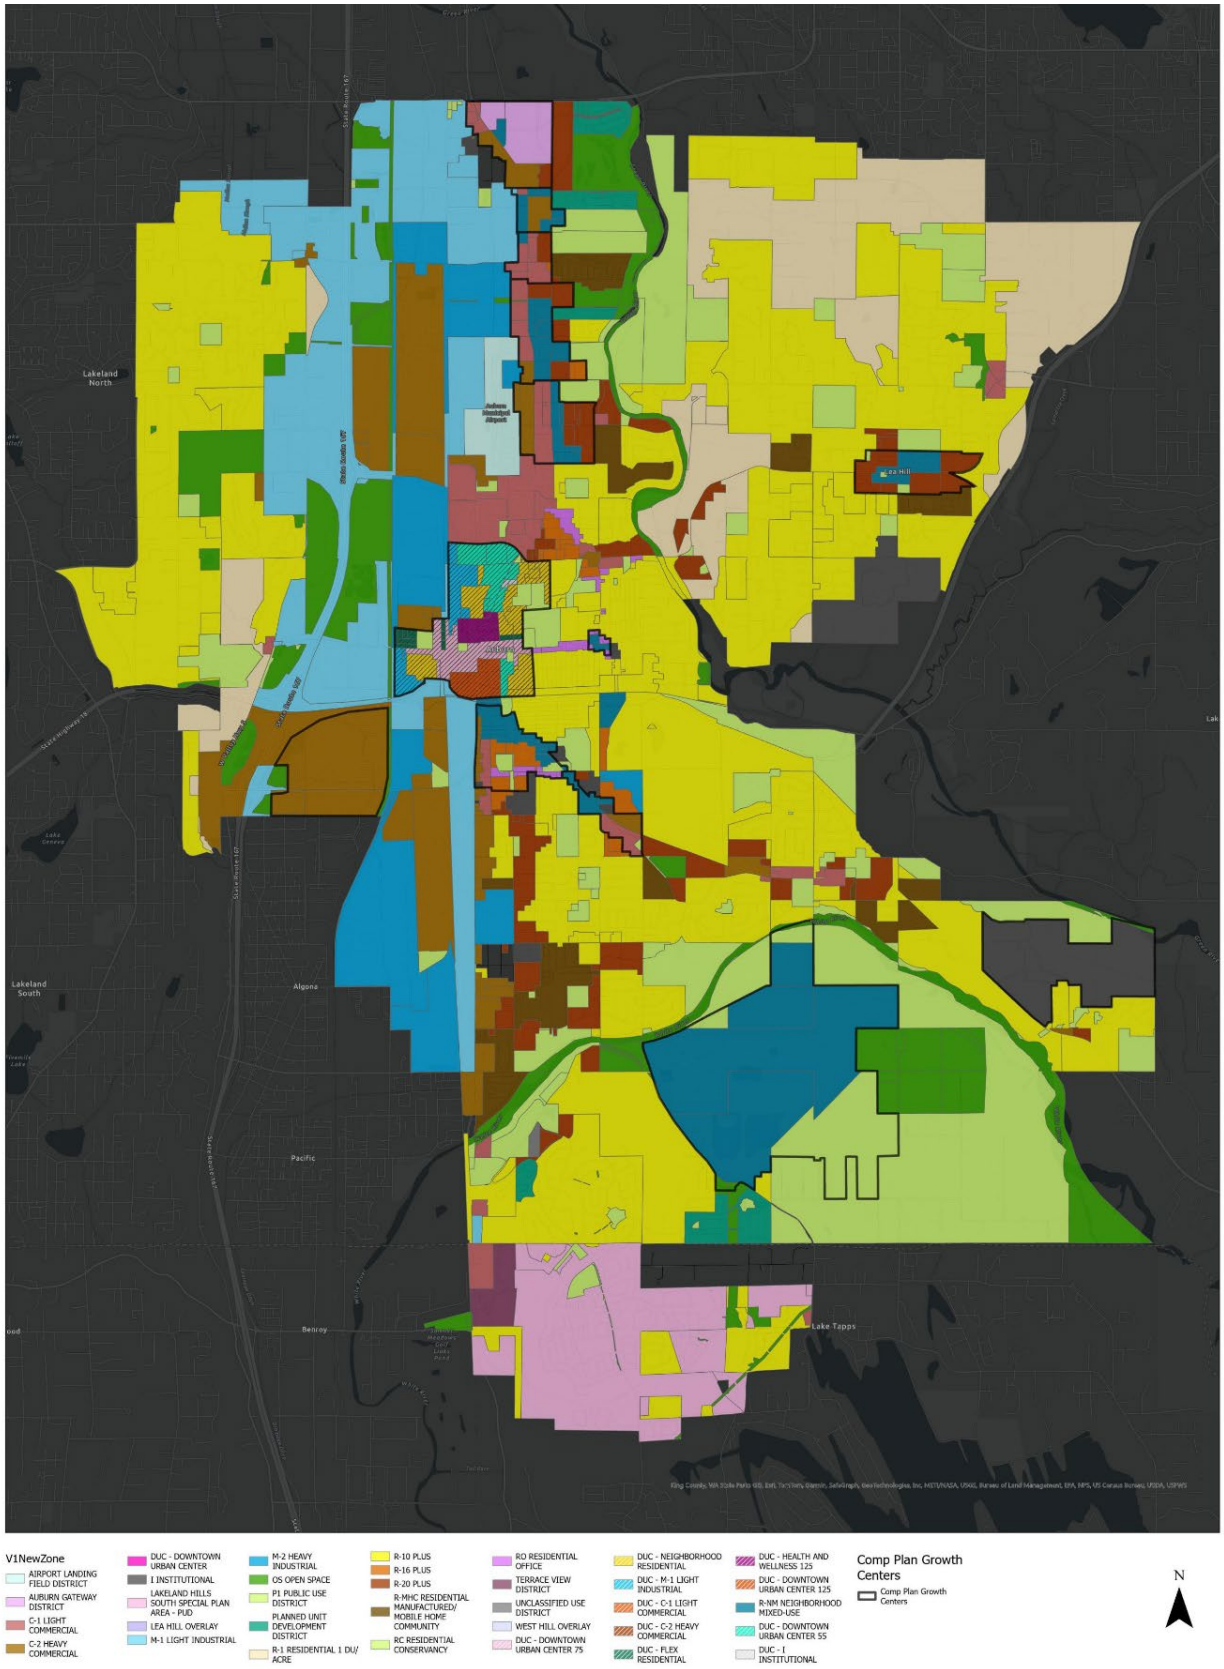
The City includes a wide range of residential, commercial, institutional, and industrial land uses. Public and quasi-public land uses include parks, open space, and public recreation as well as institutional uses such as schools. Commercial and industrial uses occur primarily in the Valley Service Area; however, large areas of residential land use and the Downtown Urban Center (DUC) also exist in the Valley Service Area.

The Academy and Lakeland Service Areas are primarily residential, although some commercial zoning is located along Auburn Way South (SR 164) in the Academy Service Area. The Lea Hill Service Area is also

primarily residential although other uses include small amounts of commercial and open space, and Green River College.

Areas within the RWSA, but outside the City limits, are governed by King County zoning. Land use was assumed to be consistent with zoning in these areas. The area in the northwest corner of the RWSA, west of SR167 and north of S 287th Street is zoned for Agriculture. A second area is located near Auburn Narrows State Park, which is north and west of SR18. This area includes Rural Residential, as well as Park and Greenbelt zoning. The City does not currently provide service in this area; however, it is willing to provide service to customers meeting the Service Area Policies. There are two additional unincorporated "pockets" of urban residential zoning within the RWSA that the City currently serves, where the southern area also contains a single parcel of Industrial zoning. The King County zoning was used in the demographic analyses.

Table 2-13 | Updated Zoning Districts and Fire Flow Requirements



Zoning District	Land Use	Definition	Fire Flow Requirement (gpm)
RC RESIDENTIAL CONSERVANCY	Residential Conservancy	No change	1,500
R-1 RESIDENTIAL 1 DU/ACRE	Neighborhood Residential One	No change	1,500
R-10 PLUS[1]	Neighborhood Residential Two	Single family, townhouse, duplex, triplex, fourplex, two-story stacked flats, cottage housing-4-6 units/lot ADUs	1,500 - 2,500
R-16 PLUS	Neighborhood Residential Two	R-10, plus five-plex, six-plex, 3 story stacked flats, courtyard apartments, apartment buildings and mixed use up to 20 units ADUs	2,500
R-20 PLUS	Neighborhood Residential Three	R-16 plus apartment buildings, and mixed use over 20 units ADUs	2,500
R-NM NEIGHBORHOOD MIXED-USE	Mixed Use	R-16 and C-1 Uses + Mixed-use (horizontal or vertical) encouraged	2,500
R-MHC RESIDENTIAL MANUFACTURED/MOBILE HOME COMMUNITY	Neighborhood Residential Three	No change	2,500
RO RESIDENTIAL OFFICE	Mixed Use	Smaller scale R-NM with emphasis on conversion of existing structure	2,500
C-1 LIGHT COMMERCIAL DISTRICT	Commercial	Generally the same as existing	2,500
C-2 HEAVY COMMERCIAL DISTRICT	Commercial	Generally the same as existing	2,500
AUBURN GATEWAY DISTRICT	Mixed Use	North Auburn Subarea Use	2,500
M-1 LIGHT INDUSTRIAL DISTRICT	Industrial	Generally the same as existing	2,500
M-2 HEAVY INDUSTRIAL DISTRICT	Industrial	Generally the same as existing	2,500
AIRPORT ZONE	Industrial	No change	2,500
P1 PUBLIC USE DISTRICT	Public/Quasi-Public	Public schools, recreational spaces, police stations, fire stations, cemeteries	2,500

Zoning District	Land Use	Definition	Fire Flow Requirement (gpm)
I INSTITUTIONAL USE DISTRICT	Public/Quasi-Public	Private schools, Green River College, large campus development	2,500
OS OPEN SPACE	Open Space	No change	-
DUC - DOWNTOWN URBAN CENTER 125	Downtown Urban Center	DUC with up to 125-ft tall buildings where permitted	2,500
DUC - DOWNTOWN URBAN CENTER 75	Downtown Urban Center	DUC with up to 75-ft tall buildings where permitted	2,500
DUC - DOWNTOWN URBAN CENTER 55	Downtown Urban Center	DUC with up to 55-ft tall buildings where permitted	2,500
DUC - NEIGHBORHOOD RESIDENTIAL	Downtown Urban Center	Mixed-use and R-15	2,500
DUC - HEALTH AND WELLNESS 125	Downtown Urban Center	R-OH-MultiCare Zone	2,500
DUC - FLEX RESIDENTIAL	Downtown Urban Center	RO with permitted specific industrial uses (craft workshops, breweries, coffee, etc.)	2,500
LAKELAND HILLS SOUTH SPECIAL PLAN AREA – PUD[1]	Neighborhood Residential Two		1,500-2,500
AIRPORT LANDING FIELD DISTRICT	Industrial		2,500
AUBURN GATEWAY DISTRICT	Mixed Use		2,500
DUC - I INSTITUTIONAL	Downtown Urban Center		2,500
DUC - M-1 LIGHT INDUSTRIAL	Downtown Urban Center		2,500
I INSTITUTIONAL	Public/Quasi-Public		2,500
PLANNED UNIT DEVELOPMENT DISTRICT[1]		Varies by location	1,500-2,500
TERRACE VIEW DISTRICT	Commercial		2,500
UNCLASSIFIED USE DISTRICT[1]		Varies by location	1,500-2,500
A-10	Agricultural	1 Dwelling Unit per 10 acres, located in unincorporated King County.	1,500
RA-5	Rural Area	1 Dwelling Unit per 5 acres, located in unincorporated King County.	1,500
R-1	Residential	1 Dwelling Unit per acre, located in unincorporated King County	1,500
R-4	Residential	4 Dwelling Units per acre, located in unincorporated King County	1,500

Note:

1. Required fire flow will be determined on a case-by-case basis pending development or re-development type.

Figure 2-5 | Comprehensive Future Land Use and Zoning Map

2.7.3 Projected Demographic Growth

Many factors influence population growth including the state of the economy, interest rates, annexation of adjacent areas, and up-zoning for new development. Growth management policies, along with coordination between local governments, should make development more predictable and growth projections more accurate than they have been historically. The City's Comprehensive Plan, as well as this Plan, are key documents to aid the City in preparing for the predicted growth. However, it is common for actual growth rates to vary from those predicted. In addition, growth rates will vary between various parts of the City based on the availability of services and the costs to develop for the zoned use.

Housing, population, and employment projections were used to calculate rates of growth. PSRC's Vision 2050 requires the City to plan for a given number of additional housing units and jobs. The demographic projections for population and employment were allocated based on water meter locations within the four Water Service Areas that comprise the RWSA. Population projections extending beyond the RWSA boundary were modified or eliminated and are not included in the projections.

2.7.3.1 Demographic Projections

Existing and future demographic projections consistent with the City's GMA goals were provided by the City for 2021 and 2044. City planning provided projections of housing, population, and employment growth based on TAZ data. The intermediate 10-year planning horizon (2034) was interpolated assuming consistent compounding growth across the planning period.

The projections were further delineated by Service Area, as growth is expected to vary due to zoning, availability of vacant or re-developable land, existing and proposed infrastructure, etc. Demographic growth rates, rather than total number of people or employed people, were used to develop demand projections. The resulting demographic growth rates as a compounding annual percentage are presented in **Table 2-14.** Total population is projected to annually increase by 1.5 percent from 2021 to 2044 and total employment is projected to increase by 1.9 percent annually over the same period. Overall, the City is planning for an additional 24,987 people and 20,525 employed people by 2044 within the RWSA.

Table 2-14 | Growth Rates by Customer Class and Service Area

	Total Growth from 2021 to 2044 (Housing Units/Population)	Total Growth from 2021 to 2044 (%)	Annual Average Compounding Growth (%)
Single-Family Unit Projections			
Lea Hill	201	5.9%	0.248%
Valley	275	5.3%	0.223%
Lakeland	534	27.0%	1.043%
Academy	436	36.3%	1.355%

Lea Hill	1,720	1,932	2,170
Valley	46,946	54,948	64,313
Lakeland	596	669	752
Academy	1,605	1,656	1,709
Subtotal	**50,867**	**59,205**	**68,944**

The demographic growth for each Service Area is shown in **Figure 2-6, Figure 2-7**, and **Figure 2-8**, where single family population, multi-family population, and employment population growth are each presented in a different graph. The figures show the anticipated variability in growth between the Service Areas. For example, employment growth rate (percentage) is projected to be greater in the Valley Service Area than the other Services Areas between 2024 and 2044. Since the Valley Service Area has a much greater magnitude of population and employment than the other Service Areas, minor differences in growth projection percentages results in larger increases in total population and employment numbers. The Valley

Service Area is projected to represent 64 percent of the system's population and 93 percent of the system's employment in 2044.

Figure 2-6 | Single Family Population Projections by Service Area

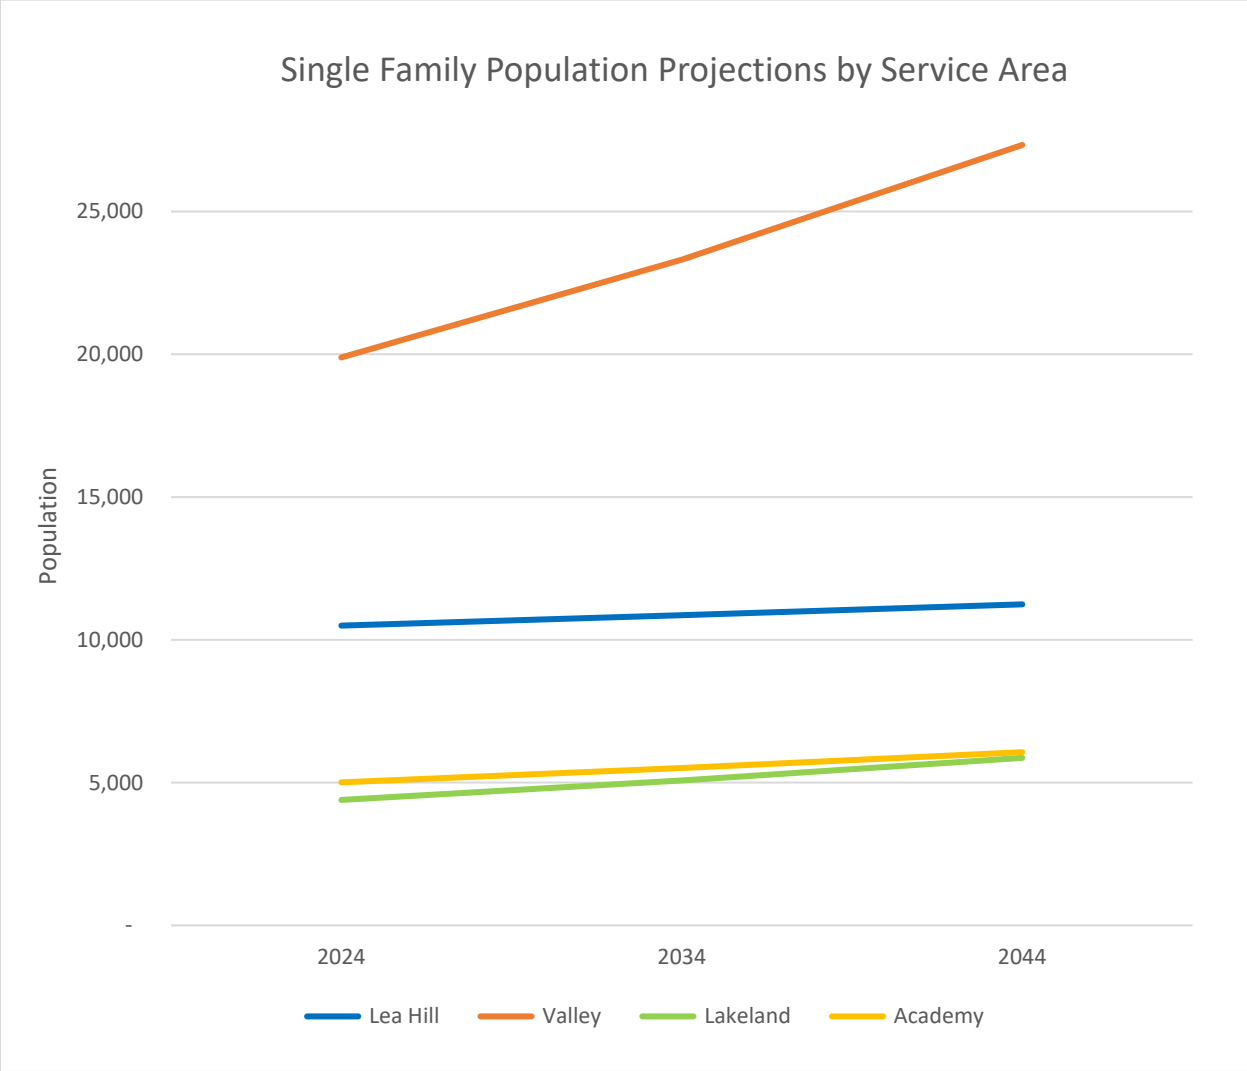

Figure 2-7 | Multi-Family Population Projections by Service Area

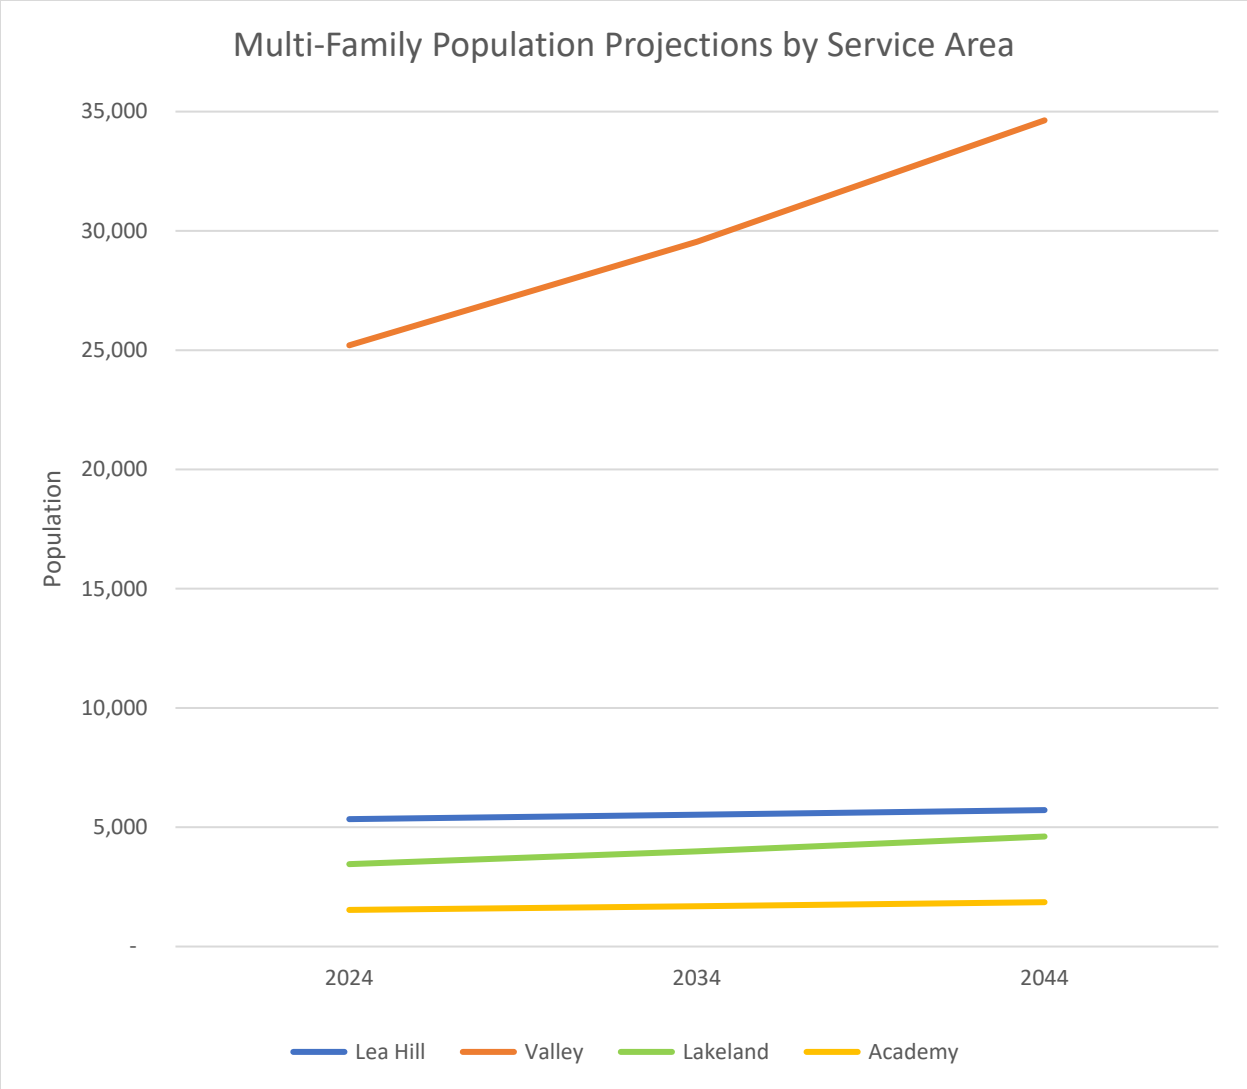

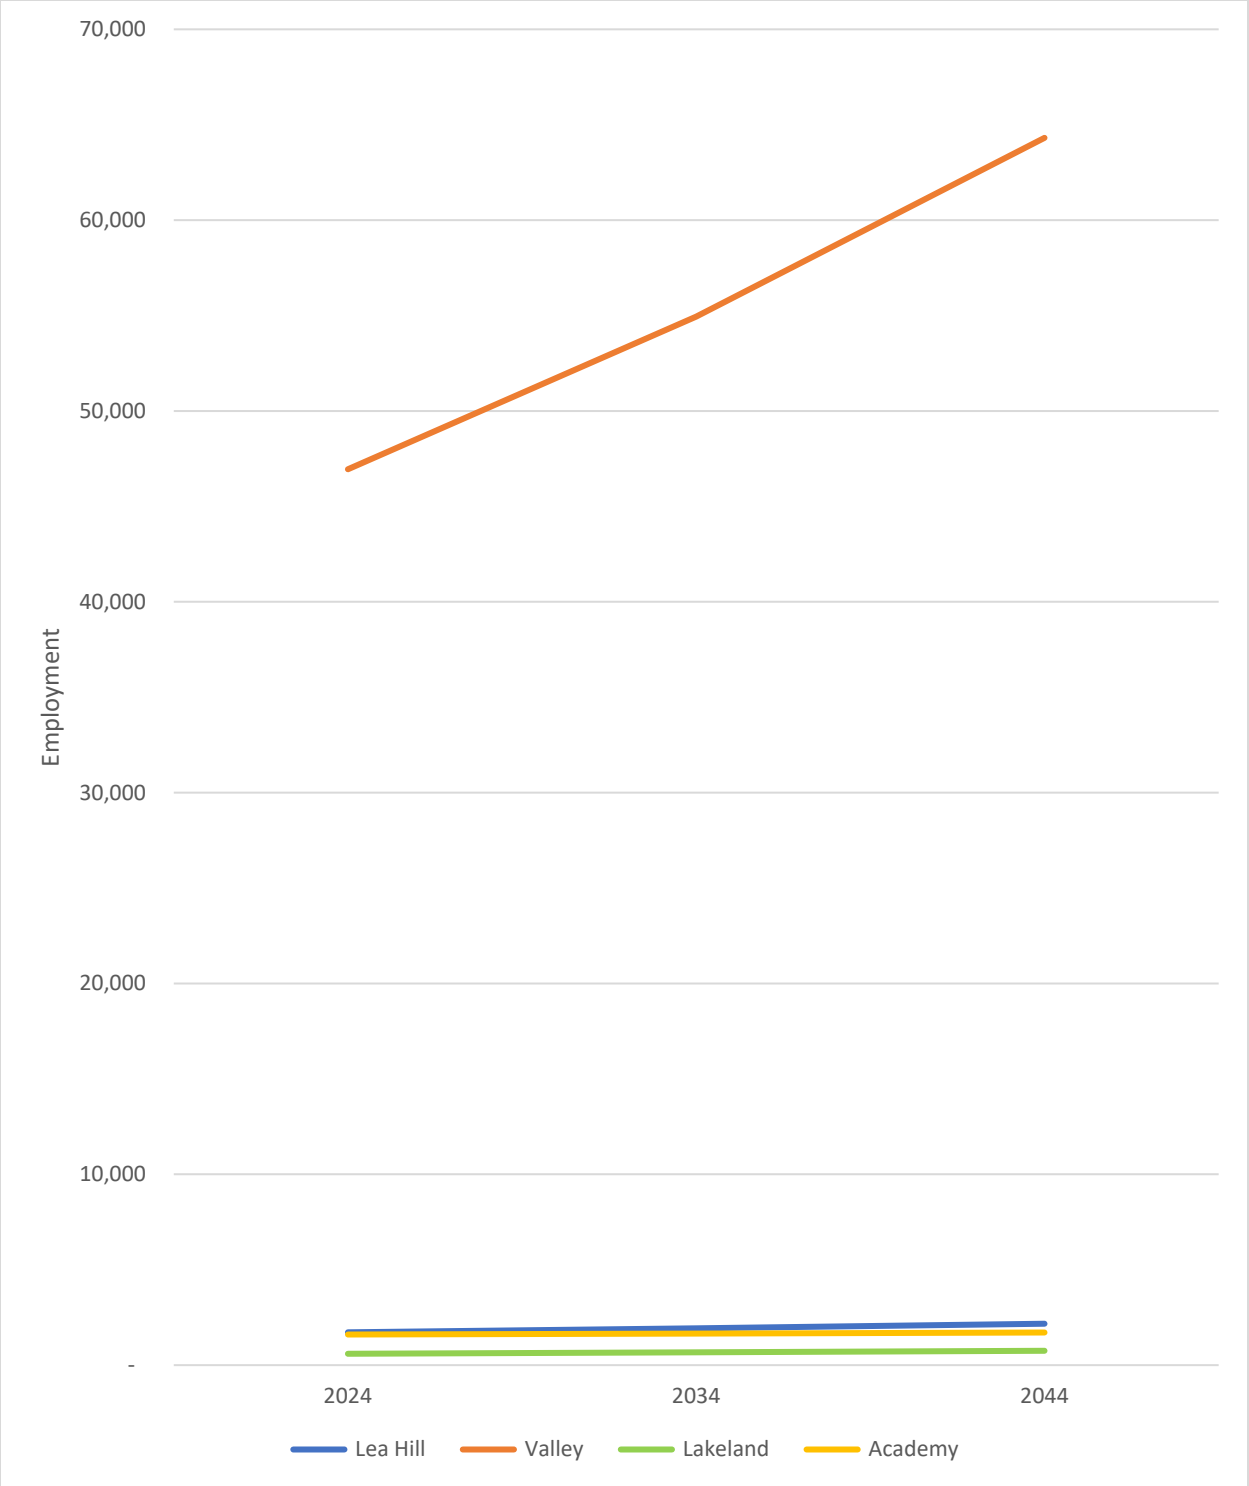

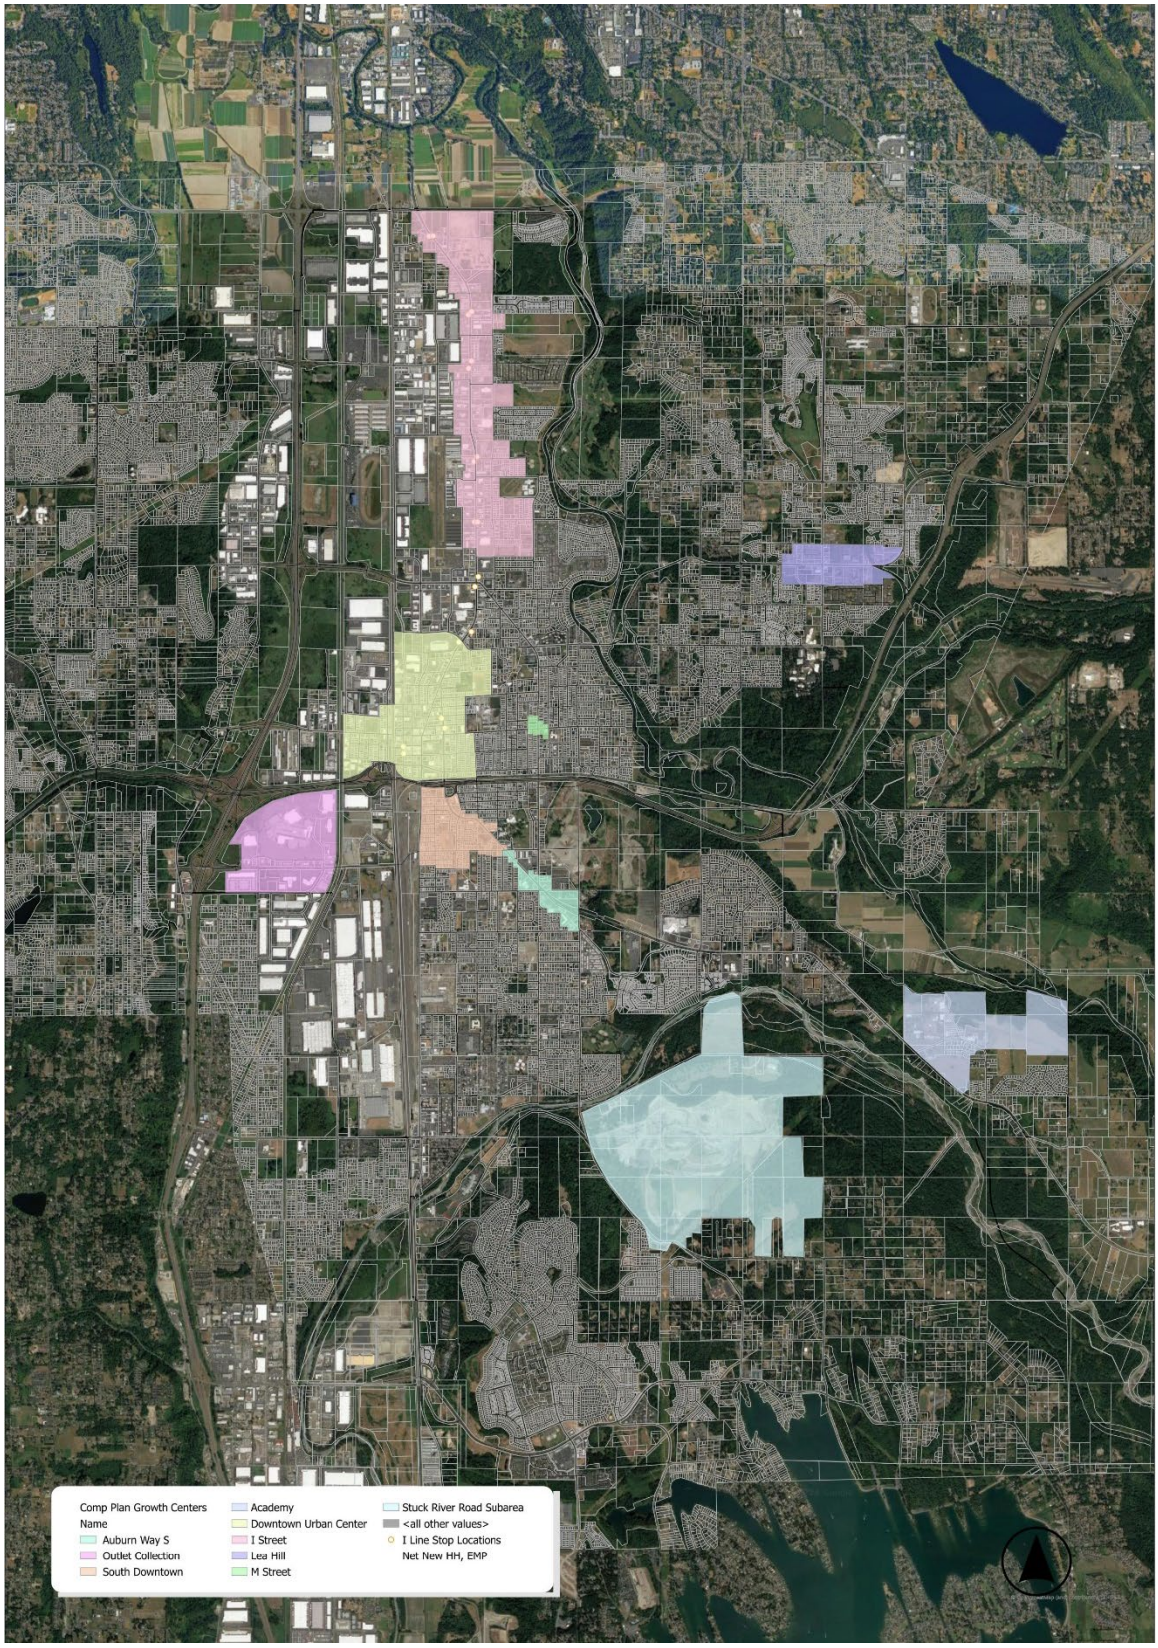

Figure 2-8 | Employment Projections by Service Area

Areas anticipated to have higher than average population and employment growth through 2044, termed "Growth Centers" identified in the City's Comprehensive Plan, are presented in **Figure 2-9.** Demand in each Service Area was modified during the system analysis to reflect focus growth in the areas identified in **Figure 2-9**, matching the population and employment growth projection data.

Figure 2-9 | Map of Projected Areas with Greatest Population Growth

2.8 Future Water Demand

2.8.1 Projected Number of Connections

The number of water connections was used in determining the ERU, ADD, and MDD projections. The number of water connections in the future was projected using the demographic growth rates presented in **Table 2-14** and the number of existing water accounts presented in **Table 2-2**. The projected future connections by both Service Area and customer classification are presented in **Table 2-16.**

- The respective housing unit growth rates for each Service Area were used to calculate projected SFR and MFR connections.
- The School connections were projected by multiplying the percentage of the City population aged 5-19 (22%) by population growth rates for each Service Area.
- The projected employment growth rates were used to calculate future Commercial, Municipal (City Accounts), and Irrigation connections.
- The City's largest user (Boeing) is not included in **Table 2-16**, their projections are based on individual demand and are presented separately. Boeing also accounts for the only Manufacturing and Industrial connections within the City.
- Wholesale customers are not included in **Table 2-16**, their projections are based on individual demand and are presented separately.

2.8.1.1 Lea Hill Service Area

The Lea Hill Service Area is located east of the Auburn-Kent Valley and the Green River. The area is mostly residential with supportive neighborhood businesses. Green River College is in the Lea Hill Service Area and has a concentration of multi-family residential units in the vicinity of the college.

The Lea Hill service area is projected to have the lowest growth rate in population with a 0.3 percent per year average increase from 2021 to 2044. This Service Area is projected to have a moderate growth in employment with a 1.2 percent growth per year from 2021 to 2044.

2.8.1.2 Valley Service Area

The Valley Service Area contains a significant amount of developable land designated as multi-family and commercial, including the Downtown Urban Center. The Service Area is projected to have the highest growth rate in population at 1.6 percent per year from 2021 to 2044. The multi-family connections in this area are projected to grow 2.5 percent per year from 2021 to 2044 and employment is projected to grow 1.6 percent per year. These growth projections are based on the City's anticipation of growth trends and the redevelopment of Auburn's Downtown Urban Center, as well as commercial developments in locations with available space throughout the Service Area.

2.8.1.3 Lakeland Service Area

The Lakeland Service Area includes the entire City south of the White River. A sizable portion of this Service Area is designated residential conservancy land use, which is anticipated to be developed within the planning horizon related to the anticipated closure of the Segale Gravel Pit. The area includes proposed special planning areas for Stuck River Road and Mount Rainier Vista anticipated to be developed with a moderate population growth rate of 1.5 percent per year. This Service Area is projected to have a moderate growth in employment with a 1.2 percent growth per year from 2021 to 2044.

2.8.1.4 Academy Service Area

The Academy Service Area is a well-developed portion of the City. It is expected to have a population growth of 1.0 percent per year from 2021 to 2044. This Service Area is projected to have minimal growth in employment with a 0.3 percent per year increase from 2021 to 2044.

2.8.2 Projected Water Demand

Projecting future water demand is one of the key elements of the water system planning process. Identification of system improvements such as supply, pumping, storage, and piping requirements are all related to demand projections. This section summarizes the ERU, ADD, and MDD projections, as well as the potential range in future demands associated with various factors, such as water use per ERU, DSL, and demographic growth rate.

2.8.2.1 Potential Range in Future Water Demand

Several factors and assumptions affect the accuracy of projected future water demands. Recognizing that certain assumptions built into the demand projections will vary in the future, the projections were developed for medium and high demand scenarios to provide a range in demands that may be experienced in the future. The medium projection will be used for the system analysis in **Chapter 3**, while the high projection will be used for the water right evaluation in **Chapter 5**. The system analysis determines future pumping, storage, and distribution system deficiencies and identifies potential improvements to achieve the City's established capacity criteria. The water right evaluation looks at both water rights and overall supply capacity. Only the medium projections are presented within this Chapter. The variables considered in developing the range of demand projections are summarized in **Table 2-17** and are discussed below.

- Future Water Connections: The future water connections are presented in **Table 2-16** and were used for both demand scenarios.
- Water Use Per ERU_{ADD}: Water use per ERU for the average demand day projections are based on the 75th percentile of the historical data, which is the medium demand scenario, presented in **Table 2-4**. This value equals 182 gpd per ERU. The high demand scenario used the highest annual value from the data set presented in **Table 2-4**, which equals 193 gpd per ERU.
- ERUs per Account: The historical ERU per account by customer classification presented in **Table 2-4** was used to develop demand projections. The ERU per Account values are based on the 75th percentile of the historical data and a water use per ERU value of 182 gpd per ERU. These values are used in both projections.
- Distribution System Leakage: Historical annual DSL varied between 0.7 and 7.4 percent of the City's total City production between 2015 and 2022. The average three-year rolling average of historical DSL values of 5.2 percent is utilized in the medium demand scenario and the maximum three-year rolling average of 6.8 percent was used for the high demand scenario.
- Authorized Unbilled Consumption: Historical annual authorized unbilled consumption varied between 0.14 and 0.54 percent of the City's total billed consumption between 2015 and 2022. The 75^{th} percentile value of 0.27 percent is utilized in the medium demand scenario and the maximum values of 0.54 percent is used for the high demand scenario.
- Water Use Per ERU_{MDD}: Water use per ERU for the maximum demand day projections are based on 75th percentile of the historical data, which is the medium demand scenario, presented in **Table**

2-10. This value equals 322 gpd per ERU. The high demand scenario used the highest annual value from the data set presented in Table 2-10, which is 358 gpd per ERU.

- MDD/ADD Peaking Factor: The 75th percentile of historical annual peaking factors of 1.77 is utilized in the medium demand scenario. The highest value in the historical annual peaking factor data set was used for the high demand scenario, which is 1.97.

The City's largest user (Boeing) and wholesale customers are not included in Table 2-17, their projections are based on individual demand and are presented separately.

Table 2-17 | Proposed Planning Values for Demand Projections

Assumptions	Medium Demand Scenario	High Demand Scenario
Water Demand per ERU_{ADD} (gpd)	182	193
DSL	5.2%	6.8%
Authorized Unbilled	0.27%	0.54%
Water Demand per ERU_{MDD} (gpd)	322	358
MDD/ADD Peaking Factor	1.77	1.97

2.8.3 Large User Demand Forecast

The large user term is used to identify customers consuming the greatest volume of water on an annual basis as presented in Table 2-6. Projections for the City's single largest user (Boeing) is separated from the demand forecasts to aid in accurate forecasting and in the system analyses. The forecasts were based on historical water use data from 2015 through 2022 and is presented in Table 2-18. The projected demand will use the 75th percentile of water use from the historical period of record. Boeing's consumption has trended down over the historical period of record, therefore, the projected demand is conservative and actual consumption is anticipated to be less than the value presented in Table 2-18.

Wholesale connections are also projected separately in Table 2-22. The remaining largest users are not presented separately in demand forecasts; their projected consumption is built into the overall Service Area projections by customer classification.

Table 2-18 | Large User Demand Projections

Large User	Customer Class	Service Area	Representative Historical Water Use Statistic[1]	Representative Annual Water Use (MG)[2]	Projected ERUs in 2044
Boeing	Manufacturing Commercial	Valley	75th percentile	210.6	3,168

Notes:
1. Historical water use data from 2015 through 2022
2. Based on representative historical water use statistic.

2.8.4 Projected Retail ERUs

Future water system demands are based on projected ERUs, which in turn are based on the projected water consumption by customer classification and the projected number of accounts discussed earlier in this chapter. Table 2-19 shows the projected ERUs for the City's individual service areas over the planning period. The projected number of ERUs for each Service Area was calculated by multiplying the projected number of accounts, provided in Table 2-16, by the number of ERUs per account, as summarized in Table

2-3, for each customer class. Wholesale customer demand in terms of ERUs is not included in the demand projections below and must be added separately as summarized in Table 2-23.

Table 2-19 | ERU Projections by Customer Class and Service Area

2.8.5 Projected Retail Average Day and Maximum Day Demands

The ADD projections include the projected customer demands by customer classification, authorized unbilled consumption, and DSL by service area. The resulting ADD projections are summarized in **Table 2-20**.

- Customer demands by classification were calculated by multiplying the projected ERUs summarized in **Table 2-19** by the average ERU water use (182 gpd/ERU).
- Authorized unbilled consumption projections were calculated by multiplying the sum of all customer classification use by the medium demand scenario percentage presented in **Table 2-17**.
- DSL consumption projections were calculated by multiplying the sum of all customer classification use and authorized unbilled use by the medium demand scenario percentage presented in **Table 2-17** for DSL.

2.8.6 Wholesale Demands

The City currently has a wholesale water contract with the City of Algona. The City is also planning to supply wholesale water for the MIT's future fish hatchery. As stated in the Retail Water Service Policy, "the City will plan for and provide water service to all retail customers and wholesale customers with firm contracts. As supply permits, the City may provide water to wholesale customers without firm contracts unilaterally or as part of a capital improvement partnership agreement." The wholesale demands for the City are summarized in Table 2-22.

Algona's current agreement allows for the sale of up to 525,000 gallons per day on a firm basis for the ADD and up to 1,114,00 gallons per day on a firm basis for the MDD. In 2022, Algona purchased an average of 342,953 gallons per day of water from the City. Algona's 2022 Water System Plan (WSP) projects 2042 ADD to be 404,278 gallons per day and 2042 MDD to be 766,137 gallons per day. Algona's WSP demand projections were used for projecting the wholesale water purchases by Algona, rather than the contractual amount, as presented in Table 2-22.

MIT plans to develop a fish hatchery on the White River. An agreement dated from 1986 (included in Appendix G) requires that the City provide the tribe with an average annual demand of 3.9 cubic feet per second (cfs) (2.52 mgd) from Coal Creek Springs for MIT's future fishery enhancement purposes. The agreement does not specify an MDD but rather states:

"The Tribe and the City agree to work in harmony toward a mutually satisfactory allocation of the Coal Creek waters. In furtherance of this goal, the City understands that the water requirements for fishery enhancement purposes are greatest in the winter and spring months. Accordingly, the City agrees to increase the amount of water above 3.9 cfs as needed for fishery purposes. The Tribe understands that the City's requirement for water for domestic use is greatest in the summer and fall months. Accordingly, the Tribe agrees to decrease its use of water below 3.9 cfs, as needed for domestic water purposes…It is further understood that the tribe requires a minimum of 3 cfs at all times for fishery enhancement purposes".

The intent of this agreement indicates that the MIT demand will be at a minimum when the City's demands are at their maximum. Based on this understanding, the planned MDD for the MIT is 1.5 mgd and the ADD was 2.5 mgd. For planning purposes, the MIT demand was added to the Algona demand and included in the "Retail + firm wholesale" group of demands.

LMWD has an interruptible wholesale contract that can be terminated at any time and is therefore represented separately. As discussed in the Historical Wholesale Consumption section, LMWD discontinued regular purchase of water from the City in 2017 per the amendment to IA2 but maintains an intertie with the City to use wholesale water supply on an as-needed basis. LMWD may purchase up to 2.5 mgd of wholesale water per IA2. The contract does not have an expiration date and therefore 2.5 mgd of interruptible wholesale demand is projected through 2044.

Table 2-22 | Wholesale Demand Projections

Wholesale Customer	Service Area	Contractual Delivery[1]	2024 (mgd)	2034 (mgd)	2044 (mgd)[2]
ADD					
Algona	Valley	Firm	0.37	0.39	0.41
MIT Fish Hatchery	Valley	Firm	2.5	2.5	2.5
LMWD	Lea Hill	Interruptible	2.5	2.5	2.5
MDD					
Algona	Valley	Firm	0.69	0.73	0.78
MIT Fish Hatchery	Valley	Firm	1.5	1.5	1.5
LMWD	Lea Hill	Interruptible	2.5	2.5	2.5

Notes:

1. The City will plan for and provide water services to all retail customers and wholesale customers with firm contracts. As supply permits, the City may provide water to wholesale customers without firm contracts unilaterally or as part of a CIP agreement.
2. Algona's projections are provided through 2042; their projected rate increase was used to project consumption to 2044.

2.8.7 Total Demands

The total projected demands are tabulated for retail customers, firm wholesale, and interruptible wholesale in **Table 2-23.** The demands are presented separately to show the level of obligation to the City's customers. Projected retail ADD, MDD, and ERUs are presented by Service Area for the medium demand scenario. Additionally, the ADD and MDD are presented as the total of the projected retail demand and firm wholesale. The retail with firm wholesale represents the projected demand that is used as the basis for the system analysis and are shown in **Figure 2-10**. The difference between the historical and projected wholesale demands is due to the projected allocation of the supply to the proposed MIT Fish Hatchery, per the 1986 Stipulation Settlement Agreement. Additionally, both CWD and LMWD discontinued regular purchase of water from the City in 2017.

The 2044 retail ADD demand is projected to 9.02 mgd, which represents a 28 percent increase from 2024. Throughout the planning period, approximately 40 percent of the City's demand may be from wholesale purchases when both firm and interruptible supply are considered. The MDD is projected to increase by 24 percent from 2024 to 2044 for the sum of firm wholesale customers and retail customers.

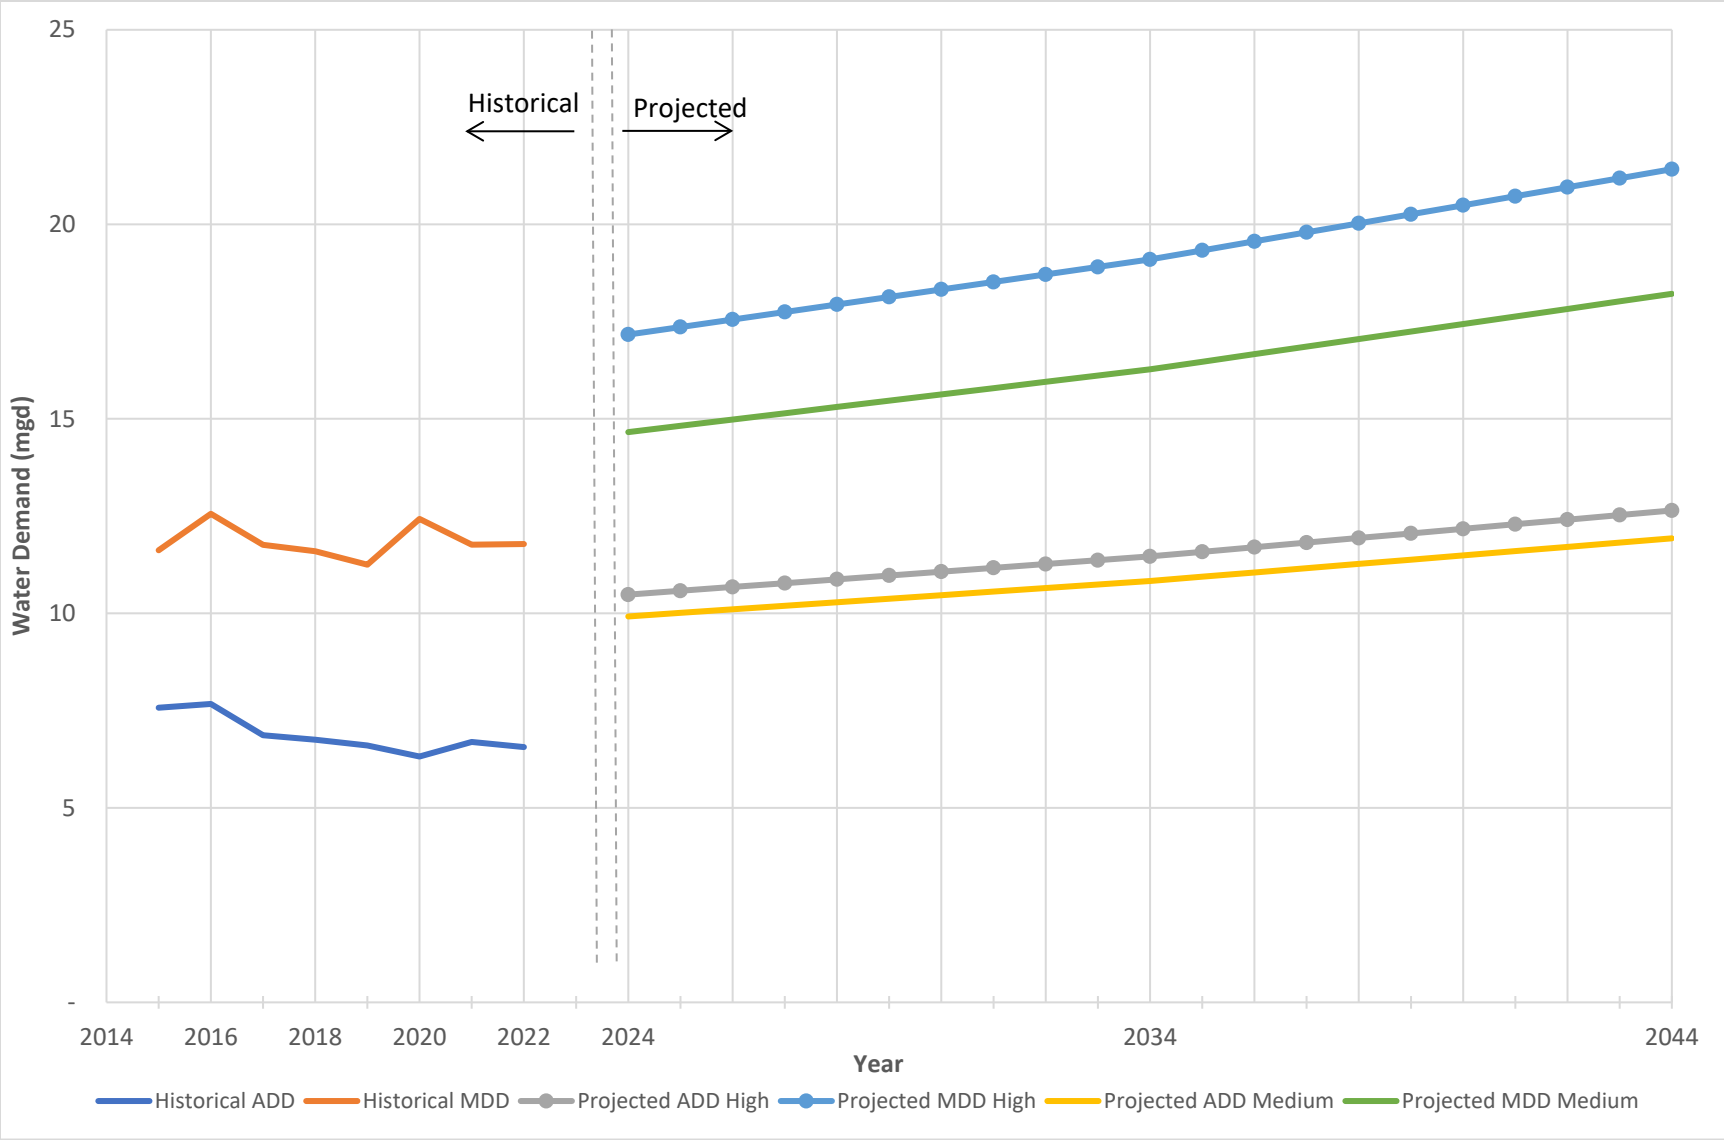

Table 2-23 | ADD, MDD, and ERUs Summarized by Service Area with Wholesale Included

	2024	2034	2044
Lea Hill			
Average Day Demand (mgd)	1.00	1.04	1.09
Maximum Day Demand (mgd)	1.77	1.84	1.92
Equivalent Residential Units	5,506	5,729	5,966
Valley			
Average Day Demand (mgd)	5.11	5.84	6.72

Algona (Firm Wholesale)			
Total Average Day Demand (mgd)	0.365	0.386	0.409
Total Equivalent Residential Units, ADD[1]	2,005	2,120	2,246
Total Maximum Day Demand (mgd)	0.692	0.732	0.775
Total Equivalent Residential Units, MDD[1]	2,150	2,274	2,409
Retail Customer Demand with Algona (Firm Wholesale)			
Total Average Day Demand (mgd)	7.42	8.33	9.43
Total Maximum Day Demand (mgd)	13.16	14.77	16.71
Retail with Firm Wholesale (Algona and MIT Fish Hatchery)			
Total Average Day Demand (mgd)	9.92	10.83	11.93
Total Maximum Day Demand (mgd)	14.66	16.27	18.21
Retail with Firm & Interruptible Wholesale (Algona, MIT Fish Hatchery, and LMWD)			
Average Day Demand (mgd)	12.42	13.33	14.43
Maximum Day Demand (mgd)	17.16	18.77	20.71

Note:

1. The Algona ERU values were calculated using the City of Algona's projected demand and the City of Auburn's ERU_{ADD} and ERU_{MDD} factors.

Figure 2-10 | Projected Retail Plus Firm Wholesale ADD and MDD

CHAPTER 3

System Analysis and Asset Management

This chapter's objective is to identify existing facilities and determine their capacity to reliably satisfy current and projected water demands with safe drinking water. The cost of addressing identified infrastructure deficiencies and operational and maintenance improvements is addressed in priority order in Chapter 8.

This chapter addresses the following topics:

3.1 Asset Management – Asset Inventory and Analysis
3.2 Water Quality
3.3 Design Standards
3.4 Capacity Analysis
3.5 Summary of System Deficiencies

3.1 Asset Management – Asset Inventory and Analysis

This section establishes a date-based inventory of all system-owned water assets and satisfies the requirements of WAC 246-290-100(4)e(iii). The City actively assesses and plans for the maintenance, repair, and replacement of its major assets while preventive maintenance practices keep assets in good condition, thereby extending their useful life.

The City utilizes Cartegraph, an asset management software program, in conjunction with ESRI ArcGIS, a geographic information system (GIS) software program to manage its water assets. GIS is updated using record drawings as projects are completed and Cartegraph is linked to automatically update with new GIS information. Cartegraph is used to track and schedule maintenance activities, as well as materials, labor hours, costs and project timelines. Capital costs for the replacement of assets are assessed on a case-by-case basis.

The City's water system is comprised of groundwater wells, springs, interties with other water systems, treatment facilities, pump stations, storage facilities, pressure reducing stations, and water transmission and distribution pipelines. The City's water system includes 28 pressure zones in four different service areas: Lea Hill, Valley, Academy, and Lakeland. The location of major assets and pressure zones are shown in Figure 3-1. The hydraulic profile of the City's water system is presented in Figure 3-2, with enlargements provided as Figure 3-3 and Figure 3-4.

Water system vulnerabilities relating to risks from natural hazards, such as power outage, flooding, and earthquake are detailed in the Natural Hazard Vulnerability Summary, which is provided in Appendix U.

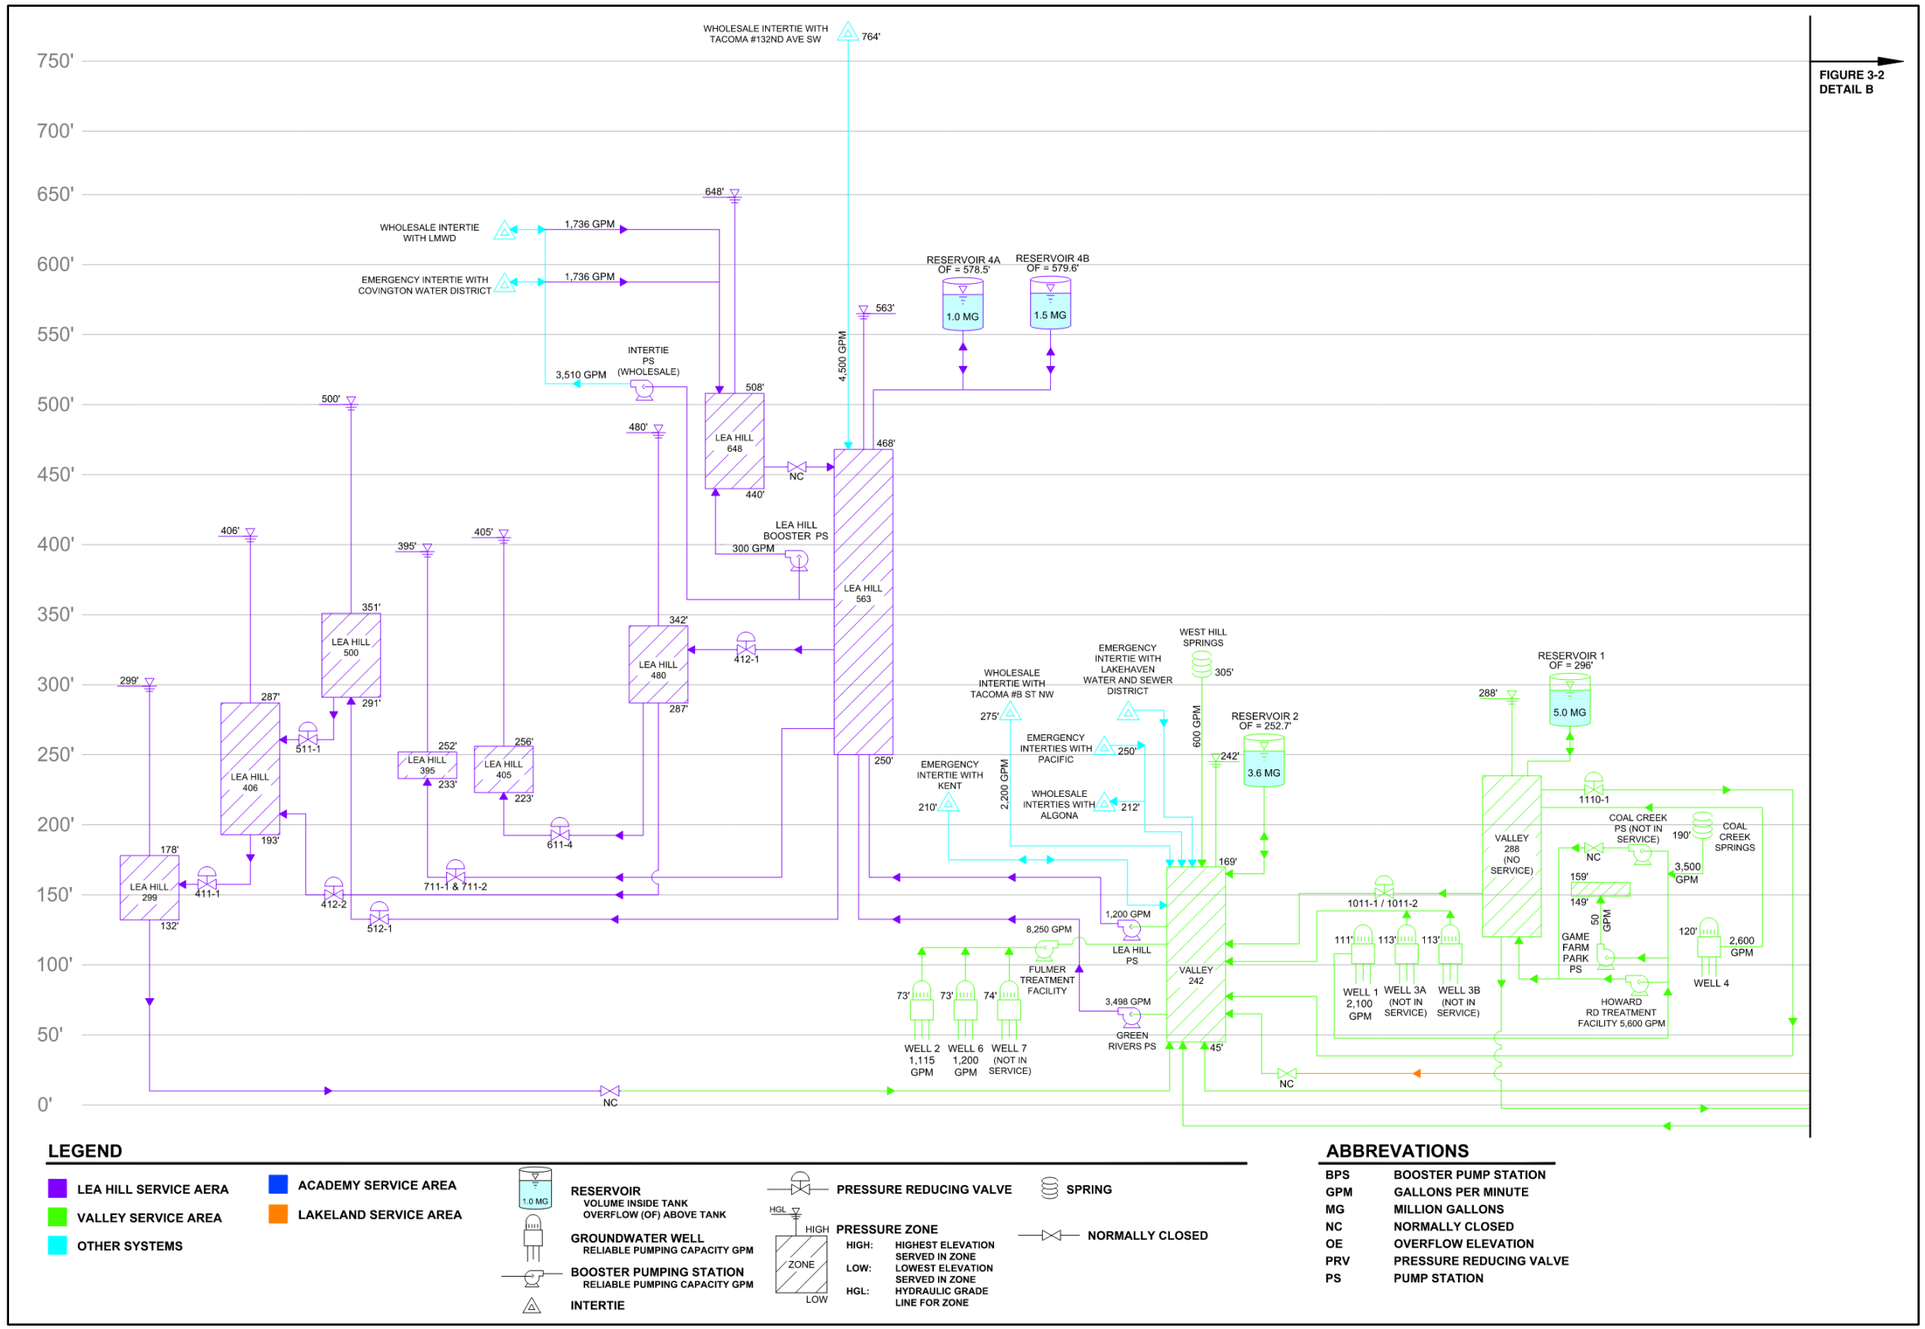

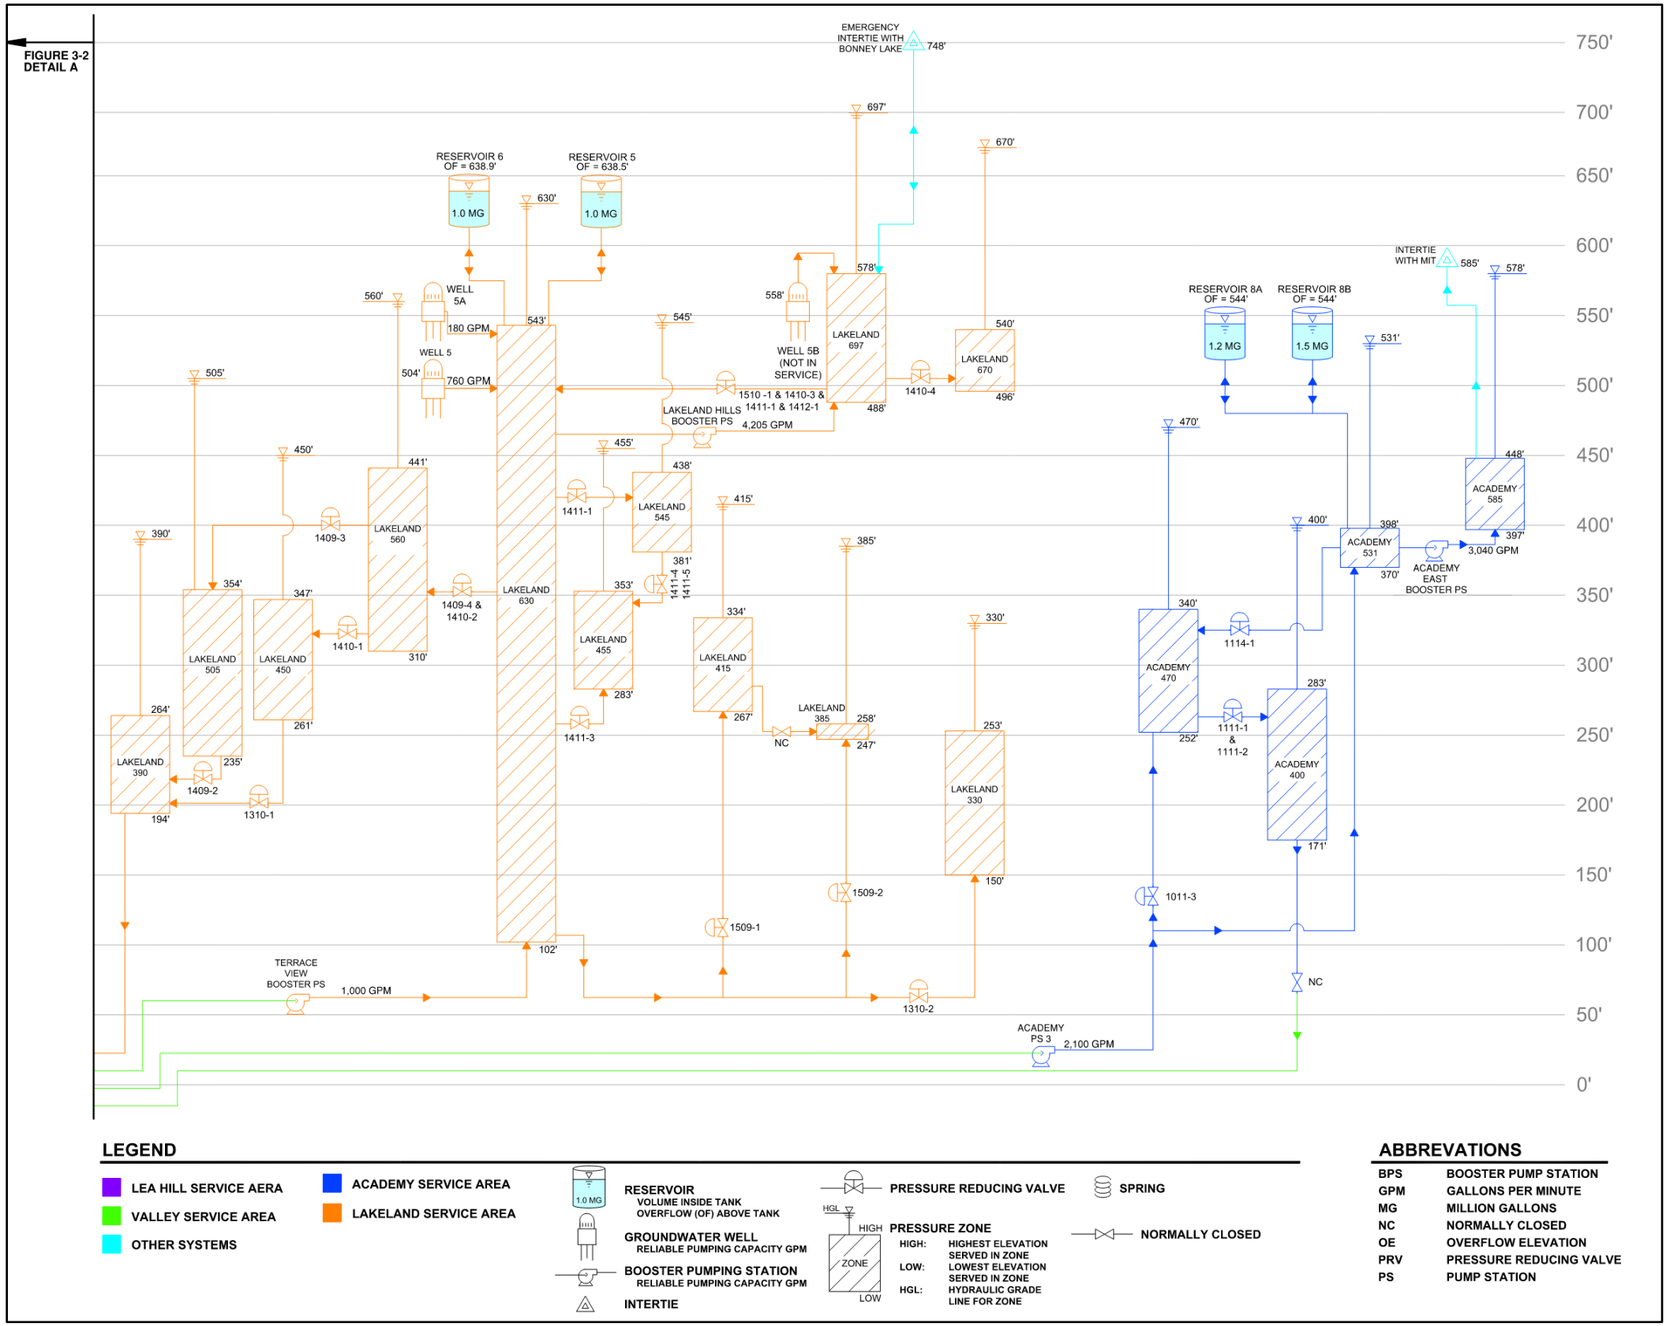

Figure 3-4 | Hydraulic Profile - Detail B

3.1.1 Distribution Facilities

The City' water distribution system includes approximately 300 miles of piping. **Table 3-1** summarizes the water piping inventory by size (diameter). The criticality ratings for the system's pipes are presented in **Table 3-1**, as criticality of the pipelines is assessed based on size. Water main and transmission pipelines vary in diameter from 4 to 36 inches, with a predominance of 8 and 12 inches, and range in age with the oldest piping dating back to 1925. Approximately 78 percent of the distribution system is ductile iron pipe.

Table 3-1 | Transmission and Distribution System Piping Inventory by Pipe Diameter

Distribution System Piping Diameter (inches)	Length (linear feet)	Design Life (years)	Criticality Rating (Bigger # = Less Critical)[1]
≤ 6	189,574	100	4
8-10	681,601		4
12-15	532,953		3
16-20	119,997		3
24-30	15,582		2
36-42	35		2
Unknown	1,380		--

Note:
1. Criticality was assessed based on pipe diameter. Larger diameter pipes were identified as being more critical than smaller diameter pipes.

Table 3-2 organizes water system piping by material and age and identifies the anticipated pipe condition. Pipe condition was assessed based on pipe age and remining useful life. Cast iron pipe that was installed after the 1930's, which constitutes over 48 miles of water mains or 16 percent of the total length of water mains in the City's system, was designated to have a significantly reduced design life of 50 years due to known pipe integrity issues. As such, the City is prioritizing replacement of cast iron pipe and regularly partners with other City projects to replace this piping efficiently and has capital programs to fund replacements as discussed further in **Chapter 8**. Piping that has an unknown material and unknown installation date will be updated in the City's GIS system and Cartegraph as more records research is completed.

In 2014, the City conducted leak detection testing and condition assessment of approximately 2.8 miles of 14 to 24-inch ductile iron and concrete composite pipe. The results indicated that the 20-inch and 16-inch ductile iron mains in the Lea Hill Service Area range from moderate to good condition. The Coal Creek Springs concrete composite main was identified as being in good condition. The 14-inch ductile iron main located in the Academy Service Area was suspected of being in poor condition, however this was later thought to be in decent condition as more information regarding the pipe material was obtained. A portion of the 14-inch piping was replaced as part of a roundabout project within Auburn Way S.

In 2020 the City conducted additional leak detection testing and condition assessment of approximately 13,500 feet of 10 to 16-inch cast iron main. With a focus on four specific sites: Auburn Way South, C Street Southwest, West Hill Springs, and Lea Hill Road. All the pipe on Auburn Way South and Lea Hill Road are in moderate condition. The pipe on C Street Southwest and at West Hill Springs are in poor to moderate condition. The C Street Southwest piping is currently being replaced by the City's "C St SW Preservation" capital project that will begin construction in in 2024.The West Hill Springs piping will be replaced in a forthcoming capital project titled "West Hill Springs Transmission Main Replacement" that is identified in **Chapter 8**.

Table 3-2 | Transmission and Distribution System Piping Inventory by Material and Installation Decade

Piping Material	Total Length (linear feet)	Install Decade (10-Year Period)	Length (linear feet)	Design Life (years)	Remaining Useful Life (years)	Condition Rating (Bigger # = Worse Condition)[1]

		2000	4,165		76	3
		2010	4,112		86	2
Unknown	23,089	Unknown	23,089	50	--	--

Notes:

1. Condition was assessed based on remaining useful life of the pipe.
2. The City is investigating pipe materials in 2024 to verify pipe materials in the City's database that may be mislabeled.

The distribution system piping is delineated into pressure zones using Pressure Reducing Valves (PRVs). An inventory of the City's PRVs, as well as their size, remaining useful life, condition, and criticality are summarized in **Table 3-3**. As PRVs approach their anticipated design life, the City's Maintenance and Operations (M&O) staff remove and rebuild the valve to extend the useful life of the asset, when feasible.

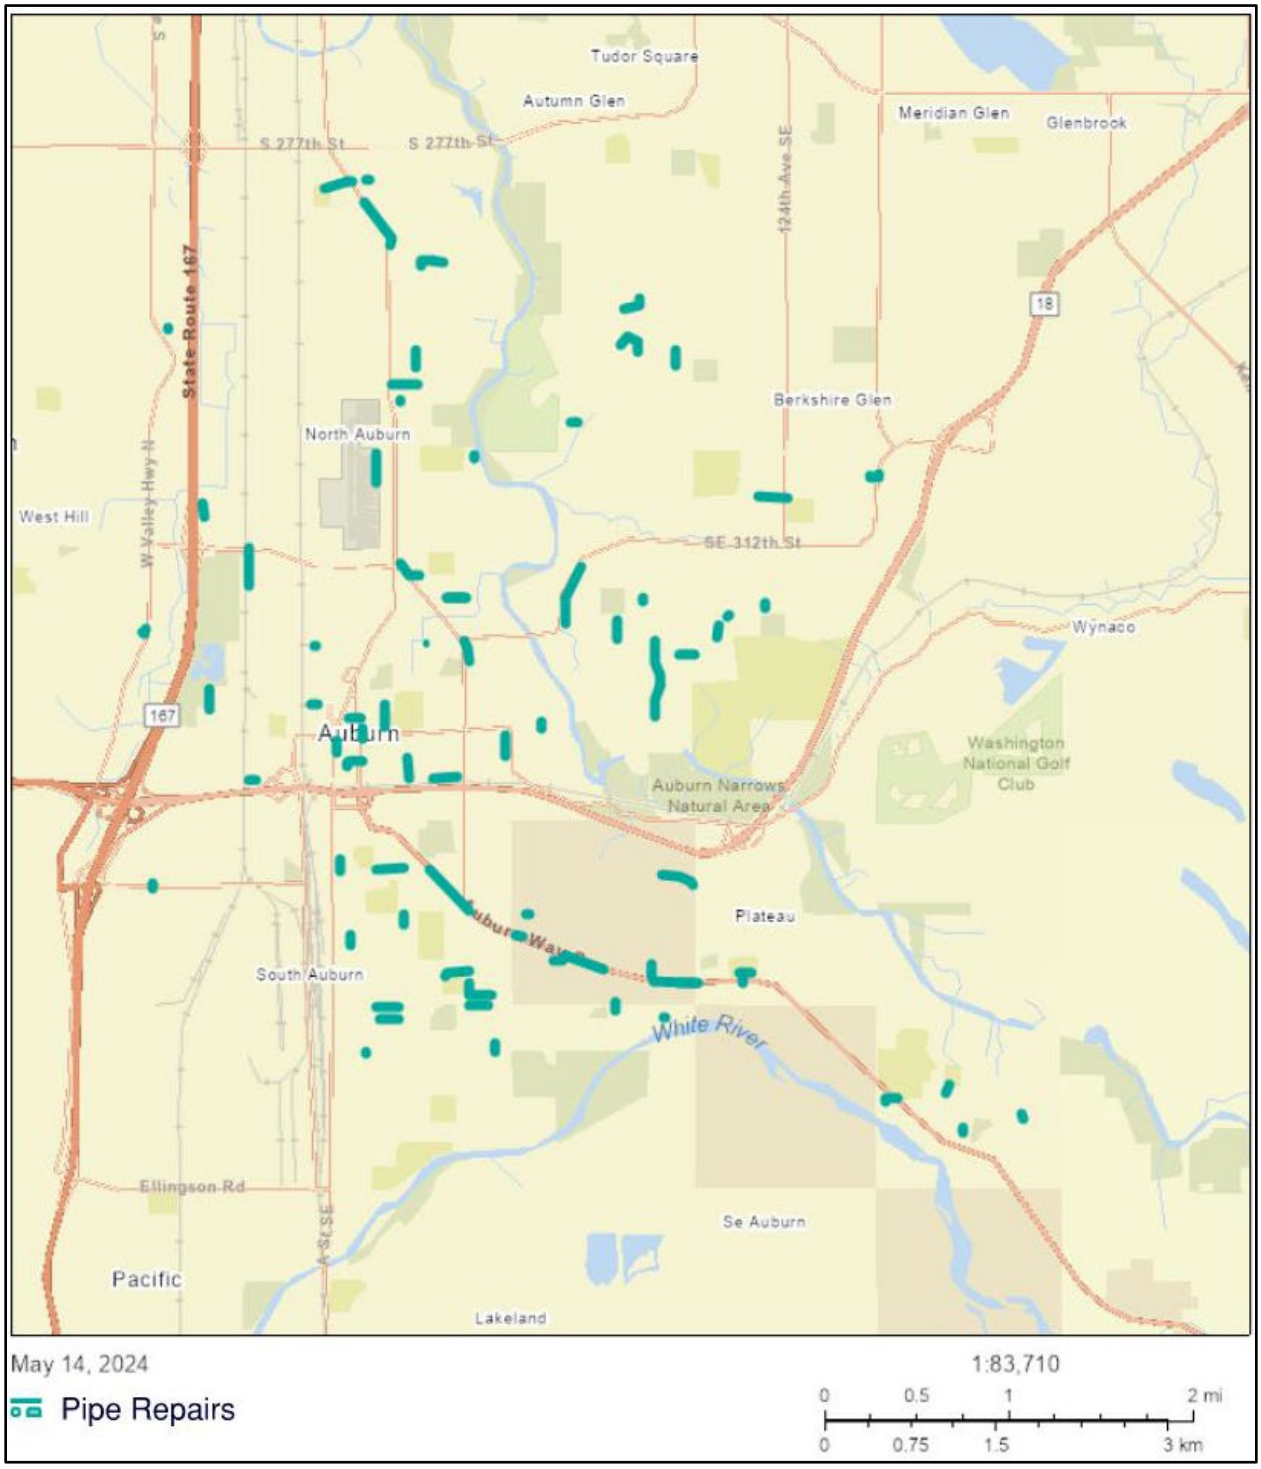
Figure 3-5 shows the locations of water main breaks and leaks that have required repair since 2014. A total of 93 repairs have been completed during this timeframe and include water main break and leak repairs, water main appurtenance repairs, service lines repairs, and repairs due to damage caused by construction contractors.

Figure 3-5 | Water Main Leak and Break Repair Locations from 2014-2024



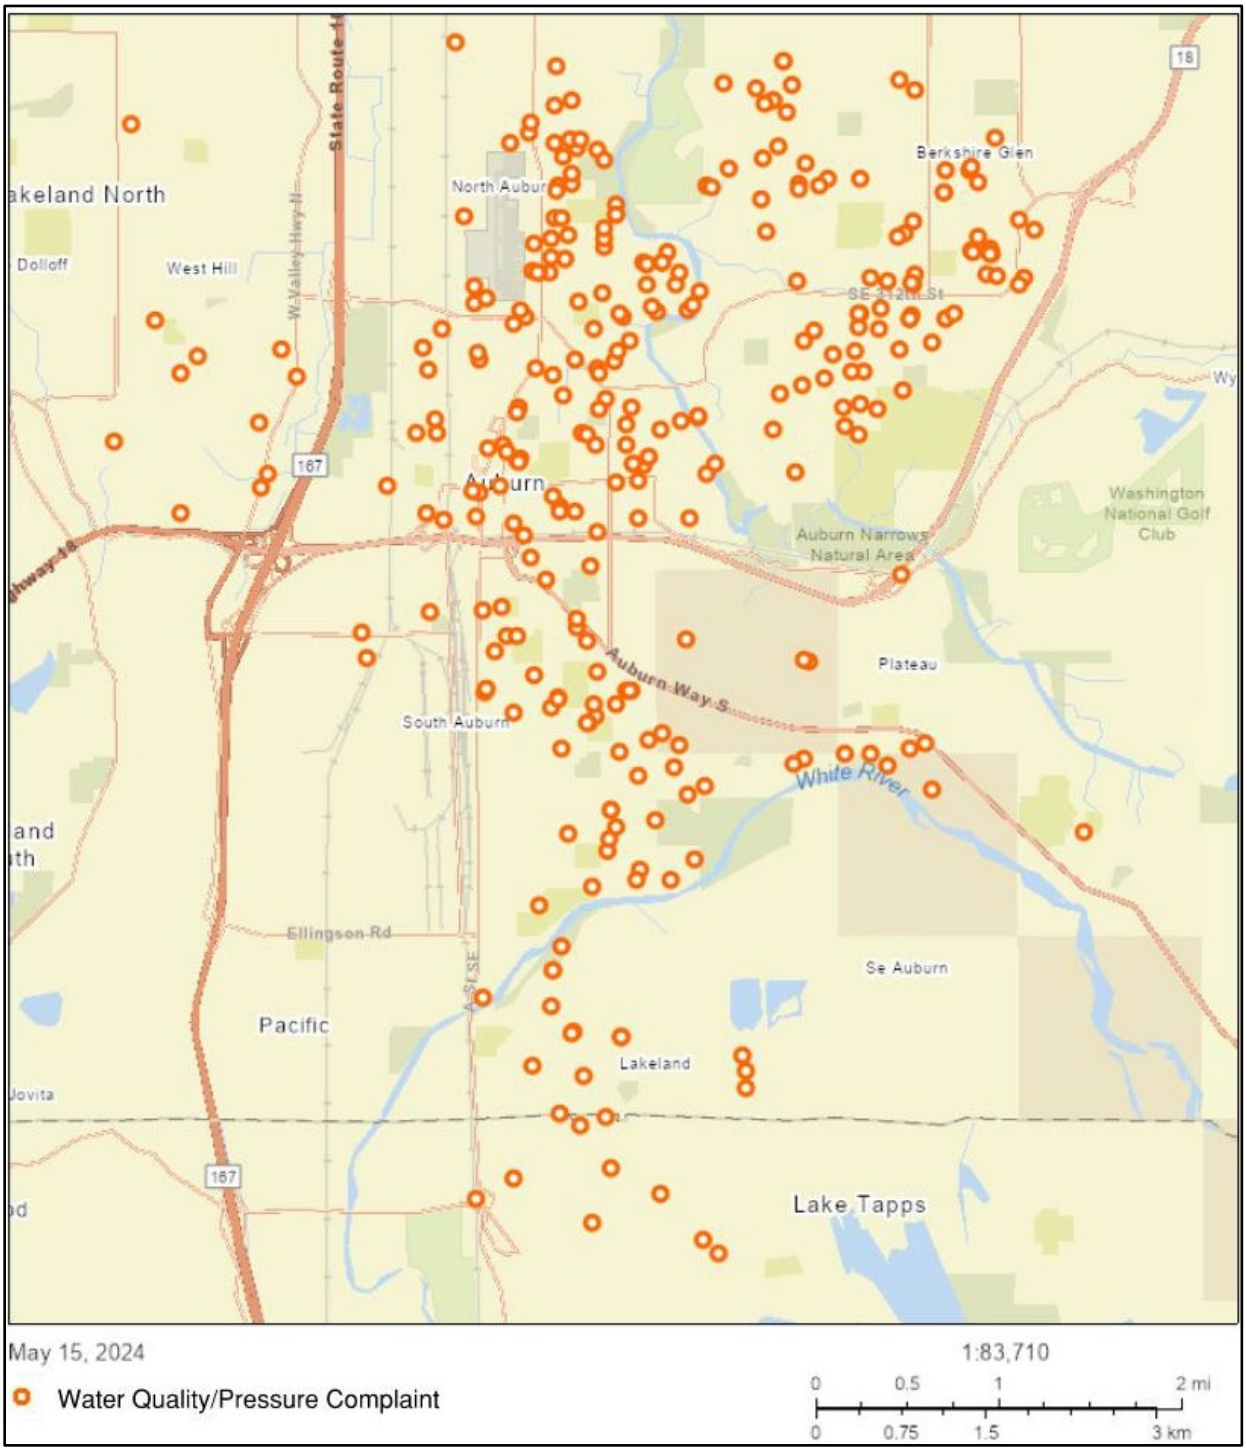


Figure 3-6 shows the locations of low pressure and water quality (odor and discolored water) complaints received since 2014.

Figure 3-6 | Low Pressure, Odor, and Discolored Water Complaints from 2014-2024

A summary of the customer complaints by category is presented in **Table 3-4**. Overall, there has been only one odor complaint within the last ten years. Pressure complaints and water quality complaints have remained fairly consistent, with the fewest number of complaints being made in 2023.

Table 3-4 | Summary Customer Complaints

Category	2014[1]	2015	2016	2017	2018	2019	2020	2021	2022	2023

Note:
1. Data in 2014 is incomplete due to the City transitioning to Cartegraph Asset Management.

3.1.2 Water Source Facilities

The City uses a combination of groundwater wells and springs as supply sources for the water system. The pumping capacity, remaining useful life, condition and criticality of the City's groundwater wells are summarized in **Table 3-5**. The City's two spring sources, Coal Creek Springs and West Hill Springs, are not included in **Table 3-5** since both these sources operate by gravity and have no on-site pumping equipment. Condition ratings are assigned based on the 2013 Water Facilities Evaluation Study.

A detailed description of each water source facility, including both springs and groundwater wells, and planned improvements is provided following **Table 3-5**. A summary of the pumping or production capacity of each source, including the springs, is included in **Section 2.6** of **Chapter 2**. Discussion of the City's current water rights for each water source is provided in **Section 3.4.1**.

Table 3-5 | Source of Supply Well Pump Inventory

Facility Name	Capacity (MGD)	No. of Pumps	Pump Type	Install Year	Design Life (years)	Remaining Useful Life (years)	Condition Rating (Bigger # = Worse Condition)	Criticality Rating (Bigger # = Less Critical)
Valley Service Area								
Well 1	3.02	1	Vertical Turbine	2016	40	32	2	2
Well 2	1.61	1	Centrifugal	2023		39	3	1
Well 3A	Not in Service							
Well 3B	Not in Service							
Well 4	3.74	1	Centrifugal	1985	40	30	1	3
Well 6	1.73	1	Vertical Turbine	1999		15	4	1
Well 7	Not in Service							
Lakeland Service Area								
Well 5	0.94	1	Submersible	1983	40	-1	7	3
Well 5A	0.26	1	Submersible	1990		6	7	2
Well 5B	Not in Service							

3.1.2.1 Coal Creek Springs

Coal Creek Springs is a primary water supply for the City due to its production capacity. This source is more economical to operate than other sources as it can provide a large volume of water and does not require pumping for extraction. Much of the spring's collector system, including the south and middle collectors, was constructed in 1964. A third collector (the north collector) was added in 1998 to enhance system performance and to provide increased reliability. Currently, the flow from this collector is by gravity, however a buried manhole structure was installed in the line to provide space for a future pump station that could increase production.

Each collector is connected to an overflow structure before connection to a 24-inch transmission line that conveys flow to the Howard Road Corrosion Control Treatment (CCT) Facility where the water is treated for corrosion and is then pumped to Reservoir 1. Between the Coal Creek Springs headworks and the Howard Road CCT Facility is a single connection that supplies potable water to Game Farm Wilderness Park. This transmission main is in good condition, however a suspected leak on the 24-inch steel transmission main crossing the White River was identified in a facility evaluation study completed in 2014. It was later identified that there was not a leak, but the evaluation results were caused by river turbulence due to portions of the pipe being exposed along the riverbed. The City is currently constructing a project that replaces the river crossing with new transmission piping suspended from a utility and pedestrian bridge; the project will be completed in 2024 and is identified in Chapter 8.

In recent years, the production capacity of Coal Creek Springs has been reduced. A maximum instantaneous production rate up to 4,500 gpm is currently feasible, however a more consistent functional production capacity of 3,500 gpm is currently achieved (approximately 52 percent of the water right capacity). The City is currently investigating the cause of reduced production and potential solutions. A capital project is planned to rehabilitate Coal Creek Springs once a solution is identified; the project is discussed further in Chapter 8.

3.1.2.2 West Hill Springs

Although the use of West Hill Springs as a potable water supply dates to before 1907, most of the current facilities and equipment were constructed after 1960. More recent improvements include replacement of the collection boxes, as recommended in the 1995 Comprehensive Water Plan, and partial fencing of the watershed, as recommended by the 2000 Water Comprehensive Plan. The spring's existing transmission main is constructed of 10-inch diameter cast iron piping and has experienced two breaks. The City plans to replace approximately 1,250 linear feet of the transmission main with 12-inch diameter ductile iron pipe in an upcoming capital project identified in Chapter 8.

3.1.2.3 Well 1

Well 1 was constructed in 1960 and underwent substantial renovation in 2016, significantly improving the overall facility condition. Renovations included transmission piping to Howard Road CCT Facility, site improvements, a new well house, new pumping system, disinfection with sodium hypochlorite, on-site emergency power, and upgraded electrical and supervisory control and data acquisition (SCADA) controls. The new well pumping system is a two-stage, vertical turbine pump with a capacity of 2,100 gpm, driven by a 100-HP motor and controlled by a variable frequency drive (VFD). Supply from Well 1 will be routed along the recently constructed 16-inch transmission main and conveyed to the Howard Road CCT Facility.

3.1.2.4 Wells 2 & 6

Well 2 was constructed in 1970 and the well and well house were replaced in 2000 with a new masonry building and pumping equipment as part of the City's corrosion control strategy. The facility built in 2000 also houses Well 6, which was built in 1999. Within the facility is a two-stage 1,115 gpm centrifugal pump powered by a 125-HP motor, installed in 2023 (Well 2), and a two-stage, vertical-turbine pump driven by a 200-HP motor (Well 6). The pumping capacity of Well 6 has been reduced in recent years to a typical production rate of 1,200 gpm due to fouling of the well screen that requires occasional cleaning. The wells discharge to a 14-inch transmission main to Fulmer Field CCT Facility for treatment prior to distribution.

Since the Fulmer Field CCT Facility is required to re-pump the water from Wells 2 and 6 into the Valley Service Area and to Reservoir 2, Wells 2 and 6 are functional only with operation of the Fulmer Field CCT Facility. Chlorination and emergency power for both Wells 2 and 6 are housed in the Fulmer Field CCT Facility.

In 2023 the City completed an interim replacement of the pump at Well 2. Full replacement of Well 2 is planned as a capital project discussed further in Chapter 8. Additionally, rehabilitation work completed in 2013 and 2014 indicated that it would be beneficial to clean and rehab both wells on a regular basis. As such, the City initiated a program for regular cleaning of the wells established on a 3-year cycle which is discussed further in Chapter 8.

3.1.2.5 Wells 3A & 3B

Wells 3A and 3B are located at the same site, off 37th Street SE on the extension of E Street SE. The wells are approximately 50 feet apart and were constructed in 1983 and 1984 respectively. Each well is equipped with a four-stage, centrifugal pump driven by a 125-HP motor, each with a maximum pumping capacity of 1,650 gpm when operated individually. A standby generator capable of running one pump at a time is available on site. The system is equipped with an automatic transfer switch.

Currently, Wells 3A and Well 3B are not operated because they produce water that contains high concentrations of manganese. Since the wells were taken offline, the chlorination facilities have been removed. If operated, the wells pump directly into the Valley Service area distribution system. The City plans to construct treatment for these wells as part of the "Wells 3A/3B Treatment" project discussed further in Chapter 8.

3.1.2.6 Well 4

Well 4 was originally constructed in 1985, was rebuilt in 2012, and is currently undergoing significant upgrades to mechanical and electrical equipment, including well pump piping, valve replacement, and control panel replacement. Once the upgrades are complete this source will be considered in excellent condition. The well is equipped with a 2,600-gpm, four-stage, centrifugal, turbine pump driven by a 300-HP motor. Well 4 pumps directly to a 16-inch transmission main that can either convey water to Reservoir 1 or to distribution through a PRV. Well 4 is an important supply for the southern end of the City's Retail Water Service Area (RWSA). Operation of the well is normally controlled by the water level in Reservoir 1.

3.1.2.7 Well 5

Well 5 is one of three City wells that were constructed to serve the Lakeland Hills Development within the City's Lakeland Service Area. Well 5 pumps directly into the Lakeland Service Area distribution system. The well was constructed in 1983 and is equipped with a seven-stage submersible turbine pump, driven by a

125-HP motor. The well facility was assessed to be in poor condition in the 2013 Water Facilities Evaluation Study. The City plans to upgrade the facility as part of the Well 5/5A Upgrades project discussed in Chapter 8.

3.1.2.8 Well 5A

Well 5A is the second well serving the Lakeland Service Area and was constructed in 1990 to supplement Well 5. The well pumps directly into the Lakeland Service Area distribution system. The well is equipped with a ten-stage submersible turbine pump, driven by a 60-HP motor and has on-site chlorination facilities. A manual transfer switch is provided to allow operation of Well 5A using a portable emergency generator. The well facility was assessed to be in poor condition in the 2013 Water Facilities Evaluation Study. The City plans to upgrade the facility as part of the Well 5/5A Upgrades project discussed in Chapter 8.

3.1.2.9 Well 5B

Well 5B was constructed in 2005 with a 600 gpm pump. Once this source came on-line, the City discovered the aquifer was not recovering, so the well was taken out of service in 2006 and has not been operated since. The City has no plans to operate this well within the planning horizon.

3.1.2.10 Well 7

Well 7 was constructed in 1997 and was originally equipped with a 3,500-gpm variable-stage, vertical-turbine pump driven by a 500-HP motor. Well 7 is configured to pump directly to the Fulmer Field CCT Facility through a 16-inch transmission main. The treated water is then re-pumped into the Valley Service Area. If necessary, Well 7 can pump untreated water directly to the Valley Service Area through a PRV. The well was taken out-of-service in 2012 due to high manganese concentrations. The City has planned capital projects to expand the treatment capacity and treat manganese at Fulmer Field CCT Facility to accommodate flows from Well 7 so operation of this facility can be reinstated. The projects to provide treatment and back-up power for Well 7 are discussed in Chapter 8.

3.1.2.11 Algona Well 1

In 1996, the City acquired the water rights for Algona Well 1 as a condition of the wholesale agreement with the City of Algona (Algona). Due to pump operational problems, Algona Well 1 was removed from service. The 500-gpm pump and associated piping have been removed from the well house and the building has been demolished, but the well casing is still intact, and the well is plugged. The City has a capital project identified in Chapter 8 to study the well and options for potential use or relocation.

3.1.3 Water Treatment Facilities

The City's water treatment facilities provide chlorination and corrosion control. An inventory of the water system's treatment facilities, including the treatment type, capacity, remaining useful life, condition, and criticality is provided in Table 3-6. Condition ratings are assigned based on the 2013 Water Facilities Evaluation Study. A detailed description of each water treatment facility and planned improvements is provided following Table 3-6.

Table 3-6 | Water Treatment Facility Inventory

Facility Name	Treatment Type	Treatment/ Dosing Capacity	Install Date	Design Life (years)	Remaining Useful Life (years)	Condition Rating (Bigger # = Worse Condition)	Criticality Rating (Bigger # = Less Critical)
Coal Creek Springs	Gas Chlorination	0.75-0.80 mg/L	1976	35	-13	3	2
West Hill Springs	Gas Chlorination	0.75-0.80 mg/L	1992		15	5	3
Fulmer Field CCT Facility	Hypochlorite	0.95 mg/L	2002	35	13	5	2
	Corrosion/Air-Stripping	11.88 MGD					1
Howard Road CCT Facility	Corrosion/Air-Stripping	8.06 MGD	2004		15	5	1
Terrace View Booster Pump Station	Re-chlorination	0.75 mg/L	2010		21	3	2
Well 1	Hypochlorite	0.75-0.80 mg/L	2016		27	2	2
Well 4	Hypochlorite	0.75-0.80 mg/L	2016		27	2	3
Well 5A	Hypochlorite	0.75-0.80 mg/L	1990		1	3	2

3.1.3.1 Chlorination Facilities

3.1.3.1.1 Coal Creek Springs Chlorination

The Coal Creek Springs chlorination station was built in 1976 and achieves 4-log treatment of the supply. The chlorination station is housed in a masonry building approximately 300 feet north of the collectors and is in fair condition. As a major source of water for the system, Coal Creek Springs is used to maintain chlorine residuals in the Academy Service Area and south end of the Valley Service Area.

This chlorination station is equipped with two chlorinators. Gaseous chlorine is stored on site in a separate room. Alarms from the chlorination equipment are transmitted back to the Water Control Center at the M&O Facility. A chlorine residual analyzer provides high and low alarms to the M&O Facility. Chlorine is dosed into the water at a range of 0.75-0.80 milligrams per liter (mg/L) and is adjusted based on the chlorine residual measured in the Academy and the south end of the Valley Service Area.

The City has a capital project planned to replace the chlorination building and upgrade the chlorination equipment from chlorine gas to hypochlorite disinfection. This project is discussed further in **Chapter 8**.

3.1.3.1.2 West Hill Springs Chlorination

The West Hill Springs Chlorination Facility was constructed in 1992. Water produced at West Hill Springs continuously flows from the collection boxes to the on-site chlorination station, housed in a wood building, where gas chlorine is metered continuously to treat the water. Chlorine dosage typically ranges from 0.75 – 0.80 mg/L and is adjusted based on the measured chlorine residual in the north end of the Valley Service Area. From the chlorination station, the water flows by gravity into the Valley Service Area.

3.1.3.1.3 Well 1

Liquid sodium hypochlorite treatment was installed at Well 1 in 2016. The chlorine dosage typically ranges from 0.75 - 0.80 mg/L. A residual monitoring system is tied into the City's existing SCADA system. The City plans to replace the liquid hypochlorite system with an on-site chlorine generation system (OSEC) to better accommodate seasonal changes to chemical demands and reduce chemical waste. This project is discussed further in Chapter 8.

3.1.3.1.4 Wells 2 and 6

Water produced at Wells 2 and 6 is treated and chlorinated at the Fulmer Field CCT Facility prior to distribution.

3.1.3.1.5 Well 4

Well 4 was equipped with a liquid sodium hypochlorite chlorination system in 2016. The chlorine dosage typically ranges from 0.75 – 0.80 mg/L. The City plans to replace the liquid hypochlorite system with an on-site chlorine generation system (OSEC) to better accommodate seasonal changes to chemical demands and reduce chemical waste. This project is discussed further in Chapter 8.

3.1.3.1.6 Well 5

There is currently no chlorination provided for water produced at Well 5. This City has a capital project discussed in Chapter 8 that will include the addition of a chlorination facility to Well 5.

3.1.3.1.7 Well 5A

Well 5A was equipped with a liquid sodium hypochlorite chlorination station in 1990. The chlorine dosage typically ranges from 0.75 – 0.80 mg/L and is adjusted based on the chlorine residual measured in the Lakeland Service Area.

3.1.3.1.8 Fulmer Field CCT Facility

The Fulmer Field CCT Facility was constructed in 2004. Chlorination at Fulmer Field CCT, along with B Street Intertie, is a major source of chlorine residual in the north end of the Valley Service Area and in the Lea Hill Service Area and is achieved using an on-site chlorine generation system. The existing on-site chlorine generation cell was replaced in 2012, but the system was identified as being in poor condition and sourcing replacement parts for repairs has become increasingly more difficult. A capital project to replace the entire on-site generation system is planned and discussed further in Chapter 8.

The Fulmer Field CCT Facility treats the water from Wells 2, 6, and 7 (when operational). Chlorine is introduced into the system prior to the air-stripping towers at a dose of approximately 0.95 mg/L. The chlorine is adjusted based on measured chlorine residual at the station analyzer. The treated water is then stored in the clearwell and boosted into the distribution system and Reservoir 2. If needed, the chlorine can be manually introduced into the clearwell rather than prior to the towers.

3.1.3.1.9 Terrace View Booster Pump Station (BPS)

The Terrace View BPS was equipped with a liquid sodium hypochlorite chlorination system in 2010, adding 6 percent solution to the discharge piping of the station at an approximate dose of 0.75 mg/L.

3.1.3.1.10 Intertie Pump Station

Through the First Amendment to Interlocal Agreement No. 2 for the Lea Hill Intertie project executed in 2017, Covington Water District (CWD) terminated its rights or obligations to Interlocal Agreement No. 2 or the First Amendment and Lake Meridian Water District (LMWD) continues to receive wholesale water from the City, as needed, on an interruptible basis. The chlorination equipment was removed from the Intertie Pump Station since the intertie is not used on regular basis.

3.1.3.2 CCT Facilities

To limit the corrosion of lead and copper in the system, the City treats major supplies. The treatment process increases the pH of the water, which reduces the solubility of lead and copper, allowing the water to comply with the Lead and Copper Rule. The goal of the CCT facilities is to adjust the water leaving the facility to a pH of approximately 7.5.

3.1.3.2.1 Fulmer Field CCT Facility

The Fulmer Field CCT Facility also adjusts the pH of the water from its sources to approximately 8.0 by air-stripping in three 33,000 gallon air-stripping towers to provide corrosion control treatment. Three 10,000 cubic feet per minute (CFM) blowers provide air. As the carbon dioxide is stripped from the water, the treated water is stored in the clearwell and boosted through four booster pumps back into the distribution system and Reservoir 2. The firm capacity of the facility is 11.88 MGD.

3.1.3.2.2 Howard Road CCT Facility

The Howard Road CCT Facility was constructed in 2004. It has a life expectancy of an additional 15 years and is generally in fair condition. This facility is housed in a masonry building and treats the water from Coal Creek Springs and Well 1. The pH of the water from Coal Creek Springs and Well 1 is then adjusted to approximately 7.8 by air-stripping in two 33,000 gallon air-stripping towers. Two 9,300 CFM blowers provide air. The treated water is then stored in the clearwell at the facility and re-boosted through three booster pumps to Reservoir 1 and the Valley Service Area. The firm capacity of the facility is 8.06 MGD.

3.1.4 Storage Facilities

The City currently maintains a total of 15.7 million gallons (MG) of water storage in eight water reservoirs located throughout the system. Storage reservoirs are present in each of the City's Service Areas. The location of each storage reservoir is shown in **Figure 3-1**. A summary of the City's storage reservoirs, as well as the type of storage tank, installation date, remaining useful life, condition and criticality is provided in **Table 3-7**. Condition ratings are assigned based on the 2013 Water Facilities Evaluation Study. The storage volumes provided in **Table 3-7** represent the maximum tank volume; however, the City commonly operates the reservoirs at below the maximum levels. A detailed description of reservoir and planned improvements is provided following **Table 3-7**.

Table 3-7 | Inventory of Storage Reservoirs

Reservoir Name	Storage Volume (MG)	Type	Install Date	Design Life (years)	Remaining Useful Life (years)	Condition Rating (Bigger # = Worse Condition)	Criticality Rating (Bigger # = Less Critical)
Valley Service Area							
Reservoir 1	5.0	Prestressed Concrete	1975	100	45	5	2
Reservoir 2	3.6	Prestressed Concrete	1975		45	3	2
Lea Hill Service Area							
Reservoir 4A	1.0	Steel Standpipe	1965	70	11	3	2
Reservoir 4B	1.5	Steel Standpipe	1983		29	4	2
Lakeland Service Area							
Reservoir 5	1.0	Steel Standpipe	1981	70	27	2	3
Reservoir 6	1.0	Steel Standpipe	2012		58	2	3
Academy Service Area							
Reservoir 8A	1.2	Steel Standpipe	1973	70	19	3	3
Reservoir 8B	1.5	Steel Standpipe	1980		26	3	3

3.1.4.1 Reservoir 1

Reservoir 1 is located at the southeast end of the Valley Service Area and is the primary storage location for water produced at Coal Creek Springs and pumped from the Howard Road CCT Facility. Reservoir 1 can also be filled by water produced at Well 4. The reservoir was constructed in 1975 and is a covered, pre-stressed concrete tank with a capacity of 5 MG. Reservoir 1 is 184.5 feet in diameter and has an overflow elevation of 269 feet. Academy Pump Station 3 draws water from Reservoir 1 to feed the Academy Service Area. Reservoir 1 also serves the Valley Service Area through Control Valve 1. Control Valve 1 is essential to limit flow and maintain adequate supply to the Valley Service Area.

Reservoir 1 was last inspected and cleaned on March 15, 2023. Recommended improvements identified in 2013 Water Facilities Evaluation Study are planned to be completed as part of the "Reservoir Capital Improvements" project discussed further in **Chapter 8**.

3.1.4.2 Reservoir 2

Reservoir 2 is located on the northeast side of the City's Water Service Area and serves the Valley Service Area. The reservoir was constructed in 1975 and is a buried, pre-stressed concrete tank with public tennis courts on the concrete roof. The reservoir has a maximum storage capacity of 3.6 MG, has a diameter of 143 feet and an overflow elevation of 252.7 feet. Reservoir 2 is filled by the water sources located in the Valley Service Area and is also filled from Reservoir 1 through Control Valve 1.

Reservoir 2 was last inspected and cleaned on March 13, 2023. A capital project is planned to replace the fill and drain valves associated with the reservoir; the project is discussed further in **Chapter 8**. This project will also resolve improvements identified in the 2022 sanitary survey.

3.1.4.3 Reservoirs 4A and 4B

Storage in the Lea Hill Service Area is provided in two steel standpipe reservoirs located in the northeast corner of the City's RWSA, Reservoir 4A and Reservoir 4B. The reservoirs have capacities of 1.0 MG and 1.5 MG respectively. Reservoir 4A was constructed in 1965 with a diameter of 46 feet and an overflow elevation of 578.5 feet. Reservoir 4B was constructed in 1983 with a diameter of 58 feet and an overflow elevation of 579.6 feet. Water is supplied to the Lea Hill reservoirs from the City's Valley Service Area through the Green River Pump Station and Lea Hill Pump Station.

The reservoirs were last inspected and cleaned in June and April of 2018. A capital project is currently installing seismic control valves on the outlet piping from both reservoirs to prevent catastrophic flow during a seismic pipe failure; the project is discussed further in **Chapter 8**. Additionally, required improvements identified in the 2022 Sanitary Survey will be completed as part of the Reservoir Repair and Replacements Program also discussed in **Chapter 8**.

3.1.4.4 Reservoir 5

Reservoir 5 is one of two reservoirs providing storage for the Lakeland Service Area. The reservoir was constructed in 1981 and has a total capacity of 1.0 MG. The reservoir is filled by Well 5, Well 5A, and the Terrace View BPS. Reservoir 5 is steel standpipe with a 53.25-foot diameter and an overflow elevation of 638.5 feet. The reservoir was last cleaned and inspected in 2019 and the interior and exterior were last painted in 2016 as part of routine maintenance.

3.1.4.5 Reservoir 6

Reservoir 6 is in the Lakeland Service Area within the boundary of the Lakeland 697 pressure zone but is connected to distribution piping for the Lakeland 630 pressure zone. Reservoir 6 is a steel standpipe constructed in 2012 and has a total capacity of 1.0 MG. This reservoir has a diameter of 63.4 feet and an overflow elevation of 638.9 feet. The reservoir is filled by Well 5, Well 5A, and the Terrace View BPS. The reservoir was last cleaned and inspected in 2019.

3.1.4.6 Reservoir 8A and 8B

Reservoirs 8A and 8B are steel standpipes that provide storage for the Academy Service Area. The reservoirs are normally operated in parallel, functioning as one large reservoir. Reservoir 8A has a diameter of 52.75 feet and a total storage volume of 1.2 MG and was constructed in 1973. Academy Reservoir 8B has a diameter of 60 feet and a total storage volume of 1.5 MG and was constructed in 1980. Both reservoirs have an overflow elevation of 544 feet. Academy Pump Station 3 fills the reservoirs.

The reservoirs were last cleaned and inspected in October 2019. A capital project is currently installing seismic control valves on the outlet piping from both reservoirs to prevent catastrophic flow during a seismic pipe failure; the project is discussed further in **Chapter 8**. Additionally, required improvements identified in the 2022 Sanitary Survey will be completed as part of the Reservoir Repair and Replacements Program also discussed in **Chapter 8**.

3.1.5 Pump Station Facilities

The City operates and maintains several pump stations to move water throughout the distribution system and to provide water at the required service pressures. An inventory of the City's pump stations is provided in **Table 3-8** and locations are shown in **Figure 3-1**. Condition ratings provided in **Table 3-8** are assigned based on findings from the 2013 Water Facilities Evaluation Study.

Table 3-8 | Pump Station and Booster Pump Station Inventory

Facility Name	Firm Capacity (gpm)	Firm Capacity (MGD)	Install Date	Design Life (years)	Remaining Useful Life (years)	Condition Rating (Bigger # = Worse Condition)	Criticality Rating (Bigger # = Less Critical)
Lea Hill Service Area							
Intertie Pump Station (Wholesale)	3,510	5.05	1999	40	15	3	4
Lea Hill BPS	300	0.432	1999		15	3	3
Lea Hill Pump Station	1,200	1.73	1965		-19	6	3
Green River Pump Station	3,498	5.04	1999		15	3	2
Valley Service Area							
Game Farm Park Pump Station	50	0.07	1988	40	4	7	4
Lakeland Service Area

Fulmer Field CCT Facility	8,250	11.88	2004		20	3	1
Howard Road CCT Facility	5,600	8.06	2004		20	4	1
Academy Service Area							
Academy Pump Station 3	2,100	3.02	2023	40	39	1	1
Academy East BPS	3,040	4.38	2014		30	2	2

3.1.6 Facility Back-Up Power

An inventory of the City's existing facilities with backup power accommodation is provided in **Table 3-9**. Of the City's twelve water sources, only Wells 5 and 7 are currently without a standby power source. Standby power will be added to both wells as part of capital projects discussed in **Chapter 8**. Back-up power for Wells 2 and 6 is housed at the Fulmer Field CCT Facility.

The Game Farm Park Pump Station, Lea Hill BPS, and Intertie Pump Station are the only pump stations without a standby power source or connection. Backup power will be added to the Lea Hill BPS as part of a capital project discussed further in **Chapter 8**. The Game Farm Park Pump Station is a small facility that serves a recreational area and does not serve residential or commercial properties, therefore back-up power is not a critical element.

Table 3-9 | Back Up Power Inventory

Generator Location	Generator Type and Size	Install or Purchase Date	Design Life (years)	Remaining Useful Life (years)	Condition Rating (Bigger # = Worse Condition)	Criticality Rating (Bigger # = Less Critical)
Fulmer Field CCT Facility	On-site, 1000 kW	2001	25	2	4	3
Howard Road CCT Facility	On-site, 600 kW	2004		5	3	3
Academy East BPS	On-site, 600 kW	2010		11	2	3

Generator Location	Generator Type and Size	Install or Purchase Date	Design Life (years)	Remaining Useful Life (years)	Condition Rating (Bigger # = Worse Condition)	Criticality Rating (Bigger # = Less Critical)
Academy Pump Station 3	On-site, 450 kW	2023		24	1	3
Green River Pump Station	On-site, 515 kW	2004		5	2	3
Lakeland Hills BPS	On-site, 300 kW	2012		13	2	3
Lea Hill Pump Station	On-site, 250 kW	1964		-35	6	3
Terrace View BPS	On-site, 250 kW	2010		11	2	3
Well 1	Portable, 230 kW	2014		15	2	3
Well 3A/3B	On-site, 210 kW	1983		-16	5	3
Well 4	On-site, 450 kW	2016		17	2	3
Well 5A	Portable, 230 kW	1992		-7	4	3
Well 5B	On-site, 400 kW	2005		6	3	4
Coal Creek Springs	On-site, 20 kW	1964		-35	6	3

3.1.7 Facility Monitoring and Control

Primary monitoring and operation of the City's water system and facilities is conducted via a SCADA computerized control system. A software program called "AVEVA" works in association with SCADA to provide real time graphical display of system data, set points, and alarms for staff monitoring and control. The City's SCADA system controls are centralized at the Public Works M&O Facility. Major upgrades of the City's SCADA system were complete in 2015 and again in 2024, and the system regularly undergoes updates as facility upgrades or improvements are completed.

3.1.8 2022 Sanitary Survey Findings

The City has already taken corrective actions and will continue to resolve all deficiencies identified in the 2022 Sanitary Survey, as summarized in **Table 3-10**.

Table 3-10 | Summary of 2022 Sanitary Survey Findings

Issues/Recommended Improvements		Required Action
Sources and Treatment		
Well 3A	Offline due to manganese issues	--
Well 3B	Offline due to manganese issues	--
Well 5	Water supply lines to chlorine solution tanks must be provided with either air gaps or reduced pressure backflow assemblies to eliminate potential cross connections.	This deficiency was mislabeled by DOH, This should have been for Well 4. A letter from the DOH acknowledging the error was received on October 17, 2022.
	Pump to waste line should terminate above grade.	Will be addressed in Well 5/5A Upgrades project included in CIP; refer to **Chapter 8**.
Well 5A	Water supply lines to chlorine solution tanks must be provided with either air gaps or reduced pressure backflow assemblies to eliminate potential cross connections.	Completed. On September 21, 2022, a reduced pressure backflow assembly was installed at Well 5A, on the water supply line to the chlorine tank.
	Raise casing to terminate above grade or provision of sump pump or alarms that activate when water accumulates in vault. In the meantime, the vault	City implemented an inspection program in October 2022.

	Issues/Recommended Improvements	Required Action
	should be inspected weekly and immediately following significant storm events.	Will be addressed further in Well 5/5A Upgrades project included in CIP; refer to **Chapter 8**.
Well 7	Offline due to manganese issues	--
Storage		
Reservoir 2	Reservoir overflow should not be connected directly to any drain, sanitary sewer, or storm sewer.	Will be addressed in Reservoir 2 improvements project included in CIP; refer to **Chapter 8**.
Reservoir 4A	Reservoir vents should open downward to prevent windblown debris from entering tank.	Will be completed as part of City's annual Reservoir Repair and Replacement program or Reservoirs 4 and 8 Seismic Rehabilitation project; refer to **Chapter 8**.
	Reservoir overflow should not be connected directly to any drain, sanitary sewer, or storm sewer.	Will be completed as part of City's annual Reservoir Repair and Replacement program or Reservoirs 4 and 8 Seismic Rehabilitation project; refer to **Chapter 8**.
Reservoir 4B	Reservoir overflow should not be connected directly to any drain, sanitary sewer, or storm sewer.	Will be completed as part of City's annual Reservoir Repair and Replacement program or Reservoirs 4 and 8 Seismic Rehabilitation project; refer to **Chapter 8**.
Reservoir 8A	Reservoir overflow screen must be repaired	Completed. On September 13, 2022, the overflow screen at Reservoir 8A was repaired.
	Reservoir vents should open downward to prevent windblown debris from entering tank.	Will be completed as part of City's annual Reservoir Repair and Replacement program or Reservoirs 4 and 8 Seismic Rehabilitation project; refer to **Chapter 8**.
Reservoir 8B	Reservoir overflow screen must be repaired	Completed. On September 13, 2022, the overflow screen at Reservoir 8B was repaired.
	Reservoir vents should open downward to prevent windblown debris from entering tank.	Will be completed as part of City's annual Reservoir Repair and Replacement program or Reservoirs 4 and 8 Seismic Rehabilitation project; refer to **Chapter 8**.

3.2 Water Quality

The quality of drinking water in the United States is regulated by the EPA. Under provisions of the Safe Drinking Water Act (SDWA) established in 1974, the EPA is allowed to delegate primary enforcement responsibility for water quality control to each state. In the State of Washington, DOH is the agency responsible for implementing and enforcing the drinking water regulations. For the State to maintain the authority to implement requirements under the SDWA, it must adopt drinking water regulations that are at least as stringent as federal regulations. In meeting these requirements, the State has published drinking water regulations that are contained in Chapter 246-290 of the WAC.

As a Group A system, the City is responsible for monitoring and complying with all applicable SDWA and WAC regulations pertaining to source water and distribution system water quality. The purpose of this section is to document the water system's water quality compared to the above drinking water standards, satisfying the requirements of WAC 246-290-100(4)(e)(ii).

The City also owns and operates the Braunwood satellite system located in southeast Auburn in the Braunwood development, also known as the Hidden Valley Acres development. This system is classified as a Group A - Community Water System by DOH. This system is not discussed further in this chapter since it is a small satellite system that is regularly monitored by the City as required and has not had water quality issues as documented in the City's annual water quality reports for the system.

This section includes the following:

- Water quality and treatment objectives
- Analysis of source water quality
- Analysis of distribution system water quality
- Recent regulatory changes

3.2.1 Water Quality Treatment and Objectives

The treatment objectives of the City are to treat source water to contaminant concentrations below the MCLs established by the EPA and WAC.

Historically, the City has relied on groundwater supplied from wells and springs, which have been determined to be not under the direct influence of surface waters (DOH 2004 for Coal Creek Springs). For these water sources, the City is required to meet the EPA's Groundwater Rule (GWR). The City treats water from all groundwater and spring sources, except for Well 5. The City's water treatment facilities provide chlorination and corrosion control. A summary of the required operator certifications for each type of facility is provided in **Table 3-11**.

Table 3-11 | Summary of Operator Certifications

Treatment Facility	Required Operator Certifications
Corrosion Control Treatment (CCT) Facilities	Water Distribution Manager 4 (WDM-4) and Water Treatment Plant Operator (WTPO)
Chlorination Facilities	WDM-4

The City began using surface water in 2012 through the B-St Wholesale Intertie with the City of Tacoma (Tacoma). This supply, referred to as the Regional Water Supply, originates from the Green River and the Howard Hansen Dam. Since the City receives treated water as a wholesale purchaser, it is not required to meet the Surface Water Treatment Rule. Tacoma maintains compliance with the Interim Enhanced Surface Water Rule, Long Term 1 and Long Term 2 Enhanced Surface Water Treatment Rules; and the Filter Backwash Recycling Rule. The City has not purchased water for consumption from Tacoma since 2016.

3.2.2 Analysis of Source Water Quality

3.2.2.1 Raw Water Quality

The City only samples post-treatment water except for Well 5, which does not currently have treatment or chlorination. Water quality data for Well 5 is provided in **Table 3-12**.

3.2.2.2 Finished Water Quality

Monitoring of inorganic chemical and physical parameters varies by source but is typically required once per 36-month compliance period, however, the City typically monitors these constituents every 12 months (annually) in July. Samples are collected from each source following treatment. A summary of the maximum detected concentrations for monitoring data from 2015 through 2022 is provided in **Table 3-12**. During this time, none of the MCLs published by the EPA were exceeded; all samples were below required limits.

Asbestos sampling is usually required once per 36-month compliance period. However, the City has a waiver that requires sampling once every nine years at three distribution system sample sites. No data was collected during the study period. The City is expected to sample again in 2028. Annual VOC sampling is required for Wells 2 and 6, which are both currently represented by the Fulmer Field CCT Facility. All active sources are disinfected with chlorine prior to entering the distribution system except for Well 5, which serves the Lakeland Service Area.

Monitoring data for 2015 through 2022 for inorganic constituents, physical parameters, SOCs, and VOCs were reviewed and is summarized in **Table 3-12**. All values are post-treatment, except for Well 5 since water from this source is not treated. Wells 3A, 3B, 5B, and 7 were not used during this period and were therefore not sampled.

Table 3-12 | EPA Primary Drinking Water Standards Results from 2015 through 2022

Constituent	MCL	Units	Maximum Detected Concentration From 2015 Through 2022[1] (mg/L)						
			Coal Creek Springs	West Hill Springs	Well 1	Well 4	Well 5	Well 5A	Fulmer Field CCT Facility[2]
EPA Primary Drinking Water Standards									
Arsenic	0.01	mg/L	0.001	0.001	0.001	0.001	0.001	0.002	0.002
Barium	2	mg/L	0.1	0.1	0.1	0.1	0.1	0.1	0.1
Cadmium	0.005	mg/L	0.001	0.001	0.001	0.001	0.001	0.001	0.001
Chromium	0.1	mg/L	0.007	0.007	0.007	0.007	0.007	0.007	0.007
Mercury	0.002	mg/L	0.0002	0.0002	0.0002	0.0002	0.0002	0.0002	0.0002
Selenium	0.05	mg/L	0.002	0.002	0.002	0.002	0.002	0.002	0.002
Beryllium	0.004	mg/L	0.0003	0.0003	0.0003	0.0003	0.0003	0.0003	0.0003
Nickel[3]	-	mg/L	0.005	0.005	0.005	0.005	0.005	0.005	0.005
Antimony	0.006	mg/L	0.003	0.003	0.003	0.003	0.003	0.003	0.003
Thallium	0.002	mg/L	0.001	0.001	0.001	0.001	0.001	0.001	0.001
Cyanide	0.2	mg/L	0.05	0.05	0.05	0.05	0.05	0.05	0.05
Fluoride	4.0	mg/L	0.2	0.2	0.2	0.2	0.2	0.2	0.2
Nitrite-N	1	mg/L	0.1	0.1	0.1	0.1	0.1	0.1	0.1
Nitrate-N	10	mg/L	1.7	3.6	2.4	1.4	1.9	0.4	1.7
Total Nitrate/Nitrite[4]	10	mg/L	1.7	3.6	2.4	1.4	1.9	0.5	1.7
EPA Secondary Drinking Water Standards[5]									
Iron	0.3	mg/L	0.1	0.1	0.1	0.62[6]	0.16	0.1	0.1
Manganese	0.05	mg/L	0.01	0.01	0.01	0.01	0.01	0.01	0.032
Silver	0.1	mg/L	0.01	0.01	0.01	0.01	0.01	0.01	0.01
Chloride	250	mg/L	5	8	5	4	6	3	9
Sulfate	250	mg/L	9	15	12	12	11	6	14
Zinc	5	mg/L	0.2	0.2	0.2	0.2	0.2	0.2	0.2
State Regulated Characteristics									
Sodium	20	mg/L	6	8	7	7	10	6	12
Conductivity	700	µmhos/cm	150	254	184	152	275	133	224

Constituent	MCL	Units	Maximum Detected Concentration From 2015 Through 2022[1] (mg/L)						
			Coal Creek Springs	West Hill Springs	Well 1	Well 4	Well 5	Well 5A	Fulmer Field CCT Facility[2]
Turbidity	1	NTU	0.4	1.5	9.6	5.8	1.2	0.4	3.1
Color	15	Color Units	5	5	10	5	5	5	5
Total Dissolved Solids (TDS)[7]	600	mg/L	N/A	N/A	N/A	N/A	N/A	N/A	N/A
State Unregulated									
Lead[8]	0.015	mg/L	0.001	0.001	0.001	0.018	0.001	0.001	0.001
Copper	1.3	mg/L	0.02	0.3	0.02	0.2	0.02	0.02	0.02
Hardness[9]	-	mg/L	66	122	83	100	130	62	100

Notes:

1. Based on monitoring conducted between 2015 and 2022. Wells 3A, 3B, and 5B were not in use during this time period and no monitoring was conducted.
2. The Fulmer Field CCT Facility was monitored in 2015, 2018,2020, 2021, and 2022, it replaces monitoring of Wells 2, 6, and 7.
3. There is no state or federal MCL, but Washington state has a detection reporting limit of 0.005 mg/L.
4. EPA has set a treatment goal of Total Nitrate at 10 mg/L.
5. EPA does not enforce these "secondary maximum contaminant levels" (SMCLs). They are established as guidelines to assist public water systems in managing their drinking water for aesthetic considerations, such as taste, color, and odor. These contaminants are not considered to present a risk to human health at the SMCL.
6. Iron levels in Well 4 exceeded the Secondary Drinking Water Standards in 2015 but have since all been below the MCL.
7. N/A - not applicable, no testing conducted; testing for total dissolved solids is only required if the specific conductivity is greater than 700 micomhos per centimeter (umhos/cm).
8. On November 30, 2023, the EPA announced the proposed Lead and Copper Rule Improvements, which would lower the Lead Action Level from 0.015 mg/L to 0.010 mg/L if finalized in October 2024.
9. No MCL, as hardness is not a regulated characteristic.

3.2.2.3 Water Quality and Treatment Technique Violations

There were no water quality treatment violations from 2015 through 2022.

3.2.3 Analysis of Distribution System Water Quality

3.2.3.1 Seasonal Water Quality Changes

Water quality within the distribution system is relatively consistent throughout the year. The Valley Service Area distribution water experiences low pH during the winter, however no changes are implemented to offset seasonal variations.

3.2.3.2 Distribution Water Quality Objectives

The City collects 100 samples at 70 dedicated sampling sites for total and fecal coliform monitoring. Sampling is conducted at one quarter of the routine sample locations each week during the first four weeks of a month. The City also monitors weekly for total and fecal coliform at Coal Creek Springs and West Hill Springs at their respective collector vaults, as well as after treatment, and at several additional sites to support operations on a weekly basis. The City uses two types of disinfectant for treatment, chlorine gas and liquid sodium hypochlorite, which both produce free chlorine residuals in the distribution system. Average chlorine residuals throughout the distribution system ranged from 0.57 to 0.71 mg/L from 2015 through 2022, as summarized in Table 3-13. Although the range of chlorine residual varies throughout the year, the range of chlorine residual is relatively consistent from year to year. Planned improvements to chlorination facilities at Well 1 and Well 4 are expected to help maintain a more consistent chlorine residual level within the water system.

Table 3-13 | Total Chlorine Residuals Results from 2015 through 2022

Year	Sample Results (mg/L)	
	Average	Range
2015	0.71	0.40 - 1.09
2016	0.64	0.37 – 0.89
2017	0.58	0.32 – 0.79
2018	0.57	0.30 – 0.78
2019	0.59	0.33 – 0.77
2020	0.57	0.33 – 0.80
2021	0.58	0.36 – 0.78
2022	0.59	0.40 – 0.77

The Stage 1 Disinfection By-Product Rule (DBPR) monitoring was superseded in 2012 with Stage 2 DBPR monitoring because the City's population exceeded 50,000 people. The City conducts monthly sampling within the distribution system to determine the concentration of fluoride. This sampling is in addition to the inorganic source monitoring required by DOH. The City does not add fluoride to their water. The City of Tacoma does fluoridate their water and is wholesale supplier to the City, but the City has not purchased water for consumption from Tacoma since 2016. Sampling is conducted for informational purposes only and to answer customer questions regarding natural fluoride in the City's water. Should the City purchase water from Tacoma, this information would also be used to monitor the blending of different water sources within the distribution system.

In the event the City purchases water from Tacoma via the Cascade Water Alliance, such as during a shortage or other such operational constraint, the City will monitor and report distribution system disinfection residuals daily. These samples will be taken at the same time and place as the City's routine coliform sampling.

The City conducted both Stage 1 and Stage 2 DBPR monitoring since the last water system plan (WSP). **Table 3-14** provides a summary of the sample results from 2015 through 2022. The City's Total Trihalomethanes (TTHMs) and Haloacetic Acid 5 (HAA5) monitoring has been conducted once per year during the month with the warmest water temperature (i.e., July or August). All samples were well below the concentrations that DOH uses to determine whether a water system qualifies for reduced monitoring (0.080 mg/L for TTHMs and 0.060 mg/L for HAA5).

Table 3-14 | Summary of Disinfection By-Product Rule Monitoring Results from 2015 through 2022

Year	TTHM Concentration (µg/L)[2]		HAA5 Concentration (µg/L)[2]	
	Range for LRAA[1]	Compliance	Range for LRAA[1]	Compliance
2015	2.6 – 19.0	< 80	Not Detected – 4.8	< 60
2016	2.2 – 23.1	< 80	Not Detected – 6.0	< 60
2017	1.7 – 15.0	< 80	1.1 – 6.9	< 60
2018	6.7 – 15.1	< 80	Not Detected – 6.9	< 60
2019	ND	< 80	0.2 – 0.3	< 60
2020	7.5 – 11.95	< 80	Not Detected – 3.66	< 60
2021	6.45 – 17.62	< 80	1.25 – 12.41	< 60
2022	9.03 – 10.41	< 80	Not Detected	< 60

Notes:
1. Local running annual average.

2. Microgram per liter (µg/L).

Corrosion control treatment (CCT) is required for the water produced at Coal Creek Springs, Well 1, Well 2, Well 6, and Well 7. Per the Lead and Copper Rule (LCR), the City is required to collect at least 30 water samples per 36-month compliance period in alignment with reduced lead and copper monitoring requirements of WAC 246-290. Sample results from 2015 through 2022 are presented in **Table 3-15**. Since the CCT facilities were constructed, the lead and copper levels have been well below the action level.

DOH granted the City a (b)(3) exemption on August 17, 2021. This exemption, under 40 CFR Part 141.81(b)(3), eliminates the requirement for the City to conduct optimal water quality parameter (OWQP) sampling throughout the distribution system. Instead, the City continues to focus on lead and copper sampling at designated monitoring sites to meet compliance requirements. A copy of the City's exemption letter from DOH is included as **Appendix F.**

Table 3-15 | Summary of Lead and Copper Sampling Results from 2015 through 2022

Constituent	Range of Results from 2015 through 2022
Copper Concentrations (mg/L)	
Copper Concentration Range	<0.02 – 0.3
Copper 90th Percentile	0.091
Lead Concentrations (mg/L)	
Lead Concentration Range	<0.001-0.018
Lead 90th Percentile	<0.001

3.2.3.3 Water Quality and Treatment Technique Violations

There were no water quality violations in the distribution system from 2015 through 2022.

3.2.4 Recent Regulatory Changes

The EPA established a health advisory for drinking water of 70 parts per trillion (ppt) for perfluorooctane sulfonic acid (PFOS) and perfluorooctanoic acid (PFOA), two commonly found Perfluorinated compounds (PFAS). When both compounds are found in the water, the combined health advisory is also 70 ppt. The Washington State Board of Health (Board) adopted rule changes to chapter 246-290 WAC, Group A Public Water Supplies and WAC 246-390, Drinking Water Laboratory Certification and Data Reporting. The newly adopted rules became effective on January 1, 2022.

The rule establishes the administrative processes for setting drinking water quality standards as State Action Levels (SAL) and state MCLs. The rule establishes SALs for five PFAS contaminants: PFOA, PFOS, perfluorohexane sulfonic acid (PFHxS), perfluorononanoic acid (PFNA), and perfluorobutane sulfonic acid (PFBS). The rule requires Group A community and non-transient noncommunity public water systems to test for PFAS. For those Group A water systems that have detections of PFAS, but do not exceed the SAL, the rule requires additional ongoing monitoring, with the frequency of monitoring based upon the detected level in comparison to the SAL. It also establishes reporting, recordkeeping, and consumer confidence report requirements. For those Group A water systems that exceed the SAL, the rule requires follow-up actions such as monitoring, public notification, additional recordkeeping, and reporting requirements. SALs for regulated PFAS compounds are shown in **Table 3-16** with results from the City's latest samples. Most results indicated that the PFAS compounds were not detected (ND), being they were below detectable limits. PFBS was detected at Well 1, Coal Creek Springs, and West Hill Springs, however the levels are far

below regulated levels. In more recent results received in May 2024, all samples were below detection limits for all facilities and the City was approved for a 3-year testing schedule.

Furthermore, in April 2024, the EPA announced the first National Primary Drinking Water Regulation for six PFAS. This established individual MCLs for PFOA, PFOS, PFHxS, PFNA, and Hexafluoropropylene oxide dimer acid (HFPO-DA) and a Hazard Index MCL for PFAS mixtures containing at least two or more of PFHxS, PFNA, HFPO-DA, and PFBS. The EPA also finalized MCLGs for these PFAs, which can be seen alongside the MCLs in Table 3-16. The regulation requires that public water systems must monitor for these PFAS and must complete initial monitoring by 2027, followed by ongoing compliance monitoring. Water systems must provide the public with information on the PFAS levels in the drinking water beginning 2027. Public water systems must implement solutions by 2029 to reduce PFAS if monitoring shows that drinking water levels exceed the MCLs.

Table 3-16 | PFAS State Action Levels and Monitoring Data

PFAS Compound	SAL (ng/L)	MCL (ng/L)	MCLG (ng/L)	Maximum Detected Concentration (ng/L)[1]									
				Well 1	Fulmer Field CCT Facility	Well 3A	Well 3B	Well 4	Well 5	Well 5A	Well 5B	Coal Creek Springs	West Hill Springs
PFOA	10	4.0	0	ND	ND	ND	ND	ND	ND	ND	ND	ND	ND
PFOS	15	4.0	0	ND	ND	ND	ND	ND	ND	ND	ND	ND	ND
PFHxS	65	10	10	ND	ND	ND	ND	ND	ND	ND	ND	ND	ND
PFNA	9	10	10	ND	ND	ND	ND	ND	ND	ND	ND	ND	ND
PFBS	345	-	-	2.8	ND	ND	ND	ND	ND	ND	ND	3.1	3.0
HFPO-DA	-	10	10	ND	ND	ND	ND	ND	ND	ND	ND	ND	ND
Mixtures containing two or more of PFHxS, PFNA, HFPO-DA, and PFBS	-	1[3]	1[3]	0	0	0	0	0	0	0	0	0	0

Notes:
1. Nanograms per liter (ng/L).
2. Not detected (ND).
3. Hazard Index – unitless.

3.3 Design Standards

The City's most recent Engineering Design Standards are available on the City's website and are provided as Appendix P. Table 3-17 highlights keys standards that are used to evaluate the capacity of the City's water system, summarizing both DOH criteria and City criteria. The City's water quality design standards follow the design standards set forth by the EPA and DOH, as discussed in Section 3.2.

Table 3-17 | System Capacity Analysis Criteria

Evaluation Type		Evaluation Criteria	Agency's Standard
Water Reliability Recommendations	Multiple Source	2 or more supply sources are available	DOH
	Backup Power	Source of supply pump stations have power connections to two independent primary public power sources, have in-place auxiliary power available, and/or maintain adequate gravity standby storage	DOH
	Surface Water Reliability	Firm watershed yield for surface water provides 98% reliability to meet normal, anticipated system demands.	DOH
	Groundwater Reliability	Factor of safety is applied to well pumping test safe yield determination.	DOH
Water Source	Source Capacity	MDD while replenishing Fire Suppression Storage (FSS) within 72-hrs (24-hr source pumping may be assumed).	DOH
		ADD with largest source out of service.	DOH
		MDD in a pumping period of 20 hours or less of pumping.	DOH
		MDD with the largest active water source out of service.	City
Pump Stations	Capacity - Open System (sufficient storage in zone)	ADD with largest pump out of service.	DOH
		MDD with all pumps in service.	
		MDD with largest pump out of service.	City
		Fire Flow is met from storage reservoir.	
	Capacity - Closed System (no/insufficient storage in zone)	PHD with largest pump out of service.	DOH
		MDD + Fire Flow at a pressure of at least 20 psi at all points throughout the distribution system.	
		PHD + Fire Flow with largest pump out of service.	City
		Standby power with capacity to run with any single pump out of service.	

Evaluation Type		Evaluation Criteria	Agency's Standard
Storage Facilities	Total Storage Capacity	Sum of operational, equalization, standby, fire suppression, and dead storage.	DOH
	Operating Storage (OS)	The volume of water before sources turn on.	DOH
		(pump off elev. – pump on elev.) x gal/ft	
	Equalizing Storage (ES)	(PHD – maximum supply capacity) x 150 min	DOH
		Min. pressure of 30 psi.	
		Must be provided when source pumping capacity cannot meet the peak hourly demand.	
	Standby Storage (SB)	Min. standby storage of 200 gallons per ERU.	DOH
		Min. pressure of 20 psi.	
		Standby storage volume equal to one day of MDD for the pressure zone(s) served.	
	Fire Suppression Storage (FSS)	(required fire flow rate) x (duration in minutes)	DOH
		Min. pressure of 20 psi.	
		Nested storage (same storage for Standby and Fire Suppression Storge) requires written consent of fire protection authority.	
	Dead Storage (DS)	Volume that cannot provide minimum design pressure (20 psi) to all customers.	DOH
		Volume below the outlet pipe and cannot be used because of hydraulic limitations.	City
Distribution System	Minimum Pressures	PHD at no less than 30 psi.	DOH
		MDD + Fire Flow at no less than 20 psi.	
	Maximum Pressures	Add individual PRVs for ADD pressures more than 80 psi.	DOH
		Max. target pressure of 80 psi in water distribution system.	City
	Maximum Velocity	No more than 8 feet per second (fps) under PHD conditions.	DOH
		No more than 8 fps in distribution mains and 5 fps in transmission mains under PHD conditions. No more than 18 fps under MDD+FF conditions.	City
	Minimum Pipe Size	6-inch diameter in residential areas and 8-inch diameter in commercial areas, unless a hydraulic analysis justifies another size.	DOH
		Single-Family Residential minimum 8-inch diameter and Industrial/Commercial/Multi-Family minimum 12-inch diameter.	City
	Telemetry	Each parcel receiving water service shall have its own meter	City
		Meters shall be located as close to the water main from which the service is taken as possible, distance not to exceed 50 feet.	
		Meters shall be placed in landscape strips, behind the sidewalk, or at the right-of-way limits in that order of availability.	
		Meters in landscaped or unimproved areas shall be set 2 inches above the finished grade.	
	Maximum Valve Spacing	Maximum 400-foot spacing and at the intersection of lateral lines in all zones.	City
	Hydrant Spacing	Single-Family Residential maximum 600-foot spacing.	City
		Industrial/Commercial/Multi-Family maximum 300-foot spacing.	
Fire Flow & Duration	Residential	Minimum 1,500 gpm at 2 hours.	City
	Multi-Family Residential	Minimum 2,500 gpm at 3 hours.	
	Commercial		
	Industrial		

3.4 Capacity Analysis

This section provides an analysis of legal and physical capacity of the water system based on the system's available water rights, sources, treatment, storage, and distribution components.

3.4.1 Water Rights

A summary of the City's current water rights is presented in **Table 3-18**. The maximum instantaneous allowable flow for each source (Qi) is in units of gpm. The total annual withdrawal for each source (Qa) is in units of acre-feet per year. The City does not have any interruptible water rights.

Table 3-18 | Summary of Existing Water Rights

Water Right	Primary Qi (gpm)	Primary Qa (acre-feet/year)
Coal Creek Springs	6,732	9,410
Well 1, 6, & 7	2,200	1,120
Well 2, 6, & 7	2,400	1,360
Well 3A & 3B, 6, & 7	2,800	3,600
Well 4, 6, and 7	2,800	3,600
Wells 5, 5A, 5B, &5C	1,000	720
Well 5A	167	0
Algona Well	500	175
Braunwood Well[1]	20	6.5
West Hill Springs[2]	625	1,010
TOTAL	**19,244**	**21,002**

Notes:

1. Water from the Braunwood well is administered through water right certificate G1-25173C, originally issued for a small domestic water system to serve up to 13 connections. Braunwood is a standalone non-municipal satellite water system that currently serves 12 connections.
2. Water from West Hill Springs operates through water right claim S1-049354CL. A claim is an assertion that a water right was created pre-code (1917 for surface water and 1945 for groundwater).

In addition to the water rights presented above, the City also has a wholesale agreement with the City of Tacoma and can purchase water through two interties as discussed in **Chapter 1, Section 1.6.1**. These two interties are also considered to be supply facilities. The City also has several emergency interties with adjacent purveyors.

3.4.1.1 Analysis Criteria

Supply facilities must be reliable and provide sufficient water at pressures that meet the requirements of WAC 246-290-230. The capacity of supply facilities in a pressure zone with adequate storage must be sufficient to provide water at a rate that is equal to or greater than the MDD of the zone being served. This approach assumes that demands greater than the MDD will be supplied using equalizing storage.

According to Section 3.10.5 and Section 5.4 of the 2020 DOH Water System Design Manual, water system sources must be capable of supplying MDD and replenishing depleted within 72-hours (assuming continuous pumping), provide MDD in a pumping period of 20 hours or less, and provide ADD with the largest source out of order. The City's standards have a more stringent requirement to provide MDD with the largest active source out of service.

3.4.1.2 Analysis Results

The City's water supply (production) capacity compared with demand projections and DOH and City criteria are summarized in **Table 3-19**. It is worth noting that the water supply (production) capacity is not synonymous with the supply water rights. The MDD and ADD values are based on the demand projections included in **Chapter 2** and include wholesale supply projections for the City of Algona. Demand allocation for the Muckleshoot Indian Tribe (MIT) Fish Hatchery and LMWD are not included. LMWD is not included since they do not rely on the City as their main source of water and have an interruptible wholesale agreement. Demand from the MIT Fish Hatchery is also not included since it is unknown when this facility will be constructed, however the analysis presented in **Table 3-19** shows that the City has sufficient surplus supply to support this demand when it comes to fruition. The FSS flow rate is calculated as the sum of the FSS for each service area presented in **Section 3.4.2.3.2**, which totals 797 gpm, divided over a 72-hour period.

The results presented in **Table 3-19** demonstrate that the City has the supply facilities necessary to meet demand projections under current and future projections for all required criteria.

Table 3-19 | Supply Analysis with Largest Source Out of Service

Description	2024 Scenario	2034 Scenario	2044 Scenario
Required Supply (gpm)			
FSS Replenished in 72-hours	797	797	797
Maximum Day Demand[1], gpm	8,657	9,751	11,068
Average Day Demand[1], gpm	4,899	5,518	6,263
Available Supply (gpm)			
Largest Source (Q_L) – Tacoma Interties	3,555	3,555	3,555
Largest Active Source – Coal Creek Springs[2]	3,500	3,500	3,500
Total Sources (Q_t)[3,4]	15,610	15,610	15,610
DOH Criteria: MDD while replenishing FSS within 72-hrs (24-hr source pumping may be assumed)			
Surplus / (Deficit) of Supply, gpm	6,156	5,062	3,746
DOH Criteria: ADD with largest source out of service			
Surplus / (Deficit) of Supply, gpm	7,156	6,537	5,792
DOH Criteria: MDD in a pumping period of 20 hours or less of pumping			
Surplus / (Deficit) of Supply, gpm	4,352	3,257	1,941
City Criteria: MDD with largest active water supply source out of service			
Surplus / (Deficit) of Supply, gpm[2]	3,453	2,359	1,042

Notes:

1. Current analysis does NOT include a separate allocation for wholesale customers who have not purchased water from the City since 2019 or earlier (i.e., MIT or LMWD).
2. The City's largest active source is Coal Creek Springs since the City has not purchased water from Tacoma since 2016.
3. Total sources are: Well 1, 2, 4, 5, 5a, and 6 (7,955 gpm), Coal Creek Springs (3,500 gpm), West Hill Springs (600 gpm), and two Tacoma Interties (3,555 gpm).
4. Supplies do NOT include emergency interties with CWD (1,736gpm) or LMWD (1,736 gpm).

The City's Water Rights Self-Assessment Form is provided in **Appendix I** and was used to assess the City's water rights water rights and includes supply that is available to the City through firm wholesale interties with Tacoma. The form includes a comparison of the available water rights to the existing, 10-year and 20-year demand projections for the "High Demand Scenario" presented in **Chapter 2**. The calculations presented in the Water Rights Self-Assessment Form conclude that the City's existing water rights are anticipated to be adequate to meet the current, 10-year, and 20-year demand projections.

The City does not have all the infrastructure required to withdraw from all water rights (i.e., Wells 3A, 3B, 5B, and 7 are not currently operational). Additionally, some sources have underlying aquifer or infrastructure restrictions that limit the capacity of the source (i.e., Well 2, Well 6, and Coal Creek Springs). Several facility improvement projects are necessary for the City to maximize water production capacity to meet future demands, and planned supply related capital projects to meet this need are discussed further in Chapter 8.

3.4.2 Physical Capacity Analysis

This section includes an analysis of the physical capacity of the City's distribution system. The specific components analyzed include:

- Pump Station Capacity Analysis
  - Open Pressure Zones: Zones with storage reservoirs
  - Closed Pressure Zones: Zones without storage
- Storage Capacity Analysis
- Hydraulic Analysis of the Distribution System
- System Analysis based on ERUs

To complete the physical capacity analysis, the projected demands calculated in Chapter 2 were utilized for the 2024 scenario (existing conditions), 2034 scenario (10-year projections) and 2044 scenario (20-year projections). When evaluating facilities under fire flow conditions, the largest fire flow demand was utilized in each Service Area. The fire flow required for single family residential customers is 1,500 gpm for two hours and all other customer types have a requirement of 2,500 gpm for two hours. There are select buildings throughout the system that require fire flow capacity in the water system that exceeds 2,500 gpm for two hours as determined by the Fire Marshal; these individual locations and their fire flow requirements are summarized in Table 3-20.

Table 3-20 | Buildings in Auburn with High Fire Flow Requirements

ID #	Location Description	Address	Service Area	Flow Required (gpm)
1	RPS Distribution Center	3702 C St. NE	Valley	4,000
2	Emerald Downs	2300 Emerald Downs Drive	Valley	3,000
3	Panattoni Warehouse	816 44th ST NW	Valley	4,000
4	Span Alaska Transportation Inc.	3815 W Valley Highway N	Valley	3,125
5	AMB Valley Distribution Center	2202 Perimeter Road SW	Valley	4,000
6	Grace Community Church	1106 12th Street SE	Valley	3,750
7	Riverside High School	501 Oravetz Road SE	Valley	3,000
8	Wesley Homes Senior Housing	10805 SE 320th Street	Lea Hill	4,000
9	Auburn Elementary School at Lakeland	1020 Evergreen Way SE	Lakeland	3,125
10	Academy Campus	5000 Auburn Way South	Academy	4,000
11	MIT Casino Expansion	2402 Auburn Way South	Academy	2,625

3.4.2.1 Pump Station Analysis: Open Pressure Zones

This section evaluates the pumping capacity of the water system on a zone-by-zone basis with consideration for pump stations between zones and supply wells pumping directly into the pressure zones

that contain a storage reservoir. All reduced pressure zones are included in the open zone analysis, as they are ultimately fed by gravity from a reservoir. Pressure zones that do not include a storage facility are analyzed as a closed zone.

3.4.2.1.1 Valley Service Area

The Valley Service Area is the largest service area in the water system and consists of two pressure zones: Valley 288 and Valley 242. The Valley 288 pressure zone is a transmission zone that does not directly serve any customers. Valley 242 is the largest pressure zone in the RWSA and is draws supply from the following facilities:

- Wells 2 and 6 via the Fulmer Field CCT Facility
- Coal Creek Springs and Well 1 via the Howard Road CCT Facility with transmission through Valley 288
- Well 4 with transmission through Valley 288
- West Hill Springs

Table 3-21 provides an overview of the total pump station capacity into the Valley Service Area compared with demand projections and DOH and City criteria. The results presented in **Table 3-21** demonstrate that the City has adequate pumping capacity within the open pressure zones of the Valley Service Area to meet current and future demand projections for all required criteria.

Table 3-21 | Pumps Station Capacity for Valley Service Area Open Pressure Zones

Description	Valley 2024 Scenario	Valley 2034 Scenario	Valley 2044 Scenario
Required Capacity (gpm)			
FSS Replenished in 72-hours	222	222	222
Maximum Day Demand, gpm	6,266	7,161	8,252
Average Day Demand, gpm	3,546	4,052	4,670
Available Capacity (gpm)			
Largest Pump (Q_L), gpm	2,800	2,800	2,800
Total Pumping Capacity (Q_t), gpm	19,400	19,400	19,400
DOH Criteria: Reliable Capacity (ADD + largest pump out of service)			
Surplus / (Deficit), gpm	15,854	15,348	14,730
DOH Criteria: Total Capacity (MDD + replenish FSS in 72-hours)			
Surplus / (Deficit), gpm	13,134	12,239	11,148
City Criteria: MDD + largest pump out of service			
Surplus / (Deficit), gpm	10,334	9,439	8,348

3.4.2.1.2 Lea Hill Service Area

Water supply for the Lea Hill Service Area is provided by the Lea Hill Pump Station and the Green River Pump Station. In 2014, the City added wholesale water supply from Tacoma through the 132nd Ave SW intertie, however the City has not purchased water for consumption from Tacoma since 2016. The intertie and pump stations feed the Lea Hill 563 pressure zone, which includes Reservoirs 4A and 4B. Therefore,

the Lea Hill and Green River Pump Stations were evaluated based on the open zone criteria. **Table 3-22** provides a summary of the pump station capacity into the Lea Hill Service Area compared with demand projections and DOH and City criteria. The results presented in **Table 3-22** demonstrate that the City has adequate pumping capacity within the open pressure zones of the Lea Hill Service Area to meet current and future demand projections for all required criteria.

Table 3-22 | Pump Station Capacity for Lea Hill Service Area Open Pressure Zones

Description	Lea Hill 2024 Scenario	Lea Hill 2034 Scenario	Lea Hill 2044 Scenario
Required Capacity (gpm)			
FSS Replenished in 72-hours	222	222	222
Maximum Day Demand, gpm	1,231	1,281	1,333
Average Day Demand, gpm	696	725	755
Available Capacity (gpm)			
Largest Pump (Q_L), gpm	1,166	1,166	1,166
Total Pumping Capacity (Q_t), gpm	6,664[1]	6,664[1]	6,664[1]
DOH Criteria: Reliable Capacity (ADD + largest pump out of service)			
Surplus / (Deficit), gpm	5,968	5,939	5,909
DOH Criteria: Total Capacity (MDD + replenish FSS in 72-hours)			
Surplus / (Deficit), gpm	5,433	5,383	5,331
City Criteria: MDD + largest pump out of service			
Surplus / (Deficit), gpm	4,267	4,217	4,165

Note:

1. The Green River Pump Station has a firm capacity of 3,498 gpm (largest pump out of service) and the Lea Hill Pump Station has a firm capacity of 1,200 gpm (largest pump out of service). The largest pump at Green River and Lea Hill PS have 1,166 gpm and 800 gpm capacity, respectively. Therefore, the firm and total pumping capacity of both pump stations is 4,698 gpm (two pumps out of service) and 6,664 gpm (all pumps in service), respectively.

3.4.2.1.3 Lakeland Service Area

The Lakeland Service Area is supplied from the Upland Well Field (Wells 5 and 5A) and by sources in the Valley Service Area using the Terrace View BPS. The Terrace View BPS supplies the Lakeland 630 pressure zone from the Valley Service Area, which is then distributed through the Service Area. Since the Lakeland 630 pressure zone contains two reservoirs (Reservoirs 5 and 6), the Terrace View BPS was evaluated based on the open zone criteria. **Table 3-23** provides a summary of the pump station capacity into the Lakeland Service Area compared with demand projections and DOH and City criteria. The results presented in **Table 3-23** demonstrate that the City has adequate pumping capacity within the open pressure zones of the Lakeland Service Area to meet current and future demand projections for all required criteria.

Table 3-23 | Pump Station Capacity for Lakeland Service Area Open Pressure Zones

Description	Lakeland 2024 Scenario	Lakeland 2034 Scenario	Lakeland 2044 Scenario
Required Capacity (gpm)			
FSS Replenished in 72-hours	130	130	130
Maximum Day Demand, gpm	629	719	823
Average Day Demand, gpm	356	407	466
Available Capacity (gpm)

Surplus / (Deficit), gpm	871	781	677
City Criteria: MDD + largest pump out of service			
Surplus / (Deficit), gpm	371	281	177

3.4.2.1.4 Academy Service Area

The Academy Service Area is supplied from the Valley Service Area using Academy Pump Station 3. The pump station operates based on levels in Reservoirs 8A and 8B located in the Academy 531 pressure zone. **Table 3-24** provides a summary of the pump station capacity into the Academy Service Area compared with demand projections and DOH and City criteria. The results presented in **Table 3-24** demonstrate that the City has adequate pumping capacity within the open pressure zones of the Academy Service Area to meet current and future demand projections for all required criteria.

Table 3-24 | Pump Station Capacity for Academy Service Area Open Pressure Zones

Description	Academy 2024 Scenario	Academy 2034 Scenario	Academy 2044 Scenario
Required Capacity (gpm)			
FSS Replenished in 72-hours	222	222	222
Maximum Day Demand, gpm	531	591	658
Average Day Demand, gpm	300	334	373
Available Capacity (gpm)

Total Pumping Capacity (Q_t), gpm	2,800	2,800	2,800
DOH Criteria: Reliable Capacity (ADD + largest pump out of service)			
Surplus / (Deficit), gpm	2,500	2,466	2,427
DOH Criteria: Total Capacity (MDD + replenish FSS in 72-hours)			
Surplus / (Deficit), gpm	2,269	2,209	2,142
City Criteria: MDD + largest pump out of service			
Surplus / (Deficit), gpm	1,569	1,509	1,442

3.4.2.2 Booster Pump Station Analysis: Closed Pressure Zones

The City operates a closed zone in each of its Service Areas. Closed zones do not have a storage reservoir directly serving the zone and are required to supply the peak hour demand (PHD) and fire flow via a BPS. The BPS serving each closed pressure zone was evaluated using the closed zone criteria as defined by DOH.

3.4.2.2.1 Lakeland Hills BPS

The Lakeland Service Area has two closed pressure zones served by the Lakeland Hills BPS: Lakeland 697 and Lakeland 670. **Table 3-25** provides a summary of the BPS capacity into the Lakeland closed pressure

zones compared with demand projections and DOH and City criteria. The results presented in **Table 3-25** demonstrate that the City has adequate pumping capacity within the closed pressure zones of the Lakeland Service Area to meet current and future demand projections for all required criteria.

Table 3-25 | BPS Capacity for Lakeland Service Area Closed Pressure Zones

Description	Lakeland 670 & 697 2024 Scenario	Lakeland 670 & 697 2034 Scenario	Lakeland 670 & 697 2044 Scenario
Required Capacity (gpm)			
Fire Flow Required, gpm	3,125	3,125	3,125
Maximum Day Demand, gpm	231	261	296
Peak Hour Demand, gpm	372	419	476
Available Capacity (gpm)			
Largest Pump (Q_L), gpm	3,125	3,125	3,125
Total Pumping Capacity (Q_t), gpm	7,330	7,330	7,330
DOH Criteria: Firm Capacity (no storage; PHD + largest pump out of service)			
Surplus / (Deficit), gpm	3,833	3,786	3,729
DOH Criteria: Reliable Capacity (no storage; MDD + FSS + largest pump out of service)			
Surplus / (Deficit), gpm	3,974	3,944	3,909
City Criteria: PHD+ FSS + largest pump out of service			
Surplus / (Deficit), gpm	708	661	604

3.4.2.2.2 Academy East BPS

The Academy Service Area has one closed zone served by the Academy East BPS: Academy 585. **Table 3-26** provides a summary of the BPS capacity into the Academy closed pressure zone compared with demand projections and DOH and City criteria. The results presented in **Table 3-26** demonstrate that the City has adequate pumping capacity within the closed pressure zones of the Academy Service Area to meet current and future demand projections for all required criteria.

Table 3-26 | BPS Capacity for Academy Service Area Closed Pressure Zone

Description	Academy 585 2024 Scenario	2 Academy 585 2034 Scenario	Academy 585 2044 Scenario
Required Capacity (gpm)			
Fire Flow Required, gpm	2,500	2,500	2,500
Maximum Day Demand, gpm	87	98	111
Peak Hour Demand, gpm	140	158	179
Available Capacity (gpm)			
Largest Pump (Q_L), gpm	1,250	1,250	1,250
Total Pumping Capacity (Q_t), gpm	4,290	4,290	4,290
DOH Criteria: Firm Capacity (no storage; PHD + largest pump out of service)			
Surplus / (Deficit) of Supply, gpm	2,900	2,882	2,861
DOH Criteria: Reliable Capacity (no storage; MDD + FSS + largest pump out of service)			
Surplus / (Deficit), gpm	1,703	1,692	1,679
City Criteria: PHD+ FSS + largest pump out of service			

Surplus / (Deficit), gpm	400	382	361

3.4.2.2.3 Lea Hill BPS

The Lea Hill Service Area has one closed zone served by the Lea Hill BPS: Lea Hill 648. **Table 3-27** provides a summary of the BPS capacity into the Lea Hill closed pressure zone compared with demand projections and DOH and City criteria. The results presented in **Table 3-27** indicate that the Lea Hill BPS is currently deficient and cannot meet the required criteria for existing or future demands.

Table 3-27 | BPS Capacity for Lea Hill Service Area Closed Pressure Zone

Description	Lea Hill 648 2024 Scenario	Lea Hill 648 2034 Scenario	Lea Hill 648 2044 Scenario
Required Capacity (gpm)			
Fire Flow Required, gpm	2,500	2,500	2,500
Maximum Day Demand, gpm	110	124	141
Peak Hour Demand, gpm	178	200	227
Available Capacity (gpm)			
Largest Pump (Q_L), gpm	1,500	1,500	1,500
Total Pumping Capacity (Q_t), gpm	1,800	1,800	1,800
DOH Criteria: Firm Capacity (no storage; PHD + largest pump out of service)			
Surplus / (Deficit), gpm	122	100	73
DOH Criteria: Reliable Capacity (no storage; MDD + FSS + largest pump out of service)			
Surplus / (Deficit), gpm	(810)	(824)	(841)
City Criteria: PHD+ FSS + largest pump out of service			
Surplus / (Deficit), gpm	(2,378)	(2,400)	(2,427)

The Intertie Pump Station shares a building with the Lea Hill BPS and contains pumps which were originally purposed to serve the intertie for wholesale supply to CWD and LMWD. Since CWD and LMWD no longer rely on the City as their primary water source, the City plans to complete facility modifications so the pumps at the Intertie Pump Station can serve the Lea Hill 648 pressure zone. This project is discussed further in **Chapter 8** and will resolve the deficiencies identified in **Table 3-27**.

3.4.2.2.4 Game Farm Park Pump Station

The Valley Service Area has one closed zone served by the Game Farm Park Pump Station: Game Farm Park (no assigned pressure zone name). **Table 3-28** provides a summary of the BPS capacity into the Valley closed pressure zone compared with demand projections and DOH and City criteria. The results presented in **Table 3-28** indicate that the Game Farm Park Pump Station is currently deficient and cannot meet the required criteria for existing or future demands.

The Game Farm Park Pump Station provides service to a park restroom facility, two fire hydrants, and individual RV campsites. As this is a small BPS with the single purpose of providing service to a recreational area, and there are no residential or commercial property connections supplied by this facility, no actions are planned to resolve this deficiency. The DOH and City criteria are geared towards providing reliable service for residents and businesses and are not applicable for this minor facility. The City has reviewed this condition with the Fire Marshal, and no exceptions were taken. As further development progresses in and around the Game Farm Park Pump Station, modifications will be considered to address the deficiency.

Table 3-28 | BPS Capacity for Game Farm Park Closed Pressure Zone

Description	2024 Game Farm	2034 Game Farm	2044 Game Farm
Required Capacity (gpm)			
Fire Flow Required, gpm	1,500	1,500	1,500
Maximum Day Demand, gpm	0.4	0.4	0.4

City Criteria: PHD+ FSS + largest pump out of service			
Surplus / (Deficit), gpm	(1,451)	(1,451)	(1,451)

3.4.2.3 Storage Analysis

This section evaluates the City's existing water storage facilities to determine if there is sufficient capacity to meet existing and future storage requirements of the system.

3.4.2.3.1 Components of Storage

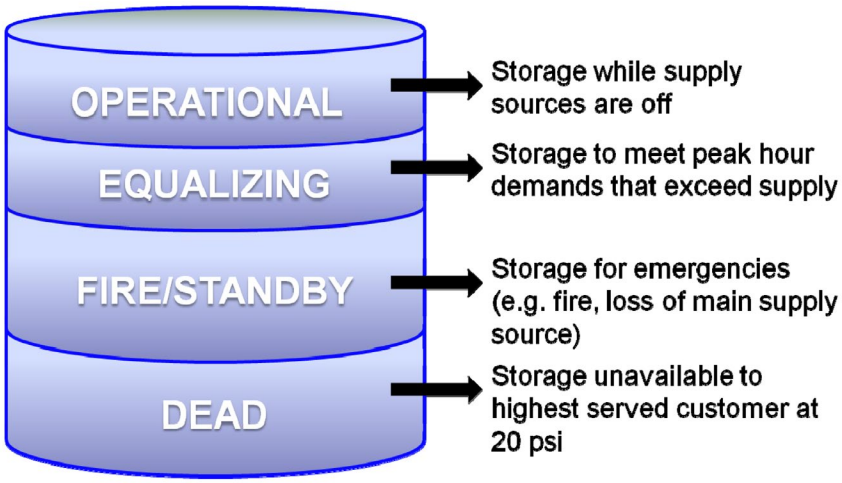
The City currently maintains a total of 15.7 MG of water storage in eight reservoirs located throughout the service area. Each Service Area has two reservoirs, providing redundancy for cleaning and maintenance. Historically, the City has evaluated each Service Area independently. However, new sources, pump stations, and PRV facilities now allow for reliable and redundant operation of the system as an interconnected whole, rather than as separate Service Areas. The storage analysis reflects the new operational ability by allowing sharing of emergency storage between the Service Areas. The existing infrastructure and customer expectations still require that other storage components, such as FSS, be stored in individual Service Areas.

Water storage requirements are typically defined by the following components: operational storage, equalizing storage, standby storage, fire suppression storage, and dead storage. A description of each storage component and the criteria used to evaluate the capacity of the City's reservoirs is as follows:

- Operational Storage: Operational storage is used to supply the water system under normal demand conditions and provides pump protection to avoid frequent starting and stopping of pumps for pump stations that are used to fill reservoirs. The operational storage is calculated per the DOH Design Manual as the pump supply firm capacity (in gpm) times 2.5-minutes.

- Equalizing Storage: When the source pumping capacity cannot meet the periodic daily (or longer) peak demands placed on the water system, equalizing storage must be provided as a part of the total storage for the system and must be available at 30 psi to all service connections. The criteria for determining the equalizing storage requirements for the City's system is based on the equalizing calculation in the DOH Design Manual (refer to equation 7-1).

- Standby Storage: Standby storage is the portion of the reservoir used to supply the water system when supply facilities are out of service. DOH allows water systems with multiple sources to require that standby volume be supplied with the largest supply source out of service but recommends a



minimum standby storage of 200 gallons per ERU in the system. The City calculates standby storage as the maximum volume required to supply all ERUs at least 240 gallons (based on the DOH minimum times a 20 percent factor of safety).

- Fire Suppression Storage (FSS): FSS is the portion of the reservoir with sufficient volume to supply water to the system at the maximum rate and duration required to extinguish a fire at the building with the highest fire flow requirement. The required volume of the FSS is the product of the fire flow rate and duration of the system's maximum fire flow requirement.

- Dead Storage: Dead storage is the bottom portion of the reservoir that cannot be used because water is stored at an elevation that is too low to provide sufficient system pressure (below 20 psi at the highest elevation served by the reservoir). This unusable storage occupies the lower portion of many ground-level standpipe-type reservoirs. When the highest service elevation is not the limiting factor, the City defines dead storage as being 1-foot above the reservoir inlet elevation for operational reasons.

The City's reservoir storage requirements depend on the water system's configuration, seasonal and daily variation in water-use patterns, and the reliability of various water system components. This section describes the five components of storage, summarizes the existing system's capacity to meet the storage needs of each Service Area, and makes recommendations to address identified storage deficits.

Figure 3-7 | Illustration of Reservoir Storage Components

3.4.2.3.2 Storage Analysis Results

The storage available in the four Service Areas was evaluated to confirm each is provided with the required usable Operational, Equalizing, Fire Suppression, and Emergency Storage volumes. Reflecting the interconnectedness of the system, excess storage in higher Service Areas (i.e., Lea Hill, Lakeland and Academy) can be used in the Valley Service Area and vice versa through use of the system pump stations. The storage analysis compares the required storage, based on the criteria in Table 3-17, and the available storage. The FSS for each region was calculated using 4,000 gpm for four hours except for Lakeland, which used 3,125 gpm for three hours based on buildings with the highest fire flow requirement in each Service Area (see Table 3-20).

Table 3-29 summarizes the existing 2024 storage analysis and results. The results indicate a deficit in the Lea Hill Service Area, however, this deficit is offset by surplus storage available in other Service Areas.

Table 3-29 | System-Wide Storage Analysis for the 2024 Scenario

Description	RWSA 2024	Academy 2024	Lakeland 2024	Lea Hill 2024	Valley 2024
Usable Storage (MG)					
Maximum Storage Capacity	15.86	2.72	2.06	2.48	8.60
Algona Reserve Storage Capacity[1]	0.28	--	0.28	--	--
Dead Storage	1.50	0.06	0.44	0.36	0.64
Total Usable Storage	14.08	2.66	1.34	2.12	7.96
Required Storage (MG)					
Operational Storage	0.05	0.01	0.00	0.01	0.03
Equalizing Storage	0.00	0.00	0.00	0.00	0.00
Standby Storage (Emergency)	9.30	0.57	0.68	1.32	6.73
FSS (Emergency)	3.44	0.96	0.56	0.96	0.96
Total Required Storage	12.79	1.54	1.24	2.29	7.72
Surplus/ (Deficit) Storage	**1.29**	**1.12**	**0.10**	**(0.17)**	**0.24**

Note:

1. The water supply interlocal agreement (IA3) between the City of Algona and the City of Auburn was updated in 2016. Through this updated agreement, Algona elected to financially participate in Lakeland Reservoir 6 to obtain a total share of 280,000-gallons of storage capacity. The agreement stipulates that if the City experiences any failure or decreased capacity, the supply of water to Algona may be decreased by the same percentage that is experienced by the City.

Table 3-30 summarizes the 2034 storage analysis and results (10-year projections). The results indicate a deficit in the Lea Hill, Lakeland, and Valley Service Areas, however, this deficit is offset by surplus storage available in other Service Areas. Additionally, the deficit in the Lakeland Service Area may not be realized based on the City's terms and conditions of the IA3 agreement with Algona.

Table 3-30 | System-Wide Storage Analysis for the 2034 Scenario

Description	RWSA 2034	Academy 2034	Lakeland 2034	Lea Hill 2034	Valley 2034
Usable Storage (MG)					
Maximum Storage Capacity	15.86	2.72	2.06	2.48	8.60
Algona Reserve Storage Capacity[1]	0.28	--	0.28	--	--
Dead Storage	1.50	0.06	0.44	0.36	0.64
Total Usable Storage	14.08	2.66	1.34	2.12	7.96
Required Storage (MG)					
Operational Storage	0.05	0.01	0.00	0.01	0.03
Equalizing Storage	0.02	0.00	0.02	0.00	0.00
Standby Storage (Emergency)	10.47	0.63	0.77	1.38	7.69
FSS (Emergency)	3.44	0.96	0.56	0.96	0.96
Total Required Storage	13.98	1.60	1.36	2.34	8.68
Surplus/ (Deficit) Storage	**0.10**	**1.06**	**(0.02)**	**(0.22)**	**(0.72)**

Note:

1. The water supply interlocal agreement (IA3) between the City of Algona and the City of Auburn was updated in 2016. Through this updated agreement, Algona elected to financially participate in Lakeland Reservoir 6 to obtain a total share of 280,000-gallons of storage capacity. The agreement stipulates that if the City experiences any failure or decreased capacity, the supply of water to Algona may be decreased by the same percentage that is experienced by the City.

The 2044 storage analysis was performed to determine the ability of the proposed storage facilities to meet the future storage requirements in 2044, based on projected demands. The analysis results indicate that the existing storage facilities do not have sufficient capacity to meet the future demands of the system

based on the demand projections presented in Chapter 2. The City is currently planning a new reservoir in the Valley Service area to address these future deficiencies in the 20-year time frame. Table 3-31 summarizes the buildout 2044 storage analysis.

Table 3-31 summarizes the 2044 storage analysis and results (20-year projections). The results indicate an overall deficit in the RWSA, spurred largely by the projected growth within the Valley Service Area in the 20-year horizon.

Table 3-31 | System-Wide Storage Analysis for the 2044 Scenario

Description	RWSA 2044	Academy 2044	Lakeland 2044	Lea Hill 2044	Valley 2044
Usable Storage (MG)					
Maximum Storage Capacity	15.86	2.72	2.06	2.48	8.60
Algona Reserve Storage Capacity[1]	0.28	--	0.28	--	--
Dead Storage	1.50	0.06	0.44	0.36	0.64
Total Usable Storage	14.08	2.66	1.34	2.12	7.96
Required Storage (MG)					
Operational Storage	0.05	0.01	0.00	0.01	0.03
Equalizing Storage	0.05	0.00	0.05	0.00	0.00
Standby Storage (Emergency)	11.88	0.71	0.88	1.43	8.86
FSS Storage (Emergency)	3.44	0.96	0.56	0.96	0.96
Total Required Storage	15.42	1.68	1.49	2.40	9.86
Surplus/ (Deficit) Storage	**(1.34)**	**0.98**	**(0.15)**	**(0.28)**	**(1.89)**

Note:

1. The water supply interlocal agreement (IA3) between the City of Algona and the City of Auburn was updated in 2016. Through this updated agreement, Algona elected to financially participate in Lakeland Reservoir 6 to obtain a total share of 280,000-gallons of storage capacity. The agreement stipulates that if the City experiences any failure or decreased capacity, the supply of water to Algona may be decreased by the same percentage that is experienced by the City.

Since most of the future storage deficiency is in the Valley Service Area, a new storage reservoir is planned in the northeastern portion of the Service Area (Valley 242 pressure zone). The reservoir is a planned capital project to be completed in the 20-year horizon and is discussed further in Chapter 8.

The Lea Hill PS has sufficient capacity to transfer standby storage from Valley to Lea Hill. In addition, there are multiple PRVs which can be used to transfer water from the Academy and Lakeland Service Areas back to Valley to utilize excess standby storage in those areas. No other projects are necessary to resolve this deficiency.

3.4.2.4 Distribution and Transmission Capacity Analysis

This section evaluates the City's existing distribution and transmission mains to determine if the water pipelines are sized and looped adequately to provide the required flow and pressures to meet existing and future system conditions. The evaluation used an updated version of the City's computerized hydraulic water system model and InfoWater Pro, a GIS-based modeling software developed by Autodesk (formerly Innovyze). The model was updated to accurately reflect the City's existing water system and verified against field hydrant test data. Results from the model were used to evaluate the existing system and identify deficiencies.

3.4.2.4.1 Model Update

The following updates were made to the City's hydraulic model prior to conducting the capacity analyses:

- Facility updates
- Pipeline network updates
- Elevation updates
- Demand updates

Each update is described in further detail below.

Facility Updates

Existing facilities within the hydraulic model were reviewed and updated based on information provided by the City. The facilities reviewed included groundwater wells, springs, interties with adjacent water systems, potable water reservoirs, pump stations, treatment facilities, flow control valves, and PRVs. The following documents were used to confirm the accuracy of the facility information within the hydraulic model:

- Interlocal agreements
- Record drawings
- PRV calibration records
- Pump curves
- SCADA data
- Operations and maintenance data

Pipeline Network Updates

The existing pipeline network within the hydraulic model was compared to the City's existing GIS data to locate areas where pipelines may have been missing in the model. In addition, the pipeline material type was added to the model to match data available from GIS to more accurately reflect the existing distribution system.

Elevation Updates

Node elevations within the model were updated using United States Geological Survey (USGS) Digital Elevation Model (DEM). The DEM is a tile of the 3-Dimenional Elevation Program (3DEP) with data that is updated regularly and distributed in geographic coordinates in units conforming with the North American Datum of 1983 (NAD 83). All elevation values are in meters and, over the contiguous United States, are referenced to the North American Vertical Datum of 1988 (NAVD 88). The assigned elevations were converted to feet when applied to the model.

In addition to the general elevation update of the model nodes, the record drawings of the water reservoirs were used to verify the bottom and overflow elevations of the reservoirs within the model. Where necessary based on date, the as-built elevations were corrected to NAVD88 values, as some of the reservoirs were constructed using National Geodetic Vertical Datum of 1929 (NGVD 29). A conversion of 3.51 feet was used to update elevations from NGVD 29 to NAVD 88.

Demand Updates

Demands in the model were updated using the City's customer billing database. The meters were geolocated based on the customer's address and assigned to the closest model junction. No demands were allocated to transmission pipelines or facility nodes (i.e., pump station, reservoirs, etc.). Approximately 10 percent of the demand was unable to be allocated using this method. The remaining demand and non-

billed usage, like DSL and construction meters, was distributed uniformly throughout the model by applying a scaling factor to match the 2022 production data. The demand sets in the model sought to distribute the demand projections provided in Chapter 2. A scaling factor was then applied to all demand nodes to equal the demand projection in years 2024.

As discussed in Chapter 2, TAZ data was used to determine growth projections and the future water demand. Based on the TAZ data, each Service Area was split between focused growth areas and non-growth areas. Future demands were allocated equally across all current demand nodes within the focused growth and non-growth areas of each Service Area. Demand peaking factors from Chapter 2 were used to adjust demands to MDD for the fire flow analyses and PHD for the pressure analysis.

3.4.2.4.2 Model Calibration

To verify and calibrate the hydraulic model, the City collected field hydrant testing data. A map of the hydrant testing locations and testing plan is included in Appendix K. The City also collected static pressure at the test locations to verify the hydraulic grade line (HGL) of specific areas of the water system.

In addition to the hydrant tests results, the boundary conditions of the water system facilities at the time of each test were provided. The boundary conditions were used to calculate the demand observed during each test. The boundary conditions were also entered into the model for each hydrant test to accurately simulate the system conditions during the hydrant test. At most locations, hydrants were operated to stress the system to identify required changes to the boundary conditions and pipe roughness factors (C-factors) within the hydraulic model.

A fire flow calibration scenario was set up within the hydraulic model and each of the hydrant test locations was simulated. Appendix K provides the field flow data compared to the flow data input into the model and a comparison of the static pressures and pressure drops observed at each hydrant test. Table 3-32 summarizes the final Hazen Williams C-factors used during the calibration based on piping material.

Table 3-32 | Final C-Factors for Piping Materials

Material	C-Factor
Cast Iron	90-120
Concrete	120
Ductile Iron	120
HDPE	130
PVC	130
RCP	120
Steel	120
Unknown	115

Valley Service Area

A total of 16 hydrant tests were conducted in the Valley Service Area, however the results from one test were excluded as the static pressure was not recorded. The static pressure and pressure drop in the calibrated model is now within 5 psi, or less, of the observed data for each of the hydrant tests.

Lea Hill Service Area

A total of nine hydrant tests were conducted in the Lea Hill Service Area. The static pressure and pressure drop in the calibrated model is now within 5 psi, or less, of the observed data for each of the hydrant tests.

The HGL from the hydrant testing was higher than the reported HGL in the hydraulic model for the Lea Hill 462 pressure zone. The PRV setpoints were referenced to confirm the higher HGL observed during the hydrant testing. As such, the naming for the pressure zone was updated to Lea Hill 480. The update and supporting calculations are included in Appendix K.

Academy Service Area

A total of five hydrant tests were conducted in the Academy Service Area. The static pressure and pressure drop in the calibrated model is now within 5 psi, or less, of the observed data for each of the hydrant tests.

The HGL from the hydrant testing was higher than the reported HGL in the hydraulic model for the Academy 350 and Academy 445 pressure zones. The PRV setpoints were referenced to confirm the higher HGL observed during the hydrant testing. As such, the naming for each pressure zone was updated to Academy 400 and Academy 470 respectively. The updates and supporting calculations are included in Appendix K.

Lakeland Service Area

A total of ten hydrant tests were conducted in the Lakeland Service Area, however the results from one test were excluded as the recorded static pressure was determined to be incorrect. The static pressure and pressure drop in the calibrated model is now within 5 psi, or less, of the observed data for each of the hydrant tests.

The HGL from the hydrant testing varied from the reported HGL in the hydraulic model for the Lakeland 440, Lakeland 441, Lakeland 446, and Lakeland 485 pressure zones. The PRV setpoints were referenced to confirm the HGLs observed during the hydrant tests. As such, the naming for each pressure zone was updated as follows:

- Lakeland 440 pressure zone was split into two pressure zones: Lakeland 450 and Lakeland 405.
- Lakeland 441 pressure zone was updated to Lakeland 385
- Lakeland 446 pressure zone was updated to Lakeland 415
- Lakeland 485 pressure zone was updated to Lakeland 455.

The hydrant test for Lakeland 575 was not simulated in the model as observed in the field since a static pressure of 101 psi was recorded during the hydrant test. According to the PRV setpoints, the HGL on the test date was anticipated to be an error. The City re-checked the hydrant on February 8, 2024, and a static pressure of 69 psi was recorded. It was concluded that the original hydrant test data was inaccurate, and the test was voided. The Lakeland 575 pressure zone was updated to Lakeland 560 instead based on the PRV setpoints and static pressure reading completed in February 2024. The updates and supporting calculations are included in Appendix K.

3.4.2.4.3 Hydraulic Analysis

PHD Analysis

During PHD conditions, the water system must maintain a minimum pressure of 30 psi at all service nodes, a maximum velocity of 8 fps in wall water mains, and a maximum velocity of 5 fps in all transmission mains in accordance with DOH and City standards. The hydraulic model was set up to evaluate pressures and velocities throughout the system under PHD conditions for the 2024 (existing conditions), 2034 (10-year), and 2044 (20-year) scenarios. The results of this analysis are shown in Figure 3-8, Figure 3-9, and Figure 3-10 respectively. The results of this analysis indicate that all areas of the water system meet these requirements under existing and future conditions.

Figure 3-8 | 2024 PHD Scenario – Pressure and Velocity

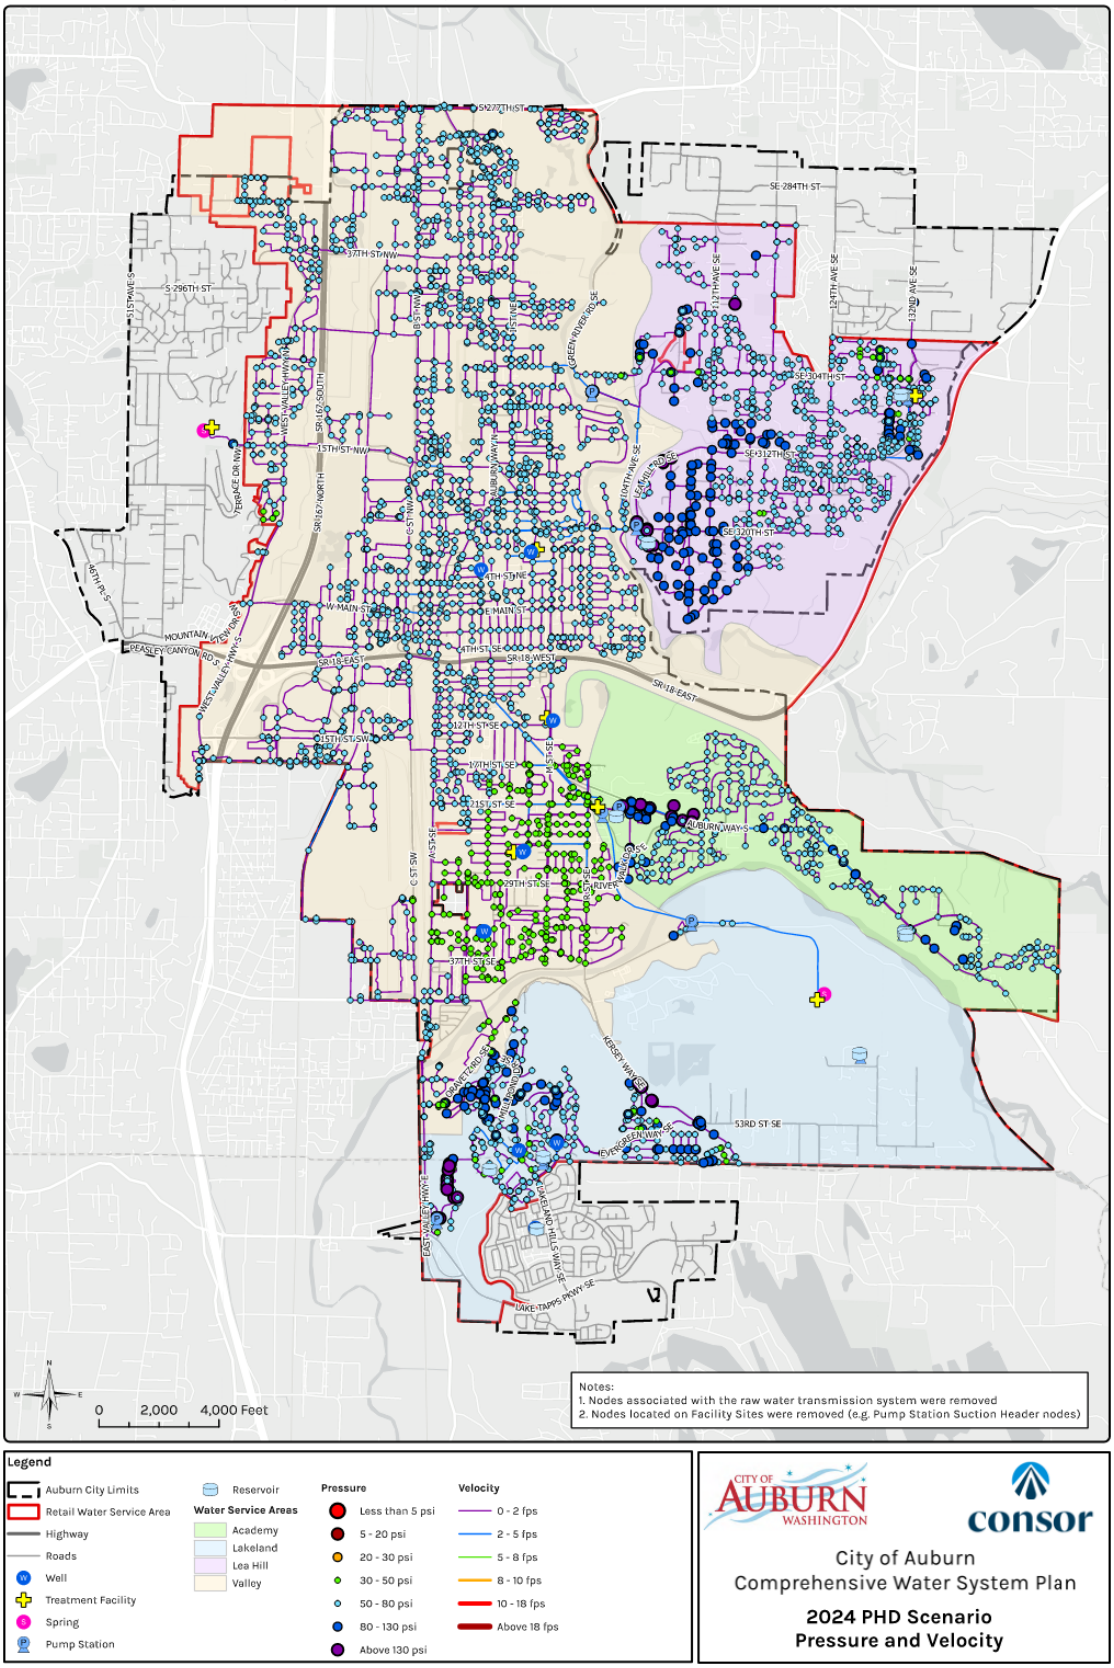


Figure 3-9 | 2034 PHD Scenario – Pressure and Velocity

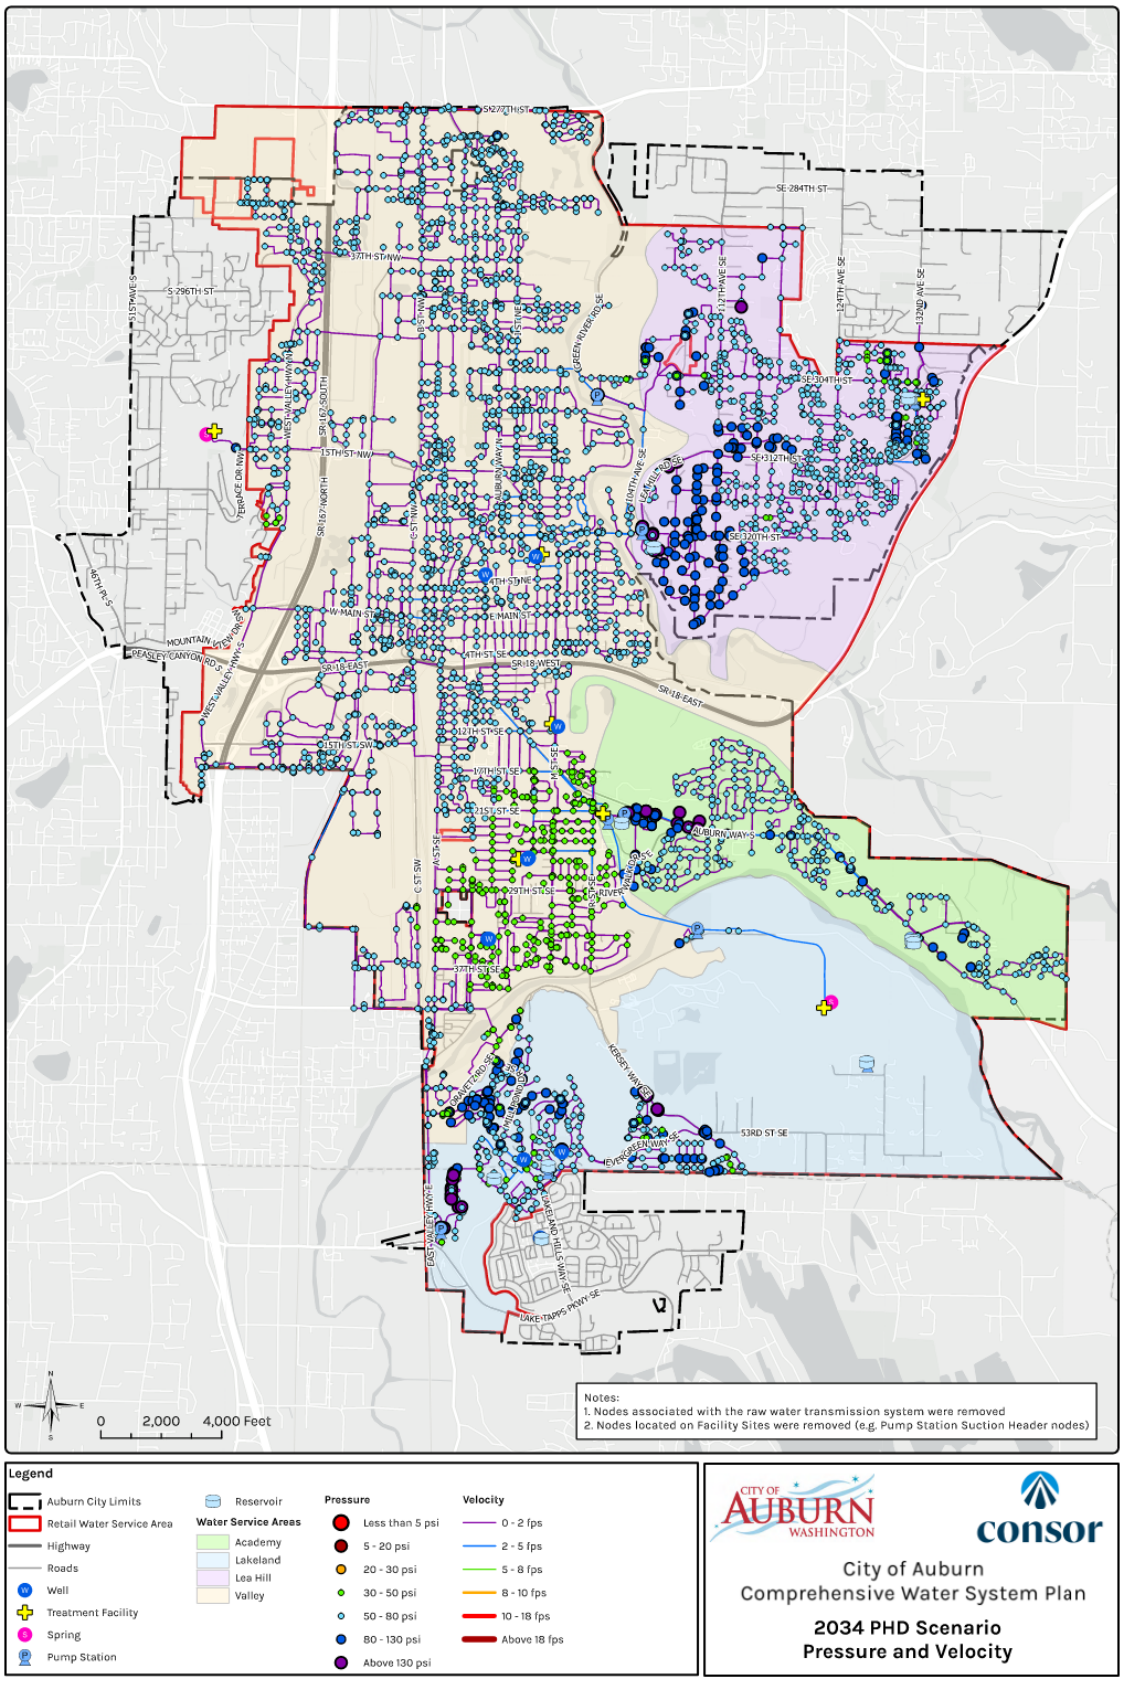

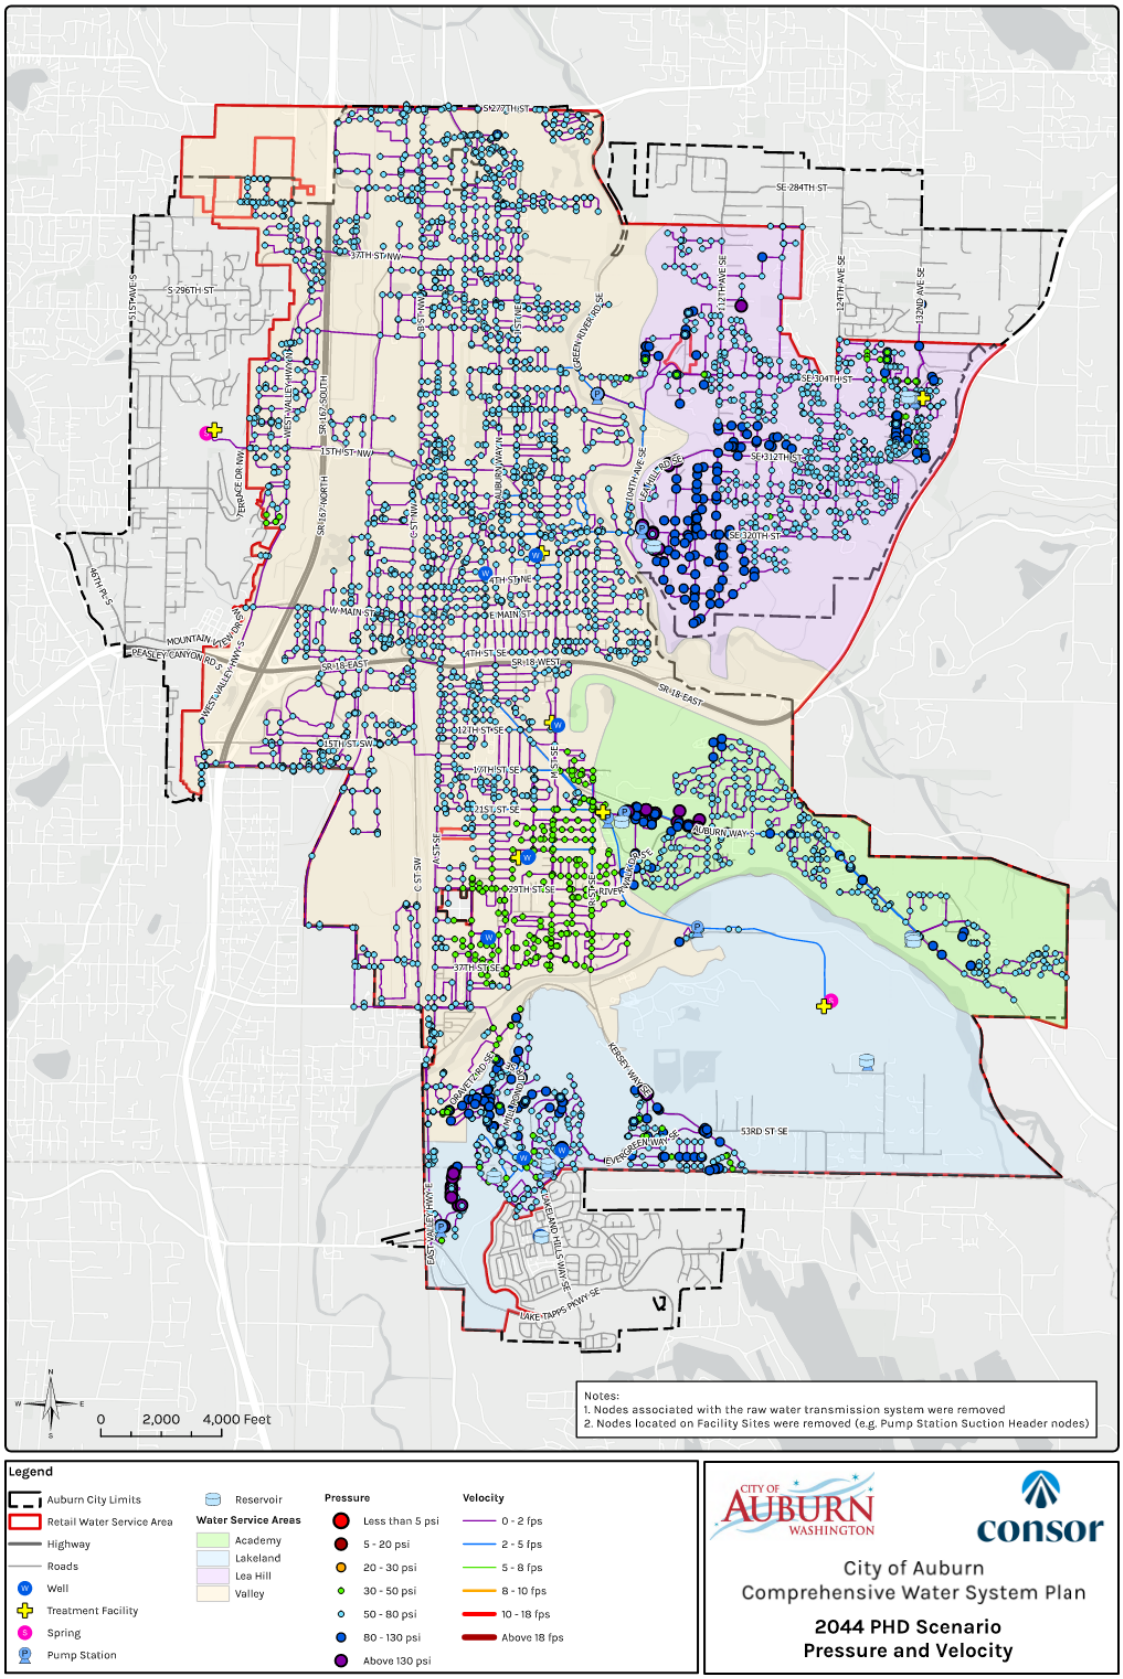

Figure 3-10 | 2044 PHD Scenario – Pressure and Velocity

Fire Flow Analysis

The fire flow analysis assesses each hydrant node in the hydraulic model to determine the available fire flow while maintaining a minimum residual pressure of 20 psi throughout the respective pressure zone. To complete the analysis, the water elevation in each reservoir was set to top of dead storage (below operational, equalizing and standby storage) per DOH recommendations. In addition, the system demands were set to MDD for each scenario (2024, 2034 and 2044). For each node, the modeled available fire flow was compared to its target fire flow requirement as follows:

- Single Family Residential Meters: 1,500 gpm of fire flow required.
- All Other Meters (i.e., multi-family, commercial, etc.): 2,500 gpm of fire flow required.
- Specific Buildings with Higher Fire Flow Requirements: Assessed individually per **Table 3-20**.

Fire flow requirements were assigned to the model nodes based on account classifications of the assigned water meters. Where multiple meters with different account classifications were assigned to the same node, the highest fire flow requirement was assigned to the node. The hydrant locations provided in the City's GIS system do not correspond to the exact location of the hydrant node in the model. Therefore, the nodes that were predicted to have fire flow below what is required were checked based on their proximity to the nearest hydrant to verify whether the appropriate hydrant could provide the required fire. As shown in **Figure 3-11** the results of this analysis indicated that multiple areas of the system under current and future demand conditions have fire flow deficiencies. A summary of the proposed pipeline improvements to resolve the deficiencies is shown in **Figure 3-12** and summarized in **Table 3-33**. **Figure 3-12** also includes on-going projects currently being completed by the City or developers.

Valley Service Area

Multiple deficiencies are identified in the Valley Service Area. The highest priority project assists with raising the HGL of the highest critical node on the west side of the RWSA. This project will increase the available fire flow at most of the western failure locations. The remaining improvements assist with specific failure locations by upsizing water mains experiencing significant headloss.

Additionally, a new PRV facility is proposed to rezone a portion of the Valley 242 pressure zone to the Academy 350 pressure zone to resolve deficiencies in the area. This PRV facility will also allow storage transfer from the Academy Service Area where this is surplus storage to the Valley Service Area to resolve the 2034 storage deficit projections. This project is discussed further in **Chapter 8**.

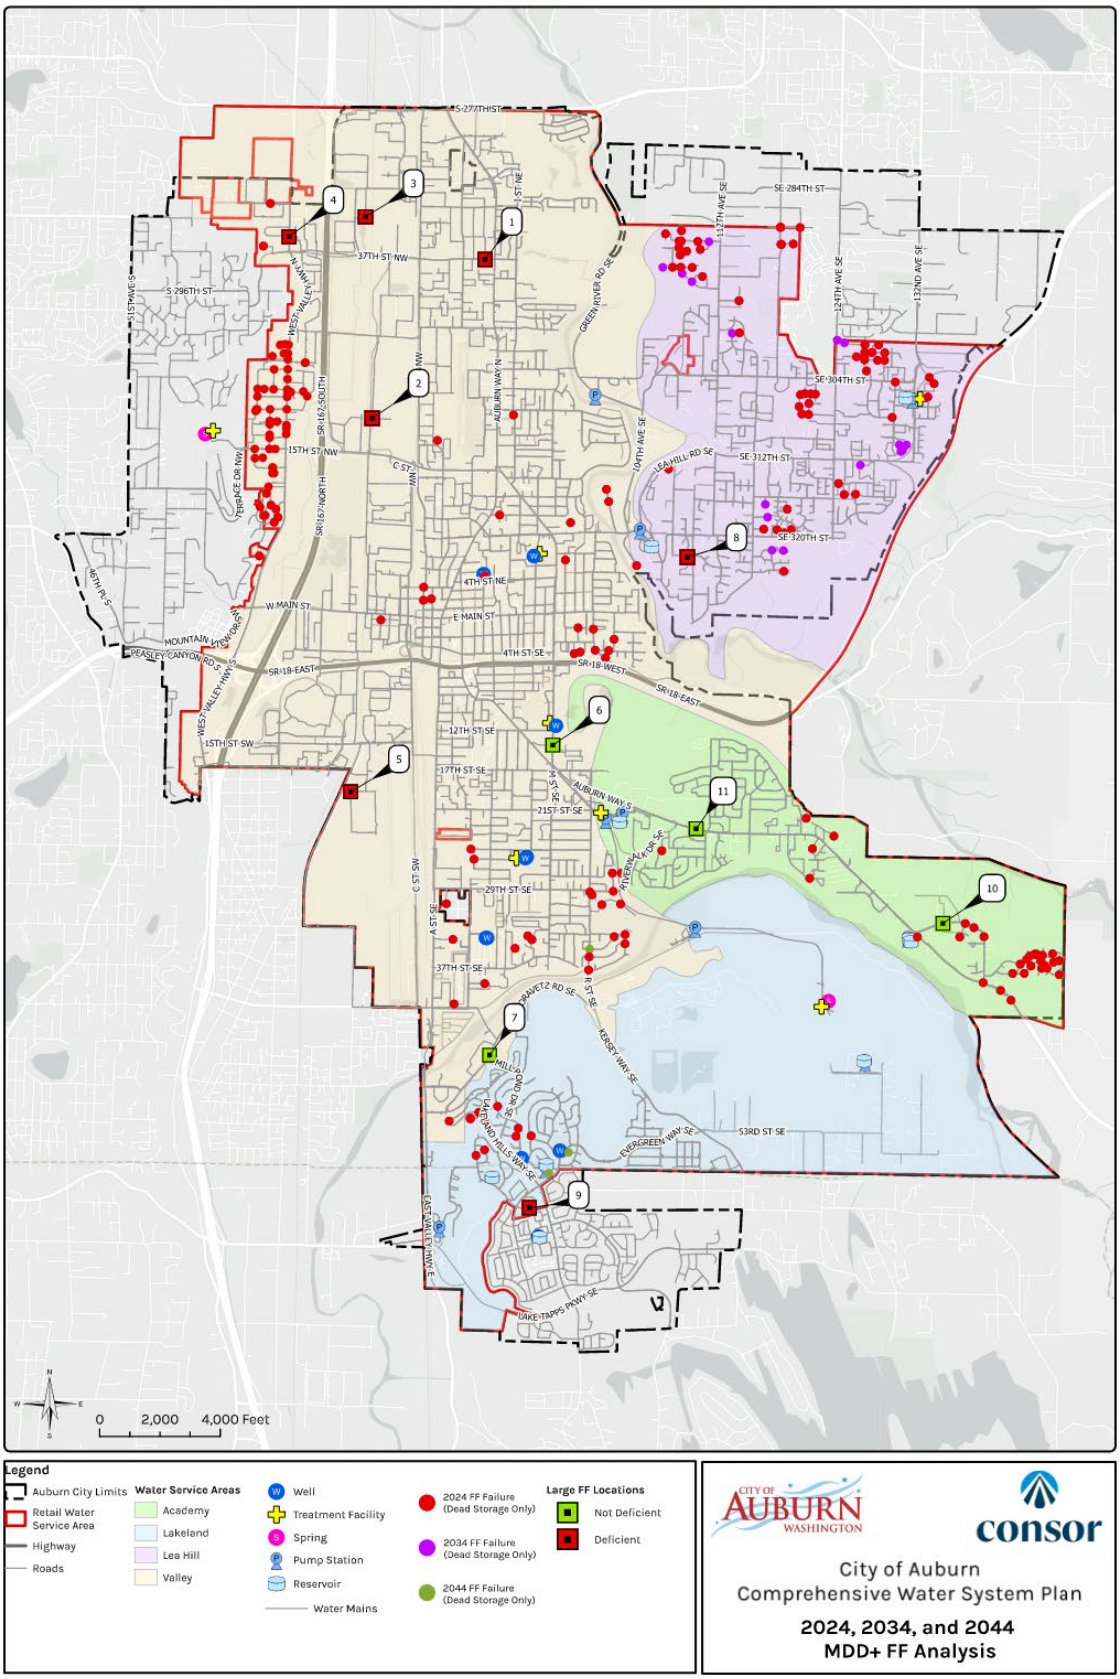
Lakeland Service Area

There were no failure locations identified within the Lakeland Service Area for the existing and future demand conditions.

Lea Hill Service Area

Multiple deficiencies are identified in the Lea Hill Service Area. The highest priority project in this area is to rezone a portion of Lea Hill 563 pressure zone to the Lea Hill 648 pressure zone. In addition, deficiencies were noted in the northern part of Lea Hill 563, in the vicinity of 112th Avenue, 290th Street, 295th Street, and 293rd Street. These pipelines were replaced recently and provide an available fire flow of approximately 1,350 gpm after the rezoning of the Lea Hill 563 pressure zone is completed. Therefore, a project was not proposed in this area and was confirmed with the Fire Marshal. The remaining improvements assist with specific failure locations by upsizing water mains experiencing significant headloss.

Figure 3-11 | MDD+FF Deficiency Locations for 2024, 2034 and 2044 Scenarios



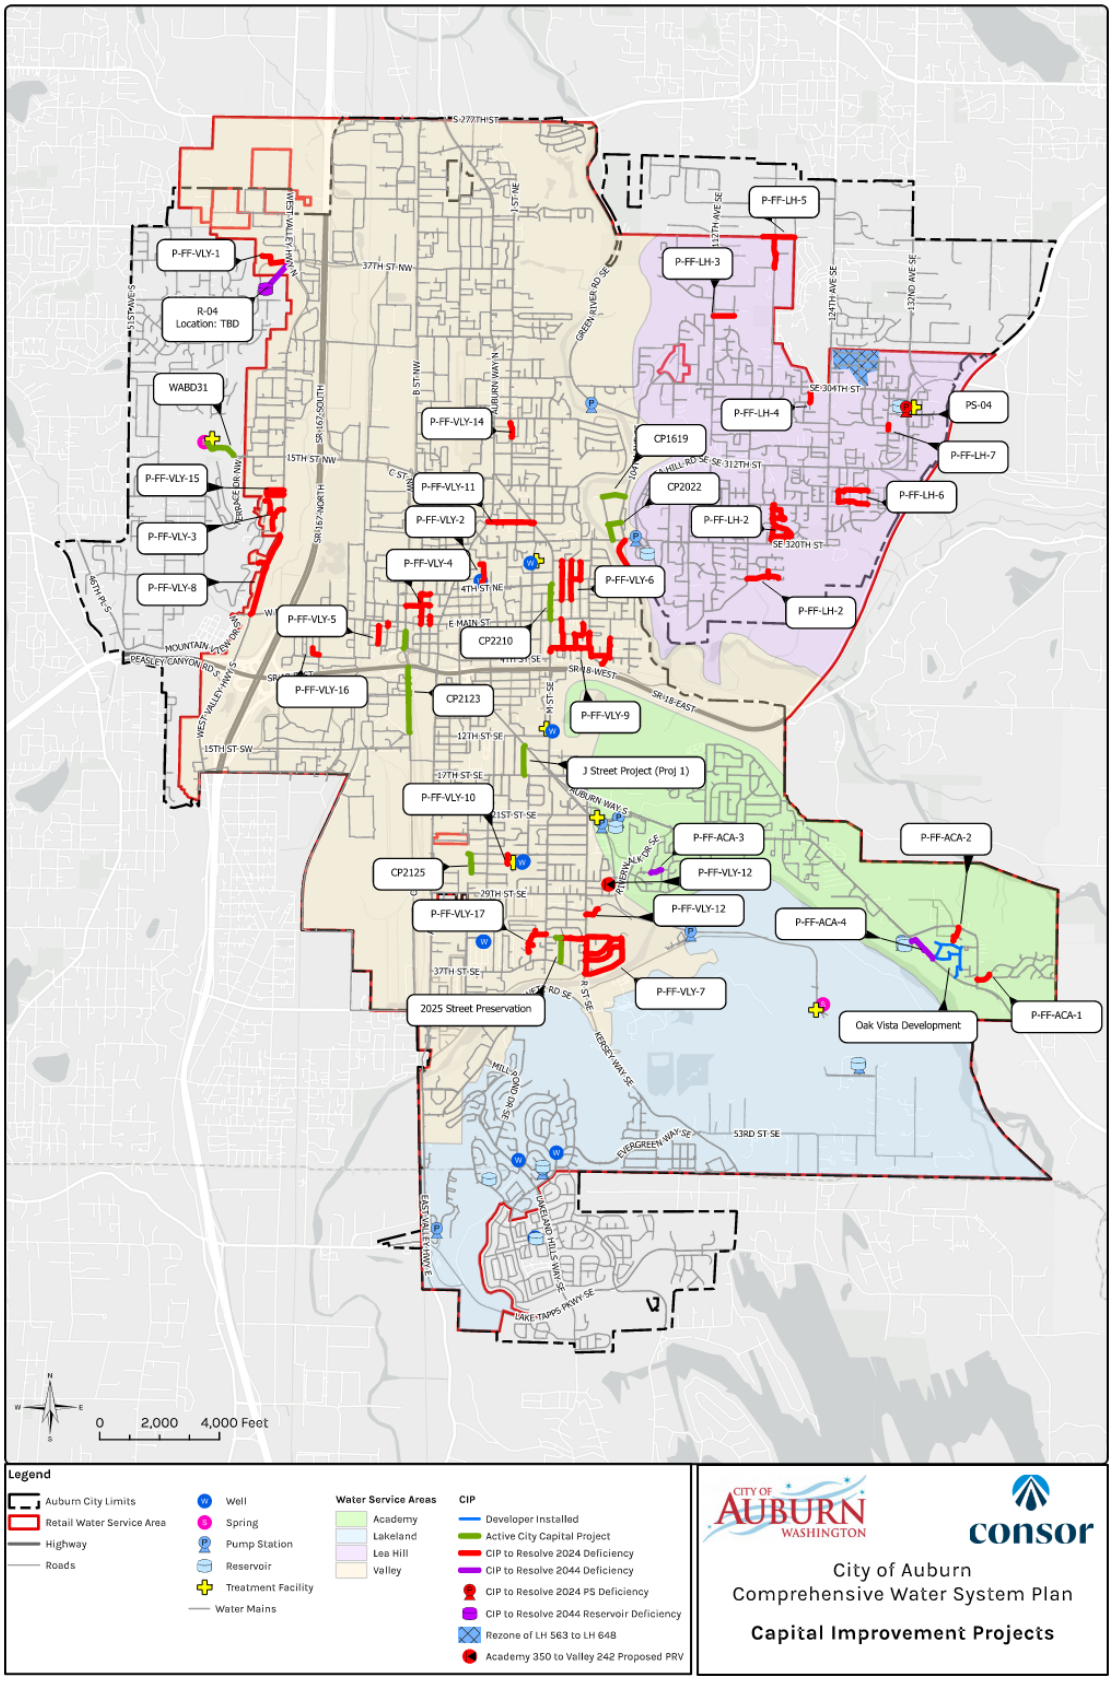


Figure 3-12 | Capital Improvement Projects Addressing Fire Flow Deficiencies

Academy Service Area

Multiple deficiencies are identified in the Academy Service Area. The planned Oak Vista Development provides a significant increase in available fire flow in Academy 585 pressure zone. The remaining improvements assist with specific failure locations by upsizing pipelines with high predicted headloss.

Table 3-33 | Prioritized Pipeline Improvements to Address Fire Flow Deficiencies

Project Priority	Service Area	Project ID	Summary of Deficiency	Summary of Improvements
1	Valley	P-FF-VLY-8	2024 Scenario: Hydrants less than 500 gpm	Replace existing with 3,200 LF of 16-inch diameter piping.
2	Lea Hill	P-FF-LH-3	2024 Scenario: Hydrants less than 1,000 gpm	Replace existing with 690 LF of 12-inch diameter piping.
3	Lea Hill	P-FF-LH-7	2024 Scenario: Hydrants less than 1,000 gpm.	Replace existing with 180 LF of 8-inch diameter piping. Move hydrant connection to higher zone.
4	Lea Hill	P-FF-LH-5	2024 Scenario: Hydrants less than 1,000 gpm	Replace existing with 1,080 LF of 12-inch diameter piping and 1,170 LF of 16-inch diameter piping.
5	Valley	P-FF-VLY-15	2024 Scenario: Hydrants less than 1,000 gpm	Replace existing with 1,320 LF of 12-inch diameter piping.
6	Valley	P-FF-VLY-6	2024 Scenario: Hydrants less than 1,000 gpm	Replace existing with 3,590 LF of 8-inch diameter piping.
7	Valley	P-FF-VLY-7	2024 Scenario: Hydrants less than 1,500 gpm	Replace existing with 7,9840 LF of 8-inch diameter piping and 4,380 LF of 12-inch piping.
8	Valley	P-FF-VLY-13	2024 Scenario: Hydrants less than 1,000 gpm	Replace existing with 1,290 LF of 12-inch diameter piping.
9	Valley	P-FF-VLY-12	2024 Scenario: Hydrants less than 1,000 gpm	Replace existing with 1,440 LF of 8-inch diameter piping and 550 LF of 12-inch piping.
10	Lea Hill	P-FF-LH-1	2024 Scenario: Hydrants less than 1,500 gpm	Replace existing with 4,540 LF of 8-inch diameter piping.
11	Lea Hill	P-FF-LH-2	2024 Scenario: Hydrants less than 1,500 gpm	Replace existing with 1,300 LF of 8-inch diameter piping.
12	Lea Hill	P-FF-LH-6	2024 Scenario: Hydrants less than 1,500 gpm	Replace existing with 2,470 LF of 12-inch diameter piping.
13	Academy	P-FF-ACA-2	2024 Scenario: Hydrants less than 1,500 gpm.	Replace existing with 590 LF of 8-inch diameter piping.
14	Academy	P-FF-ACA-1	2024 Scenario: Hydrants less than 1,500 gpm.	Replace existing with 500 LF of 12-inch diameter piping.
15	Lea Hill	P-FF-LH-4	2024 Scenario: Hydrants less than 1,500 gpm	Replace existing with 340 LF of 8-inch diameter piping.
16	Valley	P-FF-VLY-9	2024 Scenario: Multiple hydrants less than 1,500 gpm	Replace existing with 190 LF of 8-inch diameter piping and 5,765 LF of 12-inch piping.
17	Valley	P-FF-VLY-14	2024 Scenario: Hydrants less than 2,500 gpm	Replace existing with 510 LF of 12-inch diameter piping.
18	Valley	P-FF-VLY-2	2024 Scenario: Hydrants less than 2,500 gpm	Replace existing with 910 LF of 12-inch diameter piping.

Project Priority	Service Area	Project ID	Summary of Deficiency	Summary of Improvements
19	Valley	P-FF-VLY-17	2024 Scenario: Hydrants less than 2,500 gpm	Replace existing with 170 LF of 8-inch diameter piping and 1,270 LF of 12-inch piping.
20	Valley	P-FF-VLY-4	2024 Scenario: Hydrants less than 2,500 gpm	Replace existing with 2,610 LF of 12-inch diameter piping.
21	Valley	P-FF-VLY-10	2024 Scenario: 4-inch Cast Iron near 1,500 gpm dead end	Replace existing with 320 LF of 12-inch diameter piping.
22	Valley	P-FF-VLY-3	2024 Scenario: Hydrant less than 1,500 gpm available.	Replace existing with 1,010 LF of 8-inch diameter piping and 660 LF of 12-inch piping. Complete P-FF-VLY-8 has higher priority for initial improvement in this area.
23	Valley	P-FF-VLY-1	2024 Scenario: Hydrants less than 2,500 gpm	Replace existing with 960 LF of 12-inch diameter piping.
24	Valley	P-FF-VLY-11	2024 Scenario: Hydrants less than 2,500 gpm	Replace existing with 1,630 LF of 12-inch diameter piping.
25	Valley	P-FF-VLY-16	2024 Scenario: Hydrants less than 2,500 gpm	Replace existing with 390 LF of 12-inch diameter piping.
26	Valley	P-FF-VLY-5	2024 Scenario: Hydrants less than 2,500 gpm	Replace existing with 750 LF of 12-inch diameter piping.
27	Academy	P-FF-ACA-3	2044 Scenario: Hydrants less than 2,500 gpm	Replace existing with 380 LF of 12-inch diameter piping.
28	Academy	P-FF-ACA-4	2044 Scenario: Hydrants less than 2,500 gpm	Replace existing with 1,040 LF of 16-inch diameter piping.

3.4.2.5 System Capacity Analysis Results

Chapter 2 of this WSP calculated the ADD ERU planning value to be at 182 gallons per day per Equivalent Residential Units (gpd/ERU) and an MDD ERU planning value of 322 gpd/ERU. An analysis of the water system's overall physical capacity in terms of ERU using DOH Worksheet 4-1 is provided in Appendix V. Demand projection values include retail customer demands, distribution system losses, authorized unbilled consumption, and wholesale demand from Algona. Projections for the MIT Fish Hatchery and LMWD are not included. LMWD is not included since they do not rely on the City as their main source of water and have an interruptible wholesale agreement. Demand from the MIT Fish Hatchery is also not included since it is unknown when this facility will be constructed or what the actual demands will be.

The results of the ERU analysis included in Appendix V are summarized in Table 3-34. The analysis indicates that the existing system has sufficient capacity to serve the current and projected water demands through 2034 (10-year planning horizon). Under 2024 and 2034 demand conditions, storage is the limiting system component for growth and development. In 2044 (20-year planning horizon) storage is deficient, which is consistent with the analysis findings summarized in Section 3.4.2.3 and is planned to be resolved with a new reservoir project included in Chapter 8.

Table 3-34 | System Capacity Analysis in ERU Basis

Description of Capacity Parameter	2024	2034	2044
Demands per ERU Basis			
Average Day Demand, gpd/ERU	182	182	182
Maximum Day Demand, gpd/ERU	322	322	322
Peak Hour Demand, gpd/ERU	518	518	518
Projected Retail Customer Demand, ERUs	**38,731**	**43,626**	**49,515**
Algona (Firm Wholesale) Projected ADD, ERUs	2,005	2,120	2,246
Algona (Firm Wholesale) Projected MDD, ERUs	2,150	2,274	2,409

Limiting Component of System Capacity Surplus/ (Deficit), ERUs	**5,340**	**445**	**(5,445)**

3.4.3 New Source of Supply Analysis

The City has a pending water right application for 13,443 acre-feet from the existing Wells 6 and 7 and a future Well 8. The location of the future Well 8 has not been determined but is expected to be located near Wells 6 and 7. Flows from future Well 8 would be treated at the Fulmer Field CCT Facility. It is anticipated that water quality from Well 8 would be similar to Wells 6 and 7 and may require manganese treatment.

Calculations presented in the Water Rights Self-Assessment Form (**Appendix I**) conclude that the City's existing water rights are anticipated to be adequate to meet the current, 10-year, and 20-year demand projections for maximum instantaneous flows (Qi) and total annual withdrawal (Qa).

The City has established a policy of maintaining the capability to supply the MDD while the largest water source is out of service. The system analysis documented in this chapter confirms that, with projected demands over the 20-year planning period, the City will maintain the capability to meet MDD with the largest pumping source is out of service with the use of the Tacoma interties as an available source.

Mitigation obligations due to the proposed water right for Wells 6, 7, and 8 are listed below and are described in detail in the Conceptual Mitigation Plan (**Appendix S**):

- Mitigation of impacts to Green River,
- Mitigation of impacts to White River, and
- Mitigation of impacts to Mill Creek.

Water Use Efficiency measures described in **Chapter 4** will be applied to the expanded supplies from Wells 6 and 7 and the new supply from Well 8 if the pending water right is approved.

Aside from the pending water right application, the City has several projects planned over the 20-year horizon to improve supply production or fully utilize their existing water rights, as discussed in **Section 3.1.2**.

3.5 Summary of System Deficiencies

Table 3-35 provides a summary of the system deficiencies described in this chapter. Proposed improvements include pump station improvements, storage improvements, and distribution system improvements. Total project costs and the anticipated source of funding for each project are provided in **Chapter 8**.

Table 3-35 | Summary of System Deficiencies

CIP Improvement	Classification of Deficiency	Description of Project Solution	Location in WSP Where Deficiency is Identified	Location in WSP Where Analysis Demonstrates Deficiency will be Addressed by Project
Supply Improvements	Reliability, Resiliency	• Coal Creek Springs Rehabilitation • Well 2 Replacement • Well 2 and Well 6 Cleaning Program • Wells 5/5A Upgrades • Well 7 Back-up Power • Algona Well 1 Study	Section 3.1.2	Section 3.1.2 and Chapter 8

CIP Improvement	Classification of Deficiency	Description of Project Solution	Location in WSP Where Deficiency is Identified	Location in WSP Where Analysis Demonstrates Deficiency will be Addressed by Project
Treatment Improvements	Reliability	• Wells 3A/3B Treatment • Well 5 Chlorination • Well 7 Treatment • Coal Creek Springs Chlorination Building Replacement • Wells 1 and 4 On-site Chlorination Improvements • Fulmer Field CCT Facility Chlorination Improvements	Section 3.1.3	Section 3.1.3and Chapter 8
Storage Improvements	Growth, Fire Flow, Reliability, Resiliency	• Reservoir 2 Valve Improvements • Reservoirs 4 and 8 Seismic Rehabilitation • Additional storage in the Valley Service Area	Section 3.1.4 and Section 3.4.6	Section 3.1.4, Section 3.4.6, and Chapter 8
Pump Station Improvements	Reliability, Fire Flow	• Modifications to Lea Hill BPS/Intertie PS	Section 3.4.5	Section 3.4.5 and Chapter 8
Distribution Improvements	Growth, Fire Flow	• Coal Creek Springs Transmission Improvements • West Hill Springs Transmission Improvements • Replacing and upsizing pipelines where needed	Section 3.1.2 and Section 3.4.7	Section 3.1.2, Section 3.4.7, and Chapter 8

CHAPTER 4

Water Use Efficiency Program

The purpose of this chapter is to describe the water system's program to improve water use efficiency (WUE). WUE contributes to the long-term water supply reliability and promotes good stewardship of the state's water resources.

This chapter addresses the following topics.

4.1 Source and Service Metering
4.2 Distribution System Leakage
4.3 Water Use Efficiency Program
4.4 Water Use Efficiency Savings
4.5 Climate Change Resiliency

Table 4-1 lists the requirements of the WUE Rules from the DOH 2020 Water Use Efficiency Guidebook and reflects the City's level of compliance with these requirements.

Table 4-1 | WUE Rule Requirements

Category	Requirement	City of Auburn Compliance Status
Meters		
	Meter all sources.	Yes, all sources are metered.
	Meter all service connections.	Yes, all services are metered.
Data Collection		
	Provide annual consumption by customer class.	Yes, provided in Section 2.2.2.
	Provide "seasonal variations" consumption by customer class.	Yes, provided in Section 2.5.
	Evaluate reclaimed water opportunities.	Yes, provided in Section 4.3.5.
	Consider water use efficiency rate structure.	Yes, the City has an inverted block rate structure to promote conservation.
	Provide monthly and annual production for each source.	Yes, provided in Section 2.3.1.
Distribution System Leakage		
	Calculate annual volume and percent using formula defined in WUE Rules.	Yes, distribution leakage is calculated and reported in Section 4.2.
	Report annually: annual leakage volume, annual leakage percent, and for systems not fully metered, meter installation progress and leak minimization activities.	Yes, distribution leakage is reported to DOH on an annual basis.
	Develop water loss control action plan (if leakage is over 10% for 3-year average).	N/A, system has a 3-year average water loss of less than 10%.
Goals		
	Establish measurable (in terms of water production or usage) conservation goals and re-establish every 6 years. Provide schedule for achieving goals.	Yes, measurable goals were established via a public process. See Section 4.3.3.
	Use a public process to establish goals.	

Category	Requirement	City of Auburn Compliance Status
	Report annually on progress.	Yes, report submitted annually to DOH.
WUE Program		
	Describe existing conservation plan.	Yes, see Section 4.3.
	Estimate water saved over last 6 years due to conservation program.	Yes, see Section 4.3.1.
	Describe conservation goals.	Yes, see Section 4.3.3.
	Implement or evaluate 1-12 measures, depending on size. Nine measures for City of Auburn.	Yes, see Section 4.3.4.
	Describe conservation programs for next 6 years including schedule, budget, and funding mechanism.	Yes, see Section 4.3.6.
	Describe how customers will be educated on efficiency practices.	Yes, see Section 4.3.4.
	Estimate projected water savings from selected measures.	Yes, see Section 4.4.
	Describe how efficiency program will be evaluated for effectiveness.	Yes, see Section 4.3.1.
	Estimate leakage from transmission lines (if not included in distribution system leakage).	N/A, transmission line leakage included in distribution system leakage as system does not have true transmission lines.
Demand Forecast		
	Provide demand forecast reflecting no additional conservation.	Yes, provided in Section 4.4.
	Provide demand forecast reflecting all "cost effective" evaluated measures.	
Performance Reports		
	Develop annual report including goals and progress towards meeting them, total annual production, annual leakage volume and percent and, for systems not fully metered, status of meter installation and actions taken to minimize leakage.	Yes, reports will be submitted annually to DOH.
	Submit annually by July 1 to DOH and customers and make available to the public.	

4.1 Source and Service Metering

4.1.1 Source Meters

Source meters, also known as production meters, measure the amount of water emitted from the City's springs and wells. Each of the City's sources are metered to measure the amount of water produced. The meters are calibrated annually by an outside contractor under the direction of the Water Operations Supervisor to ensure an accurate accounting of water produced. If a meter cannot be calibrated properly, it is replaced with a new one. Propeller source meters are being replaced with electromagnetic (MAG) meters in conjunction with planned capital improvements projects, or as the budget allows.

Table 4-2 | Source Meter Details

Source Meter ID	Manufacturer	Meter Type	Meter Size	Years in Service	Date of Last Calibration
Coal Creek Springs	Siemens	Magnetic	24-inch	26	August 2023
West Hill Springs	Siemens	Magnetic	10-inch	10	Unknown
Algona Well 1	N/A	N/A	Not in use	Not in use	Not in use
Valley Well 1	Siemens	Magnetic	12-inch	14	August 2023
Valley Well 2	Siemens	Magnetic	10-inch	24	August 2022
Valley Well 3A	Sparling	Turbine	Not in use	Not in use	Not in use
Valley Well 3B	Sparling	Turbine	Not in use	Not in use	Not in use
Valley Well 4	Siemens	Magnetic	12-inch	39[1]	August 2023
Lakeland Well 5	Sparling	Turbine	8-inch	41[1]	August 2023
Lakeland Well 5A	Siemens	Magnetic	4-inch	34	August 2023
Lakeland Well 5B	Siemens	Magnetic	Not in use	Not in use	Not in use
Valley Well 6	Siemens	Magnetic	12-inch	24[1]	August 2023
Valley Well 7	Sparling	Turbine	Not in use	Not in use	Not in use

Note:
1. Years in service assumed to be from source's original construction date.

4.1.2 Service Meters

Water meters are installed on every service line to measure the quantity of water used by a customer per WAC 246-290-496 and City Code Chapter 13.06.320. All new direct service connections must be metered at the time-of-service activation per WAC 246-290-496(2)(d). All meters shall remain the property of the City and shall not be removed except by the City. In all cases where meters are lost, damaged or broken by carelessness, negligence, or willful actions of owners/operators of premises, they shall be replaced or repaired by or under the direction of the City. The actual cost of repairs or replacement of meters will be charged against the owners/operators. In case of nonpayment of fees, fines, charges, or penalties, the water shall be shut off and will not be turned on until all charges are paid.

In 2015, the City began installing an Automated Metering Infrastructure (AMI) system, as a part of the Water Meter and Billing System Improvements project, which was completed in 2018. With the new AMI system, the City automatically receives meter reads via radio transmission and can integrate the data into the billing software. The benefits of an AMI system include increased accuracy and efficiency, early leak detection, and improved customer service. The AMI system is anticipated to have a 20-year life, including the system components and batteries in the radios.

In conjunction with the AMI system installation, the City also completed a meter changeout in 2018. Since 2015, the City has installed 15,156 meters, ranging in size from ¾ inch to ten inches. Meter replacement will be on a 20-year program to coincide with the AMI system. Large source meters and three-inch and larger commercial meters will be tested and calibrated annually. Small meters (less than three inches) are not calibrated.

All new service connections under three inches, in addition to repairs, retrofits or replacements of existing services, are typically conducted by Water Distribution Staff unless unusual circumstances arise. Meter

services consist of meters, meter vaults, meter boxes, service lines, valves, setters, re-setters, and other associated equipment.

- Small Meters (3/4 to two inch)
    - Replacement Cost: $700 - $1,620
    - New Installation Cost: $550 - $1,500
- Large Meters (three to eight inch)
    - Replacement Cost: $3,300 - $12,000
    - New Installation Cost: $2,800 - $11,500

The City uses master meters when beneficial to the City and its customers. Master meters are used at certain locations such as mobile home parks, the Auburn Business Park (formerly the Federal General Services Administration Property), and Muckleshoot Indian Tribe (MIT) commercial properties.

4.1.2.1 Large Meters

Large meters are used to measure water consumption by customers with significant demand requirements. They are usually employed by the following customer classes.

- Commercial
- Farms or Parks – Irrigation
- Schools
- Multifamily Complexes
- Industrial / Manufacturing Businesses
- Wholesale Customers
- Municipal Buildings

Large meters are defined as water meters three inches or larger and new meters are installed by contractors rather than City maintenance staff. There are a total of 127 large meters in the City's system. All large meters are calibrated for accuracy each year, usually between the months of April and June, as part of the City's System Loss Program. Calibration of large meters is conducted by an outside contractor, but two maintenance staff members under the direction of the Water Distribution Supervisor assist in the process. If a meter cannot be calibrated, it is replaced with a new one by City maintenance staff.

4.2 Distribution System Leakage

Distribution System Leakage (DSL) represents the difference between production and documented water use (retail, wholesale, and authorized unmetered). It may include inaccurate master and service connection meters, unaccounted-for non-revenue water use, pipeline leakage, and unauthorized use. DSL does not include authorized water usage such as water used for fire protection, flushing, construction, and other maintenance and operations practices. However, to be credited, this must be accounted for by metering or estimating using credible means.

The DSL is calculated as the difference between the total amount of water produced and the sum of water sold plus any authorized unmetered water usage. The City's estimated DSL for 2015 through 2022 is presented in Chapter 2, Table 2-11. For the City's water system, the 2022 three-year rolling average DSL was 6.7 percent of total production (corrected value submitted by the City to DOH in 2024). This falls below the DOH requirement that the three-year average DSL be under ten percent to minimize water waste.

The City is committed to maintaining DSL below the required ten percent and is actively working to identify and minimize DSL. To minimize DSL, the City has ongoing leak detection, meter calibration, and an active repair and replacement program for water system infrastructure, as detailed in Chapter 6 – Operations and Maintenance. The City completes a leak detection study of 25 percent of the water distribution system every year to detect and fix leaks. Additionally, the City has recently increased its efforts to reduce non-payment of bills and water theft. The City recently completed a major SCADA system upgrade in 2024. These investments should significantly increase the City's ability to measure DSL both temporally and geographically. The resulting information may allow the City to better target its WUE activities to reduce DSL.

4.2.1 Water Audits

The City has implemented AMI throughout the system, completing installations between 2015 and 2018. AMI is a tool that improves the effectiveness of the WUE Program measures, providing detailed water use data for each customer that allows the City to better understand water use patterns and target WUE Program measures to specific customers. Data can be sent in real-time or stored for several weeks or months. Potential AMI capabilities vary depending on the chosen hardware and software however, most systems can aid in the WUE Program. Below is a summary of how the City can use the AMI data.

- Advanced algorithms and metering data will allow the City to identify customer leaks.
- Advanced metering will provide cost savings in the Leak Detection and Repair and Service Meter Replacements programs.
- Advanced metering will aid in the City's efforts to reduce non-payment of bills and water theft.
- By comparing production and customer water use, DSL can be evaluated in greater temporal and geographic detail. For example, DSL may be calculated by month or for a given service area.
- Advanced metering data will help the City identify groups of customers to target for WUE measures and can be used to track the effectiveness of the measures for the same customers.
- Advanced metering data will allow additional reporting options to educate customers, such as their peak water use.

The City reports DSL annually; refer to Appendix M for the previous three annual WUE reports. The newly installed AMI system will provide substantial benefits for the WUE Program and improve savings, further outlined in Section 4.4 of this chapter.

4.3 Water Use Efficiency Program

In 2003, the Washington State Legislature passed the 2003 Municipal Water Law (MWL) which added a requirement that water purveyors use water efficiently. This law was expanded in January 2007 with the WUE Rule and has since been updated. WUE requirements are listed under WAC 246-290 and include:

- Publicly establishing a water savings goal.
- Evaluating water use efficiency opportunities specific to each community.
- Developing a WUE planning program.
- Meter installation on all customer connections by January 22, 2017.
- Achieve a standard of no more than ten percent water loss, on a three-year rolling annual average.
- Annual reporting on WUE progress.

The City's WUE Program provides for efficient water use and supports continued growth. This program fulfills all the necessary requirements of DOH. The selected program measures will allow the City to meet its WUE goals, resulting in decreased water demand. Measures are interrelated and will help the City achieve its goals to both reduce average water use and peak water use per customer. Public education measures (showing water use in bills, workshops, school outreach, fairs/trade shows, etc.) will continue to be a focus of the WUE Program to increase customer awareness and knowledge of WUE opportunities. Public education is needed to support the City's other WUE measures and to support reductions in both average and peak water use. Continued appliance rebates and shower head giveaways help customers implement what is learned in the public education campaign. With the implementation of AMI, it is expected that the City and customers will be able to identify more water loss reduction opportunities than previously possible. Therefore, customer and City leak detection, water audits, and meter repair and replacement may have a prominent role in the 2024-2034 WUE Program. The program will also continue to provide financial disincentives for excessive water use through metering and WUE pricing. This aspect of the program is likely to help reduce peak water usage further. These measures will result in the City being able to achieve its WUE goals, which includes reduced demand.

The 2024-2034 WUE Program will be a continuation of the City's successful existing WUE Program. The program has also been updated to leverage the City's investments in improved SCADA, leak detection, and AMI. The 2024 Plan complies with regulations as set forth in WAC 246-290-830 and DOH's 2020 Water Use Efficiency Guidebook. This section summarizes the program's goals, demand and supply side measures, reclaimed water, and DSL. The projected demand with the conservation goals, program budget, and cost savings are also presented.

4.3.1 Program Requirements

The WUE requirements emphasize the importance of measuring water usage and evaluating the effectiveness of the City's program. There are three fundamental requirements of a WUE Program that the City follows.

- **Planning Requirements** – Municipal water suppliers are required to:
  - Collect data.
  - Forecast demand.
  - Evaluate WUE measures.
  - Calculate DSL.
  - Implement a WUE Program to meet their goals.
- **Distribution Leakage Standard** – Municipal water suppliers are required to meet a distribution system leakage standard to minimize water loss from their distribution system.
- **Goal setting and performance reporting** – Municipal water suppliers are required to set WUE goals through a public process and report annually to their customers and DOH.

The DOH requires that the City estimate the amount of water saved through implementation of the system's WUE program over the last six years. **Table 4-3** shows the average day demand per-capita from 2017 to 2022. Water use per-capita dropped from 112 gpd per capita in 2017 to 103 gpd per capita in 2022. The net water savings over this period equates to approximately 195.2 million gallons or 39.0 million gallons per year. This was calculated by multiplying the population for each individual year (over the six-year period) by the difference in calculated savings in gpd per capita year after year. The result was then multiplied by the total days in each year. Annual totals were summed for the entire six-year period.

Table 4-3 | Annual Average Day Demand (gpd) per Capita[1]

2017	2018	2019	2020	2021	2022
112	109	106	100	105	103

Note:

1. Average day demand per capita was calculated by dividing the Average Day Demand from Table 2-9 by the population served from Table 2-1 and converting to gpd.

4.3.2 Mandatory Measures

The WUE Program includes supply side measures that the City implements to understand and control leakage including new meters, leak detection surveys, and water audits. Per the WUE requirements, the following measures shall be continued for the 2024-2034 WUE program.

- Install production (source) meters.
- Install consumption (service) meters.
- Perform meter calibration.
- Implement a water loss control action plan to control leakage if the three-year rolling average exceeds ten percent.
- Educate customers about water use efficiency practices.

Additionally, the following measures that must be evaluated are:

- Rates that encourage water demand efficiency (discussed in **Chapter 9**)
- Reclamation opportunities (discussed below)

The City has complied with these requirements in the past and will continue to comply with these regulations.

4.3.3 Program Goals

Per the WAC 246-290-830(4)(a), all water purveyors with 1,000 or more connections were required to set efficiency goals through a public process. The City's 2024-2034 Conservation Program builds upon the goals and framework established through the public process conducted in July 2009, during which the City's water conservation goals were developed and posted to the City's website for public review, in alignment with WAC 246-290-830(4)(a). This process ensured transparency and community engagement in shaping measurable conservation objectives.

The goals established in 2009, including a 1 percent reduction per year in Equivalent Residential Unit (ERU) values, continue to guide the City's Conservation Program today. These goals emphasize efficient water usage and public education. The 2024-2034 Program incorporates updates to comply with WUE regulations and address evolving community needs, as detailed in **Section 4.3.4**. The City has chosen to focus on implementing voluntary measures to decrease both the average and peak water usage. The 2024 program has established the following goals.

- Water Use per ERU Goal: Decrease the planning ERU value (gpd/ERU) one percent annually from the current planning ERU value of 182 gpd/ERU, which is the 75th percentile of eight years of

historical data (2015 – 2022). Revaluate goal when the planning ERU value reaches less than 172 gpd/ERU.

  - To be conservative, an ERU planning value higher than the average was used by the City for demand forecasting. The 75th percentile of the eight-years of data was used to select the planning ERU value of 182 gpd. This methodology is consistent with the City's 2015 Plan. The ERU value of 182 gpd is seven percent lower than the 2015 Plan's ERU planning value of 195 gpd per ERU.

- MDD/ADD Peaking Factor: Decrease the planning peaking factor from the current 1.77, which is equal to the 75th percentile of eight years of historical data (2015-2022), to a planning peaking factor of less than 1.68, the average peaking factor from 2015-2022.

- Distribution System Leakage: Maintain three-year average DSL under ten percent to minimize water waste.

- Customer Support: Provide the service and support necessary to those water customers expressing a desire to conserve water as a part of their environmental ethic and as a means of minimizing water bills.

The WUE Program measures, as summarized below, are designed to help meet these established goals.

4.3.4 2024-2034 Demand-Side Program Measures

To encourage WUE and support customers, the City has incorporated program measures that target demand reductions. Under the WUE requirements, a program measure may include water efficient devices, actions, business practices, or policies that promote efficient water use. With 14 measures as part of the 2024 Program, the City exceeds the minimum DOH requirement of nine measures. WUE measures can target specific customer classes or a combination of customer classes. The City's demand-side program measures are summarized below.

1. School Outreach: The City will continue to participate in programs arranged to educate students on efficient water usage as requested by schools.

2. Speakers' Bureau: The City will seek speaking opportunities to discuss efficient water use with a wide audience spectrum. Topics could include water efficient fixtures and appliances, curbing seasonal peak demands, lawn watering practices, etc.

3. Program Promotion: The City will seek opportunities for social media, television, and/or radio public service announcements for WUE and submit news articles to local papers and Auburn Magazine on efficient water usage especially during the spring and summer months.

4. Theme Shows/Fairs: The City hosts an annual Kids Day fair. The fair includes a wide range of activities for all ages of kids. As part of the fair, the City has fun, water-related activities and provides water efficiency brochures and other materials. The City will conduct outreach at other Theme Shows/Fairs if requested. Water saving device kits are distributed to interested single-family and multiple-family residential customers.

5. Water Audits: The City will conduct a water audit upon the request of a customer, including industrial, commercial, and institutional customers. The audits will review items such as:

recirculation of cooling water, reuse of cooling and process water, reuse of treated wastewater, efficient landscape irrigation, low water using fixtures, fixing leaks, and process modifications.

6. Customer Leak Detection: The City identifies potential leaks through investigation of the water meter upon request of customers. The City runs multiple reports in the AMI system to analyze data and investigate water meters to identify leaks.

7. Bills Showing Consumption History: The City will continue to provide customer bills showing the previous year's water usage. The City provides water usage information from AMI on the customers e-portal.

8. Water Saving Device Kits: The City will participate in distribution of water use efficiency kits through education events such as speakers' bureaus, theme shows, fairs, and through bill insert request forms.

9. WUE Pricing: The City has an inverted block rate structure for single-family residential customers to encourage WUE. The City will consider WUE in future cost of service/rate studies. Studies should determine the most appropriate water structures and rate levels to achieve the City's WUE goals, while generating sufficient revenues for utility operations. It is recommended that the studies consider uniform rates by class, inverted block rates, seasonal rates, and excess use rates.

10. Water Efficient Toilet Rebate Program: The City will continue to provide rebates to customers that replace old toilets with new high-efficiency toilets through their Environmental Protection Agency (EPA) WaterSense Toilet Rebate program.

11. Low-Flow Shower Heads Giveaways: The City gives away free low-flow shower heads at the Utility Billing Counter.

12. School Outdoor Water Use Reduction: The City will target schools to reduce their outdoor water consumption. Water audits and education on the benefits of replacing inefficient irrigation systems or landscaping (including turf) will be conducted.

13. City Water Use Reduction: The City will audit the water use of City accounts to identify both indoor and outdoor water saving opportunities. The Water Utility staff will help educate City account holders on WUE; however, no water budget has been allocated to implement water saving devices at City facilities.

14. Rainwater Harvesting: The City will evaluate implementation of a rainwater harvesting (rainwater reclamation) promotion program as a means to reduce irrigation water usage by commercial, public, and residential customers. The City's Stormwater Utility's requirements to use Low Impact Development (LID) measures, where feasible, strives to keep rainwater on the property, further reducing irrigation demands.

It is important to note that in addition to the water cost savings for the WUE measures, other benefits result, both to the utility and to its customers, from WUE activities. Such additional benefits could include:

- Significant customer energy savings because water heaters are the second largest energy users in the home. Hot water use can be reduced by almost one-third by cost-effective WUE measures, such as water efficient fixtures and appliances. Significant energy savings can also occur for industrial processes requiring water heating and other power uses.

- Efficient landscaping and irrigation techniques save on maintenance costs.
- Reductions in water production decrease energy required by utilities to treat and distribute water and to collect and treat wastewater. Chemical costs are also reduced in water and wastewater operations.
- System measures could provide substantial benefits in addition to water production cost savings including:
    - Identification of non-revenue water could result in recovery of unbilled revenue (inaccurate meters) and reduced unauthorized water usage (theft).
    - Leak detection helps prevent major main breaks, which could result in significant repair costs.
    - Leak detection reduces a utility's liability due to prevention of potential property damage.
    - Repair and/or replacement of service and source meters allows a utility to recover unbilled water revenues.

4.3.5 Reclaimed Water

According to WAC 246-290-100 and the WUE requirements, water systems with over 1,000 connections must collect and evaluate information on reclaimed water opportunities. The City is committed to wastewater reuse and rainwater reclamation, as stated in its official water system policies summarized in Appendix A. The City participates in the King County reclaimed water program, which completed a Reclaimed Water Comprehensive Plan in 2012. Additionally, the City has completed the King County Water Reclamation Evaluation Checklist, included as Appendix L. Currently, there are no reclaimed water users in the City. The City considers the most likely candidates for use of reclaimed water to be the irrigation customer class. Since the City conveys all sewage to King County's regional sewerage system, there is not an opportunity for the City to sell reclaimed water without significant capital investments to develop a reclaimed water distribution system, and there is not currently an alternative reclaimed water source in the area.

The City will implement reclaimed water as a conservation measure and include these savings in the demand projections when specific opportunities arise. The City, in conjunction with King County, may develop projects or consider participation in water reuse projects and programs developed by adjacent purveyors and others as appropriate. The efforts may include demonstration or pilot projects developed in accordance with applicable federal, state, and local laws and regulations.

4.3.6 WUE Budget

The City has established a budget for each program measure from 2023 to 2029, as required per WAC 246-290-810 4.e, shown in Table 4-4. WUE measures are funded through rates.

Table 4-4 | Annual WUE Budget

Measure	2023	2024	2025	2026	2027	2028	2029
School Education (NPDES & Water)	$20,000	$20,000	$20,000	$20,000	$20,000	$20,000	$20,000
Conservation Public Education/ WQ Report	$6,350	$6,350	$6,350	$6,350	$6,350	$6,350	$6,350

Toilet Rebates & Low-flow Shower Heads	$11,000	$11,000	$11,000	$11,000	$11,000	$11,000	$11,000
Large Meter Test/Repair/Replace	$30,000	$30,000	$30,000	$30,000	$30,000	$30,000	$30,000
WSP Update (WUE)	$22,000	-	-	-	-	-	-
Total	**$89,350**	**$67,350**	**$67,350**	**$67,350**	**$67,350**	**$67,350**	**$67,350**

4.4 Water Use Efficiency Savings

The WUE Program primarily provides cost savings in two ways, reducing demand and reducing DSL. Reducing demand may reduce or delay capital projects for additional supply and expanded distribution infrastructure. Reducing DSL can provide additional revenue, as well as increase the efficiency of supplying existing water uses. Additionally, advanced metering will provide cost savings in the Leak Detection and Repair and Service Meter Replacements programs.

The City has completed a cost analysis of their proposed WUE Program using historical data and projected annual water savings. Table 4-5 shows projected demands with and without annual water savings. This analysis maintains the target water use efficiency goal of one percent reduction per year in the planning ERU value. This goal will be reached through implementation of the proposed program measures. These reductions in demand can be translated into tangible benefits once realized, such as more time before new sources must be developed, increased ERUs that can be served by the existing water infrastructure, and cost savings in power and water treatment.

Table 4-5 | Demand Forecast With and Without Projected WUE Savings

Year	ADD (mgd)				MDD (mgd)			
	Without WUE	With WUE	Savings	% Savings	Without WUE	With WUE	Savings	% Savings
2024	7.05	6.98	0.07	1%	12.47	12.34	0.12	1%
2025	7.14	6.99	0.14	2%	12.61	12.36	0.25	2%
2026	7.22	7.00	0.22	3%	12.76	12.38	0.38	3%
2027	7.31	7.01	0.29	4%	12.91	12.39	0.52	4%
2028	7.39	7.02	0.37	5%	13.06	12.41	0.65	5%
2029	7.48	7.03	0.45	6%	13.22	12.43	0.79	6%
2030	7.57	7.04	0.53	7%	13.38	12.44	0.94	7%
2031	7.66	7.05	0.61	8%	13.54	12.46	1.08	8%
2032	7.75	7.06	0.70	9%	13.70	12.47	1.23	9%
2033	7.85	7.06	0.78	10%	13.87	12.48	1.39	10%
2034	7.95	7.07	0.87	11%	14.04	12.50	1.54	11%

4.5 Climate Change Resiliency

In 2023, the Washington State Legislature passed House Bill 1181, which requires all group A community public water systems serving 1,000 or more connections to include a climate resilience element in water system plans initiated after June 30, 2025. Though this requirement is not yet in effect, the following section is included to initiate discussion and planning for climate resilience and to supplement the Climate Element being incorporated into the City's 2024 Comprehensive Plan update.

4.5.1 Expected Climate Changes for the City of Auburn

Climate is a key factor driving water use as temperature, precipitation, and other climate-driven weather patterns affect irrigation, and commercial and industrial cooling. Auburn's maritime climate is characterized by wet cool winters and dry warm summers. The City's temperate climate is largely protected from continental weather by the Cascade Mountains to the east.

According to the publication Climate Change Impacts and Adaptation in Washington State, Washington State is projected to experience decreases in snowpack, increases in stream temperatures, and widespread changes in streamflow timing, flooding, and summer minimum flows. Climate change is expected to cause more frequent summer water shortages, especially in fully allocated watersheds with little management flexibility. The average spring snowpack in Washington is projected to decline by 38 percent to 46 percent by the 2040s[1].

To estimate the impact of this change in climate on the City's water demands, results from the Water Supply Forum's 2009 Regional Water Supply Outlook (WSF 2009 Outlook) were used. The impacts of climate change on sources that rely on groundwater are mostly unknown due to the variability between aquifers and site-specific effects, such as recharge rates.

Continued increases in average annual and seasonal air temperatures in the Puget Sound are projected due to climate change, as well as increases in extreme heat. Projected changes in annual precipitation are generally minor, although summer precipitation is projected to decrease and heavy rainfall events are projected to become more severe[2].

No changes to demand projections were made for the 20-year planning period to account for potential climate change due to the uncertain magnitude and timing of local effects. However, it is recognized that demands have the potential to increase in the future given these changes. In the event the City experiences an increase in demand, to understand the scale of the impact, the City will run a model of the City water system that would compute firm yield from inputted streamflow data, replacing historic inflows with projected inflows from three climate change scenarios as described by the WSF 2009 Outlook. Those climate change scenarios for King County are provided in **Table 4-6**.

Table 4-6 | Predicted Increase in Demand from Baseline Due to Climate Change[1]

Climate Change Scenario	2005	2020	2030	2040
Baseline	0.0%	0.0%	0.0%	0.0%
Warm	3.5%	4.4%	4.9%	5.4%
Warmer	4.6%	4.9%	5.8%	7.4%
Warmest	4.8%	6.2%	7.6%	9.5%

4.5.2 Extreme Weather Events and Significant Challenges

To meet the requirements for risk and resilience assessments in America's Water Infrastructure Act (AWIA) of 2018, the City completed a Risk and Resilience Analysis (RRA) in December 2020 using the EPA's Vulnerability Self-Assessment Tool (VSAT). VSAT was developed to serve as an all-hazards assessment tool for water and wastewater utilities of all sizes and addresses malevolent acts, dependency/proximity

[1] Climate Change Impacts and Adaptation in Washington State: Technical Summaries for Decision Makers (uw.edu)
[2] *2009RegionalWaterSupplyOutlook.pdf (amazonaws.com)

threats, and natural hazards. Through this effort, the City has identified the following assets as the most vulnerable to flood hazards.

- Coal Creek Springs aquifer
- Coal Creek Springs and West Hill Springs piping
- Valley Aquifer (Wells 1, 2, 3A, 3B, 4, 6, 7)
- Green River and Lea Hill pump stations
- Distribution System

Climate change exacerbates existing challenges with flooding, landslides, droughts, wildfire, and other natural hazards by potentially changing the frequency, intensity, and duration of these events. Heavier rainfall increases the threat of flooding. In addition to immediate flood threats, flood waters can damage and contaminate wells and water treatment plants resulting in short-term outages and increased risk of waterborne diseases in drinking water. Higher levels of pathogens in runoff from areas around drinking water wells and surface water intakes from flooding of the wells themselves.

In October 2018, the Intergovernmental Panel on Climate Change (IPCC) released the Special Report on Global Warming of 1.5 degrees Celsius (^{O}C). Warming of 1.5^{O}C is projected to decrease summer streamflow in the Puget Sound by 23 percent. Average temperatures in 2015 were 2.7^{O}C warmer than pre-industrial era temperatures which resulted in low summer streamflow and warmer waters[3]. According to the King County Climate Change GIS map "Summer Runoff: Change, 2040s", summer (July-September) runoff in the City of Auburn is expected to decrease by 2.4 percent by the 2040s from historical conditions (1970-1999)[4]. The WSF 2009 Outlook believes the region is reasonably well prepared for drought, however further actions could improve drought preparation. During droughts, water supplies may fall short of meeting demands, especially in summer months. In the past, water utilities in the Puget Sound have adapted to fluctuations in water supplies from droughts through reservoir management and system adaptations such as long-term conservation programs and short-term demand curtailments[1].

Warming of 1.5^{O}C is also expected to bring larger and more frequent wildfires, which could disrupt regional water supplies. Significant water quality impairments from a wildfire include increased turbidity and introduction of radionuclides, metals, and fire-retardant chemicals[5], although impacts to the City's water quality is not likely as there are not surface water sources. The City can maintain existing emergency interties to mitigate wildfires that affect adjacent systems more severely than the City's. While the City contains land that is considered Wildland-Urban Interface, the United States Forest Service has classified the City as either Very Low or Non-burnable in its Potential Wildfire Hazard GIS map (2020)[6].

4.5.3 Assessment of Actions to Protect System

In the face of continued warming, there are actions the City can take to improve the resiliency of the water system from the impacts of climate change. Below are possible short-term and long-term actions for the City to consider. The short-term measures can improve resiliency within three to five years while the long-term measures may require decades to be fully implemented[5].

4.5.3.1 Short-Term Actions

Source Inventory: Identify sources that will remain online in the event of a 100-year or 500-year flood. Utilize GIS or other mapping tools to create a map to visualize which sources are at risk of inundation in such events. Develop protocols for isolating these sources. Determine how sources could be used for critical health and safety following an extreme weather event and how these sources relate to emergency shelters and critical facilities, such as hospitals.

Groundwater Supplies: Develop new groundwater supplies or augment existing groundwater supplies to improve drought resiliency and offset challenges posed by the wetter winters and drier summers expected with warming temperatures. Establish models to understand the effects of drier summers and increased risk of drought on groundwater supplies. Evaluate impacts of lower snowpack levels in the Cascade Mountains on aquifer recharge.

Wildfire Mitigation: Evaluate fire-fighting capacity for open space areas such as Game Farm Park and Wilderness Area.

Interaction with Research Community: Build and sustain routine interactions with the research community on the subject of climate change and water supply. Consider opportunities to fund water-industry research with direct application to water supplies in western Washington. Explore opportunities to have imbedded persons, such as employing a scientist with climate change expertise.

Rate Factors: Implement less frequently used rate factors, such as a rate for drought periods, to encourage lower demands.

Floodproofing: Build flood barriers such as levees and dikes to protect critical infrastructure. Elevate critical equipment or place it within waterproof containers or foundation systems.

Power Supplies: Extreme weather events can cause power outages. Consider alternative or on-site power supplies to provide resiliency during such events.

4.5.3.2 Long-Term Actions

Monitor Aquifer Conditions: Establish a program of long-range monitoring of aquifer recharge and water levels as affected by climate change. Assess risk of saltwater intrusion. Establish models to assess source redundancy in extreme drought events.

Green Infrastructure: Apply green infrastructure strategies to collect and manage stormwater. Regional or water-shed scale plans for stormwater management can be more cost effective than individual plans.

Water Use Efficiency: Continue to invest in and evaluate WUE programs to reduce water consumption and improve efficiency. Consider partnering with King County to assess reclamation and reuse programs to augment non-potable water demands.

Water Rights: Invest in permanent or mobile infrastructure to ensure access to all available water rights to maximize available sources.

CHAPTER 5

Source Water Protection

The City relies on groundwater sources to meet current water supply demands. This chapter's objective is to update the City of Auburn's (City's) program to protect and improve source water used by the City. As the City's sources only include groundwater wells and springs which are not under the influence of surface water, a Watershed Control Program is not required.

This chapter addresses the following topics:

5.1 Sanitary Control Area
5.2 Wellhead Protection Program

5.1 Sanitary Control Area

Sanitary Control Areas (SCAs) have been established for each of the City's water sources per WAC 246-290-135(2). An SCA is the front-line protection against contamination of the water source. The standard SCA for wells has a minimum radius of 100 feet from the wellhead. The standard SCA for spring sources has a minimum radius of 200 feet from the spring head. All City water sources have SCAs that were established and approved by DOH, and are documented in the susceptibility forms provided in Appendix T. All properties within the SCA for each water source are under the City's ownership and control.

5.2 Wellhead Protection Program

DOH has developed regulations that require Group A water systems using groundwater sources to develop and implement a Wellhead Protection Program (WHPP) in accordance with WAC 246-290-135. The basic elements required of a WHPP are:

- Assessment of initial groundwater susceptibility (physical susceptibility to contamination) for each water supply source,
- Delineation of the wellhead protection area (WHPA) that directly contributes groundwater to each water supply well,
- Identification of potential sources of contamination within each WHPA,
- Documentation of notification to owner/operators of known or potential hazards, and
- Development of spill prevention plans and water contingency plans that minimize or eliminate the possibility of contamination to the groundwater supply and development of options for maintaining water supply in the event the aquifer contributing to a source is contaminated.

The City maintains its WHPP for 12 groundwater sources. A WHPP was prepared in 2014 for the City's 2015 WSP; this remains the current WHPP for the City. The purpose of the WHPP is to help prevent the City's water supply from becoming contaminated and to develop contingency and emergency response procedures in case one or more sources are lost due to contamination. This is accomplished by providing

WHPAs around public groundwater sources, identifying existing groundwater contamination sources, and managing potential groundwater contamination sources prior to their entry into the drinking water system.

The WHPP provides tasks for the City to implement wellhead protection and the City prioritizes those tasks by criteria such as available staff, time to complete, cost, and urgency due to limited available resources. The City maintains an annual operating budget for implementing tasks related to the wellhead protection program, as well as identifying and monitoring potential new hazards. The City allocates budget annually for the Water Resources Protection Program, as discussed in **Chapter 8.**

5.2.1 Susceptibility Assessment

Susceptibility Assessment Forms have been completed by the City and submitted to the DOH. The forms are provided in **Appendix T**. The DOH's susceptibility assessment rating for each source is summarized in **Table 5-1.**

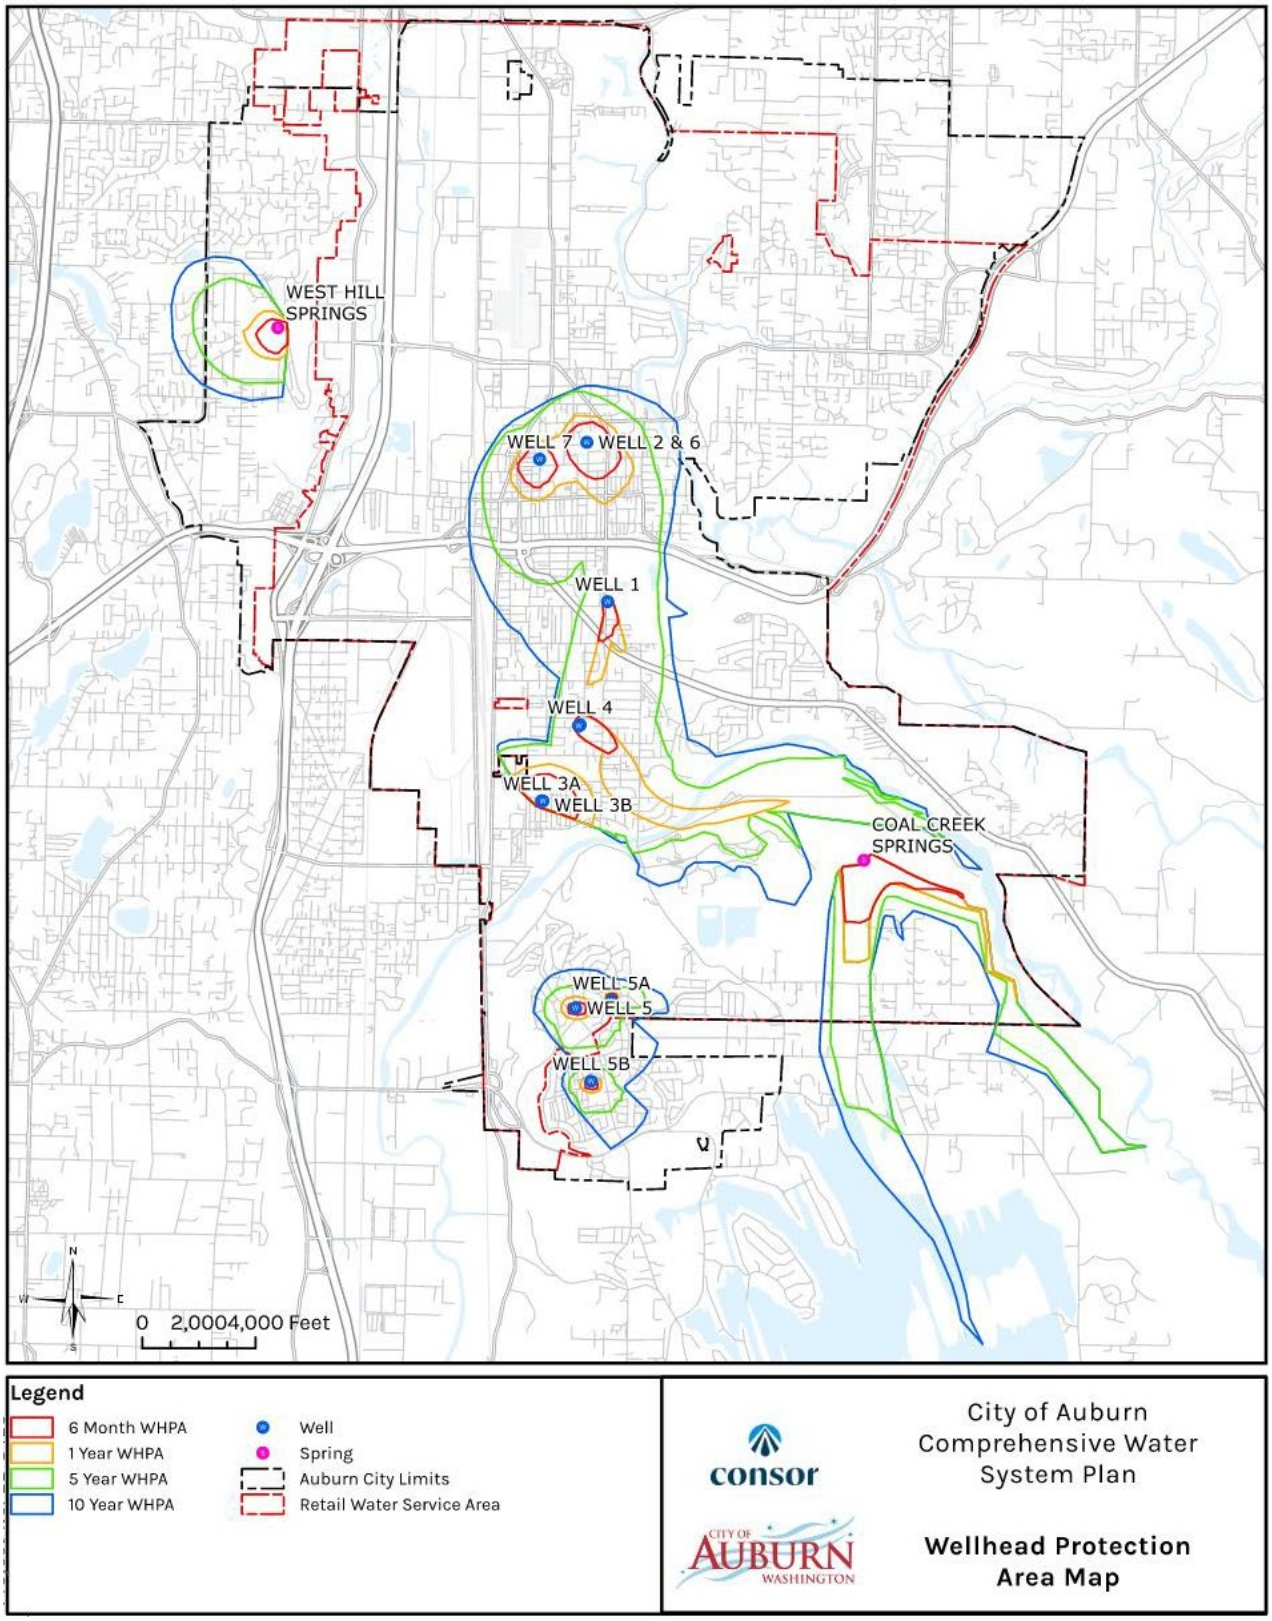

Table 5-1 | Source Susceptibility Assessment Ratings Issued by DOH

Source	Susceptibility Rating
Coal Creek Springs	High
West Hill Springs	High
Well 1	Moderate
Well 2	High
Well 3A	Low (Off-line)
Well 3B	Low (Off-line)
Well 4	Low
Well 5	Low
Well 5A	Low
Well 5B	Low (Off-line)
Well 6	High
Well 7	High (Off-line)

5.2.2 Wellhead Protection Area Delineation

The WHPA defines the area around a groundwater source that has the potential to contaminate the source. This area is based on the source's capture zones, which are the zones of the source aquifer and ground surface that can contribute water to the source in six months, one year, five years, or ten years. The City's 2014 WHPP largely replaced the initial plan created in 2000. The study area, physiographic settings, and WHPAs were defined in the 2000 WHPP and remain valid. Capture zones were delineated using a three-dimensional particle-tracking program with a steady-state head distribution created by a numerical model. The established WHPAs are shown in **Figure 5-1.**

Figure 5-1 | Wellhead Protection Area Map

5.2.3 Contaminant Source Inventory and Notification of Findings

A summary of potential contaminant sources for the City's water sources was updated in April 2024. The Contaminant Source Inventory (CSI) was updated utilizing Ecology's Facility/Site ID database. The contaminant sources are organized by water source and time travel zones, and are included in **Appendix T**.

DOH requires notifications be sent to landowners with potential contaminant sources, as well as state and local agencies, of the CSI findings. Letters and WHPA maps were mailed to landowners in June 2024; copies of the notification letter template and maps that were sent to landowners are included in **Appendix T.**

State and local agencies use the CSI findings and WHPAs to help prioritize local and state pollution control outreach, to provide incentives to landowners for risk reduction, and to support local land-use planning decisions. DOH requires that state and local emergency responders be notified of the WHPAs, results of the susceptibility assessment, CSI findings, and the contingency plan. Copies of the notifications sent to emergency responders and regulatory agencies, as well as the WHPA maps, are included in **Appendix T**. A list of state and local agencies that were sent notifications letters, along with the date of the notification is summarized in **Table 5-2**.

Table 5-2 | State and Local Agencies Notified of CSI Findings

Agency	Notification Date
Washington Department of Ecology	June 2024
Washington State Department of Health Southwest Regional Office	June 2024
King County Public Health	June 2024
Auburn Police Department	June 2024
East Pierce Fire and Rescue	June 2024
King County Fire Protection District 31	June 2024
Mountain View Fire and Rescue	June 2024
South King Fire and Rescue	June 2024
Valley Regional Fire Authority	June 2024

5.2.4 Contingency Plan

The City developed a Water Source Loss Mitigation Plan (City of Auburn Standard Operating Procedure 5.2.1) to address how the water system will provide consumers with adequate supply of potable water in the event one or more sources become temporarily or permanently unavailable; this plan is included in **Appendix T**. Should one water source be unavailable, the City has sufficient capacity across the remaining sources and interties to supply potable drinking water to its customers; water supply availability is evaluated in greater detail in **Chapter 3**.

CHAPTER 6

Operations and Maintenance Program

This chapter provides an overview of the City of Auburn's (City) Water Utility organization, operations and maintenance (O&M). The purpose of the chapter is to document existing procedures and to identify areas where improvements or changes could enhance system operation.

The following topics are addressed in this chapter:

6.1 Water System Management and Personnel
6.2 Operations and Preventive Maintenance
6.3 Comprehensive Water Quality Monitoring
6.4 Emergency Preparedness and Response
6.5 Safety Procedures
6.6 Cross Connection Control Program
6.7 Sanitary Survey Findings
6.8 Customer Complaint Response Program
6.9 Recordkeeping and Reporting
6.10 Summary of O&M Deficiencies and Recommended Improvements

6.1 Water System Management and Personnel

6.1.1 Mission Statement

The mission statement of the City's Water Utility is to provide for the efficient, environmentally sound, and safe management of the existing and future water system within the City's service area.

6.1.2 Department Overview

The Water Utility is responsible for providing potable water to the City's customers that meets or exceeds the recognized standards of today and the future by efficiently administering, operating, and maintaining the water supply. The Water Utility will also continue to enhance its customer service through public education and information. A primary responsibility of the Water Utility is implementing the Comprehensive Water Plan (Plan).

6.1.3 Internal and External Factors

The objective of the Water Utility is based on compliance with internal and external factors. An internal Work Plan Overview is generated at the beginning of each work year with a review process at the end of the year. The Work Plan Overview describes budget goals, performance measures, engineering tasks,

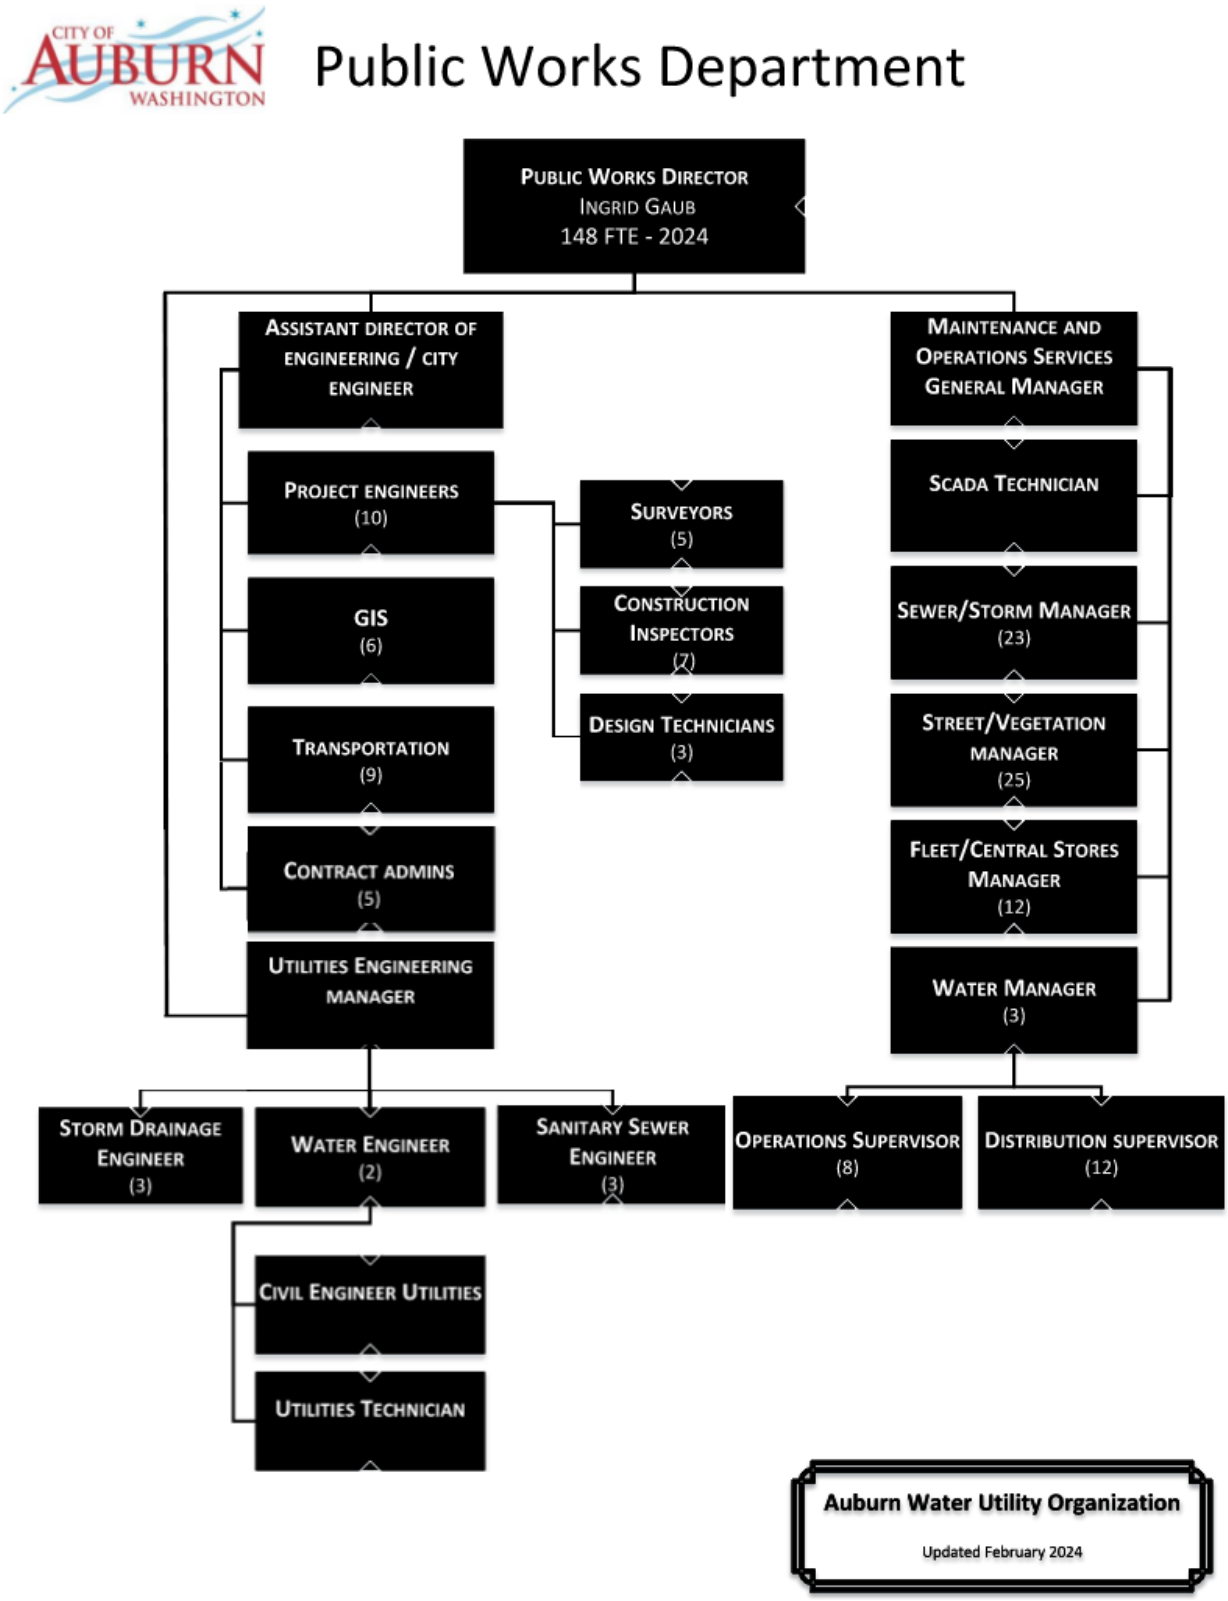
capital projects, and maintenance and operations tasks. External factors include adoption of goals, recommendations, and standards established by the following regulatory or professional practice agencies:

- Washington State Department of Health (DOH)
- Washington State Department of Ecology (Ecology)
- American Public Works Association (APWA)
- Association of Washington Cities (AWC)
- Department of Homeland Security (DHS)
- American Water Works Association (AWWA)
- Washington Cities Insurance Authority (WCIA)
- Municipal Research and Services Center of Washington (MRSC)
- United States Environmental Protection Agency (USEPA)

6.1.4 Water Utility Division Organization

The Auburn Water Utility is operated as a utility enterprise under the direction of the Public Works (PW) Director. Specific Water Utility Management Responsibilities within the PW Department fall under either the Utilities-Water Section of Engineering Services or the Water Division of Maintenance and Operations Services.

The Utilities-Water Section of Engineering Services is responsible for comprehensive water system planning, development of a Capital Improvement Program (CIP), as well as programming the design, construction, and inspection of projects related to the water system.



The Water Division of Maintenance and Operations Services is responsible for operating and maintaining the water system, performing daily operation and inspection, water quality monitoring as required by DOH, and line management of the Water Utility.

The organization of the Water Utility is shown within the Public Works Organizational chart in Figure 6-1. The responsibilities of each staff within the Utilities-Water Section of Engineering Services, including professional and technical support staff from within Engineering Services that are not specifically within the Water Utility are summarized below.

- Utilities Engineering Manager and Water Utility Engineer: Primarily responsible for development of the comprehensive water plans, water capital facility plan, annual project budgeting, technical design, and construction standards, "as-built" drawings, and designs, utilized in the construction of the water systems facilities. They also provide technical computations, water modeling and other analysis required to support system operation. Additional responsibilities include engineering, consultant contracts, capital projects planning, and customer assistance with City code, drawings, and permits.

- Water Quality Programs Coordinator: Assist with the Water Quality and Water Conservation Programs and is responsible for compiling DOH sampling data and verifying DOH sampling was conducted per the sampling schedule.

Figure 6-1 | Auburn Water Utility Organizational Chart

- City Engineer: Responsible for issuance of the City's Design and Construction Standards. Responsible for the management and the design and construction of capital projects managed by Project Engineers, including consultant-designed projects and construction contractors. Under the direction of the City Engineer, GIS Specialists are responsible for the transfer of data from "as-built" drawings to the GIS database. GIS is a mapping software that records and locates infrastructure related to the water system. GIS Specialists are also responsible for provision of maps and statistics to staff within the PW Department.

- Utilities Technician: Assist with certain permit-related activities involving the water system. The Technician is also responsible for customer inquiries, assistance with applications, tracking water system usage for reporting, and updating and updating water system records.

- Utilities Civil Engineer: Review City capital improvements and development projects pertaining to water system improvements and provides customer assistance regarding projects and permit activities.

Personnel lists for Engineering and Maintenance and Operation (M&O) staff that are responsible for daily operations are summarized in Table 6-1 and Table 6-2. Operations staff provide daily O&M of wells, corrosion control treatment facilities, pump stations, and reservoirs. They also implement the cross connection control program and provide locating services for all City utilities. Distribution staff maintains the complete distribution system including water mains, valves, hydrants, pressure reducing stations, and meters.

The City has a mayor-council form of government; therefore, the PW Director reports to the Mayor. The City Council provides oversight of the Water Utility regarding policy, planning, and management of the water system.

6.1.5 Communication System

The City maintains a robust communication system to contact Water Utility personnel during normal work hours and after hours. This system is necessary to respond to customer requests, routine maintenance, or emergency situations. Maintenance staff vehicles and other rolling stock are all equipped with radios and personnel carry cellular phones. The Water Utility also has access to an inventory of portable emergency use radio units, should they be required.

A Standby Call-Out Program was initiated in 2006 to ensure that coverage for after-hours response was guaranteed. One staff member in Operations and one staff member in Distribution always carry a dedicated cell phone during their off hours. Standby duration runs for one week before responsibility is rotated to the next staff member on the roster.

Water problems involving service leaks, quality issues, main breaks, broken hydrants, etc., that occur outside normal working hours, are reported through the City's 911 emergency response system. An "Emergency Call-Out List" is provided to the emergency operators who will attempt to contact the designated standby Water Distribution or Water Operations employee, based on the type of service required. If contact cannot be made, the operator will contact the designated Standby Public Works Maintenance and Operation Manager.

Table 6-1 | Water Operations and Distribution Staff and Certifications

Position	Primary Function(s)	Certification(s)[1]
Water Manager	Management	Water Distribution Manager 4
Water Operations Field Supervisor	Management (Operations)	Water Distribution Manager 4, Water Treatment Plant Operator 1, Cross Connection Specialist
Water Distribution Field Supervisor	Management (Distribution)	Water Distribution Manager 3
Maintenance Lead (Distribution)	Management (Distribution)	Water Distribution Manager 2
Cross Connection Control Specialist	Cross Connection Control & Backflow Assembly Tester	Water Distribution Manager 1, Cross Connection Specialist, Backflow Assembly Tester
Distribution Specialist	Distribution Operations Maintenance	Water Distribution Manager 1
Maintenance Worker II / Locator	Operations & Distribution Maintenance	N/A
Maintenance Worker I	Operations & Distribution Maintenance	N/A

There are 12 staff members on the On-Call Manager Standby List and one of them has call-out responsibility for an entire week until it rotates to the next staff member. The 12 staff positions on the Standby List are:

- Water Manager
- Water Distribution Supervisor
- Water Operation Supervisors
- Sanitary Sewer and Storm Drainage Manager
- Sanitary Sewer Supervisor
- Storm Drainage Supervisor
- Streets and Vegetation Manager
- Street Supervisor
- Vegetation Supervisor
- Fleet/General Service Manager
- Maintenance & Operations (M&O) Support Supervisor
- M&O Services General Manager

There are also three other maintenance staff members on standby that can be called out as needed. The staff members are employed by Sanitary Sewer Division, Storm Drainage Division, and Street Division. The 911 operator also has phone access to the other Public Works staff, if the situation warrants it.

Telemetry alarms that occur after hours are handled by an automated Supervisory Control and Data Acquisition (SCADA) alarm and an automated dialer for notification called WIN911. The SCADA alarm calls standby staff from the WIN911 list. If no one responds within 15 minutes, then WIN911 calls the Water Operations standby staff on the call out list. The system will continue to cycle through the roster of seven employees until contact is made.

6.1.6 Operator Certification Program

The Washington Administrative Code (WAC) 246-292, requires minimum standards for the certification status of water operators. Also, the City has recognized the value of having a knowledgeable and well-trained staff operating the Water Utility and encourages employees to obtain the highest level of certification available. The City currently serves a population of greater than 50,000, which classifies their

distribution system into a group 4 according to WAC 246-292-040. Certifications required per staff role are summarized in Table 6-1.

The City pays for annual certification fees, provides time and tuition for certification training courses, and allows time for certification examinations. In addition, the City provides opportunities for staff to obtain continuing education units (CEUs) to maintain certification. Professional growth requirements for certification CEUs are monitored and maintained by the Washington Certification Services.

6.1.7 Education and Training Program

Continuing educational opportunities are fundamental for staff in the Water Utility. The Water Utility training budget is funded to support staff in maintaining their technical awareness and skill sets. Seminars, conferences, and college coursework: 1) broaden their knowledge and 2) allow them to network with other professionals involved in Water Utility work. Subjects include cross connection control, pumps, motors, pressure reducing valves, hydrants, chlorination, generators, forklift training, confined space, first aid, CPR, electrics, and other essential topics.

Most staff are tasked with specific job functions during their normal work shift and the consistent nature of the work allows them to complete their jobs in a very professional and efficient manner. However, all staff are rotated through an active cross training program to cope with employee absences such as vacation, sickness, retirement, and termination.

6.2 Operations and Preventive Maintenance

The City's water system is comprised of pump stations, chlorination stations, corrosion control facilities, reservoirs, springs, and wells. Figure 1-3 presented in Chapter 1 provides an overview map of the major existing system facilities. These components all work together to ensure that water is available to meet customer demands. Primary operation of the water system is maintained via the SCADA computerized control system. AVEVA software works in association with SCADA to provide real time graphical display of system data for staff interpretation and control. The SCADA system is often referred to as the Telemetry system based on one of the definitions of Telemetry (the science and technology of the transmission and measurement of data from a distant source). The City's SCADA system is monitored in the Public Works M&O Building, 1305 C Street SW, and responsibility for the system related to the Water Utility falls under the Water Manager and associated staff.

Some of the functions that SCADA monitors, records, and controls include:

- Reservoir levels
- Source meter production
- Pumps
- Motors
- Valves
- Chlorination
- Pressures: Low, High, Discharge, Suction
- Alarms: Intrusion, Fire, Generator Run, Low Fuel, Overflows, Failures, Turbidity

Status reports are continuously received via radio and information regarding system demand is used to determine system activation. The SCADA system includes logic programming which automates the process; however, Operations staff can manually override most computer decisions, if necessary. The alarm infrastructure is linked to WIN911 for after-hour call-out and response.

All data monitored by the SCADA system is electronically recorded by a computer server maintained by the Innovation & Technology (IT) Department. A back-up copy is made each evening to ensure that records are retrievable should hardware or software failures occur. SCADA records are available to all PW staff via the City's computer server. Access and control of the system is relegated to two dedicated computer terminals at the M&O Building. The computer terminal that houses SCADA is password protected and entry into the building is keycard access controlled.

The SCADA software and historical data is maintained on the City's Wide Area Network (WAN). Staff have access to the system via workstations connected to the WAN or remote network applications. A telephone connection provides the auto-dialer for the WIN911 notification to phones or pagers. An Ethernet radio connected to the computer system at the M&O Building sends and receives radio signals to/from the Programmable Logic Controllers (PLCs) at the water facilities. PLCs at the facilities are also able to communicate directly with each other via radio signal.

The City recently completed a SCADA Upgrade Project, completed in 2024, which updated the system platform to the most current version, modernizing the City's SCADA system from its last major upgrade in 2015. Major components were also replaced throughout the system to provide more reliable communication. The new hardware, in conjunction with software upgrades, provides additional control of the city's facilities.

6.2.1 Inspections, Preventive Maintenance, Repairs, and Replacement

Systematic inspection of Water Utility facilities is conducted on a daily or weekly basis by Distribution Specialists under direction of the Water Operations Supervisor as summarized in Table 6-2. The inspection process serves the following purposes:

- System Confirmation - proper operation of automated control and monitoring equipment
- Sound Check - listen for unusual noises
- Well Levels - static and dynamic
- Equipment Check - pumps, motors, valves, chlorination, heaters, vents, generators, etc.
- Security Verification - intrusion, vents, hatches, locks, gates, graffiti, etc.

A portion of the maintenance tasks handled by the Operations staff are associated with a Preventive Maintenance Program and some of those activities are arranged to coincide with the Facility Inspection Schedule shown in Table 6-2. The maintenance activities are based on equipment manufacturer recommendations and maintenance staff observations for infrastructure located within and outside the facility. Preventive maintenance tasks are essential for reliable operations and preservation of investment so adherence to the program is stressed. Additional maintenance activities handled by Water Operations staff include repairs, replacement, small improvement projects, and response to customer requests.

The Distribution staff is involved in the same activities as Water Operations staff regarding inspection, preventive maintenance, repairs, replacement, and response to customer requests. Water Distribution staff activities are usually in response to damage or leaks involving mainlines, service laterals, meters, meter boxes, and hydrants. Other Distribution tasks include fire flow testing, system flushing, meter installation, and miscellaneous small improvement projects.

Most customer requests are associated with water quality concerns and water pressure issues. Those requests are handled by the Distribution staff and/or Cross Connection Specialists, on a case-by-case basis.

Table 6-2 | Water Operations - Facility Inspection Schedule

Type of Facility	Facility Name	Daily Inspection 5 Day Workweek	Weekly Inspection
Booster Pump Station	Academy Pump Station 3	X	
	Academy East Booster Pump Station	X	
	Green River Pump Station	X	
	Lea Hill Pump Station	X	
	Lea Hill Booster Pump Station		X
	Lea Hill Intertie Booster Pump Station	X	
	Terrace View Booster Pump Station	X	
	Lakeland Hills Booster Pump Station	X	
	Game Farm Park Pump Station		X
	Braunwood Booster Pump Station	X	
Chlorination Facility	Lea Hill Intertie Pump Station (Re-chlorination)	X	
	Terrace View Booster Pump Station (Re-chlorination)	X	
	Coal Creek Springs – Chlorine Gas	X	
	West Hill Springs - Chlorine Gas	X	
	Well 1 – Hypochlorite	X	
	Well 3A – Chlorine Gas (when well is in operation)		Off-line
	Well 3B – Chlorine Gas (when well is in operation)		Off-line
	Well 4 - Hypochlorite	X	
	Fulmer Field Corrosion Control Facility – Onsite Generated Hypochlorite (Treats Well 2, 6, and 7 sources)	X	
	Well 5A - Hypochlorite	X	
	Braunwood Well - Hypochlorite	X	
Corrosion Control Facility	Howard Road Corrosion Control Treatment Facility (Treats Coal Creek Springs source)	X	
	Fulmer Field Corrosion Control Treatment Facility (Treats Well 2, 6 and 7 sources)	X	
Metals Removal Facility	Well 5B (Treats iron and manganese)		Off-line
Reservoir	Reservoir 1 – Valley Service Area	X	
	Reservoir 2 – Valley Service Area	X	
	Reservoir 4A – Lea Hill Service Area	X	
	Reservoir 4B – Lea Hill Service Area	X	
	Reservoir 5 – Lakeland Service Area	X	
	Reservoir 6 – Lakeland Service Area	X	
	Reservoir 8A - Academy Service Area	X	
	Reservoir 8B - Academy Service Area	X	
	Braunwood Reservoir	X	
Spring Source	Coal Creek Springs	X	
	West Hill Springs	X	

Type of Facility	Facility Name	Daily Inspection 5 Day Workweek	Weekly Inspection
Well Source	Well 1	X	
	Well 2	X	
	Well 3A (Off-line)		Off-line
	Well 3B (Off-line)		Off-line
	Well 4	X	
	Well 5	X	
	Well 5A	X	
	Well 5B (Off-line)		Off-line
	Well 6	X (when on)	X (when off)
	Well 7 (Off-line)		Off-line
	Braunwood Satellite Well	X	
Intertie Supply	Tacoma B Street Intertie		X
	Tacoma 132nd Avenue Intertie		X

6.2.2 Reservoir Maintenance

Reservoirs are a fundamental part of the water distribution system. They act as storage and regulating devices for water flow and maintaining them in prime physical condition is an essential activity. The Water Utility began a rigorous reservoir maintenance program in 1997 and it has evolved into an annual routine function. Each year, two of the reservoirs have their interiors thoroughly inspected by a contractor experienced in reservoir maintenance. The annual inspection process is based on a rotational schedule to ensure inspection of each reservoir on a 5-year timetable.

Since the reservoirs are usually filled with water, a diver must conduct the inspection. The diver is equipped with lights and an audio/video device to record the process. Issues of concern include corrosion, cracks, and condition of coating on the walls, valve, fasteners, etc. The diver is also equipped with a vacuum unit to remove sedimentation. The contractor also performs a visual inspection of the exterior of the reservoir for the same elements noted for the interior. The recording is reviewed by the contractor, a report is generated based on the interior and exterior inspection and a copy of the report and recording are given to the Water Manager and Water Utility Engineer for review.

If the report and recording indicate that a reservoir needs major repair, relining, or repainting, another contractor is acquired for a recommended course of action. If interior work is required, the reservoir must be drained of water. In those situations, a carefully orchestrated timetable and shifting of water resources is necessary to balance maintenance with the needs of the City's customers.

6.2.3 Pump Station Maintenance

Pump Stations are inspected daily or weekly depending on the station by Water Operations staff. The inspection checklist includes confirming that proper operation of the automated controls and monitoring equipment align with the standard operating procedures for the equipment, sound checks for unusual noises, static and dynamic well level checks, equipment checks (pumps, motors, valves, chlorination, heaters, vents, generators, etc.), security checks through visual inspection of the facility grounds for

intrusion, graffiti, or issues with vents, hatches, locks, gates, and anything else that may seem unusual or misaligned.

6.2.4 Treatment Facility Maintenance

Treatment Facilities are inspected daily by Water Operations staff. The inspection checklist includes confirming that proper operation of the automated controls and monitoring equipment align with the standard operating procedures for the equipment, sound checks for unusual noises, equipment checks (pumps, motors, valves, chlorination, heaters, vents, generators, aeration towers, etc.), security checks through visual inspection of the facility grounds for intrusion, graffiti, or issues with vents, hatches, locks, gates, and anything else that may seem unusual or misaligned.

6.2.5 Pressure Reducing Valve Stations

Pressure Reducing Valve (PRV) Stations are inspected every month by Water Operations staff. The inspection checklist includes condition of the vault, valves, inlet pressure, outlet pressure, and pilot controls. Staff inspections are supplemented by a more thorough inspection and calibration process conducted annually by a contractor that specializes in PRVs. Repair or replacement maintenance, unless minor, is usually performed by the contractor. The City plans to implement an in-house repair maintenance program.

Rebuilds of PRVs are typically done every three to five years based on the rebuild schedule.

6.2.6 Utility Locating Service

Two Water Utility staff are designated as the Utility Locators for all City utilities and roadway infrastructure (Water, Storm Drainage, Sanitary Sewer, and Street lights and traffic signals) and additional staff may also be present to provide flagging when safety issues arise. The number of location requests varies daily but averages out to a full-time commitment. The Utility Locators report to the Water Operation Supervisor, but location requests may be made indirectly by the Water Distribution, Sanitary Sewer, or Storm Drainage Supervisors.

6.2.7 Fire Hydrant Inspection

In 1999, a fire hydrant inspection goal was initiated. The intent was to inspect, repair, and test at least one third of the utility owned fire hydrants in the system each year. The importance of this program cannot be understated since fire hydrants are the first defense against loss of life or property due to fire. The inspections also improve water quality due to the stagnant water that is purged from the hydrant stubs. A water de-chlorination program, in response to Ecology guidelines, was initiated in 2001 to treat water purged from hydrant stubs. The Water Distribution Supervisor has made public hydrant inspection a year-round routine task of Water Utility operations. Secondary maintenance of public hydrants such as rust removal, painting, street reflector replacement, clearing obstructions, etc., is handled by seasonal part time staff when time permits. Property owners with private hydrants are solely responsible for obtaining annual, satisfactory inspections of their private hydrants from a qualified inspector.

6.2.8 Dead-end Flushing

A key component of water quality control is dead-end line flushing. The City has approximately 548 dead-end mains throughout the distribution system. The water in dead-end mains tends to stagnate due to lack of turnover which can have an impact on water quality for customers in the immediate vicinity. Flushing dead-ends is the only effective way to purge the lines of stagnant water and associated particulate matter.

In 2000, an engineering consulting firm was hired to assist the City with the development of a Dead-end Flushing Program. They examined the City's distribution system via GIS data and supplemented the study with field inspections. A comprehensive operating procedure detailing separate flushing instructions for each dead-end was developed and continues to be used today.

Maintenance staff, under the direction of the Water Distribution Supervisor, follow the program instructions and record their activities. This program has been incorporated into the Unidirectional Flushing program, see Section 6.3.8.

6.2.9 Valve Exercising

The AWWA technical manual *M44 Distribution Valves: Selection, Installation, Field Testing, and Maintenance*, suggests that valve exercising should be conducted each year and more frequently for valves 16 inches and larger.

The Water Utility has a Valve Exercising Program, which is in concert with the Unidirectional and Dead-end Flushing programs. Historically, distribution valves have only been exercised on a limited and sporadic basis. Through the Valve Exercising Program, the City's goal is to exercise 25 percent of the distribution valves each year. Hydrant foot valves are not included in the valve exercising program and instead, are exercised as part of the hydrant inspection process.

Opening and closing valves by hand is a repetitive, ergonomically unsafe, and time-consuming task. The City has purchased a portable valve exercising machine and vacuum device to speed up removal of debris that collects in the bottom of valve boxes. Valves requiring repair or replacement are documented and corrected by City Staff or contractors.

Additionally, Distribution staff work with GIS staff to correct inaccurate valve information in the City's GIS data.

6.2.10 Unidirectional Flushing

In 2013, the City implemented a comprehensive Unidirectional Flushing (UDF) program to flush its water system. The program's goals include:

- Improving cleaning of accumulated deposits on pipes,
- Reducing water use, as compared with conventional flushing, and
- Reducing the impact on customers.

The Water Distribution Supervisor is responsible for the UDF program to maintain Water Quality.

The UDF process concentrates flow within a pipe by closing valves and using specific hydrants to isolate each pipeline and create flow in a single direction. The concentrated flows increase velocities within the pipe that results in scouring of accumulated deposits on pipes. UDF may remove sand, gravel, plastic, biofilms, and other accumulated materials that are not removed by conventional flushing. The cleaned mains may have improved water clarity or color, reduced turbidity, and improved chlorine residual.

Flushing times of a half hour or less are typical, which can equate to substantial water savings. Therefore, UDF is a key component of the City's Water Use Efficiency (WUE) program. The reduced flushing time also limits the impact on the Water Utility's customers.

As previously mentioned, the City has incorporated the valve exercising and dead-end flushing programs into the UDF program. Valves not used as part of a flushing sequence along each pipe length are exercised by distribution system staff to complete the Valve Exercising Program. While the UDF program flushes dead-end mains, more frequent dead-end main flushing may be required for water quality reasons. The UDF program also provides static pressure measurements.

The City's goal is to conduct UDF of approximately 20 percent of the system each year.

6.2.11 System Loss Program

The City has committed to an active System Loss Program to maintain water loss under 10 percent. The achievement is documented each year in the Distribution System Leakage Report. Elements of the Program include Leak Detection, Source Meter Calibration, Large Meter Testing, and Meter Replacement. Each of these is discussed in detail below.

6.2.11.1 Leak Detection

The City is committed to a tight, non-leaking water distribution system. As of 2016, the city implemented an in-house Leak Detection program, with a goal to inspect 90 miles of water main every year.

6.2.11.2 Source Meters

Source meters, also known as production meters, measure the amount of water emitted from the City's springs and wells. They are calibrated by an outside contractor under the direction of the Water Operations Supervisor and if a meter cannot be calibrated properly, it is replaced with a new one.

6.2.11.3 Meter Replacement Program

Between 2017 and 2018, the City replaced all service meters with an Automated Metering Infrastructure (AMI) system, under the Water Meter and Billing System Improvements project. The system automatically receives meter reads via radio transmission and integrates the data into the City's billing software. The benefits of an AMI system include increased accuracy and efficiency; early leak detection; high usage, zero usage, and backflow detection; and improved customer service. This has saved staff time associated with regular meter reading, missed or incorrect reads, final reads for customer account close-out, and confirmation of high reads for potential leaks. An optional interactive customer portal allows customers to view their monthly, daily, and hourly usage to see exactly when they are using water and how much. This allows customers to better understand their water usage, encourages conservation, and potentially saves them money.

The AMI system is anticipated to have a 20-year life. That includes the system components and batteries in the radios. Meter replacement will be on a 20-year program to coincide with the AMI system.

6.2.11.4 Meter Services

Water Distribution staff are responsible for all new service connections under three inches and contractors are usually secured for installation of sizes three inches and larger. Repairs, retrofits, or replacements of existing services are typically conducted by Water Distribution Staff unless unusual circumstances arise. Meter services consist of meters, meter vaults, meter boxes, service lines, valves, setters, and other associated equipment. The City uses master meters when beneficial to the City and its customers. Master meters are currently used at several mobile home parks, the Auburn Business Park, and Muckleshoot Indian Tribe (MIT) commercial properties.

6.2.11.5 Large Meter Testing

Large meters are devices that measure water consumed by customers with significant demand requirements. They are usually employed by the following customer classes:

- Commercial
- Farms or Parks – Irrigation
- Schools
- Multifamily Complexes
- Industrial / Manufacturing Businesses
- Wholesale Customers
- Municipal Buildings

Large meters are defined as water meters three inches or larger. The system contains a total of 151 large meters, all of which are calibrated annually, as part of the City's System Loss Program.

Calibration of large meters is conducted by an outside contractor, but one maintenance staff member under the direction of the Water Distribution Supervisor assists in the process. If a meter cannot be calibrated, it is replaced with a new one.

6.2.12 Distribution System Corrosion Inspection

One program that the Water Distribution Division would like to activate, if additional funds and labor resources are available, is a Distribution System Corrosion Inspection program. A significant percentage of the City's piping system is constructed of metal which is subject to corrosive deterioration. Corrosion is an electrochemical reaction whereby metal is eroded and reduced. It is not possible to stop corrosion of metal pipe, but it can be substantially reduced if proper anti-corrosive measures are taken.

The Distribution System Corrosion inspection will identify which pipes can benefit from corrosion resistance measures, resulting in a longer serviceable life. Popular measures taken to resist corrosion include coatings, poly-bagging, and anode packs, and they are described further below:

- Coatings are electrical insulator types of finishes applied to a surface and is the most common method of corrosion protection. Though coatings are common, they are subject to damage and decay. Damage from soil stress such as contraction and expansion can rip coatings from pipes. Pinholes in the insulation, also known as holidays, can allow seepage between the coating and pipe and accelerate corrosion. Penetration of the pipe occurs even more rapidly when pinholes are present than it would on a bare line.

- Anode packs are metal cylinders that are connected to a metal structure via electrically conductive wires and inserted into the ground adjacent to the structure. The ground is subject to stray electric currents and these currents are the electrical component of the electrochemical nature of corrosion. Anode packs become the sacrificial metal to corrode in lieu of the structure. This type of treatment, when initiated, provides benefits in two ways: 1) it could save substantial amounts of money by reducing unnecessary, early replacement of pipe and 2) it would reduce possible disruptive service to the City's customers that could occur if pipe replacement were necessary. Though anodes packs are effective and economical, their current capacity is limited and they typically have a short lifespan.

- Poly-bagging is the process of wrapping the exterior of buried water mains and appurtenances, typically under the influence of corrosive soils, with polyethylene, creating a protective layer around the mains and appurtenances. Poly-bagging is an effective method for corrosion protection of water mains and they are resistant to tearing or puncturing. Though economical, they are not as environmentally friendly and add another layer to maintenance activities.

6.3 Comprehensive Water Quality Monitoring

The Water Operations staff maintains an active and ongoing program of water quality monitoring and reporting to ensure a safe, high quality water supply. Two staff members are responsible for water quality monitoring, sampling, control, and record keeping. The Water Operations staff also receives assistance from the Engineering Services - Water Quality Program Coordinator. A detailed description of the City's water quality monitoring and results is presented in Appendix Q, which includes the following:

- Summary of the City's water quality monitoring programs.
- Summary of recent water quality testing results.
- Summary of the Wholesale Interties Blending Evaluation.

The City's Water Quality Monitoring Program is detailed in a manual entitled "City of Auburn Public Water System Water Quality Monitoring Plan" provided in Appendix O. The document includes plans associated with coliform, lead and copper, disinfection by-products and treatment specific monitoring, and the Water Quality Monitoring Schedule. These plans comply with DOH regulations for Group A public water systems. All sampling is conducted in accordance with the annual Water Quality Monitoring Schedule received from DOH. The City samples for inorganic and physical parameters, synthetic and volatile organic compounds, asbestos, nitrate and nitrite, radionuclides, coliforms, residual chlorine, disinfection byproducts, lead and copper, fluoride, and per and poly-fluoroalkyl substances (PFAS). A map of the sampling locations is included with the documents provided in Appendix O.

Additional sampling also occurs based on special requests by DOH or by customers concerned about water quality issues involving unusual taste, odor, or color.

The Water Manager maintains hard copies of the water quality analysis laboratory reports. These reports are kept at the M&O Building in files organized by years and analysis type. As specified by DOH regulations, chemical analysis reports are kept indefinitely, and bacteriological reports are maintained for a minimum of five years.

The City will comply with the Follow-Up Action Requirements of WAC 246-290-320 whenever water quality results exceed a prescribed level. The Water Utility also complies with the requirements of WAC 246-290 for public notification, as established by the Safe Drinking Water Act (SDWA) and DOH.

Forms for "Water Boil Notification" and "Drinking Water Problem Corrected Notification" have been developed and are available for immediate distribution, if necessary. A list of the appropriate print, TV, and radio media to contact for public notice is included in the electronic Emergency Response Manual. An additional procedure described in the Emergency Response Manual to address water quality issues involves an "Action Plan for Water System Contamination Via Threat Warning."

The City maintains equipment to perform some basic water quality monitoring functions. However, all testing required for water quality regulatory compliance is contracted to independent testing laboratories. The current primary laboratory used by the City is:

Water Management Laboratory
1515 80th Street East
Tacoma, Washington 98404
206-531-3121

If testing cannot be done on a timely basis, the City also uses the following laboratory:

Analytical Resources, Inc.
4611 South 134th Place, Suite 100
Tukwila, WA 98168
206-695-6200

6.4 Emergency Preparedness and Response

The City has prepared an electronic Public Works Emergency Response Manual (Manual) as a guide for management of emergency situations, with the objective of protecting life and property and restoration of essential services, such as providing clean water, as quickly as possible. The Manual is only one element of the City's overall Emergency Response Plan, which serves as a guide and was first developed in 1999 in response to the potential impact of Y2K. The Emergency Response Plan is updated annually at the first of the year. It is not all-inclusive for every type of disaster that could occur but is a valuable tool for dealing with many of the emergency situations that most utilities could face.

The Manual contains a detailed table of contents and is tabbed to allow quick access to information. Three copies of the Manual have been published. Copies are located at the M&O Building, in Engineering Services with the Public Works Director, and at the Valley Regional Fire Authority, Station 31. The Manual is also available in digital format on the City's computer server.

The master response program for the entire City is documented in the Comprehensive Emergency Management Plan (CEMP), which provides guidance to the Emergency Management Organization for mitigation, preparedness, responsibilities, recovery operations, training, and community education activities. The CEMP also describes the functions of local government and incorporation of essential non-governmental organizations into the Emergency Management Organization. Copies are in each City Department, the Public Works M&O Building, and the Valley Regional Fire Authority, Station 31. The CEMP is also available in digital format on the City's Emergency Operation Center (EOC) computer server.

An additional emergency response manual that is available for use is the Water Division Intertie Locations and Policy Manual. This manual contains contact names, addresses, and phone numbers for cities and water districts that have intertie connections with the City. Included are photos of the intertie vaults, valves, and meters, along with information for activating or deactivating an intertie. Three copies have been published and are located at the M&O Building, in Engineering Services with the Water Utility Engineer, and at the Valley Regional Fire Authority, Station 31.

The City has been involved with several tabletop exercises to prepare for emergencies and they are an ongoing feature of the City's Emergency Response Program. Staff, depending on their position, have also been trained for emergencies in accordance with the Federal Emergency Management Authority (FEMA)

under the auspices of Homeland Security. The training program, known as the National Incident Management System (NIMS), offers educational classes tailored for the Incident Command System (ICS).

The NIMS and ICS program is a solid blueprint for federal and local emergency command activities, but it does not provide the type of response details needed by PW maintenance staff and managers. Consequently, the PW Emergency Response Manual is the reference tool referred to on a more intimate scale.

6.4.1 Vulnerability Assessment

The City's Vulnerability Assessment (VA) was prepared in 2004 under the guidance of an engineering consultant firm and it was submitted to the USEPA on November 15, 2004. A Water System Security Improvement Plan (WSSIP) was also prepared in conjunction with the VA to prevent or significantly lessen the impact of intrusive activities.

Recommendations noted in the WSSIP have been adequately addressed by completing the SCADA system upgrades and physical security project. As further upgrades are completed at City facilities, the recommendations noted in the WSSIP are considered, as well as other considerations as technology continues to advance.

6.4.2 Wellhead Protection Program

The City's wellhead protection program is key to managing potential sources of groundwater contamination prior to their entry into the drinking water system. The wellhead protection plan (WHP) was updated as part of the Plan and summarized in Chapter 5.

Engineering Services staff are charged with implementation of the program. Staff track and follow up on construction projects, spills, and monitor possible contamination sources, as possible.

6.4.3 Water Shortage Contingency Plan

In Auburn City Code (ACC) 13.14 the Mayor may order water use restrictions and conservation measures, when necessary, to protect public health, safety, and welfare during a water shortage or emergency caused by drought conditions, city water utility damage or destruction, or any other cause which threatens to disrupt or diminish the City's water supply below its ability to meet normal demands.

The City has also updated its Water Shortage Contingency Plan, attached as Appendix R, which establishes actions and procedures during impending or actual water shortages. These actions and activities maintain levels of service essential for public health and safety, minimize adverse impacts on economic activity, and protect customers' lifestyles. The plan addresses both progressive situations, such as those that are weather-related, and more drastic and immediate situations such as facility emergencies (e.g., a pipeline break). Initial stages of the Water Shortage Contingency Plan may coincide with efforts in the WUE program; however, it is distinct as it is a response to a specific situation, and it may lead to mandatory restrictions and curtailment.

6.5 Safety Procedures

The City has a comprehensive safety program that meets Occupational Safety and Health Administration (OSHA) and Washington Industrial Safety and Health Act (WISHA) regulations. The safety policies and procedures for the water department are documented in 25 policies that are summarized in Table 6-3. The

policies cover the full range of hazards staff may experience while operating the water system. These include, but are not limited to, operation of motor vehicles and equipment, chemicals, confined spaces, falls, traffic, and fires. Each policy includes a purpose, organization affected, references, the policy, definitions, procedures to implement the policy, and responsibilities for the implementation. Responsibilities are assigned to individual roles, such as employee, supervisor, or safety manager. The policies and procedures clearly identify contact information of the applicable regulating agencies in case of a serious incident. All policies are available on the City's intranet.

Table 6-3 | Safety Policies and Procedures

Number	Policy Name	Description
300-01	Workplace Health & Safety	Document workplace health and safety policy
300-03	Hearing Conservation	Implement program to protect employee hearing
300-04	Personal Protective Equipment	Establish policy that requires employees to always use personal protective equipment when performing certain tasks or when in an unsafe environment
300-05	Flagger Certification	Flagger certification requirements
300-06	First Aid	Employee first aid training, first aid supplies and emergency stations
300-07	Hazard Reporting	Procedure to report an obvious or potential safety or health hazard
300-08	Incident Reporting	Procedures for reporting non-vehicular incidents
300-09	On The Job Injury	Establish policy to monitor on-the-job injuries
300-10	Safety Inspection of City Owned Facilities	Procedure for inspection of all City-owned and operated facilities
300-11	Central Safety Committee	Establish function and structure of Central Safety Committee
300-13	Emergency Evacuations of City Buildings	Procedure for evacuation of City buildings in the event of an emergency
300-14	Safety Restraints & Seat Belts	Requires mandatory use of safety restraints/seat belts while driving or riding in the City vehicles
300-15	Excavation Trenching & Shoring	Establish policy for shoring and sloping all excavations or trenches over four (4) feet in depth
300-16	Safety Line Procedure All Cranes, Backhoes, & Hoists	Procedures for controlling moving loads being hoisted or swinging ground or truck using hoists, backhoes, cranes, or any mechanical device use in moving loads
300-17	Chemical Hazard Communication (Worker Right To Know)	Establish chemical and global hazard communication program to assure the health and safety of City employees
300-18	Welding, Brazing, & Cutting	Procedure for welding, cutting or brazing work or practices which may result in an injury or death
300-19	Lockout & Tagout	Requirements for the lockout or tagout of energy isolating devices
300-20	Bloodborne Pathogens	Procedure to prevent exposure to blood or other substances and materials that may carry bloodborne pathogens. Procedures for decontamination of equipment and evaluation and treatment of employees who experience exposure.
300-21	Reporting Vehicle Accidents	Procedure for reporting vehicle accidents
300-22	Heat Related Illness	Training for potential heat related illness

Number	Policy Name	Description
300-23	Confined Spaces	Procedures for entering a confined space
300-24	Green Housekeeping Guidelines	Procedures that sustain a "Green Cleaning" environment
300-25	Respiratory Protection Program	Procedures that will prevent employees from inhaling hazardous airborne chemicals
300-26	Fall Protection & Rooftop Safety	Procedures for rooftop safety and use of fall protection
300-27	Powered Industrial Trucks	Training, operation, and safety of powered industrial vehicles

In addition to the policies, all M&O staff receive safety training. The contents of the training are periodically reviewed and updated, if necessary, through departmental and city-wide safety committees. The Human Resources and Risk Management Department maintains information and schedules on safety training.

The City maintains appropriate safety equipment and information. Each vehicle and facility have a fire extinguisher and first aid kit. All staff use personal protective equipment, such as hard hats, safety glasses, safety vests, etc., appropriate to the task. Climbing equipment and lockout/tagout equipment is available and stored at the M&O Building and the Well 7 storage facility. Additionally, each site with chemicals has a Safety Data Sheets (SDS) book that contains the Material Safety Data Sheets (MSDS) for all chemicals on site. A master sheet of all chemicals used by the Water Utility is maintained at the M&O Building.

6.6 Cross Connection Control Program

The City's Cross Connection Control Program (provided in Appendix Q) protects the public water system as defined by WAC 246.290.010, WAC 246.290.490, and Auburn City Code (ACC) 13.12 from contamination via cross connection hazards. It describes minimum operating policies, provides guidelines for installation, testing, and maintenance of approved backflow prevention assemblies, permitting process, inspection, and survey requirements for existing and new water service connections. The program is maintained by two Cross Connection Specialists under the direction of the Water Operations Supervisor. The specialists are responsible for identification and elimination of potential and actual cross connections and contamination hazards within the public water system.

6.7 Sanitary Survey Findings

DOH completes periodic inspections of the City's water facilities, their operations, and facility records to identify potential health risks to the public. The sanitary survey, conducted by DOH on August 22, 2022, identified significant deficiencies such as air gaps or backflow assemblies that must be added to the water supply lines at Wells 5 and 5A. Additionally, repair needs were identified for the reservoir overflow screens at Reservoirs 8A and 8B.

DOH identified the need to terminate the pump to waste line at Well 5 above grade and either raise the casing at Well 5A or provide a sump pump or alarms to address potential water accumulation in the vault. Weekly vault inspections, especially after significant storms, were recommended until a permanent solution is implemented.

The survey noted that the reservoir vents at Reservoirs 4A, 4B, and 8A should open downward to prevent debris entry. It also identified a need for evaluation of the overflow piping at Reservoirs 2, 4A, and 4B, to ensure compliance with regulations.

The next DOH sanitary survey is scheduled for 2027.

The City has taken the following actions to address some of the deficiencies identified in the sanitary survey.

- A backflow assembly was installed at Well 5A.
- The reservoir overflow screen at Reservoirs 8A and 8B was repaired on September 13, 2022.
- The City implemented an inspection and maintenance program to conduct weekly inspections at Well 5A and immediately after a significant storm even.
- The direct connections of reservoir overflows (Reservoirs 4A and B to drains, sanitary sewer, and/or storm sewer) have been addressed.

The following deficiencies identified in the sanitary survey will be addressed with ongoing or planned Capital Improvement Projects identified in Chapter 8 and are captured in Section 6.10.2 as recommended improvements:

- Reservoir vents will be retrofitted or replaced as part of the ongoing Reservoirs 4A, 4B, 8A, and 8B Seismic Valves Retrofit capital project.
- The request for the pump to waste line at Well 5 to terminate above grade will be addressed with a capital improvement project.
- The direct connections of reservoir overflows (Reservoirs 2) to drains, sanitary sewer, and/or storm sewer, will be addressed with a capital improvement project.

6.8 Customer Complaint Response Program

One member of the Water Distribution staff is a Customer Service Representative. This individual is responsible for meter turn-on and turn-off, delinquency notices, meter rereads, new service reads, final service reads, leak adjustments, high consumption investigations, account documentation, and other duties, as assigned. The employee maintains a modified work schedule, which provides more flexibility in dealing with emergency service requests by customers.

Beginning in 2006, the Water Utility, along with the rest of PW transitioned to an asset management software system called CarteGraph. Some of the benefits include:

- Ability to assign and track citizen complaints and requests
- Produce work orders
- Monitor work and maintenance projects
- Track costs for labor, equipment, and material
- Enhanced inventory control
- Integration with GIS
- Benchmark analysis
- Generate reports
- Track infrastructure conditions – GASB 34

The City has a customer service program accessible by the public and City staff via the City's website. Customers fill out the online Citizen Report form and describe the services they are seeking. The submitted form downloads into the CarteGraph system for review and action by staff. In addition, customers can stay connected with the City on mobile devices with a SeeClickFix application. The SeeClickFix app allows customers to report graffiti, abandoned vehicles or potholes, water issues, etc.

6.8.1 Customer Request Response Program

As described above, the CarteGraph system can assign and track customer requests (or complaints) and produce work orders. The City maintains a list of requests and identifies the work done to respond to any requests from the public. The City categorizes the citizen reported issues into the following five categories:

- Water Appearance: contains all requests related to the color of the water (brown, discoloration, cloudy, etc.)
- Odor: contains all requests related to water smell (chemical, sulfur, chlorine smell, etc.)
- Pressure: contains all requests related to change in water pressure (pressure drop, high water pressure, fluctuation in pressure, etc.)
- Taste: contains all requests related to water taste (poor, bitter, strong chlorine taste, etc.)
- Water Quality: contains all requests related to a combination of odor, taste, and discoloration issues.

Customer requests are entered into the CarteGraph or SeeClickFix and a work order is generated. Typically, a Distribution staff member or team will investigate the issue and respond directly to the customer.

A table summarizing the number and type of requests or complaints is provided in Chapter 3.

6.9 Recordkeeping and Reporting

All recordkeeping and reporting practices follow DOH regulations as specified in WAC 246-290-480. The Water Manager maintains hard copies of the water quality analysis laboratory reports. These reports are kept at the M&O Building in files organized by year and analysis type.

Analytical laboratories submit reports directly to DOH. As specified by the regulations, chemical analysis reports are kept indefinitely, and bacteriological reports are maintained for a minimum of five years. Additionally, Construction Completion Reports are submitted to DOH, as required. Construction Completion Reports for distribution main projects are maintained on file at the City and are available upon request by DOH, in accordance with WAC 246-290-125.

Water production and purchase source meters are read daily (during the work week). Paper copies are scanned at the end of the month and digital copies in pdf format are maintained on the City computer server by month and year. Annual summary spreadsheets are also maintained on the computer server. This data is added to the monthly DOH reports. Records are maintained for a minimum of 10 years.

Chlorine residual samples are collected in the distribution system and analyzed on a weekly basis. Summary spreadsheets are maintained on the City computer server by year. Records are maintained for a minimum of three years.

Monthly reports containing water production and treatment data are submitted to DOH by the 10th day of the following month, using forms provided by DOH. Signed paper copies are scanned to produce a digital copy and are maintained on the City computer server, organized by year. Digital copies are maintained for a minimum of 10 years.

Most records that Water Utility collected in the past are based on hard copy paper forms. This includes forms that track maintenance and inspection records used for pumps, valves, meters, reservoirs, hydrants, operating equipment, etc. A portion of the integration process with CarteGraph involved the collection and collation of historical data into a form that can be downloaded into the software system. The City's goal is a near-paperless documentation system that can be accessed by staff in the office, field, or home on a 7-day, 24-hour basis. Existing electronic records include those described below.

6.9.1 Cross Connection Control Program

Cross Connection Control records are managed with Tokay software and Laserfiche. Test reports conducted are stored in Laserfiche and are kept for 5 years. Tokay is used for creating reports, identifying and updating when tests are required, and general data entry and management of cross connection devices per parcel.

6.9.2 Water Meter Consumption

Water meter consumption records are maintained by the Finance Department using the Springbrook Utility Billing System. These records include customer account data for classes of customers, billing, service, comments, and questions. The system also includes a tracking feature for water sold each month as well as annual total water sales. The tracking feature is useful because data on water consumption by customer type and season supports the City's WUE Program, per Chapter 4. The Finance Department also provides staff with monthly financial reports regarding Water Utility operations.

The City also uses AMI throughout the system as a tool for the WUE Program. Using AMI data, the City may be able to identify customer leaks and, as a result, provide cost savings in the Leak Detection, Repair, and Service Meter Replacements programs. Advanced metering also aids the City's efforts to reduce non-payment of bills and water theft.

6.9.3 Supervisory Control and Data Acquisition (SCADA)

The SCADA system monitors, records, and controls water system operations at various facilities. The electronic records are maintained by the IT Department and a back-up copy is made each evening to ensure that records are retrievable should hardware or software failure occur.

Please note that the SCADA system is discussed more thoroughly in Section 6.2 of this chapter.

6.9.4 Water Meter Reading

Effective January 1, 2019, the City transitioned to monthly consumption billing. The Utility Billing staff imports the water meter reads monthly into the City Utility Billing System. With the implementation of the AMI system, the City obtained a Cloud-Based Data Analytics Solution with meter data management capabilities called Sensus Analytics. Within Sensus Analytics, is a billing access application, which enables Utility Billing staff to generate and export a billing request file defined by a billing cycle and billing window. Subsequently, the file that contains meter numbers, account numbers, and current water meter reads are imported into the City Utility Billing System. The Utility Billing staff reviews abnormally high or low consumption levels compared to previous readings from the previous year, same period.

Water service meters are read monthly to document customers' water usage for billing purposes. The AMI system automatically stores and transmits the water use data for utility billing, without the need for personnel to collect the data on site.

6.10 Summary of O&M Deficiencies and Recommended Improvements

6.10.1 Water Facilities Evaluation Study

The City completed an extensive Water Facilities Evaluation Study in 2014. The study conducted a physical inspection and evaluation of 40 out of the City's 97 water supply facilities. Inspections included pump stations, treatment facilities, reservoirs, wells, transmission mains, and PRVs. Inspections considered general conditions, corrosion and rust, structural deficiencies, ability to meet current code, and operational constraints. In addition to the inspections, the remaining useful life of the facilities were developed in a desktop analysis for pump, motor, pipe, valve, general electrical equipment, and major electrical equipment.

Where notable deficiencies were identified in the inspections or assets exceeded their usable life, improvements were recommended. Many of the recommended improvements have been completed or are currently scheduled to be completed and identified in the Capital Improvement Plan. Remaining improvements less than or equal to $10,000 are considered capital maintenance projects, which the City staff or a small works contractor will address as part of the normal M&O budget and are not identified in the Capital Improvement Plan.

Based on the observed facilities, general maintenance improvements are recommended for each facility to create a schedule of improvements based on the facility's remaining useful life. Regular facility inspections are also recommended, as summarized Table 6-4. Additionally, maintenance plans were developed for each inspected water system facility. These plans included the improvement type, estimated project cost, and frequency the improvement is required.

Table 6-4 | Recommended Inspections

Asset Type	Recommended Inspection	Frequency (years)
Pump	Perform pump test	5
Motor	Check motor amp draw	5
Reservoir	Inspect coating thickness	5
Reservoir	Inspect reservoir interior	5
PRV Station	Inspect for corrosion and signs of flooding	1
Structure	Inspect for cracks in grout (where applicable)	1
Piping	Inspect for general coating conditions	3

6.10.2 Recommended Improvements

The City operates and maintains an efficient, environmentally sound, and safe water system. Recommended improvements include the outstanding projects identified from the 2014 Facility Evaluation Study, outstanding items to be corrected from the 2022 Sanitary Survey, and general continued repairs and maintenance activities that are conducted by M&O staff or contracted out. Table 6-5 provides a summary of the identified O&M projects and their costs.

Table 6-5 | O&M Improvement Projects

O&M Deficiency	Planned Year	Notes
The pump to waste line at Well 5 to terminate above grade will be addressed with a capital improvement project. (Identified in 2022 Sanitary Survey)	2026-2028	Included with the Well 5/Well 5A Upgrades Project
Raising the casing at Well 5A to terminate above grade or the provision of a sump pump or alarms to activate when water accumulates in the vault. (Identified in 2022 Sanitary Survey)	2026-2028	Included with the Well 5/Well 5A Upgrades Project
Reservoir vents will be retrofitted or replaced as part of the ongoing Reservoirs 4A, 4B, 8A, and 8B Seismic Valves Retrofit capital project. (Identified in 2022 Sanitary Survey)	2024-2025	Included in CP2219 – Reservoirs 4 and 8 Seismic Rehabilitation
The direct connections of reservoir overflows at Reservoirs 2 to drains, sanitary sewer, and/or storm sewer, will be addressed with a capital improvement project. (Identified in 2022 Sanitary Survey)	2024-2025	Included in Reservoir 2 Valves Project
Conduct inspections of facilities at frequency recommended in the Facilities Evaluation Study.	--	Refer to **Table 6-4**. To be completed via annual M&O operating budget.
Continue distribution system corrosion inspection.	TBD	To be completed via annual M&O operating budget as funds are available.
Develop a UDF Program for the Lakeland Service Areas.	TBD	To be completed via annual M&O operating budget as funds are available.
Replace source water supply meters with flow transmitters for improved electronic data transmission and record keeping.	TBD	To be completed via annual M&O operating budget as funds are available.
Continue PRV Vault Repairs	2024-2026	To be completed via annual M&O operating budget as funds are available.
Continue Pump and Equipment Repairs and Maintenance	2024-2026	To be completed via annual M&O operating budget as funds are available.
Continue Annual HVAC Maintenance and Repairs	2024-2026	To be completed via annual M&O operating budget as funds are available.
Continue Fencing Repairs at Water Facilities	2024-2026	To be completed via annual M&O operating budget as funds are available.
Continue Generator Maintenance and Repair	2024-2026	To be completed via annual M&O operating budget as funds are available.
Continue Large Meter Repair and Testing	2024-2026	To be completed via annual M&O operating budget as funds are available.
Continue Chlorine Feed and Analyzer Maintenance	2024-2026	To be completed via annual M&O operating budget as funds are available.

O&M Deficiency	Planned Year	Notes
Continue Vegetation Control and Maintenance at Water Facilities	2024-2026	To be completed via annual M&O operating budget as funds are available.

CHAPTER 7

Distribution Facilities Design and Construction Standards

This chapter outlines the Engineering Design and Construction Standards (EDCS) of the City of Auburn (City), concerning its water system. It encompasses policies and procedures governing project review and approval. To ensure the highest level of water system reliability, integration of the EDCS into the broader city infrastructure is essential. The City recognizes the interdependence of its water system with other municipal services. As such, there is an ongoing collaborative effort between the Water Division and other relevant City departments, such as Community Development and Finance, as well as non-City stakeholders, such as the Valley Regional Fire Authority (VRFA).

The integration of the EDCS in this Water System Plan empowers the City to employ an alternative review process for distribution main projects, through the submittal exception process, which permits the City to approve project reports and construction documents without written approval from the Department of Health (DOH). This submittal exception is granted provided the conditions specified in WAC 246-290-125(2) are met.

The submittal exception does not apply for source of supply, reservoir, pump station, and water treatment projects. For those projects, the City will seek approval from DOH through the submittal process outlined in WAC 246-290-110 and 246-290-120.

The following topics are addressed in this chapter:

7.1 Project Review Procedures
7.2 Policies and Requirements for Outside Parties
7.3 Design and Construction Standards
7.4 Construction Certification

7.1 Project Review Procedures

For all construction activities related to the City's water system, coordination must be done directly through the City's Water Department. The City's Water Department reviews plans, including calculations, reports, and AutoCAD files, to verify conformity with development requirements, City standards, City policies, as well as other federal, state, and local requirements. The plan sets are required to feature an overall utility plan illustrating public water facilities and private connections within the water service boundary, regardless of whether the project is inside or outside the City limits. City staff also review projects proposed by developers or other water purveyors to determine impacts to the City's water system facilities.

Development review processes are detailed in the Engineering Design Standards (EDS), available on the City's website. Compliance with Washington State Department of Transportation (WSDOT) "Standard Specifications for Road, Bridge, and Municipal Construction," and relevant City, State, and Federal regulations is also evaluated during the review process.

All water-related improvements projects, whether for capital improvement or development, undergo a thorough review process by the Water Division, including evaluation by the VRFA and City's Fire Authority for fire protection standards. Additionally, all plans involving main extensions, modifications, and fire service installations must be stamped by a Professional Engineer licensed in Washington State.

7.2 Policies and Requirements for Outside Parties

The City manages the water utility in accordance with established water- system policies that govern various facets of utility operations. City policies are established by the City to provide a vision or mission of the water utility and to provide a framework for the design, operation, and ongoing wellbeing of the City's water utility.

Policies are developed specifically for the City's multi-source municipal water system and seek to provide consistent treatment to all utility customers and to provide documentation to current water-system customers as well as those considering service from the City. What is included in these policies is limited to those things related to the water system and its design, maintenance, and operation. There are other policies and criteria that pertain to the water utility the City has in place regarding land use, development, and financial components that could still have an impact on the needs of the water system. These policies and criteria may include factors such as zoning regulations, building codes, infrastructure requirements, and financing options. These additional factors will be considered when planning for the water system, to meet the needs of the community in a sustainable and effective matter.

Policies set forth for development are described in the Water System Policies provided as Appendix A of this Plan.

7.3 Design and Construction Standards

Within the Retail Water Service Area (RWAS), the City has established specific standards governing the design and construction of water mains, detailed in the City's EDCS. The EDCS collectively contains the following:

- City of Auburn Engineering Design Standards (EDS).
- City of Auburn Engineering Construction Standards (ECS):
    - City of Auburn Engineering Construction Standards – Standard Details (STD DTL)
    - City of Auburn Engineering Construction Standards – General Special Provisions (GSP)
    - City of Auburn Engineering Construction Standards – Technical Special Provisions (TSP)

These standards undergo periodic updates, with the most recent revision in 2024. The City's 2024 design standards and construction specifications related to the water system are outlined in Appendix P. Additionally, this plan incorporates relevant sections of the City's current construction standards, including materials, methods, and standard details applicable to the construction of water system appurtenances.

For detailed information, the latest versions of the collective EDCS are accessible for view on the City's Public Works web page.

Table 7-1 lists sections of the EDCS sections for the specifications, drawing standards, and special conditions of water main installations, extensions, and replacements. Standards for supply sources, reservoirs, pump stations, and water treatment facilities are not presented due to the complex nature of these facilities. For

those projects, the City will seek approval from DOH through the submittal process outlined in WAC 246-290-110 and 246-290-120.

Table 7-1 | Water Main Design and Construction Standards

Specifications for:	
Pipe material and pipe class. ANSI/NSF Standard 61 certified materials required for all pipes.	EDS Section 7.01.02
Disinfection procedures (include de-chlorination or chlorinated water disposal specifications).	TSP – 7.09.3(24)
Pipe bedding and installed depth of bury.	EDS Section 9.05
Bacteriological testing.	TSP – 7.09.3(24)N
Pressure and leakage testing.	TSP – 7.09.3(23)
Separation from sewer mains, non-potable conveyance systems, and other buried utilities.	EDS Section 6.02
Valve spacing.	EDS Section 7.03
Construction Drawings Standards	
Plan and profile views drawn to a particular scale	EDS Sections 3.03, 3.04 & 3.04.07
Easement locations and dimensions	EDS Sections 2.02, 3.04 & 3.04.07.B, 6.01, 7.01.04, 7.01.05, 7.02.01, 7.03 and STD DTL W-06.3, W-22.2, W-23.3,
Appurtenant Design Standard Drawings	
Pipeline trench cross-section, including pipe bedding, backfill, compaction, and road restoration standard details	STD DTL T-01
Hydrants (for fire, flushing)	STD DTL W-07, W-08
Valves	STD DTL W-17, W-18, W-19
Service Meters	STD DTL W-15, W-16, W-16a
Service lines and service connection to main	STD DTL W-9, W-13, W-14
Air relief, vacuum relief, and combination air-vacuum relief valve and valve vault	STD DTL W-02
Pressure reducing valve stations	Submittal review (project specific)
Thrust blocking	STD DTL W-01
Backflow prevention assemblies	STD DTL W-21, W-22, W-23, W-24, W-25
Blow-offs	STD DTL W-03, W-04
Special Conditions	
Pipeline corrosion mitigation measures	TSP 7.09.03(25)
Potable/non-potable pipeline crossing construction details	EDS Section 6.02
Stream-crossing construction details	N/A
Individual service booster pumps	N/A
Temporary water service (i.e., employed during water main replacement or emergency repair)	N/A

7.4 Construction Certification

Construction work aimed at improving City roads and utilities, whether initiated by private developers or the City itself, must adhere to approved contract documents. City approval is mandatory for any modifications to approved plans before implementation, especially for work within the public right-of-way (ROW) or designated easements. Compliance with general WSDOT/APWA Standard Specifications, approved plans, and the City's EDCS is strictly enforced.

Prior to the start of construction, a pre-construction meeting must be held by the City and the developer, contractor, and/or designated representative. Pre-construction meetings establish the first touch point between the City and developer/contractor to discuss the schedule, certain unique aspects of the work, any special restrictions, and general coordination and communication protocols. Consistent presence of the approved set of plans with redline markups identified and requisite permits at the job site during construction is a shared responsibility of the City, the developer, and the construction contractor. The City exercises its authority to enforce standards through appointed project engineers, assistants, and inspectors, ensuring collective adherence to specified standards. Inspections, test measurements, and actions outlined in the City's Development Guidelines and Public Works Standards are pivotal. Post-construction, the submission of as-built drawings is mandated.

Non-compliance with approved project documents can lead to stop-work orders and potential removal of completed elements, subject to penalties established by ordinance. The project's conclusive status is granted only when the City issues a formal letter of acceptance to the responsible party.

Upon completion of construction activities related to the water system, including disinfection, flushing, and pressure testing for water mains, a construction completion report must be submitted. This document becomes part of the project records, and the release of water meters for any lot or building linked to a project is contingent upon final acceptance.

CHAPTER 8

Capital Improvements Program

This chapter's objective is to develop a cohesive Capital Improvement Program (CIP) for the City of Auburn (City) by summarizing and prioritizing all capital projects identified in the previous chapters. The CIP provides a comprehensive accounting of capital projects needed to continue consistent, efficient water supply to the City's Retail Water Service Area (RWSA) through the 20-year planning horizon. The recommended projects were developed in coordination with City staff.

Projects identified as part of the City's asset management program that are anticipated to cost greater than $50,000 were included as capital projects. The capital projects discussed in Section 8.2 include water supply and storage improvements, improvements to the distribution system, and upgrades or replacement of aging facilities and distribution piping as discussed in Chapter 3.

Projects were allocated to the 10-year (2025 to 2034) and 20-year (2035-2044) planning horizons. Planned projects coincide with the City's current Capital Facilities Plan (CFP) and have been placed into specific years for planned completion. These timeframes are intended to be a framework for future funding decisions that directs when future actions and decisions are intended to occur. However, these timeframes are estimates, and depending on factors involved in the processing of applications and project work, and availability of funding, the timing may change from the included timeframes. The framework does not represent actual commitments from the City, which may depend on funding and staffing resources available.

8.1 Prioritization

8.1.1 Project Identification

Capital projects are organized into two categories to help provide a better understanding of the primary project driver as follows:

- Capacity Projects (CAP): These projects are needed to expand infrastructure capacity to meet increased demands associated with current deficiencies or projected growth.
- Non-Capacity (Non-CAP): These projects are needed to address aged and/or obsolete equipment to maintain and/or improve the reliability of the infrastructures system. These projects are needed to improve existing infrastructure for reasons other than capacity.

The capital projects are also identified and grouped into categories based on the infrastructure they are focused on. Each project is assigned an identification number (Project ID) with the following ID prefixes:

- Supply (S): These projects are associated with the City's water supply sources and treatment facilities.

- Storage (R): These projects are associated with the City's storage reservoirs or allow modifications in the system impacting reservoir storage transfer throughout the RWSA.
- Pump Stations (PS): These projects are associated with the City's pump stations or booster pump stations (BPS).
- Distribution (D): These projects are associated with the City's transmission and distribution piping systems.
- General Improvements (G): General improvement projects do not fit into the other categories and may be broader, impacting multiple components of the City's water system.

8.1.2 Prioritization Factors

The capital projects for the facilities improvements were prioritized based on system deficiencies, safety concerns, maintenance or capacity requirements, and regulatory requirements.

The capital projects for the capacity driven distribution system improvements were prioritized based on the fire flow availability; projects resolving the largest deficits were prioritized higher, and as such are planned to be completed sooner than projects resolving smaller deficits. The capital projects for the condition driven distribution improvements were prioritized based on the existing pipe age, size, and material. More details are discussed in Chapter 3.

The priority order of these improvements is reflected in the schedule of improvements, which is presented in Section 8.3 and Appendix W.

8.1.3 Estimated Costs

"Active projects" are projects that are currently underway for completion. The project costs presented include total project costs for the current and future years and are presented in 2024 dollars.

For projects already included in the City's 2023 CFP, it was assumed that the project cost in 2024 dollars remains the same, unless the costs were identified as needing to be reassessed.

For planned capital projects identified in the 2015 WSP that have not been completed and are not included in the City's 2023 CFP, the project costs were escalated from 2014 dollars as presented in the 2015 WSP to 2024 dollars using the Engineering News Record (ENR) Construction Cost Index (CCI).

For all other projects that were newly identified, modified, or reassessed, planning-level project cost estimates were developed for the improvements using average costs from RSMeans, HeavyBid Construction Cost Data, recent City of Auburn project bid tabs, City input, industry experience, and local contractor and supplier costs. These project costs are planning-level estimates and are categorized as Class 5 estimates, as defined by the Association for the Advancement of Cost Engineering (AACE) International:

> *Class 5 estimates are generally prepared based on very limited information, and subsequently have wide accuracy ranges. As such, some companies and organizations have elected to determine that due to the inherent inaccuracies, such estimates cannot be classified in a conventional and systemic manner.*
>
> *Class 5 estimates are prepared for any number of strategic business planning purposes, such as but not limited to market studies, assessment of initial viability, evaluation of alternate schemes, project*

screening, project location studies, evaluation of resource needs and budgeting, long-range capital planning, etc.

Typical accuracy ranges for Class 5 estimates are -50 % to -20% on the low side and +30% to +100% on the high side, depending on the construction complexity of the project, appropriate reference information and other risks (after inclusion of an appropriate contingency determination). Ranges could exceed those shown if there are unusual risks.

All project descriptions and cost estimates in this WSP represent planning-level accuracy and opinions of costs (-50 percent to +100 percent).

During the pre-design phase of each project, the project definition, scope, and specific information (e.g., pipe length and diameter, roadway restoration requirements, permitting requirements) should be verified. The final cost of individual projects will vary depending on actual labor and material costs, site conditions, market conditions, regulatory requirements, project schedule and other factors. Because of these factors, project feasibility and risks must be carefully reviewed prior to making specific financial decisions or establishing project budgets to support proper project evaluation and adequate funding.

Total estimated project costs were developed through a progression of steps and multiple methodologies. The steps included development of component unit costs, construction costs and, finally, total project costs. The component unit cost includes the sum of materials, labor and equipment of a project's basic features. The construction cost is the sum of component costs and construction markups, which includes a 30 percent allowance for contingency and 10.2 percent for sales tax. The total project costs presented is the sum of construction costs with the following additional allowances:

- 15 percent for City management, survey, legal, and project administration.
- 15 percent engineering design.
- 15 percent construction management and inspection.

The following costs are not included, unless specifically noted:

- Land or right-of-way acquisition.
- Maintenance expenses.
- Operation expenses.

All cost estimates were developed as total project costs in March 2024 dollars. In Table 8-10, costs have been inflated and escalated using an annual increase rate from 2024 dollars to their planned implementation year. For projects that will be designed or constructed in 2024, an annual increase of eight percent was used. For projects that will be designed or constructed after 2024, an annual increase of five percent was used. For future budgeting purposes, the latest engineering news record (ENR) Construction Cost Index (CCI) can be used to project current estimates to the year of implementation. The cost estimates for the Auburn area used the ENR CCI in Seattle of 15,477 (March 2024).

8.1.3.1 Pipeline Component Unit Costs

The pipelines unit costs were developed using recent City construction bid tabs assuming the use of ductile iron pipe and a typical cover depth of four feet. The estimated unit cost is provided by pipe diameter per linear foot of pipe in Table 8-1, which includes the cost for the pipe, trench, roadway restoration, appurtenances, installation, and direct construction markups. As the diameter of pipe and the trench width increase, the costs also increase.

Table 8-1 | Water Pipeline Construction Costs per Linear Foot

Pipe Diameter (inch)	Unit Construction Cost ($/linear foot)
8	$490
10	$510
12	$520
14	$570
16	$630
18	$730
20	$780
24	$880

8.1.3.2 Reservoir Component Unit Costs

Reservoir (storage tank) unit costs were determined based on the tank volume in gallons. Conceptual costs for tanks vary based on the material of storage: prestressed concrete and welded steel being the most common options. Unit costs for the different reservoir options are presented in Table 8-2 in terms of cost per gallon of storage. The unit costs do not include site piping, site improvements, land acquisition, repair, or recoating. Storage reservoir costs are sensitive to site-specific geotechnical and seismic considerations. A tank siting study is necessary whenever a new tank project is initiated to obtain the information required to inform the design.

Table 8-2 | Reservoir Tank Construction Costs per Gallon

Tank Material	Unit Construction Cost ($/gallon)
Prestressed Concrete	$1.50
Welded Steel	$1.25

8.2 Capital Improvement Program Summary and Schedule

8.2.1 Completed Projects

The following projects have been completed since 2015 WSP was completed:

- S-01: Onsite Improvements Projects, completed in 2016.
- S-02: Emergency Power Improvements Project, completed in 2016.
- S-17: West Hill Springs Flow Control Improvements, completed in 2017.
- S-19: Fulmer Field Improvements Project, completed in 2018.
- R-01: Lakeland Hills Reservoir 5 Improvements, completed in 2016.
- D-03: SCADA Upgrades, completed in 2015.
- D-10: Pipeline Asset Management Study, completed in 2020.
- D-13: Lea Hill PRV Station Improvements, completed in 2018.
- D-14: Valley AC Main Replacement, completed in 2015.
- PS-03: Green River Pump Station Emergency Power, completed in 2020.
- PS-07: Academy Pump Station No.1 Improvements, completed in 2023.
- G-06: Muckleshoot Indian Tribe (MIT) Casino Master Meters, completed in 2016.
- G-09: Water Meter & Billing System Improvements, completed in 2018

The following projects have been eliminated since 2015 WSP was prepared:

- G-05 - Utilities Field Operations Center: This project was replaced with a more comprehensive upgrade to the City's Operations and Maintenance Facilities as reported in the 2021 Limited Comprehensive Plan Update.

- D-12 - Academy Transmission Replacement: This project was eliminated, after further investigation found no issues with the existing pipeline.

- D-15: Braunwood Transmission: This project was split from Reservoir Seismic Rehabilitation (R-06) identified in the 2015 WSP. This project was originally planned to incorporate the Braunwood Satellite System, however after further evaluation, there is not a business case to support this project. Instead, it is replaced in this WSP with a mechanical upgrades project for the Braunwood Pump Station to maintain operation. The potential for incorporation of the Braunwood Satellite System may be more viable in the future pending potential development in the southern portion of the City's RWSA.

- D-16 - Game Farm Park Transmission: This project was originally planned to allow for the decommissioning and removal of the Game Farm Park Pump Station, however after further evaluation, there is not a business case to support this project. Instead, it is replaced in this WSP with a mechanical upgrades project to maintain operation of the Game Farm Park Pump Station. Elimination of the Game Farm Park Pump Station may be more viable in the future pending potential development in the southern portion of the City's RWSA.

- S-12 - West Hill Springs Water Quality Improvements: The City had planned to replace the aging West Hill Springs chlorination building and equipment with a new liquid chlorination system. However, since this project is not required to meet regulatory requirements and after further review of the City's Financial Program, this project was eliminated to prioritize projects required to resolve deficiencies. This project will be completed later, likely beyond the planning horizon for this WSP.

- S-14 - Algona Well 1 Redevelopment: This project was eliminated until the Algona Well 1 Study is completed. A new capital project may be developed in the 10 to 20-year planning horizon pending the outcome of the study.

8.2.2 Active Projects

The following projects are currently underway for completion by the City and are referred to as "Active Projects" that have remaining costs to be spent in the near term:

- CP2021 - Well 4 Facility Improvements: This project was split from the Well 4 Pump Improvements project (S-22) identified in the 2015 WSP. This project includes upgrades to much of the mechanical systems at the facility.

- CP2043 - Well 4 Electrical Improvements: This project was split from the Well 4 Pump Improvements project (S-22) identified in the 2015 WSP to accommodate beneficial electrical improvements outside the original scope of the project. The well facility is over 40 years old and much of the electrical equipment is original. Upgrades to the electrical system will improve the overall efficiency of the facility.

- CP2219 - Reservoir 4 and 8 Seismic Rehabilitation: This project was split from Reservoir Seismic Rehabilitation (R-06) identified in the 2015 WSP. The City plans to install seismic control valves on outlet piping of the Lea Hill Reservoirs (4A & 4B) and Academy Reservoirs (8A & 8B). A seismic control valve isolates the reservoir to prevent catastrophic flows from the reservoir during a seismic pipe failure. This project will also address outstanding deficiencies identified in the 2022 Sanitary Survey, including vent modifications, overflow connection modifications and overflow screen repairs.

- CP2134 - Comprehensive Water System Plan Update: This project was split from identified in the 2015 WSP (G-08), which originally included updates for both 2024 and 2034. This project will be carried forward in the CIP with further WSP updates being required in 2034 and 2044.

- CP1603 - Coal Creek Springs Transmission Main Replacement: This project was identified in the 2015 WSP as project (D-11) will be completed in 2024. The project will replace the existing 24-inch diameter steel transmission main crossing the White River with a new transmission main suspended from a utility and pedestrian bridge to cross the White River.

- CP2204 - Coal Creek Springs Rehabilitation (Phase 1): The Coal Creek Springs Rehabilitation project aims to investigate the cause of low yield and identify potential upgrades to improve water production. The updates will be completed in Phase 2 of the project.

- CP2413 - Reservoir 2 Valves: This project was split from Reservoir Seismic Rehabilitation (R-06) identified in the 2015 WSP. This project will replace the existing 20-inch supply valve with a seismic control valve and replace the 12-inch drain valve at Reservoir 2. Both valves will be installed in a vault. This project was identified as a maintenance issue due to limited access to the valves. The addition of a seismic control valve will improve the resiliency of the distribution system. This project will address the outstanding deficiency identified in the 2022 Sanitary Survey by modifying the overflow connection.

- CP1914 - Cascade Water Alliance Water Purchase: This project was identified in the 2015 WSP as project (S-04) and finances System Development Charges for the right to purchase water from Tacoma Public Utilities (TPU) through the Second Supply Pipeline to meet future projected demand, based on agreements with Cascade Water Alliance. Council approved the agreements for permanent and reserve wholesale supply in September 2013, and a new agreement was executed in 2014. Budget reflects purchase of permanent supply; payments will continue through 2029.

- S-08 - Water Resources Protection Program (Wellhead Protection): This program provides annual funding for implementing strategies identified in the Wellhead Protection Plan. Although some tasks will be performed as part of the water operations budget, other tasks will require consultants with expertise in review and investigation of contaminant sites and other environmental databases, development of spill response plans, and leaking underground storage tanks. This program will continue through the 20-year planning horizon.

- R-03 - Reservoir Repair and Replacements: This is an annual program that provides budget for general reservoir maintenance and minor repairs. This program will continue through the 20-year planning horizon.

- R-05 - Reservoir Painting: This is a program that operates on a 10-year cycle to complete reservoir coatings. This program will continue through the 20-year planning horizon with the next anticipated painting project planned in 2025.

The following projects include distribution improvements identified in the 2015 WSP to be completed as part of either the Annual Distribution System Improvements Program (D-02), Water Repair and Replacement Program (D-09) or are in partnership with other City utilities and are funded by budget available in the Street Utility Improvements annual program (D-06). All three programs have been updated and will continue through the 20-year planning horizon. In total the following active projects will replace approximately 9,000 linear feet of water main in the City's system. The locations of all active distribution system improvement projects are identified in Figure 3-12 in Chapter 3.

- CP1619 - 104th Park Development (104th to 102nd Water Main Loop)
- CP2301 - 104th Avenue SE PRV Replacement
- CP2123 - C St SW Preservation
- CP2125 - D St SE and 23rd Street SE Storm Improvements
- CP2410 - 112th Pl SE Water Main Replacement
- CP1622 - Auburn Way South - Hemlock St SE to Poplar St SE
- CP2022 - Garden Avenue Realignment
- CP2210 - M Street NE Widening
- CP2116 - R Street SE Widening
- CP2308 - R St SE and 21st St SE Roundabout
- CP2315 - R St SE Preservation - 33rd St SE to 37th St SE
- CP2319 - Lea Hill Road/104th Ave SE Roundabout
- CP2404 - 12th St SE and Auburn Way South Water R&R
- CP2412 - 2025 Local Street Preservation
- 2026 Local Street Preservation

The following active projects were not identified in the 2015 WSP:

- CP2405 - Fulmer Treatment Facility VFD Replacements: The variable frequency drive (VFD) for pumps 1 and 2 at Fulmer Corrosion Control Treatment Facility (CCTF) were installed in 2002. They are at the end of their useful life and require replacement as repair parts are no longer available.

- CP2329 - Coal Creek Springs Flowmeter Replacement: The project will replace existing source meters on the Coal Creek Springs collectors to improve the accuracy and frequency of production readings.

- Algona Well 1 Study – Phase 1: The project will conduct a preliminary assessment of options to utilize the existing water right.

- Valley Service Area Reservoir No. 3 Siting Analysis: The project will conduct a siting analysis to identify and evaluate possible locations for the new reservoir.

- Braunwood Pump Station Assessment: The project will identify process mechanical upgrades necessary to continued operation. The project will also evaluate roofing replacement material options and costs.

- Coal Creek Springs Rehabilitation – Phase 1: The project will investigate the cause of reduced production from Coal Creek Springs and recommend improvements to increase production capacity.

8.2.3 Capital Improvement Projects

The following projects identified in the 2015 WSP have not been completed since the WSP was prepared, but have been revisited and are discussed in detail in the following sections for completion during this planning period. The timing of most projects has been adjusted based on the City's financial analysis and project prioritization updates.

- S-03 - Well 7 Back-Up Power: Delayed to 2032 since Well 7 has been offline due to high levels of Manganese. The timing of this project will be aligned with the completion of the Well 7 Treatment Phase 1 project (S-15) that will allow the Well to resume operation.
- S-06 - Well 5/5A Upgrades: Delayed from 2022 to 2026.
- S-07 - Well Inspection and Redevelopment Program: Delayed from 2015-2033 to 2026.
- S-09 - Coal Creek Springs Rehabilitation: Delayed from 2018 to 2027 based on awaiting results of ongoing investigations to identify the cause and possible solutions to improve production from Coal Creek Springs. The timing of this project may be adjusted pending results of the on-going investigation.
- S-11 - Wells 3A/3B Treatment: Delayed from 2035 to 2036.
- S-13 - Algona Well 1 Study: Delayed from 2015 to 2039.
- S-15 - Well 7 Treatment Phase 1: Delayed from 2022 to 2030 based on City financial analysis and updated project prioritization.
- S-16 - Well 7 Treatment Phase 2: Moved forward from 2035 to 2033.
- S-18 - Howard Road CCTF Expansion: Delayed from 2025 to 2032. The timing of this project must be aligned with the completion of the Coal Creek Springs Rehabilitation project, as its purpose is to provide increased treatment capacity to accommodate increased flows from Coal Creek Springs.
- S-20 - Well 2 Replacement: Moved forward from 2035 to 2030.
- S-21 - Coal Creek Springs Chlorination Building Replacement: Moved forward from 2035 to 2030.
- R-04 - Valley Service Area Reservoir No. 3: Delayed from 2025 to 2041.
- R-07 - Reservoir Capital Improvements: Delayed from 2025 to 2027 to avoid timing conflicts with other current projects at Reservoirs 4A, 4B, and 8A.
- R-07 - Braunwood Reservoir Improvements: Separated from "Reservoir Capital Improvements" project and delayed from 2025 to 2039.
- PS-04 - Intertie Booster Pump Station Improvements: Delayed from 2021 to 2024.
- PS-09 - Game Farm Park Pump Station Mechanical Upgrades: Replaces original project 'Game Farm Park Pump Station/Distribution System Improvements. Delayed from 2025 to 2034.
- PS-10 - Lea Hill Pump Station Replacement: Delayed from 2025 to 2027 to avoid conflicts with concurrent work in area being completed as part of a separate project.

- G-08 - Comprehensive Water System Plan Update: This project was split into two separate completion years for future updates (2034 and 2044).

Based on the information provided by the City, information included in the 2023 CFP, asset management program input, and results of the system capacity analysis provided in **Chapter 3**, the following new projects were identified that are included in the CIP and are discussed in further detail below:

- Rehabilitate & Clean Wells 2 and 6 (3-year Cycle).
- On-Site Chlorine Generation Systems (OSEC) at Wells 1 and 4.
- Academy PRV Project.
- Braunwood Pump Station Mechanical Upgrades.
- Water Trench Patches Program.
- West Hill Springs Transmission Main Replacement.
- Lea Hill 648 Zoning Adjustment.

8.2.3.1 Water Supply

The City's water supply strategy details both project sizing and timing. A summary of the 0 to 10-year and 10 to 20-year capital projects recommended for securing adequate supply to meet the system's future demands are presented in **Table 8-3**. Project IDs have been revised to reflect the updated prioritization and planned timing of projects presented in this WSP. Previous project IDs from the 2015 WSP as presented above will be discontinued for clarity purposes. Active projects identified above are not discussed in detail as they are already well defined and in progress.

8.2.3.1.1 Cascade Water Alliance Water Purchase (S-01)

Financing to purchase water from Tacoma Public Utilities (Tacoma) to meet water demands is based on an agreement with Cascade Water Alliance (Cascade), which had purchased water supply from Tacoma. The Council approved the agreement for permanent wholesale supply in September 2013. The agreement provides an additional 3.32 mgd of supply during the peak day and 1.5 mgd of average day supply. The City's permanent and reserve agreement requires System Development Charges (SDC) payments of $21,073,743 between 2017 and 2029. A total of $934,810 of payments will continue from 2023 through 2029. The SDC costs will decrease if less than the full reserve amount is purchased. The project ID was previously S-04 in the 2015 WSP.

8.2.3.1.2 Water Resources Protection Program (Wellhead Protection) (S-02)

Annual funding for implementing strategies identified in the Wellhead Protection Plan. Although some tasks will be performed as part of the water operations budget, other tasks will require consultants with expertise in review and investigation of contaminant sites and other environmental databases, development of spill response plans, and leaking underground storage tanks. The project ID was previously S-08 in the 2015 WSP.

8.2.3.1.3 Rehabilitate & Clean Wells 2 and 6 (3-year Cycle) (S-3)

Rehabilitation work completed in 2013-2014 indicated it would be beneficial to clean and rehabilitate both wells on a regular basis to improve production capacity and pumping efficiencies. Cleaning was completed in 2020 and again in late 2023/early 2024. This program was originally established as a 5-year cycle, however based on more recent evidence, more frequent cleaning is required. Cleaning and rehabilitation for Wells 2 and 6 will be performed over a 3-year cycle. This program was not identified in the 2015 WSP.

8.2.3.1.4 Well Inspection and Redevelopment Program (S-04)

The City allocates annual funding for investigations and redevelopment of supply wells and springs necessary to support production at maximum capacity for efficient utilization. This program is to be used for production wells and spring collectors, and is not intended to finance the replacement of pumps, motors, buildings, etc. The project ID was previously S-07 in the 2015 WSP.

8.2.3.1.5 On-Site Chlorine Generation Systems (OSEC) at Wells 1 and 4 (S-05)

The existing liquid chlorine (sodium hypochlorite) used at Wells 1 and 4 degrades during low winter demand periods when the volume used is much lower and product turnover is decreased. This results in more chemical consumption to achieve the same chlorine dose which is not cost effective. The hypochlorite systems will be replaced with on-site chlorine generation systems sized to meet peak summer demands while providing flexibility during winter months. This project was not identified in the 2015 WSP.

8.2.3.1.6 Fulmer CCTF Replace On-Site Chlorine Generation System (OSEC) (S-06)

The existing on-site chlorine generating equipment was installed in 2002. The generation cell was replaced in 2012. Sourcing parts for equipment repairs has become increasingly difficult due to the equipment age. An analysis performed in 2018 comparing chlorine alternatives indicated that on-site generation has the lowest overall cost. This project will replace the entire generation system. The chlorination system will be sized to accommodate future production from Well 7.

8.2.3.1.7 Well 5/5A Upgrades (S-07)

Well 5 needs significant improvements including a new building, a backup generator, chlorination, and a hydrologic investigation to evaluate observed decreased production. Due to the small size of the existing site, the acquisition of an adjacent parcel may be required. Additionally, the project will address the recommended Capital Improvements identified in the 2014 Facility Evaluation Study (CIP Project G-01), including a new pump at Well 5 and new pump and motor at Well 5A. Additional upgrades may be identified in the hydrologic investigation; therefore, the cost of this CIP item should be revisited upon completion of the study. This project will also include improvements to address outstanding deficiencies identified in the 2022 Sanitary Survey, including modifications to the pump waste line for Well 5 and addressing water accumulation in the vault at Well 5A. The project ID was previously S-06 in the 2015 WSP.

8.2.3.1.8 Coal Creek Springs Rehabilitation – Phase 2 (S-08)

Complete rehabilitation of the Coal Creek Springs collectors to improve production capacity resulting in greater utilization of the water right. Improvements are to be defined by the outcomes of the 2023/2024 hydrogeologic study currently being completed as Phase 1 (S-04). Additional upgrades may be identified in the hydrologic investigation; therefore, the cost of this CIP item should be revisited upon completion of the study.

8.2.3.1.9 Coal Creek Springs Chlorination Building Replacement (S-09)

Coal Creek Springs chlorination building was identified as requiring replacement in the 2013 Facility Evaluation Study. Additionally, the project will upgrade the source treatment from chlorine gas to a liquid sodium hypochlorite disinfection system. Sizing of the new equipment will be dependent upon capacity improvements completed as part of the Coal Creek Springs Rehabilitation Project. A new building will be constructed to house the equipment. The project ID was previously S-21 in the 2015 WSP.

8.2.3.1.10 Well 7 Treatment Phase 1 (S-10)

Well 7 is not operational due to high manganese levels. Manganese treatment is required to allow operation of this facility to be restored and to utilize the full water right for this well. Due to space limitations at the Well 7 site, the treatment facilities will be added at the Fulmer Field CCT Facility. The treatment facility will be installed in two phases. The first phase will provide 2.5 mgd of capacity. Additionally, phase 1 of the project will address the recommended improvements to the Fulmer Field CCT Facility identified in the 2013 Facility Evaluation Study, including a new pump and motor. The project ID was previously S-15 in the 2015 WSP.

8.2.3.1.11 Well 2 Replacement (S-11)

The Fulmer Well Field Improvement project found that Well 2 can continue to serve the City but would need to be replaced to resolve ongoing operational challenges. This project includes installation of a new large diameter well. It is assumed that the well will remain on its existing site, or other City-owned property. The project ID was previously S-20 in the 2015 WSP.

8.2.3.1.12 Howard Road CCTF Expansion (S-12)

The inflow to the Howard Road CCTF will increase with the completion of the Well 1 Improvements project in 2016 and planning production improvements for Coal Creek Springs Collector Improvements. The existing facility will be expanded to its full capacity to provide additional treatment capacity and redundant pump capacity to match increased flows. Additionally, the project will address the recommended improvements to Howard Road CCTF identified in the 2013 Facility Evaluation Study, including a new pump and motor. The expansion will include an additional aeration tower and a pump to match existing. The project ID was previously S-18 in the 2015 WSP.

8.2.3.1.13 Well 7 Back-up Power (S-13)

Well 7 is currently out of service, but the City has plans to bring the facility back online once manganese treatment is provided as part of the Well 7 Treatment Phase 1 Project. Without back-up power to its pumps, Well 7 is not considered a reliable source of supply for the Valley Service Area. The City has limited land available at the Well 7 site, therefore, backup power will be installed at the Fulmer Field CCT Facility. The project also includes installing underground electrical transmission capability between Well 7 and the Fulmer Field CCT Facility. The project ID was previously S-03 in the 2015 WSP.

8.2.3.1.14 Well 7 Treatment Phase 2 (S-14)

Well 7 Treatment Phase 2 will complete the manganese treatment facilities at the Fulmer Field CCT Facility to allow year-round use of Well 7. Phase 2 will add 2.5 mgd of treatment for a total capacity of 5.0 mgd. The project ID was previously S-16 in the 2015 WSP.

8.2.3.1.15 Wells 3A/3B Treatment (S-15)

Wells 3A and 3B are not operated due to high manganese levels. Manganese treatment is required to allow these wells to be used, which would add 4.03 mgd of instantaneous flow capacity to the City's supply capabilities. The project includes manganese treatment, a new well and treatment building, well pumps, and onsite backup-power. Additionally, a new sodium hypochlorite system for chlorination will be installed. The project ID was previously S-11 in the 2015 WSP.

Table 8-3 | Prioritized Water Supply Improvement Projects

Project Name	Project ID	Project Timing	Added Qi Capacity (mgd)	Estimated Cost 2024 USD	Brief Project Description
0 to 10-Year Planning Horizon					
Cascade Water Alliance Water Purchase	S-01	2024-2029	3.32	$5,608,860	The agreement provides an additional 3.32 mgd of supply during the peak day and 1.5 mgd of average day supply.
Water Resources Protection Program (Wellhead Protection)	S-02	2024-2044 (Annual)		$1,287,700	Annual funding for Wellhead Protection activities.
Rehabilitate & Clean Wells 2 and 6 (3-year Cycle)	S-03	2025-2044		$1,750,000	3-year cycle program to clean and rehab Wells 2 and 6.
Well Inspection and Redevelopment Program	S-04	2026-2027		$420,000	Annual funding allocation for investigations and redevelopment of wells and springs to maximize production capacity.
On-Site Chlorine Generation Systems (OSEC) at Wells 1 and 4	S-05	2026-2027		$275,000	Replace liquid hypochlorite systems with on-site generation systems.
Fulmer CCTF Replace On-Site Chlorine Generation System (OSEC)	S-06	2026-2027		$500,000	Replace aged on-site chlorine generation equipment.
Well 5/5A Upgrades	S-07	2026-2028		$2,715,000	New building, back-up generator, chlorination, and a hydrologic investigation to evaluate the reasons for decreased production.
Coal Creek Springs Rehabilitation – Phase 2	S-08	2027-2030	4.32	$5,337,000	Rehabilitation of the Coal Creek Springs collectors to improve production.
Coal Creek Springs Chlorination Building Replacement	S-09	2030-2031		$2,081,000	Replace chlorination system and building at Coal Creek Springs Facility with hypochlorite disinfection system.
Well 7 Treatment Phase 1	S-10	2030-2032	2.5	$10,097,000	Requires manganese treatment facilities
Well 2 Replacement	S-11	2030-2031	3.46	$1,960,000	Replace Well 2 to resolve ongoing operational challenges.
Howard Road CCTF Expansion	S-12	2032-2033		$1,450,000	Expand the facility to its full capacity (including an additional aeration tower and pumps).
Well 7 Back-Up Power	S-13	2032-2033		$2,075,000	Provide back-up power for this source.
Well 7 Treatment Phase 2	S-14	2033-2035	2.5	$8,054,000	Requires completion of manganese treatment facilities.
10 to 20-Year Planning Horizon					
Wells 3A/3B Treatment	S-15	2036-2038	4.03	$13,945,000	Provide manganese treatment for well operation
Algona Well 1 Study – Phase 2	S-16	2039		$250,000	Evaluate possible uses of water right.
Subtotal				**$57,805,560**	

8.2.3.1.16 Algona Well 1 Study – Phase 2 (S-16)

Algona Well 1 has been abandoned and all related facilities removed. This project will study possible options to utilize the existing water right. One option may be to redevelop the well on-site at its previous location. Another alternative may be to pursue an alternative well location or how to use the water right at another existing facility. The project does not include the development of design, permitting or construction of well infrastructure. The project ID was previously S-13 in the 2015 WSP.

8.2.3.2 Storage

Table 8-4 provides a summary of the planned reservoir projects. Project IDs have been revised to reflect the updated prioritization and planned timing of projects presented in this WSP. Previous project IDs from the 2015 WSP as presented above will be discontinued for clarity purposes. Active projects identified above are not discussed in detail as they are already well defined and in progress.

8.2.3.2.1 Reservoir Repair & Replacements (R-01)

The City has allocated an annual capital expenditure for general reservoir maintenance and minor improvements. Projects are identified by the City on an as-needed basis. The project ID was previously R-03 in the 2015 WSP.

8.2.3.2.2 Reservoir Painting (10-year Cycle) (R-02)

The City plans to paint the welded steel reservoirs to extend their useful life. This program finances the painting of two reservoirs every 10 years. The project ID was previously R-05 in the 2015 WSP.

8.2.3.2.3 Academy PRV Project (R-03)

A new PRV facility will be located to rezone a portion of the Valley 242 pressure zone to the Academy 350 pressure zone to resolve fire flow deficiencies in the area. This PRV facility will also allow storage transfer from the Academy Service Area where this is surplus storage to the Valley Service Area to resolve 2034 storage deficit projections, allowing for more system flexibility. The PRV facility location is assumed to be in a cul-de-sac where U St SE meets 28th St SE but will be confirmed during design. The PRV vault is assumed to house a 2-inch PRV for low flows (normal operation) and a 6-inch PRV for fire flows. This project was not identified in the 2015 WSP.

8.2.3.2.4 Reservoir Capital Improvements (R-04)

The 2013 Facility Evaluation Study identified improvements to reservoir facilities based on the condition and remaining useful life of the assets within the facilities. Improvements were identified at Reservoir 1, Reservoir 4A & 4B, and Reservoir 8A & 8B. The project ID was previously R-07 in the 2015 WSP.

8.2.3.2.5 Braunwood Reservoir Improvements (R-05)

The 2013 Facility Evaluation Study identified improvements to reservoir facilities based on the condition and remaining useful life of the assets within the facilities. Improvements were identified at the Braunwood Reservoir and were previously included in Reservoir Capital Improvements project (R-07) in the 2015 WSP.

8.2.3.2.6 Valley Service Area Reservoir No. 3 (R-06)

To meet future storage requirements in the Valley Service Area, it is recommended that a new, 2-MG storage reservoir. A siting study should be conducted to identify the preferred reservoir location and other details; it is assumed that the reservoir will be in the northeast portion of the Valley 242 pressure zone.

Property acquisition is expected to be required and an allowance of $1M is included in the project budget. The project ID was previously R-04 in the 2015 WSP. It was assumed that the new reservoir will be a prestressed concrete tank, however this should be confirmed during the siting study.

Table 8-4 | Storage Improvements Projects

Project Name	Project ID	Project Timing	Added Storage (MG)	Estimated Cost 2024 USD	Brief Project Description
0 to 10-Year Planning Horizon					
Reservoir Repair & Replacements	R-01	2024-2044 (Annual)		$1,392,000	Annual program for reservoir maintenance and minor improvements.
Reservoir Painting (10-year Cycle)	R-02	2025-2044		$3,500,000	Required for maintenance and reservoir longevity in both Academy and Lea Hill service areas.
Academy PRV Project	R-03	2027		$470,000	PRV for storage transfer and rezoning to meet fire flow demands.
Reservoir Capital Improvements	R-04	2027		$470,000	Improvements to Reservoir 1, Reservoir 4A&4B, Reservoir 8A&8B based on the condition and remaining useful life.
10 to 20-Year Planning Horizon					
Braunwood Reservoir Improvements	R-05	2039-2040		$250,000	Improvements based on condition and remaining useful life.
Valley Service Area Reservoir No. 3	R-06	2041-2044	2.0	$11,745,000	Required to meet future storage requirements in the Valley service area.
Subtotal				**$17,827,000**	

8.2.3.3 Pump Stations

Table 8-5 provides a summary of the planned pump station projects. Project IDs have been revised to reflect the updated prioritization and planned timing of projects presented in this WSP. Previous project IDs from the 2015 WSP as presented above will be discontinued for clarity purposes. Active projects identified above are not discussed in detail as they are already well defined and in progress.

8.2.3.3.1 Intertie Pump Station/Lea Hill BPS Improvements (PS-01)

The Lea Hill BPS serves the closed 648 Pressure Zone and does not have sufficient capacity to meet fire flow requirements under current or future demand projections. To meet fire flow requirements, an additional 2,500 gpm of firm capacity is required. The Lea Hill BPS and that Intertie Pump Station share a building. To increase capacity of the Lea Hill PS, the project will provide additional piping and modify the existing Intertie Pump Station/Lea Hill BPS building to utilize the existing Intertie Pump Station pumps to serve the Lea Hill 648 pressure zone. The project will also add pressure reducing valves and control valves at Lea Hill reservoirs, and system valves to provide efficient operation of the 132nd Ave Tacoma Intertie. On-site back-up power improvements for the Lea Hill BPS are also included to improve facility reliability.

In the 2015 WSP, this project also included distribution system improvements to rezone a portion of the Lea Hill Service Area; this work has been shifted to a separate project titled the Lea Hill 648 Zoning Adjustment project. This project ID was previously PS-04 in the 2015 WSP.

8.2.3.3.2 Lea Hill Pump Station Replacement (PS-02)

The Lea Hill Pump Station will be reconstructed to provide redundant pumped supply to the Lea Hill area. If the Green River Pump Station is out of service for maintenance, a redundant pump station would avoid the need to purchase more expensive regional surface water through the 132nd Intertie. The pump station needs to be relocated from its current location on the shoulder of Lea Hill Road at the base of a steep hill for safety and reliability considerations. Two separate active projects (Garden Avenue Realignment and Lea Hill Roundabout) will construct approximately 900 feet and 835 feet of 12-inch diameter transmission main respectively, that is required for the future pump station. The project ID was previously PS-10 in the 2015 WSP.

8.2.3.3.3 Braunwood Pump Station Mechanical Upgrades (PS-03)

The Braunwood Pump Station is an aging facility that serves the Braunwood Satellite System. The project will include minor mechanical or electrical improvements to rehabilitate the facility for continued use. This project ID was previously PS-09 in the 2015 WSP. This project was not identified in the 2015 WSP.

8.2.3.3.4 Game Farm Park Pump Station Mechanical Upgrades Project (PS-04)

The Game Farm Wilderness Park Pump Station is an aging facility that serves the Game Farm Wilderness and recreational area. The 2013 Facility Evaluation Study identified improvements to allow continued use of the station including pump replacement and building repairs. Additional minor mechanical or electrical improvements may be warranted to rehabilitate the facility for continued use. This project ID was previously PS-09 in the 2015 WSP.

Table 8-5 | Pump Station Improvement Projects

Project Name	Project ID	Project Timing	Added Firm/Reliable Capacity (gpm)	Estimated Cost 2024 USD	Brief Project Description
0 to 10-Year Planning Horizon					
Intertie Pump Station/Lea Hill BPS Improvements	PS-01	2024-2026	2,500 gpm	$2,325,000	Expand the fire flow capacity of the Lea Hill BPS by connecting to the Intertie PS pumps.
Lea Hill Pump Station Replacement	PS-02	2027-2029		$6,365,000	Decommission and replace the pump station at the end of its usable life.
10 to 20-Year Planning Horizon					
Braunwood Pump Station Mechanical Upgrades	PS-03	2034-2035		$250,000	Rehabilitate Pump Station to allow continued use.
Game Farm Park Pump Station Mechanical Upgrades	PS-04	2034-2035		$250,000	Rehabilitate Pump Station to allow continued use.
Subtotal				**$9,190,000**	

8.2.3.4 Distribution System

The City's water distribution system will require many improvements to address fire flow deficiencies identified by the system analysis presented in **Chapter 3**. Additionally, the City has undersized, and aging piping within the water system that needs to be replaced to reduce the risk of breaks and leaks. The identified distribution system improvements programs are described below and summarized in **Table 8-7**.

Project IDs have been revised to reflect the updated prioritization and planned timing of projects presented in this WSP. Previous project IDs from the 2015 WSP as presented above will be discontinued for clarity purposes. Active projects identified above are not discussed in detail as they are already well defined and in progress.

8.2.3.4.1 Annual Distribution System Improvements Program (D-01)

The Annual Distribution System Improvements Program is focused on capacity related improvements to the City's water distribution system as identified in **Figure 3-12** and **Table 3-33** of **Chapter 3**. These improvements address deficiencies during fire flow demand scenarios. A comprehensive list of the projects and their individual estimated costs are provided in **Appendix W**. The total of all project costs is distributed across the 20-year planning horizon and will be prioritized to address the areas with the greatest deficiency first. This project ID was previously D-02 in the 2015 WSP.

8.2.3.4.2 Street Utility Improvements (D-02)

The City Street Utility program provides an annual budget to perform water main improvements in coordination with the Street Preservation programs and general arterial street improvements. By replacing water infrastructure concurrent with other utility or street improvement projects, the City can reduce overall project costs. Identified projects are anticipated to occur annually throughout the planning period. This project ID was previously D-06 in the 2015 WSP.

8.2.3.4.3 Water Repair & Replacements (D-03)

Previous WSPs identified pipelines for the City's Water Repair & Replacement program focus on replacement of old cast iron pipes, pipes under 6-inches that serve fire hydrants, dead-end mains in non-residential areas, and decommissioned duplicate pipes. The budget for this project has been re-evaluated and is revised to focus on the replacement of undersized cast iron pipe. The budget was developed focusing specifically on 4-inch diameter cast iron pipe, however the City may also allocate this budget to replace other undersized cast iron pipe within the system. **Table 8-6** summarizes the basis of the program budget using the same unit cost assumptions and allowances established in **Section 8.1.3**. The City's pipeline water repair and replacement program will be accomplished through the combination of the Street Utility Improvements (D-02) and this program. Ideally, Water Repair and Replacement and Street Utility projects will be constructed on alternating years to maintain consistent levels of capital expenditures. This project ID was previously D-09 in the 2015 WSP.

Table 8-6 | Water Repair & Replacements Cost Estimate

Length (LF)	Existing Size (inch)	New Size (inch)	Unit Cost	Component Cost	Construction Cost	Project Cost
11,740	4	8	$490/LF	$5,752,500	$8,241,000	$11,950,000

8.2.3.4.4 Water Trench Patches Program (D-04)

This program provides annual funding for roadway restoration of trench patches from water main leak repairs and water service installation that are beyond the scope of work done by City maintenance staff. This project was not identified in the 2015 WSP.

8.2.3.4.5 West Hill Springs Transmission Main Replacement (D-05)

The 2020 pipeline assessment indicated the existing cast iron transmission main is in poor condition. The main has experienced two breaks in the past. The project will replace approximately 1,250 LF of 10-inch

diameter cast iron pipe with 12-inch diameter ductile iron pipe. The project includes preliminary geotechnical investigations prior to design and construction. This project was not identified in the 2015 WSP.

8.2.3.4.6 Lea Hill 648 Zoning Adjustment (D-06)

The system capacity analysis identified deficiencies in the upper portion of the Lea Hill 563 pressure zone where the highest service elevations of the zone are located. This project includes system piping and valving modifications to rezone a portion of the Lea Hill 563 pressure zone to the Lea Hill 648 pressure zone. GIS and site verification, as well as minimal system modeling are required to verify necessary modifications.

Table 8-7 | Distribution System Improvements Projects

Project Name	Project ID	Project Timing	Estimated Cost 2024 USD	Brief Project Description
0 to 20-Year Planning Horizon				
Annual Distribution System Improvements Program	D-01	2025-2044 (Annual)	$59,699,000	Pipe improvement projects required to address system capacity deficits.
Street Utility Improvements	D-02	2025-2044 (Annual)	$24,618,000	Water main improvements concurrent with street improvements.
Water Repair & Replacements	D-03	2025-2044 (Annual)	$11,950,000	Pipe improvements to replace aging and undersized pipes.
Water Trench Patches Program	D-04	2024-2044 (Annual)	$3,360,000	Annual program for restoration following water and service leaks.
West Hill Springs Transmission Main Replacement	D-05	2024, 2026-2027	$1,401,000	Transmission piping replacement.
Lea Hill 648 Zoning Adjustment	D-06	2027	$104,000	Pressure zone modifications to address fire flow capacity deficit.
Subtotal			**$101,132,000**	

8.2.3.5 General Utility Projects

The general water system projects and their estimated costs are provided in **Table 8-8**. Project IDs have been revised to reflect the updated prioritization and planned timing of projects presented in this WSP. Previous project IDs from the 2015 WSP as presented above will be discontinued for clarity purposes.

8.2.3.5.1 Water System Plan Updates (G-01, G-02)

DOH requires Water System Plans to be updated every ten years. The City has allocated budget to complete Water System Plan Updates in 2034 and 2044. The project ID for both updates was previously G-08 in the 2015 WSP.

Table 8-8 | General Water System Projects

Project Name	Project ID	Project Timing	Estimated Cost 2024 USD	Brief Project Description
0 to 10-Year Planning Horizon				
Water System Plan Update - 2034	G-01	2033-2034	$750,000	Mandated by Washington Department of Health.
10 to 20-Year Planning Horizon				
Water System Plan Update - 2044	G-02	2043-2044	$750,000	Mandated by Washington Department of Health.
Subtotal			**$1,500,000**	

8.3 CIP Summary and Schedule

Table 8-9 summarizes the total CIP cost by project categories for the 20-year planning horizon. All costs shown are in 2024 dollars. Distribution system improvements comprise more than 50 percent of the allocated costs for the CIP.

Table 8-9 | Total CIP Cost by Project Category from 2024 through 2044

Category	Total CIP Cost Summary 2024 – 2044 (2024 USD)
Supply	$60,416,013
Storage	$21,579,621
Pump Stations	$9,230,000
Distribution	$121,858,681
General	$1,750,000
TOTAL	**$214,834,315**

The results of prioritizing the improvements were used to establish an implementation schedule that can be used by the City for preparing its 20-year CIP and 6-year CFP. The implementation schedule for the active projects and planned CIP projects is summarized in **Table 8-10**. More details are included in **Appendix W**. The City uses this information to develop rates and SDC charges.

The City will schedule the water main projects in the Annual Distribution Improvements Program and Water Repair and Replacements during the annual budget process. This provides the City with the flexibility to coordinate these projects with roadway or other projects within the same area.

Table 8-10 | Capital Improvements Program Costs and Phasing

CIP ID	Name	CAP/ Non-CAP	Total Estimated Cost 2024 USD	2024	10-Year										20-Year

CHAPTER 9

Financial Program

9.1 Introduction

This chapter was prepared by FCS GROUP to provide a financial program that allows the City of Auburn (City) water utility to remain financially viable during the planning period. This financial viability analysis considers the historical financial condition, current and identified future financial and policy obligations, operation and maintenance (O&M) needs, and the financial impacts of the capital projects identified in this Water System Plan (WSP). Furthermore, this chapter provides a review of the water utility's current rate structure with respect to rate adequacy and customer affordability.

9.2 Past Financial Performance

This section includes a historical summary of financial performance as reported by the City, including fund resources and uses arising from cash transactions.

9.2.1 Comparative Financial Statements

The City legally owns and operates a water utility. Table 9-1 shows a summary of water fund resources and uses arising from cash transactions for the previous 6 years (2017 through 2022). 2023 financial statements were not available at the time the chapter was developed. Table 9-2 shows a summary of assets and liabilities, with the difference between the two reported as "net position." Increases and decreases in net position are useful indicators of the financial position of the City's utility. Noteworthy findings and trends for the historical performance and condition of the City's water utility are then discussed.

9.2.1.1 Findings and Trends

- The City's water charges for services increased from $14.8M in 2017 to $16.5M in 2022. The average annual increase was approximately 2.2 percent per year, with a total increase of 11.4 percent from 2017 to 2022. Charges for services increase each year, except for 2019 and 2020 where revenues fell by 1.5 percent and 1.4 percent respectively. Operating Expenditures increased by $1.7M across the six years with an average annual increase of 2.8 percent. Similar to observations made in revenues, expenditures dropped in 2020 but to a greater extent, decreasing by 2.0 percent. Despite total operating expenses slightly outpacing growth in operating revenues, operating income has been positive in all years observed. 2019 and 2020 had slightly less operating income than other years, observed at $2.7M, with the remainder of the years averaging $3.1M.

- The O&M coverage ratio (total operating revenues divided by total operating expenses) was 126.3 percent in 2017. With expenses slightly outpacing revenues this metric decreased and ended 2022 at 122.8 percent. A ratio of 100.0 percent or greater shows that operating revenue will successfully cover operating expenses, and the utility has remained above this ratio for all years observed.

Table 9-1 | Summary of Historical Fund Resources and Uses Arising From Cash Transactions

	2017	2018	2019	2020	2021	2022
OPERATING REVENUES						
Charges for Service	$ 14,781,310	$ 15,293,485	$ 15,057,517	$ 14,846,679	$ 15,879,799	$ 16,459,868

- Net operating income as a percentage of operating revenue was 20.8 percent in 2017, decreasing to a low of 17.9 percent in 2019, before ending 2022 at 18.6 percent. Similar to the O&M coverage ratio, these trends show how successfully operating revenue actually covered operating expenses, with higher positive numbers being the best and negative numbers showing a need for improvement. In addition, these trends demonstrate the ability of the utility to invest in capital, whether through direct cash transfers or the issuance and servicing of debt.

- The debt service coverage ratio measures the amount of cash flow available to meet principal and interest payments. Typically, revenue bond debt service coverage requires a minimum factor of 1.25 during the life of the loans. This ratio is calculated by dividing cash or net operating income (operating revenues less operating expenses) by annual revenue bond debt service. The debt service coverage ratio for all outstanding revenue bond debt ended 2017 at 3.83, decreasing to 2.85 by 2022, as the City took on more debt liabilities. The fact that this ratio has sustained levels higher than the minimum target of 1.25 indicates a stable capacity for new debt and will likely result in favorable terms when entering the bond market.

9.2.1.2 Findings and Trends

- The current ratio is calculated by dividing unrestricted current assets by current liabilities and measures an entity's ability to pay short-term obligations. This ratio ranges from a low of 2.8 in 2017 to a high of 6.9 in 2020, ending at 6.0 in 2022. Anything above 2.0 for this liquidity ratio is good.

- The Debt to Net Position Ratio compares total debt to total net position, which is the difference between total assets and liabilities. This ratio ranged from a high of 0.33 or 33 percent in 2020 to a low of 0.20 or 20 percent in 2019. For utilities, a ratio of 40 to 60 percent helps to moderate rate impacts by spreading costs over a longer period of time. Based on these results, the City may consider utilizing debt service for future capital investments, especially if it benefits system expansion.

- The Debt to Noncurrent Capital Asset Ratio compares total debt to noncurrent capital assets, which are also known as property, plant and equipment. This ratio begins at 0.22 or 22 percent debt to 78 percent noncurrent assets in 2017. Noncurrent capital assets increase by $20.6 million throughout the six-year history while debt increased by $6.2 million, and the ratio increases to 24 percent by 2022. Similar to the debt to net position ratio, these results indicate the utility has ample borrowing capacity and may consider utilizing debt service for future capital investments, especially if it benefits system expansion. A ratio of 40 percent debt to 60 percent equity or below is a general industry target.

9.3 Financial Plan

The water utility is responsible for generating sufficient revenue to meet all of its costs. The primary source of funding is derived from ongoing monthly service charges, with additional revenue coming from late penalties and interest earnings. The City controls the level of user charges and, with City Council approval, can adjust user charges as needed to meet financial objectives.

The financial plan can only confirm financial feasibility if it considers the total system costs of providing water services, both operating and capital. To meet these objectives, the following elements have been completed.

1. **Capital Funding Plan.** Identifies the total capital improvement plan (CIP) obligations of the planning period. The plan defines a strategy for funding the CIP, including an analysis of available resources from rate revenues, existing reserves, connection charge revenues, debt financing, and any special resources that may be readily available (e.g., grants, developer contributions, etc.). The capital funding plan impacts the financial plan through the use of debt financing (resulting in annual debt service) and the assumed rate revenue made available for capital funding.

2. **Financial Forecast.** Identifies future annual non-capital costs associated with the operation, maintenance, and administration of the water system. Included in the financial plan is a reserve analysis that forecasts cash flow and fund balance activity, along with testing for satisfaction of actual or recommended minimum fund balance policies. The financial plan ultimately evaluates the sufficiency of utility revenues in meeting all obligations, including cash uses such as operating expenses, debt service, capital outlays, and reserve contributions, as well as any coverage requirements associated with long-term debt. The plan also identifies the future adjustments required to fully fund all utility obligations in the planning period.

9.3.1 Capital Funding Plan

To properly evaluate future capital funding needs, capital costs were escalated by 3.00 percent annually to the year of planned spending. The CIP developed for this WSP identifies $143.3M in escalated project costs over the 11-year planning horizon from 2024-2034. The 20-year period, through 2043, includes $262.6M in total escalated project costs.

A summary of the 11-year and 20-year CIPs are shown in **Table 9-3**. As shown, each year has varied capital cost obligations depending on construction schedules and infrastructure planning needs.

Table 9-3 | 11-Year and 20-Year CIPs

Year	Unescalated $	Escalated $
2024	$ 15,368,740	$ 15,368,740
2025	13,020,848	13,411,473

9.4 Available Funding Assistance and Financing Resources

9.4.1 City Resources

Resources appropriate for funding capital needs include accumulated cash in the capital fund, rate revenues designated for capital spending purposes, developer contributions, and capital-related charges such as system development charges. The first two resources will be discussed in the **Fiscal Policies** section of the **Financial Forecast**. Capital-related charges are discussed below.

9.4.1.1 System Development Charges

A connection charge such as the City's system development charge (SDC) refers to a one-time charge imposed on new customers as a condition of connecting to the water system. The purpose of the SDC is two-fold: 1) to promote equity between new and existing customers; and 2) to provide a source of revenue to fund capital projects necessary for meeting growth. This revenue can only be used to fund utility capital projects or to pay debt service incurred to finance those projects. In the absence of a connection charge, growth-related capital costs would be borne in large part by existing customers. In 2024, the City charged all new customers an SDC of $9,553 per meter capacity equivalent (MCE). MCEs are defined by the American Water Works Association and represent the maximum safe operating flow capacity in gallons per minute, relative to the base meter size.

9.4.1.2 Local Facilities Charges

While a connection charge is the manner in which new customers pay their share of system investment costs, local facilities charge funding is used to pay the costs of local facilities that connect each property to the system's infrastructure. Local facilities funding is often overlooked in rate forecasting because it is funded upfront by either connecting customers and developers, or through an assessment to properties, but never from rates.

A number of mechanisms can be considered toward funding local facilities. One of the following scenarios typically occurs: (a) the utility charges a connection fee based on the cost of the local facilities (under the same authority as the facilities assessment fee); (b) a developer funds an extension of the system to its development and turns those facilities over to the utility (contributed capital); or (c) a local assessment is set up called a Utility Local Improvement District (ULID/LID) or a Local Utility District (LUD), which collects tax revenue from benefited properties.

A local facilities charge (LFC) is a variation of the connection charge. It is a city-imposed charge to recover the cost related to service extension to local properties. Often called a front-footage charge and imposed on the basis of footage of the main "fronting" a particular property, it is usually implemented as a reimbursement mechanism to a city for the cost of a local facility that directly serves a property. It is a form of a connection charge and thus can accumulate up to 10 years of interest. It typically applies in instances when no developer-installed facilities are needed through developer extension due to the prior existence of available mains already serving the developing property.

The developer extension is a requirement that a developer install on-site and sometimes off-site improvements as a condition of extending service. These are in addition to the connection charge required and must be built to City standards. Part of the agreement between the City and the developer planning to extend service might include a latecomer agreement (also called payback agreements), resulting in a latecomer charge to new connections for the developer extension.

Latecomer charges are a variation of developer extensions, whereby new customers connecting to a developer-installed improvement make a payment to the City based on their share of the developer's cost. The City passes this charge on to the developer who installed the facilities. As part of the developer extension process, this defines the allocation of costs and records latecomer obligations on the title of affected properties. No interest is allowed, and the reimbursement agreement cannot exceed 20 years in duration.

ULID/LID is another mechanism for funding infrastructure that assesses benefited properties based on the special benefit received by the construction of specific facilities. Most often used for local facilities, some

ULIDs also recover related general facilities costs. Substantial legal and procedural requirements can make this a relatively expensive process, and there are mechanisms by which a ULID can be rejected.

9.4.2 Outside Resources

This section outlines various grant, loan, and bond opportunities available to the City through federal and state agencies to fund the CIP identified in the WSP.

9.4.2.1 Grants and Low-Cost Loans

Historically, federal and state grant programs were available to local utilities for capital funding assistance. However, these assistance programs have been mostly eliminated, substantially reduced in scope and amount, or replaced by loan programs. Remaining grant programs are generally lightly funded and heavily subscribed. Nonetheless, the benefit of low-interest loans makes the effort of applying worthwhile.

The State of Washington's Department of Commerce maintains a document currently entitled "*Funding Programs for Drinking Water and Wastewater Projects; Updated 3-5-2024*", which contains details on government programs, eligibility requirements, and contact information, should the City wish to inquire about program offerings and eligibility requirements.

9.4.2.2 Bond Financing

General Obligation Bonds – General obligation (G.O.) bonds are bonds secured by the full faith and credit of the issuing agency, committing all available tax and revenue resources to debt repayment. With this high level of commitment, G.O. bonds have relatively low interest rates and few financial restrictions. However, the authority to issue G.O. bonds is restricted in terms of the amount and use of the funds, as defined by the Washington constitution and statute. Specifically, the amount of debt that can be issued is linked to assessed valuation.

Revised Code of Washington (RCW) 39.36.020 states:

> (2)(a)(ii) Counties, cities, and towns are limited to an indebtedness amount not exceeding one and one half percent of the value of the taxable property in such counties, cities, or towns without the assent of three-fifths of the voters therein voting at an election held for that purpose.
>
> (b) In cases requiring such assent counties, cities, towns, and public hospital districts are limited to a total indebtedness of two and one-half percent of the value of the taxable property therein.

While bonding capacity can limit the availability of G.O. bonds for utility purposes, these can sometimes play a valuable role in project financing. A utility rate savings may be realized through two avenues: the lower interest rate and related bond costs, and the extension of repayment obligation to all tax-paying properties (not just developed properties) through the authorization of an ad valorem property tax levy.

Revenue Bonds – Revenue bonds are commonly used to fund utility capital improvements. The debt is secured by the revenues of the issuing utility. With this limited commitment, revenue bonds typically bear higher interest rates than G.O. bonds and require security conditions related to the maintenance of dedicated reserves (a bond reserve) and financial performance (added bond debt service coverage). The City agrees to satisfy these requirements by resolution as a condition of bond sale.

Revenue bonds can be issued in Washington without a public vote. There is no bonding limit, except perhaps the practical limit of the utility's ability to generate sufficient revenue to repay the debt and provide coverage. In some cases, poor credit might make issuing revenue bonds problematic.

9.4.3 Capital Financing Strategy

An ideal capital financing strategy would include the use of grants and low-cost loans when debt issuance is required. However, these resources are very limited and competitive in nature and do not provide a reliable source of funding for planning purposes. It is recommended that the City pursue these funding avenues but assume revenue bond financing to meet the needs which can't be met by available cash resources. The capital financing strategy developed to fund the CIP identified in this WSP assumes the following funding resources:

- Accumulated cash reserves,
- Transfers of excess cash (over minimum balance targets) from the Operating Fund,
- System development charge revenue,
- Interest earned on Capital Fund balances,
- Grant proceeds, and
- Revenue bond financing.

The cash resources described above are anticipated to fund 58.1 percent of the 11-year CIP and 56.4 percent of the 20-year CIP. The remaining funding is assumed to be from new debt obligations of $69.1M in the next 11-year planning period and an additional $45.3M between 2034-2043. Table 9-5 presents the 11-year and 20-year capital financing strategy.

Table 9-5 | 11-Year and 20-Year Capital Financing Strategy

Year	Capital Expenditures Escalated	System Development Charge Revenue	Grant Funding	Revenue Bond Proceeds	Cash / Reserve Funding	Total Financial Resources
2024	**$ 15,368,740**	$ 325,000	$ 2,717,531		$ 12,326,209	**$ 15,368,740**
2025	**13,411,473**	452,813		12,958,660	-	**13,411,473**
2026	**13,682,743**	468,497		3,541,340	9,672,907	**13,682,743**
2027	**11,664,653**	484,723		11,179,930	-	**11,664,653**
2028	**12,791,194**	501,511		6,320,070	5,969,613	**12,791,194**
2029	**11,841,764**	518,881		10,400,000	922,883	**11,841,764**
2030	**10,671,544**	536,853		-	10,134,691	**10,671,544**
2031	**13,095,389**	555,446		12,539,943	-	**13,095,389**
2032	**14,624,811**	574,684		2,260,057	11,790,070	**14,624,811**
2033	**12,224,471**	594,589		9,900,000	1,729,882	**12,224,471**
2034	**13,933,236**	615,182			13,318,054	**13,933,236**
Subtotal	**$ 143,310,019**	**$ 5,628,179**	**$ 2,717,531**	**$ 69,100,000**	**$ 65,864,309**	**$ 143,310,019**
2035 - 2043	**119,267,070**	6,589,599		45,300,000	67,377,472	**119,267,070**
Total	**$ 262,577,089**	**$ 12,217,778**	**$ 2,717,531**	**$ 114,400,000**	**$ 133,241,780**	**$ 262,577,089**

9.5 Financial Forecast

The financial forecast, or revenue requirement analysis, forecasts the amount of annual revenue that needs to be generated by user rates. The analysis incorporates operating revenues, O&M expenses, debt service payments, rate-funded capital needs, and any other identified revenues or expenses related to operations. The objective of the financial forecast is to evaluate the sufficiency of the current level of rates. In addition

to annual operating costs, the revenue needs also include debt covenant requirements and specific fiscal policies and financial goals of the City.

For this analysis, two revenue sufficiency tests have been developed to reflect the financial goals and constraints of the City: cash needs must be met; and debt coverage requirements must be realized. In order to operate successfully with respect to these goals, both tests of revenue sufficiency must be met.

Cash Test – The cash flow test identifies all known cash requirements for the City in each year of the planning period. Typically, these include O&M expenses, debt service payments, rate-funded system reinvestment funding or directly funded capital outlays, and any additions to specified reserve balances. The total annual cash needs of the City are then compared to projected cash revenues using the current rate structure. Any projected revenue shortfalls are identified, and the rate increases necessary to make up the shortfalls are established.

Coverage Test – The coverage test is based on a commitment made by the City when issuing revenue bonds and some other forms of long-term debt. For the purposes of this analysis, revenue bond debt is assumed for any needed debt issuance. As a security condition of issuance, the City would be required per covenant to agree that the revenue bond debt would have a higher priority for payment (a senior lien) compared to most other expenditures; the only outlays with a higher lien are O&M expenses. Debt service coverage is expressed as a multiplier of the annual revenue bond debt service payment. For example, a 1.00 coverage factor would imply that no additional cushion is required. A 1.25 coverage factor means revenue must be sufficient to pay O&M expenses, annual revenue bond debt service payments, and an additional 25.0 percent of annual revenue bond debt service payments. The excess cash flow derived from the added coverage, if any, can be used for any purpose, including funding capital projects. Targeting a higher coverage factor can help the City achieve a better credit rating and provide lower interest rates for future debt issues.

9.5.1 Current Financial Structure

The City maintains a fund structure and implements financial policies that target management of a financially viable and fiscally responsible water system.

9.5.1.1 Fiscal Policies

A summary of the key financial policies employed by the City, as well as those recommended and incorporated in the financial program, are discussed below.

Operating Reserve – Operating reserves are designed to provide a liquidity cushion to ensure that adequate cash working capital will be maintained to deal with significant cash balance fluctuations, such as seasonal fluctuations in billings and receipts, unanticipated cash expenses, or lower than expected revenue collections. Like other types of reserves, operating reserves also serve another purpose: they help smooth rate increases over time. Target funding levels for an operating reserve are generally expressed as a certain number of days of O&M expenses, with the minimum requirement varying with the expected revenue volatility. Industry practice for utility operating reserves ranges from 30 days (8.0 percent) to 120 days (33.0 percent) of O&M expenses, with the lower end more appropriate for utilities with stable revenue streams and the higher end more appropriate for utilities with significant seasonal or consumption-based fluctuations. The City's current goal is to maintain a minimum balance in the Operating Fund equal to 90 days of O&M expenses for working capital.

Capital Reserve – A capital contingency reserve is an amount of cash set aside in case of an emergency should a piece of equipment or a portion of the utility's infrastructure fail unexpectedly. The reserve also could be used for other unanticipated capital needs, including capital project cost overruns. Industry practices range from maintaining a balance equal to 1.0 to 2.0 percent of fixed assets, an amount equal to a 5-year rolling average of CIP costs, or an amount determined sufficient to fund equipment failure (other than catastrophic failure). The final target level should balance industry practices with the risk level of the City.

This financial plan targets a minimum balance in the water utility capital fund equal to 1.0 percent of fixed assets.

System Reinvestment – System reinvestment funding promotes system integrity through ongoing repair and replacement of system infrastructure. Ideally, a detailed asset management plan would guide the level of rate funded system reinvestment, however, in absence of this level of effort, annual depreciation expense is commonly used as a measure of the decline in asset value associated with routine use of the system. Particularly for utilities that do not already have an explicit system reinvestment policy in place, implementing a funding level based on full depreciation expense could significantly impact rates. An alternative benchmark is annual depreciation expense net of debt principal payments on outstanding debt. This approach recognizes that customers are still paying for certain assets through the debt component of their rate and intends to avoid simultaneously charging customers for an asset and its future replacement. The specific benchmark used to set system reinvestment funding targets is a matter of policy that must balance various objectives, including managing rate impacts, keeping long-term costs down, and promoting "generational equity" (i.e., not excessively burdening current customers with paying for facilities that will serve a larger group of customers in the future).

The City is currently phasing in system reinvestment funding, aiming to reach 100 percent of annual depreciation levels by 2030. With this phase-in strategy in place, the City is forecast to fund an average of $4.1 million in capital costs annually through dedicated rate revenues within the 11-year forecast period.

Debt Management – It is prudent to consider policies related to debt management as part of a broader utility financial policy structure. Debt management policies should be evaluated and formalized, including the level of acceptable outstanding debt, debt repayment, bond coverage, and total debt coverage targets. The City has three outstanding water revenue bonds, a Public Works Trust fund loan, and two other low interest loans. This forecast meets or exceeds the required revenue bond debt service coverage of 1.25.

9.5.1.2 Financial Forecast

The financial forecast is primarily based upon the City's budget through 2024 and takes into consideration other key factors and assumptions needed to develop a complete portrait of the City's annual water utility financial obligations. The following is a list of the key revenue and expense factors and assumptions used to develop the financial forecast.

- **Growth** – Rate revenue is escalated utilizing a 0.45 percent growth rate developed based on actual historical trends at the City.

- **Revenue** – The City has two general revenue sources: 1) water service charges (rate revenue); and 2) miscellaneous (non-rate) revenue. In the event of a forecasted annual shortfall, rate revenue can be increased to meet the annual revenue requirement. For the purpose of this financial forecast, rate revenues are forecasted to increase with customer growth. Non-rate revenues are

held constant throughout the forecast period, with the exception of interest earnings which are calculated based on projected balances and assumed investment rates.

- System Development Charge Revenue – the existing system development charges are applied to the projected new connections to forecast revenue. Connection charges are forecast to generate an average of $512,000 annually from 2024-2034. This equates to an average of 46 new MCEs per year. Connection charge revenue is directed towards annual capital needs.

- Expenses – O&M expense projections are based on the City's budget through 2024 with general cost inflation increases of 3.0 percent, labor cost inflation of 5.0 percent for 2025 and 2026, decreasing to 3.0 percent thereafter and benefit cost inflation increases of 12.50 percent for 2025 and 2026, decreasing to 5.5 percent per year thereafter. Budget figures were used for taxes in 2024. Future taxes are calculated based on forecasted revenues and prevailing tax rates.

    - Facilities GO Bond - In order to construct a new facility for Maintenance and Operations for the City, the water utility will fund part of a General Obligation Bond totaling approximately $39.1 million. Beginning in 2025, the water utility's proportionate share of the bond is forecasted at $333,000 annually for the remainder of the twenty-year forecast.

- Existing Debt – The water utility has six (6) outstanding debt issues: three (3) revenue bonds, one (1) Public Works Trust Fund (PWTF) loan and two (2) Drinking Water State Revolving Fund (DWSRF) loans. Total annual existing debt service obligations begin 2024 at $2.7 million, decreasing to $1.1 million by 2034 as four (4) of the six (6) loans are fully repaid.

- Future Debt – The capital financial strategy developed for this WSP forecasts the need for $69.1M in new debt proceeds in five (5) separate instances throughout the eleven-year forecast. The analysis performed assumes all new debt is through revenue bond financing. Annual new debt service obligations are forecasted to begin in 2025 at $1.5 million increasing to $6.1 million by 2034.

- Transfers to Capital - Operating fund balance above the minimum requirement is assumed to be available to fund capital projects and projected to be transferred to the Capital Fund each year, if needed. In total, the utility is forecast to fund $17.9 million in capital projects from excess operating fund cash within the 11-year forecast period.

Although the financial plan is completed through 2043, the rate strategy focuses on the shorter-term planning period of 2024 through 2034. It is recommended that the City revisit the proposed rates every 3 to 4 years to ensure that the rate projections developed remain adequate. Any significant changes should be incorporated into the financial plan and future rates should be adjusted as needed.

Table 9-6, following, summarizes the annual revenue requirements based on the forecast of revenues, expenditures, fund balances, and fiscal policies.

Table 9-6 | 11-Year Financial Forecast

Revenue Requirement	2024	2025	2026	2027	2028	2029	2030	2031	2032	2033	2034
Revenues											
Rate Revenues Under Existing Rates	$ 18,398,987	$ 18,480,409	$ 18,562,210	$ 18,644,392	$ 18,726,956	$ 18,809,906	$ 18,893,241	$ 18,976,964	$ 19,061,078	$ 19,145,583	$ 19,230,482
Non-Rate Revenues	711,618	995,023	921,087	742,167	760,542	763,594	775,863	779,012	795,263	798,519	810,558
Total Revenues	**$ 19,110,605**	**$ 19,475,432**	**$ 19,483,297**	**$ 19,386,559**	**$ 19,487,499**	**$ 19,573,500**	**$ 19,669,104**	**$ 19,755,976**	**$ 19,856,341**	**$ 19,944,102**	**$ 20,041,040**
Expenses											
Cash Operating Expenses	$ 14,490,240	$ 15,195,624	$ 15,775,495	$ 16,147,464	$ 16,560,290	$ 16,986,418	$ 17,429,740	$ 17,888,499	$ 18,366,342	$ 18,860,547	$ 19,374,767
Existing Debt Service	2,674,248	2,671,361	2,665,106	2,615,447	2,611,734	2,601,528	2,598,336	1,759,410	1,759,292	1,090,490	1,089,760
New Debt Service	-	1,455,336	1,455,336	2,998,874	2,998,874	3,916,177	3,916,177	5,221,569	5,221,569	6,094,771	6,094,771
Rate Funded System Reinvestment	1,738,857	1,037,921	2,016,114	1,877,607	3,393,539	4,213,598	5,626,454	5,888,362	6,180,858	6,425,348	6,704,012
Total Expenses	**$ 18,903,345**	**$ 20,360,242**	**$ 21,912,050**	**$ 23,639,392**	**$ 25,564,438**	**$ 27,717,721**	**$ 29,570,707**	**$ 30,757,840**	**$ 31,528,062**	**$ 32,471,155**	**$ 33,263,310**
Total Surplus (Deficiency)	**$ 207,259**	**$ (884,810)**	**$ (2,428,754)**	**$ (4,252,833)**	**$ (6,076,939)**	**$ (8,144,221)**	**$ (9,901,603)**	**$ (11,001,863)**	**$ (11,671,720)**	**$ (12,527,053)**	**$ (13,222,271)**
Annual Rate Adjustment	**0.00%**	**7.50%**	**9.50%**	**9.50%**	**9.50%**	**9.50%**	**9.50%**	**3.00%**	**3.00%**	**3.00%**	**3.00%**
Cumulative Annual Rate Adjustment	**0.00%**	**7.50%**	**17.71%**	**28.90%**	**41.14%**	**54.55%**	**69.23%**	**74.31%**	**79.54%**	**84.92%**	**90.47%**
Rate Revenues After Rate Increase	$ 18,398,987	$ 19,866,440	$ 21,850,041	$ 24,031,724	$ 26,431,269	$ 29,070,437	$ 31,973,157	$ 33,078,288	$ 34,221,651	$ 35,404,570	$ 36,628,414
Additional Taxes from Rate Increase	-	229,097	543,446	890,472	1,273,446	1,695,963	2,161,979	2,330,808	2,505,891	2,687,448	2,875,704
Net Cash Flow After Rate Increase	**$ 207,259**	**$ 272,124**	**$ 315,632**	**$ 244,027**	**$ 353,928**	**$ 420,347**	**$ 1,016,334**	**$ 768,653**	**$ 982,962**	**$ 1,044,486**	**$ 1,299,958**
Coverage After Rate Increases	3.00	2.10	2.40	1.91	2.24	2.19	2.52	2.41	2.50	2.43	2.51

The financial forecast indicates that at existing rate levels the utility will become deficient in 2025 as growth in expenses outpaces growth in revenues and the utility takes on additional debt obligations to fund capital infrastructure investment. The City has adopted a 7.50 percent increase for 2025, to resolve the remaining projected deficiency, rates will need to increase by 9.50 percent annually from 2026 through 2030, before decreasing to 3.00 percent annually through 2034.

9.5.1.3 City Funds and Reserves

Table 9-7 shows a summary of the projected Operating Fund and Capital Fund ending balances through 2034 based on the rate forecasts presented above. The Operating Fund is maintained above 90 days of O&M expenses. The Capital Fund balance meets or exceeds the minimum target of 1 percent of fixed assets in most years of the study timeframe with the exception of 2026, 2028 and 2030 where balances fall below target. Fund balances are rebuilt and meet or exceed target balances by the end of the eleven-year timeframe.

Table 9-7 | Ending Cash Balance Summary

Ending Fund Balances	2024	2025	2026	2027	2028	2029	2030	2031	2032	2033	2034
Operating Fund	$ 8,988,743	$ 9,260,867	$ 3,943,874	$ 4,036,866	$ 4,140,073	$ 4,246,604	$ 4,357,435	$ 4,472,125	$ 4,591,586	$ 4,715,137	$ 4,843,692
Capital Fund	2,019,201	6,659,039	1,226,711	9,587,690	1,038,144	4,653,056	1,096,853	9,910,203	3,003,538	8,649,973	3,293,834
Total	**$ 11,007,944**	**$ 15,919,905**	**$ 5,170,585**	**$ 13,624,556**	**$ 5,178,217**	**$ 8,899,660**	**$ 5,454,288**	**$ 14,382,328**	**$ 7,595,123**	**$ 13,365,110**	**$ 8,137,526**

9.6 Current and Projected Rates

9.6.1 Current Rates

The existing water rates are composed of a fixed monthly charge that varies by meter size and a variable consumption charge per hundred cubic feet (CCF) for all water usage. While fixed charges are consistent across customer classes for all meter sizes except one inch, usage charges are different for each customer class. Consumption for the single family class is divided into three escalating pricing tiers that are applied year-round. This type of inclining tier structure is designed to discourage discretionary usage of water and encourage conservation. All other customers are charged a uniform rate for all consumption used. Table 9-8 shows the existing City of Auburn water system rate schedule.

Table 9-8 | Existing Schedule of Rates

Description	2024 Existing
Monthly Fixed Charges (All Classes)	
3/4"	$ 21.08
1" - Single Family	21.08
1" - All Other Classes	23.66
1 1/2"	25.76
2"	29.69
3"	57.11
4"	71.66
6"	91.57
8"	118.30
10"	167.97
Volume Charges per CCF	
Single Family	
0-7 CCF	$ 4.18
7-15 CCF	5.11
Greater Than 15 CCF	5.81
Multi-Family	$ 5.00
Commercial	5.27
Manufacturing / Industrial	5.15
Schools	5.61
Municipal	5.19
Irrigation	6.94

9.6.2 Projected Rates

The financial forecast discussed above indicates the need for annual rate adjustments to satisfy all forecasted financial obligations. The City has adopted a 7.50 percent increase for 2025, with annual 9.50 percent increases forecasted from 2026 through 2030, and 3.00 percent increases from 2031 to 2034. Table 9-9 shows the projected rates with increases applied uniformly to the water fixed and volume components for all classes. A more detailed rate study that will analyze the projected increases beyond the current adopted rates will be conducted in 2025.

Table 9-9 | Proposed Schedule of Rates

Description	Existing	Proposed

9.6.3 Conservation Based Rates

In 2003 the Washington State Legislature passed the Municipal Water Supply Efficiency Requirements Act. The Water Use Efficiency rules went into effect on January 22, 2007 and typically apply to Water System Plans that each jurisdiction is required to develop every six to ten years. The Revised Code of Washington (RCW) outlines the rules of this act, under RCW 70.119.180. In section 4(B), the RCW states that jurisdictions must perform an "evaluation of the feasibility of adopting and implementing water delivery rate structures that encourage water conservation." The City of Auburn currently charges their single family residential customers based on an inclining block rate structure to incentivize water use conservation, therefore no additional evaluation was performed.

9.7 Affordability

The Washington State Department of Health and the Department of Commerce Public Works Board use an affordability index to prioritize low-cost loan awards depending on whether rates exceed 2.5 percent of the median household income for the service area. The average median household income for the City was $87,406 between 2018 and 2022, expressed in 2022 dollars, according to the U.S. Census Bureau. The 2022 value is escalated based on the actual rate of inflation in 2023 of 4.31 percent and the 3.00 percent inflation rate used in the financial forecast to project the median household income in future years. Table 9-10

presents the City's monthly water bill, projected to 2034 and tested against the 2.5 precent monthly affordability threshold.

Table 9-10 | Community Affordability Test

Year	Inflation	Median HH Income	2.5% Monthly Threshold	Projected Monthly Bill	% of Median HH Income
2022		$ 87,406			
2023	4.31%	91,173			
2024	3.00%	93,908	$ 195.64	$ 50.34	0.64%
2025	3.00%	96,726	201.51	54.09	0.67%
2026	3.00%	99,627	207.56	59.25	0.71%
2027	3.00%	102,616	213.78	64.90	0.76%
2028	3.00%	105,695	220.20	71.05	0.81%
2029	3.00%	108,866	226.80	77.80	0.86%
2030	3.00%	112,132	233.61	85.17	0.91%
2031	3.00%	115,495	240.62	87.71	0.91%
2032	3.00%	118,960	247.83	90.35	0.91%
2033	3.00%	122,529	255.27	93.10	0.91%
2034	3.00%	126,205	262.93	95.88	0.91%

Applying the 2.5 percent monthly affordability test, the City's rates are forecasted to remain within the indicated affordability range through 2034.

9.8 Conclusion

The results of this analysis indicate that at existing rate levels the utility will be deficient beginning in 2025. To keep pace with expenses and prepare for new debt obligations needed to fund system infrastructure needs, the City has adopted a 7.50 percent rate increase in 2025. Forecasting into the future a 9.5 percent annual rate increase will be required from 2026 through 2030, followed by 3.00 percent increases through 2034. It is recommended that the City regularly review and update the key underlying assumptions that compose the multi-year financial plan to ensure that adequate revenues are collected to meet the City's total financial obligations.

Background for Motion:

Background Summary:
The Washington State Growth Management Act (RCW 36.70A.130) requires that all cities and counties periodically take legislative action to review and, if needed, revise their Comprehensive Land Use Plan and Development Regulations to ensure the Plan and Regulations comply with the requirements of the Growth Management Act (GMA). The City has determined that the Comprehensive Plan is consistent with the GMA, the King County County-Wide Planning Policies, Pierce County County-Wide Planning Policies, and the Puget Sound Regional Council Vision 2050. By adoption of this ordinance, the City of Auburn has completed the mandatory periodic Comprehensive Plan review process that is set forth in RCW 36.70A.130.

Councilmember: Tracy Taylor **Staff:** Jason Krum

ORDINANCE NO. 6960

AN ORDINANCE OF THE CITY COUNCIL OF THE CITY OF AUBURN, WASHINGTON, RELATING TO COMPLETION OF THE 2024 PERIODIC COMPREHENSIVE PLAN UPDATE REQUIREMENTS UNDER THE WASHINGTON STATE GROWTH MANAGEMENT ACT AND ADOPTION OF THE UPDATED ELEMENTS, APPENDICES, PLANS INCORPORATED BY REFERENCE, LAND USE MAP, AND ZONING MAP

WHEREAS, the Washington State Growth Management Act (Revised Code of Washington (RCW) 36.70A.130) requires that all cities and counties periodically take legislative action to review and, if needed, revise its comprehensive land use plan and development regulations to ensure the plan and regulations comply with the requirements of the Washington State Growth Management Act; and

WHEREAS, RCW 36.70A.70 describes required and optional Elements of the Comprehensive Plan (the Plan). The Plan shall be an internally consistent document, and all elements shall be consistent with a future land use map; and

WHEREAS, RCW 36.70A.140 indicates that a comprehensive plan shall be adopted and amended with public participation. Auburn City Code (ACC) 14.22.030 required early and continuous public participation in the comprehensive plan process; and

WHEREAS, ACC 14.22.010 provides a description of the purpose of the comprehensive plan. The city of Auburn comprehensive plan establishes the principles, goals, objectives and policies guiding future development of the city in compliance with Chapter 36.70A RCW, the Washington State Growth Management Act. The purpose of this chapter is to establish procedures and review criteria for amending the

comprehensive plan and to provide provisions for public participation in the planning process; and

WHEREAS, pursuant to Chapter 36.70A RCW, the Environmental Impact Statement (EIS) Scoping Notice was transmitted to the Washington State Department of Commerce on October 23, 2023; and

WHEREAS, Pursuant to Revised Code of Washington (RCW) 36.70A, the draft Comprehensive Plan was transmitted to the Washington State Department of Commerce on April 9, 2024. The 60-day notice period ended June 9, 2024; and

WHEREAS, pursuant to Chapter 36.70A RCW, the Draft Environmental Impact Statement (DEIS) was transmitted to the Washington State Department of Commerce on May 20, 2024; and

WHEREAS, Agencies, affected tribes, and members of the public were invited to comment on the proposed contents of the DEIS. Comments were accepted up to the 60-day notice period on 5:00 p.m. PST on June 19, 2024; and

WHEREAS, Pursuant to Chapter 36.70A RCW, the Final Environmental Impact Statement (FEIS) was transmitted to the Department of Commerce on October 18, 2024. The City did not act upon the FEIS until November 8, 2024; and

WHEREAS, the City of Auburn provided its draft Comprehensive Plan to the Puget Sound Regional Council (PSRC) on May 20, 2024 to provide comment on the draft Comprehensive Plan prior to PSCR's certification of the plan; and

WHEREAS, the City of Auburn also provided its draft Comprehensive Plan to the King County Affordable Housing Committee to provide comment on the draft Comprehensive Plan; and

WHEREAS, the City held an in-person public meeting on June 5, 2024 at 6:00 p.m. PST in City Council Chambers and a virtual meeting (or telephonically) meeting on June 6, 2024 at 6:00 p.m. PST to discuss the DEIS and draft Comprehensive Plan.

WHEREAS, the City of Auburn Planning Commission scheduled and held public meetings on April 2, 2024, April 16, 2024, April 30, 2024, May 21, 2024, June 4, 2024, June 18, 2024, July 2, 2024, April 30, 2024, September 17, 2024, October 8, 2024, December 3, 2024, for the purposes of staff presentations and discussion on the various components of the plan; and

WHEREAS, the Planning Commission scheduled and held public hearings on April 16, 2024, April 30, 2024, May 7, 2024, June 4, 2024, June 18, 2024, July 2, 2024, July 16, 2024, October 8, 2024, December 3, 2024, to receive public testimony on the proposed Plan; and

WHEREAS, the Auburn City Council finds it appropriate and in the best interest of the City to adopt the Auburn Comprehensive Plan, which includes the Land Use Element, the Housing Element, the Capital Facilities Element, the Utilities Element, the Transportation Element, the Economic Development Element, the Parks and Recreation Element, the Appendices listed within and the referenced functional plans listed in the Capital Facilities Element; and

WHEREAS, the Auburn City Council determines that the adoption of the Comprehensive Plan meets the criteria set forth in the Auburn City Code and all other applicable legal criteria; and

WHEREAS, the Auburn City Council determines that the Comprehensive Plan is consistent with the Growth Management Act, the King County and Pierce County

County-Wide Planning Policies, and the Puget Sound Regional Council Vision 2050; and

WHEREAS, by adoption of this ordinance, the City of Auburn has completed the mandatory periodic comprehensive plan review process that is set forth in RCW 36.70A.130.

NOW, THEREFORE, THE CITY COUNCIL OF THE CITY OF AUBURN, WASHINGTON, DO ORDAIN as follows:

Section 1. Adoption of Comprehensive Plan. The City of Auburn 2024 Comprehensive Plan, its updated Chapters of the Comprehensive Plan, updated Additional Documents of the Comprehensive Plan, that are incorporated by reference, and Supplementary Reports Documents of the Periodic Comprehensive Plan Update, set forth in Exhibits 1 through 24, is on file with the office of the City Clerk is adopted and is available for inspection therein.

Section 2. Implementation. The Mayor is authorized to implement those administrative procedures necessary to carry out the directives of this legislation.

Section 3. Severability. The provisions of this ordinance are declared to be separate and severable. The invalidity of any clause, sentence, paragraph, subdivision, section, or portion of this ordinance, or the invalidity of the application of it to any person or circumstance, will not affect the validity of the remainder of this ordinance, or the validity of its application to other persons or circumstances.

Section 4. Effective date. This Ordinance will take effect and be in force five days from and after its passage, approval, and publication as provided by law.

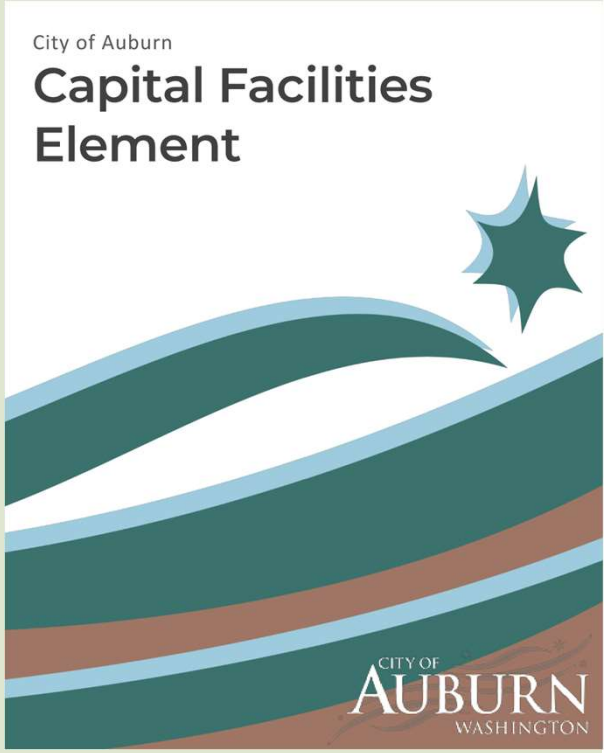
2024 PERIODIC COMPREHENSIVE PLAN PACKAGE

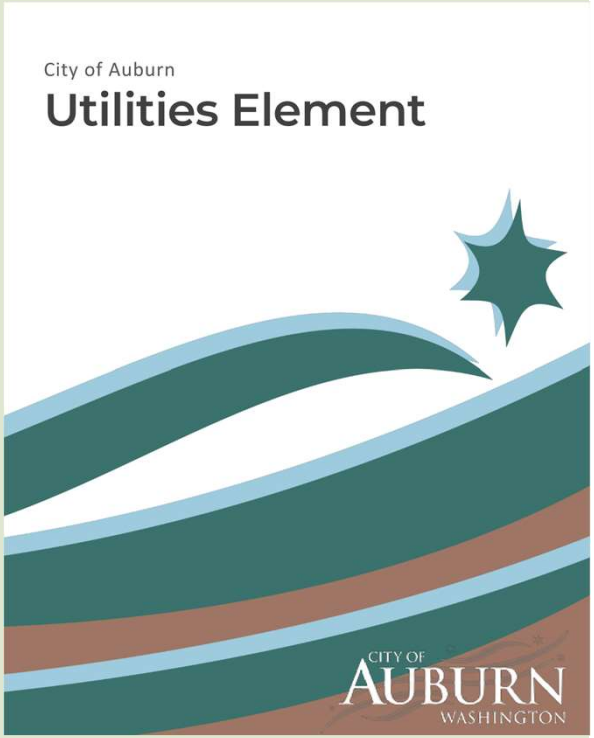
Auburn Comprehensive Plan Elements

- Land Use
- Housing
- Historic Preservation
- Climate Change
- Economic Development
- **Capital Facilities**
- **Transportation**
- **Utilities**
- **Parks and Recreation**



Citywide effort involving all departments coordinating together to create a cohesive, consistent, and forward-thinking Plan covering range of subject areas

SERVICE • ENVIRONMENT • ECONOMY • CHARACTER • SUSTAINABILITY • WELLNESS • CELEBRATION



CAPITAL FACILITIES ELEMENT

- Provides overview for each of the “system plans” including:
  - Facilities Inventory
  - Levels of Service Standards
  - Future Plans
  - Known Capacity Issues
- High-level policy goals for the capital facility plan
  - Goal 1 Keeping Pace with Growth
  - Goal 2 Public Facilities and Funding
  - Goal 3 Public and Environmental Health
  - Goal 4 Community Benefits of Public Facilities
  - Goal 5 Consistency with Other Adopted Plans
  - Goal 6 Public and Institutional Buildings
  - Goal 7 Essential Public Facilities
- City plans and programs are further refined in other plans (e.g. PROS)

UTILITIES ELEMENT

- Includes general capacity of all existing and proposed utilities including electrical, telecommunications, and natural gas systems
- Generally, describes these “privately-owned "utilities including electricity, natural gas, telecommunications, and solid waste
- High-level policy goals for the different utility services
  - Goal 1 Service Area
  - Goal 2 Compatibility in the Community
  - Goal 3 Safety and Efficiency
  - Goals 4 Sustainability and Equity
  - Goal 5 Solid Waste

PARKS ELEMENT & TRANSPORTATION ELEMENT

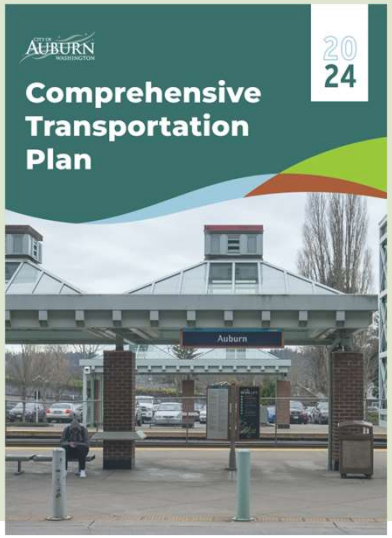
City of Auburn

Parks and Recreation Element

- High-level policy goals for the PROS PLAN
  - Goal 1 Serve all residents
  - Goal 2 balanced mix of passive and active recreation opportunities
  - Goal 3 system of high-quality parks
  - Goal 4 a park system that enhances the quality of life
  - Goal 5 Identify, acquire, and effectively manage significant open spaces
  - Goal 6 inclusive network of trails designed for all
  - Goal 7 Enhance our existing park portfolio

City of Auburn

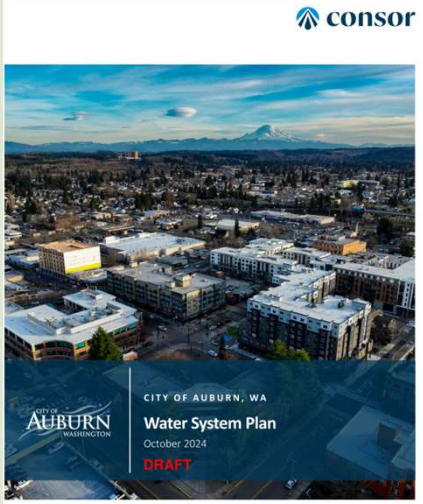
Transportation Element



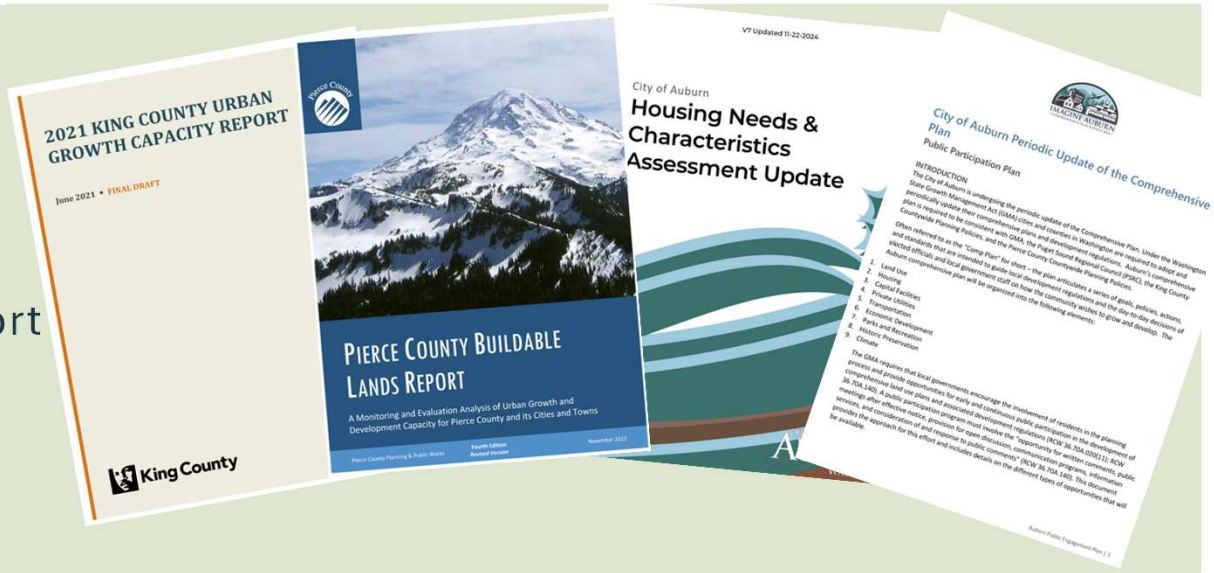
- Provides only a brief overview of the City's Comprehensive Transportation Plan
- Describes the Planning Framework
- Agency Coordination

SYSTEM PLANS

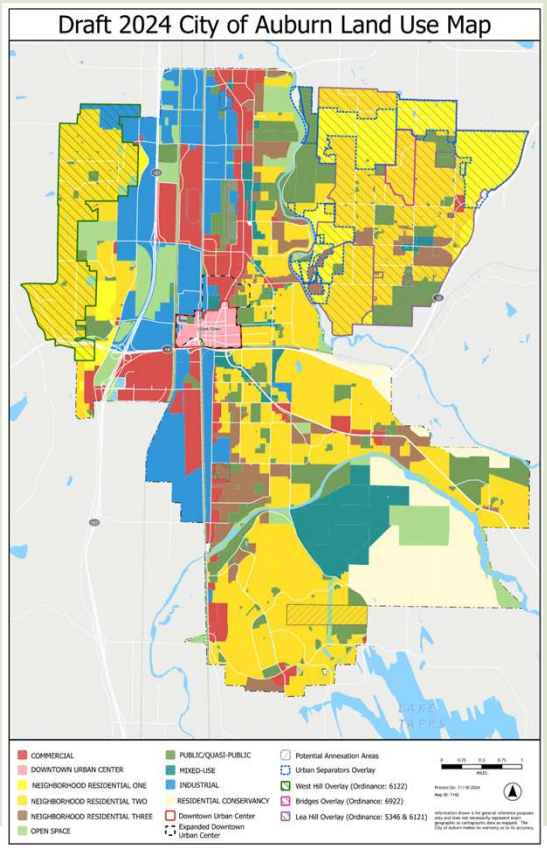
- Parks, Recreation, and Open Space (PROS) Plan
- Comprehensive Transportation Plan
- Comprehensive Water Plan
- Comprehensive Sewer Plan
- Comprehensive Storm Drainage Plan



- Planning Commission Meetings
- Planning Commission Public Hearing & Deliberation
- Council Study Session



APPENDICES & SUPPORTING DOCUMENTS



- Housing Needs Assessment Update
- Public Participation Plan
- King County Buildable Lands Report
- Pierce County Buildable Lands Report
- Climate Element Framework
- Public Comments
- Agency Checklists
- Agency Comments

The Comprehensive Plan is Moving Auburn Forward

As we continue to develop our vision for the future of Auburn, we want to ensure that everyone has the opportunity to help us create our vision for the next 20 years. In 2022-2024, the City is updating the previous Comprehensive Plan adopted in 2015, and your feedback is needed. Please visit the project website to sign up for news, participate in surveys, and to stay up to date on upcoming community workshops.

What is a Comprehensive Plan?

The City of Auburn's Comprehensive Plan update will provide a general vision for the future of the community and a roadmap for the next twenty years. It outlines what the community wants to look like moving forward towards 2044, and how to make that collective vision a reality. The Plan also addresses regional growth requirements provided by Puget Sound Regional Council. The Plan addresses a broad range of issues and sets policy direction for:

Housing
Economic Development
Parks and Open space
Environmentally Sensitive Areas Transportation
Community Health and Well-being
Historic Preservation
Public Utilities and Facilities
Land Use
Climate Change

Notice of Public Hearing
2024 Auburn Periodic Comprehensive Plan Update

The City of Auburn will be holding a series of Public Meeting presentations and Public Hearings to discuss the 2024 Periodic Comprehensive Plan Update. These Planning Commission meetings will occur on Tuesday evenings beginning at 6:00 pm. The first Public Hearing will be held on April 16, 2024, and Public Hearings are expected to continue through July 2024. The presentations and hearings are open to the public and will be held in-person in the City Council Chambers, 25 W Main St., Auburn, WA, 98001. Each meeting will consist of a Staff presentation on a specific Comprehensive Plan Element(s), a Public Hearing on an Element(s), and Planning Commission deliberation and action on an Element(s). The currently scheduled Public Meeting and Public Hearing dates are listed to the right.

A complete project schedule and more information on the 2024 Auburn Periodic Comprehensive Plan can be found at www.speakupauburn.org/comprehensive-plan. Specific dates for each Element presentation, public hearing, and deliberation and action are subject to change. Please contact planning@auburnwa.gov with questions.

Land Use Element

Introduction

All land within the City of Auburn is assigned a land use designation and implementing zoning district, which builds from previously adopted Comprehensive Plan Maps, the existing land use pattern, adopted subarea plans, topography, natural features, and targeted goals for shifting the character of specified areas. This chapter provides a description for each designation, general criteria for how to assign the designation, and a series of goals and policies that govern land use within each designation.

The Comprehensive Plan Land Use Map shows the location and boundaries for each designation. This map should be consulted together with the written policies of this Plan when decisions about zoning designations, land use activities, and development of public infrastructure are considered.

The Land Use Element explains the reasoning and intention behind the land use designations. This should be useful in:

- Developing and implementing tools (such as zoning provisions)
- Interpreting the Land Use Map as it applies to specific regulatory decisions or development proposals
- Adjusting or amending the Land Use Map when changing conditions or land use markets warrant
- Planning for public services and infrastructure

Finally, this Element sets forth special policies intended to address the unique challenges and opportunities of specific locations within Auburn. These specific policies supplement the general goals, objectives and policies found in other Elements of the comprehensive plan.

Vision

The Auburn community is both physically and socially connected. We take pride in the quality of our built environment as well as the beauty and function of our natural environment. Land use patterns are supported by a complete and efficient transportation and utility infrastructure system. Neighborhoods, commercial centers, and parks are attractive, interesting, accessible, and well maintained. Natural riverine and forested corridors are interspersed throughout the city, offering sanctuaries where fish and wildlife reside, and providing opportunities for people to observe and learn about the environment. Residents have a strong association with their neighborhoods, are engaged and involved in the decisions that steer Auburn into the future.

Planning Framework

The Growth Management Act (GMA), codified as RCW 36.70A, is the enabling legislation that renders this Comprehensive Plan a legally recognized document by the State of Washington. This plan is a policy document only; the policies are required by GMA to be implemented through the use of such regulatory tools as zoning and subdivision ordinances, as well as other innovative techniques. The implementing regulations must be developed and maintained in accordance with the goals and policies of this Comprehensive Plan, and as set forth in the Growth Management Act, as amended, and consistent with King and Pierce County, Countywide Planning Policies (CPP).

In 1991, the State Legislature amended the GMA to require that counties adopt CPP's in cooperation with their municipalities. The purpose of these policies is to establish a coordinated, countywide framework within which to develop comprehensive plans. The CPP must guide the subsequent adoption of comprehensive plans without overly constraining with excessive detail. The Countywide Planning Policies shall, at a minimum, address the following:

1. Policies to implement RCW 36.70A.110;
2. Policies for promotion of contiguous and orderly development and provision of urban services to such development;
3. Policies for siting public capital facilities of a countywide or statewide nature, including transportation facilities of statewide significance as defined in RCW 47.06.140;
4. Policies for countywide transportation facilities and strategies;
5. Policies that consider the need for affordable housing, such as housing for all economic segments of the population and parameters for its distribution;
6. Policies for joint county and municipality planning within urban growth areas;
7. Policies for countywide economic development and employment, which must include consideration of the future development of commercial and industrial facilities; and
8. An analysis of the fiscal impact.
9. Policies that address the protection of tribal cultural resources in collaboration with federally recognized Indian tribes that are invited pursuant to subsection (4) of this section, provided that a tribe, or more than one tribe, chooses to participate in the process.

Land Use Patterns

For the first 100 years of Auburn's existence, the land use pattern developed in a relatively logical manner. Auburn was fully contained to the valley floor with a

traditional downtown urban center, several north/south heavy commercial and industrial corridors paralleling Highway 167, and a surrounding housing stock that was built primarily between 1910 and 1960. In the last 30 years, the land use pattern of Auburn has changed, primarily from incorporation of areas to the south, east, and west. Each newly incorporated area has its own identity and land use pattern.

Because a significant portion of today's Auburn was settled prior to incorporation, the basic land use patterns and infrastructure have already been established. Furthermore, much of today's Auburn land use pattern was established in either Auburn, the Muckleshoot Reservation, or prior to incorporation in King County or Pierce County. Given the mix of jurisdictional oversight, myriad land use policies, regulations, infrastructure standards, and investments have been applied in these areas. This has resulted in a relatively uncoordinated and random land use pattern. It also means that the various communities lack connectivity to each other, have a mix of identities, and are experiencing a change in their character from rural to more urban.

Auburn has a strong mix of housing and industry. Auburn's residential land use pattern includes a variety of densities, ages, and housing type. Auburn's nonresidential land use pattern includes a mix of local and regional retail, entertainment, services, manufacturing, warehousing, and distribution centers. This mix of land use is a strength because it exemplifies social, economic, and cultural diversity.

Auburn's natural resources include the Green River and its tributaries, the White River and its tributaries, a robust inventory of wetlands, floodplains, steep slopes, and mature open spaces. With a strong base to work from, the city and its partners can be strategic about how to better connect and preserve natural areas so that the overall system is enhanced for future generations to enjoy.

Future Land Use

The City of Auburn conducted a process to determine the preferred alternative for Auburn's future land use. Alternatives are different options to achieve the project's purpose and needs, and they serve as the basis for analyses related to environmental elements. The alternatives considered provide a range of capacities to accommodate growth for housing and employment, housing types, and citywide infrastructure investments. The Preferred Alternative, which is adopted as the future Zoning and Land Use maps, incorporate feedback from the community regarding where household and growth should occur as well as modelling to determine how growth may affect local infrastructure such as transportation and utilities. The Land Use and Zoning maps and assumptions described in the Land Use Element are assumed in each of the Comprehensive Plan Element and related systems plans. Future land use and zoning decisions were based on modelling results and calculations to demonstrate that there is adequate zoned capacity to accommodate the city's required future housing and employment targets.

Future Land Use Housing and Employment Capacity

A residential land capacity analysis evaluates whether jurisdictions have sufficient land capacity available to allow for the types and amount of new housing needed to meet identified housing needs is required as part of HB 1220 requirements. The 2021 Housing Element updates amended RCW 36.70A.070(2)(c) of the Growth Management Act to require the Housing Element to include explicit consideration of capacity for the following household needs and building types:

- Moderate, low, very low, and extremely low-income households;
- Permanent supportive housing;
- Emergency housing and emergency shelters; and
- Duplexes, triplexes and townhomes (within an urban growth area boundary

The intent of this analysis is to assess the City of Auburn's current capacity to accommodate different housing income brackets and whether that capacity is sufficient to meet Auburn's housing targets established by King and Pierce counties. In addition, this analysis considers implementing a preferred land use alternative through zoning changes and provides updated capacity calculations to ensure sufficient capacity of suitable land to meet growth targets.

Full analysis of housing and employment capacities and future need is described in *Appendix A - Housing Needs and Characteristics Assessment*.

Preferred Alternative Implementation

To address an anticipated deficit of zoned capacity to accommodate future growth targets of 12,112 new housing units and 19,520 new jobs based on current zoning, Auburn is consolidated zoning districts, developing dedicated Growth Centers, increasing densities, and permitting additional housing types. The changes in zoning are based on a preferred alternative completed as part of the land use scenario process where select centers and nodes were identified for increased density. This preferred alternative is reflected in the Comprehensive Plan Land Use and Comprehensive Plan Zoning maps. Results of the zoning changes pertaining to housing unit and employment growth are summarized below. The full zoning analysis is described in *Appendix A - Housing Needs and Characteristics Assessment*.

Residential and Employment Zoned Capacity

Residential and employment capacity by zone is based primarily on the assumptions outlined Buildable Lands Report process in 2021, updates to reflect

changes to zoning and density assumptions since that time. Downtown Urban Center mixed-use development assumes a distribution of 75% residential and 25% commercial, whereas the R-NM Neighborhood Mixed Use assumes a 50-50% split for mixed uses both vertically and horizontally. The residential capacity estimates accommodating 47,922 housing units at max buildable capacity and 35,507 net new housing units, exceeding the 12,112 net new housing unit target. This increase is due largely to Middle Housing policies consistent with HB 1110 which allows for Middle Housing in all residentially zoned areas. Four middle housing units per lot are permitted in moving forward, with up to two additional units permitted if within ¼ mile of a major transit stop or of those units are dedicated to affordable housing. Specific information on middle housing development regulations and requirements are found in city code. The R2 – Residential Low zone is found widely throughout the city.

Table 1. Residential Capacity by Zone

Residential & Mixed-Use Zoning Districts	Zone category	Developable Acres	Net zoning changes (acres)	Assumed Density - DU/Acres	Residential Capacity (units)	Net New (Units)
King County						
Residential Conservancy (RC)	Low Density	745	0	1	745	-
R-1 Residential	Low Density	275	0	4	1,471	-
R2 – Residential Low	Moderate Density	294	1158	25	37,789	28,950
R3 – Residential Moderate	Moderate Density	0	22	30	660	660
R4 – Residential High	High Density	79	-1	50	3,890	-50
Neighborhood Mixed-Use (R-NM)	High Density Mixed-Use	0	89	30	2,670	2,670
Manufacture Home/Community (R-MHC)	Low Density	27	0	10	273	
DUC Downtown Urban Center - 125	High Density Mixed-Use	0	5	100	125	500
DUC Downtown Urban Center - 75	High Density Mixed-Use	0	5	95	119	475
DUC Downtown Urban Center - 55	High Density Mixed-Use	0	4	90	90	360
DUC Neighborhood Residential	High Density Mixed-Use	0	3	30	90	90
Total		1,420	1,285	-	47.422	35,310
Pierce County						

R2 – Residential Low	Moderate Density	20	20	**25**	500	500
Total		20	20	-	500	500
			Total New (2044) Housing Capacity		47,922	35,810

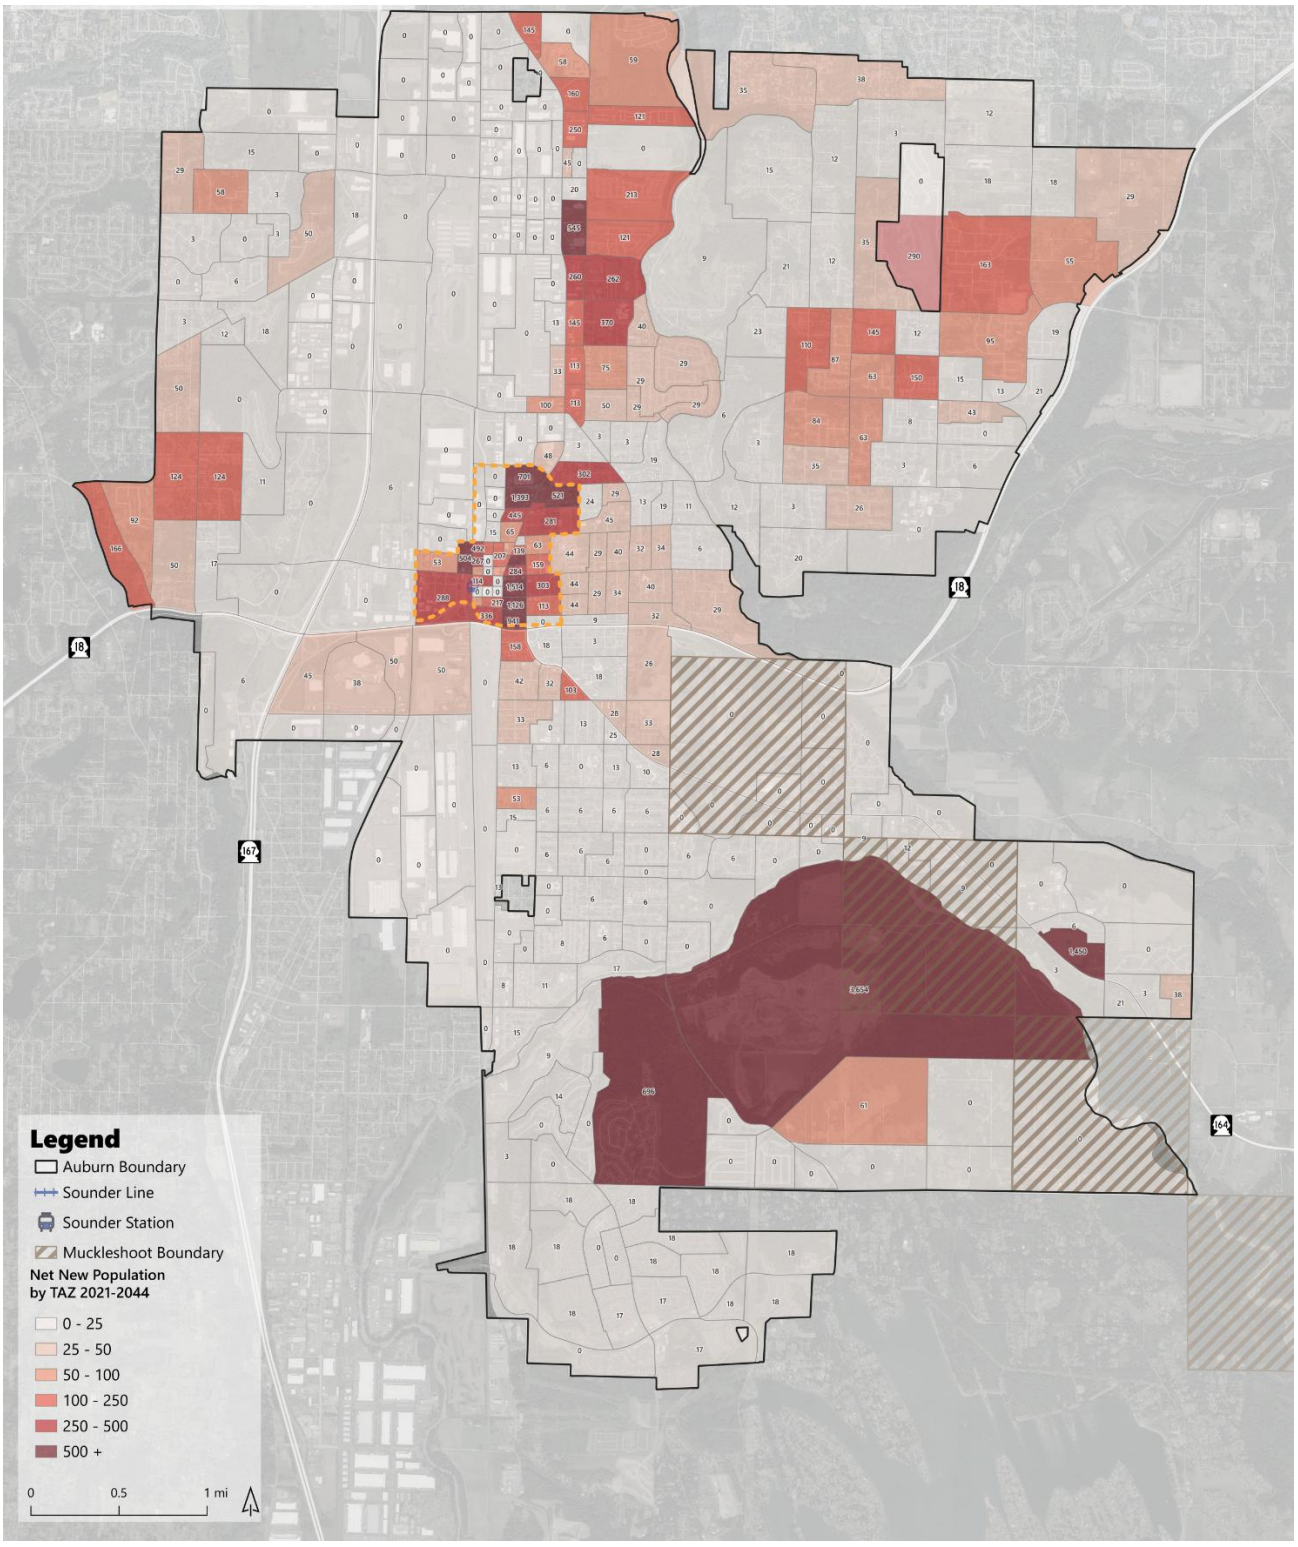
Table 2. Adjusted Employment Development Capacity by Zone

Non-Residential Districts	Developable Acres	Net zoning changes (acres)	Assumed Density – DU/Acres	Employment Capacity (units)
Light Commercial (C-1)	32	-13	845,391	2,254
Heavy Commercial District (C-2)	8	-8	-	-
Auburn Gateway District (C-AG)	0	15	653,400	653
Light Industrial (M-1)	132	-41	3,945,338	3,945
Heavy Industrial (M-2)	81	-9	3,122,925	3,123
Airport Landing Field (AF)	5	0	233,038	233
Mixed-Use Districts	**Developable Acres**	**Net zoning changes (acres)**	**Assumed Density – DU/Acres**	**Employment Capacity (units)**
DUC Downtown Urban Center – 125	0	5	163,350	408
DUC Downtown Urban Center – 75	0	5	163,350	408
DUC Downtown Urban Center – 55	0	4	130,680	327
DUC Neighborhood Residential	0	3	98,010	245
DUC Health and Wellness – 125	0	2	87,120	218
DUC C-1	0	13	566,280	1,510
DUC C-2	0	12	522,720	1,394
DUC M-1	0	39	1,698,840	1,699
Neighborhood Mixed-Use (R-NM)	0	89	1,938,420	5,169
		Total New (2044) Jobs Capacity		**21,587**

The employment capacity estimates accommodating 20,701 new jobs at max buildable capacity by 2044, exceeding the city's target of 19,520. Growth is located in the Downtown Urban Center (DUC) and in Growth Centers, whose core is primarily R-NM Neighborhood Mixed-Use. Additional growth in commercial space is anticipated, following a recent trend in industry job growth in Auburn.

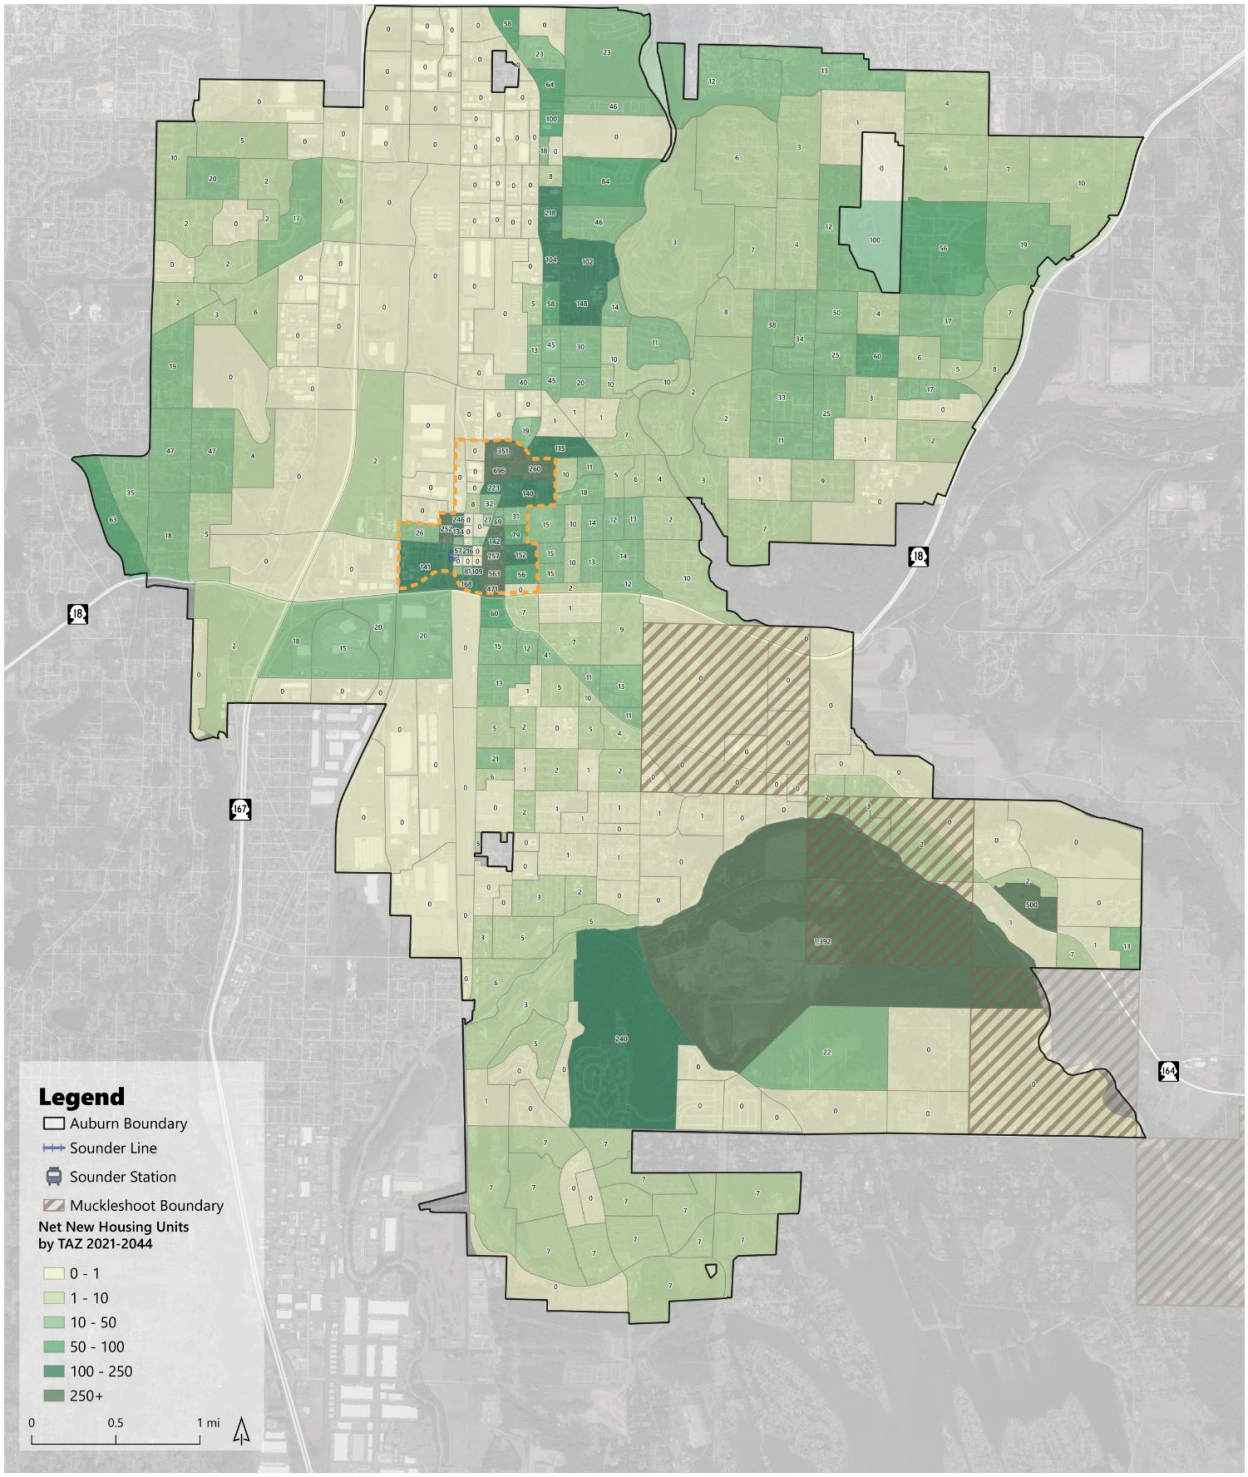
Housing Affordability by Average Median Income (AMI)

Income Level (% AMI)	Zone Categories Servicing these Needs	Housing Needs	Capacity prior to Zoning Adjustment	Post-Rezone Capacity	Capacity surplus or deficit
King County					
0-30% PSH	High Density-Mixed Use	2,389	566	3,004	**615**
0-30% Other					
>30-50%	High-Density, ADU	962	1,532	4,823	**3,861**
>50-80%					
>80-100%	Moderate Density, ADU	2,458	5,058	37,379	**35,33**
>100-120%					
>120%	Low-Density, ADU	6,303	348	2,217	***(4,086)***
Pierce County					
>80-100%	Moderate Density, ADU	112	100	500	***388***
Aggregated Total	-	12,112	7,504	46,070	*35,810*



In addition to meeting the residential and employment capacity targets through zoning and policy decisions, the city meets the aggregate King and Pierce County housing needs for income level groups. The only exception is the >120% Average Median Income (AMI) category, which includes primarily low-density housing in the R-1 and RC zones. However, this AMI category is not required to be met under HB 1220 requirements as high-income earners are represented in this group and can also purchase moderate density housing options as well.

In Pierce County, the City's primary residential zone is R-2 Residential Moderate which for purposes of this capacity analysis aligns with the 80-120% AMI range. This zone can adequately accommodate the total housing need of 112, however AMI below 80% is not accounted for in this analysis. As indicated earlier, the housing target for the Pierce County portion of Auburn is only 112 housing units and as a result the city does not intend to rezone small areas of land in order to satisfy AMI requirements since actual development is unpredictable. The R-2 Residential Moderate zone can accommodate middle housing, single unit detached housing, and ADUs that can realistically serve a range of incomes, and the city will continue to provide flexibility in the development types allowed in this part of the city to best accommodate the full range of AMI levels.



An estimated 1,852 new Accessory Dwelling Units (ADUs) are accounted for prior to rezoning, as these developments are currently allowed in various zones are expected to occur naturally over the next 20-years. In total, 80% of new ADUs are planned for in the 80-120% AMI range, and 20% in the greater than 120% AMI range. ADUs are expected primarily in the low-density and moderate-density land uses found in throughout the city.

Map 1.1 below shows where future new population is anticipated based on new households. It is anticipated that Auburn will have a population of 100,000 by 2029 and approaching 130,000 by 2044.

Map 1.2 shows the allocation of net new housing units by 2044 throughout the city. The net new housing units are consistent with King County and Pierce County Countywide Planning Policies required household units for 2044. Many of the new housing units are allocated in the Downtown Urban Center and in designated Growth Corridors.

Map 1.1 – 2044 Population Estimates by Area

Map 1.2 – 2044 Net New Housing Units by Area

Goals, Policies, and Land Use Characteristics

Residential Land Use Designations

Character

Residential uses will comprise a diverse arrangement of multiple densities and housing types. The pattern of one single density in a zone or neighborhood will evolve into increased and mixed densities in exchange for amenities that enhance quality of life. There will be greater connectivity and stronger spatial relationships between neighborhoods through strategic locations of roadway, trail, park, and neighborhood-serving businesses. These amenities will help create localized identity while also linking one area to another. The design and build quality of the new construction and infill will be held to a high standard. The city will encourage projects to be unique, innovative, and provide the residents of Auburn with true choice.

Values

- *Character:* Residential neighborhoods will include amenities, features, and layouts that promote interaction amongst residents.
- *Wellness:* The design of residential neighborhoods will emphasize safety and nonmotorized connectivity.
- *Service:* Through outreach and engagement, individual residents and homeowners' associations are connected to and aware of municipal services, events, and activities.
- *Economy:* Neighborhoods have a physical and personal connection to Auburn's commercial centers and attractions. People want to move to Auburn because of the commercial and recreational opportunities it has to offer.
- *Celebration:* Districts and neighborhoods are identified, promoted, and celebrated.
- *Environment:* The built environment will fit into the natural landscape in a way that protects and respects ecosystem function and that preserves native vegetation and soils.
- *Sustainability:* Natural resources, economic prosperity, and cultural vibrancy are balanced in a way that builds and maintains a thriving and long-lasting community.

Policies

LU-1 Regulations for new developments and infill should address the following elements:

a. Connectivity by multiple means to adjacent subdivisions, nearby commercial hubs, and parks and recreation facilities.

b. Relationship to nearby existing or future transit service.

c. Usable community amenities and spaces.

d. Environmental protection and preservation of natural features.

e. Preservation of areas that can support low-impact development techniques.

f. Promote the use of energy and water conservation measures

g. Efficient and effective delivery of utility service.

h. Innovative design.

i. Crime prevention through environmental design.

j. Long-term maintenance considerations.

LU-2 As denser development continues to occur; standards should be developed to maximize density while preserving open space and critical areas.

LU-3 Programs should continue to be implemented to improve the quality of low-income neighborhoods and encourage rehabilitation of deteriorating structures and facilities.

LU-4 Public/Quasi-Public uses may be permitted as a conditional use if de signed in a manner that enhances the residential character of the area. Special care shall be given to ensuring appropriate levels of parking, landscaping, and traffic circulation to avoid conflict with residential uses.

LU-5 New residential development shall contribute to the creation, enhancement, and improvement of the transportation system, health and human services, emergency services, school system, and park system. This may be accomplished through the development of level-of-service standards, mitigation fees, impact fees, and/or construction contributions.

LU-6 Cluster development is the preferred form of residential development in all residential designations with the goal of preserving natural areas, critical areas, and areas that support low-impact development. Where clustering accomplishes these objectives, it should not come at the expense of lost development potential. Variances to lot size, lot dimensions, building height, and other bulk or dimensional standards should be utilized in order to create incentives that promote preservation.

LU-7 Ensure that new development in Growth Centers meets minimum development intensity thresholds to ensure that employment and housing growth will help achieve the desired levels of jobs and housing units.

LU-8 Designated Growth Centers and Downtown Urban Center shall promote physical activity and reduce per capita vehicle miles traveled within the jurisdiction, but without increasing greenhouse gas emissions elsewhere in the state.

LU-9 Consider land use patterns and development regulations to promote development that addresses potential environmental health disparities in coordination with the Climate Element.

LU-10 Identify and implement strategies to mitigate the risk to lives and property posed by wildfires. Risk identification and strategies should be aligned with Climate Element workplan through 2029.

LU-11 Coordinate land use choices with neighboring jurisdictions, agencies, and the Muckleshoot Indian Tribe to encourage consistency and predictability for regional planning and environmental considerations.

LU-12 Encourage inclusive engagement on land use decisions to ensure decisions do not negatively impact historically marginalized communities.

LU-13 Land Uses decisions should provide for protection of the quality and quantity of groundwater used for public water supplies.

Residential Conservancy Designation

Description

This designation should consist primarily of low-density residential uses (one dwelling unit per four acres is allowed) and accessory agricultural uses in areas featuring environmental constraints or requiring special protection such as the Coal Creek Springs watershed area, low-lying areas along the Green River, and areas that are isolated from the full complement of urban services. This designation will serve to both protect environmental features and hold areas for higher density development until such a time public facilities become available. Per HB 1110 requirements adopted in 2023, Middle Housing is permitted in this zone however adopted city development regulations still apply.

Designation Criteria

1. Areas with significant environmental constraints, intrinsic value, or that may pose environmental hazards if developed, such as areas tributary to public water sources;
2. Affords greater protections to environmental features than existing designation;
3. Level of service for property consistent with adjacent residential conservancy properties; or
4. Location, size of properties, and character is consistent with a residential conservancy use.

Implementation Zoning Designation

A. RC Residential Conservancy

Policies

LU-14 Densities and activities shall be of a very low intensity and shall not compromise environmental and watershed resources.

LU-15 In addition to single-family homes, these larger properties can also be developed with garages, accessory dwelling units, barns, and other accessory outbuildings. Home occupations, agricultural uses, and other allowed nonresidential activities may operate out of any type of permitted building, subject to intensity and use limitations.

LU-16 Until these areas are served by public utilities (water, sewer, storm services), existing and new development is not expected to be served by public infrastructure, such as urban streets, curbs, gutters, sidewalks, street lighting, and landscaping.

LU-17 As the market and utility availability enable denser development to occur, standards should be developed to maximize density while preserving open space and critical areas.

LU-18 Small-scale agricultural uses are allowed and encouraged. Commercial activities that are directly related to and support agricultural uses may also be allowed. The procedural standards may vary depending upon the type and scale of agricultural uses and supporting commercial activities. Small-scale agricultural uses are allowed and encouraged.

LU-19 Land use standards should adequately limit and control excessive accumulation of de bris. Where a permitted activity does allow outdoor storage, it should be adequately screened from adjacent properties and roads, as well as ensuring adequate soil and environmental protection.

LU-20 Public/Quasi-Public and resource extractive uses that are low-intensity and preserve the environment may be considered conditional uses.

Neighborhood Residential One Designation[1]

Description

Low density land use for detached single-unit detached housing with a density of one unit per acre. Neighborhood Residential One includes all properties zoned R1 -

[1] This designation was previously called “Single Family” prior to the 2024 Periodic Comprehensive Plan Update. However, the implementing zones may have changed.

Residential 1 du/acre including areas within the Urban Separator Overlay, as designated in King County Countywide Planning Policies. Per HB 1110 requirements adopted in 2023, Middle Housing is permitted in this zone however adopted city development regulations still apply.

Designation Criteria

1. Low density residential areas located within the Urban Separator Overlay that are also constrained by the presence of critical areas

Implementing Zoning Designations

A. R1 - Residential Zone (One Dwelling Unit Per Acre): All properties located within the Urban Separator Overlay are zoned R-1, as consistent with King County Countywide Planning Policies.

Policies

LU-21 Accessory dwelling units should play an integral part of promoting infill development and affordable housing and are therefore encouraged within this land use category.

LU-22 Home occupations, bed-and-breakfasts, day cares, and other appropriate uses should be encouraged as viable accessory uses.

LU-23 Manufactured homes shall be permitted on single-family lots provided they are sited and constructed in a manner that would blend with adjacent homes.

LU-24 Encourage the development of a variety of housing typologies to suit the needs of various potential residents.

LU-25 Density bonuses outside of the Urban Separator Overlay should be approved based on innovations in transportation, stormwater management, and public amenities proposed for the development or adjacent neighborhoods associated with the request. The onus is on the developer to justify density above baseline. Examples of amenities and concepts that justify density bonuses include park space, art, enhanced landscaping, trails that connect to adjacent properties, neighborhood commercial property set asides, use of low-impact development techniques beyond the minimum code requirements, incorporation of Crime Prevention Through Environmental Design (CPTED) (Public Comment, LU 2) concepts, and variation of architecture and housing typology.

Neighborhood Residential Two Designation[2]

[2] This designation was previously called “Moderate Density Residential” prior to the 2024 Periodic Comprehensive Plan Update. However, the implementing zones may have changed.

Description

Neighborhood Residential Two designated areas are planned to accommodate a variety of residential dwelling types. Varying intensities may be permitted to provide a transition between Neighborhood Residential One and other more intensive uses or activities (such as arterial streets) based on adjacent density, intensity, and/or character. Appropriate densities in these areas range from 25-30 dwelling units per acre, with between 4 and 6 Middle Housing units per lot permitted. Dwelling types generally range from single-unit detached dwellings to Middle Housing, and moderately sized mixed-use and apartment buildings that fit the size and character of traditional single-family neighborhoods. Low-impact, neighborhood scale business such as small-scale food stores, coffee shops, and cultural or recreational services in pre-existing structures, either separate from or as part of a mixed-use building, are allowed in Neighborhood Residential Two.

Designation Criteria

1. Previously developed Neighborhood Residential Two areas; or

2. Areas that provide a transition between Neighborhood Residential One and Neighborhood Residential Three, Neighborhood Residential One and nonresidential, Neighborhood Residential Three and nonresidential zones or development that are adjacent and meet the development parameters of the Neighborhood Residential Two designation.

Implementing Zoning Designations

A. R2 – Residential Low
B. R3 – Residential Moderate

Policies

LU-26 Density bonuses and flexible development standards should be considered an incentive for innovative neighborhood design.

LU-27 Carefully developed low-intensity commercial uses (such as day care centers, food and beverage establishments) can be compatible.

LU-28 Middle Housing and accessory dwelling units should play an integral part of promoting infill development and affordable housing and are therefore encouraged within this land use category.

Neighborhood Residential Three Designation[3]

Description

Neighborhood Residential Three encourages a mix of Middle Housing residential, apartment buildings and mixed-use development at a greater density compared to Neighborhood Residential Two. These communities are served by nearby high-capacity transit, have nonmotorized connections to surrounding amenities (parks, libraries, community centers, etc.) and services, or have access to on-site amenities. Small, local commercial development is allowed consistent with Neighborhood Resident Two.

Land use density standards are based on dwelling units per lot for all Middle Housing types, while base density of units per acre continues to apply for detached single-unit housing. This use includes Residential Manufactured Home communities, for which the City will be coordinating with the Department of Commerce for exception to compliance with middle housing requirements.

Designation Criteria

1. Previously developed high-density residential or manufactured/mobile home parks; or
2. Properties that are connected to Neighborhood Residential One and nonresidential designations by the Neighborhood Residential Two designation or are connected to a Mixed-Use District.

Implementing Zoning Designations

A. R4 - Residential High
B. R-MHC Residential Manufactured/Mobile Home Community

Policies (cont.)

LU-29 Development regulations should include density bonuses and flexible development standards that create incentives for innovative site and building design, incorporation of open space and public art, nonmotorized connectivity to parks and commercial areas, proximity to transit services, supplemental natural resource protection, supplemental use of Crime Prevention Through Environmental Design (CPTED) (Public Comment, LU 2), and supplemental use of low-impact development techniques.

LU-30 Home occupations and shared housing should be allowed in this designation; however, given their high densities, it is appropriate to establish

[3] This designation was previously called “Multiple-Family” prior to the 2024 Periodic Comprehensive Plan Update. However, the implementing zones may have changed.

additional restrictions, procedures, and requirements in order to ensure that they are compatible with their surroundings and do not adversely affect the community.

LU-31 Live–work units are encouraged in Neighborhood Residential Two and Neighborhood Residential Three designations.

LU-32 Improve the quality of low-income neighborhoods and implement programs that encourage rehabilitation of deteriorating structures and facilities the downtown area, areas between lower-density residential uses and more intense nonresidential activities, and areas with high levels of transit service and available high-quality services.

LU-33 Parking requirements for Middle Housing types of development shall be reduced within ½ mile walk of a major transit stop, consistent with state requirements.

LU-34 Middle Housing types are eligible for bonus of two dwelling units depending on proximity to a major transit stop or when two dwelling units are developed as affordable housing. Affordable housing bonus dwelling units shall remain affordable for a 50-year period and recorded on the covenant, per RCW 36.70A.030.

Mixed-Use Designation

Description

The Mixed-Use Designation permits a complementary mix of residential and commercial uses in a single land use designation. This designation encourages vertical mixed-use, horizontal-mixed use, conversion of existing residential to commercial, middle housing, and pedestrian and non-motorized travel, while allowing flexibility for how uses are combined within this area. Mixed-Use Districts align with areas where moderate and high-density development is served by transit, bicycle facilities and sidewalks, and amenities that create healthy and livable neighborhoods.

Designation Criteria

1. Mixed-Use Districts are primarily located within designated Growth Centers or other areas where it can be demonstrated that the Mixed-Use District provides local neighborhood benefits consistent with the description and intent of the Mixed-Use District and where orientation to walkable communities is desired.
2. Residential and commercial uses are encouraged to be integrated as a component in all development projects.
3. A variety of housing options and development types is encouraged within this designation.
4. Mixed-Use District is not intended for automobile oriented or businesses that rely on outdoor storage, or any other type of storage facility. Such uses will be not permitted.

5. Development within a Growth Center designation along major roadways between Mixed-Use zones should provide additional building setback from the street right of way and include areas for landscaping, open space, and pedestrian activity.

Implementing Zoning Designations

A. R-NM Neighborhood Mixed-Use
B. RO Residential Office District
C. Auburn Gateway District

LU-35 Apartment development should be subject to building and site design standards. These standards should address the appearance of buildings, compatibility with nearby uses, exterior lighting, connectivity with surrounding properties and uses, the relationship of ground floor spaces and entryways with the streetscape, and connectivity to nearby nonresidential hubs (shopping centers and schools). Protected bicycle parking should be provided.

LU-36 Provide a variety of housing typologies to suit the needs of various potential residents.

LU-37 Establish intensity limitations such as floor area ratios, density, building height, coverage ratios, setbacks, and other standards.

LU-38 Access to nearby amenities and health and human services should be considered when reviewing senior housing and STEP (shelters, transitional housing, emergency housing, and permanent supportive housing) developments.

LU-39 Encourage development of permanent supportive housing to address the homeless population and those with special needs.

LU-40 Encourage adaptive reuse, particularly of historic properties.

LU-41 Mixed-Use Districts should support cohesive, diverse, neighborhood mixed-use centers that allow vertical and horizontal mixed-use flexibility, as well as flexibility in uses, that provide for local housing, shopping, and employment options that also allows each center to foster it's own identity. (Public Comment, LU 2),

LU-42 Encourage sustainable transportation options by creating viable options for people to get to destinations by alternatives to personal vehicles in Mixed-Use Districts, Neighborhood Residential Three, and Neighborhood Residential Two designations.

LU-43 Support development of small-scale, local neighborhood serving commercial such as food and drink establishments and local services in Residential Two and Three designations.

LU-44 The residential uses permitted must be carefully regulated in regard to performance criteria to ensure alignment with the City's responsibility to accommodate required share of regional growth.

Commercial Land Use Designation

Character

Commercial uses will be wide ranging in terms of scale and type. A mix of businesses – local, regional, and national – will be among the businesses in the various designations and will be carefully located to create balance and maintain appropriateness based on adjacent uses. These commercial areas will be economically vibrant, unique, and active outside of traditional work hours. They will be accessible by foot, bike, car, and public transport.

Values

Character – Active gathering spaces, such as parks, plazas, cafes, concert venues, festivals and markets, will be distributed throughout the City; these spaces will be engaging and filled with people interacting, irrespective of culture, age, or income level.

Wellness: A variety of healthy food options will be physically and economically accessible to all members of the Auburn community.

Service: The City's resources and services are available and utilized by the business community. The business community finds the City approachable, empathetic, and responsive. An open and collaborative dialogue exists to help identify problems and find solutions.

Economy: A wide complement of retail, service, and dining options will cater to local needs, attract visitors, and encourage consistent patronage of local businesses.

Celebration: Auburn will have a thriving and expanding arts and culture community. There will be events, amenities, and attractions that draw people to congregate and socialize.

Environment: Local businesses benefit from Auburn's collection of natural resources and amenities because residents and visitors are choosing Auburn as their home or destination.

Sustainability: Local businesses benefit from, and contribute to, a sustainable economy because Auburn is an easy location to start up, maintains opportunity for growth, and has a business-friendly economic climate.

Policies

LU-45 The commercial uses permitted must be carefully regulated in regard to performance criteria and design to ensure alignment with the City's responsibility to accommodate required share of regional growth.

LU-46 Permitted uses in Residential designations would consist of local-serving and community-serving retail trade, offices, personal services, and eating establishments.

LU-47 Encourage uses that provide health and human services to the adjacent community.

LU-48 Encourage adaptive reuse, particularly of historic properties.

LU-49 Promote the use of energy and water conservation measures

LU-50 Ensure that legally established existing uses that may not conform with the underlying zone, but that are compatible with their surrounding uses, and are allowed to continue to evolve and operate without being classified as "nonconforming" uses.

LU-51 Consider commercial displacement when evaluating new development proposals and determine strategies to mitigate impacts when possible.

Description

Commercial land use designations are predominantly a mix of retail, office, service, hospitality, entertainment, and eating/drinking establishments. Some districts have a greater non-motorized emphasis where buildings and site features are scaled to a pedestrian level while other districts are more auto-centric. Extra design emphasis is placed on architecture, lighting, landscaping, accessory uses, landscaping, hours of operation, site layout, and transitions to adjacent uses.

Designation Criteria

1. Previously developed light commercial areas buffered from more intense commercial or industrial designations by landscaping or environmental features; or
2. Previously developed heavy commercial areas; or
3. Located along arterial or collector streets;
4. Properties that are buffered from the single-family designation by landscaping, or environmental features,; and
5. Meets the development parameters of the Light and Heavy Commercial designations.

Implementing Zoning Designations

A. C-1 Light Commercial
B. C-2 Heavy Commercial

Downtown Urban Center Designation

Description

The Downtown Urban Center (DUC) land use designation should be applied exclusively in the Downtown Auburn Subarea and Regional Growth center as identified in the Comprehensive Plan and 2024 Auburn Downtown Plan. As a Regional Growth Center, the DUC must maintain a planned target density of 45 activity units per acre minimum, per Puget Sound Regional Center Requirements. The Land Use Element assumes this target when considering future land use and zoning changes in the DUC. DUC zoning and land use in the Land Use Element and map are consistent with those in the draft 2024 Auburn Downtown Plan, which is under development with an anticipated 2025 adoption date. The DUC is implemented by zoning districts specific to Downtown Urban Center and the Downtown Design Guidelines. The ambiance of the downtown should encourage leisure shopping, provide amenities that attract regional visitors and shoppers, and provide housing and services to local residents and area employees.

Designation Criteria

1. Located within the Urban Center boundaries established by the King County Countywide planning policies or within the PSRC Regional Growth Center boundaries.

Implementing Zoning Designations

DUC Subarea-Specific Zoning classifications consisting of:

A. DUC Downtown Urban Center - 125' District
B. DUC Downtown Urban Center - 75' District
C. DUC Downtown Urban Center – 55' District
D. DUC Downtown Urban Center – Health and Wellness District
E. DUC Downtown Urban Center - C1 Light Commercial District
F. DUC Downtown Urban Center - C2 Heavy Commercial District
G. DUC Downtown Urban Center - M1 Light Industrial District
H. DUC Downtown Urban Center - Flex-Residential District
I. DUC Downtown Urban Center - Neighborhood Residential District

Policies

LU-52 Vertical mixed-use should be encouraged; the location of retail sales and services should predominately be on the ground floor with residential or more retail or services above. However, small freestanding commercial spaces may be established as an accessory use to a larger vertical mixed-use development.

LU-53 Deviations of height, density or intensity limitations should be allowed when supplemental amenities are incorporated into site and building design. Examples of amenities include use of low-impact development, use of sustainable site and building techniques, public space and art, transit-oriented development (TOD),

landscaping and lighting, and bike shelters as well as the inclusion of affordable housing.

LU-54 Encourage a broad mix of uses within the downtown area. A wide range of consumer-oriented goods and services are compatible within this designation since creating an attractive shopping environment is a primary emphasis. Permitted uses include retail trade, offices, personal services, eating and drinking establishments, financial institutions, governmental offices, and similar uses. Legally established existing uses that do not fit within the range of desired new uses continue to be a valuable part of the downtown economy and character and should be allowed to evolve and operate in a manner that resembles listed permitted uses.

LU-55 Encourage residential dwellings within the upper stories of buildings and provide flexibility with how those spaces are organized and utilized.

LU-56 Drive-in windows shall not be permitted to maintain the area's pedestrian environment.

LU-57 Parking standards within the downtown should reflect the pedestrian orientation of the area, but also consider parking's impact for economic development.

LU-58 Discourage uses that rely on direct access by vehicles or involve heavy truck traffic (other than for merchandise delivery).

LU-59 Unsightly outdoor storage and similar activities should be prohibited.

LU-60 The downtown should capitalize on opportunities for multimodal transportation.

LU-61 Encourage adaptive reuse of existing buildings, particularly of historic properties.

LU-62 As a designated VISION 20 50 Regional Growth Center that contains a transit station, land use policies and regulations should encourage population and employment growth.

LU-63 The commercial uses permitted must be carefully regulated in regards to performance criteria and design. Architectural style, building height and size, lighting, and signage should be consistent with the surrounding residential properties.

LU-64 Permitted uses would consist of community and regional-serving retail trade, offices, personal services, and non-drive through eating establishments.

LU-65 Special emphasis will be directed at those accessory activities that can alter the character of these areas into heavier commercial areas. Examples include outdoor storage, location, and screening of trash receptacles, loading and unloading zones, and parking lots. Regulations and permit conditions will employ

techniques that mitigate light and noise impacts associated with surrounding residential properties.

LU-66 Commercial uses will have an orientation that is directed toward adjacent public streets while also providing pedestrian and bike-oriented access.

LU-67 Upzone requests to the next zone will be considered for approval based on the innovations in transportation and stormwater management and public amenities proposed for the development associated with the request.

LU-68 Encourage occupancy of storefront and other ground floor public-facing spaces to create a active environment downtown.

LU-69 Explore opportunities to increase the amount of public green space in downtown that provide spaces for recreation and activation.

LU-70 A wide range of consumer-oriented goods and services are compatible within this designation since creating an attractive shopping environment is a primary emphasis. Permitted uses would consist of local-serving and community-serving retail trade, offices, personal services, eating establishments, financial institutions, governmental offices, and similar uses.

LU-71 Parking lots must be located and designed in a manner that softens their appearance from adjacent public roads. This is accomplished through landscaping, pedestrian spaces, and the location of buildings on the property. Where practicable, low-impact development techniques and landscaping should be used to promote on site stormwater infiltration and shading of hard surfaces. Minimum and maximum parking ratios must be established for each type of permitted use.

LU-72 Development incentives should be established that encourage the creation of electric car charging stations, use of sustainable building and/or operational practices, development of nonmotorized infrastructure, and proximity and connection to public transit.

LU-73 Multiple family dwellings are only allowed as part of mixed-use developments where they do not interfere with the shopping character of the area, such as within the upper stories of buildings.

LU-74 Drive in windows should only be allowed accessory to a permitted use, and only when carefully sited under the administrative use process, in order to ensure that an area's pedestrian environment is not compromised

LU-75 Large-scale regional retail uses and uses that rely on direct access by vehicles or involve heavy truck traffic (other than for merchandise delivery) are not appropriate in this category.

LU-76 Unsightly outdoor storage and similar activities should be prohibited.

LU-77 Encourage adaptive reuse, particularly of historic properties.

LU-78 Upzone requests to the next zone should be approved based on the innovations in transportation and stormwater management and public amenities proposed for the development associated with the request.

LU-79 A wide variety of commercial-oriented services are appropriate within this category. This includes but is not limited to regional-scale retail and entertainment uses, commercial uses with outdoor sales areas, drive-in restaurant or other drive-in commercial businesses, and commercial services with outdoor storage as an accessory use.

LU-80 Parking lots must be located and designed in a manner that softens their appearance from adjacent public roads. This is accomplished through landscaping, pedestrian spaces, and the location of buildings on the property. Where practicable, low-impact development techniques and landscaping should be used to promote on site stormwater infiltration and shading of hard surfaces. Minimum and maximum parking ratios must be established for each type of permitted use.

LU-81 Development incentives should be established that encourage the creation of electric car charging stations, use of sustainable building and/or operational practices, development of nonmotorized infrastructure, and proximity and connection to public transit.

Industrial Land Use Designation

Character

Industrial uses will become a more integrated part of the physical and social life of the city. Since so many people work in these areas and these companies contribute so much to the financial life of the city, it is important that they are connected through paths, roads and by public transportation. Locations that have access to rail and highways that also encourage intelligent growth patterns will be prioritized. Innovation will be a key requirement of new and infill projects as the city looks to mitigate impacts of production and limit damage to the environment.

Values

Character: Buildings, landscaping, and outdoor spaces will be attractive, interesting, well designed, and well maintained.

Wellness: Risk to life and property from all hazards will be minimized. Properties and businesses are connected to nonmotorized corridors that offers alternative means to commute.

Service: The city works closely with individuals and organizations to fully understand the demands, needs, and concerns of the industrial community so that the city can sponsor initiatives that help aid in their success.

Economy: Cornerstone institutions will strategically expand in regional prominence. As industry grows, land use policy will support efforts to grow within Auburn.

Celebration: The Community will be made aware of and celebrate the accomplishments of our local, regional and international leaders in manufacturing, warehousing, and distribution.

Environment: The built environment will fit into the natural landscape in a way that protects and respects ecosystem function. Natural resource protection will be supported and celebrated by City leadership and the community.

Sustainability: Industrial uses are contributing to, and supportive of, efforts to build and maintain a transportation system that ensures the people and goods move safely throughout the city and beyond.

Description

Industrial lands allow for a mix of manufacturing, logistics, and warehousing along with the space needed to store materials and vehicles. These areas have a heavy reliance upon the transportation of goods by rail or truck which necessitates loading docks/bays, ample area for truck movement, and convenient access to robust rail and road infrastructure. These areas can also accommodate uses such as breweries and distilleries and their associated tasting rooms, restaurants and banquet halls, warehouse style retail outlets, and a modest level of integrated housing.

Designation Criteria

1. Previously developed light or heavy industrial areas; or
2. Light Industrial provides buffering for heavy industrial areas or is buffered from the single-family designation by landscaping, environmental features, and buffered from all other Residential designations;
3. Meets the development parameters of the Light and Heavy Industrial zoning districts.

1. Heavy Industrial districts should not located along high-visibility corridors serving non-industrial uses;
2. Properties identified as LF Airport Landing Field on the zoning map in the Airport Master Plan, and properties identified for future acquisition.

Implementing Zoning Designations

A. M-1 Light Industrial
B. M-2 Heavy Industrial
C. Airport Landing Field District

LU-82 A wide range of industrial uses may be permitted, subject to performance standards.

LU-83 Outside storage shall be permitted subject to performance criteria addressing its quantity and location.

LU-84 Development incentives should be established that encourage the creation of electric car charging stations, use of sustainable building and/or operational practices, development of nonmotorized infrastructure, and proximity and connection to public transit.

LU-85 Promote the use of energy and water conservation measures.

LU-86 A wide range of industrial uses may be permitted, subject to performance standards. Heavy commercial uses that serve the needs of workers in light industries are also appropriate. These uses include indoor manufacturing, processing, and assembling of materials from previously prepared or raw materials and ancillary and necessary warehousing and distribution of finished goods associated with manufacturing and industrial uses.

LU-87 Parking lots must be located and designed in a manner that softens their appearance from adjacent public roads. This is accomplished through landscaping, pedestrian spaces, and the location of buildings on the property. Where practicable, low-im pact development techniques and landscaping should be used to promote on site stormwater infiltration and shading of hard surfaces. Minimum and maximum parking ratios must be established for each type of permitted use.

LU-88 Landscaping, sidewalks, and bike paths will be integral parts of site design if a development is located on an impression corridor or located within or adjacent to an identified nonmotorized corridor.

LU-89 Outside storage shall be permitted subject to performance criteria addressing its quantity and location. This is to ensure compatibility with adjacent uses, so that such storage would not detract from the potential use of the area for light industry. In all cases, such storage shall be extensively screened.

LU-90 Where an Industrial use is located adjacent to a property with a less intense zoning designation, the light industrial use bears the burden of incorporating techniques that mitigate the visual, noise, dust, and odor impacts.

LU-91 Uses involving substantial storage or processing of hazardous materials, as well as substantial emissions, should not be permitted in these areas.

LU-92 A wide range of commercial activities may be allowed to provide increased opportunities for sales tax revenue.

LU-93 The Burlington Northern Santa Fe Railroad Auburn Yard located within the Railroad Special Plan Area is considered a compatible use at its current level of usage. It is not bound by the policies concerning outside storage under the existing light industrial designation as it was an existing use prior to the development of this policy. Should BNSF decide to reactivate its applications to upgrade the yard to

an intermodal facility, the proposal will be subject to the essential public facility siting process as defined in the Capital Facilities Element.

LU-94 Upzone requests to the next zone should be approved based on the innovations in transportation and stormwater management and public amenities proposed for the development associated with the request.

LU-95 While this zone should be reserved primarily for the heavier forms of industrial activities, a wide range of industrial activities may be permitted. These heavier forms of industrial activities may include outdoor or semi-enclosed manufacturing, processing, or assembling activities, significant outdoor storage, and uses involving substantial storage or processing of hazardous materials. Heavy commercial uses that serve the needs of workers in heavy industries are also appropriate.

LU-96 Landscaping, sidewalks, and bike paths will be integral parts of site design if a development is located on an impression corridor or located within or adjacent to an identified nonmotorized corridor.

LU-97 For the LF Airport Landing Field District, the Airport Master Plan (AMP) establishes the vision, policies, and implementation strategies that govern uses, management principles, and future planning efforts. The AMP is incorporated by reference in the Auburn Comprehensive Plan as an appendix.

LU-98 Auburn Municipal Airport is included in the federal airport system the National Plan of Integrated Airport Systems (NPIAS). Participation in the NPIAS is limited to public use airports that meet specific FAA criteria. NPIAS airports are eligible for federal funding of improvements through FAA programs. To maintain eligibility for funding through FAA programs, the Airport Master Plan should be periodically updated as conditions change.

LU-99 Uses, activities, and operations within the LF Airport Landing Field District must be coordinated and consistent with the Airport Master Plan.

LU-100 Future expansions of the LF Airport Landing Field District, for the purpose of airport uses, activities, and operations, should be coordinated and consistent with the Airport Master Plan.

LU-101 While the industrially designated area east of the Airport is highly suited for airport related activities, other industrial type uses are now located here. Therefore, the City will encourage use in this area to take advantage of its proximity to the Airport.

LU-102 New commercial land uses in proximity to the airport should be air related and/ or complementary to the airport.

LU-103 To protect the viability of the Auburn Municipal Airport the City shall create an airport overlay that is consistent with FAA regulations and WSDOT guidance.

LU-104 The City's zoning ordinance and other appropriate regulatory measures shall enforce the airport overlay and the FAR Part 77 surfaces.

LU-105 The airport overlay shall protect the operations of the Auburn Municipal Airport by establishing controls on incompatible land uses and development.

LU-106 The airport overlay should be implemented to manage land uses and development around the airport to ensure compatibility into the future and prevent incompatible future uses. The regulations applied to properties surrounding the airport should encourage land uses that are related to, and benefit from, proximity to the airport but not restricted exclusively to only these.

LU-107 The impact of development on air safety shall be assessed through the City zoning ordinance, FAA regulations, SEPA review, input from the Auburn Municipal Airport, and relevant technical guidance. Appropriate mitigation measures shall be required by the City.

LU-108 Uses in proximity to the airport that may create potential operational (e.g. height or noise) conflicts shall be reviewed for their consistency to airport operations and conformance with the FAA regulations.

LU-109 The airport should be protected from nonconforming uses and structures that pose a safety concern to airport operations.

LU-110 The City shall determine whether nonconforming uses and structures affect airport operations and require their minimization or elimination, at cost to owner, based on individualized study of proposals, City regulations, input from the Auburn Municipal Airport, and relevant technical guidance.

Public/Quasi-Public Designation

Character

This category includes those areas that are reserved for public or quasi-public uses. It is intended to include those of a significant extent, and not those smaller public uses that are consistent with and may be included in another designation. These public uses include public schools, developed parks, and uses of quasi-public character such as large churches and private schools. Public uses of an industrial character are included in the industrial designation, and small-scale religious institutions of a residential character are included in the residential designation. Streets, utilities, and other separate uses are not intended to be mapped separately as Public/Quasi-Public.

Values

Character: Community facilities and programs bring people together and connect residents and visitors to our natural resources.

Wellness: Multiple recreation options, and nearby trails, parks, activities, and events will be readily accessible to the entire community.

Service: Land use policy supports the provision of community, health and human services to all residents.

Economy: Residents and visitors seek Auburn as a residence or destination because of its natural resources, community events, and community pride.

Celebration: We utilize our open spaces and public facilities to promote who we are, our diversity, and our community pride.

Environment: Residents and visitors will enjoy open spaces and environmentally sensitive areas, while encouraging the appreciation of their importance and beauty. Impacts of new development on natural resources are considerate of their sensitivity and importance.

Sustainability: Public and private funds are used to make investments in land preservation, restoration and protection. Public investments in land and facilities are considered for their perpetual or generational value versus short-term motivations.

Policies

LU-111 The primary purpose of this designation is to address public needs while taking advantage of synergies with the adjacent areas where they are sited.

LU-112 Appropriate uses for this designation include facilities that serve the needs of the larger community such as public schools, active parks, city operated municipal facilities, police stations, and fire stations.

LU-113 Innovative strategies to integrate the uses and sites into the areas where they are sited is encouraged. These strategies should maximize use of the site while minimizing fiscal impacts and impacts to adjacent areas.

LU-114 Increase visibility of resources through public information campaigns.

LU-115 Appropriate uses include low-intensity recreational uses, passive use open areas, protected environmental habitat, stormwater detention facilities, and similar low-intensity uses.

LU-116 Promote the use of energy and water conservation measures.

LU-117 A responsible management entity and the purpose for Institutional districts should be identified for each property interest within this designation. Management policies and plans are appropriate for all lands in this designation.

LU-118 This designation permits a wide array of uses that tend to be located in the midst of other dissimilar uses. For this reason, special emphasis should be directed at the following:

a. The appropriateness of new requests for this designation and the impacts that it may have on the surrounding community.

b. Site-specific conditions that should be attached to the granting of new requests for this designation that are designed to mitigate impacts on the surrounding community.

c. Site-specific conditions that should be attached to development proposals that are designed to mitigate impacts on the surrounding community.

LU-119 Coordination with other Institutional entities is essential in the implementation of the Public/Quasi-Public land use designation.

LU-120 Industrial and commercial uses that are affiliated with and managed by educational institutions for vocational educational purposes may be classified as a Publican Public/Quasi-Public use and permitted on a conditional basis.

Designation Criteria

1. Previously developed institutional uses; or
2. Meets the development parameters of the Public/Quasi-Public designation.

Implementing Zoning Designations

A. *I Institutional*

B. P-1 Public Use District

Open Space Designation

Description

Open space lands are in public ownership or an otherwise permanently protected state that provide enhanced protection of floodplains, aquatic and/or wildlife corridors, wetlands, hazardous slopes, or that protect groundwater supplies. Open Space lands may be made available for public access and education which includes ancillary supportive uses such as bathrooms, trails, boardwalks, interpretive signs, parking, and picnic areas.

Designation Criteria

1. Passive parks or undeveloped Parks Department property;
2. Any site containing a significant developmental hazard; or
3. Any site containing open space value suitable for public protection without unduly encroaching on private property rights.
4. Sites that are permanently protected as a result of the terms of acquisition or a recorded instrument.

Implementing Zoning Designations

A. OS Open Space

Policies

LU-121 Active parks that provide sports field, activity and community centers, cemeteries, and public buildings should not be designated as open space.

LU-122 Open space lands are primarily designated to provide wildlife and aquatic habitat, flood detention, vegetation and soil preservation, and view shed protection. Land designated as open space may be used for public access to trails, interpretive centers, education opportunities, and other uses and facilities that support the purpose of their designation.

LU-123 Increase distribution of open space and increase access to open space amenities throughout Auburn.

LU-124 Enhance restoration, preservation and protection of natural resources and critical areas.

LU-125 Seek out opportunities to develop recreation and education opportunities on public lands or through public–private partnerships.

LU-126 Increase visibility of resources through public information campaigns. Continue to work with regional partners to develop and maintain trail systems that connect Auburn with regional destinations.

LU-127 Build on partnerships with school districts to expand public use of school facilities for recreation and exercise, and to improve public access to facilities for this purpose, as appropriate.

Overlays, Urban Growth Area, and Special Planning Land Use Designations

Character

These areas help control growth, protect the environment, and prevent urban sprawl conditions in our City. For a variety of reasons, specific areas exist within the City that require further specificity or focus of land use planning, policy, regulation, or investment. Overlays, urban growth areas, and special planning areas may be designated that help further enumerate a purpose. These areas are to be designated through the Comprehensive Plan and treated as a component of the Land Use Element of the Plan.

Values

Each area designated as an overlay, urban growth area, or special planning area shall reflect the values identified in the Core Comprehensive Plan.

General Policies

LU-128 These land use designations must be consistent with the Growth Management Act, Puget Sound Regional Council, and countywide planning policies.

LU-129 Any proposed changes to these designations must be pursued in coordination with applicable State, Regional and County agencies.

Urban Separator Designation

Description

Urban separators are areas designated for low-density uses in the King County Countywide planning policies. They are intended to "protect Resource Lands, the Rural Area, and environmentally sensitive areas, and create open space and wildlife corridors within and between communities while also providing public health, environmental, visual, and recreational benefits." There are two primary areas of urban separators, one on Lea Hill and one on West Hill.

Designation Criteria

Areas designated through the process of annexation.

Implementing Zoning Designations

A. Lea Hill Overlay
B. West Hill Overlay
C. Bridges Overlay
D. Urban Separator Overlay

Policies

LU-130 The City is obligated to maintain (and not redesignate) the Urban Separator designation until at least the year 2022, pursuant to countywide planning policies and an annexation agreement with King County. The City will coordinate with King County on redesignation of Urban Separators in 2025.

LU-131 Urban separators are deemed to be both a regional as well as local concern and no modifications to development regulations governing their use may be made without King County review and concurrence. Therefore, the areas designated as "urban separator" on the Comprehensive Land Use map, will be zoned for densities not to exceed one dwelling unit per acre, with lot clustering being required if a subdivision of land is proposed.

Urban Growth Area and Potential Annexation Area Designation

Description

Urban growth areas and potential annexation areas are areas located outside of the municipal city limits of Auburn. They are areas that are anticipated to be incorporated into the City within 10 years of their designation.

Designation Criteria

Potential annexation areas are jointly developed by cities and the County in which they are located. They are based upon countywide growth projections that are divided among all urban growth areas within each respective County. Urban growth areas and potential annexation areas are distinguished from each other by whether they have been assigned to a city or not. Urban growth areas have been identified but have not been assigned to a city. Potential annexation areas are urban growth areas that have been assigned to a specific city.

Implementing Zoning Designations

A. Urban Growth Area Potential Annexation Area

Policies

LU-132 Work with King and Pierce County, as well as nearby cities, to redesignate urban growth areas into potential annexation areas.

LU-133 Auburn's Potential Annexation Area is shown on the Comprehensive Plan Land Use Map (Map 1.1). Map 1.1 also depicts Growth Impact Areas. These Growth Impact Areas are generally adjacent to cities or unincorporated County lands in which development that occurs potentially impacts the city of Auburn.

LU-134 The Auburn City Council may revise the boundaries of the Potential Annexation Area in the future, in response to:

a. Amendments to King and Pierce County Urban Growth Areas as specified in the King and Pierce County countywide policies
b. Discussions between Auburn and adjacent jurisdictions regarding potential annexation area boundaries
c. Discussions with Pierce County concerning the designation of potential annexation area boundaries
d. Changed circumstances relating to population and employment growth and projections, urban service feasibility, or similar factors.

LU-135 Develop strategies and agreements for the review of development and provision of utilities within potential annexation areas that have yet to be annexed.

LU-136 Prior to annexation, develop strategies and agreements that address the orderly transition of areas into the city such as transfer of permit authority, infrastructure financing, financing of fire and police services, and interim development regulations.

Critical Area Overlay Land Use

Description

Under the Growth Management Act cities and counties are required to identify, designate and protect critical areas. Critical areas include (a) wetlands, (b) aquifer recharge areas (including areas with a critical recharging effect on aquifers used for potable water), (c) fish and wildlife habitat conservation areas, (d) frequently flooded areas, and (e) geologically hazardous areas.

Designation Criteria

Designation of critical areas includes both criteria that should be applied to the specific type of critical area as well as buffers and/or setbacks that are necessary for the protection of the critical area and/or life and property. Designation of critical areas is based on best available science as it applies to local conditions.

Implementing Zoning Designations

A. Wetlands
B. Aquifer Recharge Areas
C. Fish and Wildlife Habitat Conservation Areas
D. Frequently Flooded Areas
E. Geologically Hazardous Area

Policies

LU-137 Best available science will be utilized for the specific designation criteria and the associated adopted protection standards and development regulations.

LU-138 Reasonable use provisions will be included within the critical area regulations that ensure a property owner is not denied use of a preexisting parcel, lot or tract.

LU-139 Exemptions to the critical areas ordinance should be provided for very limited and justified circumstances such as maintenance of existing land uses, work within some types of human-made features, limited types of site investigation work, emergency activities, and certain types of invasive vegetation control.

LU-140 Critical area regulations will identify the process and standards for alteration of a critical area and criteria related to mitigation, performance, and monitoring.

Special Planning Area Designation

Description

“Special Planning Areas” consist of Districts, subareas, Impression Corridors, and Gateways within Auburn that warrant additional emphasis in planning, investments, and policy development. Each may be recognized separately within the Comprehensive Plan, as an Element of the Comprehensive Plan, or as an

subarea plan (discussed below). There are a variety of reasons for designating and distinguishing a special planning area, and once designated, a variety of potential outcomes. Reasons for designating a special planning area include:

- Growth Centers are areas of the city identified though the Comprehensive Planning process where a large share of growth is allocated. These areas provide a combination of Mixed-use, higher density residential, and higher density commercial uses which serve the local area. There will be a special focus on the performance of these Centers, including housing units and jobs created, to ensure the City accommodates the required share of regional growth by 2044. Growth Centers are shown in Map 1.4 and reflected in development regulations found in city code.
- Areas of high visibility and traffic. These areas create an impression or image of Auburn. It is therefore particularly important to ensure that they are attractive and well maintained. Examples include Auburn Way South and associated major highway on- and off-ramps.
- Land use activities that warrant joint planning between the city and owner/operator. In addition to developing approaches and strategies for the land use activity, there may be additional emphasis on ensuring compatibility with surrounding land uses. Examples include Green River College, the Auburn Municipal Airport, and Emerald Downs Thoroughbred Horse Racetrack.
- Neighborhoods in which a resident and merchant live and conduct daily business and leisure. Neighborhoods may also be distinguished by physical setting, physical separations, and similarity over an area. Examples include downtown, Lea Hill, and Lakeland.
- Areas with a focused desire to create greater physical and economic cohesiveness. These may be large, planned developments or clusters. Examples include the Auburn North Business Area and Mt. Rainier Vista.
- Areas with an existing built environment or an existing regulatory framework that does not, in itself, meet the expectations of the seven values that underscore the Comprehensive Plan. Examples include the need for multimodal connections between West Hill and Lea Hill to north and downtown Auburn.

Designation Criteria

1. **Districts:** The geographic limit of districts and areas that make up this category of Special Planning Areas extends beyond an alignment with any particular street, trail, river, stream, or other linear corridor. Districts may contain other smaller Special Planning Areas, such as subareas. Additionally, districts are generally consistent with the geography of one of the eight “neighborhoods” identified in the 2014 City of Auburn Community Vision

Report. Generally speaking, districts are identified for the purpose of creating identity. This means that the land use designations and overarching policies and implementing regulations are not going to change from one district to the next. Instead, Districts are important for event planning, establishing park and open space level-of-service standards, and promoting community identity.

Districts (see Map 1.4)

- West Hill
- North Auburn
- Lea Hill
- Downtown
- South Auburn
- Plateau
- Lakeland
- Southeast Auburn

2. **Subareas:** Subareas are smaller in geography than a district. Though relatively large, multiple subareas may be located within a single district. Subareas allow for the refinement and recognition of existing unique characteristics within a district. Subareas are intended to anticipate, support, and guide long-term growth and redevelopment through planned development and a unique vision for how that area should look and function in the future. It can also be used to provide flexibility when there is uncertainty regarding how an area may be most appropriately developed in the future.
3. Twenty-eight (28) subareas currently exist. These subareas are categorized into five different types of subareas:

- Identified Areas;
- Designated Areas;
- Economic Development Strategy Areas (a Designated Areas sub-category);
- Areas of Concern (another Designated Areas sub-category); and
- Adopted Areas.

Uses, intensities, and infrastructure development determined for each subarea or planned area through individual planning processes. Connectivity throughout the planned area, and connections to multimodal transportation opportunities outside of the planned area are also emphasized through the individual planning process.

The result of each individual planning process is the adoption of Comprehensive Plan element or subarea plan for the particular subarea by the City Council. Each Plan element must be consistent with the general goals, objectives, and policies of the Comprehensive Plan, and once adopted, subarea plans are intended to guide the future development of each respectively adopted subarea.

2a. **Identified Areas:** Identified areas are identified as a subarea within the Comprehensive Plan, but have not been established on the Comprehensive Plan Map. Therefore, the specific and detailed boundaries of an identified subarea have not been defined. Identification of a subarea within the Comprehensive Plan occurs by official action of the City Council.

Identified Areas

- Auburn Golf Course
- GSA/Boeing
- Green River College
- Mary Olsen Farm
- Les Gove Campus
- Emerald Downs
- Auburn High School

2b. **Designated Areas**: Designated Areas have been designated on the Comprehensive Plan Map, which defines the specific and detailed boundaries of the area. Designation of an area on the Comprehensive Plan Map occurs by official action of the Auburn City Council. It is intended that future development of these areas will be guided by individual Plan element or subarea plan of the Comprehensive Plan. The future subarea plan will either supplement existing goals, policies, and implement strategies, or replace existing Comprehensive Plan designations and policies for the area within the specific and detailed boundary.

Designated Areas (see Map 1.6):

- Auburn Municipal Airport
- BNSF Rail Yard
- Stuck River Road
- Mount Rainier Vista
- Lakeview

2b(1). Designated Areas - Areas of Concern: Areas of Concern are a specific type (or subcategory) of the designated area. Areas of Concern are established because they represent an area that features a lack in the infrastructure and services (e.g.

municipal water and sewer service, urban roads, traffic demand, and storm water management) necessary to support increase in density or other development. These areas require a close assessment of and an emphasis on infrastructure development and planning to support further development. While this Plan may not fully represent the intensity of uses that could ultimately be supported in these areas (in part due to the current weakness of the City's infrastructure to support future growth). Development intensification within the Area of Concern needs to be coordinated with the necessary infrastructure and services to support growth.

Designated Areas - Areas of Concern (see Map 1.6):

- AWS/Auburn Black Diamond Rd.
- Pike Street NE
- 8th Street NE

2b (2). Designated Areas - Economic Development Strategy Areas: The Economic Development Strategy Areas are a specific type (or subcategory) of designated area. In 2005, City Council adopted six Economic Development Strategy Areas under Resolution No. 3944. These areas, initially identified by a focus group of diverse business and community interests, are targeted for population and employment growth within the planning horizon of the City's 20-year growth target (204431). By 2012, the City Council added three additional economic development strategy areas, bringing the total to nine (9) strategy areas.

During the City's 2015 update of the Comprehensive Plan the list of economic development strategy areas reflects current conditions and status of these areas. As such, two of the original six economic development strategy areas were removed from the list. The Urban Center, one of the original six development strategy areas, was removed as it is no longer a designated area. The Urban Center, also known as "Downtown Auburn" or the "Downtown Urban Center" is an adopted area (since 2001) and features its own subarea plan. The Auburn Environmental Park (AEP)/Green Zone has also been removed as an economic development strategy area. The AEP/Green Zone economic development strategy area was previously zoned EP, Environmental Park Zone. The intent of this zone was to encourage economic development in the form of medical, biotech and "green" technologies including energy conservation, engineering, water quality and similar uses. Through Ordinance No. 6660 City Council rezoned the AEP/Green Zone from EP, Environmental Park Zone to M-1, Light Industrial, hereby effectively removing the need to designate the AEP/Green Zone as a specific economic development strategy area.

The current economic development strategy areas are included below. The boundaries of the economic development strategy areas are incorporated as designated sub-areas "Designated Areas – Special Planning Areas" map of the Land Use Element.

Designated Areas -Economic Development Strategy Areas (see Map 1.6)

- A St SE (corridor)
- Auburn Way South (AWS) Corridor
- Auburn Way North (AWN) Corridor
- M St SE (between AWN and AWS)
- SE 312th/124th Ave
- NW Manufacturing Village
- 15th St SW/West Valley Hwy N

2c. Adopted Areas: Adopted Areas include an Adopted Subarea Plan incorporated into the Comprehensive Plan that establishes the purpose of its designation, goals and policies, and implementation strategies. Adoption of a subarea plan occurs by official action of the City Council. As an adopted document of the Comprehensive Plan, the subarea Plans are subject to a review, and if necessary, revision to address changes in conditions, issues, or even characteristics of the planned areas. The review and revision of the Subarea Plan will also include the review and, if necessary, a revision of zoning regulations and architectural design standards.

Adopted Areas (see Map 1.7)

- Downtown (Ordinance No. 5549)
- Auburn Adventist Academy (Resolution No. 2254)
- Auburn North Business Area (Resolution No. 2283)
- Lakeland Hills (Resolution No. 1851)
- Lake Hills South (County H.E. Case Z15/UP70)
- Northeast Auburn (Ordinance N. 6183)

3. Impression Corridors: Impression corridors are aligned with a particular street, trail, river, stream, or specific linear corridor. Some corridors may be part of a subarea, in which case the Impression Corridor policies are additive to a subarea plan. Impression corridors enhance the areas in which residents, businesses, and visitors move throughout the city. The benefit of an impression corridor is two-fold: residents know that the city is invested in the aesthetic of main thoroughfares and businesses can build off of the design and aesthetic provided by the impression corridor. Improvements or modification to impression corridors consist of aesthetic signage, landscaping, and monument features, and the rehabilitation or removal of existing buildings and property. Impression Corridor boundaries and policies are formally designated by adoption of the Comprehensive Plan. Priority is given to the impression corridors that are a part of a subarea. Priority impression corridors are the thoroughfares in which residents,

businesses, visitors move throughout a specific subarea. The priority impression corridors are italicized below.

Impression Corridors (see Map 1.8)

- *Auburn Way North*
- *Auburn Way South*
- *Auburn Black Diamond Road*
- *A Street SE/Auburn Avenue*
- *C Street SW*
- *Division Street*
- *M Street/Harvey Road*
- *Main Street*
- *8th Street NE*
- *15th Street SW*
- *West Valley Highway*
- *15th Street NW/NE*
- 132nd Ave SE
- SE 320th Street
- SE 312th Street
- SE 304th Street
- R Street
- Lake Tapps Pkwy SE
- Green River Road
- 37th Street NW
- S 277th Street
- Interurban Trail
- Green River
- White River

- Mill Creek

4. Gateways: Gateways are specific places, intersections, or blocks within the city. These essential locations are established because they constitute the first impression into of Auburn. Gateways are intended to create a "welcome" into distinct areas of the city or into the city itself. They are therefore highly important to plan, construct, maintain, and enhance their appearance and function. Gateway locations and policies are formally designated by adoption of the Comprehensive Plan. Priority is given to those gateways that are along a priority impression corridor. Priority gateways function as an entrance to an impression corridor. The priority gateways are italicized below.

Gateways (see Map 1.9)

- *Auburn Way North and Auburn Avenue (where the roads converge)*
- *East Main Street and M Street NE/ SE (at the intersection)*
- *Auburn Way South and 4th Street SE*
- *Auburn Way S and 6th Street SE*
- *West Main Street between C Street NW and B Street NW*
- All roads with an entry into the city
- Hwy 167 Off Ramps
- SR 18 Off Ramps

Implementing Zoning Designations

A. Planned Unit Development (PUD) Master Plans

Special Plan Area Policies

District Policies.

LU-141 Through regulation, capital investment, and community planning, identify, promote and market district identity.

Subarea Policies.

LU-142 Each subarea will contain its own vision, goals, policies and strategies.

LU-143 BNSF Rail Yard - This approximately 150-acre Special Planning Area is located in the south-central portion of the city and surrounded by SR-18 to the North, Ellingson Road to the South, C Street SW to the west and A

Street SE to the East. The Special Planning Area should consider both sides of C Street and A Street. Consideration should be given to:

- The needs of Burlington Northern.
- Providing pedestrian, bicycle and vehicular access across the site to connect the southeast and southwest sides of the city.
- Providing a more visually appealing “entry corridor” into the city from the south along A and C Streets.
- Allowing for a mix of uses including single and multifamily development and commercial and industrial uses where appropriate.

LU-144 Stuck River Road - A portion of the Stuck River Road Special Planning Area is currently the site of a large sand and gravel mining operation. This area and other adjacent land comprising a total of approximately 664 acres has been designated as a long-term resource area (mineral resource area), so development of the Special Area Plan for this area should be a low priority as mining is expected to continue on this site for as long as 30 years. The land uses for the Stuck River Road Special Planning Area will be determined through the subarea planning process and the City Council’s adoption of the subarea plan. Potential land uses applied through the subarea planning process could include single-family residential, multi-family residential, commercial, institutional, and recreational. Some light industrial uses may be appropriate for consideration and designation through the subarea planning process if the uses are “industrial or business park” in character, conducted entirely within an enclosed building, and exhibit a high degree of performance standards and are non-nuisance in nature and if appropriately limited in extent and location. A mix of housing types ranging from single family residential to multi-family residential is appropriate for this planning area. The subarea plan should be adopted taking into consideration the period during which mining is expected and the intent of the ultimate development of the area. An active permit has been processed by the city with respect to the mining activity on a portion (approximately 664 acres) of the mineral extraction operation. The permit process should continue, however, any permit for mining in the mineral resource area should be granted for the life of the resource, with reviews conducted periodically (every five years) to determine whether changes in the originally proposed mineral extraction operation have arisen and give rise to the need for additional or revised permit conditions to address the new impacts (if any) of any such changes. Any permit applications for additional acreage within the mineral resource area shall be processed by the City.

Development of this area should not occur until adequate public facilities are available to support the development consistent with City concurrency policy.

The City recognizes the potential for expanding the Stuck River Road Special Planning Area to include additional land east of Kersey Way and north of the Covington-Chehalis power line easement and will consider a proposal by all affected property owners. If the area is expanded, the

number of non-multiple family, non-manufactured home park dwellings units may be increased proportionate to the increase in acreage. Any such proposal shall specifically apportion the types and quantities of development to occur within each separate ownership.

LU-145 Lakeview - The Lakeview subarea is currently the site of two independent sand and gravel mining operations. While mining activity continues in the eastern operation, indications in 1995 are that the western operation has ceased. Activity in the western portion is now limited to a concrete batch plant and future site reclamation. Following reclamation, the area should be developed as a primarily single-family residential neighborhood of low to moderate urban density. A planned development would be particularly appropriate for this approximately 235-acre site. The permitted development density of the site will depend heavily upon the ability of the transportation system near the site to handle the new uses. Consideration shall be given to the environmental, recreational and amenity value of White Lake, the historical and cultural significance, as well as tribal ownership and jurisdiction of the Muckleshoot Tribe in the development of the Lakeview Plan element. Permit applications have been accepted and are currently being processed by the city with respect to the mining activity in the eastern portion of the area. The permit process should continue, however, any permit for continued mining in this portion of the area should be limited to 10 years to encourage completion of the mining, and subsequent reclamation by the property owner in preparation for development. The Lakeview Plan element should be adopted prior to the City's acceptance or processing of any other permit applications for the mining operation in the Lakeview Special Planning Area. The environmental information and analysis included in the Final Environmental Impact Statement for Lakeview (November 1980), shall be considered in the development of the Lakeview Plan element. While heavy commercial or industrial uses would not be appropriate as permanent uses of this area, conversion of the area now zoned for heavy industry to office commercial (or similar) uses would be appropriate.

LU-146 Mt. Rainier Vista - This 145-acre subarea is located south of Coal Creek Springs Watershed. Overall development of the Mt. Rainier Vista subarea plan shall be consistent with the following conditions:

1. Primary consideration in the use and development of the property shall be given to protection of Coal Creek Springs' water quality. Development types, patterns and standards determined to pose a substantial risk to the public water source shall not be allowed.

2. The maximum number of dwelling units will be determined as part of any sub-area plan process. Dwelling units shall be located within portions of the property where development poses the least risk of contamination for Coal Creek Springs. Lands upon which any level of development would have a high risk for contaminating the water supply shall not be developed, but would be retained as open space. The development pattern shall provide for a logical transition between areas designated for rural uses and those designated for single family residential use. All dwelling units shall be served by municipal water and sanitary sewer service, and urban roads. If 53rd Street S.E. is the major access to serve the Special Planning Area, the

developer will be responsible for developing the street to urban standards, from the property owners' eastern property line that abuts 53rd Street, west to the intersection of 53rd and Kersey Way.

3. Percolation type storm sewer disposal systems shall not be permitted. All surface water drainage shall be conveyed consistent with the City's current storm drainage standards. Treatment of stormwater shall occur prior to its discharge to any surface water body, consistent with standard public works or other requirements in general effect at the time of development.

4. The site shall be zoned temporarily, at one unit per four acres, until the sub-area plan is completed, and the long-term urban zoning determined.

5. The Mt. Rainier Vista special planning area boundary may be modified through the development of the subarea plan.

6. The Mt. Rainier Vista and Stuck River Road Special Planning Areas shall be coordinated subarea plans.

Designated Areas - Areas of Concern Policies

LU-147 AWS/Auburn Black Diamond Rd – The area between Auburn-Black Diamond Road and the Burlington Northern Railroad currently lacks urban facilities necessary to support urban development. Major development proposals shall be carefully assessed under SEPA to ensure that the development can be supported by the available facilities. Once property owners are able to demonstrate to the City that they can provide urban services (municipal water and sewer service, urban roads and storm water management) necessary to support the intensity of development proposed within the entire area, the Plan designation and zoning for this area should be changed to an urban residential or commercial classification. The appropriate classification(s) shall be determined after a review of the development proposal and the pertinent Comprehensive Plan policies.

LU-148 Pike Street NE – The area located north of 8th NE, east of Harvey Road, and south of 22nd NE is inadequately served by residential arterials. No increase in density or other development which would increase traffic demand in this area should be approved.

LU-149 8th Street NE – The areas paralleling 8th Street NE located between Auburn Way and M Street are designated for multiple family residential while 8th Street NE is designated as a minor arterial. However, the road is not currently constructed to this standard and is not able to support current traffic demand adequately. The Plan designation would greatly increase traffic volumes. Implementation of the Plan designations should not occur until 8th Street NE is constructed to the adequate arterial standard and water service is upgraded. Up zones should not be granted from current zoning until these stems are upgraded or guaranteed.

Designated Areas - Economic Development Strategy Areas Policies

LU-150 The City should adopt a formal subarea plan for each of the seven economic development strategy areas (listed below) as an element of the Comprehensive Plan. Each economic development strategy area subarea plan should identify the uses, intensities, and infrastructure development necessary to support the types of business and activities that are most consistent with community aspirations. Each

subarea plan should address and include policies regarding the expected level of housing density (or residential growth targets) and employment growth targets.

- Auburn Way South Corridor
- Auburn Way North Corridor
- NW Auburn Manufacturing Village
- 15th St. SW/C St. SW/W Valley Hwy. N
- A St. SE
- SE 312th St. /124th Ave SE
- M St. SE between Auburn Way N and Auburn Way S

Adopted Areas Policies

LU-151 Adoption or revision of a subarea plan will be treated as a comprehensive plan amendment and will comply with the Growth Management Act, Countywide planning policies, Vision 20 50, and the Core Comprehensive Plan.

LU-152 Adventist Academy - Adopted under Resolution No. 2254 on November 14, 1991. The Auburn Adventist Academy is Special Planning Area (Adopted Area) is a multi-use campus operated by the Western Washington Conference of Seventh-Day Adventists. The Campus plays a large role in the Western Washington Conference of Seventh- Day Adventists' private elementary and secondary education system in Washington and hosts many community events as well as an annual regional camp meeting for Adventists from Washington and around the world. The Campus previously housed Harris Pine Mill, a furniture manufacturer, for many years. The Mill provided financial benefit to the Academy's budget and provided employment opportunities, learning experiences, and vocational education for Academy students. The Academy continues to include in its plan industrial uses that support the mission of the school financially. The reuse of existing mill buildings and redevelopment of buildings lost to a fire in 1989 are the focal points of the current industrial development. In addition to institutional and industrial uses, the Academy also operates a landing strip and associated aircraft hangars for student aviation and flight training. A single-family subdivision is located to the south of the airstrip. In addition to these uses, the Academy wishes to allow development of uses such a multi-family and senior housing and assisted living and memory care which will generate perpetual revenue through a long-term land lease on a portion of the Campus lying generally north of Auburn Way South and south of 32nd Street S.E. that will directly aid its mission. The financial benefit from these uses will allow funding an endowment, subsidize student tuition, provide financial aid for students needing tuition assistance, for new educational programs, for additional faculty, facility maintenance and upgrades, and other needs. The plan focuses on provides predictability to planning, zoning, subdivision, and development decisions within the Special Planning Area (Adopted Area) made by the city.

LU-153 Auburn North Business Area - Adopted under Resolution No. 2283 on March 2, 1992. The Auburn North Business Area Special Planning Area Plan was the result of a comprehensive planning study due to increased development pressure north of the Central Business District. Since the Central Business District, which contains Downtown, the core of Auburn, is adjacent to these areas, future development in this area is crucial. A comprehensive and cohesive direction was also needed based on increased development proposals and rezone requests. In addition to development concerns, many of the considerable undeveloped parcels contain wetlands. All of these factors made development controls beyond zoning and development regulations advisable.

LU-154 Lakeland Hills - Adopted under Resolution No. 1851 on April 18, 1988. Lakeland Hills area lies between the Stuck River and the southern City limits of Auburn in the most southwestern part of the city. The area consists of planned residential and commercial subdivisions, and is predominately residential in nature, offering a range of housing types, including single family and multi-family dwellings. The Lakeland Hills Plan was intended to provide long-term predictability to both the city and potential developers. As a planned community, development and design must be consistent with the policy guidance of the Lakeland Hills Plan.

LU-155 Lakeland Hills South - Approved under Pierce County Hearing Examiner Case Z15/UP70.Lakeland Hills South lies south of the Lakeland Hills special plan area and is the most southwestern part of the city. The area is predominately residential, allowing for a range of housing types, with commercial uses, including Lakeland Town Center, in the center. Nonresidential uses, including civic, religious, and municipal services are allowed throughout the area through an Administrative Use Permit. Unlike Lakeland Hills, Lakeland Hills South was accepted into Auburn was a Planned Unit Development (PUD). The Lakeland Hills PUD, originally the Lakeland Hills South Planned Development District (PDD), was approved under Pierce County Hearing Examiner Case no Z15-UP70 in 1990. Lakeland Hills South PUD is intended to provide enhanced flexibility to develop a site through innovative and alternative development standards. As a PUD, specific development and design standards are prescribed.

LU-156 Auburn Downtown Plan (Downtown Urban Center) – Adopted under Ordinance No. 5549 on May 21, 2001. Downtown Auburn is the business, governmental, and cultural hub of Auburn, its physical and cultural heart. Many stores, restaurants, service providers, and small offices are well-represented throughout this district. Downtown hosts many community events and activities, such as the weekly Auburn International Farmers Market in the summer, Soundbites! Concert Series (in the City Hall Plaza) and the Veterans Day Parade. Downtown features public art that includes temporary installations such as Pianos on Parade and a permanent outdoor Downtown Sculpture Gallery with rotating pieces. This dynamism is possible because the district is a collection of uses that coexist in close proximity to one another. Due to the value, importance, and

complexity of this district, The Auburn Downtown Plan identified four general needs to be addressed by the plan:

- Update of the existing plan in order to continue Downtown revitalization
- Concern over the reopening of Stampede Pass
- Multiple large projects proposed for Downtown
- Scarce private investment

In conjunction with project-based items, a regulatory element that emerged from the goals of the Auburn Downtown Plan was the Downtown Urban Center (DUC) zoning district, which was established in 2007. While the DUC zoning district is intended specifically to address the needs of downtown, though the implementation of policies identified by the Downtown Auburn Plan, many challenges related to public and private investment, development, and strategic planning have yet to be addressed as downtown has evolved.

The Auburn Downtown Plan is in the process of being updated and is expected to be considered for adoption in 2025, after this Periodic Comprehensive Plan update is adopted in 2024. The DUC zoning districts and DUC boundaries found in the Comprehensive Plan Land Use Map, related Zoning Map, and Implementing Zones is consistent with direction in the updated Auburn Downtown Plan.

LU-157 Northeast Auburn Special Plan Area – Adopted under Ordinance No. 6183 on June 5, 2008. The Plan was prepared in fulfillment of the policies included in the Comprehensive Plan for the area between Auburn Way North and the Green River, south of 277th Street (52nd Street NE) and north of approximately 37th Street NE in the City of Auburn (Map No. 14.2). The planning area was narrowed to an area covering approximately 120 acres, north of 45th Street NW and between Auburn Way North and the existing I Street NE right-of-way. The Northeast Auburn/ Robertson Properties Special Area Plan focuses on proposed develop of the Auburn Gateway project area, a 60-acre group of properties owned or under consideration for purchase by Robertson Properties Group, owners of the Valley 6 Drive-In Theater. The plan calls for a mix of office, retail, and multifamily development under a new zoning designation (C-AG Auburn Gateway) for the central portion of this planning area, created to accommodate mixed use development. The plan calls for phased development in coordination with the provision of new roads, stormwater and other utilities, and flood management measures.

Impression Corridor Policies.

LU-158 Create specific plans for each identified corridor, outlining development policies and regulations, necessary capital improvements, and implementation strategies. In the absence of any specific corridor plans, this section contains general policies that are to be applied within designated impression corridors.

LU-159 Coordinate corridor planning, design, construction, and maintenance with other agencies, such as BNSF, the Muckleshoot Indian Reservation, and the Washington State Department of Transportation. Where one agency may more effectively manage the corridor, management or ownership consolidation is appropriate.

LU-160 Promote the elimination or renovation of existing derelict or unmaintained structures, signs, fences, and properties along impression corridors through regulatory or enforcement mechanisms.

LU-161 Work with private and public property owners to educate, create incentives, and enforce regulations that are intended to improve the overall appearance of identified corridors.

LU-162 Emphasize the design, orientation, construction materials, landscaping, and site layout for development proposals of new and existing buildings along impression corridors. New construction and the renovation of existing buildings create important opportunities for enhancing the appearance of impression corridors.

LU-163 Establish regulations that ensure coordinated, attractive commercial signage is of an appropriate size and quantity. Signage regulations along these corridors may be different than those in other areas.

LU-164 Take advantage of opportunities to provide informational signs, wayfinding signs, and traffic control signs that are attractive, useful, and integrated into a larger citywide signage plan or policy.

LU-165 Outdoor storage of materials, inventory, and other goods and off-street surface parking should be located at the rear of the property. If outdoor storage cannot be located in the rear of the property, then it should be screened from view from adjacent rights-of-way.

LU-166 Design, construct, and enhance impression corridors to accommodate multimodal uses.

LU-167 Design and construct vehicular access points in a manner that consolidates access points serving multiple uses.

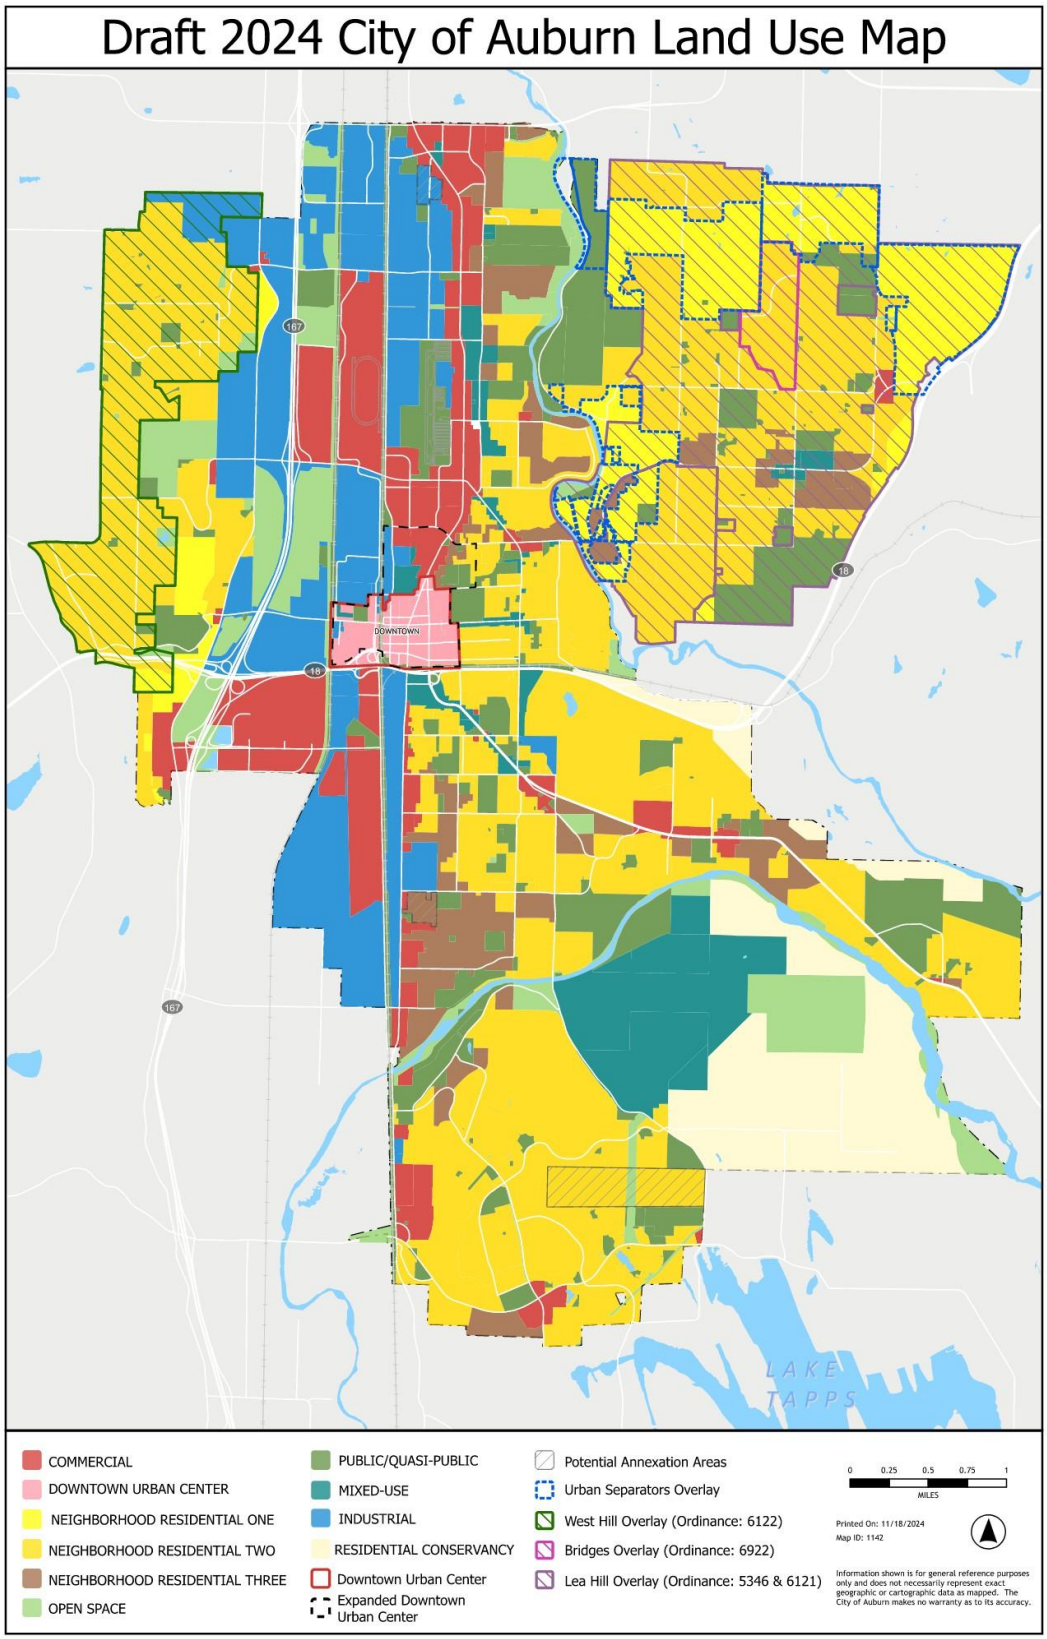
LU-168 Signage, landscaping, and monument features should be used to establish prominent access points.

LU-169 Discourage aerial utilities.

LU-170 Invest in impression corridors by acquiring rights-of-way, constructing and widening sidewalks, installing landscaping, building center medians, constructing parklets, providing street furniture, and constructing other improvements.

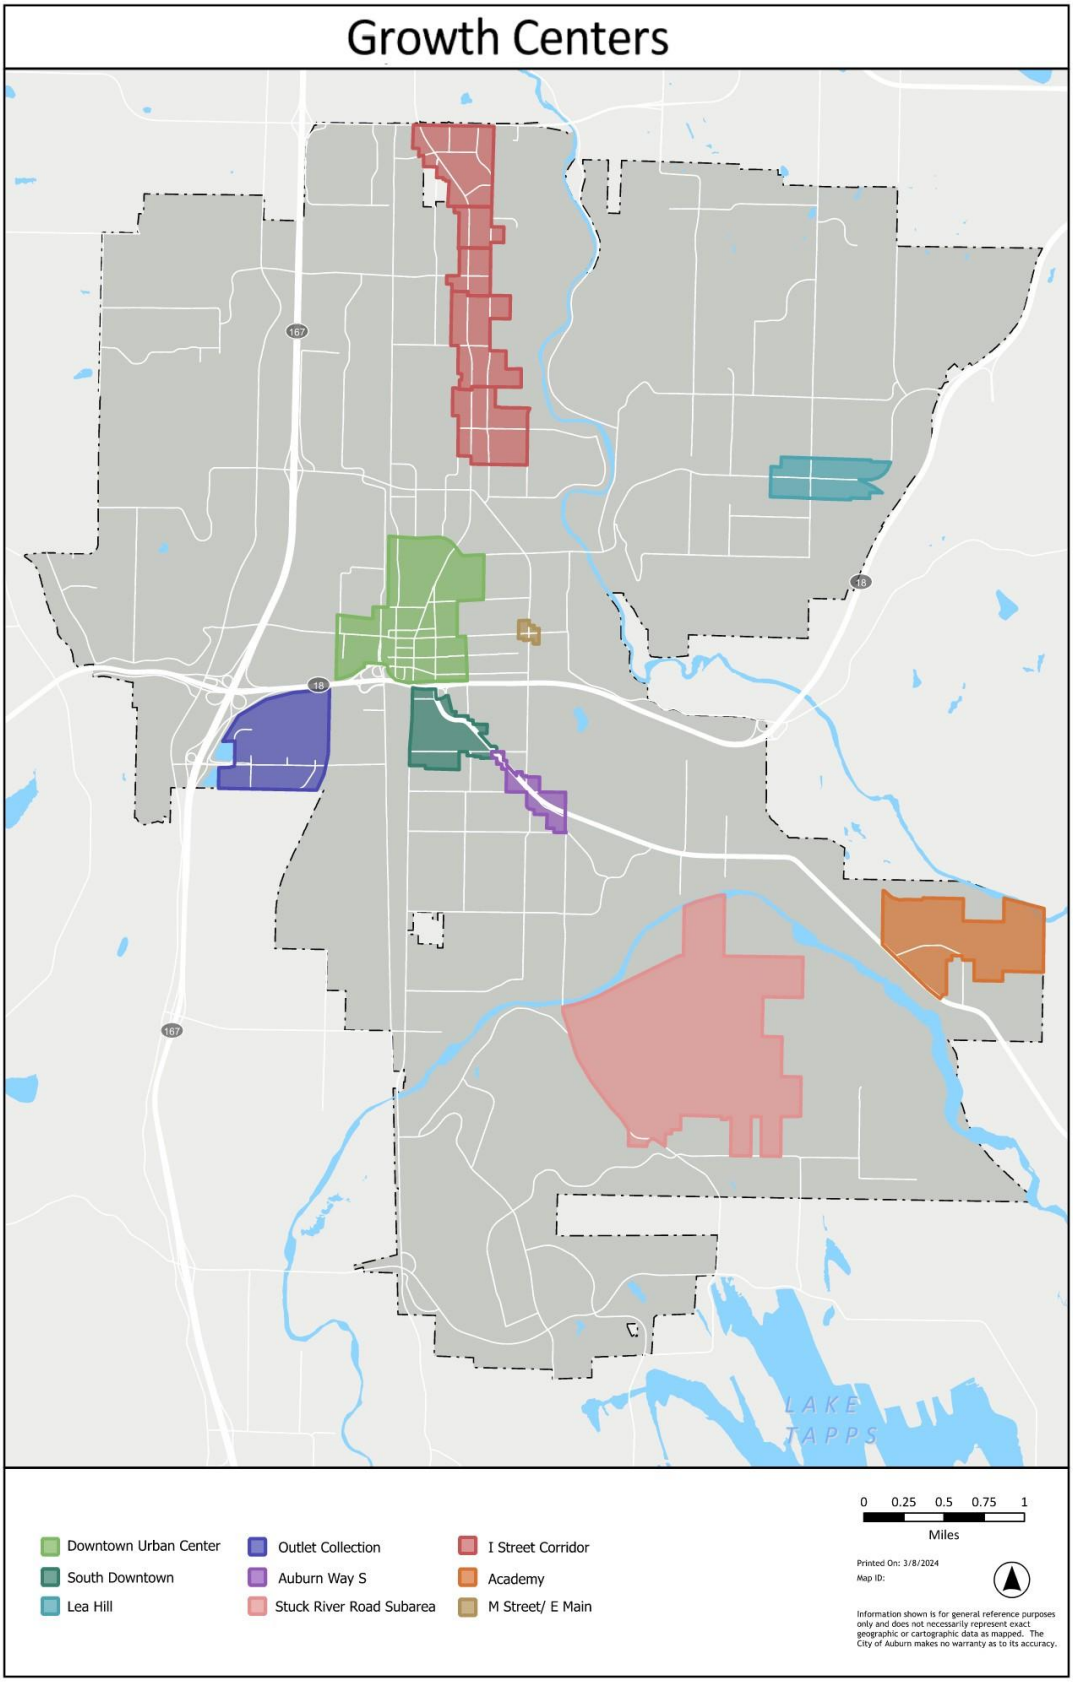
Gateway Policies

LU-171 Prioritize by ranking all gateways and develop potential opportunities and designs for each location.



LU-172 Develop land use regulations that incorporate gateway priorities and concepts into private development proposals that are located at identified gateways.

LU-173 Coordinate with the Washington State Department of Transportation to understand options and implement actions at gateway location. Many of the gateway locations are within the WSDOT right-of-way.



LU-174 Develop design layouts for gateway locations. Designs will identify key areas that greet residents and visitors as they enter the city or downtown center, opportunities for signage and monument features, and landscaping.

LU-175 Maintain established gateways.

Why is Housing Important to Auburn's Future?

The Housing Element can serve as a useful management tool to meet changing community needs for housing and address land use, economic development, transportation, environmental, and other concerns.

- A variety of housing choices can meet the needs of Auburn's current and future residents across all ages and affordability levels, help residents maintain and retain their homes, and promote services and amenities that improve neighborhood livability.
- Well-planned housing can support Auburn's economic goals by making it attractive and possible for residents to live near their jobs and by serving as a source of customers to support commercial districts.
- Housing in proximity to transit or mixed-use projects can help reduce the need for costly infrastructure such as roads and sewers, and reduce environmental impacts related to transportation. In addition, housing in proximity to a variety of transportation modes can increase a household's disposable income and savings by reducing household transportation costs.
- Well-designed and located housing can reduce energy and water consumption, and it can promote healthy lifestyles.

For these reasons, as well as others discussed or referenced in this Housing Element, an emphasis on encouraging Middle Housing, Mixed-Use, Transit-Oriented Development is core to planning for housing both in the near-term and by 2044.

Vision

Auburn is a place that those in our diverse community are proud to call home for a lifetime. Auburn provides opportunities for attainable housing in a variety of styles to meet the needs of all ages, abilities, cultures, and incomes. Our neighborhoods are safe and attractive, offer gathering places to meet friends and family, are connected by trails, streets, and transit, and are well kept. Our households are aware of the opportunities and services offered by governmental, educational, employment, health, and service providers that can enhance their quality of life. Volunteerism to improve our parks, schools, streets, and homes makes our neighborhoods and families stronger. Our quality housing and neighborhoods support our local economy.

Conditions and Trends

This section summarizes key findings of the Housing Needs and Characteristic Assessment (HNCA), which was updated in 2023. The HNCA provides a comprehensive picture of Auburn's housing conditions, needs, and regional context.

Analysis and data to support required analysis, policy choices, and to help illustrate the housing picture in Auburn was collected from a variety of sources. In 2021, the City of Auburn prepared and adopted a Housing Action Plan (HAP), funded by a state grant (authorized by HB 1923) for the purpose of identifying city strategies and recommendations to increase residential capacity. Findings in the HAP may vary slightly from those completed for the HNCA due to differences in horizon years. Both of these data sources, as well as others from the Washington State Department of Commerce, Puget Sound Regional Council, King and Pierce Counties, as well as other sources are referenced in the HNCA and this Housing Element. The Housing Needs and Characteristics Assessment can be found in Appendix X of the Comprehensive Plan.

The conditions and trends inform Housing Element goals and policies to address projected housing need in Auburn.

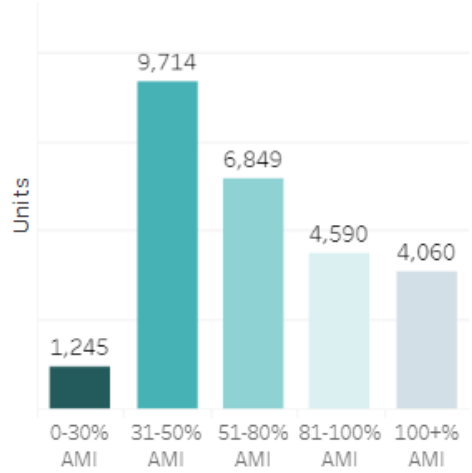
Affordability

The cost of housing in Auburn has substantially increased from 2010 to 2020. Between 2010 and 2020, the average monthly rent in Auburn increased by 49 percent ($459 per month). In this same period, the median sales price for a home increased by 88 percent ($195,550) based on 2017-2021 American Community Survey Data.

Of the approximate 15,507 renter households in Auburn, more than half (53 percent) are cost-burdened, and more than one-quarter (27 percent) are severely cost-burdened. About a quarter of households are considered unaffordable for renters and homeowners in Auburn according to state and federal affordability thresholds. While Auburn is more affordable than other cities in King County, housing is unaffordable for most households.

Household Size

Trends in household size indicate that Auburn will need to ensure the availability of a variety of housing types to match the needs of both small and large households. Auburn has both a larger household size (2.7) and a larger share of family households compared to King and Pierce Counties overall. Data on household composition indicates however, that 38% of the City's households are made up of single-person and two-person households without children, and Auburn also has a higher-than-average percentage (7%) of single-parent households compared to King and Pierce County (4% and 6%, respectively). Overall, 24% of Auburn



households are married with children, compared to 21% in King and Pierce Counties. The types of homes needed for smaller households may be different than those needed for larger households, putting an emphasis on planning for a variety of housing types and sizes in the future.

Housing Stock

Auburn's housing stock is older than average, and much of its rental housing stock is in fair or poor condition. Though housing is affordable in Auburn, the City could lose some of its most affordable rental housing as structures approach the end of their useful lives. About half of Auburn's housing stock is 2-3-bedroom units, accounting for 56.7% of housing units.

Most of the existing housing stock in Auburn accommodates the 31-50% AMI affordability levels, as shown in Figure 2. Preservation of this housing stock is discussed in policy H-23 and accommodating the city's share of housing growth at a range of affordability levels is addressed in policy H-32.

Figure 1. Total Existing Housing Units

Source: King County, CHAS 2015-2019

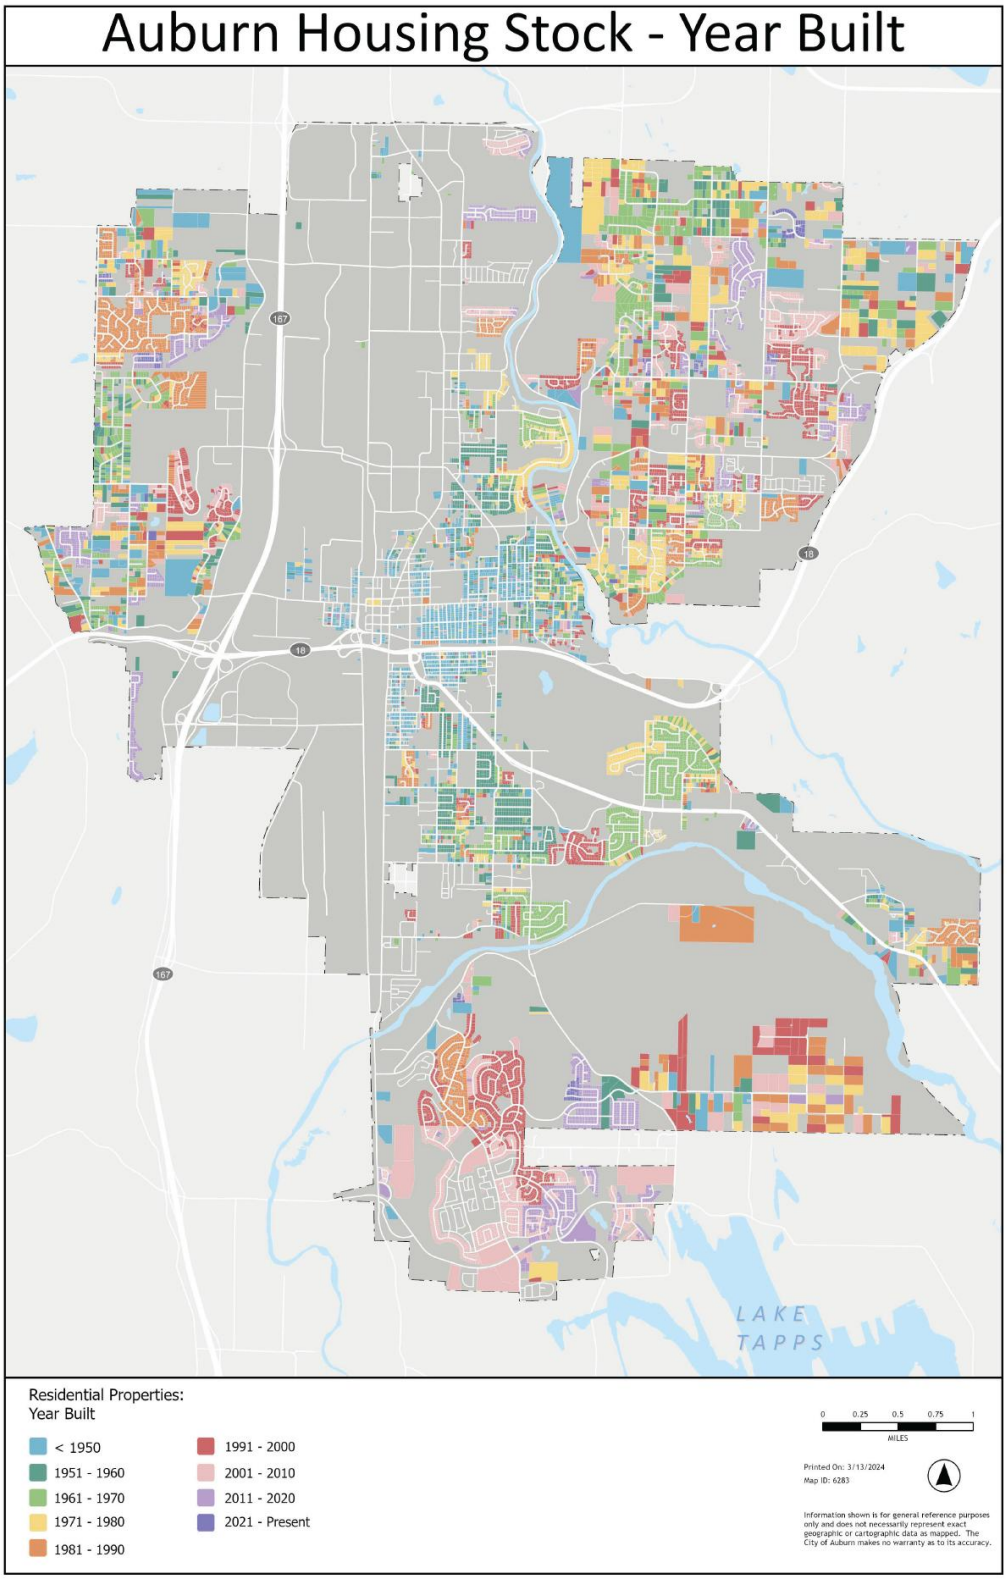
The city aims to preserve housing stock and create more opportunities for the creation of new homes through coordinated collaboration with regional organization such as South King County Housing and Homelessness Partners (SKHHP), Auburn's Housing Repair Program, and various Community Block Grant programs. Polices for the preservation and creation of homes is addressed in policies in this Element.

Existing Partnerships and Strategies for Housing Needs

To align with countywide goals and polices for meeting housing needs and eliminating disparities Auburn is a member of the South King Housing and

Homeless Partners (SKHHP). SKHHP is a joint board formed by an interlocal agreement between the jurisdictions of Auburn, Burien, Covington, Des Moines, Federal Way, Kent, Maple Valley, Normandy Park, Renton, SeaTac, Tukwila, and King County. Through SKHHP, South King County jurisdictions can take a coordinated and comprehensive approach to increasing housing stability and producing and preserving quality affordable housing in South King County. Auburn pools SHB 1406 funds with SKHHP for the development and preservation of affordable housing in South King County.

In addition, the City of Auburn administers the Housing Repair Program within the Building Division of the Department of Community Development. This program provides eligible homeowners grants up to $9,999 for emergency minor home repairs. Leaky roofs, unsafe stairs, floor repair, access for individuals with disabilities, and heating system repairs are examples of work funded with Minor Housing Repair grants. The Housing Repair program helps Auburn's low-income homeowners preserve and stay in safe and affordable housing.



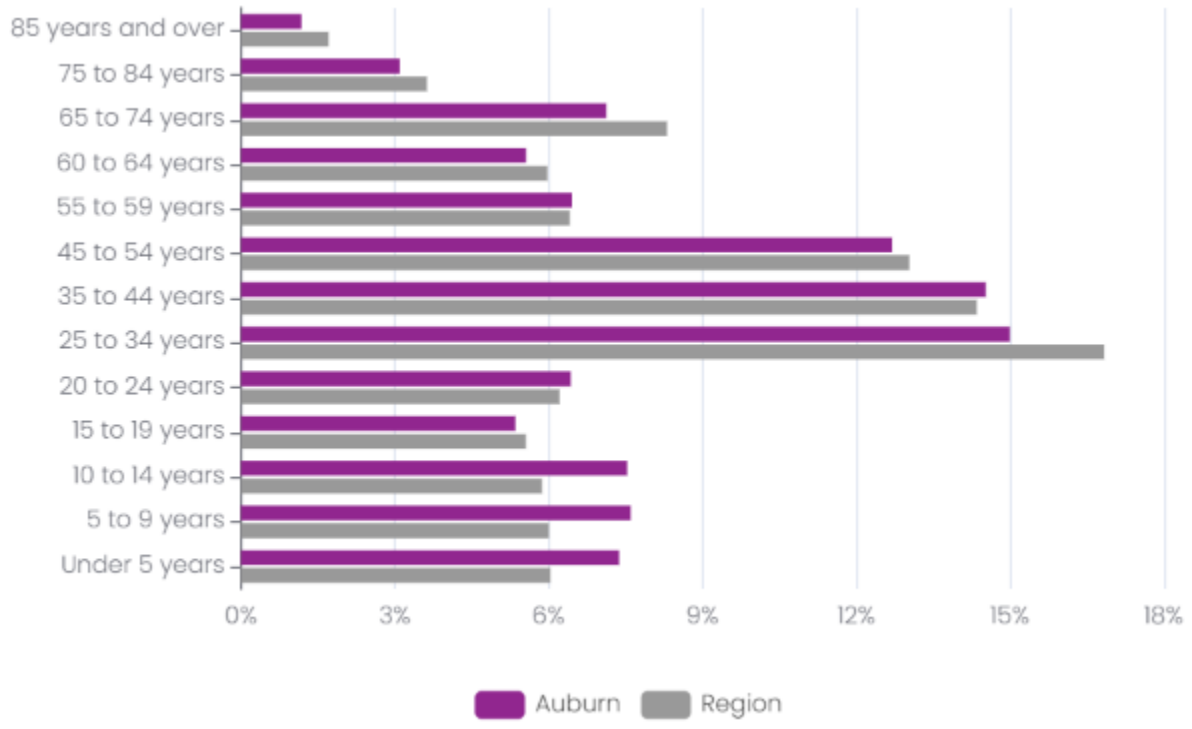


Figure 2 - Housing Stock by Year Built

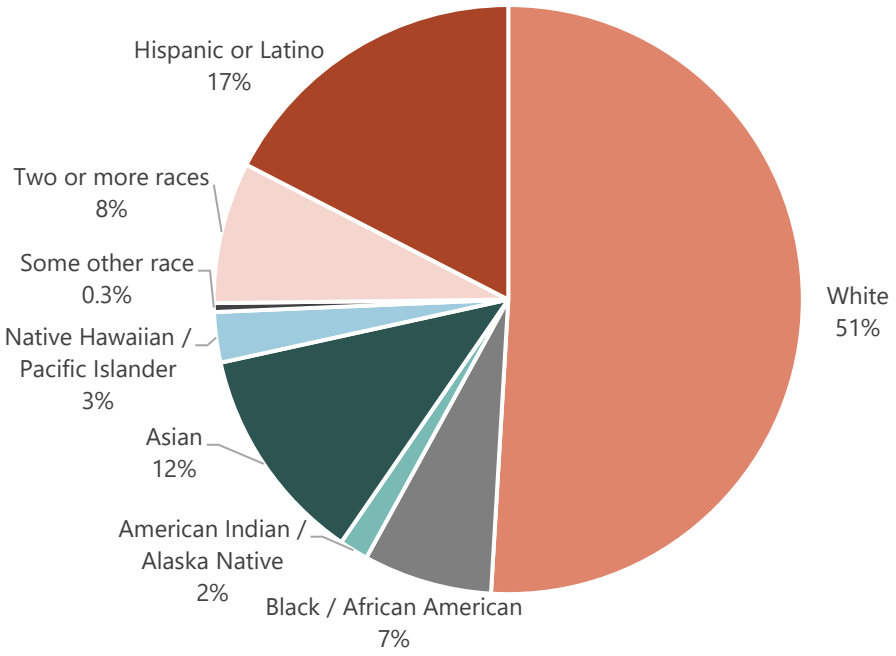
Diversity

Auburn is diverse. Approximately 25% of Auburn residents speak a language other than English. Auburn's population generally follows regional trends for age distribution. Most of the city's population is between 25-54 years of age. Auburn's racial and ethnic makeup is more diverse than that of King County and Washington as a whole, with 48% of residents identifying as Black, Indigenous, or People of Color (BIPOC), compared with 42% in King County and 34% statewide.



Auburn's diverse communities may have different housing, neighborhood amenities, and service needs. For example, outreach conducted with the Hispanic community has shown that most would recommend Auburn as a place to live for family and friends, and though residents wanted their children to grow up and remain in Auburn, they desired improved security and traffic calming. Outreach participants were interested in helping to improve their neighborhood and in volunteering.

Figure 4. Race and Ethnicity in Auburn (2021)

Source: 2020 ACS 5-Year Estimates, Table DP05

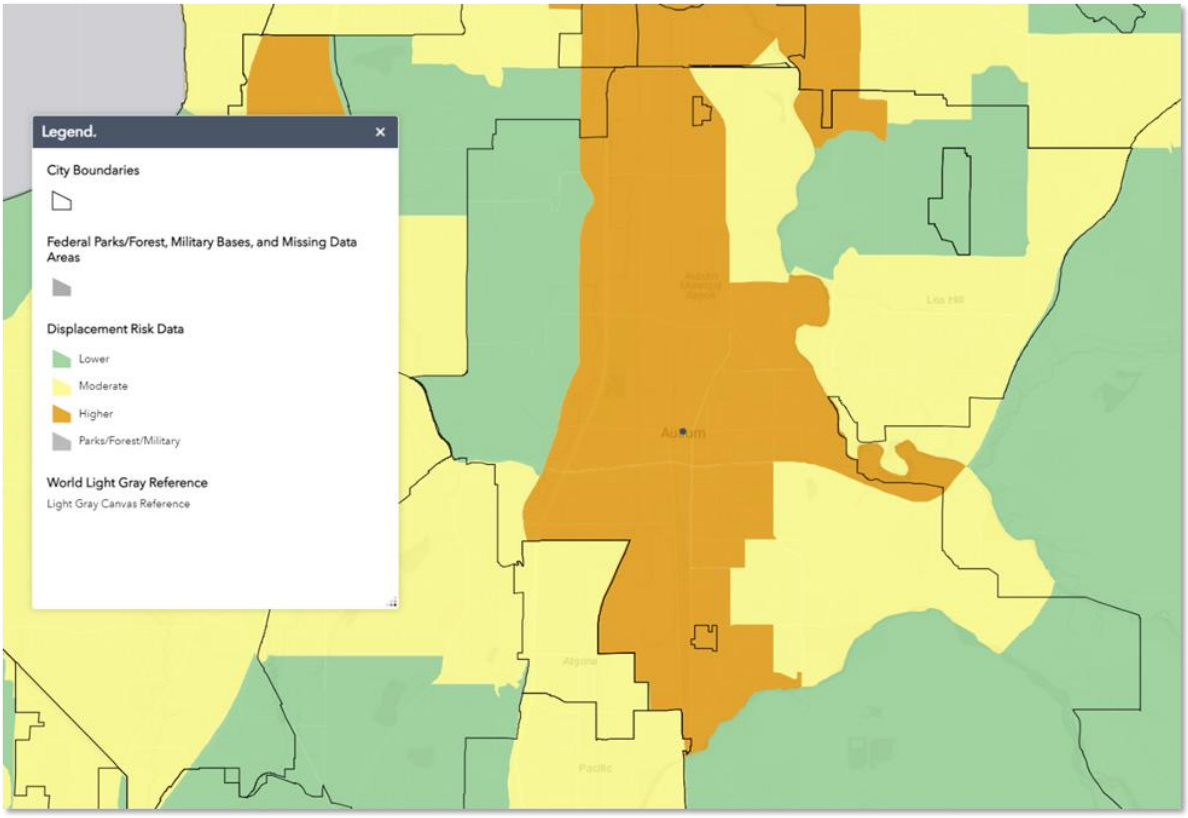
Trends

Overall, Auburn's housing market is characterized by strong growth in both the homeownership and multifamily rental markets. These trends are important to consider as the City works to encourage development to reach the 10,429 units needed by 2040. Key findings include the following:

- Multifamily rents in Auburn increased 47 percent from $1.14 per square foot in 2010 to $1.68 in 2020 Q3. Auburn did not see a dip in rents in 2011-2013 like many of its peer cities. In addition, thus far through 2020, multifamily rents are continuing to grow in Auburn, approaching levels in Kent and Tukwila which have started to level off.
- Auburn's rental vacancy rates are low, indicating continued demand for housing. Multifamily vacancy rates in Auburn increased by 2.7 percentage points from 8.3 percent in 2008 to 11.0 percent in 2020 Q3, spurred by the recent Copper Gate affordable apartment complex, which added 500 units to Auburn's housing market in late 2020. Although this increase in vacancy is reflected by an influx of new multifamily units that have yet to be rented, the mostly positive net absorption in the City from 2008 to 2019 indicates demand for multifamily housing is strong.
- About 60 percent of the new units developed in Auburn between 2010 and 2018 are for homeownership, while only about 40 percent are intended as

rentals. These ownership trends, coupled with strong price growth, indicate strength in the market.

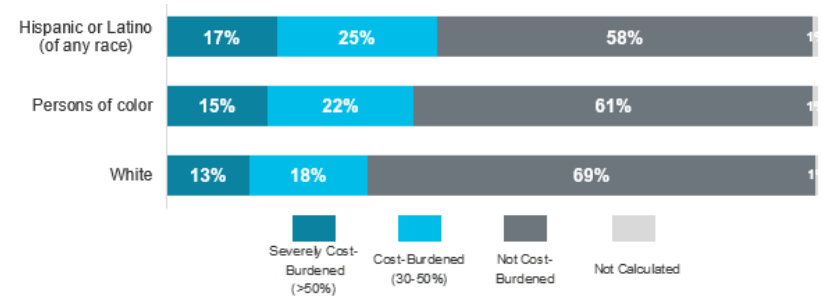
- Auburn has not been producing enough housing to meet its demand from household formation (net in-migration and people forming new households, such as moving out of a family home). Over the 2010-2019 time period, only 7.8 housing units (of all types and sizes) were constructed for every 10 new households that formed. This translates into housing underproduction and is a contributor to Auburn's rent and price increases.
- An additional 12,112 housing units are needed in Auburn citywide by 2044 to accommodate growth.



Racially Disparate Impacts

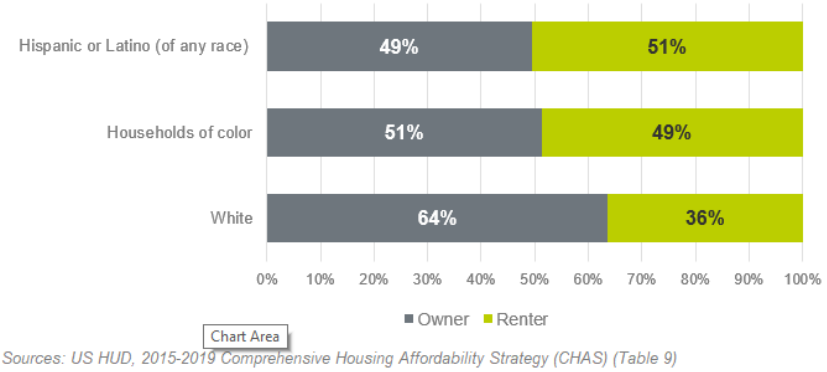
The Housing Element and Housing Needs and Characteristics Assessment (Appendix A) identifies data and strategies to undo local policies and regulations that result in racially disparate impacts. Racially Disparate Impacts were identified in Auburn such as potential for displacement due to the percentage of residents, especially renters, who are cost burdened and at high risk of displacement if market forces shift and historical records of restrictive housing covenants.

Considerations for displacement are also addressed in the Land Use Element when developing future land use goals. Where appropriate, goals, policies, actions, and overall strategies have been created or revised to address these issues as a first step towards undoing racially disparate impacts. This includes refinements to goals and policies to preserve existing housing stock, create opportunities for increased capacity for the development of multi-family, mixed-use, and middle housing throughout the city to accommodate a range of affordability levels, and regional coordination to address housing issues.



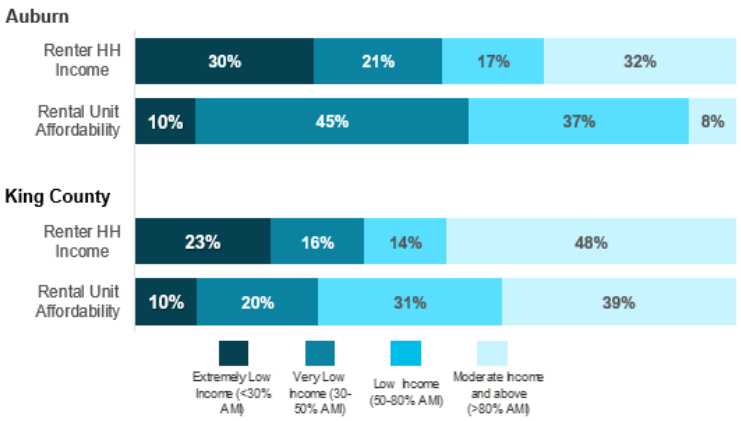
Displacement Risk

The highest displacement risk in Auburn is the few housing units located in southwest Auburn where mostly industrial and commercial is located. In particular, a mobile home park located in this block group is particularly vulnerable to displacement. Downtown Auburn is also susceptible to moderate to high displacement risk. The downtown area currently contains 426 subsidized affordable units in several developments, slightly more than a quarter of the housing units in the area. A full analysis is located in the Housing Needs and Characteristics Assessment.



Source: Puget Sound Regional Council

As part of an evaluation of racially disparate impacts, the city identifies housing costs and cost-burdened households as especially vulnerable to displacement. In Auburn, 42 percent of the community identifying as Hispanic or Latino (of any race) is either cost-burdened or severely cost-burdened (<50% AMI) and persons of color are 37 percent cost-burdened or severely cost-burdened, compared to 31 percent identifying as white. These communities are about 50 percent renters and 50 percent homeowners, while those identifying as white are 64 percent homeowners in Auburn. The gap in homeownership is addressed through thoughtful and effective policy including increasing affordable ownership opportunities by encouraging diverse housing stock.



Source: US HUD, 2015-2019 Comprehensive Housing Affordability Strategy (CHAS) (Table 9); Washington Department of Commerce, 2023

Sources: US HUD, 2015-2019 Comprehensive Housing Affordability Strategy (CHAS) (Table 9)

Overall, the Auburn community spends a greater amount of income on rental housing costs compared to King County, with 51 percent of renters in the very low or extremely low-income bands (<50% AMI) in Auburn and 39 percent in King County. While Auburn has a naturally occurring affordable housing stock of 55 percent serving very-low and extremely-low incomes, this means there is only 11 percent additional capacity available to serve extremely-low and very low-incomes. If housing cost trends in King County continue, and Auburn housing prices in Auburn continue to rise, the amount of naturally affordable housing is expected to decrease. Again, preservation strategies and housing policies supporting a range of development types is key while encouraging housing growth.

Sources: US HUD, 2015-2019 Comprehensive Housing Affordability Strategy (CHAS) (Table 8)

Historically Restrictive Housing

The lands of Auburn have been historically utilized by many different groups of people. Year 1920 census records showed that Japanese farmers operated 25,320 acres and 699 farms. This number dropped to 7,030 acres and 246 farms in 1925 after the Alien Land Law of 1921 restricted “non-citizen aliens from sharecropping, leasing or renting land.” (It is important to note due to a series of Congress legislation (Naturalization Act of 1870, Chinese Exclusion Act of 1882, and The Immigrant Act of 1924) citizenship was a closed door for persons of Asian descent.

When considering historic and restrictive land use in Auburn, it is important to consider the official record keeping is very slim regarding restrictions as it wasn't until 1920 when Auburn's population rose above 2,500 (3,163) and was more detailed in its recording of population ratios in the census. (census 1920 vol 3 table 11, page 1092). 3096 persons of this population were recorded as white (Native white, foreign or mixed parentage, or foreign-born), with 67 persons being classified as non-white. As Auburn has grown certain covenants have been placed on plat maps and deeds within the county, with 759 recorded parcels containing/that have contained this restrictive language. These have been recorded on Auburn parcels from 1900 up to 1959, with many plat maps still containing the language. These restrictions were largely put in place by the developers, with many of them (464 or 61.1%) being placed by the Hillman Investment company, or Clarence Dayton Hillman.

These covenants were developed to only allow "members of the Caucasian race" the ability to purchase and use the land. There are different variations and verbiage depending on the plat or deed, but they all come to the same end, only white persons were eligible to own these properties. These restrictions shaped the sections of the city to where they are today, the growth in culture and development was stunted. The policies in this Housing Element create housing opportunities for all members of the community in an effort to undo historically documented racially disparate impacts and look forward to a more equitable Auburn.

Planning Approach

Auburn's preferred Comprehensive Plan Land Use Map sufficiently addresses housing needs for all economic segments of the Auburn community. The Comprehensive Land Use map considers adequate capacity for housing and employment targets and housing needs by income level through a Centers approach. Centers in Auburn are high-intensity and density cores characterized as primarily as mixed-use areas served by Middle Housing and commercial development. Most new housing is planned to be built in the neighborhood centers and downtown. More information on the Comprehensive Land Use Map and future land uses can be found in the Land Use Element, Chapter 1 of the Comprehensive Plan.

Housing Choices for All

Central to planning for future housing is providing a range of housing types to choose from which facilitates home ownership across a wide range of households and affordability levels. Consideration "Middle Housing" is key to increasing housing types in Auburn. Middle Housing, typically attached to one-another, provide options to increase residential density in existing residential neighborhoods and are designed at the scale and overall aesthetic of these areas. In 2023, the Washington State Legislature passed HB 1110 which requires jurisdictions to incorporate Middle Housing into Comprehensive Plans and related development regulations. This Housing Element, and updated city code, fully complies with HB 1110 requirements by allowing for townhomes, duplexes, triplexes, fourplexes, fiveplexes, sixplexes, stacked flats, cottage housing, courtyard housing in residential zones throughout the city. In addition, the City also acknowledges Accessory Dwelling Units (or ADUs) as an important piece of Middle Housing, complying with HB 1337 legislation allowing ADUs in residential zones throughout the City. Middle Housing, in combination with Mixed-Use Development, are critical development types that enable the City to meet future housing needs and provide a variety of housing options for current and future residents.

Housing and Employment Targets

Based on legislative changes, communities must plan for housing and employment targets allocated by Countywide Planning Policies (CPP). These growth targets are consistent with PSRC Vision 2025 requirements and originate at the state level. King County CPP, and the related 2021 King County Urban Growth Capacity Report, identifies targets of 12,000 net new residential units and 19,520 net new jobs between 2019-2044. Pierce County CPP identifies 112 net new residential units and 0 net new jobs targets by 2044. The Comprehensive Plan Land Use and Zoning Maps and policies adopted in the Comprehensive Plan demonstrate adequate capacity and strategies in order to accommodate these housing and employment targets.

Housing Need by Income Level

The Housing Needs and Characteristics Assessment projects housing need by income level using Area Median Income (AMI) bands. This assessment, as required by the Department of Commerce in coordination with counties, identifies the number of units necessary to serve varying AMI levels and for Emergency Housing. These figures were provided by both King and Pierce Counties using their own methodologies. The full methodology for the projections is provided in the assessment. As shown in Table 1, Auburn has a need for housing primarily at the 80% or greater AMI and for less than 30% AMI. Policies in this Element describe how Auburn plans to address these housing needs.

Table 1. Housing Need by Income and County

County	Total	**0-30%**	>30% to 50%	>50% to 80%	>80% to 100%	>120%	**Net New Emergency**

			Non-PSH	PSH				>100% to 120%		Housing Needs
King	Supply (2019)	28,049	1,076	237	8,029	8,075	4,427	3,302	2,903	58
	Net New Need (2044)	12,000	1,543	812	309	616	1,146	1,299	6,275	2,293
Pierce	Supply (2019)	3,963	0	33	134	493	1,141	680	1,482	8
	Net New Need (2044)	112	14	20	21	16	7	6	27	7
Total	Net New Need (2044)	12,112	1,557	892	330	632	1,153	1,235	6,302	2,300

Source: King County Ordinance 19660, Countywide Planning Policies; Pierce County Ordinance 2023-22s, Countywide Planning Policies

The overall housing need by 2044 in Auburn is 9,722 additional permanent units between 30% and greater than 125% AMI range, and 2,300 additional temporary/emergency housing beds totaling 12,112 new housing units.

Barriers that limit the development of affordable housing such as gaps in local funding and incompatible development regulations have been addressed in this Element and in Auburn City Code as part of the comprehensive plan update. Strategies to overcome these barriers include allowing appropriate housing types to serve various income levels, permitting a range of development serving all income levels in various zones, and development-related bonuses related to inclusion of affordable housing. The Housing Needs by Average Median Income (AMI) analysis discussed in the next section describes how the city is ensuring adequate zoned capacity and development types to accommodate a range of affordable housing.

STEP Housing

STEP housing (previously “supportive housing”, as defined HB 1220, includes emergency shelters, transitional housing, emergency housing, and permanent supportive housing. Households earning below 30% of the AMI are considered extremely low income and severely cost-burdened. In Auburn by 2044 the city needs an additional 2,389 supportive housing units for households earning below 30% AMI.

Permanent supportive housing includes supportive services such as health care and housing assistance. Auburn needs 812 additional permanent supportive housing units by 2044 in King County (King County CPPs) and another 20 in Pierce County (Pierce County CPPs).

Non-permanent supportive housing is to provide temporary or transitional shelter and supportive services to those struggling to stay housed. Auburn needs 1,543 additional non-permanent supportive housing units by 2044 in King County (King County CPPs) and 14 in Pierce County (Pierce County CPPs). Auburn also has a severe shortage of emergency housing beds compared to the projected need in

2044. As of 2020, there are 66 emergency/temporary housing beds citywide and 2,300 are needed by 2044 (King and Pierce CPPs). An additional 115 beds a year will need to be built between 2024-2044.

Housing Needs by AMI Capacity Analysis

In addition to meeting the residential and employment capacity targets through zoning and policy decisions, the city meets the aggregate King and Pierce County housing needs for income level groups. The only exception is the >120% Average Median Income (AMI) category, which includes primarily low-density housing in the R-1 and RC zones. However, this AMI category is not required to be met under HB 1220 requirements as high-income earners are represented in this group and can also purchase moderate density housing options as well.

Table 2. Housing Capacity by Income Level Future Surplus or Deficit

Income Level (% AMI)	Zone Categories Servicing these Needs	Housing Needs	Capacity prior to Zoning Adjustment	Post-Rezone Capacity	Capacity surplus or deficit
King County					
0-30% PSH	High Density-Mixed Use	2,389	566	3,004	**615**
0-30% Other					
>30-50%	High-Density, ADU	962	1,532	4,823	**3,861**
>50-80%					
>80-100%	Moderate Density, ADU	2,458	5,058	37,379	**35,033**
>100-120%					
>120%	Low-Density, ADU	6,303	348	2,217	***(4,086)***
Pierce County					
>80-100%	Moderate Density, ADU	112	100	500	***388***
Aggregated Total	-	12,112	7,504	46,070	*35,810*

In Pierce County, the City's primary residential zone is R-2 Residential Moderate which for purposes of this capacity analysis aligns with the 80-120% AMI range. This zone can adequately accommodate the total housing need of 112, however AMI below 80% is not accounted for in this analysis. As indicated earlier, the housing target for the Pierce County portion of Auburn is only 112 housing units and as a result the city does not intend to rezone small areas of land in order to satisfy AMI requirements since actual development is unpredictable. The R-2 Residential Moderate zone can accommodate middle housing, single unit detached housing, and ADUs that can realistically serve a range of incomes, and the city will continue to provide flexibility in the development types allowed in this part of the city to best accommodate the full range of AMI levels.

An estimated 1,852 new Accessory Dwelling Units (ADUs) are accounted for prior to rezoning, as these developments are currently allowed in various zones are expected to occur naturally over the next 20-years. In total, 80% of new ADUs are planned for in the 80-120% AMI range, and 20% in the greater than 120% AMI range. ADUs are expected primarily in the low-density and moderate-density land uses found in throughout the city.

Housing Capacity in Future Land Use

Total Housing Capacity

Residential capacity by zone is based primarily on the assumptions outlined Buildable Lands Report process in 2021, updates to reflect changes to zoning and density assumptions since that time. Downtown Urban Center mixed-use development assumes a distribution of 75% residential and 25% commercial, whereas the R-NM Neighborhood Mixed Use assumes a 50-50% split for mixed uses both vertically and horizontally. The residential capacity estimates accommodating 47,922 housing units at max buildable capacity and 35,507 net new housing units, exceeding the 12,112 net new housing unit target. This increase is due largely to Middle Housing policies consistent with HB 1110 which allow for Middle Housing in all residentially zoned areas. The R2 – Residential Low zone is found widely throughout the city. It is assumed that 32,889 housing units at max buildable capacity are located within a ½ mile walkshed of a major transit stop, including both Auburn Station and future (2025) RapidRide I-Line stops. This aligns with the comprehensive plan vision for encouraging dense residential development near transit facilities.

Table 3. Residential Capacity by Zone

Residential & Mixed-Use Zoning Districts	Zone category	Developable Acres	Net zoning changes (acres)	Assumed Density - DU/Acres	Residential Capacity (units)	Net New (Units)
King County						
Residential Conservancy (RC)	Low Density	745	0	1	745	-
R-1 Residential	Low Density	275	0	4	1,471	-
R2 – Residential Low	Moderate Density	294	1158	25	37,789	28,950
R3 – Residential Moderate	Moderate Density	0	22	30	660	660
R4 – Residential High	High Density	79	-1	50	3,890	-50
Neighborhood Mixed-Use (R-NM)	High Density Mixed-Use	0	89	30	2,670	2,670
Manufacture Home/Community (R-MHC)	Low Density	27	0	10	273	

DUC Downtown Urban Center - 125	High Density Mixed-Use	0	5	100	125	500
DUC Downtown Urban Center - 75	High Density Mixed-Use	0	5	95	119	475
DUC Downtown Urban Center - 55	High Density Mixed-Use	0	4	90	90	360
DUC Neighborhood Residential	High Density Mixed-Use	0	3	30	90	90
Total		1,420	1,285	-	47,422	35,310
Pierce County						
R2 – Residential Low	Moderate Density	20	20	**25**	500	500
Total		20	20	**-**	500	500
			Total New (2044) Housing Capacity		47,922	35,810

Goals and Policies

Goal 1: Healthy Homes and Neighborhoods

H-1 Recognize the important role of public improvements, facilities, and programs in providing a healthy home environment within the community.

H-2 Through integrated planning for land use, parks and recreation, transportation, housing, and jobs, support active living and healthy eating opportunities.

H-3 Promote safe and connected neighborhoods.

a. Continue to implement crime prevention programs such as neighborhood block watches.
b. Through the land use and building permit process, implement principles of crime prevention through environmental design.
c. Promote community volunteerism to increase the well-being and safety of residents.
d. Invest in transportation improvements that will create safe neighborhoods for walking, biking, and connecting to transit.

H-4 Promote housing that meets the needs of Auburn's workforce, is located near and designed to take advantage of affordable multimodal transportation options and contributes to a regional jobs–housing balance.

H-5 Improve streetscapes in developed neighborhoods. Continue to repair and/or replace deteriorated sidewalks and remove barriers to pedestrian traffic.

H-6 Seek and provide assistance for the reduction of lead-based paint hazards and measures to remove mold, improve energy conservation and provide for healthy indoor air quality.

H-7 Promote the City's neighborhood program. Connect residents to volunteer activities.

H-8 When evaluating proposed developments, apply site and building design standards, require quality streetscape, landscape, on-site recreational and open space, and low-impact development measures that will improve community character and environmental quality.

H-9 As neighborhoods change, work to eliminate the displacement of those who are under-served or under-represented.

H-10 Promote housing stability for the most vulnerable residents.

How can Auburn plan for Active Living and Healthy Eating?

- *Provide for a complete community with a variety of work, shopping, recreation, health and education, and home environments.*
- *Implement a connected nonmotorized trail and park system with neighborhood gathering spaces. Work with transit providers to connect neighborhoods to commercial and social services.*
- *Facilitate access to regional transportation and job centers in and near Auburn.*
- *Support art projects and cultural events to provide opportunities to build a sense of community investment, improve aesthetics, bring people together cross-culturally, and involve neighborhood youth. Support community gardens to improve access to healthy food and to build community relationships.*

Goal 2: Support Housing Growth

H-11 Provide a land use plan and zoning that offers opportunities to achieve a variety of housing styles and densities for private and nonprofit housing providers.

H-12 Support development of a variety of housing choices by allowing Middle Housing types in residential zones including townhomes, duplexes, triplexes, fourplexes, fiveplexes, sixplexes, cottage housing, courtyard apartments, and accessory dwelling units.

H-13 Provide dense housing choices downtown and other areas identified in the Comprehensive Plan where infrastructure is more available or can be improved with regional and local funds.

H-14 Encourage residential development downtown, particularly housing that is integrated with commercial development.

H-15 Allow accessory dwelling units as an affordable housing strategy and Middle Housing option.

H-16 Promote greater opportunities for home ownership for all incomes and ethnicities in the community through development of middle housing options and fee-simple development.

H-17 Implement incentives for developing underutilized parcels into new uses that allow them to function as pedestrian-oriented mixed-use neighborhoods. Existing uses that are complementary, economical, and physically viable shall integrate into the form and function of the neighborhood.

H-18 Use innovative zoning provisions to encourage infill development of underutilized parcels in zones that have been identified in the Comprehensive Plan as areas where infill residential development should be encouraged. Certain development requirements for infill development may be relaxed, while requiring adherence to specific design requirements to ensure compatibility with the character of nearby existing residential structures.

H-19 Allow appropriately designed manufactured housing within Neighborhood Residential areas, consistent with state law and city code.

H-20 Allow manufactured housing parks, transitional housing, supportive housing, and multiplex housing in appropriately zoned areas.

H-21 Adopt incentives, strategies, actions and regulations to create and sustain neighborhoods that provide equitable access to parks and open space, safe pedestrian and bicycle networks, clean air, soil and water, healthy foods, high-quality education, affordable and high-quality transit options and jobs.

H-22 Prioritize affordable housing when surplusing publicly owned land or property to provide opportunities for increased affordable housing.

Goal 3: Maintenance and Preservation

H-23 Conserve Auburn's existing housing stock because it is the most affordable form of housing.

H-24 Inventory and map dilapidated properties.

H-25 Organize, educate and assist property managers and owners in the creation and preservation of safe neighborhoods.

a. Offer an owner–landlord training program to better market, manage and maintain residential rental property.
b. Encourage retention of professional management assistance.
c. Recognize and publicize well-maintained apartment properties, such as by awarding a "multifamily property of the year."
d. Advise landlords with problem buildings about the benefits of donating their property or selling it below market cost to a specially designated nonprofit organization.

H-26 Promote housing improvements by property owners and building managers. Seek available assistance for housing rehabilitation. Assistance will include the development of residential infrastructure and the rehabilitation of individual properties.

a. Find public and private sources of capital and offer low-interest loans for rehabilitation.
b. Continue to participate in the Emergency Home Repair Program and consider partnering with nongovernmental organizations to maximize funds.
c. Encourage green lending for improved energy conservation, indoor air quality, and other measures.
d. Help identify professional volunteers at educational or professional associations to plan redesign or architectural upgrades of the properties.
e. Support additional healthy housing and preservation strategies, such as property tax exemptions to preserve affordable housing opportunities and utilizing community health workers to offer property owners and residents the education and resources needed to maintain housing.

H-27 Evaluate and update codes applicable to housing and provide effective and appropriate enforcement.
a. Enforce city ordinances regarding abandoned properties.
b. Consider a multifamily inspection program.
c. Consider public identification of landlords who are found to be out of compliance for extended time periods and unwilling to take steps to ameliorate substandard conditions.
d. Consider a landlord compliance program where code enforcement penalties can be reduced if attending landlord training programs.
e. Work with park owners, managers, and park tenants to develop policies and regulations to preserve manufactured home parks and the affordable housing they offer.
f. Consider an Auburn Housing Authority.

H-28 Ensure that rental housing units comply with life and fire safety standards and provide a safe place for tenants to live, including renters with disabilities.

H-29 Promote the maintenance, energy efficiency, and weatherization of existing affordable housing stock.

Goal 4: Housing Attainability and Affordability

H-30 Promote affordable housing that meets changing demographic needs.

H-31 Promote housing stability for the most vulnerable residents.

H-32 Work in partnership with King and Pierce Counties and other cities to plan for and accommodate its allocated share of countywide future housing needs for moderate-, low-, very low-, and extremely low-income households as well as emergency housing and permanent supportive housing, including those with special needs and our veterans.
a. Focus Auburn's efforts toward the countywide and community need for low- and moderate-income housing on preserving existing

affordable housing with robust maintenance and repair programs, minimizing displacement impacts, and ensuring long-term affordability of existing housing.

b. Act as a County leader in the exploration and implementation of new funding mechanisms and strategies to develop housing affordable at 30% AMI and below across King County and throughout South King County.

H-33 Encourage and assist in the renovation of surplus public and commercial buildings and land into affordable housing. Additionally, explore opportunities to dedicate revenues from sales of publicly owned properties, including tax title sales, to affordable housing projects.

H-34 Seek, encourage, and assist nonprofit organizations in acquiring depreciated apartment units for the purpose of maintaining and ensuring their long-term affordability.

H-35 Review and streamline development standards and regulations to advance their public benefit, provide flexibility, and minimize additional costs to housing.

H-36 Promote compliance with federal and state fair housing laws. Support fair housing opportunities for all regardless race, color, national origin, religion, sex, familial status, or disability.

H-37 Explore the use of density bonuses, parking reductions, multifamily tax exemptions (MFTE), fee waivers and exemptions, and permit expediting to encourage the development of housing affordable at below-market rate.

H-38 Where practical, ensure that housing created or preserved using local public resources or by regulation benefits low-income households and retains its affordability over time.

H-39 Partner with Affordable Housing Providers – partner with local affordable housing providers and services who have additional knowledge and resources that are not available to the city.

H-40 Support existing programs that provide emergency rental assistance for families facing homelessness due to temporary economic hardship.

H-41 Engage with communities disproportionately impacted by housing challenges in developing, implementing and monitoring policies that reduce and undo harm to these communities. Prioritize the needs and solutions expressed by these disproportionately impacted communities for implementation.

H-42 Support the long-term preservation of income-restricted affordable housing with expiring affordability covenants through acquisition by acting as a facilitator between affordable housing groups interested in purchasing the property and property owners.

H-43 Explore opportunities to implement a Community Preference policy or a first right to return policy that prioritizes members of the community in new affordable housing developments.

Goal 5: Supportive Services

H-44 Encourage and support human and health service organizations that offer programs and facilities for people with special needs. Support programs in particular that help people to remain within the community, including those that are veterans, disabled, seniors, single-parent households, and the homeless.

H-45 Assist low-income people, who are displaced as a result of redevelopment, find affordable housing in accordance with state and federal laws and regulations.

H-46 Develop strategies that seek to preserve naturally occurring affordable housing at-risk of redevelopment and/or in deteriorating physical condition.

H-47 Continue to ensure that funding becomes available to support youth, veterans, and social services in Auburn.

H-48 Support seniors who wish to age in place in their homes, such as with home rehabilitation services, adult day health and Senior Center activities.

H-49 Provide opportunities for transitional housing assisted living and retirement communities.

H-50 Promote universal design principles to ensure housing is designed to be compatible with surrounding neighborhoods.

H-51 usable by all people regardless of age or abilities.

H-52 Provide empowering training for residents who want to participate in civic activities and who would like to improve their knowledge and skills around community leadership.

H-53 Provide information in multiple languages to Auburn's diverse communities regarding services offered by local and regional governmental, educational, employment, health, and other providers to improve residents' quality of life and to promote resident engagement and household economic independence.

H-54 Offer financial and homebuyer education to encourage household saving and budgeting to consider home ownership.

H-55 Provide information and resources that educate and guide low-income persons toward affordable housing opportunities. Develop materials in multiple languages.

H-56 Review proposals to site facilities providing new or expanded human services within the City to determine their potential impacts and whether they meet the needs of the Auburn community. Important caveats in the City's consideration will include the following:

a. While Auburn will willingly accept its regional share of facilities that provide residential services, or influence residential location decisions, Auburn will expect other communities to accept their share as well.

b. The funding of human service centers sited in Auburn that serve an area larger than Auburn would rely on an equitable regional source of funding.
c. The siting of all facilities shall be based on sound land use planning principles and should establish working relationships with affected neighborhoods.

Goal 6: Implementation and Monitoring

H-57 Partner with South King County jurisdictions in ongoing efforts to coordinate the human, educational, and housing needs of our diverse cultural communities, such as through the Road Map Project, interjurisdictional housing and human services forums, and other efforts.

H-58 Pursue partnerships with non-profits, housing authorities, SKHHP, and other organizations to preserve existing unregulated and naturally occurring affordable housing including through acquisition.

H-59 Work with other jurisdictions and health and social service organizations to implement a coordinated, regional approach to homelessness.

H-60 Support national, state and especially regional efforts to address the housing and human service needs of the region and the City.

H-61 Explore all available federal, state and local programs and private options for financing affordable housing, removing or reducing risk factors, and preserving safe neighborhoods.

H-62 Work in partnership with public and private housing providers, businesses, and other agencies in the provision of housing assistance to Auburn residents and business employees.

H-63 Support nonprofit organizations during all stages of siting and project planning and when applying for county, state, and federal funding.

H-64 Through the building permit process, inventory and track affordable housing opportunities within Auburn. Distribute affordable housing information to nonprofit agencies serving the homeless and low-income people.

H-65 Monitor housing supply, affordability, and diversity in Auburn and its contribution to the countywide and regional housing need.

H-66 Explore options to identify and monitor unregulated affordable housing for the purpose of long-term preservation particularly in urban centers, near transit, and/or where most redevelopment pressure is anticipated.

H-67 Review and amend, a minimum every 5 years, local housing policies and strategies.

H-68 Consider opportunities to evaluate potential displacement risk for naturally occurring affordable housing and vulnerable communities, especially those with historical and cultural ties to the community in daily work, and mitigate or review actions that significantly increase this risk.

Housing Objectives and Implementation

The City has developed housing objective implementation strategies addressing housing diversity, condition, attainability, and programs to serve special needs. The City will monitor the objectives over time.

Figure 5. Housing Objectives and Tools

Outcomes	Indicators	Example Tools
Improve housing quality	Increased quality of rental housing	• Housing rehabilitation and repair loans • Loans for energy conservation and healthy indoor air quality • City-sponsored and nonprofit property manager programs • Housing inspection program Code enforcement • Community volunteer program
Meet demand for new housing units	Land capacity to meet or exceed housing target	• Land use plan and zoning • Variety of housing options
Promote housing ownership	Maintain or increase homeownership rates	• Accessory dwelling units • Middle Housing • Unit-Lot Subdivision
Allow for a variety of housing types to meet size, age, and cultural trends	Increased numbers of middle housing units and apartment units with neighborhood recreation and service amenities Retention of housing stock with larger units	• Middle Housing on small and infill lots • Accessory dwelling units • Mixed-use zoning • Incentivize infill development
Increase opportunities for housing to extremely-low, very-low, low-, and moderate-income households	Increased numbers of ownership dwellings available to moderate incomes Increased mixed-use development for all incomes Increased preservation and improvement of rental housing with long-term affordability commitments	• Accessory dwelling units Downtown and Growth Center incentives for apartment and mixed-use • Infill incentives • Permit and impact fee waivers • See also “improve housing quality” above • Expansion of MFTE program outside of Downtown

Improved opportunities for special needs housing and services	Greater match of housing to special needs including housing for all ages and abilities as well as the homeless	• Community services programs • Partnerships with nonprofit housing providers and nongovernmental organizations
Monitor housing supply, affordability, and diversity	Address achievement of indicators above	• Monitor in conjunction with regular and annual Comprehensive Plan updates and new countywide planning policy housing targets

Introduction

This volume provides overall policy direction for the different capital facility plans and programs provided by the City. Capital facilities belonging to privately owned utilities (electricity, natural gas lines, etc.) and those that are city-operated (water, sewer, stormwater, etc.) are covered in the Utilities Element (Volume 4). Certain City plans and programs are further refined in other sections of this volume, such as Parks, Recreation, and Open Space, and Transportation. Overall, however, this volume acts as a reference for all of the City's various capital facility plans except for those found in other Elements, including the City of Auburn Six-Year Capital Facilities Plan (a key component of and adopted with this plan), comprehensive plans, capital improvement and investment programs, inventories, and studies that together represent the planning and financing mechanisms required to serve the capital facility needs of Auburn. For more details on a particular capital facility or the City's overall capital facility plan, see the most recently adopted version of the following:

- City of Auburn Airport Master Plan
- City of Auburn Capital Facilities Plan
- City of Auburn Comprehensive Water Plan
- City of Auburn Comprehensive Sewer Plan
- City of Auburn Comprehensive Stormwater Plan
- City of Auburn Parks and Recreation Master Plan
- City of Auburn Comprehensive Transportation Plan
- Auburn School District Capital Facilities Plan
- Kent School District Capital Facilities Plan
- Dieringer School District Capital Facilities Plan
- Federal Way School District Capital Facilities Plan
- Valley Regional Fire Authority (VRFA) Capital Facilities Plan

Vision

Capital facilities in Auburn are planned, designed, and constructed in a manner that adequately supports the future growth scenarios in the City's Land Use Element and that meets the needs of residents, visitors, and businesses. Sustainability is a principle that guides decisions about where facilities are placed, how they are constructed, how they are operated and maintained, and how all aspects of design, construction, and operation are funded.

Conditions and Trends

Growth: The provision and sizing of public facilities such as streets or waterlines and sewer lines can influence the rate or timing of development and is an important means of managing growth. Timed provision of facilities also ensures that new development can be assimilated into the existing community without serious disruptions or adverse impacts. This Plan establishes policies to allow development when and where all public facilities are adequate or can be made adequate, but only if such development can be adequately served by public facilities and services consistent with the adopted level-of-service standards.

A key provision of the Growth Management Act is concurrency. In general, concurrency seeks to ensure that development is permitted only if adequate public facilities are, or can be guaranteed to be, available to support new development. Concurrency requires that facilities needed to maintain a locally adopted level of service be provided "concurrently" with development. Concurrency places the finance function of local government in a much more prominent role in the land use development process. While the concept of concurrency is new to many jurisdictions, it has been used in Auburn since the adoption of its 1986 Comprehensive Plan.

The Act requires concurrency only for transportation facilities, though if a jurisdiction desires, concurrency can be applied to other public facilities as well. With respect to transportation facilities, concurrent is defined within the Act as being provided at the time of or within 6 years of development (this is done to coincide with the six-year time frame of most capital facilities plans). If the facility is not available at the time of development, the funding to construct the facility must be included in the six-year capital facilities plan.

Regardless of whether a local jurisdiction applies concurrency to public facilities beyond those for transportation, new development must be coordinated with the provision of capital facilities. This ensures that all relevant public facilities and services are planned and available to serve the demands of new growth.

Planning Approach

The Capital Facilities planning approach is to manage growth in a manner that enhances from community quality and values by actively coordinating land use type and intensity with City facility and service development and provision.

Values

Character: Public buildings and spaces incorporate high-quality building and landscape design so that they positively impact the surrounding built environment.

Wellness: Public spaces that are purchased and developed for capital facilities also incorporate features and infrastructure that provide more complete nonmotorized connections.

Service: City utilities and buildings are of high quality and complete, reliable, and available to residents and business owners.

Economy: City utilities are available or planned to be available to serve allowed commercial, recreational, and residential uses.

Celebration: Capital facility spaces will be available, designed, and programmed in a manner that promotes public gathering.

Environment: Development of capital facilities will place a premium on environmental preservation and protection.

Sustainability: Our philosophy of designing, constructing, and maintaining utilities and buildings embraces a long-term investment horizon rather than concepts that only provide short-term benefits and outcomes.

Concurrency and Levels of Service

Levels of Service

Level of Service (LOS) is a common measure used to determine the efficiency or effectiveness of services. For the City of Auburn, LOS targets serve as a means to assess the adequacy of public facilities in meeting the needs of the population for which it serves. The GMA requires that LOS be established for certain transportation facilities for the purposes of applying concurrency to development proposals. The State GMA guidelines recommend the adoption of LOS standards for other capital facilities to measure the provision of adequate public facilities.

Typically, measures of level of service are expressed as ratios of facility capacity to demand (i.e., actual or potential users). For example, in the case of park space, when there is an increase in population without a corresponding increase in park acreage, the LOS unit of measure (acres per 1,000 population) will decline, indicating a potential need to increase the total amount of park acreage to keep pace with population growth. On the other hand, a slight increase in population, coupled with a large increase in facilities, will result in an increased LOS. For example, facilities such as buildings or burial plots may be constructed or expanded to keep pace with anticipated population growth. While this will have the effect of increasing LOS in the short-term, in the longer-term, the LOS will gradually decline to the targeted level based on forecasted population. The impact of population growth to the LOS for facilities will vary depending on the type of facility and long-range planning by the City.

Concurrency

The GMA requires that jurisdictions have certain capital facilities in place or available within a specified time frame when development occurs. This concept is called concurrency. Under the GMA, concurrency is required for transportation

facilities and is recommended by the State for certain other public facilities, namely potable water and sanitary sewer.

Concurrency has a direct relationship to level of service. The importance of concurrency to capital facilities planning is that development may be denied if it reduces the level of service for a capital facility below the locally adopted minimum. The level of service is unique for each type of facility and is presented in the subsequent sections. Concurrency has a direct relationship to level of service. The importance of concurrency to capital facilities planning is that development may be denied if it reduces the level of service for a capital facility below the locally adopted minimum. The level of service is unique for each type of facility and is presented in the subsequent sections.

The need for capital facilities is largely determined by a community's adopted LOS standards and whether or not the community has formally designated capital facilities, other than transportation, as necessary for development to meet the concurrency test. The CFP itself is therefore largely influenced by the selection of the level of service standards. Level of service standards are measures of the quality of life in the City. The standards should be based on the City's vision of its future and its values.

Level of Service Standards and Needs

Based on the proposed six-year capital projects and the projected population increase of 4,585 (5.1%) between 2023 and 2028, the LOS for the following City-owned public facilities will change as follows:

The LOS for the following facilities will be increased as a result of population projections described in the Capital Facilities Plan (CFP), comparing the 2023 LOS to the projected 2028 LOS.

Capital Facility	LOS Units	2023 LOS	2028 LOS (Projected)
Cemetery	Burial Plots per 1,000 population	29.00	56.00
Community Parks	Acres per 1,000 population	2.62	2.95
Linear Parks	Acres per 1,000 population	0.18	0.21
Neighborhood Parks	Acres per 1,000 population	0.72	0.78

The LOS for the following facilities will be maintained as a result of the CFP.

Capital Facility	LOS Units	2023 LOS	2028 LOS (Projected)
Transportation	See Comprehensive Transportation Plan		
Airport	% of Air Operations Support	100%	100%
Storm Drainage	N/A	N/A	N/A
Water	Residential GPCPD[1]	182.00	181.00

1 – GPCPD = Gallons per Customer per Day, or the equivalent of water used by a single-family residential unit per day.

The LOS for the following facilities will be decreased as a result of the CFP, comparing the 2023 LOS to the projected 2028 LOS.

Capital Facility	LOS Units	2023 LOS	2028 LOS (Projected)
General Municipal Buildings	Square Feet per 1,000 population	3,290.44	3,173.11
Open Space	Acres per 1,000 population	4.25	4.10
Senior Center	Square Feet per 1,000 population	135.70	129.12
Special Use Areas	Acres per 1,000 population	2.83	2.69

Other Level of Service metrics and thresholds related to specific capital facilities are located in the sections below.

Capital Facilities and Services

Municipal Facilities

The current inventory of City government administration and operations facilities include 207,629 square feet for general government operations, 66,469 square feet for police services, and 21,726 square feet for fire protection, for a total of 295,824 square feet. The table below lists the facilities along with their current capacity and location.

Community Facilities

Facilities Inventory

Facility Name	Location	Size
Community Center	910 9th St SE	19,804 sq ft
Senior Center	808 9th St SE	11,667 sq ft
Cemetery	2020 Mountain View Dr	4,011 sq ft (out buildings not included)
Golf Course	29630 Green River Rd	14,114 sq ft (out buildings not included)
Postmark Center for the Arts	20 Auburn Ave	8,744 sq ft
GSA	2905 C St SW	11,837 sq ft
4910 A Street	4910 A Street	5,920 sq ft
City Hall	25 W Main St	57, 316 sq ft
City Hall Annex	1 E Main St	47,000 sq ft
Justice Center	340 E Main St	36,000 sq ft
Maintenance & Operations	1305 C St SW	18,232 sq ft (out buildings not included)

Parks Maintenance	1403 C St SW	6,094 sq ft (out buildings not included)
Les Gove MPP Building	1040 Deal's Way	1,262 sq ft (out buildings not included)
R Street Building	2840 Riverwalk Drive SE	4,798 sq ft (out buildings not included)
Warren Building	411 E Street NE	1,813 sq ft (out buildings not included)
Herr Storage	1140 Auburn Way S	3,600 sq ft
Auburn Ave Theatre (scheduled for demolition)	10 Auburn Ave	7,590 sq ft
Auburn valley Humane Society	4910 A Street SE	5,920 sq ft

Level of Service

The current LOS of 3,290 square feet per 1,000 population is based on the existing inventory divided by the 2023 citywide population of 89,904. The proposed LOS of 3,173 square feet per 1,000 population is based on the projected inventory divided by the 2028-projected citywide population of 94,489.

Future Plans

As of 2024, the City is in the process of designing and constructing a replacement for the Auburn Ave Theatre, which was damaged when the adjacent historic mixed-use building on E Main Stret was damaged beyond repair due to fire. The new theatre is anticipated to be an activity anchor in downtown with its central location.

Public Library Facilities

The City of Auburn is served by the King County Library System in 15,000 square foot Auburn Library building at 1102 Auburn Way S. The library opened in 2000 after moving first from the Carnegie Library building in downtown (constructed in 1914), then from another facility in Les Gove Park (constructed in 1964). The current building has continued to be renovated and expanded over the past 25 years, with the last construction completed in 2012. Detailed information regarding the King County Library System is available at www.kcls.org.

Police

Facility Inventory

Name	Location	Size
Auburn Justice Center (Police)	340 E Main St	16,000 sq ft
Evidence Building	340 E Main St	4,400 sq ft

The Auburn Police Department has a staff of the Chief, Assistant Chief, 5 Commanders, 13 Sergeants, 57 Patrol Officers, 20 Detectives, 5 Traffic Officers, and multiple supervisors, specialists, technicians, and other staff as of 2023.

Police services are centered around the Auburn Justice Center that serves the entire City and supports the required staff, the majority of who are assigned to the patrol division. In 2004, the police department took occupancy of a portion of the Justice Center, primarily in the basement, with the Court located on the primary level. The police portion occupies just over 16,000 square feet. Currently the police facility houses 118 sworn police officers in addition to 22 civilian staff. Police headquarters provides both designated and temporary workspace, meeting rooms, common areas, locker rooms, storage space, utility space, electrical and utility space, and records storage space. A separate evidence building at the same site houses evidence storage, general equipment storage, and records archives. Additionally, the department maintains temporary evidence storage in the basement of city hall, utilizing approximately 200 square feet of space.

A facility needs assessment was completed in 2020 and was incorporated in the 2020 Facilities Master Plan.

Known Capacity Issues

Police facilities lack adequate space to support current staff and operations, and future growth.

- Suboptimal climate control, especially on ground floor as HVAC zone configuration does not align with current space configuration due to renovations.
- Facility too small to accommodate both Court and Police in long-term.
- Severely space-constrained, especially for Police, which grew 40% between 2004 and 2019.
- Undersized public lobby and soft interview space.
- Limited meeting/briefing space for all meeting types, including large groups, confidential discussions, and interviews.

Police office space is primarily in basement areas that have limited natural light.

- Defensive tactics and classroom training occur in a room with irregular column placement which impedes sightlines, creates barriers for physical training, and complicates furniture/mat reconfiguration.
- Evidence building is at capacity.
- Undersized parking; unsecured parking for marked vehicles.

Future Plans

A property located near the intersection of Auburn Way Sout & 12th Street Southeast has been acquired by the City. 2023-2024 budget allocated funding for facility planning at new location. Other than planning, there is no funding allocated for this project.

Fire Protection

The Valley Regional Fire Authority (VRFA) provides critical fire and life safety services to the approximately 97,000 citizens residing in the 37 square miles of Algona, Auburn, and Pacific. Oversight of the VRFA is provided by a nine-member Governance Board consisting of the Mayor and two council members from each participating city. Twenty personnel respond from five fire stations. These stations are staffed 24 hours a day, seven days a week, by four shifts. A battalion chief oversees each shift, and a deputy chief manages the entire division.

The Auburn Fire Department was formed over a century ago as a result of a devastating fire in August of 1890. The fire destroyed an entire city block of businesses in what was then known as the town of Slaughter. The original department, consisting of volunteer firefighters and a hand-drawn hose cart, was first named the Auburn Bucket Brigade. The name changed to the Auburn Volunteer Fire Department in 1908. On January 1, 2007, as a result of a voter-approved measure, the Auburn Fire Department combined with the Pacific Fire Department and the City of Algona to form the Valley Regional Fire Authority, which provides fire and EMS services to all three cities.

In an emergency, every second counts. The VRFA has established a Total Response Time (TRT) benchmark of seven minutes and 34 seconds (7:34) for EMS Calls and seven minutes and 49 seconds (7:49) for fire calls. TRT is the time it takes a unit to arrive at a scene once the call is received at the Fire Alarm Center. In 2022, we achieved those benchmarks 51% of the time for fire response and 57% for EMS response.

The VRFA's Capital Facilities Plan (CFP), which was adopted by the Board of Governance in 2021, made four recommendations:

- Priority 1: build an additional station in the northern part of VRFA's service area
- Priority 2: relocate and rebuild Station 38 in Pacific
- Priority 3: remodel or replace Station 31
- Priority 4: find a permanent location for Support Services

In 2022, the VRFA took several significant steps to implement the CFP, including:

- Purchasing property on 30th and I Street Northeast for a new north end fire station. Evaluating property on the Ellingson corridor in Pacific in order to relocate Station 38.
- Contracting with the leading architectural firm TCA to consult on land acquisition and complete preliminary design concepts on each element of the CFP.
- Initiating a discussion on the best way to fund these critical projects.

In 2022, 45% of revenue was from Property Taxes, 34% from Fire Benefit Charges, and 21% from other sources such as grants and permit fees. Expenditures in 2022

include 52% for wages, 15% for capital projects, 19% for benefits and 14% for other services and supplies.

Valley Regional Fire Authority Capital Facility Plans, Annual Reports, and other documents can be found at www.vrfa.org.

Level of Service

The current LOS of 0.20 fire apparatus per 1,000 population is based on the existing inventory (18 fire apparatus) divided by the 2023 citywide population estimate of 89,904. The proposed LOS of 0.20 fire apparatus per 1,000 is based on the 2028-planned inventory (19 fire apparatus) divided by the 2028-projected citywide population of 94,489.

Parking

Facilities Inventory

Facility Name	Location	Capacity	Condition
Kiss-n-Ride Parking Lot	Parcel #7815700172	21 Non-Handicap spaces; 1 accessible space	Fair
11 A Street NW Parking Lot	11 A Street NW	47 Non-Handicap spaces; 2 accessible spaces	Poor
B Street Parking Lot	137 E Main Street	60 Non-Handicap spaces; 13 accessible spaces	Fair
Safeway Parking Lot	Parcel #7331400135	122 Non-Handicap spaces; 4 accessible spaces	Poor
D Street Parking Lot	350 E Main St	20 Non-Handicap spaces; 0 accessible spaces	Very Poor
JC Employee Parking Lot	20 D Street SE	55 Non-Handicap spaces; 1 accessible spaces	Fair

Future Plans

On April 1, 2024, the City of Auburn relinquished possession and use of 113 off-site parking stalls to Sound Transit. The 113 parking stalls were code required parking stalls tied to two office-condominiums owned by the City and utilized as office space by City employees. The City will need to replace these 113 parking stalls within the code required 1,000/ft radius of the office condominiums with which they serve. Funding for the parking replacement will come in whole or in part from the monetary amount awarded to the City by the arbitrator who presided over the arbitration hearing.

Replacement of the 113 parking stalls relinquished to Sound Transit will likely need to be accomplished by constructing a multi-story parking garage.

Cemeteries

The City owns two cemeteries. The Mountain View Cemetery is a fully developed facility (60 acres and five buildings) that provides burial services and related merchandise for the community. The Pioneer Cemetery is a historic cemetery that is no longer used for burial purposes.

Level of Service

The current LOS of 29 burial plots/niches and cremation in ground plots per 1,000 population is based on the existing inventory divided by the estimated 2023 citywide population. The proposed LOS of 56 burial and plots/niches and cremation in ground plots per 1,000 population is based on the projected inventory divided by the 2028-projected citywide population.

Parks and Recreation

The Parks, Recreation, and Open Space (PROS) Plan is needed to meet legal requirements and secure funding for the City's parks and recreation areas for the next six to ten years. Developed with public involvement, city staff, and several city commissions, this plan provides a summary of the city's parks, recreation programs, and open spaces, and gathers information on the community's recreational needs through surveys, outreach, and online tools. This Plan establishes a vision, goals, and assesses the current level of service provided by city parks and open spaces. The Capital Improvement Plan (CIP) and its formal approval adoption completes the PROS Plan suggesting a series of recommended improvements to better serve the citizens of Auburn for the next six years and beyond, each tied to potential grant funding sources, serving to guide the City's response and priorities to the desired quality of life envisioned from its citizens.

Facilities Inventory

Currently, the City manages a diverse range of parks and recreation assets, including 23 neighborhood, or local, parks, 14 community parks, 7 parcels of dedicated open space including a golf course, trail systems, and 16 special use facilities. More information on parks and recreation assets can be found in Appendix F – PROS Plan of the Comprehensive Plan

Facility Type	Quantity	Location	Existing Inventory (Total Acres)	LOS (2015) Acres/1,000 Res.	LOS (2024)	Future Facilities	Future Capital Projects
Community Parks	14	City-Wide	283.3	4.5	3.5	Jacobsen Tree Farm & 104th Ave SE Property	Jacobsen Master Plan, Ph. 1, Ph. 2 Sunset Park Ph. 2, Ph. 3 Game Farm Rec. Courts & Field Imps. Brannan Field Conversions
Neighbor Parks	10	City-Wide	51.23	1.32	1	Auburndale 2	

Open Spaces	6	City-Wide	321.42	As Acquired	4	Lakeland Nature Area	Lakeland Nature Area Parking & Access Imps., Interpretive Trail
Special Use Areas	14	City-Wide	307.69	As Identified	N/A		Golf Course Maint. Building & Les Gove Pavilion
Tot Lots	13	City-Wide	16.71	N/A	.25		
Trails	N/A	City-Wide	26.87 Miles	0.21	.25 miles		White River Trail Reconstruction

Level of Service (LOS)

A 10-minute walk is considered an important park access metric for several reasons. A 10-minute walk (approximately 1/2 mile on level ground) as a park access metric is important because it promotes physical activity, equity, sustainability, social interaction, and overall community well-being. It aligns with various health, environmental, and social goals the City has and should encourage staff and policymakers to prioritize accessible green spaces as a fundamental part of Auburn's development and the community's desired quality of life.

Future Plans

A Needs Analysis and Capital Improvement Program (CIP) project list can be found in Appendix F – PROS Plan of the Comprehensive Plan.

Transportation

Roadways: The City's street system consists of a network of approximately 249 miles of arterials, collectors, local streets and alleys. Existing nonmotorized facilities include a mix of trails, sidewalks, and both dedicated and shared bicycle facilities.

Signals and ITS: The City's transportation system also includes 95 traffic signals, a Traffic Control Center employing Intelligent Transportation Systems (ITS), which centrally directs the signals, 89 traffic cameras, and various traffic beacons all communicating on a network of copper wire and fiber optic cable. The City also has three roundabouts.

Transit: King County Metro Transit, Sound Transit and Pierce Transit serve the Auburn area. Auburn is currently served by six Metro, two Sound Transit, and one Pierce Transit bus route. In addition, Sound Transit "Sounder" commuter trains provide peak hour and midday service at the Auburn Station. The Sounder also provides special event service to selected sporting events. Park and Ride facilities and the Auburn Station support bus and rail service.

Facilities Inventory

Quantity	Description
249	Miles of Streets
17	Bridges
11,000	Street Signs
13,389	Feet of Guardrail
96	Traffic Signals
31	Rapid Rectangular Flashing Beacons
3.684	Street Lights - City Owned
2,261	Street Lights - PSE Owned
53	School Zone Flashing Beacons
19	Speed Radar Feedback Signs
89	Traffic Cameras
12	Speed Photo Enforcement Locations (School Zones)
4	Dynamic Message Signs
43.86	Miles of Fiber Optic Systems
2	Community Banner Locations
22.62	Miles of Class I Bikeways
1.29	Miles of Class II Bikeway with Buffer (Both Sides of Roadway)
15.95	Miles of Class II Bikeway (Both Sides of Roadway)
4.21	Miles of Class II Bikeway (Intermittent or 1 Side of Roadway)
2.60	Miles of Class III Bikeway with Pavement Markings
298.21	Miles of City Sidewalk

Level of Service

The City's Comprehensive Transportation Plan (CTP) establishes multimodal level of service standards for City streets, active transportation facilities, and access to transit service, and freight movement to provide guidance to evaluate the multimodal facilities, identify deficiencies, and prioritize projects to eventually reach a complete multimodal network that can support and promote mode shift, reducing the vehicle capacity demand on the roadways. The following policies relate to vehicle level of service which the City primarily utilizes to evaluate transportation system capacity. Other level of service standards are utilized for concurrency and planning but generally focus on the existing or absence of facilities and services and the quality of those facilities and services rather than their capacity.

- Policy TR6-1-1: The City adopts the following Vehicle Level of Service (LOS) Standards for the AM and PM peak periods per the Highway Capacity Manual:

- Signalized: The LOS standard for signalized intersections is “D”, with the following exceptions: for signalized intersections of two principal arterial roads the LOS standard is “E”.
- Stop Controlled: The LOS standard stop controlled intersections is “D”.
- Roundabout: The LOS standard for roundabout controlled intersections is “D” with a V/C ratio for each lane group of less than 0.90.
- Queuing: The LOS standard for intersection queuing is the 95th percentile queue shall not extend across an adjacent driveway, alley, or street intersection, except if the driveway, alley, or street intersection is within the functional intersection boundary of the queue in which case the queue may extend to the limit of the functional intersection boundary. Additionally, queuing for a designated turn lane shall not exceed turn lane storage area and cause a blockage of through lane(s).

Known Capacity Issues

The City utilizes the vehicle intersection delay level of service standard to evaluate general transportation system capacity for concurrency. Of the 157 intersections evaluated with the CTP, the following 11 (or 8%) were operating below the City’s adopted level of service standard under existing conditions:

- Auburn Way North & 45th Street NE
- 116th Avenue SE & SE 304th Street
- 46th Place S/44th Avenue S & S 321st Street/51st Avenue S
- 51st Avenue S & 316th Avenue
- Henry Road NE/Pike Street NE & 8th Street NE
- C Street SW & 3rd Street NW
- M Street SE & Auburn Way South
- Auburn Way South & 17th Street SE
- A Street SE & 44th Street SE
- Lakeland Hills Way SE & Oravetz Road SE
- R Street SE & 33rd Street SE

Initial modeling of future conditions (2044) added another 10 intersections to the list of intersections that would be operating below the City’s adopted level of service standard:

- Auburn Way N & 42nd Street NE
- I Street NE & 37th Street NE
- 30th Street NE & I Street NE
- 112th Avenue SE & SE 304th Street
- SE 304th Street & 118th Avenue SE
- 56th Avenue S & S 316th Avenue
- 15th Street NE & M Street NW

- A Street SE & 12th Street SE
- A Street SE & 21st Street SE
- A Street SE & Ellingson Road/41st Street SE

Transportation Project List

The Comprehensive Transportation Plan (CTP) includes projects and programs to address the vehicle level of service issues at intersections identified in the existing and future conditions. Those projects include new traffic signals, new roundabouts, modified lane configurations, new roadways, and other measures intended to reduce intersection vehicle delays. The CTP also includes projects, programs, and other actions intended to address to address level of service issues related to active transportation (bicycle and pedestrian), transit, and freight movement. Please refer to the CTP for lists and summaries of the projects, programs, and actions.

Public Utilities

The City of Auburn manages sanitary sewer, water, and storm drainage utilities as well as solid waste collection. The sanitary sewer and water utilities serve the City and several areas outside the City limits. The efficient provision of these services can play a significant role in managing the growth of the City as well as affecting the quality of life for residents of Auburn and the surrounding areas. Public utilities can serve the following goals:

- To protect the public health and safety by providing efficient and cost-effective water, sanitary sewer, storm drainage, and solid waste services to the community.
- Ensure that development will only occur if the urban services necessary to support such development will be available when it is developed.

Water

The City provided water service to over 15,000 service connections as of 2024. The City's water sources include the Coal Creek Springs and West Hill Springs watersheds and are supplemented by a system of ten wells (6 active) and two connections to the regional water system operated by Tacoma Public Utilities. Storage facilities are found on the Enumclaw plateau, at Lakeland Hills, and at Lea Hill. For more background information, see the Comprehensive Water Plan.

Facilities Inventory

- Approximately 306 miles of Water Main
- Over 15,000 Service Connections
- 8 Pump Stations
- 8 Reservoirs
- 1 Satellite Water System
- 6 Active Wells
- 2 Springs

Levels of Service Standards

The System Policies included in Appendix A of the Comprehensive Water Plan and provide direction for City Staff in the management of the utility. The City of Auburn (City) manages the water utility in accordance with established water system policies that govern various facets of utility operations. City policies are established by the City to provide a vision or mission of the water utility and to provide a framework for the design, operation, and ongoing wellbeing of the City's water utility.

The policies included in Appendix A of the Comprehensive Water Plan are developed specifically for the City's multi-source municipal water system and seek to provide consistent treatment to all utility customers and to provide documentation to current water-system customers as well as those considering service from the City.

The City's Comprehensive Water Plan is based upon the following mission statement for the water utility:

"The City will provide for the efficient, environmentally sound and safe management of the existing and future water system within Auburn's service area."

The City's Water utility policies are grouped within goal statements that are headlined under the following categories:

- Business Practices
- Service Area
- Operations and Maintenance
- Financial
- Planning
- Environmental Stewardship
- Design and Construction

A few examples of policies related to level of service standards provided by the water system include:

- Policy 5.3 - System-Wide Reliability
  The City shall invest the resources necessary to construct, maintain, and renew water-system infrastructure and equipment to ensure that customers are provided consistent, reliable service in accordance with WAC 246-290-420 Reliability and Emergency Response. Wherever possible, the City should anticipate system interruptions and design and operate the system to minimize the impact of such interruptions to customers.

- Policy 5.8 - Water Supply Planning

The City's objective is to ensure a continuous, safe water supply to meet firm customer demands. Provision of water service must be consistent with the goals, objectives, and policies of the City of Auburn Comprehensive Water Plan. Effects of past water conservation will be considered when projecting future water needs. Future water demands will be estimated using existing water usage patterns and projected future populations developed by the City's comprehensive Plan and consistent with the Puget Sound Regional Council data.

- Policy 5.10 - Service Pressure
  The City should provide potable water to customers in sufficient quantity to meet maximum day demands at a pressure that meets or exceeds all minimum applicable regulations, except during emergency conditions. Property owners may install private booster pumps to achieve higher pressures under supervision of the City and in accordance with WAC 246-290-230 Distribution Systems.

Known Capacity Issues (based on Level of Service or other standards)

The preparation of the Comprehensive Water Plan included hydraulic modeling for existing and future conditions. Issues derived from the modeling with respect to pipeline improvements needed to meet fire flow conditions were ranked, with those locations ranked higher given more priority to be completed. The projects are anticipated to be completed under the Repair and Replacement program identified in Chapter 7 of the Comprehensive Water Plan. In addition, other known capacity issues with respect to water facilities and sources, include:

- Lea Hill Intertie Booster Pump Station - the Intertie Booster Pump Station (serves the Lea Hill 648 pressure zone) has a pumping capacity deficit, and the Pump Station lacks emergency power, impacting water supply during power outages.
- Lea Hill Service Area Storage - There is a reservoir/storage capacity shortage of 0.54 MG for the Lea Hill service area.
- Valley Service Area Storage - There is a reservoir/storage capacity shortage of 1.28 MG in the Valley service area.
- Wells 3A/3B - are offline due to high manganese levels.
- Wells 7 - is offline due to high manganese levels.
- Coal Creek Springs - is underutilizing its water right, leading to inefficiency.
- Well 5 - needs upgrades and property acquisition for expansion.
- Well 4 - requires facility and electrical improvements for efficient operation.
- Well 1 and Well 4 - Liquid chlorine degradation at the facilities affect water treatment during low winter demand periods.
- West Hill Springs - Aging chlorination building.
- Lea Hill Pump Station – pump station lacks redundancy.

- Game Farm Wilderness Park - pumps need replacement and building repairs.
- Reservoir 2 - Limited maintenance access to Reservoir 2 valves and lack of earthquake resiliency.
- Coal Creek Springs Transmission Main- 100+ year old pipe that needs to be replaced and is susceptible to leaks.
- West Hill Springs - Poor condition of existing cast iron transmission main.
- Howard Road Corrosion Control Treatment Facility (CCTF) - will exceed capacity after Coal Creek Springs Rehabilitation project completion.
- Howard Road Corrosion Control Treatment Facility (CCTF) - Existing liquid chlorine generating equipment reaching the end of its useful life at Fulmer CCTF.

Stormwater

The System consists of a combination of open ditches, closed conveyance pipes, water quality facilities, and pump stations. For more details, see the Comprehensive Storm Drainage Plan.

Facilities Inventory

- Over 240 miles of storm drainage pipe
- Over 40 miles of open channels and ditches
- Over 13,900 junction structures (catch basins, manholes)
- 167 detention ponds
- 7 pump stations.

Levels of Service Standards

The System Policies included in Chapter 3 of the Comprehensive Storm Drainage Plan provide direction for City Staff in the management of the utility. The following policies are specifically related to designed capacity level of service provided by the sewer conveyance system:

- Policy 1.1 -The City shall seek to manage stormwater runoff within the public Right of Way (ROW):
    - to provide access to and functionality of critical services.
    - to preserve mobility on major transportation routes (i.e., arterial roads) and residential roads.
    - to protect real property structures (e.g., residences and businesses.)
- Policy 1.2 - The City shall seek to provide pump redundancy and backup power generators or dual power feeds at City- owned and -operated drainage pump stations.
- Policy 1.3 - The City shall routinely assess the performance of pumped systems with a focus on capacity and vulnerability. This review aims to

ensure that these systems operate efficiently, meet their intended capacity, and remain resilient against potential risks.

Known Capacity Issues

The preparation of the Comprehensive Storm Drainage Plan included hydraulic modeling focused on updating models within locations of proposed capital projects. In addition, existing drainage problems have been observed by the staff and are known to cause flooding of roadways at the following locations:

- Auburn Way South/ SR 18 Underpass - minor roadway flooding causes disruptions to traffic during periods of certain intense rainfall events.
- I St NE between 33rd St NE and 35th St NE – minor flooding has been observed when the Green River flows are high, and the gravity discharge is impacted.
- There are areas within the city not served by the public storm system, such as paved alleys or residential streets where minor flooding is observed.

Future Plans

The 6-year capital improvements are discussed in detail in Chapter 7 and the implementation schedule presented in Chapter 8 of the Comprehensive Storm Drainage Plan.

Sewer

The system is primarily a collection system with treatment provided by Metro. The system includes approximately 205 miles of sewers and force mains and 17 sewer pump stations. Significant portions of the City's service area are currently on septic systems, although plans for future expansion of sewer service into these areas is included in the Comprehensive Sewer Plan. For more details, see the Comprehensive Sewer Plan.

Facilities Inventory

Sewer facilities in the City currently consist of:

- 205 miles of gravity sanitary sewer main
- 17 sewer pump stations
- 5 miles of force main associated with pump stations
- 3 siphons (1 single pipe, and one double pipe under the Green River
- 2,700 sewer service connections

Level of Service Standards

The System Policies included in Chapter 2 of the Comprehensive Sewer Plan provide direction for City Staff in the management of the utility. The following policies are specifically related to designed capacity level of service provided by the sewer conveyance system:

Policy 3.3 - Require the transport of sewage by gravity whenever feasible in order to increase reliability, sustainability, and long-term cost effectiveness.

Policy 4.5 - Size the sewer collection system for peak wet weather flow rates that include I/I flows. Gravity sewers will be sized to convey the once-per-20-year peak hour flow without surcharging.

Policy 4.6 - Size pump stations and force mains for peak wet weather flow rates that include I/I flows. Pump stations will be sized to convey the once per 5-year flow with one pump out of service and convey the once per 20-year flow with all pumps in service.

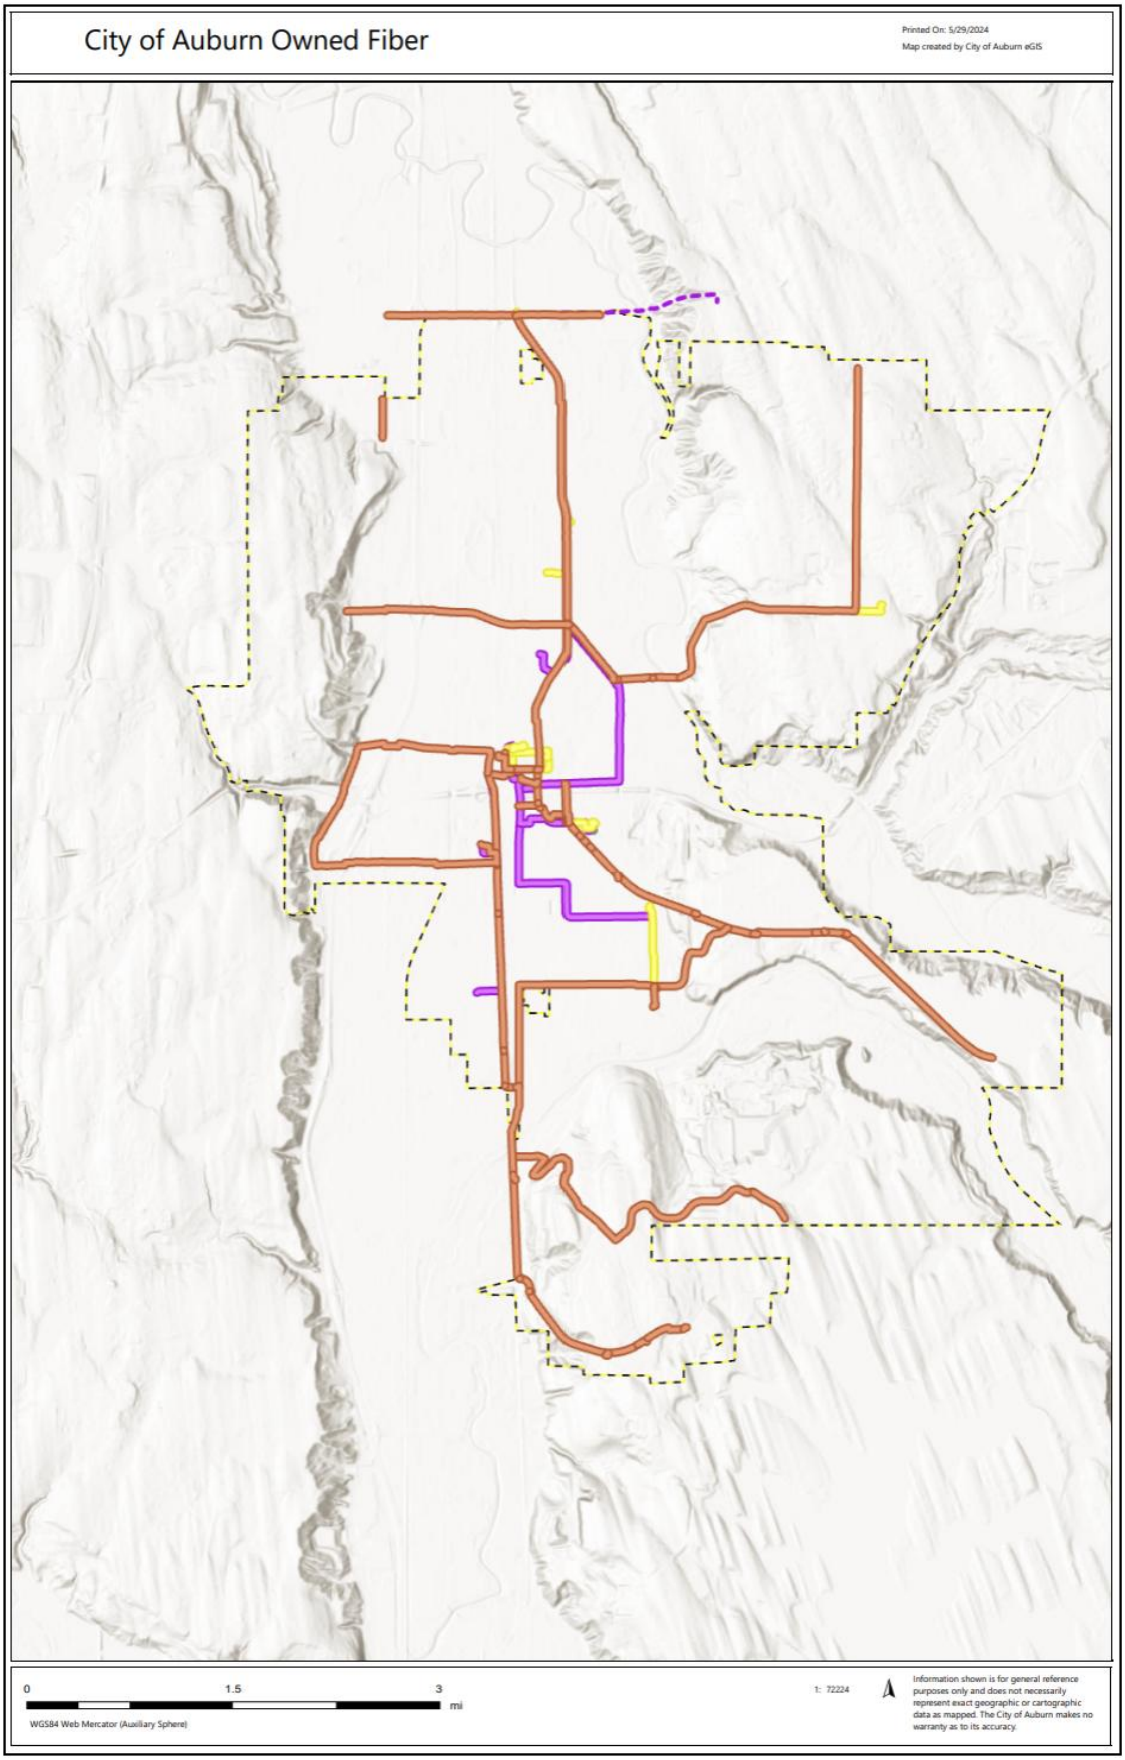
Known Capacity Issues

The preparation of the Comprehensive Sewer Plan included hydraulic modeling for three scenarios. The first used existing system wastewater flows and applied the expected additional flow during a design storm (with a 20-year recurrence). The second was to escalate wastewater base flows based on population and employment projections for the year 2044, and the last was to increase the intensity and duration of the design storm based on anticipated rainfall changes associated with climate change.

- The existing system is shown to have few deficient pipes, none of which cause overflows.
- For future scenarios (2044-both including and not including climate change effects) show the following deficiencies:
    - The Rainier Ridge Pump Station's capacity is anticipated to be under capacity; however, a project is currently underway to replace that station in 2025.
    - The Dogwood Pump Station is anticipated to be under capacity in 2044.
    - Approximately 4,000 feet of gravity sewer in Roegner Park is expected to be under capacity in 2044.
    - Individual pipe segments upstream of each of the Green River crossings are expected to be under capacity at various times throughout the 20-year planning period. The precise timing is dependent on the rate and distribution of population and employment growth.

Future Plans

Conceptual plans for future sewer extensions and facilities are shown on Figure 5.5 of the Comprehensive Sewer Plan. Those extensions are to be funded by the property owners of the parcels served by them, so the timing of their construction is unknown. The Capital Improvement Plan is described in detail in Chapter 7 of the Comprehensive Sewer Plan. The Plan includes projects related to system capacity, repair and replacement, and system evaluation.



Solid Waste

The City of Auburn contracts with Waste Management (WM) for collection of municipal garbage, recycling, and yard waste. Waste Management disposes of Auburn's garbage at a King County Solid Waste transfer station. Recycling is processed at WM's material recycling facility in Tacoma, WA. WM takes the yard and food waste to either DTG in Tacoma, WA or Cedar Grove in Maple Valley, WA to be converted into compost. There is a small area of Auburn that was recently annexed. This area is serviced by Republic Services. Republic Services takes the garbage to a King County Solid Waste transfer station, the recycling is processed at their material recycling center in Seattle, WA, and yard and food waste is taken to Cedar Grove in Maple Valley, WA.

Telecommunications

The City of Auburn owns and maintains a robust fiber optic Metropolitan Area Network (MAN) that connects most City owned building facilities and traffic signals throughout the Auburn area. This infrastructure delivers secure, high-speed broadband capabilities essential for supporting various government functions, including public safety, public works, planning, permitting, and tourism.

Additionally, our fiber optic network enhances city operations by facilitating interconnections with regional partners and service providers such as City of Algona, City of Pacific, King County, The Community Connectivity Consortium, University of Washington, Valley Communications and Microsoft.

Information shown is for general reference purposes only and does not necessarily represent exact geographic or cartographic data as mapped. The City of Auburn makes no warranty as to its accuracy.

Public Education Facilities

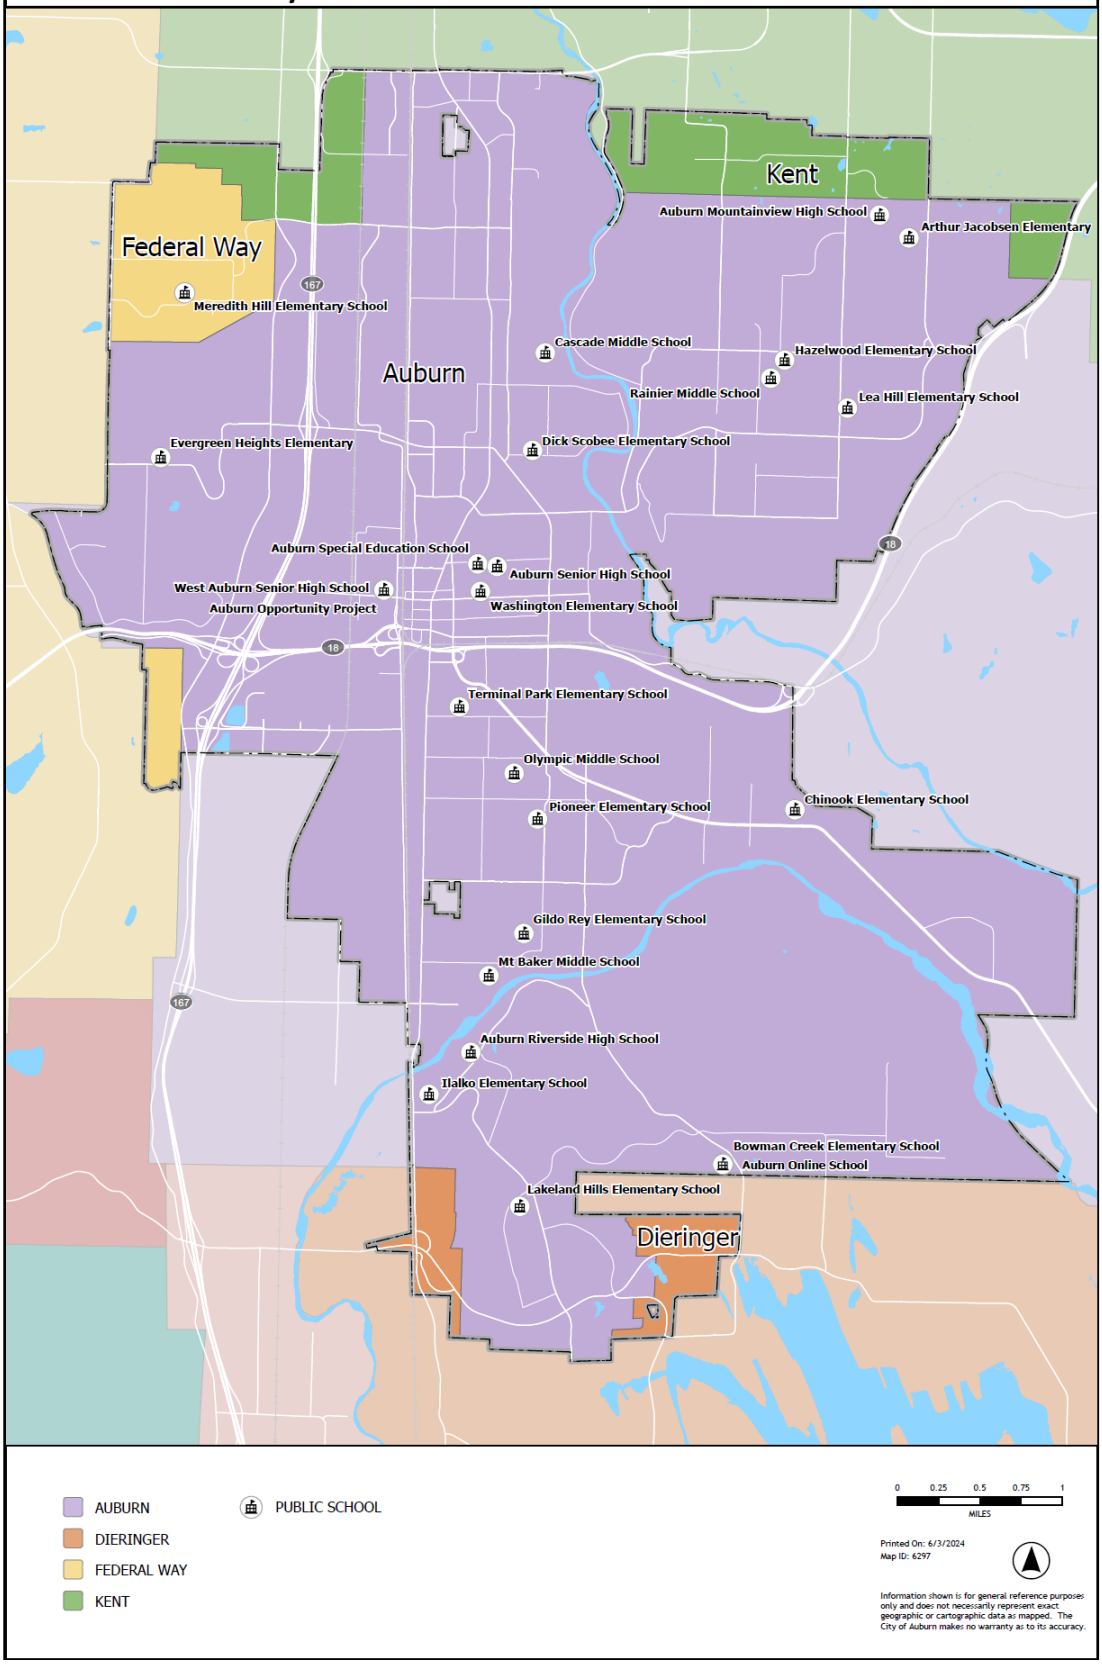
Auburn's residential areas are served by a combination of Auburn School District, Dieringer School District, Federal Way Public Schools, and Kent School District. Detailed inventories of school district capital facilities and levels-of-service are contained in the Capital Facilities Plan (CFP) of each school district. The CFPs of the four school districts serving Auburn residential areas and the associated school impact fees are adopted annually as part of the Annual Comprehensive Plan amendment process. Locations of schools and school districts within the City of Auburn which are illustrated in the map below.

Future Plans

To accommodate projected growth, the school districts have noted the following projects in their 2023 Capital Facilities Plans:

Auburn School District

- Portable Relocation – Opens 2023-2024
- Middle School #5 – Opens 2027-2028



Dieringer School District

- Elementary School #3 – Opens 2027
- North Tapps Middle School Classroom Addition – Opens 2027

Federal Way Public Schools

- Illahee Middle School Modernization and Expansion – Opens 2024
- Former DeVry/ES 24 Site Acquisition – Opens 2028
- Portables Expansion – Through 2030

City of Auburn School Districts

Goals and Policies

Goal # 1 - Keeping Pace with Growth

Ensure that new development does not outpace the City's ability to provide and maintain adequate public facilities and services, by allowing new development to occur only when and where adequate facilities exist or will be provided, and by encouraging development types and locations that can support the public services they require.

Policies:

CF-1. Lands designated for urban growth by this Plan shall have public facilities (streets, sewer, water, storm drainage, and parks) that meet City standards prior to or concurrent with development.

CF-2. Encourage development where new public facilities can be provided in an efficient manner.

CF-3. If adequate facilities are currently unavailable and public funds are not committed to provide such facilities, developers must provide such facilities at their own expense to develop their proposed projects.

CF-4. The City shall encourage and approve development only where adequate public services including police protection, fire and emergency medical services, education, parks and other recreational facilities, solid waste collection, drinking water, storm drainage, roadway and nonmotorized and other governmental services are available or will be made available at acceptable levels of service prior to project occupancy or use.

CF-5. Provide additional public facility capacity when existing facilities are used to their maximum level of efficiency (consistent with adopted standards for level of service).

CF-6. Encourage development where new public facilities can be provided in an efficient manner.

CF-7. Public facilities shall be provided in accord with the guidance of the Capital Facilities Plan or, as may be appropriate a system plan for each type of facility designed to serve at an adequate level of service the locations and intensities of uses specified in this Comprehensive Plan.

CF-8. New development shall not be approved that is not supported by a minimum of facilities to support the development and that does not provide for its proportionate share of related system needs.

CF-9. The city will perform its activities and make capital budget decisions in conformity with the comprehensive plan. The Land Use Element of the

comprehensive plan shall be reassessed if probable funding falls short of meeting existing needs.

CF-10. Establish land use patterns that optimize the use of public facilities.

CF-11. Exempt the following from the concurrency management program:

- Development vested by RCW 19.27.095, 58.17.033 or 58.17.170.
- Development that creates no added impact on public facilities.
- Expansions of existing development that were disclosed and tested for concurrency as part of the original application.

Goal # 2 – Public Facilities and Funding

Provide needed public facilities that are within the ability of the City to fund or within the City's authority to require others to provide.

Policies:

CF-12. Establish level of service standards that are achievable with the financing plan of this Capital Facilities Plan.

CF-13. Base the financing plan for public facilities on realistic estimates of current local revenues and external revenues that are reasonably anticipated to be received by the City.

CF-14. Match revenue sources to capital projects based on sound fiscal policies.

- The City shall continue to fund utility costs through utility enterprise funds, based on user fees and grants. Public facilities included in utilities are sewer, solid waste, storm drainage, and water.
- Where feasible pursue joint venture facility construction, construction timing, and other facility coordination measures for City provided facilities, as well as with school districts and other potential partners in developing public facilities.
- The City shall continue to assist through direct participation, LIDs and payback agreements, where appropriate and financially feasible. Where funding is available, the City may participate in developer-initiated facility extensions or improvements, but only to the extent that the improvements benefit the broader public interest and are consistent with the policies of this Capital Facilities Plan.

CF-15. If the projected funding is inadequate to finance needed public facilities and utilities based on adopted level of service standards and forecasted growth, the City will do one or more of the following to achieve a balance between available revenue and needed public facilities:

- Lower the level of service standards;
- Increase the amount of revenue from existing sources;
- Adopt new sources of revenue;

- Require developers to provide such facilities at their own expense; and/or
- Amend the Land Use Element to reduce the need for additional public facilities.

CF-16. Both existing and future development will pay for the costs of needed capital improvements.

- Ensure that existing development pays for capital improvements that reduce or eliminate existing deficiencies and pays for some or all of the cost to replace obsolete or worn-out facilities. Existing development may also pay a portion of the cost of capital improvements needed by future development. Existing development's payments may take the form of user fees, charges for services, special assessments, and taxes.
- Ensure that future development pays a proportionate share of the cost of new facilities that it requires. Future development may also pay a portion of the cost to replace obsolete or worn-out facilities. Future development's payments may take the form of voluntary contributions for the benefit of any public facility, impact fees, mitigation payments, capacity fees, dedications of land, provision of public facilities, and future payments of user's fees, charges for services, special assessments, and taxes.

CF-17. The City will determine the priority of public facility capital improvements using the following criteria as general guidelines. Any revenue source that cannot be used for the highest priority will be used beginning with the highest priority for which the revenue can legally be expended.

- Projects that eliminate hazardous conditions.
- Refurbishment of existing facilities that contribute to achieving or maintaining standards for adopted level of service.
- New or expanded facilities that reduce or eliminate deficiencies in level of service for existing demand.
- New or expanded facilities that provide the adopted level of service for new development and redevelopment during the next six fiscal years.
- Capital improvements that significantly reduce the operating cost of providing a service or facility, or otherwise mitigate impacts of public facilities on future operating budgets.
- Capital improvements that contribute to stabilizing and developing the economy of the City.
- Project priorities may also involve additional criteria that are unique to each type of public facility, as described in other elements of this Comprehensive Plan.

CF-18. Ensure that the ongoing operating and maintenance costs of a capital facility are financially feasible prior to constructing the facility.

Goal # 3 – Public and Environmental Health

Protect public health, environmental quality, and neighborhood stability and viability through the appropriate design and installation of public facilities.

Policies:

CF-19. Promote conservation of energy, water and other natural resources in the location and design of public facilities.

CF-20. Require the separation of sanitary and storm sewer facilities wherever combined sewers may be discovered.

CF-21. Practice efficient and environmentally responsible maintenance and operating procedures.

CF-22. The siting, design, construction and improvement of all public buildings shall be done in full compliance with the Americans with Disabilities Act (ADA).

CF-23. Promote economic and community stability and growth through strategic investments in public facilities and public/private partnerships.

Goal # 4 – Community Benefits of Public Facilities

Provide public facilities that provide a sense of community that is inclusive of diverse populations.

Policies:

CF-24. Contribute to community pride and foster a sense of community through provision of public facilities that create a community-gathering place for neighbors, family and friends.

CF-25. Through provision of public facilities, offer a broad range of activities promoting social interactions especially with new residents.

CF-26. Provide maximum flexibility and multiple uses through design of public facilities that are adaptable to changing interests.

CF-27. Provide a community center facility that is financially feasible, affordable for participants, and can generate revenue to offset a portion of the operating costs.

Goal # 5 – Consistency with Other Adopted Plans

Make the Capital Facilities Plan consistent with other elements of the comprehensive plan, and with other city, county, regional and state adopted plans.

Policies:

CF-28. Ensure that the growth and development assumptions used in the Capital Facilities Plan are consistent with similar assumptions in other elements of the comprehensive plan.

CF-29. Coordinate with non-city providers of public facilities on a joint program for maintaining applicable level of service standards, concurrency requirements, funding, and construction of public facilities.

Goal #6 - Public and Institutional Buildings

To site public and institutional buildings in accord with their service function and the needs of the members of the public served by the facility.

Policies:

CF-30. All "people-oriented" City facilities should be located near high-amenity sites. Les Grove Park and downtown are particularly appropriate sites for senior services, community centers, libraries, museums, etc.

CF-31. City park buildings should be developed in accordance with the Parks, Recreation, and Open Space Element.

CF-32. Public and institutional facilities should incorporate practices that reduce energy consumption, reduce the emission of greenhouse gases, conserve water, provide electric vehicle infrastructure, and preserve native vegetation.

CF-33. Public and institutional facilities that attract a large number of visitors (City Hall, museums, libraries, educational facilities, permit and license offices, health and similar facilities, etc.) should be sited in areas that are accessible (within 1/4 mile) by transit.

CF-34. The City shall encourage other agencies to follow these siting principles in considering new sites for public buildings.

CF-35. The location of religious institutions, private schools, community centers, parks and similar public or institutional facilities shall be related to the size of the facility and the area served. Citywide facilities should be sited in visible and accessible locations.

CF-36. Small public or institutional facilities intended to serve one or two residential neighborhoods may be located within a neighborhood. Larger public or institutional facilities intended to serve mainly Auburn residents or businesses shall be located along major arterial roads within the community-serving area of Auburn; however, elementary schools should be given flexibility to locate along smaller roads. Buffering from adjacent land uses may be required.

CF-37. The location of utility facilities is often dependent upon the physical requirements of the utility system. Sewage lift stations, pump stations, water

reservoirs, and other similar facilities should be sited, designed, and buffered (through extensive screening and/or landscaping) to fit in harmoniously with their surroundings. When sited within or adjacent to residential areas, special attention should be given to minimizing noise, light, and glare impacts.

CF-38. Public facilities of an industrial or heavy commercial character should be confined to the region-serving area of Auburn, unless no other reasonable siting opportunity exists, in which case siting still must comply with applicable zoning standards. Examples of such facilities are the City maintenance and operations facility, state and regional solid waste facilities, and the Auburn School District bus barn.

CF-39. The siting and relocation of City maintenance and operation facilities shall be responsive to growing demands for utility, transportation, and fleet services, and shall also account for the City's role in emergency preparedness and response.

Goal # 7 - Essential Public Facilities

Essential public facilities include those facilities that are typically difficult to site such as airports, state education facilities, state or regional transportation facilities as defined in RCW 47.06.140, state and local correctional facilities, solid waste handling facilities, and in-patient facilities including substance abuse facilities, mental health facilities, group homes, and secure community transition facilities as defined in RCW 71.09.020."

More generally, essential public facilities are facilities, conveyances, or sites that meet the following definition: (1) the facility, conveyance or site is used to provide services to the public; (2) these services are delivered by government agencies, or private or nonprofit organizations that are under contract to or with substantial funding from government agencies, or by private firms or organizations subject to public service obligations; and (3) the facility or use of the site is necessary to adequately provide a public service.

The Growth Management Act requires that a local comprehensive plan include a process for siting essential public facilities. The Growth Management Act includes these provisions because siting certain public facilities has become difficult due to the impacts many of these facilities have on the adjacent community. Many factors contribute to this problem, including increased demand for facilities to serve a growing population, increased competition for land as the state becomes more urbanized, problems with siting processes, and judicial decisions that compel jurisdictions to provide certain facilities. By including a process for siting essential facilities in the Comprehensive Plan, deficiencies in the siting process can be minimized.

This section contains Auburn's process for siting essential public facilities. This is an interim process until development regulations are incorporated into city code.

When that process is developed, Auburn may modify these procedures to reflect the Council's recommendation.

Policies:

CF-40. Essential Public Facility Siting Process.

1. The City will review proposals through the process outlined in Policies 3 through 8 below, if the essential public facility largely serves a regional, countywide, statewide, or national need, and is included in a policy sense within an adopted state or regional plan that meets both of the following criteria:

a. The state or regional plan was developed through an appropriate public process (including at least one local public hearing) and has undergone a NEPA and/or SEPA review.

b. A clear policy statement supporting the type of facility proposed must be included. The plan should also include, in a policy sense, a set of siting guidelines to be used for such a facility. Such criteria may include but are not limited to the type and sufficiency of transportation access, colocation requirements, preferred adjacent land uses, on- or off-site security and/or mitigation, and required public facilities and services.

2. If the essential public facility largely serves a regional, countywide, statewide or national need and is not part of an adopted state or regional plan, the proponent will be required to request that the appropriate state or regional plan be amended to include the proposal meeting the criteria contained in Part 1 above. The proposal will also be reviewed following the process outlined in Parts 3 through 8.

Essential Public Facilities of a regional, countywide, statewide, or national nature:

3. Essential public facilities of a regional, countywide, statewide or national nature will be reviewed by the City through the special area plan process. The boundaries of the special area plan will be set at a scale directly related to the size and magnitude of the proposal. For facilities of regional, state, and national need, an alternative analysis will be performed, but will not be limited to, the guidelines described in Part 1 above. Auburn staff shall participate in the review process of Part 1 above, and use the data, analysis, and environmental documents prepared in that process to aid the City's special area plan review, if Auburn determines that those documents are adequate. If the facility requires other development permits, those approvals also shall be considered within the review process.

4. Impacts of the proposed essential public facility must be identified and an appropriate mitigation plan developed. Unless otherwise governed by state law, the financing strategy for the mitigation plan shall be structured so that the costs of the plan shall be allocated proportionally on a benefit basis using nonlocal sources of funding, although local sources of funding may also be used.

5. The special area plan process to be used for essential public facilities of a regional, countywide, statewide or national nature shall follow the City's Comprehensive Plan amendment process that includes multiple opportunities for public involvement.

6. An analysis of the facility's impact on City finances shall be undertaken. If the study shows that locating a facility in a community would result in a disproportionate financial burden on the City of Auburn, an agreement with the project's proponents must be executed to mitigate the adverse financial impact or the approval shall be denied.

Essential Public Facilities of primarily local nature:

7. If the essential public facility meets largely local needs (for example, in-patient facilities, including substance abuse facilities, mental health facilities and group homes), the facility shall be considered based upon Section 8 below.

All Essential Public Facilities:

8. The following criteria shall be used to evaluate all applications to site essential public facilities:

a. Whether there is a public need for the facility

b. The impact of the facility on the surrounding uses and environment, the City and the region

c. Whether the design of the facility or the operation of the facility can be conditioned, or the impacts mitigated, in a manner similar to those used in traditional private development, in order to make the facility compatible with the affected area and the environment

d. Whether a package of mitigating measures can be developed that would make siting the facility within the community more acceptable.

e. Whether the factors that make the facility difficult to site can be modified to increase the range of available sites or to minimize impacts on affected areas and the environment.

f. Whether the proposed essential public facility is consistent with the Auburn Comprehensive Plan.

g. Essential public facilities shall comply with any applicable state siting and permitting requirements (e.g., hazardous waste facilities).

h. Whether the State proves by clear, cogent, and convincing evidence that (1) a sufficient and reasonable number of alternative sites have been fully, fairly, and competently considered, and (2) such sites were found to be unsuitable for an SCTF for reasons other than the cost of property.

i. Whether careful analysis has been completed to show that siting of the facility will have no undue impact on any one racial, cultural, or socioeconomic group, and that there will not be a resulting concentration of similar facilities in a particular neighborhood, community, jurisdiction or region.

CF-41. The Planning Director or designee shall determine whether a development application will result in a significant change of use or a significant change in the intensity of use of an existing essential public facility. If the Planning Director or designee determines that the proposed changes are significant, the proposal will be subject to the essential public facility siting process as defined in Goal #4, Policy CF-10. If the Planning Director or designee determines that the proposed changes are insignificant, the application shall be reviewed through the City's standard development review procedures. The Planning Director or designee's determination shall be based upon:

a. The proposal's impacts on the surrounding area.

b. The likelihood that there will be future additions, expansions, or further activity related to or connected with the proposal.

CF-42. One of the difficulties of siting essential public facilities is that they are allowed in some but not all appropriate areas. To help address this problem, Auburn shall allow essential public facilities in all zones where they would be compatible. The types of facilities that are compatible will vary with the impacts likely from the facility and the zoning district. Essential public facilities are likely most compatible in the M-2 Heavy Industrial Zoning District. Uses within the zone may generate more externalities to the surrounding area.

CF-43. Essential public facilities shall be allowed in those zoning districts in which they would be compatible, and impacts can be mitigated. In situations where specific development standards cannot be met, but it is determined that the facility can be made compatible, the City Council can waive those specific standards with the requirement that appropriate mitigation is provided. The M-2 Zoning District should include broad use categories that allow all essential public facilities that are difficult to site as permitted or conditional uses as appropriate.

CF-44. Essential public facilities should be equitably located throughout the City, county and state. No jurisdiction should absorb a disproportionate share.

CF-45. Essential public facilities of a regional, countywide, statewide, or national nature should be restricted to the region-serving area of Auburn. Such facilities should be located in relationship to transportation facilities in a manner appropriate to their transportation needs. Extensive buffering from adjacent uses may be required. Facilities that generate a significant amount of truck traffic should be located such that they are served by existing truck routes or mitigation provided to address impacts on the street network.

CF-46. Infrastructure investments should consider equity and plan for any potential displacement impacts.

Goals and Policies 10

Intent of the Utilities Element

The Utilities Element required by the Department of Commerce per RCW 36.70A.070, and consists of the general location, proposed location, and capacity of all existing and proposed utilities including electrical, telecommunications, and natural gas systems. This Element generally describes these "privately-owned" services, and solid waste services, provided within the city, however Auburn does not own or operate these services and relies on outside service providers such as Puget Sound Energy and Waste Management to provide these services.

This Element includes descriptions those "privately-owned" utilities note above as well as summaries of city-owned and operated utilities such as water, sewer, and stormwater. Detailed information for both privately-owned and city-owned utilities can primarily found in the Water, Sewer, and Stormwater Systems Plans adopted by the City and that are incorporated by reference in the Comprehensive Plan, and by contacting privately-owned utility providers.

Values

Character: Private utilities will provide a positive contribution to the quality, aesthetics, and functionality of the community.

Wellness: Utility infrastructure and systems support the delivery of safe and efficient electricity, gas, and telecommunications.

Service: Utility infrastructure and systems support the City's goals of providing accessible and transparent government services and processes.

Economy: Businesses are served by utility infrastructure meeting or exceeding the needs for market entry and future growth.

Celebration: Telecommunication systems are fully utilized to reach a broader cross-section of the community in a way that brings people together for civic activities, cultural events, and social awareness.

Environment: Siting, installation, and maintenance of utilities will ensure protection, preservation, and respect of the wildlife habitat, water quality, and environmentally sensitive features.

Sustainability: When designing, constructing, and maintaining utilities, a long-term investment horizon is favored over concepts that only provide short-term benefits and outcomes.

City-Owned and Operated Utilities

Introduction

This section provides overall policy direction for the different utility services provided by the city, including water, sewer, and stormwater facilities. A key provision of the Growth Management Act is concurrency. In general, concurrency seeks to ensure that development is permitted only if adequate public facilities are, or can be guaranteed to be, available to support new development. Concurrency requires that facilities needed to maintain a locally adopted level of service be provided "concurrently" with development. Concurrency places the finance function of local government in a much more prominent role in the land use development process. While the concept of concurrency is new to many jurisdictions, it has been used in Auburn since the adoption of its 1986 Comprehensive Plan.

Conditions and Trends

Accommodating Growth

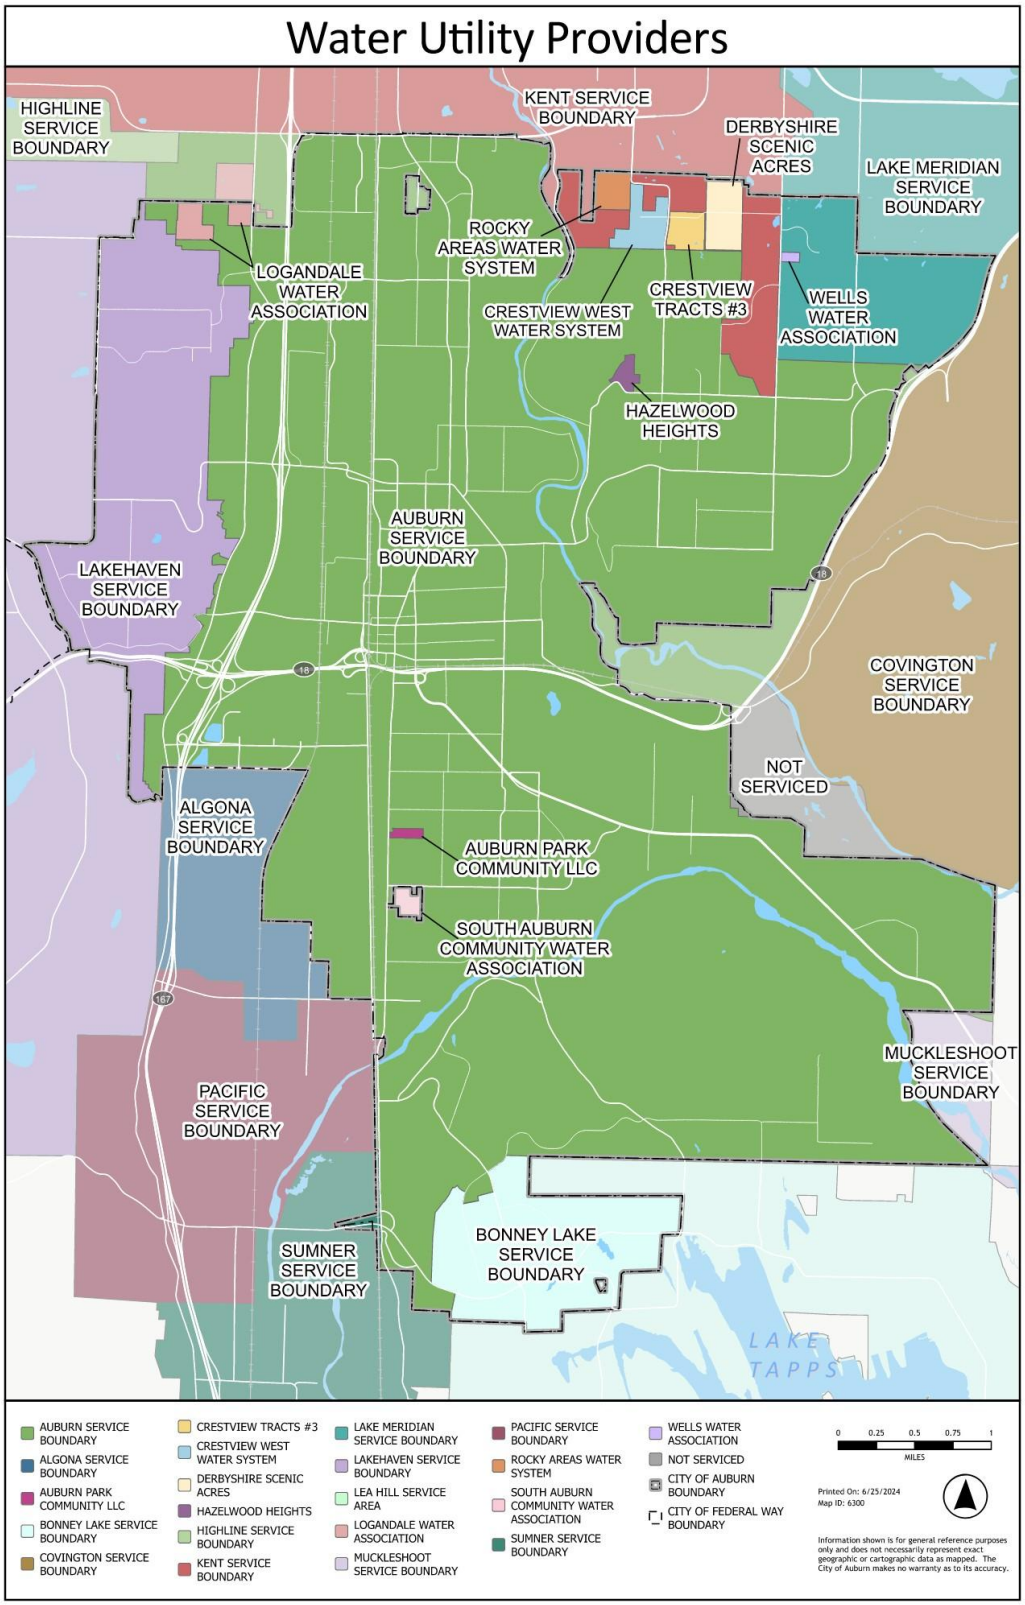
The provision and sizing of public facilities such as streets or waterlines and sewer lines can influence the rate or timing of development and is an important means of managing growth. Timed provision of facilities also ensures that new development can be assimilated into the existing community without serious disruptions or adverse impacts. This Plan establishes policies to allow development when and where all public facilities are adequate or can be made adequate, but only if such development can be adequately served by public facilities and services consistent with the adopted level-of-service standards.

Utility Services

The following services are owned and operated by the City of Auburn.

Water System

The City of Auburn (City) manages the water utility in accordance with established water- system policies that govern various facets of utility operations. City policies are established by the City in order to provide a vision or mission of the water utility and to provide a framework for the design, operation, and ongoing wellbeing of the City's water utility.



The policies included in this Water Comprehensive Plan are developed specifically for the City's multi-source municipal water system and seek to provide consistent treatment to all utility customers and to provide documentation to current water-system customers as well as those considering service from the City. It should be noted that what is included in these policies is limited to those things related to the water system and its design, maintenance, and operation. There are other policies and criteria that pertain to the water utility the City has in place regarding land use, development, and financial components, which are not directly addressed in this plan, that could still have an impact on the needs of the water system. These

policies and criteria may include factors such as zoning regulations, building codes, infrastructure requirements, and financing options. These additional factors will be considered when planning for the water system, to meet the needs of the community in a sustainable and effective matter.

The City's Water Comprehensive Plan is based upon the following mission statement for the water utility: "The City will provide for the efficient, environmentally sound and safe management of the existing and future water system within Auburn's service area."

- The City's Water utility policies are grouped within goal statements that are headlined under the following categories:
- Business Practices
- Service Area
- Operations and Maintenance
- Financial
- Planning
- Environmental Stewardship
- Design and Construction

Map U-1 – Water Utility Providers

Stormwater Systems

This chapter describes a set of overarching goals for the City's Storm Drainage Utility and policies for complying with these goals.

UE-83 City Comprehensive Plan Consistency

The City Comprehensive Plan is the City's growth management plan and contains policies for protecting critical areas and natural resource lands, designating urban growth areas, preparing comprehensive utility plans, and implementing them through capital investments and development regulations. Therefore, the City Comprehensive Plan provides a framework of policies for development, expansion, and maintenance of the Storm Drainage Utility reflected in this Storm Drainage Comprehensive Plan.

UE-84 Storm Drainage Comprehensive Plan Policy Goals

The City's Storm Drainage Utility policies are grouped within goal statements that are headlined under the following categories:

- System Planning
- Operations and Maintenance
- Fiscal Responsibility
- Environment and Regional Coordination

Taken together with the City Comprehensive Plan and Auburn City Code (ACC) these goals define how the Storm Drainage Utility shall be operated and maintained. Several policies have been developed within each goal, many of which are also based on the Washington Department of Ecology Stormwater Management Manual (SWMMWW) and the City's Phase II National Pollutant Discharge Elimination Stormwater Permit (NPDES).

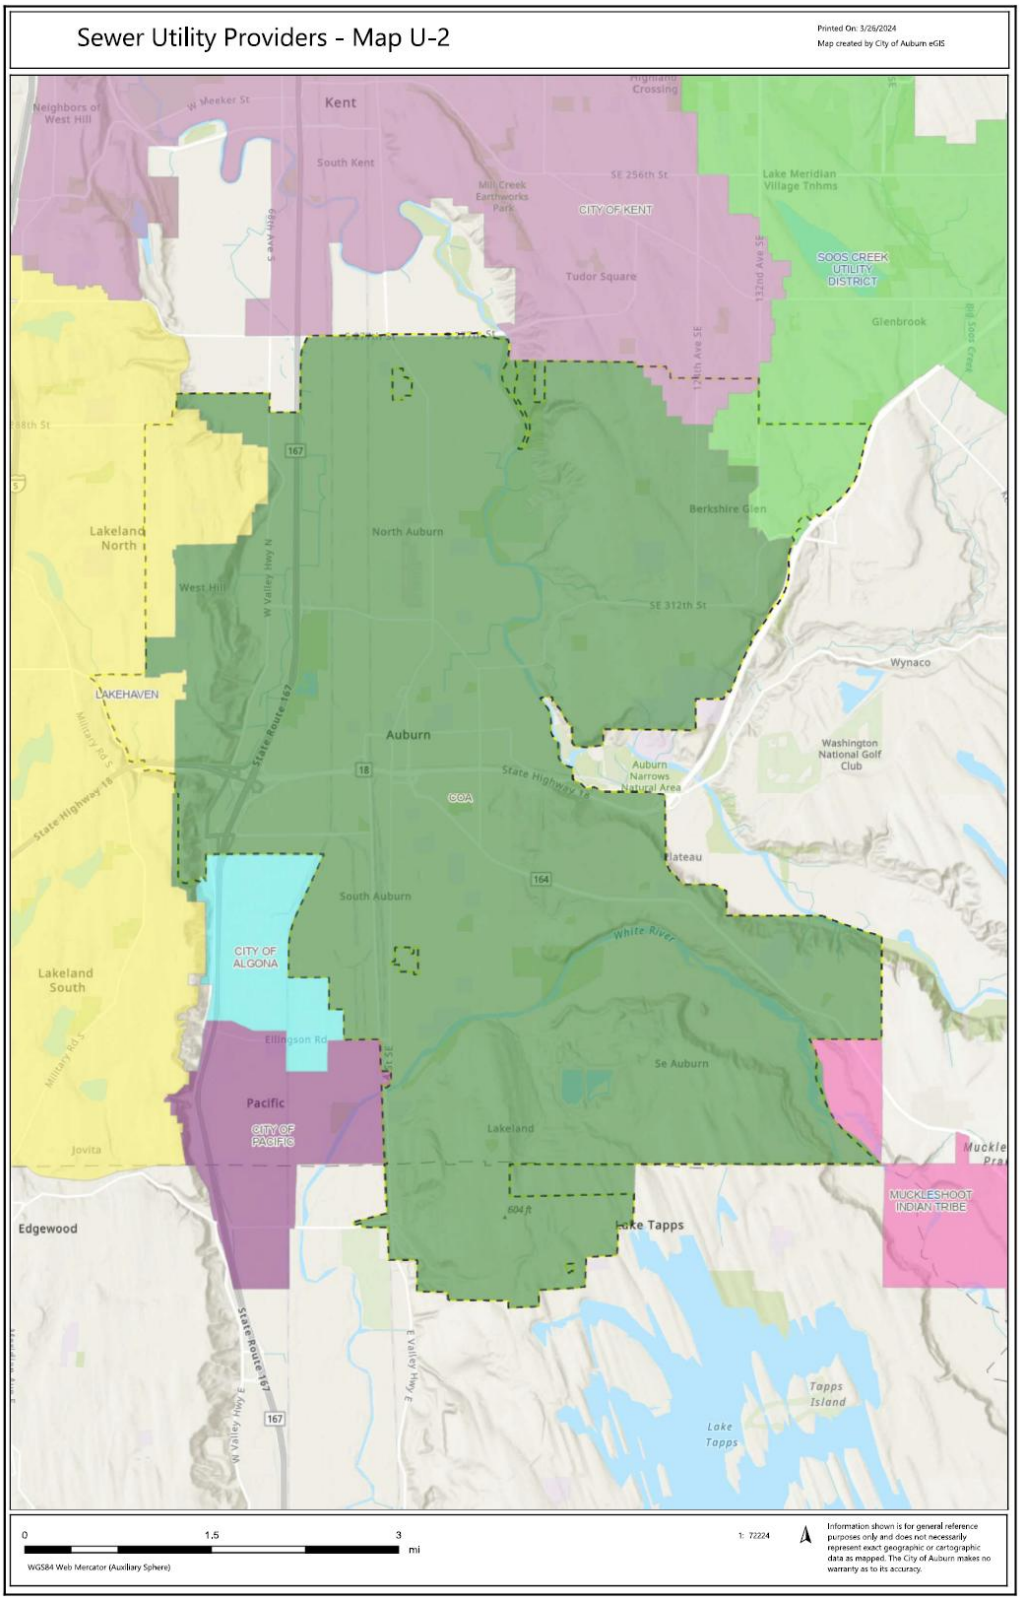
Sewer Systems

The City desires to employ recognized best business practices that result in an efficient and cost-effective operation of the Sanitary Sewer Utility. The City shall identify the key business functions within the Sanitary Sewer Utility (e.g., billing, permitting, asset management, and planning) and develop supporting best business practices for each.

The City understands that defining and implementing best business practices is a long-term effort and will require a stepwise approach. Given that the Sanitary Sewer Utility is made up largely of physical assets that have the greatest value and deserve the greatest commitment to operate and maintain, the City shall continue to prioritize the business practice of asset management.

Asset management is a systematic approach to maintaining assets in good working order to minimize future costs of maintaining and replacing them, especially to avoid costly deferred maintenance. The best practices for asset management involve systematically basing choices on an understanding of asset condition and performance, risks, and costs in the long term. Asset best practices include:

- Having extensive knowledge about assets and their costs for maintenance and replacement (i.e., detailed inventories);
- Maintaining Levels of Service;
- Taking a life-cycle approach to asset management planning; and
- Implementing the planned solutions to provide a reliable, cost-effective service.



Since the adoption of the 2016 Comprehensive Sewer Plan, the Sanitary Sewer Utility has compiled an inventory of assets and their conditions for approximate 70% of its currents assets. The Sanitary Sewer Utility shall continue implementing the above best practices during the next planning period.

Sewer Comprehensive Plan Policies, Standards, and Guidelines

This Plan presents policies and standards related to system development, maintenance, funding, and generally how the Sanitary Sewer Utility should operate. These policies define limits and outline how the wastewater collection system should be operated and maintained and are grouped within goal statements that are headlined under the following categories:

- Service Area
- System Planning
- Operations and Maintenance
- Environmental Stewardship
- System Performance and Reliability
- Fiscal Responsibility

Map U-2 – Sewer Utility Providers

Private Utilities

Introduction

The Growth Management Act requires the City of Auburn to include a Private Utilities Element within its Comprehensive Plan. The element should pro- vide a framework for the efficient and predictable provision and siting of utility facilities and ser- vices within the City, consistent with each serving utility's public service obligations. This element covers private utilities (those not provided by the City of Auburn), and includes electricity, telecommunications, and natural gas. City-owned water, sewer, and stormwater utilities are described within the Capital Facilities Element (Chapter 3) of this Comprehensive Plan.

Investor-owned utilities in the state of Washington are regulated by the Washington Utilities and Transportation Commission. State law regulates the rates, charges, services facilities, and practices of utilities. Any changes in policies of these aspects of utility provision require WUTC approval.

The primary responsibility for the planning of private utilities rests with utility providers. Clearly, however, planning cannot take place without open lines of communication between the City and utility providers. The City acknowledges that some private utility providers are not willing to provide capacity or future construction plans, as some of this information may affect their competitiveness or be considered proprietary. Private utilities, however, must recognize that not pro- viding relevant information may hinder the City's ability to assist them in their projects.

Vision

Private utilities in Auburn are planned, designed, and constructed in a manner that adequately supports the future growth scenarios predicted in the City's Land Use Element and that meets the needs of residents, visitors, and businesses. Sustainability is a principle that guides decisions for where utilities are placed, how they are constructed, how they are operated and maintained, and how all aspects of design, construction, and operation are funded.

Electricity and Natural Gas

Puget Sound Energy provides electrical and natural gas service to the City of Auburn and its potential annexation area. PSE is an investor-owned private utility that provides service to approximately 1.2 million customers in a service area that covers 6,000 square miles.

Electricity

PSE builds, operates, and maintains an electrical system consisting of generation, transmission, and distribution facilities. Facility technology for electricity transmission may change in the future in order to respond to the need for more efficient facilities, address various electromagnetic field and health concerns, and diversify resources. Utility policies should be updated in the future to consider changes in technology, facilities, and services.

Natural Gas

The Northwest Pipeline Corporation and Enumclaw Natural Gas also have gas lines in the southeastern portion of the City. Northwest

Pipeline Corporation's only customer in Auburn is Enumclaw Natural Gas. Enumclaw Natural Gas serves Auburn residential customers in the area of the Auburn Adventist Academy.

Telecommunications

Telecommunications includes a wide range of services including conventional telephone, cellular telephone, and cable television. Telecommunications technology continues to change rapidly. The City of Auburn owns and maintains a robust fiber optic Metropolitan Area Network (MAN) that connects most City owned building facilities and traffic signals throughout the Auburn area.

Conventional Telephone

Conventional local telephone service to the City is provided by CenturyLink. CenturyLink is a global provider of telecommunications services.

Calls are switched at facilities called central offices. Typically, four main lines leave each central office – one in each direction. Auburn's central office is located in downtown Auburn.

Several carriers provide long distance service to the area. These providers have underground fiber-optic cables passing through the City of Auburn.

Cellular Telephone

Cellular telecommunications provide mobile telephone communications via radios that send and receive signals from a network of receivers mounted on utility poles, towers, buildings, or other structures on private property or within a right-of-way. Cellular communication companies offer digital voice, messaging, and high-speed wireless data services to customers.

Cellular telephone service within the City, its potential annexation areas, and the Puget Sound region overall is provided by multiple private companies. Cellular providers are regulated by the Federal Communications Commission. Technology and business practices in the area of telecommunications continue to change rapidly.

Cable Television

Cable television service is provided by Comcast through a combination of aerial and underground cables. The locations of existing and planned cable lines are shown on Map 6.4.

Solid Waste

The City of Auburn contracts with WM for collection of municipal garbage, recycling, and yard waste. Waste Management disposes of Auburn's garbage at a King County Solid Waste transfer station. Recycling is processed at WM's material recycling facility in Tacoma, WA. WM takes the yard and food waste to either DTG in Tacoma, WA or Cedar Grove in Maple Valley, WA to be converted into compost. There is a small area of Auburn that was recently annexed. This area is serviced by Republic Services. Republic Services takes the garbage to a King County Solid Waste transfer station, the recycling is processed at their material recycling center in Seattle, WA, and yard and food waste is taken to Cedar Grove in Maple Valley, WA. There are approximately 20,200 Waste Management accounts as of 2024.

Goals and Policies

Goal # 1 – Service Area

Allow the development of private utilities to meet the needs of the existing community and provide for its planned growth consistent with serving utilities' public service obligations.

Policies:

U-1. Private utility providers will utilize the City's Comprehensive Plan Map for guidance regarding future land uses and intensities in order to determine and plan for future service. Private utility facilities and systems should be consistent with the uses and densities allowed by the Comprehensive Plan and Zoning Code. The City will make this information easily available to utility providers. The City will also coordinate with utility providers on pending development proposals (both public and private). In return, the City expects a cooperative posture toward coordinated and timely expansion of infrastructure.

U-2. Private utility companies should strive to provide utility services to all segments of the Auburn population and areas of the community in an equitable manner that prioritizes easy access and that offers pricing structures that strive to reduce barriers that otherwise exclude portions of the community.

U-3. Construction of facilities and provision of services by private utility providers within the City of Auburn shall be in compliance with all of the goals and policies of this Comprehensive Plan.

Goal # 2 – Compatibility in the Community

Prioritize visual quality of private utility facilities consistent with the serving utilities' public service obligations.

U-4. The City shall require that new private utility distribution, service, and telecommunication lines be located underground within all new developments. The City will also work with utility companies to relocate existing distribution, service, and telecommunication lines underground as a part of new development whenever it is technologically feasible, and as part of City capital roadway projects whenever it is economically and technologically feasible. Expansions and upgrades completed by private utilities will be required to be underground unless they meet appropriate exemptions.

U-5. To reduce visual clutter, antennas, relay mechanisms, and similar structures should be located on existing poles, structures, or buildings whenever possible. When deemed feasible and necessary to minimize impacts on adjacent uses or views by the City, visual screening may be required.

U-6. The location of utility facilities is often dependent upon the physical requirements of the utility system. All utility facilities should be sited, designed, and buffered (through extensive screening and/or landscaping) to fit in with their surroundings harmoniously and safely. When sited within or adjacent to residential areas, special attention should be given to minimizing noise, light, and glare impacts.

U-7. Utility service boxes and cabinets should be designed, oriented and/or treated with in a manner intended to reduce the likelihood of graffiti tagging, contribute to Auburn's arts and culture programming, and to enhance the overall appearance of the community.

U-8. Generator and back up generators that are located within residential areas should be visually screened and incorporate techniques that mitigate noise impacts consistent with local and state requirements.

U-9. Substations and maintenance buildings within residential areas should be screened, landscaped and/or designed in a manner that provides visual compatibility.

Goal # 3 – Safety and Efficiency

Prioritize the safe and efficient installation, maintenance and operation of private utility facilities consistent with the serving utilities' public service obligations.

Policies:

U-10. Common utility trenches should be encouraged and coordinated by both private and public providers whenever possible.

U-11. Decisions regarding private utility facilities within Auburn should consider the safe, adequate, and efficient availability of these utilities to other jurisdictions.

Goals # 4 – Sustainability and Equity

Prioritize equitable access to the services offered by private utility facilities and ensure that the location, installation and maintenance of private utilities is carried our in an environmentally sensitive manner.

Policies:

U-12. The City shall consider the environmental impacts of proposed utility facilities as a part of its environmental review process. When requested by the City, the utility provider shall furnish documentation of current research results and/or provide additional information related to determination of the potential environmental impacts, if any, from the proposed facilities.

U-13. Private utility companies are recognized as providers of important services necessary for maintaining current and future lifestyles as well as contributing to equitable community outcomes.

U-14. Private utilities that are permitted to operate within Auburn offer various technological means for accessing information, education, services, and assistance. Because Auburn believes that all residents should be afforded equal access to education, information and services private utility providers should seek to recognize and reduce access barriers.

Comcast	www. business.comcast.com 1-855-237-7896	N/A – Consistent with City boundary

Goal # 4 - Solid Waste

To provide area residents and businesses with a universal and compulsory system for collection and disposal of all solid waste, including ample waste reduction and recycling opportunities intended to maximize diversion of the City's waste stream away from costly landfills, incineration, or other solid waste disposal facilities, and to conserve exhaustible resources.

Policies:

U-15. The King County Solid Waste Management Plan and Solid Waste Interlocal Forum, except as modified by City of Auburn Ordinance No. 4413 and this Plan shall form the basis for solid waste management activities within the City.

U-16. The City shall continue to fund solid waste collection, disposal and waste reduction and recycling programs and services through the existing solid waste utility, with supplemental funding provided through available grants.

U-17. The City shall implement solid waste management programs and services that provide ample opportunities and incentives to maximize the community's participation in local and regional waste reduction and recycling efforts.

U-18. The City's solid waste management programs shall be developed to make waste reduction and recycling efficient, reliable, cost-effective, and convenient for all residents and businesses.

U-19. The City encourages and should promote the use of products manufactured from recycled materials, and the use of materials that can be recycled. City Departments and contractors shall use recycled and recyclable products whenever and wherever feasible.

U-20. The City shall implement solid waste reduction and recycling programs that have the cumulative effect maintaining the 50 percent waste reduction and recycling goal (recycling tons/total solid waste stream).

U-21. The City shall periodically monitor and evaluate the effectiveness of Auburn's waste reduction and recycling programs to ensure that local and state goals and policies are being met.

U-22. The City shall promote the recycling of solid waste materials by providing opportunities for convenient recycling and by developing educational materials on recycling, composting and other waste reduction methods.

Planning Framework....1
Growth Management Act (GMA) and Puget Sound Regional Council (PSRC) Requirements....1
How the City Uses the Plan....2
Land Use Characteristics and Transportation Systems....4
Goals and Policies....6

Introduction

The transportation system is a vital component of Auburn's social, economic, and physical structure. The primary purposes of the transportation system is to support the movement of people and goods within the City and connect the City to the broader region. The transportation system influences patterns of growth, development, and economic activity by providing access to adjacent land uses. Planning for the development and maintenance of the transportation system is a critical activity promoting the efficient movement of people and goods, ensuring emergency access, and optimizing the role transportation plays in attaining other community objectives.

This chapter provides only a brief overview of the City's ***Comprehensive Transportation Plan***, located in Appendix G of the 2024 Periodic Comprehensive Plan.

Vision

The Comprehensive Transportation Plan reflects the current and future needs of the Auburn community and, in doing so, seeks to:

- Enhance the quality of life for all Auburn residents;
- Encourage healthy community principles through nonmotorized travel;
- Promote a transportation system that supports local businesses and enhances economic development opportunities;
- Create a transportation system that is efficient, uncomplicated, and welcoming to visitors; and
- Provide a balanced, multimodal transportation system that addresses both local and regional needs.

Planning Framework

The Comprehensive Transportation Plan (CTP) is the framework for transportation planning in Auburn. It functions as the overarching guide for changes to the transportation system. The CTP evaluates the existing system by identifying key assets and improvement needs. These findings are then incorporated into a needs assessment, which guides the future of the transportation system.

This CTP is multimodal, addressing multiple forms of transportation in Auburn including the street network, nonmotorized travel, and transit. Evaluating all modes enables the City to address its future transportation needs in a comprehensive and balanced manner.

Growth Management Act (GMA) and Puget Sound Regional Council (PSRC) Requirements

Washington State's 1990 Growth Management Act (GMA) requires that transportation planning be directly tied to the City's land use decisions and fiscal planning. This is traditionally accomplished through the adoption of the Transportation Element of the Comprehensive Plan. The City of Auburn is a member of the Puget Sound Regional Council (PSRC), the regions Metropolitan Planning Organization (MPO). As the MPO, PSRC is responsible for developing a long-range regional transportation plan and near-term regional transportation improvement program. PSRC establishes policies, procedures, and programs for award of Federal Highway Administration (FHWA) funding. PSRC has established requirements for agency comprehensive transportation plans that must be met to maintain eligibility for PSRC managed grant funding.

Transportation modelling and planning is consistent with the Land Use Element, including 2044 household and employment targets for both King and Pierce Counties.

How the City Uses the Plan

The Comprehensive Transportation Plan provides policy and technical direction for development of the City's transportation system through the year 2044. It updates and expands the 2015 Comprehensive Transportation Plan by recognizing network changes since the last plan, evaluating current needs, and identifying standards for future development and various infrastructure improvement scenarios.

Needs Assessment

A system-wide, multimodal needs assessment was conducted throughout plan development to ascertain which aspects of Auburn's existing transportation system work well and which ones need improvement. An evaluation of potential solutions and investment priorities was also conducted as part of this process. The end result is that Auburn has a more thorough understanding of system deficiencies, how best to address these deficiencies, and direction for expanding the system in a sustainable manner.

Multimodal Level of Service Standards

Prior to the 2024 Plan, as with comprehensive transportation plans for most other agencies in Washington, the City of Auburn's Comprehensive Transportation Plan only included LOS standards for motorized vehicles (vehicle LOS). Without adopted multimodal LOS standards (MMLOS), there were no metrics by which the effectiveness of the active transportation and transit systems could be measured and evaluated. With MMLOS, the City of Auburn can ensure that transportation system improvements are planned, funded, and implemented to develop a comprehensive, connected, and versatile transportation system. One of the main goals of MMLOS is to realize a transportation system that doesn't rely on adding more vehicular capacity alone to address growing needs to move people and goods. The MMLOS approach supports providing other transportation modes including walking, bicycling, and transit to address these needs. The City of

Auburn's MMLOS have been developed with the strategic and focused intent of maximizing potential mode shifts from driving cars to walking, biking, and riding transit. The standards work towards this by setting higher level of service standards for walking and biking in areas where doing so will best support existing and planned transit service.

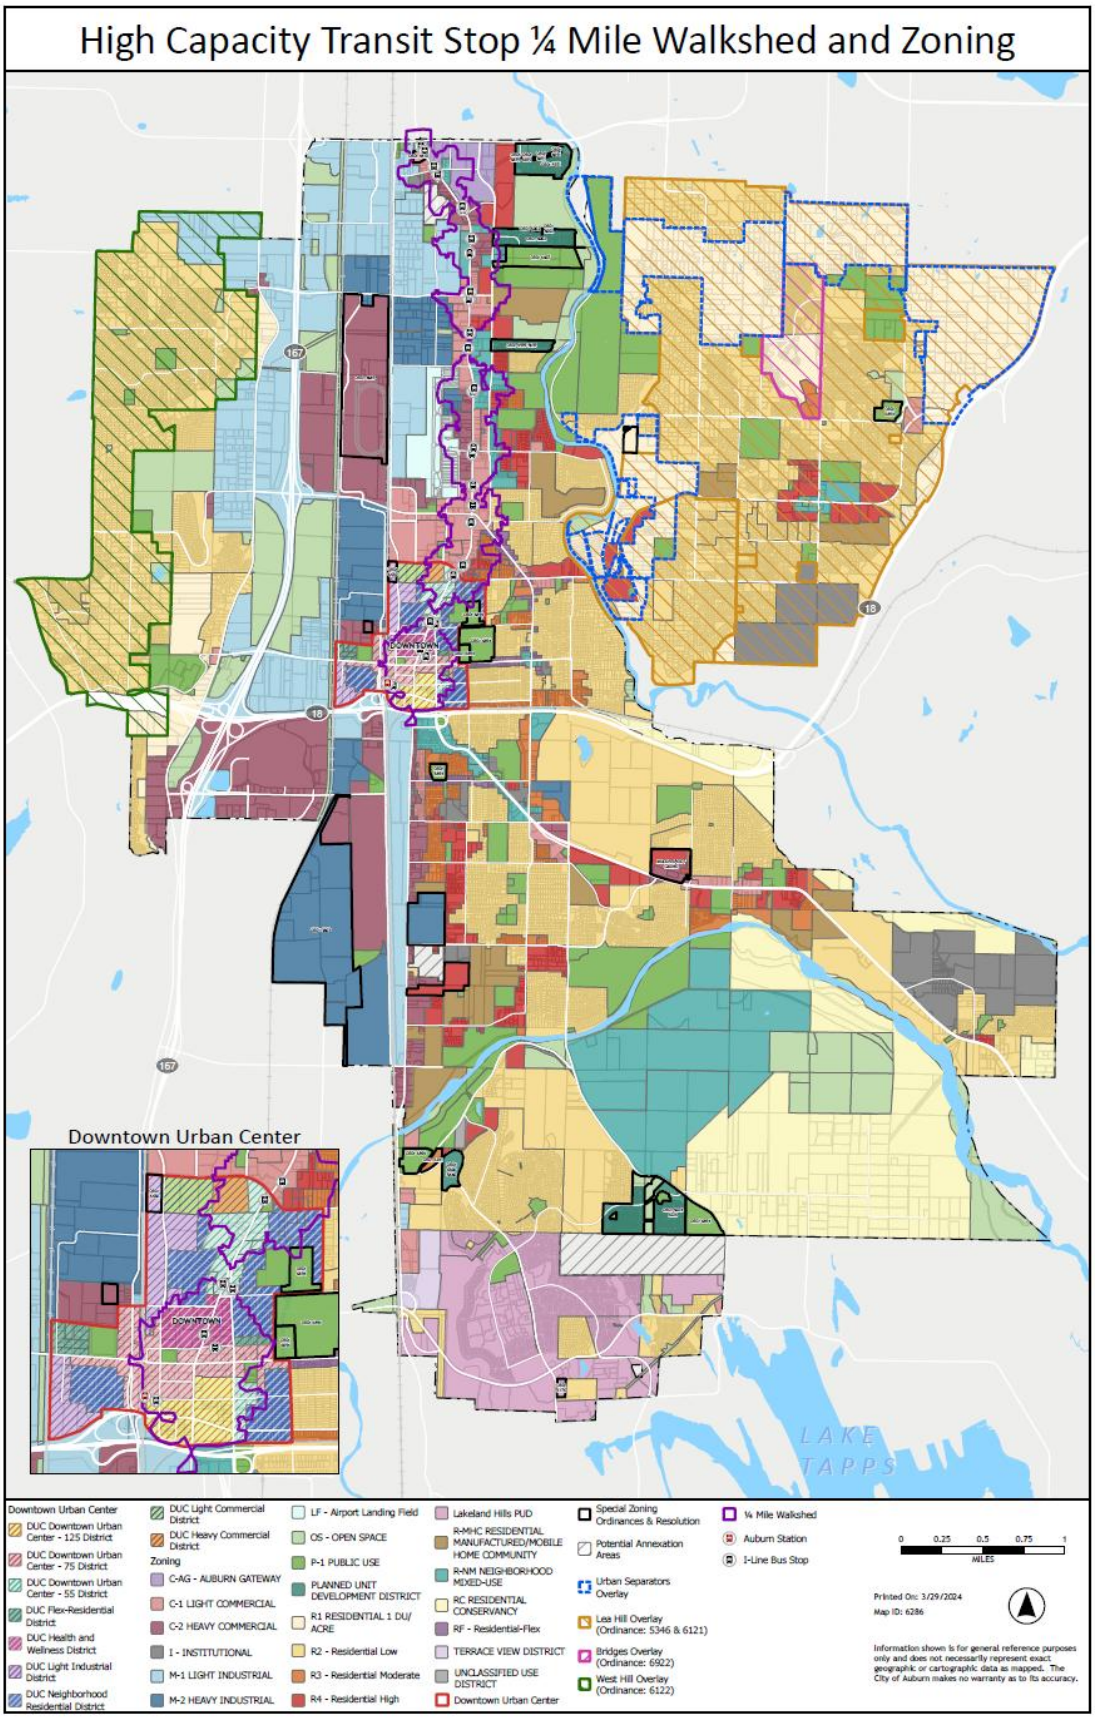
These principles, many of which can be promoted by thoughtful transportation systems planning, encourage healthier communities by increasing physical activity and decreasing air pollution caused by vehicle emissions. Auburn has historically planned for a transportation system that incorporates many healthy community principles, such as transit facility planning and regional trail planning. In addition, the Downtown Plan calls for a mixed-use, high density, pedestrian-oriented downtown. In the future, Auburn shall continue to promote these principles through long-range planning efforts, capital facility improvements, development review, and community activities involving active lifestyle elements.

Capital Faciltites Plan and Transportation Improvement Program

The City uses the Transportation Improvement Program (TIP) and Capital Facilities Plan (CFP) to develop a financial plan for capital improvements in Auburn, thus enabling the City to fulfill the GMA requirement of having a multiyear financing plan based on the identified transportation needs. The TIP, is a financial planning tool used to implement the list of transportation improvement projects identified in the Transportation Plan. It is a six-year plan which is reviewed and updated annually by the City Council to reflect changes to project priorities and funding circumstances. The first three years of the plan are fiscally constrained. Traffic impact fees on new development are determined by the cost of the capacity projects included in the TIP. The Capital Facilities Plan is also an annually adopted six-year financing plan. However, it is fiscally constrained for all six years. Unlike the TIP, the CFP is an adopted element of the City's Comprehensive Plan.

Agency Coordination

In addition to being influenced by factors within the City's jurisdiction, Auburn's transportation system is influenced by what happens outside its jurisdiction and/or boundaries: growth in neighboring communities, infrastructure maintenance by regional agencies, the lack of funding for road maintenance, new capacity projects, and competing demands for transit service. The Plan calls for effective inter-jurisdictional actions to address cross-border issues and to mitigate the impact of new development. The Plan also recognizes that other jurisdictions, particularly state agencies and transit providers, are responsible for a major share of the transportation facilities serving Auburn. These jurisdictions include:



- Muckleshoot Indian Tribe (MIT)
- WSDOT
- Sound Transit
- King County Metro

- Pierce Transit
- King County
- Pierce County
- Puget Sound Regional Council (PSRC)
- Cities of Kent, Federal Way, Sumner, Pacific, Algona, and Bonney Lake

Land Use Characteristics and Transportation Systems

Based on the available land capacity as zoned in 2023, Auburn showed a deficit of capacity for both the 2044 housing unit and jobs targets. The future land use map developed with the 2024 Comprehensive Plan was developed to accommodate the 2044 housing and jobs targets through new zoning and land uses in various corridors and nodes throughout Auburn, and in the Downtown area in particular. Development of the future land use map involved evaluating alternative land use scenarios and testing them against various factors. Further information regarding this process is included in the Comprehensive Plan. This Comprehensive Transportation Plan is based on the Draft Preferred Land Use Alternative documented in the Comprehensive Plan. This land use alternative was a combination of two alternatives that each focused on centralizing housing and employment growth with either corridors or centers approach. Both alternatives included intense housing and employment growth focused in the Downtown area by expanding and increasing development density and intensity. The combined alternative targets employment and housing along the Auburn Way North and I Street NE corridors where frequent transit is planned to start operating in 2026. Focused growth in employment and housing was also identified at locations of known future development plans. These areas include the Outlet Collection Mall area along 15th Street SW, the Icon Materials mining operations and adjacent lands along the east side of Kersey Way (known as the Segale development area), and at vacant or underdeveloped land areas on Lea Hill and West Hill.

To comply with recent HB 1110 state legislation, middle housing is permitted in all residential zones in Auburn, which is incorporated into the Comprehensive Plan zoning map. Density increases in high-capacity transit station areas have also been assumed in the zoning map, which is implemented primarily by designated Growth Centers. Density has also been increased near future planned RapidRide high-capacity transit locations in Lea Hill and near the Outlet Collection. In addition, up to 6 middle housing units per lot will be permitted within ¼ mile of a high-capacity transit stop, which in Auburn includes future RapidRide I-Line stop locations as well as Auburn Station. The map below shows the area where the density bonus will be applied. Parking for middle housing is not required within ½ mile of these same stop locations. Middle housing considerations for density and parking is being addressed through updates to city code.

Goals and Policies

The City creates policies to state preferences for preservation of the existing system and development of the future transportation system. Policies can be qualitative in nature, but often they are quantitative and prescribe a specific standard.

Policies are also important for communicating the City's values and needs to neighboring jurisdictions and regional and state agencies. Having established policies in place enables the City to more effectively influence change in keeping with its needs and objectives.

Goals and Policies are housed in the ***Comprehensive Transportation Plan***, located in Appendix G of the 2024 Periodic Comprehensive Plan.

Introduction

Economic development is a crucial aspect of the City of Auburn's overall well-being and quality of life. A strong and diverse economy provides opportunities for residents through job creation, business growth and a robust tax base that funds essential services such as police, streets, and parks.

The Economic Development Element of the Comprehensive Plan serves as a guide to attract, retain and grow businesses in the city, expand economic opportunity for everyone, ensure that economic expansion is carried out in a sustainable fashion, and drive regional economic growth. It recognizes that economic development is not a standalone endeavor but is closely linked to other key elements of the plan, including land use, infrastructure, transportation, housing, and sustainable resource management.

The Economic Development Element is designed to establish policies and strategies that promotes the implementation of Auburn's vision for a strong, inclusive, and diverse local and regional economy. The Economic Development Element therefore provides a comprehensive overview of Auburn's economy, sets policy direction for economic growth, and identifies strategies, programs, and projects to improve the local and regional economy

Vision

The City of Auburn is a diverse and inclusive economy that promotes prosperity for all members of the community. New business and industry desire to locate in Auburn and existing businesses are able to grow and prosper. The economic landscape is welcoming to large and small businesses as well as an array of different industry sectors. Economic growth is carried out in a climate friendly manner that effectively weathers economic volatility. A pathway to success exists for all residents and business owners regardless of their background or socioeconomic status.

Planning Framework

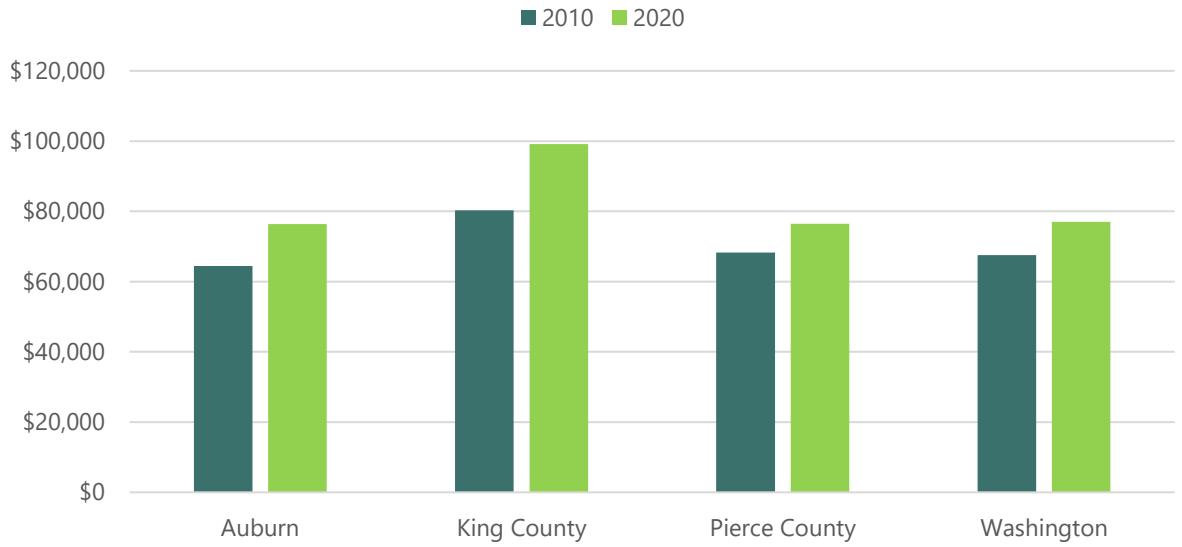
Vision for 2044

To achieve this vision, the city will focus on strategic partnerships, targeted investments, and inclusive policies and programs. In 2044, Auburn will be a city where people want to start their careers, raise their families, and enjoy all that life has to offer. It will be a place where businesses want to locate and visitors want to spend time.

Our vision for the future is one in which Auburn is a model of sustainable living, where residents, business owners, and workers enjoy a high quality of life while also

reducing their impact on the planet. We are working to create an efficient economy that minimizes waste and maximizes resource efficiency.

Conditions and Trends



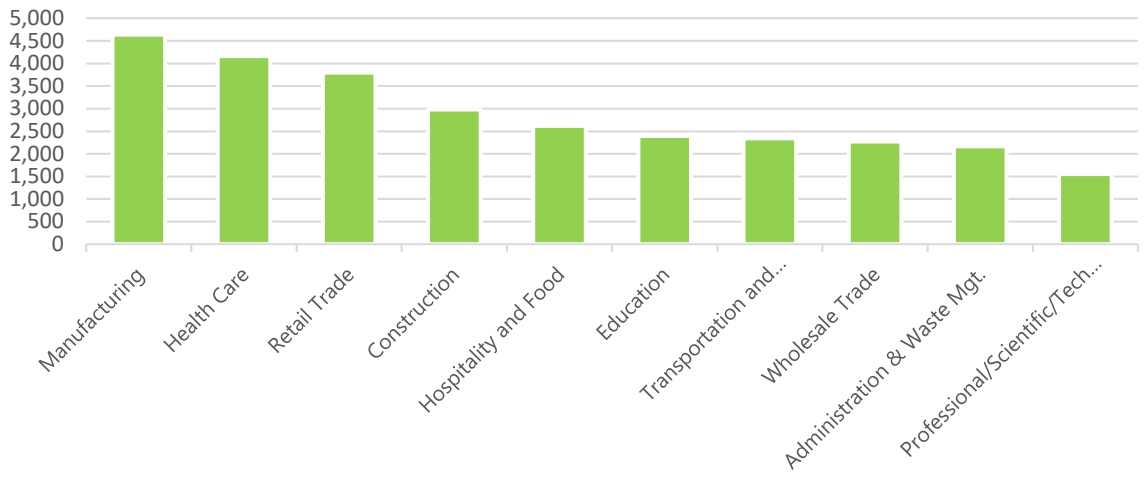
Auburn Profile

Auburn is a vibrant and growing city located in the Pacific Northwest region, situated about 15 miles north of Tacoma and 20 miles south of Seattle and is part of the greater Seattle metropolitan area. Most of the city is in King County, with a small portion extending into Pierce County. Auburn is currently ranked as the 14th largest city in Washington State and shares its borders with Federal Way, Kent, Pacific, Algona, Sumner and unincorporated King County. The Muckleshoot Indian Reservation lies partly within and partly adjacent to the City. Auburn is known for its natural beauty, strong economy, and diverse community, offering residents and visitors a high quality of life and a sense of belonging. The city boasts a thriving business community, top rated schools, and ample recreational opportunities, including access to the Green River, White River and the Cascade Mountains. Auburn also has a rich history and cultural diversity reflected in its many festivals, events, and community organizations. Auburn is a city that is constantly evolving and improving, yet always maintains its small-town charm and is a place where people come to start their careers, raise their families, and enjoy all that life has to offer.

Household and Income Characteristics

In 2020, Auburn was estimated to have 29,220 households, an increase of 12% since 2010. The average household size was 2.75, larger than the King County average of 2.43. This is likely due to the larger share of family households in Auburn, at 68%, compared with 59% in King County, and a smaller share of householders living alone. This reflects Auburn's suburban development patterns compared with some of the denser urban areas in Seattle and its closer-in suburbs. About 60% of Auburn's households are homeowners and 40% are renters, a slightly lower share of homeowners than Washington as a whole, but higher than the King County average.

Figure 1 - Inflation-Adjusted Median Household Income in Auburn with Regional Comparison (2020)



Source: 2020 ACS 5-Year Estimates, Table S2503, CPI Inflation Index

Auburn's median household income was $76,410 in 2020, an increase of 19% from $64,443 in 2010 (adjusted for inflation). As shown in Figure 1, Auburn's incomes are on par with statewide and Pierce County averages but lag behind the higher incomes of King County households primarily as a result of Seattle and Eastside residents. Rental households in Auburn earn significantly less than ownership households – the average renter household earns $54,396 compared with $98,153 for ownership households. Auburn's BIPOC households are more likely to be renters. Around 46% of renters are non-white residents, compared to 33% of homeowners. These types of intersections of income, race, access to housing and wealth-building are important considerations when planning to accommodate the needs of all Auburn residents.

Resident Labor Force and Employment Characteristics

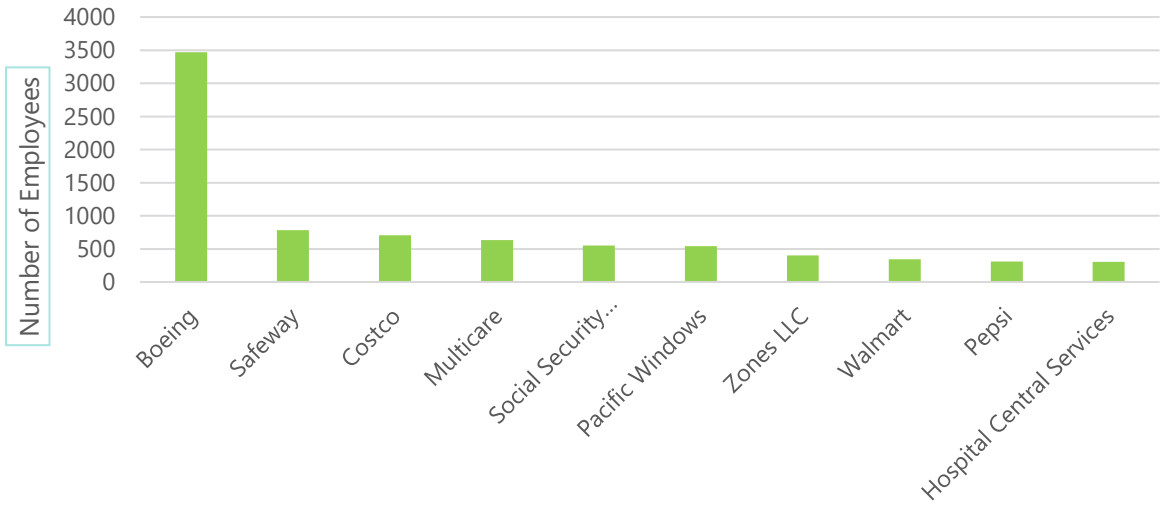


Figure 2 - Auburn Workforce Top Industry Sectors (2019)

Source: US Census On The Map

The top ten industry sectors in which Auburn residents were employed in 2019 is shown in Figure 2. Auburn has traditionally been a blue-collar community since its initial early 20th century population boom stemming from the construction of a railroad freight terminal. Despite a decrease in manufacturing employment in the 1990s and early 2000s, 13% of Auburn residents were currently employed in the industry in 2019. Since the recession of 2008, the number of Auburn residents employed in health care, retail, and construction have increased substantially and the overall diversity of jobs worked by Auburn residents has increased, reflecting the rapidly increasing population and shifts in demographics discussed previously.

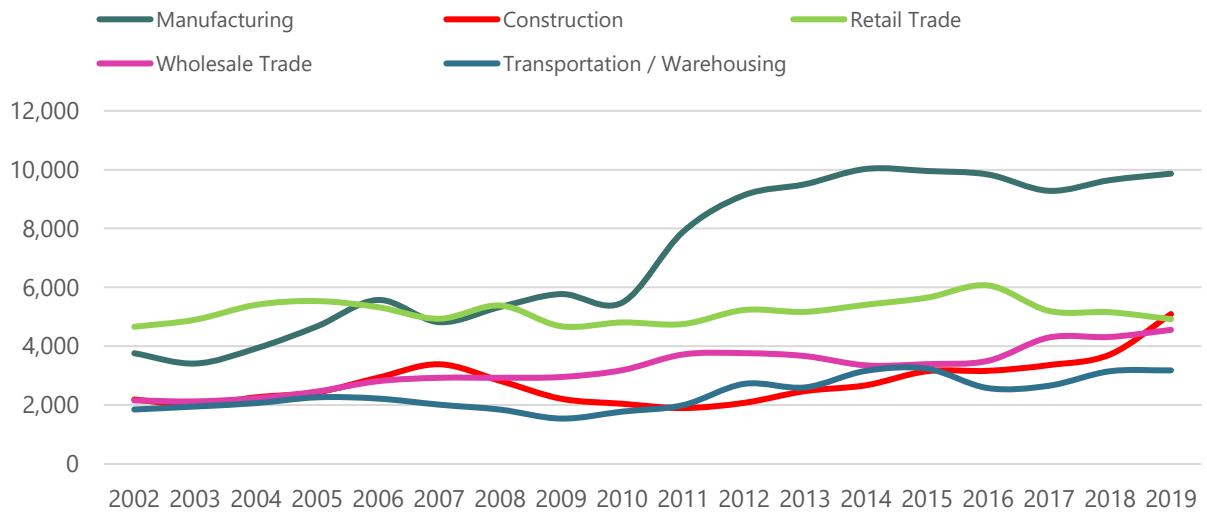

Figure 3 - Top Ten Employers in Auburn (2022)

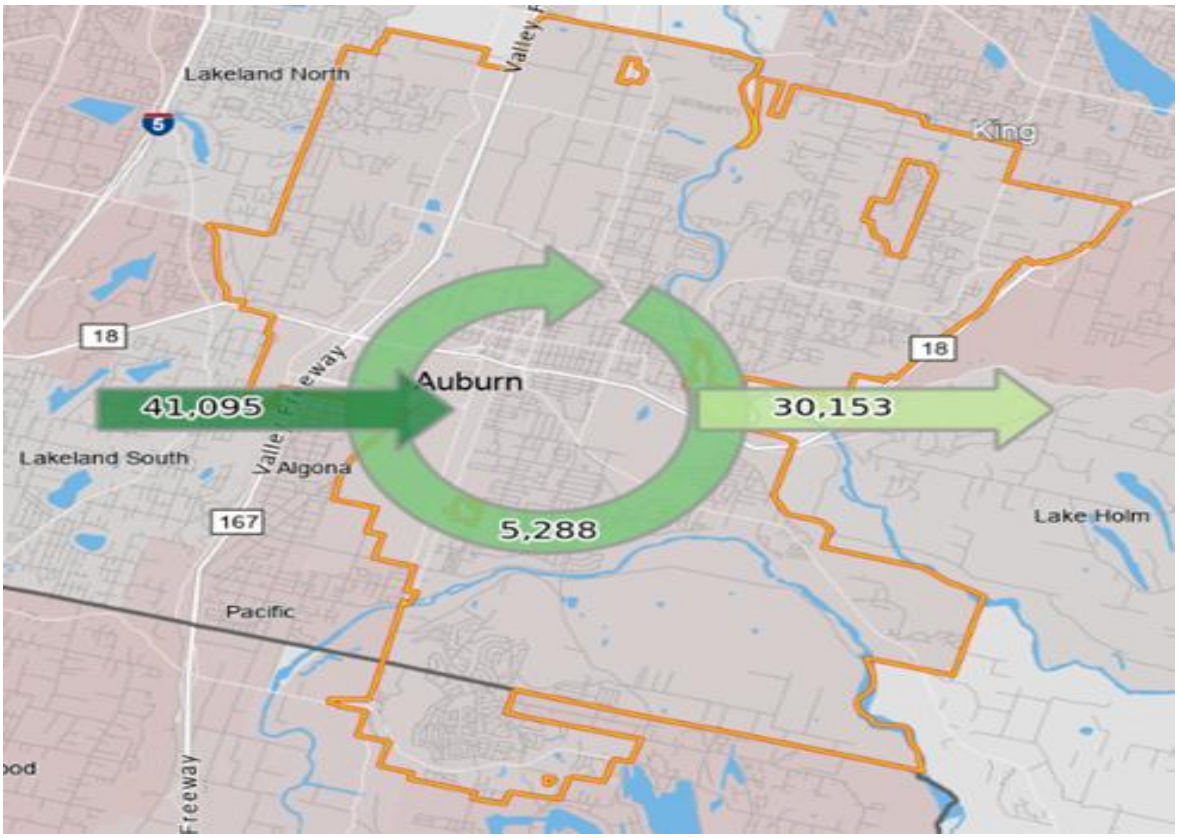
Source: Washington Employment Security Department

The top employers in Auburn are shown in Figure 3. Boeing is the largest employer in the City, as it has been several decade, followed by a variety of retail, manufacturing, and wholesale businesses, as well as Multicare, the regional hospital and health care center in Downtown Auburn. The top ten employers in Auburn currently account for about 23% of the jobs in the City, down from 55% in 2011 and 85% in 2002, further demonstrating the increasing diversity of business activity in Auburn in recent decades

Figure 4 - Top Industry Sectors in Auburn (2002-2019)

Source: US Census On The Map



As of 2019, there were about 46,383 jobs located in Auburn. The top sectors are shown in Figure 4 along with their change over the past two decades. Despite decreases in the manufacturing industry from 1990 and 2000 noted in Auburn's previous (2014) comprehensive plan, the sector has seen rapid increases since the 2008 financial crisis and now accounts for over 20% of jobs in the City. Other notable shifts include a rapid increase in construction jobs over the past several years as well as a decrease in retail which corresponds to an increase in wholesale trade, perhaps reflecting increasing patterns of online rather than in-store shopping.

Daily Inflow and Outflow

As of 2019, 5,288 Auburn residents, or 15% of the population both lived and worked in the City. The remaining 85% of those who worked in Auburn commuted from outside the City. As shown in Figure 5, there are more people who work in Auburn

and live elsewhere than those who live in Auburn and work elsewhere. This results in an increased pool of residents and employees who engage with City services and businesses. Although this data predates the COVID-19 pandemic, the relatively large share of in-person manufacturing and retail jobs in the City suggests that the commuting patterns may have been less affected by the pandemic in Auburn compared with other areas which have a higher share of office jobs.

Growth Projections

Understanding future population and employment growth is essential for planning. King County, Pierce County, the Puget Sound Regional Council (PSRC) and the Washington State Office of Financial Management (OFM) are each involved in forecasting population and job growth in Auburn over the coming decades, and this section summarizes the current forecasts from these agencies which can be

used to inform future actions on land use, infrastructure, housing, economic development, and transportation in Auburn.

Planning Approach

Values

Character: Our community values the unique perspectives and experiences that our diverse population brings, and we strive to create inclusive spaces that celebrate our differences and foster a sense of belonging for all.

Wellness: We are a secure community with walkable commercial districts where the perception and reality are that crime activity is low.

We prioritize the health and well-being of our residents by investing in programs and infrastructure that promote active living, access to healthy food, and mental health support for all residents.

Service: Our economic development strategies are guided by a commitment to equitable growth, which means ensuring that all businesses and entrepreneurs have equal access to resources and opportunities to succeed.

Economy: We are working to create a resilient and equitable economy that benefits all members of our community, including those who have historically been marginalized or underrepresented.

Celebration: We actively promote our local businesses and have been successful at making our residents more aware of what is available locally as well as attracting visitors from beyond our City.

We take pride in our vibrant arts and culture scene, which serves as a cornerstone of our community and attracts visitors from around the region. We are committed to supporting and promoting local artists and cultural institutions.

Environment: Our economy is growing and diversifying because of our efforts to protect our rivers, streams, wetlands, and other environmental resources.

Sustainability: Residents are staying in Auburn to work and shop, and we are widely considered a regional dining, shopping, and entertainment destination.

Goals and Policies

Goal # 1 – Retention of Existing Businesses

Retain existing businesses by developing growth opportunities, cultivating local talent, promoting safety measures, and facilitating supportive expansion and relocation options.

Policies:

ED-1. Collaborate with local educational partners (e.g. Green River College & Auburn School District) and vocational centers to develop programs that are aligned with the skills needed by businesses in Auburn. This will necessitate a deep understanding of employer needs and educational/employment pipelines and includes fostering partnerships with businesses to provide internships, apprenticeships, and job placement opportunities for local talent.

ED-2. Implement and promote security measures in commercial areas, including physical improvements such as enhanced lighting, surveillance, and landscaping as well as strengthening communication amongst the business community and the City in order to create a secure environment that encourages businesses to succeed.

ED-3. Nurture/foster a collaborative environment by conducting regular gatherings and forums for businesses, community leaders and local government representatives to share their ideas, needs, strategies, and concerns.

ED-4. Develop and implement a support system for existing businesses within the city by assisting them in optimizing their operations and addressing challenges they may encounter during expansion or relocation within the city. Provide comprehensive information on available commercial properties, zoning regulations, and necessary permits. Offer proactive assistance to navigate local government procedures, ensuring a seamless transition for businesses committed to staying and growing in Auburn.

ED-5. Promote diversity and inclusion within the local business community by supporting initiatives that encourage greater participation and inclusion of minority owned businesses. Create resources and programs that provide equitable opportunity for businesses owned by underrepresented groups to be fully engaged in the local business community and the full array of resources and partnerships that exist.

ED-6. Establish a dedicated business retention program that proactively engages with local businesses to understand their needs, challenges, and opportunities. Identify and provide resources and support to address issues before they become significant barriers to continued operation and/or expansion.

Goal # 2 – Attract New Businesses

Attract new, high performing businesses by identifying market gaps, precisely defining the types of businesses Auburn seeks, strategically marketing Auburn's advantages, and optimizing available land and space.

ED-7. Perform regular market analyses to identify emerging trends, gaps, and opportunities in the local and regional markets. Conduct periodic research and collaboration with local education centers, research institutions and industry experts in order to stay updated on emerging needs and opportunities. Emphasize efforts and prioritize opportunities that attract businesses that are positively contributing to a more sustainable and climate-friendly operation. This can be in the form of businesses that are designing, creating, selling and distributing climate-friendly products and approaches or businesses that are seeking to incorporate sustainable development or building management practices.

ED-8. Clearly define the types of businesses that align with the city's economic development strategies, considering local strengths and market demands. Engage with local business associations and community stakeholders to gather input on desired business types. Develop industry profiles to guide prospective businesses in understanding the local market.

ED-9. Implement targeted marketing campaigns to showcase the city's advantages and attract businesses that fit the defined criteria. This includes developing a comprehensive marketing strategy highlighting Auburn's infrastructure, workforce, incentives, and quality of life. Leverage digital platforms, industry conferences, and targeted events to reach potential businesses and investors.

ED-10. Establish incentive programs to encourage desired businesses and industries to choose Auburn as their location. Collaborate with local and state governments to create tax incentives, grants, and other financial support mechanisms. Develop customized incentive packages based on the specific needs of target businesses. Build out a set of incentives that are specifically targeted towards attracting climate-friendly businesses to locate and grow in Auburn.

ED-11. Foster collaboration between the public and private sectors to create a supportive environment for attracting high-performing businesses. This includes establishing a platform for ongoing dialogue and collaboration between local government and business leaders and encouraging private sector participation in infrastructure development, workforce training, and other initiatives.

Goal # 3 – Missing or Underrepresented Industries

Identify and support emerging high performing business sectors with growth potential, contributing to a resilient and dynamic economic landscape, particularly in industries that are currently underrepresented.

Policies

ED-12. Identify and analyze emerging high performing business sectors with growth potential through ongoing collaboration with industry professionals, research institutions, and local business leaders. Develop a systematic process for monitoring market trends and assessing the viability of missing new economic sectors.

ED-13. Direct strategic investments and resources towards industries that are currently underrepresented in the local economy but show potential for growth. This involves creating incentive programs and support mechanisms tailored to the specific needs of these industries to foster their development.

ED-14. Establish programs to support entrepreneurs and startups within the identified high potential sectors. Provide mentorship, access to resources, and networking opportunities to nurture the growth of emerging businesses in underrepresented industries.

ED-15. Collaborate with educational institutions and industry partners to develop training programs and educational initiatives that align with the needs of emerging sectors. This ensures a skilled workforce is ready to contribute to the growth and development of underrepresent industries.

ED-16. Foster a collaborative economic ecosystem by encouraging partnerships between local businesses, startups, research institutions, and government agencies within the identified sectors. Facilitate networking events, conferences, and collaborative projects to strengthen the overall business environment.

Goal #4 – Supporting Industry Clusters

Implement strategies that support local and regional industry clusters which includes approaches that support Auburn specific clusters as well as regional clusters that represent the Highway 167 Corridor clusters, King and Pierce County identified clusters, and regionally identified Puget Sound clusters.

ED-17. Retain and recruit businesses that support an already robust aerospace industry by encouraging establishment and growth of manufacturing, innovation and design, and transport of materials and goods.

ED-18. Seek legislative solutions and private partnerships that are designed to offset the local impacts that occur as a result of logistics uses that are space consumptive, have high impacts on local street conditions, and that result in low performing ratio of jobs to square footage.

ED-19. Upon successful completion of Policy P.2, support the logistics needs that exist along the Highway 167 Corridor between the Port of Seattle and the Port of Tacoma.

ED-20. Expand upon opportunities to build out the local educational systems with the intention to create a stronger and more targeted employment pipeline that supports local industry clusters.

Goal #5 – Downtown Auburn

Develop downtown as a livable, walkable and drivable destination by fostering an active community through art, entertainment, and evening activity. Enhance building design, amenities and safety measures to create a welcoming environment that encourages residents and visitors to explore Auburn.

Policies:

ED-21. Implement public art initiatives and cultural programs in downtown Auburn to enhance the aesthetic appeal and cultural vibrancy of the area. This includes installing public art installations, organizing cultural events, and collaborating with local artists and performers.

ED-22. Foster an active downtown community by organizing regular events, festivals, and markets in downtown Auburn. This involves collaborating with local businesses, community groups, and event organizers to create a diverse calendar of activities that attract residents and visitors.

ED-23. Offer incentives for mixed use developments in the downtown area, encouraging the combination of residential, commercial, and entertainment spaces. This policy aims to create a vibrant and dynamic urban environment that supports both daytime and evening activities.

ED-24. Develop comprehensive parking and transportation plans to ensure convenient access to downtown. This involves strategically placing parking facilities, promoting public transportation options, and encouraging alternative modes of transportation to make the area both drivable and accessible.

ED-25. Enhance security measures, including increased police presence, improved lighting and surveillance systems, to ensure a secure environment for residents and visitors, especially during evening activities. Collaborate with local law enforcement agencies to address security concerns proactively.

ED-26. Improve and expand the existing facade improvement program to support local businesses in upgrading their storefronts, signage, and exterior aesthetics. This not only contributes to the overall visual appeal of downtown but also encourages economic growth.

ED-27. Develop a mix of incentives and penalties that seek to eliminate ongoing vacancy of ground floor commercial spaces.

Goal # 6 – High Standards

Promote high quality architectural design, pedestrian circulation, landscaping, lighting, public amenities, security investments, and signage that are customized to the various commercial and mixed-use areas of the city.

Policies:

ED-28. Implement lighting standards that contribute to the security and quality of commercial areas. This involves strategically placed lighting fixtures, street lighting, and architectural lighting to enhance visibility and create a secure and attractive environment during both day and night.

ED-29. Invest in infrastructure, such as improved multimodal transportation systems, electric vehicle charging stations, rideshare features, parks and open space, and enhanced security measures, to ensure the well-being of pedestrians and cyclists in commercial and mixed-used zones.

ED-30. Establish design standards and procedures within commercial and mixed-use areas. This ensures that development plans align with the preferences and needs of the local community.

ED-31. Establish a mechanism for regular design reviews to assess ongoing and proposed developments in commercial and mixed-use areas. This process ensures that projects align with established design standards and contribute positively to the overall urban beauty.

Goal #7 – Incentives

Develop and implement a comprehensive incentive program designed to attract and support business recruitment and retention. Incentives will include financial benefits, ease of access, community acceptance, strong connections to local goals, and maintaining support beyond initial opening.

Policies:

ED-32. Routinely provide workforce development, business assistance, and business development programs.

ED-33. Implement a streamlined permitting and approval process for businesses, reducing bureaucratic hurdles and ensuring a swift and efficient process. This policy aims to enhance ease of access for both new and existing businesses.

ED-34. Develop incentives that encourage local and regional businesses to actively engage with the local community. This includes supporting community events, participating in local initiatives, and fostering a positive relationship with residents to enhance community acceptance.

ED-35. Establish economic incentives that are geographically targeted and intended to attract specific local and regional businesses, brands, sectors, and amenities within the community.

Goal #8 – Partnership

Facilitate dynamic partnerships between the city, business community, educational institutions, event organizers and lodging providers.

Policies.

ED-36. Develop a comprehensive framework for promoting dynamic partnerships between the city, business community, educational institutions, and business associations. This framework will outline strategies for collaboration, communication channels, and shared goals.

ED-37. Conduct regular meetings and forums to bring together representatives from the city, business community, educational institutions, DAC, chamber. These meetings will serve as platforms for discussing opportunities for collaboration, addressing challenges, and sharing best practices.

ED-38. Encourage the development of collaborative initiatives that leverage the strengths and resources of each stakeholder group. This will include joint marketing campaigns, workforce development programs, community events, and infrastructure projects that benefit all parties involved.

ED-39. Collaborate with event organizers and lodging providers to coordinate and support events that drive economic activity and tourism in the city. This will involve providing logistical support, marketing assistance, and facilitating partnerships to enhance event experiences.

ED-40. Facilitate resource sharing and support services among stakeholders to maximize efficiency and effectiveness. This will involve sharing facilities, equipment, expertise, and access to networks to support mutual goals and initiatives.

ED-41. Acknowledge and appreciate the contributions of stakeholders in fostering dynamic partnerships and collaborative efforts. This could include awards, acknowledgments, and public recognition for exemplary partnerships and initiatives that benefit the city and its community.

Goal #9 – Tourism

Drive the growth of tourism by strategically investing in tourism related initiatives, fostering partnerships with key stakeholders and implementing effective promotional campaigns that are collectively designed to increase the number and length of hotel stays.

Policies

ED-42. Identify and prioritize strategic tourism initiatives, such as the development of tourist attractions, cultural events, and recreational facilities. Ensure these initiatives align with the city's unique offerings and contribute to an attractive and memorable visitor experience.

ED-43. Foster public private partnerships in the tourism sector to leverage the expertise and resources of both the public and private sectors. Encourage collaboration with local businesses, event organizers, and attractions to create a unified and compelling tourism experience,

ED-44. Develop and implement effective promotional campaigns and marketing strategies to increase the visibility of the city as a tourist destination. Utilize digital platforms, social media, and traditional marketing channels to reach target audiences and showcase the city's attractions.

ED-45. Maintain a strong level of communication and coordination with the lodging industry in order to cross promote events and amenities within the city and build Auburn's reputation as a destination.

Goal #9 – Diversity

All members of the community operate on a level playing field with equal access to services and where their participation is welcome and heard.

ED-46. All economic development goals, policies, and strategies will be designed around inclusiveness and with an intention to reach the entire business community.

ED-47. Intentionally identify and recruit missing or underrepresented ethnic and cultural groups to serve on economic development, tourism and downtown boards and commissions.

ED-48. Establish opportunities that enable broader engagement and listening from underserved communities within the city in the development of plans, strategies and decision making.

ED-49. Identify and eliminate barriers that have traditionally made it difficult to start or grow a business due to language. This includes providing translation and interpretation for non-English speaking people and accommodating individuals where a physical disability is eliminating adequate access to services.

Goal #10 – Displacement

In support of a stronger and more diverse economy the city will plan, protect, preserve and produce housing options that are intended to be attainable to all members of the community where the primary goal is to ensure that residents' choices about when, whether and under what circumstances to remain in their home or move.

ED-50. While the Economic Development Element places a heavy emphasis on the attraction of new businesses it is not the intent of this Plan to displace people, communities, populations, or affordable housing. Nor is it the intent of this Plan or any specific Goal or Policy to be considered higher priority in the event that there are conflicts.

ED-51. Establish zoning district boundaries that avoid a result where residential communities are designated as a non-conforming use.

ED-52. Avoid issuance of conditional use permits, variances, and other special land use approvals that convert existing residential uses into new commercial uses. This does not include the allowance of home-based businesses.

ED-53. Establish development standards that mitigate the impacts of noise, light, odor, and building massing generated on commercial sites that are adjacent to existing residential communities.

ED-54. Embrace housing policies that support the creation of more housing across the full spectrum of affordability ranges in order to stabilize housing prices and avoid rapid volatility in the housing market. A strong and stable housing market in all sectors of affordability is an important element of a strong, local, and diverse workforce.

City of Auburn

Parks and Recreation Element

Table of Contents

Introduction....1
Vision....1
Goals and Policies....1

Introduction

Adequate parks and recreation facilities are an essential amenity to maintain a suitable quality of life in the community. As the population of Auburn grows, the demand for its parks and recreational programs will increase. To maintain Auburn's quality of life, the supply of these parks and programs must keep pace with the demand placed on them by a growing population.

Open space also plays a key role in the quality of life in an area. While many understand the concept of the attraction of the western United States and its "open spaces," the concept of open space becomes less clear when it comes to open space and its appropriateness to a city such as Auburn. The policies below provide a definition of open space as applied to Auburn and its surroundings and provide a framework for the identification and preservation of these areas.

Vision

A diverse mix of park and recreation amenities, open spaces, and trails are distributed throughout the city and accessible to the majority of the population. Nonmotorized trails and paths connect residential neighborhoods, commercial centers, and other attractions. People are visiting Auburn because of the robust inventory and quality of park spaces and associated event programming. Community facilities are accessible and are serving the needs of our seniors, youth, and the rest of the community.

Goals and Policies

The mission of the Auburn Parks, Arts and Recreation Department is to "Protect the City of Auburn's natural beauty through a vibrant system of parks, open space, and trails while enhancing the quality of life for our residents by providing outstanding recreational and cultural opportunities."

The goals and policies outlined in this chapter were developed from the following resources:

- 2015 City of Auburn Park, Arts and Recreation Open Space Plan
- 2023 City of Auburn Parks, Recreation and Open Space Survey
- 2023 Washington State Statewide Comprehensive Outdoor Recreation Plan (SCORP)
- Park and Recreation staff meetings
- Participation rates and interests
- Evaluation of existing park conditions.

Goal 1: Serve all residents and provide a broad range of programs and facilities in order to serve all residents regardless of age or ability.

The Auburn Parks, Arts, and Recreation Department is committed to offering leisure and recreational programs and facilities that are accessible to all residents in our community. We recognize the unique needs of certain groups within our population and are dedicated to continually improving our facilities and programs to cater to these needs. This includes increasing awareness of our facilities and programs by incorporating both innovative and traditional methods to engage our citizens.

Policies

PR-1. Incorporate diverse activities: Offer a range of recreational facilities and programs that cater to different age groups, interests, and fitness levels to improve the physical and mental well-being of community members.

PR-2. Promote accessibility: Develop a comprehensive system of neighborhood and community parks ensuring that every resident lives within a half-mile walking distance to a developed park.

PR-3. Adapt to trends: Regularly survey community members to understand changing recreational trends and develop multi-use facilities that can be adapted to meet these evolving needs.

PR-4. Identify and serve: Continually identify under-served segments of the population and develop targeted programs to satisfy their unmet needs.

PR-5. Expand reach: Utilize both traditional and digital marketing strategies to ensure the widest possible distribution of information concerning park facilities and recreation programs.

PR-6. Affordability: Strive to provide programs and facilities that are affordable to local residents, considering tiered pricing structures or discounts for certain groups where appropriate.

PR-7. Expand financial aid: Continue to improve and expand the Fee Waiver and Scholarship Programs, exploring partnerships with local businesses or grants to allow more low-income youth and seniors to participate at reduced rates.

PR-8. Improve accessibility: Continue to improve access for the disabled and seniors by providing wheelchair ramps and other appropriate facilities in parks where they do not currently exist and consider adding more sensory-friendly spaces.

PR-9. Encourage participation: Maintain an open decision-making process that allows for resident input, perhaps through regular town hall meetings or an online suggestion portal.

PR-10. Staffing and resources: Ensure that staffing levels are sufficient to maintain and improve existing cultural and recreation programs. As programs expand or additional parks are developed, evaluate the impact on current staff levels and the need for additional staff.

PR-11. The City shall evaluate the impacts of new development on parks and recreational resources through the SEPA environmental review process and shall take appropriate steps to mitigate significant adverse impacts.

PR-12. New developments shall contribute to the development of new parks at a level commensurate with their share of new facility needs as established by the PROS Plan. If the City determines that the development does not contain an acceptable park site, the City shall require the payment of cash in lieu of land. The funds shall be used to acquire land and/ or develop recreational facilities at a location deemed appropriate by the City. Criteria for site acceptability and appropriateness shall be environmental limitations, accessibility, maintenance costs, consistency with the PROS Plan and the ability to meet more of the Community's recreational needs by the coordinated development of parks located elsewhere

PR-13. The City shall explore all means of funding the purchase of park land including, but not limited to, bond issuance, the collection of cash in lieu of land and federal, state, or county grants.

PR-14. Park impact fees will be established that help fund the future development of new parks, park facilities, trails, and acquisition of open space that meet the needs of an increasing population.

Goal 2: Provide a balanced mix of passive and active recreation opportunities to promote healthy and balanced activities.

Historically, the Auburn Parks and Recreation Department placed an emphasis on sports and active recreation. While the Department and park facilities continue to be oriented towards active recreation, recent developments have included the addition of walking trails and appealing natural environments. These additions are more conducive to a quieter, more relaxed experience in our parks.

Policies

PR-15. Cultivate a comprehensive park system: Develop a park system that caters to a variety of needs by providing facilities for social gatherings, cultural events, and physical activities.

PR-16. Promote passive recreation: We aim to provide park areas that offer opportunities for passive recreation, such as picnicking, birdwatching, and walking, allowing residents to relax and enjoy nature.

PR-17. Facilitate active recreation: Our objective is to provide park areas equipped with facilities for active muscle-powered recreation, including ball fields, skate parks, spray parks, and sports courts, to promote physical fitness and community engagement.

PR-18. Adapt to changing trends: Annually review our recreation programs and compare them to evolving, state, and national trends. Respond with appropriate programs and facilities that meet these changing needs, within the constraints of available funding and budgets, and in line with the service expectations of Auburn's residents.

PR-19. Encourage healthy eating: Provide access to healthy foods by continuing to operate the Auburn Farmer's Market and Community Gardens, promoting local produce and encouraging sustainable living.

Goal 3: Establish a system of high-quality parks that are not only well-maintained but also aesthetically pleasing.

Ensure that Auburn's parks, open spaces, and trails, as one of the most prominent public features in a city, contribute positively to the community's perception. We are committed to the long-term maintenance, thoughtful design, and use of high-quality, durable materials in our parks. This commitment aims to create inviting, safe, and enjoyable spaces that appeal enduringly to all community members. Our overarching objective is to enhance the quality of life in our community through well-maintained and aesthetically pleasing parks.

Policies

PR-20. Develop Level of Service Standards: Establish standards that assure residents' expectations are met. This could involve surveys or public forums to understand community needs and expectations.

PR-21. Intentional design: Design parks to require low maintenance, and low water and energy consumption. Reserve higher maintenance features like fountains or annual beds for high visibility locations.

PR-22. Sustainable materials: Select materials that are not only durable and aesthetically pleasing, but also environmentally friendly.

PR-23. Maintenance and appearance: Ensure parks exhibit a "cared for" appearance through close attention to maintenance, including regular cleaning, landscape updates, and prompt facility repair.

PR-24. Staff evaluation: Regularly evaluate maintenance staff levels, especially when new parkland or facilities are added, to ensure parks remain in a safe and attractive condition.

PR-25. Renovation and redesign: Identify deteriorating features and conditions that require redesign or construction of new facilities. Schedule and budget necessary changes in the City's Capital Facilities Plan.

PR-26. Regular inspections: Conduct regularly scheduled inspections to identify necessary repairs and upgrades, ensuring safe conditions in all park facilities.

Goal 4: Provide a park system that not only enhances the quality of life for our residents but also contributes positively to the city's image.

Strive to develop recreational spaces in Auburn that are well-maintained, accessible, and diverse. These spaces should reflect Auburn's dedication to the well-being of its community, environmental sustainability, and aesthetic appeal. Through thoughtful park design, aim to improve Auburn's image and identity, thereby contributing to a positive perception of the city by creating a visually pleasing environment.

PR-27. Enhance park visibility: Select new park sites that are highly visible. Position at least one side of larger parks along arterial streets, making them more accessible, both physically and visually, and known to the broader community.

PR-28. Boost aesthetics and environment: Increase the quantity of trees, shrubs, and ground covers in parks. Enhance the ambiance of our parks and public spaces that improves the overall aesthetics of the city.

PR-29. Promote urban forestry: Continue to work towards Tree City USA goals for improved urban forestry design and tree preservation.

PR-30. Revitalize the downtown core: Create green spaces in the downtown core that serve as focal points for community activities and stimulate economic growth.

PR-31. Incorporate artwork: Incorporate artwork as part of new park developments or when upgrading existing parks or other public facilities.

Goal 5: Identify, acquire, and effectively manage significant open spaces within the City of Auburn, preserving these areas for their environmental, recreational, and aesthetic value to the community.

Undeveloped open spaces are invaluable assets to the City of Auburn, contributing significantly to the well-being of our community. These spaces serve as protective

buffers against urban encroachment, preserving the natural charm of our city while enhancing the quality of life for Auburn's residents.

Policies

PR-32. Preserve Natural Buffers: Maintain and protect a system of forested corridors and buffers to provide a natural separation between urban land uses and natural areas.

PR-33. Target Open Spaces: Prioritize significant open space areas in the city for planning and acquisition. These target areas include lands along the Green and White Rivers, steep hillsides, the Mill Creek Corridor, and the West Hill Watershed.

PR-34. Secure Funding: Explore all possible funding mechanisms to enable regular acquisition of open space, allowing for the identification and purchase of properties as they become available.

PR-35. Ensure Accessibility: Make city-owned open space lands accessible to the public wherever possible and appropriate, promoting community engagement with nature.

PR-36. Manage and Maintain Spaces: Provide adequate management and maintenance of public open spaces, ensuring their ability to provide environmental benefits and serve as wildlife habitats.

PR-37. Engage the Community: Involve the community in habitat restoration activities through the city's annual Clean Sweep event, community service days, and the adopt-a-park program.

PR-38. Evaluate Ecosystem Services: Determine the ecosystem service value of each open space and park space, ensuring that these areas continue to address climate resiliency goals.

Goal 6: Develop an inclusive network of trails designed for all, accommodating pedestrians, cyclists, and individuals of all mobility levels.

To develop an inclusive network of trails, we will prioritize the needs of all residents. We will create a comprehensive multi-use trail system that facilitates movement throughout the city and region without the need for a car. This approach is not only environmentally friendly, reducing pollution and traffic congestion, but also promotes a healthier lifestyle. The objectives that follow are designed to enhance our trail system, transforming it into a truly multi-modal environment that caters to pedestrians, cyclists, and individuals of all mobility levels.

Policies

PR-39. Expand the trail network: Develop and extend a network of trails to provide comprehensive coverage for both commuting and recreational cyclists, while creating stronger East/West connections throughout the city.

PR-40. Prioritize the Green River Trail: Continue prioritizing the acquisition of land for the proposed Green River Trail.

PR-41. Leverage natural locations: Design and layout trails to take advantage of unique natural locations, providing access to a variety of landscapes and habitats.

PR-42. Regional collaboration: Actively participate in planning activities for regional trails in South King County and North Pierce County.

PR-43. Explore New Connections: Investigate possibilities for new trail connections between Auburn and neighboring communities.

PR-44. Ensure Accessibility: Develop and maintain trails in compliance with the Americans with Disabilities Act, ensuring accessibility for all.

PR-45. Promote Safety: Foster a safe trail system by discouraging crime through environmental design concepts.

PR-46. Standardize Wayfinding: Continue to implement an interpretive and way-finding program for use throughout our trail system.

PR-47. Secure funding: Identify and secure funding to maintain existing trail systems.

Goal 7: Enhance our existing park portfolio by addressing areas where service standards are currently not met, prioritizing improvements, particularly in the West Hill and Lea Hill regions of the city.

Provide unique opportunities for the community to shape the city in ways that benefit everyone, especially the underserved areas.

Policies

PR-48. Prioritize community parks: Prioritize the development of community parks and linear parks with trail systems over small neighborhood parks when possible and appropriate.

PR-49. Secure funding: Apply for grants from King County Conservation Futures and the Recreation & Conservation Office, among other available funding sources, to acquire and preserve parkland and natural areas.

PR-50. Acquire community amenities: Emphasize the acquisition of community amenities, such as shoreline property, to preserve these special places and provide public access.

PR-51. Minimize land use conflicts: Minimize conflicts between parks and other land uses, and employ sensitive design measures when locating parks in residential neighborhoods.

PR-52. Ensure quality design: Establish criteria for new park development to ensure consistent high-quality design that meets the needs of the community.

PR-53. Develop master plans: Develop Master Plans for undeveloped park properties and incorporate future park development costs into the Capital Facilities Plan as appropriate.

PR-54. Engage the community: Schedule public meetings as part of the Master Planning process to ensure residents' voices are heard and their needs are met when developing new parks.

PR-55. Create public gathering spaces: Develop public gathering spaces in the downtown core to foster community interaction and engagement.

CONDITIONS AND TRENDS 3
Main Street 3
Historic Registry 3
GOALS AND POLICIES 6

INTRODUCTION AND BACKGROUND

Through the recognition and preservation of its past, Auburn can ensure its uniqueness and strengthen its identity as it moves into the future. The City recognizes the importance of maintaining this connection with its past by including policies which address the enhancement and maintenance of historic resources within this Comprehensive Plan. This importance is also recognized by both the State and the County by the inclusion of historic preservation as one of the goals of the Growth Management Act (GMA) and in the King County Countywide policies.

Planning Approach to maintain, preserve, and enhance the City's historic, cultural and archaeological resources to provide a sense of local identity and history to the visitors and residents of the community.

In 2010 the United States Census Bureau identified Auburn's population as being 70,180 residents. Auburn grew in population to 84,858 residents in 2022, a 20% increase in 12 years but has since gone down in population to 82,657 in 2024... The growth applied substantial development pressure onto the city and enabled new businesses and services to prosper, but without the proper management of growth and development, these forces have potential to negatively impact the historic sites and cultural practices that exist in Auburn, and which contribute to the reason why residents and visitors are drawn to Auburn in the first place.

Proper identification and stewardship of historic and cultural assets is critical as the city works to balance competing demands on space, housing, services, and resources, because said assets help to create an identifiable identity for Auburn and often enable residents to better connect with their community. These assets may be historically significant structures, landmarks, and places and practices of tribal importance.

Vision

Unlike many cities within the Puget Sound Region, Auburn has a long and established history. Auburn has been a vibrant and freestanding community for over 100 years. As a result, Auburn developed its own downtown as the focus of business and community life. The downtown in particular, and the community as a whole, were linked to the railroads, which were the major mode of transportation throughout the region for decades. In the past several decades, the region has experienced significant population growth. Due to the nature of this growth, the differences between one community and another have blurred, and communities are becoming more and more alike. If Auburn is to retain its identity as a unique community, it must seek to emphasize its differences and celebrate them. Auburn's history is a part of its identity that is unique to Auburn.

VALUES

Auburn's history is identifiable and unique, contributing to an evident community identity. By preserving where this community has already been, we better inform where it's going. Under pressure to grow its economy while simultaneously meeting the emerging needs of its residents, Auburn's municipal policies aimed at preserving the city's historic and cultural assets will be shaped by our shared values. These values are:

Character

Historic structures and culturally significant sites are protected, ensuring that Auburn's community identity is grounded in its historic legacy.

Wellness

Efforts to support the livability of historic neighborhoods and structures are supported through city programs, projects, and collaboration with communities.

Service

The ongoing function and operations of historic structures and places are supported through the investment into, and maintenance of, the utilities that serve them.

Economy

One-of-a-kind historic structures and places are revitalized, enhancing property values, and encouraging consumers to remain in place and purchase goods.

Celebration

Auburn's history and local culture is actively promoted to residents and visitors in collaboration with city-supported organizations and official programs.

Environment

Investment, maintenance, and restoration of existing buildings and places are prioritized, disincentivizing urban sprawl into natural and open spaces.

Sustainability

Growth and business activity in Auburn does not damage local historic sites and culturally important practices continue to be emphasized and supported.

CONDITIONS AND TRENDS

Main Street

In 2017 the Heritage Building, a structure which housed apartments and local storefronts since 1924, tragically burned down, creating a gap in Auburn's otherwise well-defined and preserved Main Street. Four years later, in 2021, the Max House Apartments, another mature Main Street-defining structure also caught fire, eventually spreading to the historic and beloved Auburn Avenue Theater, rendering both buildings unsalvageable. Today, the city and stakeholders continue work to reimagine the sites of the three lost Main Street structures, and though their absence serve as an opportunity to imagine a new direction, their loss nonetheless remains an important reminder of the importance of historic preservation, because many culturally and historic assets cannot be replaced so easily once gone.

Historic Registry

There are currently six properties in the city of Auburn listed on either the King County Landmarks List or the National Register of Historic Places. When a property is added to either of these lists it means that their historic status is secured and they are now subject to a number of legal protections to prevent their removal, destruction, or alteration.

The six properties are:

- *Auburn Masonic Temple* – Designated 2002

  In the late 1800s, settlers in Auburn formed King Solomon Lodge No. 60, becoming the town's second fraternal order. They built the Auburn Masonic Temple in 1924, a historic Italian Renaissance Revival-style building listed on the King County Landmarks List in 2002 and National Register of Historic Places in 2015. It is located at 10 Auburn Way S.

- ***Auburn Pioneer Cemetery*** – Designated 2016

Auburn Pioneer Cemetery, established in the 1860s, is the city's oldest cemetery. It underwent various name changes and was designated a landmark in 2016. In 2019, the restored cemetery was officially dedicated, featuring new walkways, signage, and the Tora Kato monument's restoration. It is located at 850 Auburn Way N.

- ***Auburn Post Office*** – Designated 2000

Built in 1937, the Auburn Post Office transitioned to King County's use in the 1960s. In 2016, the City of Auburn acquired the building to create the Auburn Postmark Center for the Arts & Culture Center preserving its character for diverse community arts activities. It is located at 20 Auburn Ave.

- ***Auburn Public Library*** – Designated 1995

- In 1914, Auburn celebrated the opening of its Carnegie Library, located at 3rd Street NE and Auburn Avenue. Designed by architect David J. Myers and funded by a $9,000 grant from the Carnegie Corporation, the 5,000 square-foot brick building featured a central librarian's desk, a children's section, and an adult section, serving the city for 50 years. It is located at 306 Auburn Ave.

- ***Mary Olson Farm*** – Designated 2000

Mary Olson Farm, a partnership between the White River Valley Museum and City of Auburn, is a fully restored 1880s subsistence farm, known for its preservation and conservation awards. This historic 67-acre site includes seven wooden buildings, an orchard, and meadows, offering a glimpse into early 1900s farm life. It is located at 28728 Green River Road.

- ***Oscar Blomeen House*** – Designated 1991

Built by owner Oscar Blomeen in 1914, the Oscar Blomeen House features a corner turret and a rich history. It served as Auburn's first hospital during the 1917-1919 influenza epidemic, a maternity hospital, and a surgical center. It's also an example of post-Victorian architecture with Craftsman influences. It is located at 324 B St NE.

GOALS AND POLICIES

Goal 1. To enhance and maintain the quality of historical resources in the region.

HP-1 - Encourage the protection, preservation, recovery and rehabilitation of significant archaeological resources and historic sites in Auburn

HP-2 – Educate City staff to recognize significant resources and structures or provide City staff with access to professionals who specialize in historic preservation.

HP-3 - Seek grant opportunities to conduct historic building inventories of neighborhoods.

HP-4 - Develop an Historic Preservation Plan to identify and protect Auburn's historic resources.

HP-5 - Update the historic site and building inventory as part of this plan to include additional buildings, signage, corridors, and public spaces of historical significance.

HP-6 - Amend existing historic preservation codes and incentives as needed to implement the Historic Preservation Plan.

HP-7 - The City should consider the impacts of new development on existing historic buildings and resources as a part of its environmental review process and encourage alternatives to demolition.

HP-8 - Propose adaptive reuse ideas to encourage the rehabilitation of sites and buildings with unique or significant historic characteristics.

HP-9 - Archival quality historical documentation should be required when a historical building cannot be preserved. Buildings eligible for landmark status shall require the most detailed level of archival documentation and/or measured drawings.

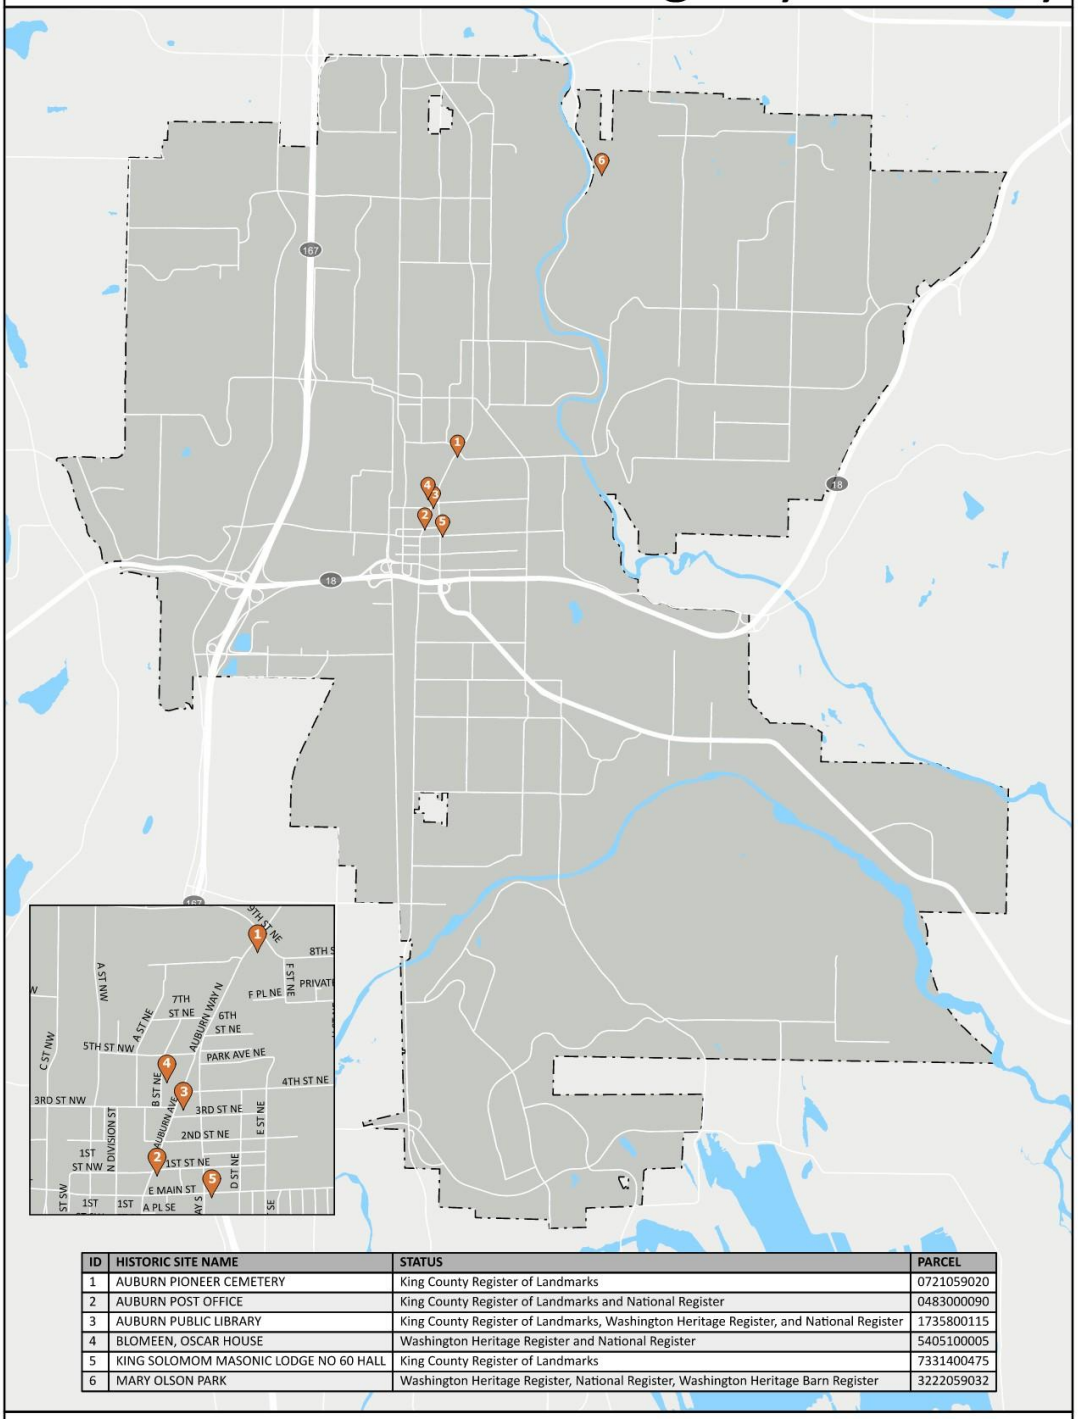
HP-10 - Require appropriate mitigation measures if demolition is imminent, such as establishing a mitigation fund that could be used to further preservation elsewhere in the City.

HP-11 - Future development in the Downtown area should be sensitive to the character of surrounding buildings and the historical context of the area.

HP-12 - Retain existing buildings with historic characteristics and research the potential for placing additional buildings on the historic register.

HP-13 - Modifications of existing buildings shall consider the appropriate treatment or restoration of historic architectural features.

HP-14 - Make restoration of historic buildings known to the public through publication of projects to foster pride in downtown Auburn.



HP-15 - The White River Valley Historical Museum is recognized as the primary repository of historic artifacts which relate to the City's historic and cultural heritage.

HP-16 - Promote activities that create awareness and support cultivating the heritage of Auburn by offering walking or biking tours, festivals, and other means.

HP-17 - Recognize Auburn's past prior to the arrival of settlers by promoting Native American sites and artifacts.

HP-18 - Market the economic benefits to business owners and community groups when promoting cultural and historical events to gain a variety of involvement from various sectors in the City.

Introduction

The Climate Element of the City of Auburn's comprehensive plan is a strategic document to guide policy implementation in Auburn as it pertains to addressing anticipated climate-related changes to the city's and region's local environment. The city is undertaking planning for climate change as a response to House Bill 1181, passed by the Washington State Legislature in July 2023, and which requires that the city adopt climate planning goals, policies, and actions into its comprehensive plan by 2029.

The City of Auburn is choosing to proactively engage in planning for climate change now, as opposed to by 2029. This is in part due to the immediate importance of preparing for climate change, and in anticipation of the expected long-term timelines of a number of climate response strategies.

What does the Climate Element do?

- Identify priority climate-driven natural hazards anticipated to impact Auburn
- Determine community vulnerability, resilience, and risk
- Provide policy guidance for ensuing 20 years of planning for climate change

The Climate Element is organized by two overarching principles: Resilience and Mitigation. The resilience sub-element will lay out policies and strategies devised to improve the health of Auburn's natural environment and citizens, while protecting local services and assets from negative impacts associated with climate change.

The mitigation sub-element will lay out policies and strategies directed at reducing city and community emissions contributions to global greenhouse gas levels and work to discourage other environmentally harmful actions.

Vision

Nestled in the heart of the Green River Valley with Mt. Rainer as a backdrop, Auburn is a historic and welcoming community with an innovative industrial-based economy and a wealth of outdoor and cultural activities at its doorstep. Yet the vitality, livelihoods, and surrounding environment that make up the fabric of Auburn's community are threatened by human-driven climate change as concentrations of carbon dioxide and other greenhouse gases in the atmosphere continue rising. By taking action to mitigate the worst impacts of climate change, Auburn is living out its commitment to its core community values of sustainability, environmental stewardship, and economic vibrancy and ensuring that it remains a livable, sustainable, and safe place to live, work, and visit.

Values

Auburn is a dynamic community with much to offer both residents and visitors. Here, people understand the value of protecting cherished community assets, both urban and natural. With severe climate-driven changes expected to come to Auburn over the coming decades, Auburn's shared community values will stand as clear directions which will shape and guide municipal climate policy. These values are:

Character

Auburn's surrounding natural environment is restored and investments in Auburn's resilience enhance the aesthetic and social qualities of the built environment.

Wellness

Resilience and emissions mitigation investments are grounded in environmental justice and target front-line communities who are most at risk of suffering adverse health impacts as a result of climate-related hazards.

Service

The city ensures the long-term maintenance and protection of vital infrastructure and services in order for residents to continue to rely on them in the face of extreme weather events.

Economy

Auburn is a leader in providing green job opportunities and training and ensures that it remains a vibrant and supportive community in which to conduct business.

Celebration

Places and assets of communal value are protected from degradation under extreme weather events and worsening climatic conditions.

Environment

The natural environment is protected and restored and the built environment appropriately safeguards natural lands.

Sustainability

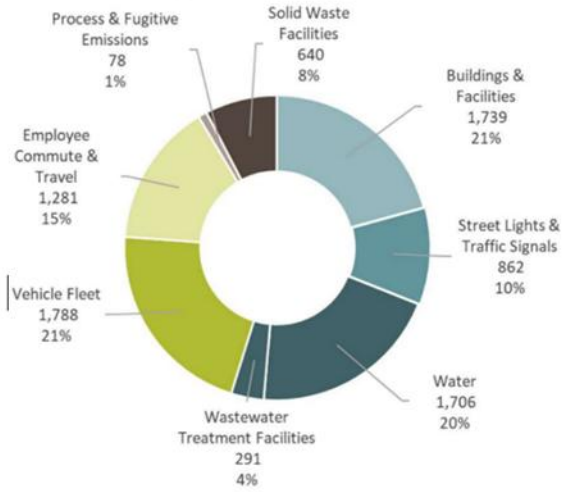
Activity in Auburn does not deteriorate the local natural environment and its emission contributions continue to decline.

Conditions and Trends

Greenhouse Gas Emissions

In 2007 the City of Auburn joined the U.S. Mayors' Climate Protection Agreement, committing to reducing the city's greenhouse gas (GHG) emissions and subsequently conducted its first GHG emissions inventory, marking 2008 as the baseline year to compare future emissions against. That year, it was revealed that community activities in Auburn – transportation, residential and commercial building energy use, and waste – were responsible for 848,324 metric tons of Carbon Dioxide, CO2 (mtCO2e) emitted. Municipal emissions – emissions directly caused by City of Auburn activity – were revealed to contribute 10,373 mtCO2e that year.[1]

Figure 1 – Municipal Emissions Inventory by Sector ($MTCO_2e$) 2015. Source: Climate Action Plan of the City of Auburn



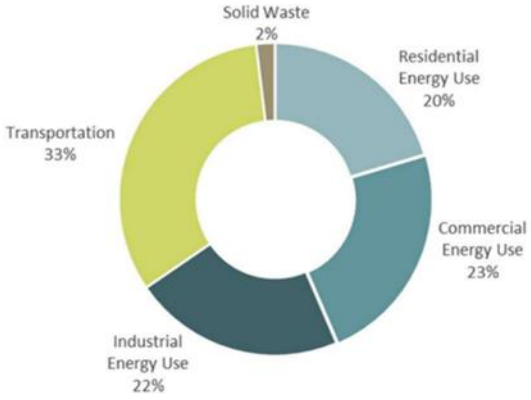


Figure 2 – Community Emissions Inventory by Sector ($MTCO_2e$) 2015. Source: Climate Action Plan of the City of Auburn

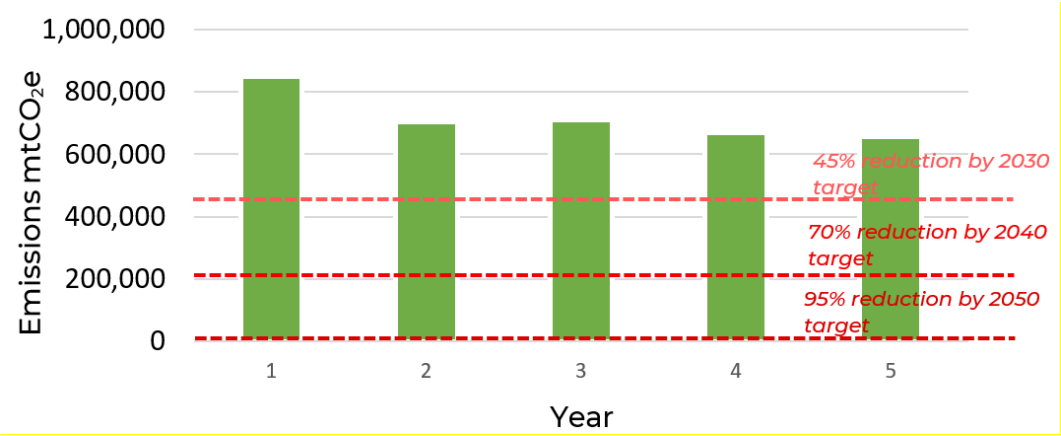
In 2018 the City commissioned its second greenhouse gas inventory and determined that community and municipal emissions had each declined since 2008 despite Auburn's population having grown during this same time period. Community emissions declined by 16% and municipal emissions declined by 19%.

Auburn was able to achieve these reductions through significant cuts to electricity demand on municipal buildings, lower diesel and gasoline community demand due to commute trip reduction plans, and the implementation of waste diversion programs.[2]

Nonetheless, the City's State and County partners have adopted ambitious emissions reductions timelines, and though Auburn has found success in its approach to emissions reduction, the City will have to take on a more aggressive

[1] Cascadia Consulting Group, Inc. Climate Action Plan of the City of Auburn, 2018

[2] Cascadia Consulting Group inc. Greenhouse Gas Inventory for the City of Auburn, Washington, 2018



stance of curbing its emissions sources in order to meet its legally mandated reduction targets on time.

Table 1 – Greenhouse Gas Emissions Reductions Targets

	2030	2040	2050
Statewide*	-45%	-70%	-95%
PSRC**	-50%	-	-80%
King County**	-50%	-	-80%
Pierce County*	-45%	-70%	-95%

*Pierce county and statewide targets based on 1990 GHG emissions levels.
**PSRC and King County targets based on 2007 levels.

Identified Priority Climate Hazards

Climate change-related hazards are not expected to impact communities and regions uniformly, some communities may get wetter, others drier, some may be impacted by significant sea-level rise while others will not. Some communities are also going to be more vulnerable to particular climate change-related hazards than others due to the presence or absence of particular infrastructure, its state of repair, and exposure to risk. A community's demographic characteristics may also contribute to its vulnerability; for example, a community with a notable degree of respiratory illness may find it valuable to prioritize preparing for worsening air quality. Each of these are things to keep in mind when identifying priority climate hazards of which are most important to prepare for.

The process of identifying priority climate hazards projected to afflict Auburn relied on the University of Washington's Climate Mapping for a Resilient Washington tool, a climate analysis tool developed to help jurisdictions across Washington

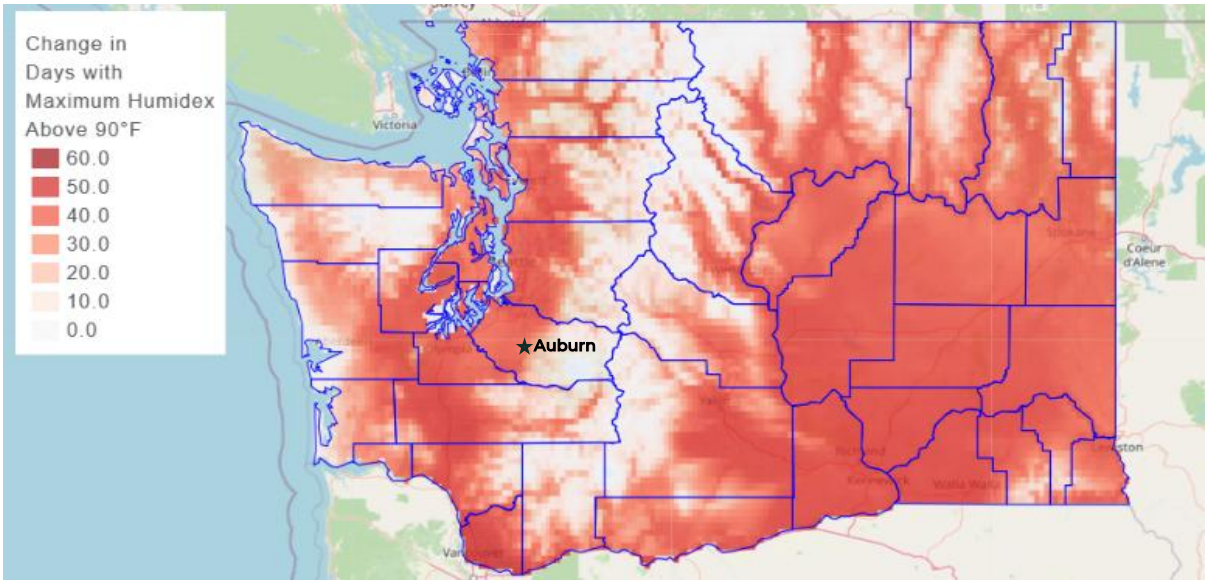
understand and visualize various climate change impacts and vulnerabilities across the next century and determine the specific affects.

Given the regional context, the characteristics of the city's infrastructure, and the economic and public health vulnerabilities of Auburn at large, the climate-change related hazards which are expected to present the greatest concern for the Auburn community are rising temperatures and exposure to extreme heat, increasingly severe storms and flooding, and more frequent droughts and wildfires.[3]

Priority Climate Hazards Anticipated to Impact Auburn Most

- Rising Temperatures and Extreme Heat
- Severe Storms and Flooding
- Drought and Wildfires

Rising Temperatures and Extreme Heat



In the Pacific Northwest, average annual temperatures rose 1.5°F over the last century, resulting in a reduction of snowpack across the Cascade Mountains, more frequent droughts, and more extreme heat events. Left unaddressed, the impacts of rising temperatures will have tangible effects on public health and quality of life in Auburn. Warmer temperatures and extreme heat can increase heat stress and worsen air quality, heighten allergy symptoms, and exacerbate respiratory illness. Greater average annual temperatures are also expected to coincide with an increase in the number of very hot days – days over 90°F – which may result in greater health risks to those who work outdoors or vulnerable populations such as the elderly.

Rising temperatures also carry the potential to affect our region's bodies of water and negatively impact the quality of Auburn's natural environment. Warmer streams and lakes can harm fish stocks and produce harmful algal blooms; in 2012 for example, over 80 percent of surveyed streams in King County exceeded state standards for salmon habitat protection. Meanwhile higher temperatures can intensify droughts by reducing snowpack and water storage, leading to a drier landscape in and around Auburn.[4]

[3] Cascadia Consulting Group, Inc. Climate Element Comprehensive Plan Framework, 2023

[4] University of Washington Climate Impacts Group. Climate Mapping for a Resilient Washington, 2022

Figure 2 – Projected Change in Days with Maximum Humidex Above 90° in Washington by 2050-2079. Source: University of Washington Climate Impacts

Severe Storms and Flooding

Climate change is expected to cause precipitation patterns to shift into the extremes, with far less rainfall occurring in the summer months resulting in drought-like conditions for portions of the year, while heavier-than-normal rains are expected to increase the likelihood and frequency of flooding events the rest of the year.[5]

In Auburn this means greater likelihood for floods in low-lying areas surrounding the Green and White Rivers during severe storms, more potential for landslides along sloped areas of the city as a result of erosion and soil displacement caused by heavy rains, and water quality concerns in the event that runoff exceeds the capacity of existing stormwater management facilities and infiltrates polluted lands. Each of these potential impacts also carry additional concerns for public health, economic activity, the quality of Auburn's natural environment, and produce direct financial costs to Auburn residents.

[5] University of Washington Climate Impacts Group

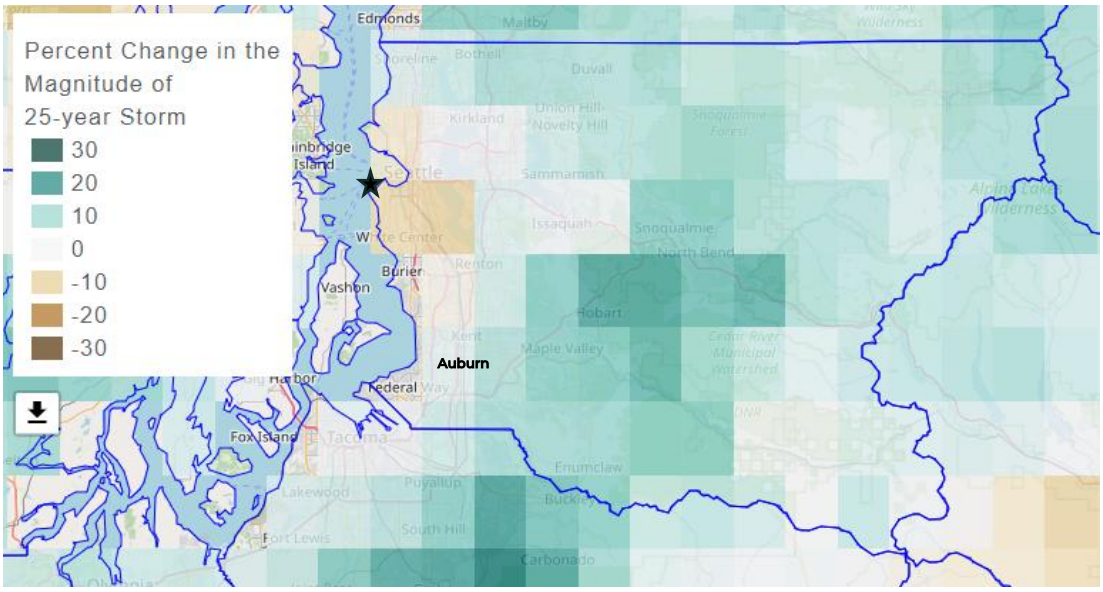


Figure 3 – Projected Percent Change in Magnitude of 25-year Storm inking County by 2020-2049. Source: University of Washington Climate Impacts Group (2023)

Drought and Wildfires

Places in Washington once thought to have minimal wildfire risk are increasingly becoming less so as global average annual temperatures continue to rise, drying out more and more Washington land which in turn serves as greater reserves of potential fuel for wildfires to spread.

Wildfire risk is expected to grow significantly in many neighboring counties, including King County, increasing the intensity and frequency of days with unhealthy levels of air quality in Auburn due to smoke. This will exacerbate respiratory illness, limit outdoor activities, and harm the natural environment.[6]

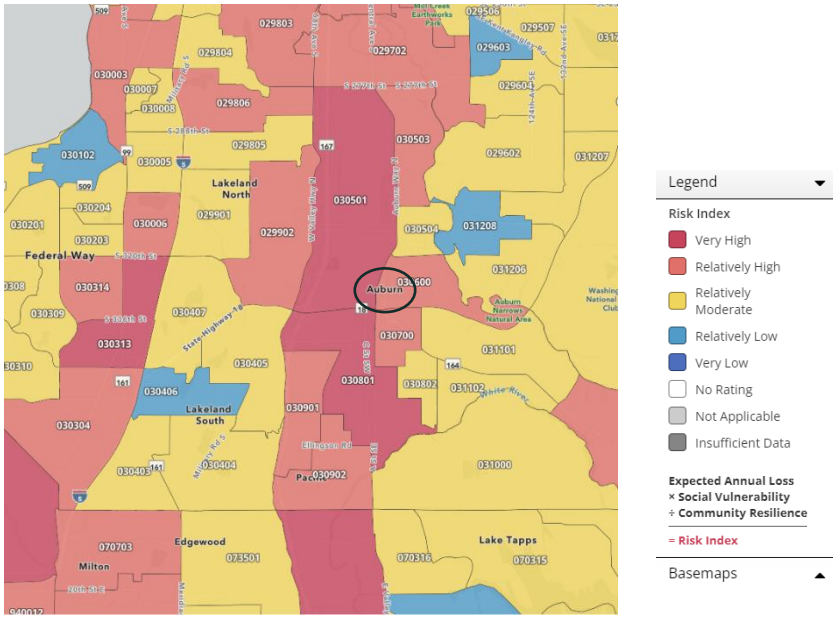
Likelihood of drought in any given year by 2100

(High Global Emissions Scenario)

- *Auburn – 32%*
- *King County – 34%*
- *Pierce County – 34%*

[6] King County Wildfire Risk Reduction Strategy

Figure 4 – Wildfire Smoke Seen in Seattle. Source Getty Images (2020)



If current emissions trends continue, greater conservation of water during drought years will be necessary and increased demand on emergency services in response to reduced access to potable water will become more likely.

Risk Index

These identified priority climate hazards are expected to interact with Auburn's prevailing resiliency and vulnerability characteristics in such a way that FEMA has determined that much of Auburn is at relatively high or very high risk of negative impacts from climate change, underscoring the necessity to plan for climate change[7].

Figure 5 – Risk Index for Auburn and South King County. Source: Federal Emergency Management Agency (2023)

[7] Federal Emergency Management Agency. National Risk Index, 2023

Climate Policy at a Glance

The state legislature requires that Auburn's Climate Element include several components in order to be in compliance with the Growth Management Act. Likewise, the Climate Element will reflect the requirements set by the Puget Sound Regional Council and Auburn's King and Pierce County partners.

Sub-Elements

The Climate Element will feature goals, policies, objectives, and implementation strategies which will be organized into two sub-elements, one which addresses resilience and one which addresses greenhouse gas emissions mitigation.

Resilience Sub-Element

The first of two sub-elements, the Resilience sub-element will layout methods to address climate resilience, environmental justice, and equity. This section of the Climate element will also identify natural hazards which will be exacerbated by climate change, and the potential approaches to assess community vulnerability. The sub-element will also address conservation of natural areas and the introduction of green infrastructure investments, which will allow Auburn to overcome future hazards.

The Resilience Sub-Element will:

- **Take Stock of Assets**
- **Identify Vulnerabilities**
- **Assess Risks**
- **Recommend Protections**

Greenhouse Gas Emissions Mitigation Sub-Element

The Emissions Mitigation sub-element will identify significant sources of emissions, establish methods of measuring municipal and community emissions, and set emissions reduction targets to work toward. This is an important aspect of planning for climate change as greenhouse gas emissions are largely contributing to the projected change in global climate.

The Emissions Mitigation Sub-Element will:

- **Identify Community and Municipal Emissions**
- **Establish Reduction Targets**

- **Recommend Mitigation Efforts**

RESILIENCE SUB-ELEMENT

The Washington State Department of Commerce defines resilience as, "...the ongoing process of anticipating, preparing for, and adapting to changes in climate and minimizing negative impacts to our natural systems, infrastructure, and communities." Auburn can improve its resilience by introducing mitigation efforts against natural hazards, adapting to unpreventable impacts, protecting and restoring natural areas, and developing recovery responses. The goals, policies, and implementation strategies of the Resilience sub-element are organized into six key themes:

1. Public Health and Community Resilience
2. Infrastructure and Emergency Preparedness
3. Cultural Resources and Practices
4. Water Conservation and Stormwater Management
5. Natural Habitats and Urban Green Space
6. Economic Development

***** Policy developed for concurrency with King County's Strategic Climate Action Plan

****** Policy developed for concurrency with Washington Department of Commerce Climate Planning guidance

******* Policy developed for concurrency with Puget Sound Regional Council's Vision 2050

Goals, Policies, and Actions

Theme 1. Public Health and Community Resilience

Policies related to identifying climate vulnerable communities, investing in programs and services that reduce vulnerability in vulnerable and frontline communities, and prioritizing green affordable housing should be considered.

Goal 1. Conduct, and periodically update, a climate vulnerability and risk assessment

C-1 * Integrate a climate impacts risk assessment and policies into the local hazard mitigation plan.

C-2 ** Support enhanced data collection for hazard events of all magnitudes to provide a fuller understanding of the community's hazard characteristics — including those affected by climate change.

C-3 *** Promote the use of health impact assessments and other tools to address the potential impacts of health, equity, and climate change on vulnerable communities.

Goal 1 Actions

Action 1.1 *** Conduct, and periodically update, a climate vulnerability and risk assessment that includes a focus on the built environment, community, and natural systems. Support enhanced data collection for hazard events to provide a fuller understanding of the community's hazard characteristics—including identifying demographic groups/community members most vulnerable to climate impacts. Use assessment findings to evaluate changes to comprehensive plan goals and policies and enhance resilience.

Goal 2. Minimize disproportionate impacts of climate change on vulnerable and frontline communities and focus/maximize associated benefits

C-4 * Improve access to services throughout the community by investing in partnerships with frontline communities to co-identify and remove systemic and physical barriers to services that increase climate resilience such as green living environments and adequate public facilities.

C-5 * Identify those communities disproportionately impacted by extreme heat events and prioritize equitable access to emergency preparedness resources for vulnerable populations and areas. Develop and distribute tools and resources for the community to stay safe during extreme heat events.

Goal 3. Prioritize green, affordable housing to meet projected growth and needs of the community

C-6 Support projects that bring renewable energy and/or higher standard of energy efficiency to communities of color, low-income populations, and members of limited-English speaking communities, based on evaluation and assessment of barriers and challenges.

C-7 *** Uphold the Growth Management Act to prioritize dense, mixed use, transit-oriented development (TOD) and affordable housing by encouraging integrated site planning and green building, with a focus on early consideration of these in the site development process. Encourage the location of new green, affordable housing units near community amenities and services, such as transit and green space.

C-8 * Give consideration to and promote a local community response to homelessness with affordable, green housing and those which include supportive services.

Theme 2. Infrastructure and Emergency Preparedness

Policies related to and offering equitable access to adaptation resources (i.e., resilience hubs), developing strategies to aid community members ability to respond to extreme weather events (i.e., extreme heat, wildfire smoke events), and ensuring critical and non-critical infrastructure is resilient in the face of climate change should be considered.

Goal 4. Equitably protect public health and safety by identifying and planning for risks associated with climate change.

C-9 *** Ensure that people, including the community's most vulnerable groups, are resilient to climate and weather-related hazards by better understanding hazard type and impact and equipping people and the community to prepare for and respond to emergency situations.

C-10 *** Develop community-serving facilities augmented to support residents and that coordinate resource distribution and services before, during, and after a hazard event.

C-11 *** Work toward a distribution of growth that promotes equitable access for frontline communities and reduces the potential for displacement through program services such as municipal emergency preparedness with consideration of climate impacts such as extreme heat, flooding, wildfire smoke, and drought.

C-12 *** Factor climate impacts into the planning of operations and coordination of preparedness, response, and recovery activities among first responders and partners, including public health, law enforcement, fire, school, and emergency medical services (EMS) personnel.

Goal 4 Actions

Action 4.1 ** Create evacuation plans and outreach materials to help residents plan and practice actions that make evacuation quicker and safer.

Goal 5. Protect the community from extreme heat impacts and wildfire smoke

C-13 ** Prioritize at-risk community members for actions that mitigate wildfire smoke, including providing filter fans or incentivizing infrastructure updates that protect against wildfire smoke (e.g., HVAC updates and MERV 13 filters for air intake) for facilities that serve high-risk populations.

C-14 * Review and update land use and development codes to encourage the use of passive cooling approaches to reduce urban heat island effects. Utilizing energy efficient cooling technologies, reflective and/or vegetated roofs, and the integration of trees where appropriate, landscaping, and green space should be implemented

to help reduce the health effects of extreme heat on frontline communities and vulnerable populations.

C-15 * Encourage the use of methods that contribute to improved indoor air quality during wildfire smoke events.

C-16 ** Develop and implement notification alerts within the community to reduce the risk of exposure to wildfire smoke and particulate matter.

C-17 ** Promote equitable access to green space within a half-mile of all community members.

C-18 ** Support programs to distribute cooling units and install heat pumps, prioritizing households with residents (e.g., low-income seniors) most vulnerable to extreme temperature events.

Goal 5 Actions

Action 5.1 * Develop and implement an urban heat resilience plan or strategy that includes heat mitigation and management actions to prepare for and respond to chronic and acute heat risk in the community. The strategy should be informed by urban heat island mapping and may include coordinated efforts such as cooling centers, early warning systems, development/land use codes, and energy grid resilience. Utilize the King County Extreme Heat Mitigation Strategy to align with county planning efforts.

Action 5.2 * Develop community wildfire preparedness, response, and recovery plans as part of local hazard mitigation plans.

Action 5.3* Provide community education and outreach on flood mitigation best management practices and expand household-level wildfire mitigation assistance.

Action 5.4 * Provide community education and outreach on wildfire smoke mitigation best management practices. Ensure outreach is accessible and prioritize frontline communities.

Action 5.5 ** Develop and implement a wildfire smoke resilience strategy in partnership with local residents, emergency management officials, regional clean air agency officials, and other stakeholders.

Action 5.6 ** Develop and implement an urban heat resilience strategy that includes land use, urban design, urban greening, and waste heat reduction actions.

Goal 6. Ensure that infrastructure (critical and noncritical) and utilities are resilient to climate change impacts (e.g., precipitation events and stormwater flooding)

C-19 * Integrate local climate impacts risk assessment into hazard mitigation planning.

C-20 *** Factor climate impacts into the planning of operations and coordination of preparedness, response, and recovery activities.

C-21 * Encourage coordination and support public education by utility providers that raises awareness of the need for water and energy conservation and empowers individuals across diverse audience segments to take action.

C-22 *** Account for climate change impacts in planning, designing, and operating stormwater management approaches, including stormwater infrastructure and stormwater best management practices.

C-23 * Identify areas prone to flooding and encourage the reduction of flooding through improvements to drainage systems, particularly in traditionally underserved areas.

C-24 ** Incorporate post-wildfire debris flow and flooding hazard information into critical area delineation in fire-prone communities.

Goal 6 Actions

Action 6.1 ** Develop and improve transportation network with consideration of infrastructure within floodplains and other critical areas to provide for alternate routes and network resiliency.

Action 6.2 ** Analyze how the municipal water system maintains adequate pressure during major drought events as well as under reasonably forecasted drought conditions.

Goal 7. Provide all residents an equitable opportunity to learn about climate impacts, influence policy decisions, and take action to enhance community resilience through community engagement efforts.

C-25 ** Create and implement culturally contextualized outreach and education initiatives and materials that will inform the community about near-term and longer-term climate change threats and ways that the community can prepare and build resilience to these changes.

C-26 ** Build and support partnerships with community organizations with the capacity and relationships to convene diverse coalitions of residents and to educate and empower them to implement climate resilience actions.

C-27 ** Cultivate relationships with climate justice coalitions that can help facilitate frontline community learning and engagement that links local issues with regional and statewide issues.

Theme 3. Cultural Resources and Practices

Additional policies related to assessing climate vulnerability of the city's historic resources and establishing and maintaining government-to-government relations with tribes related to preserving sites should be considered.

Goal 8. Protect and preserve cultural resources and practices to build resilient communities and ecosystems in the face of climate change

C-28 ** Promote or work with partners to establish a native plant nursery and seed bank to support long-term restoration and carbon sequestration efforts.

C-29 ** Maintain government-to-government relations with Native American tribes for the preservation of archaeological sites and traditional cultural properties that are vulnerable to climate impacts.

Theme 4. Water Conservation and Stormwater Management

Policies that link climate change with water conservation efforts and stormwater management should be considered.

Goal 9. Protect and preserve water quantity and quality from drought, extreme heat, and other hazards exacerbated by climate change consistent with the Utilities element

C-30 ** Utilize water conservation methods and technologies in development of irrigation infrastructure within parks and recreation areas to foster climate resilience.

C-31 *** Promote water conservation through management of water resources, including efficient irrigation, preventative maintenance, efficient plant selection, and landscape management.

C-32 Account for climate change impacts in planning, designing, and operating stormwater management approaches consistent with the Comprehensive Storm Drainage Plan.

C-33 *** Identify opportunities to retrofit undersized stormwater infrastructure and areas with uncontrolled runoff to improve flow control and water quality, with a priority on locations providing the most benefit, are identified to be most vulnerable to extreme precipitation climate impacts, and are communities that have been historically under-resourced.

Goal 9 Actions

Action 9.1 * Review and update development codes and design standards for requirements for stormwater facility sizing, low-impact development, adopt nature-based solutions, and minimize impervious surface areas in private development and city capital improvements to be consistent with the requirements of the City's NPDES Phase 2 Permit.

Theme 5. Natural Habitats and Urban Green Space

Additional policies that speak to tree management and link the protection of healthy habitats to climate resiliency should be considered.

Goal 10. Support preservation and access to green and open spaces

C-34 * Ensure equitable access to parks, green space, and recreational services for all residents consistent with the Land Use Element.

Goal 11. Protect and enhance the climate resilience of urban forests by implementing climate-smart forest management

C-35 ** Encourage participation in Washington's small forest landowner assistance cost-share and stewardship programs.

Goal 11 Actions

Action 11.1 * Review, update, and implement tree protection codes to increase tree retention. Encourage the protection, maintenance, and expansion of tree canopy throughout the community, prioritizing residential and mixed-use areas with the least current tree canopy to equitably distribute benefits.

Action 11.2 ** Adopt an urban forest master plan and implementing ordinances to maintain and expand tree canopy cover, improve tree and watershed health, prioritize carbon sequestration, and build climate resilience.

Goal 12. Ensure the protection and recovery of ecosystems to provide healthy habitat in a changing climate

C-36 ** Ensure no net loss of ecosystem composition, structure, and functions, especially in Critical Areas, and strive for net ecological gain to enhance climate resilience in accordance with the Land Use Element and as may be feasible.

C-37 ** Identify opportunities to expand habitat protection and improve habitat quality and connectivity to foster climate resilience using conservation area designations, buffers, and open space corridors.

C-38 ** Commensurate with resources provided the city should implement actions identified in restoration and salmon recovery plans to improve climate resilience of streams and watersheds.

C-39 ** Commensurate with resources provided the city should protect and restore riparian vegetation to reduce erosion, provide shade, and support other functions that improve the resilience of streams to climate change.

Theme 6. Economic Development

Policies related to developing a green job strategy, equitable access to green job training (including education and workforce training), and a just transition should be considered.

Goal 13. Increase access of green jobs, with special consideration to increasing access for frontline communities.

C-40 *** Develop a green workforce that is representative of the diversity of the city's communities and reflects the diverse skill sets, knowledge systems, and experiences of communities through targeted hiring, workforce development, community agreements, and creating intentional pathways for frontline communities across sectors and seniority levels. A Green Workforce refers to jobs that help advance toward a more sustainable society and help to transition from over-dependence on oil industries and reducing greenhouse gas emissions.

C-41 ** Ensure that the Comprehensive Emergency Management Plan responds to the impacts of climate change and identifies roles and responsibilities to support a sustainable economic recovery after a disaster.

C-42 ** Support local businesses' efforts to generate and store renewable electricity on-site, which can provide back-up power during emergencies and help ensure continuity of operations.

C-43 *** Promote local industrial development to support a circular economy that increases demand for recycled materials and reduces demand for new raw materials and their inherent carbon emissions.

Goal 13 Actions

Action 13.1 * Develop a green jobs strategy in partnership with community groups, community resources such as Green River College, frontline communities, and businesses that:

(1) supports sustainable practices, green skills development, and the low carbon transition of the city's impacted industries.

(2) develop pathways for youth and impacted workers to transition into green jobs.

(3) ensures opportunities (e.g., local hiring requirements) for these jobs.

EMISSIONS MITIGATION SUB-ELEMENT

Global climate change and its localized effects are an immediate consequence of overabundant levels of greenhouse gases permeating Earth's atmosphere and causing heat to be retained on our planet rather than radiate outward. This is why it is critical to eliminate the emission of greenhouse gases as part of widespread human activity. Actions taken to reduce or eliminate the emission of greenhouse gases constitute emissions mitigation. To mitigate its emissions, Auburn must update its municipal and community emissions inventories, identify reduction targets, and target policies and investments to meet them, considerate of available resources. The goals, policies, and implementation strategies of the Emissions Mitigation sub-element are organized into four key themes:

7. Transportation and Planned Development
8. Renewable Energy and Energy Efficiency
9. Waste Management and Circular Economy
10. Natural Habitats and Urban Green Space

***** Policy developed for concurrency with the King County Regional Hazard Mitigation Plan, including the City of Auburn annex

**Policy developed for concurrency with King County's Strategic Climate Action l1Plan

******* Policy developed for concurrency with Washington Department of Commerce l11climate planning guidance

******** Policy developed for concurrency with Puget Sound Regional Council's Vision 11112050

Goals, Policies, and Actions

Theme 7. Transportation and Planned Development

Additional policies related to electric vehicles (EVs) and EV infrastructure, reducing vehicle miles traveled, and supporting increased density in transit-oriented areas.

Goal 14. Reduce GHG emissions by prioritizing accessible multi-modal and low-carbon transportation options

C-44 *** Prioritize investments that expand and implement active transportation options, including bicycling and walking, that improve access to transit.

C-45 * Encourage the prevention of displacement of households and businesses from transit-oriented locations, with a focus on low-income households and small businesses, as appropriate.

Goal 14 Actions

Action 14.1 * Encourage increased density near transit-oriented locations to allow for a variety of housing types that support local business and residents. This can be accomplished through zoning regulations.

Goal 15. Increase the percentage of EV and other low-emission transportation modes operating within the city

C-46 * Work with utility providers and other partners (e.g. developers and EV companies) to encourage increased access to EV charging where it is needed and expand EV charging readiness for buildings by administering and enforcing the Washington State Building Code. Achievement will be commensurate with financial resources and availability of the vehicles, and associated infrastructure, where appropriate. Expansion of access and opportunity for EV charging will be achieved in part through enforcement of Washington State Building Code requirements. These requirements include:

- Installation of a dedicated circuit for EV charging at the time of construction of all new dwelling units
- Installation of EV Charging Stations, EV-Ready Parking Spaces, and EV-Capable Parking Spaces as a proportional quantity of total parking required for new commercial development projects
- Installation of EV Charging Stations, EV-Ready Parking Spaces, and EV-Capable Parking Spaces as a greater proportional quantity of total parking required for new developments that include multiple residential or sleeping units such as apartments, hotels, and congregate living facilities

C-47 * Support state and regional requirements for electric delivery vehicles and Transportation Network Corporations (TNC's).

Goal 16. Reduce greenhouse gas emissions by promoting densification and efficient land uses in mixed-use urban villages near transit corridors

C-48 * Prioritize dense, mixed use, transit-oriented development, and affordable housing in Auburn and the downtown regional growth center.

Goal 16 Actions

Action 16.1 * Adopt “missing middle” housing policies and codes to allow for broader housing types in single family zones, particularly near transit, to promote affordability for current and future residents.

Theme 8. Renewable Energy and Energy Efficiency

Policies aimed at transitioning to renewable energy sources, promoting energy conservation and efficiency measures, building grid resilience, and educating homeowners about energy efficiency upgrades should be considered.

Goal 17. Reduce greenhouse gas emissions by transitioning to renewable energy sources, decarbonizing buildings, and increasing energy efficiency

C-49 ** Retrofit municipal buildings for energy efficiency, as resources allow.

C-50 ** Promote improved energy efficiency in existing commercial and residential buildings by offering expedited permitting process, limiting administrative barriers, and reducing costs for residential solar projects.

C-51 *** Maximize renewable energy sources for the supply of electricity and heat to new and existing residential and commercial building construction through administration and enforcement of the Washington State Energy Codes, both commercial and residential. This will also ensure new development accounts for future solar systems and include solar readiness zones, structural integrity, and electrical service capacity in the design and planning of new commercial buildings.

C-52 ** Retrofit publicly owned buildings with solar panels and electric heat pumps, as structural stability and resources allow.

C-53 *** Support and expand building energy efficiency retrofit programs to reduce building energy use and improve energy resilience, including a focus on affordable housing.

C-54 * Explore and promote low interest loan options and incentive programs to finance energy efficiency upgrades for commercial and residential buildings, while seeking other finance mechanisms to fill in potential funding gaps. Investments and programs should be prioritized in historically underserved areas.

C-55 * Develop energy efficiency outreach programs for residents and businesses by partnering with Puget Sound Energy (PSE) and other local jurisdictions with the goals to identify and select appropriate and cost-effective energy improvements. This could involve supporting local schools in integrating climate and sustainability education into curriculum.

C-56 * Building on proposed WA state policy, strengthen energy efficiency codes to reflect best practices and meet established energy targets (e.g., require energy use disclosure and benchmarking for buildings, starting with commercial and multifamily buildings over a size threshold).

C-57 * Expand local onsite renewable energy production, such as through installation at municipal facilities, support of incentive programs, and coordination of community-based partnership projects and programs.

C-58 ** Encourage additional net-zero greenhouse gas emission features in all new residential and commercial structures.

C-59 * Incentivize electric heat pumps and restrict natural gas in new commercial and residential construction through administration and enforcement of the Washington State Energy Code.

C-60 ** Phase out natural gas use in existing publicly owned facilities by 2040 and retrofit with electric heat pumps as resources allow.

C-61 ** Encourage all new publicly owned buildings to be powered 100% by renewable energy as availability and resources allow, and evaluate opportunities to retrofit municipal buildings for energy efficiency as resources allow.

C-62 ** Develop low-energy-use requirements and building code compliance for residential buildings as incorporated in state building codes.

C-63 *** Educate community members about incentives for emerging alternative energy technology, such as tax exemptions for solar installations, and increase community awareness of existing solar arrays and water heating systems in the city.

Goal 18. Promote a diverse, clean, efficient grid that increases the grids reliability as demand increases

C-64 * Work with and encourage Puget Sound Energy (PSE) to plan, site, build and maintain an electrical system that meets the needs of existing and future development, and provides highly reliable service for City customers and coordinate with non-city utility providers to ensure planning for system growth consistent with the city's Comprehensive Plan and growth forecasts.

C-65 * Advocate for increased grid reliability through state and utility regulatory rulemaking and legislation that supports demand response and environmentally responsible storage technologies that reduce peak load and provide grid flexibility.

C-66 * Advocate for energy utilities to adopt efficient practices and explore alternative energy resources, in order to help meet long-term energy needs and reduce environmental impacts associated with traditional energy supplies.

Theme 9. Waste Management and Circular Economy

Policies aimed at supporting a circular economy, supporting urban agriculture and local food production, encouraging composting, enforcing sustainable construction

and demolition (C&D) practices, and environmentally friendly purchasing policies should be considered.

Goal 19. Reduce greenhouse gas emissions from materials and organic waste by minimizing waste generation

C-67 * Encourage local food production, processing, and distribution through the support of home and community gardens (i.e., P-Patches), farmers' markets, community kitchens, and other collaborative initiatives which provide healthy foods and promote food security.

C-68 * Promote prevention and redistribution of food waste, such as through expanding and encouraging community and school gardens, urban agriculture, and farmers markets and working with local grocery stores to support a food donation program to send surplus food.

C-69 * Support extended producer responsibility (EPR) related policies and actions that require companies that make consumer products fund the residential recycling system and that ensure that packaging and paper products actually get recycled.

Goal 19 Actions

Action 19.1 * Update municipal solid waste contract policies and programs to encourage waste prevention and take-back programs, maximize diversion, ensure efficient collection routes, and promote hybrid and electric vehicles to transport and collect waste.

Goal 20. Reduce greenhouse gas emissions from materials and organic waste by maximizing waste diversion

C-70 ** Encourage recycling of construction and demolition debris.

C-71 ** Use recycled materials in the construction of transportation and other infrastructure facilities, as resources allow and to the extent feasible.

Goal 20 Actions

Action 20.1 * Expand commercial recycling and organics collection and service, including making recycling and organics disposal as convenient as garbage service and adequate to serve the number of tenants. Implement compost requirements for food businesses in accordance with HB 1799. Consider the implications of implementing an organics disposal bans and/or requiring services.

Action 20.2 * Expand recycling and compost service for single-family and multifamily properties and provide technical assistance to help compost successfully. Consider the implications of implementing an organics disposal bans and/or requiring services.

Action 20.3 ** Support a business technical assistance program to increase recycling and reduce waste.

Action 20.4 ** Support a program that will enable recycling of all construction and demolition debris.

Action 20.5 * Support development, implementation, and enforcement of construction and demolition (C&D) recycling and deconstruction ordinances.

Theme 10. Natural Habitats and Urban Green Space

Protect and enhance carbon sinks like forests and urban green spaces, establish green belt of parks with connections to housing, schools, and businesses.

Goal 21. Protect and enhance land carbon sinks (e.g., trees, urban green space) to mitigate GHG emissions

C-72 ** Require open space set-asides (such as parks) for new development when appropriate.

C-73 *** Maximize tree canopy coverage in surface parking lots to mitigate the negative impacts of urban heat islands caused by excessive impervious surfacing.

C-74 ** Improve and expand urban forest management to maximize or conserve carbon storage.

C-75 *** Manage natural lands (forests, grasslands, wetlands) to maintain and/or increase their carbon concentrations. Avoid the conversion of carbon-rich ecosystems. Prioritize increasing tree canopy cover and open space in overburdened frontline communities.

C-76 * Increase resilience to flooding, protect, and where possible, enhance, and restore existing flood storage, conveyance, and ecological functions and values of floodplains, wetlands, and riparian corridors as resources allow.

Glossary of Terms

Algal bloom

A rapid growth of microscopic algae or cyanobacteria in water. Algal blooms can often be harmful to the surrounding environment and human health.

Adaptation

The process of adjusting to new (climate) conditions in order to reduce risks to valued assets.

Assets

People, resources, ecosystems, infrastructure, and the services they provide. Assets are the tangible and intangible things people or communities value.

Climate change

A change of climate attributed directly or indirectly to human activity that alters the composition of the global atmosphere.

*RCW 28B.30.640(3)

Drought

In Washington, the legal definition of drought is based on water availability. A drought emergency is declared when water supply conditions are expected to fall below 75 percent of average, and there is potential for undue hardships due to low water supply.

Ecosystem

A biological environment consisting of all the living organisms or biotic component in a particular area, and the nonliving, or abiotic component, with which the organisms interact such as air, soil, water, and sunlight.

Environmental justice

The fair treatment and meaningful involvement of all people regardless of race, color, national origin, or income with respect to the development, implementation, and enforcement of environmental laws, regulations, and policies.

Erosion

The wearing away of rock or soil and the movement of the resulting particles by wind, water, ice, or gravity, usually excluding mass movements.

Exposure

The presence of people, assets, and ecosystems in places where they could be adversely affected by hazards.

Extreme heat

Summertime temperatures that are much hotter and/or humid than average.

Extreme weather event

A time and place in which weather, climate, or environmental conditions – such as temperature, precipitation, drought, or flooding – rank above a threshold value near the upper or lower ends of the range of historical measurements.

Frontline community

People who experience the first and worst consequences of climate change. Such residents' health and livelihoods are often highly vulnerable to climate-exacerbated hazards and economic disruptions, and their communities often lack basic support infrastructure and suffer disproportionately from the compounding impacts of pollution, discrimination, racism, and poverty.

Greenhouse gas

Gases such as carbon dioxide, methane, nitrous oxide, and certain synthetic chemicals which trap some of the Earth's outgoing energy, retaining heat in the atmosphere.

Hazard

An event or condition that may cause injury, illness, or death to people or damage to assets.

Mitigation

Actions taken to reduce or eliminate the emissions of greenhouse gases (present and future) in order to reduce the rate and extent of climate change damage.

Resilience

The ongoing process of anticipating, preparing for, an adapting to changes in climate and minimizing negative impacts to our natural systems, infrastructure, and communities.

Risk

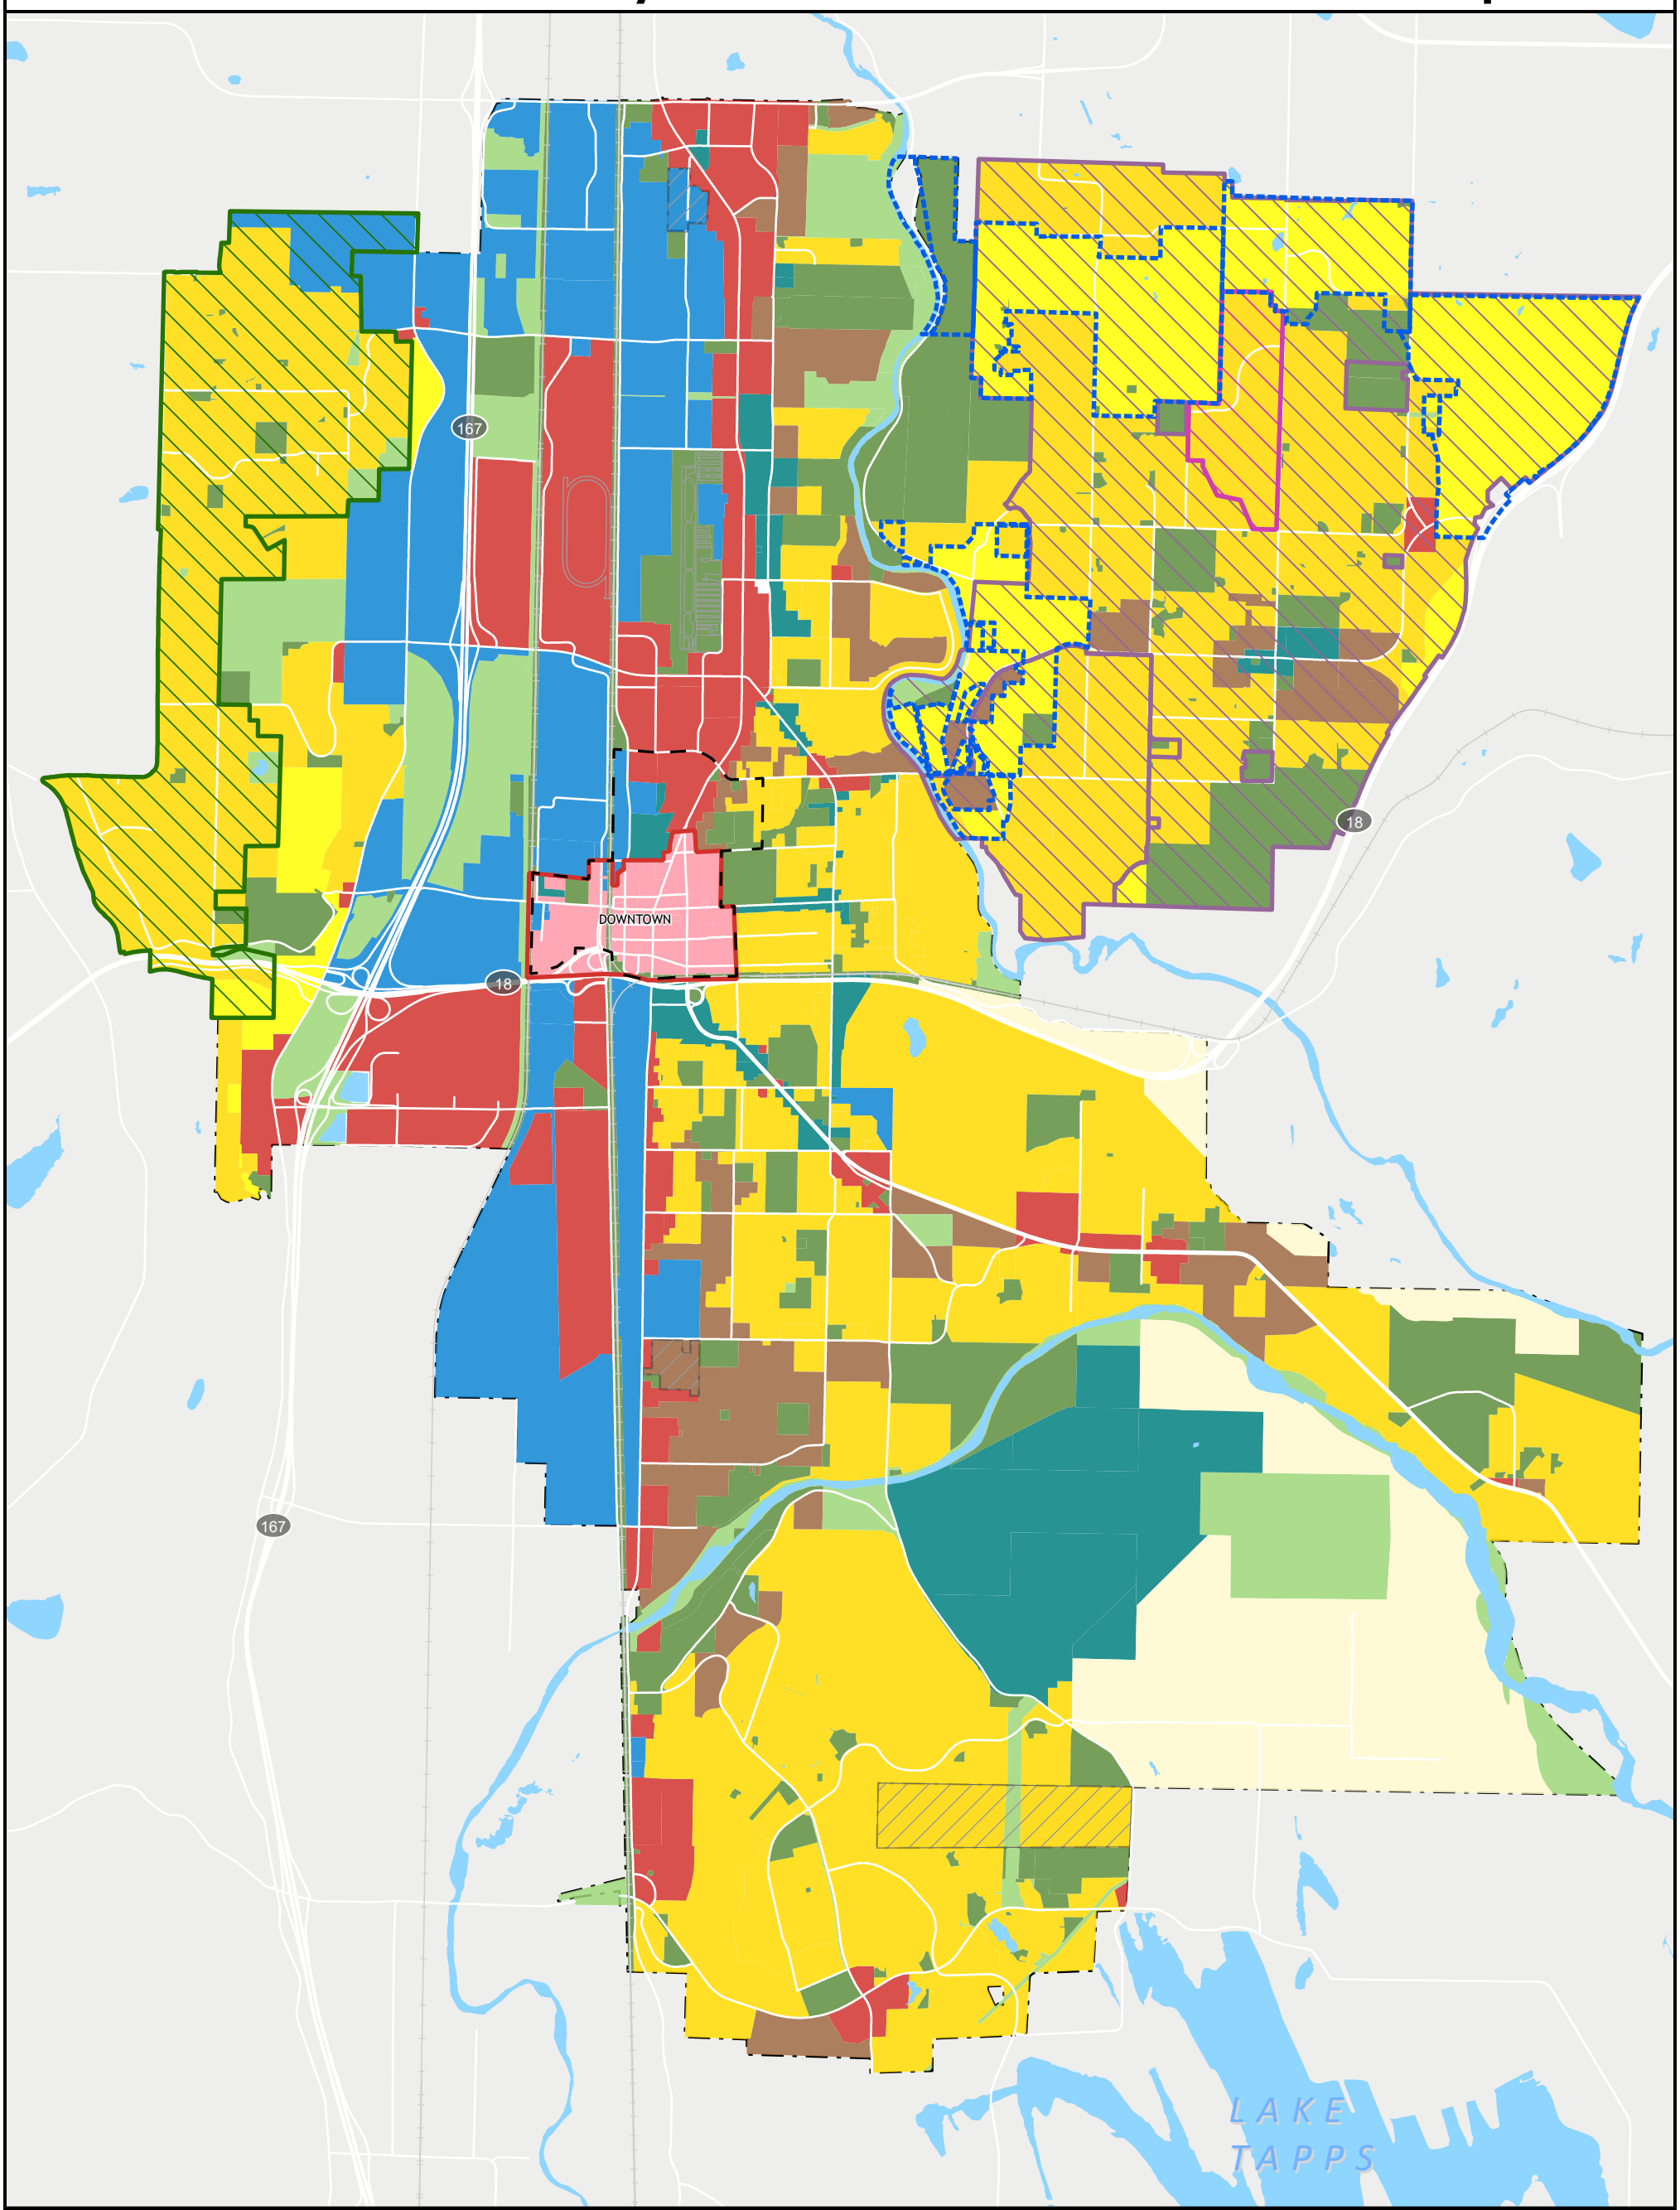
The potential for negative consequences where something of value is at stake. In the context of climate change, this term is often used to refer to the potential for adverse consequences of a climate-related hazard. Risk can be assessed by multiplying the probability of a hazard by the magnitude of the negative consequences or loss.

Severe storm

A storm is classified as ‘severe’ when it produces hail one inch in size or greater, winds in excess of 57.5 miles per hour, or a tornado.

Stormwater runoff

Water originating from rainfall and other precipitation becomes surface flow or interflow.



Vulnerability

The propensity of predisposition of assets to be adversely affected by hazards. Vulnerability encompasses exposure, sensitivity, potential impacts, and adaptive capacity.

Acronyms

ABOUT THIS DOCUMENT

A housing element is a plan that addresses a community's current and projected needs for housing, including housing variety, attainability, and preservation. This document is intended to provide an assessment of housing needs and characteristics to support Auburn's Housing Element Update as part of the City's effort to update its Comprehensive Plan. This report also meets the requirements of the Countywide Planning Policies for King County (2023) to assess housing needs and conditions to help meet the countywide need for various housing types as well as the City's specific needs.

The report is structured in four parts:

- Housing Planning and Policy Context
- Population and Community Characteristics
- Household Economics
- Housing Inventory and Affordability

The conditions report draws on publicly available data from the following sources:

U.S. Census Bureau

- Decennial Census
- American Community Survey (5-year estimates)

Federal Agencies

- U.S. Department of Housing and Urban Development

Washington State Agencies

- Washington State Office of Financial Management
- The Office of Superintendent of Public Instruction

County and Regional Agencies

- King County Assessor's Office
- Puget Sound Regional Council
- Public Health of Seattle/King County
- Seattle/King County Coalition on Homelessness

Other

- Dupre and Scott
- Zillow.com

Qualitative information about housing and livability conditions based on community outreach is also considered in the housing element update and can be found in Part II of this document.

1 Housing Planning and Policy Context

This section provides housing planning and policy context regarding state and regional housing policy affecting Auburn. Auburn is located mid-way between Seattle and Tacoma, Washington's two largest cities, and is primarily situated within King County, with a small portion of the City extending into Pierce County. Both King and Pierce countywide planning policies apply to Auburn. In addition, multicounty planning policies established by the Puget Sound Regional Council (PSRC) apply to the city.

State Context

Growth Management Act

In Washington State, the Growth Management Act (GMA) requires fast-growing cities and counties to develop a comprehensive plan to manage their population growth[1]. The GMA establishes fourteen goals to guide planning in the state. One of these goals is to plan for and accommodate housing affordable to economic segments.

The GMA housing goal is addressed through the Housing Element and this assessment, which includes an inventory and analysis of existing and projected housing needs. The project needs include units for moderate, low, very low, and extremely low-income households and permanent supportive housing.

Recent Housing Legislation

Based on a 2022 opinion survey conducted by the Department of Commerce, housing costs are a statewide problem and the state needs more housing supply. Washington state needs 1.1 million new homes over the next year and 91,357 emergency housing beds. Since 2021, the Washington State legislature passed multiple bills to address the state's housing needs.

In 2021, the Legislature passed HB 1220, which substantially amended the housing-related provisions of the GMA. HB 1220 amended the GMA housing goal to require inventories of housing needs by income level, permanent supportive housing, and emergency housing, as well as identify sufficient land capacity for housing needs. New requirements include identifying local policies and regulations that result in racially disparate impact, displacement, and exclusion, and implement policies and regulations to undo them. Housing production should also be encouraged near employment centers and areas of planned employment growth.

HB 1110, passed in May 2023, builds from HB 1220 requirements and substantially changes the way many cities in Washington are to plan for housing. The bill requires cities of certain sizes and locations to allow multiple dwelling units (du/)

[1] Growth Management Act, MSRC https://mrsc.org/explore-topics/planning/general-planning-and-growth-management/growth-management-act

per lot in a middle housing type form. "Middle housing" is defined in the bill as “buildings that are compatible in scale, form, and character with single-family houses and contain two or more attached, stacked, or clustered homes including duplexes, triplexes, fourplexes, fiveplexes, sixplexes, townhouses, stacked flats, courtyard apartments, and cottage housing.” Cities must allow at least six of the nine types of middle housing to in all residential zones,. Auburn is considered “Tier 1” and must allow 4 middle housing du/on all lots zoned predominantly residential, 6 middle housing du/lot within ¼ of a major transit stop, and 6 middle housing du/lot if at least two are affordable. The bill also includes considerations for parking requirements and for the subdivision of land under single-unit attached middle housing options like townhomes allowing for ownership of the land under the unit.

HB 1337, also passed in May 2023, amends RCW 36.70A.696 expanding accessory dwelling unit (ADU) definitions and easing development regulations. Jurisdictions are now required to permit two ADUs per lot in city limits and within GMA urban growth areas. Cities may not require the owner to occupy the property, may not prohibit sales as an independent unit, must allow an ADU of at least 1,000 square feet and adjust zoning to be consistent, set consistent parking requirements, and may not charge more than 50% of impact fees charged for the principal unit.

HB 1042 permits the conversion of existing commercial office and mixed-use buildings for residences. Cities may not impose restrictions on housing unit density, parking requirements in excess of the current parking, additional permitting requirements, excess design standard requirements, exterior design or architectural requirements beyond health and safety, prohibitions on the additions of housing, current energy code requirements for unchanged portions of the building, and transportation concurrency or SEPA study.

Regional Planning and Growth Targets

PSRC VISION 2050 - Regional Housing Strategy

In 2022, Puget Sound Regional Council (PSRC) developed a Regional Housing Strategy to support local 2024 comprehensive plan updates. The strategy is part of the region’s plan for growth known as VISION 2050. The region’s vision for 2050 is to provide exceptional quality of life, opportunity for all, connected communities, a spectacular natural environment, and an innovative, thriving economy.

The goal of the Regional Housing Strategy is to ensure that all people have a range of safe and affordable housing choices to create a healthy and prosperous future for the region, including eliminating racial disparities in access to housing. The PSRC region is about two years behind in housing production, with an even greater deficit for affordable housing, and continues to face acute housing challenges. If we are to meet the region’s housing needs now and, in the future, cities, counties, agencies, coalitions, businesses, and other housing advocates need to begin to implement these strategies.

With a projected need for more than 800,000 new housing units and more than a third of households anticipated to be at moderate- and lower-income levels, VISION 2050 aims to substantially increase the construction of housing and to build more housing that is affordable to more families. The Regional Housing Needs Assessment concluded that about 34% of new housing will need some level of public incentive – ranging from flexible development standards to direct subsidy — to be affordable to households earning less than 80% area median income (AMI). In response to this need, the Regional Housing Strategy calls for three areas of action:

1. **Supply: Build more housing of different types.**
   To meet the region's vision for a more livable, prosperous, and equitable future, more housing is needed of different types, costs, and access to jobs, transit, and services.

2. **Stability: Provide opportunities for residents to live in housing that meets their needs**
   As the region grows and becomes a more expensive place to live, many households are under serious threat of being displaced from their communities. More housing options and strategies are needed to help people have the option to stay in their neighborhoods, with an emphasis on lower-income communities and Black, Indigenous, and People of Color (BIPOC) communities that have been systemically excluded from homeownership opportunities.

3. **Subsidy: Create and sustain long-term funding sources to create and preserve housing for very low-income households and unhoused residents**
   At the lowest income levels, the market is not capable of building housing at an affordable cost. Eliminating the cost burden for households will require a major increase in funding to subsidize housing costs and to build more housing affordable to households earning less than $50,000 per year.

PSRC VISION 2050 – Multicounty Planning Policies

The Multicounty Planning Policies (MPPs) contained in VISION 2050 and produced by the PSRC, include policies and actions as well as the Regional Growth Strategy, which promotes a focused regional growth pattern and serves as a guide for counties and cities as they set local growth targets through their countywide processes to implement the strategy. PSRC and local jurisdictions are expected to address these actions through their planning and work programs.

VISION 2050 establishes twelve multicounty planning policies in the PSRC region about housing. The policies aim to address an overarching goal where the region preserves, improves, and expands its housing stock to provide a range of affordable, accessible, healthy, and safe housing choices to every resident. The region continues to promote fair and equal access to housing for all people.

Housing Countywide Planning Policies

King County

King County established housing countywide planning policies (CPPs) in 2021 to reflect a commitment to address dramatic housing price increases, which resulted in 156,000 extremely low to low-income households cost-burdened by housing. The policies also address findings that Black, Hispanic, Indigenous, and extremely low-income households are among those most disproportionately impacted by housing cost burden.

The county's overarching goal is to provide a full range of affordable, accessible, healthy, and safe housing choices to every resident in King County. All jurisdictions work to:

- preserve, improve, and expand their housing stock;
- promote fair and equitable access to housing for all people; and
- take actions that eliminate race-, place-, ability-, and income-based housing disparities.

There are 27 housing CPPs as of August 7, 2023. On July 25, 2023, the Local Services and Land Use Committee recommended amendments to the housing CPPs. The amendments are intended to incorporate legislative required changes especially due to HB 1220, which substantively amended the Growth Management Act to require jurisdictions to plan for and accommodate housing needs and resulted in other substantive changes to how jurisdictions plan for housing in the housing element of their comprehensive plan.

Pierce County

In May 2022, Pierce County adopted eight affordable housing policies that shall at a minimum "consider the need for affordable housing, such as housing for all economic segments of the population and parameters for its distribution". Based on the adopted housing targets compared to the existing housing stock, there is a need for an additional 37,773 additional housing units within the 20-year planning period in unincorporated Pierce County.

Buildable Land Capacity

The 2021 King County and Pierce County Buildable Lands Reports analyzed parcel-level capacity for new jobs and housing units in Auburn, classifying parcels as Vacant, Redevelopable, or Constant (i.e. unlikely to change) based on land values, home values, zoning, and other data. As part of this comprehensive planning process, the data from these Buildable Lands Reports was further refined to take into account development since 2019 and other potential parcels deemed developable by the city and consultant team.

Based on the available land capacity as currently zoned, Auburn shows a deficit of capacity for both the 2044 housing unit and jobs targets, as detailed below. These figures differ from the total housing units and total job capacity described in the *2021 Urban Growth Capacity Report, Exhibit 31* because city zoning as of 2023 was

used for this analysis. The future land use map developed during this comprehensive plan is intended to accommodate these 2044 housing and jobs targets through new zoning and land uses in various corridors and nodes throughout Auburn, and in the Downtown area in particular. The housing unit targets set have since increased with amendments to both counties CPPs, which is explained further in the Land Capacity for Additional Housing section.

Figure 1. Auburn Housing Targets and Capacity

Housing Units	
King and Pierce Counties combined adopted housing unit growth target (per Countywide Planning Policies)	12,112 units (2019-2044) 11,141 units (adjusted to 2021-2044 based on existing and pipeline development from 2019-2021) *(Note: the Pierce County portion of Auburn has a 2020 to 2044 growth target of just 4 units and is thus ignored for this analysis.)*
2021 King County Urban Growth Capacity Report Capacity	7,927 units
2022 Pierce County Buildable Lands Report	656 units
Total Countywide Planning Policies Housing Capacity	8,583 jobs
Employment	
King County adopted employment growth target (per Countywide Planning Policies)	19,520 jobs (2019-2044) *(note: Pierce County has already exceeded their adopted job growth targets for 2035 and has no additional targeted growth)*
2021 King County Urban Growth Capacity Report Capacity	7,927 jobs
2022 Pierce County Buildable Lands Report	656 jobs
Total Countywide Planning Policies Employment Capacity	8,583 jobs
Estimated Capacity under current zoning	8,236 jobs

2 Population and Community Characteristics

This section describes who lives in Auburn, including total population, age distribution, household size, racial and ethnic composition, and languages spoken at home. This information allows the city an understanding of who the City serves and whether some people have special housing needs.

Auburn Population and Community Characteristics

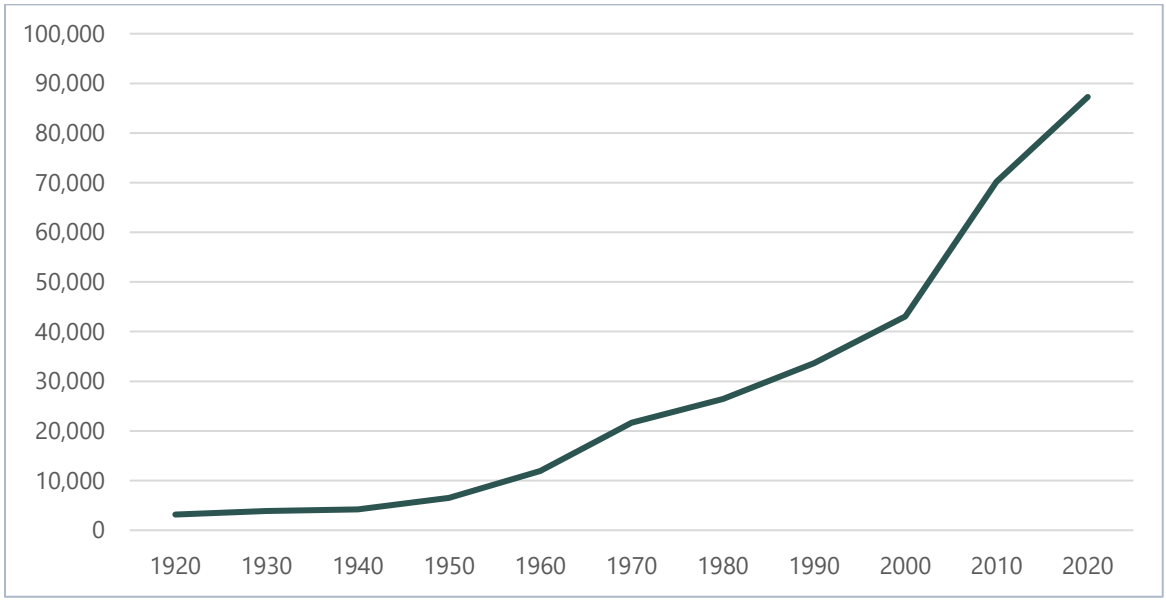

Figure 2. Population Growth Rate Comparison

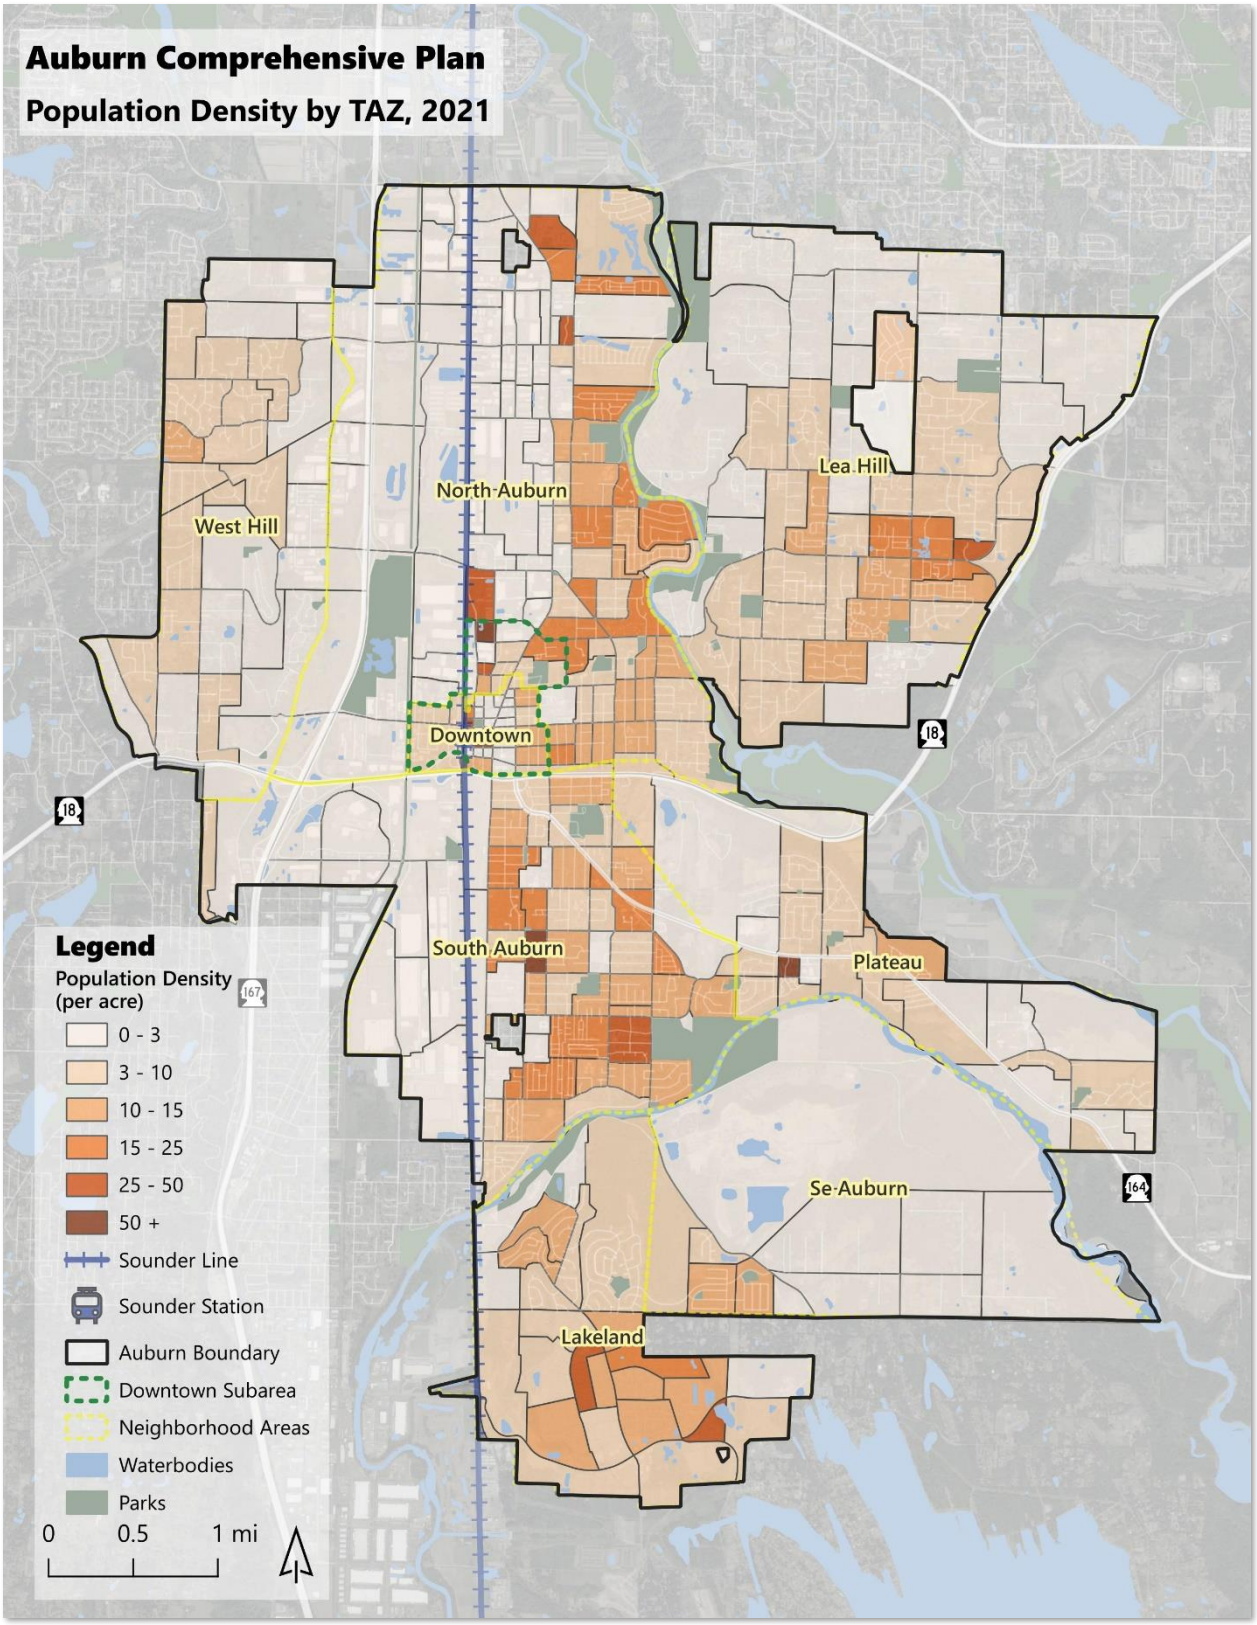
	2019 Population **Estimate**	2020 Population **Census**	2021 Population Estimate	2022 Population Estimate	2023 Population Estimate	2019-2023 **Average** Annual Growth
Auburn	86,353	87,256	88,080	88,750	88,820	0.71%
King County	2,227,755	2,269,675	2,287,050	2,317,700	2,347,800	1.32%
Pierce County	905,841	920,393	928,200	937,400	946,300	1.10%

Source: OFM Forecasting and Research Division, 2023

Auburn is located mid-way between Seattle and Tacoma, Washington's two largest cities, and is primarily situated within King County, with a small portion of the City extending into Pierce County. As of 2023, it was ranked the 14th most populous city in Washington, with a population of 88,820.[2] Its location in the densely populated and urbanized area between Seattle and Tacoma has provided for substantial population growth since World War II and particularly since 2000, as shown in Figure 3.

Figure 3. Auburn Population (1920-2020)



Source: Washington Office of Financial Management

In the 1950-2000 era, the City grew rapidly, with an average population increase of 4.2% per year and a total increase of 36,550 residents over the 50-year period. In the 22-year period since 2000, Auburn has grown by another 45,703 residents, outpacing the growth of the previous 50 years as well as annexing three areas with substantial development potential since 1990. Housing units increased by 12%

[2] Washington Office of Financial Management (OFM) April 1, 2023 Official Population Estimates

between 2010 and 2020, though population increased by 25% over the same period, suggesting that the supply of housing units may not be keeping up with demand. Rapidly increasing population can also have effects on many aspects of planning and city management, including infrastructure capacity, transportation and traffic, and school capacity.

Figure 4. Population Density

Source: King & Pierce County Buildable Lands Reports GIS Data, City of Auburn, Leland Consulting Group

- Population density is generally between 3-10 persons per acre across the City with greater nodes of density in North Auburn, South Auburn, Lea Hill, and Lakeland Hills; where there are smaller lots with single-family homes and attached housing.

Population by Age

Based on the 2020 Census, the last universal assessment of population structure, Auburn's population of 19 years old or younger made up 27.9% of the total population, and the senior population (ages 65 years and over) was 11.4% of the total population.

Figure 5 compares Auburn to King County and Pierce County averages using broad age categories.

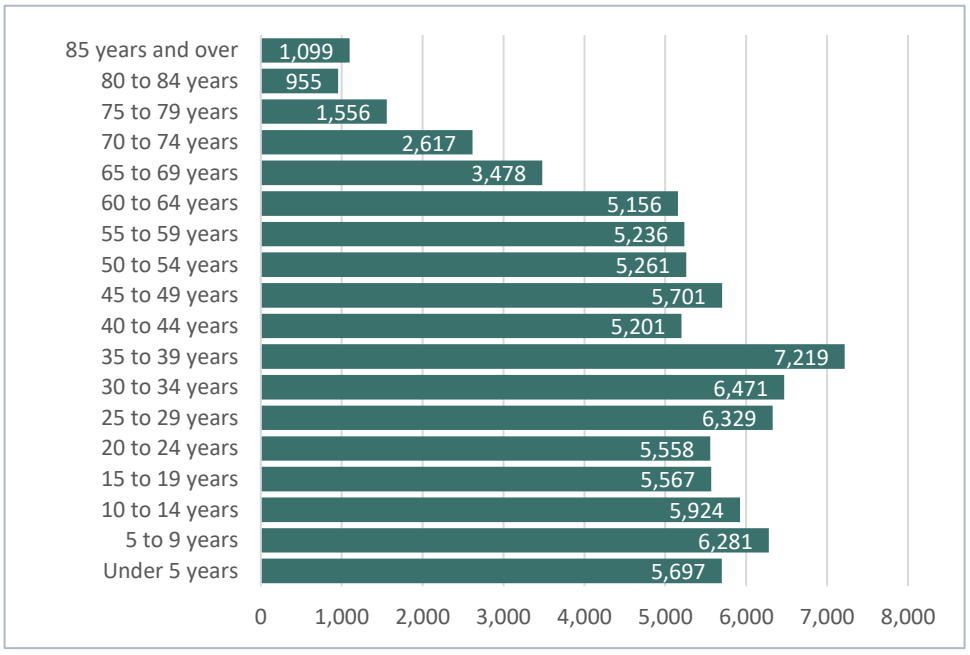


Figure 5. Auburn, King, and Pierce County Age Category Distributions, 2020

	19 and Younger	20 – 64 Years	65 Years and Over
Auburn	27.9%	60.7%	11.4%
King County	22.3%	64.5%	13.2%
Pierce County	25.9%	60.3%	13.8%

Source: US Decennial Census, 2020

- Auburn has a higher percentage of residents 19 years old and younger than both King and Pierce County averages, a similar percentage of residents between 20-64 years old as both counties, and a lower percentage of residents over 65 years old compared to both counties, but the differences are not substantial.

Figure 6. Age Category Distributions, 2020

Source: US Decennial Census, 2020

- The largest age group in Auburn is 35 to 39 years old, making up 8.5% of the population total. This group will start turning 65 by 2050.
- In the next ten years, another 10,392 individuals will be 65 years or older, adding another 12% to the retiree population.
- Auburn's growing population is becoming younger over the years with those under 20 years old making up over a quarter of the population.

Household Size

Figure 7. Average Household Size: Auburn, King County, and Pierce County

	Average Household Size	Average Family Size
Auburn	2.71	3.27
King County	2.40	3.02
Pierce County	2.61	3.10

Source: 2021 American Community Survey 1-Year Estimate

- According to American Community Survey estimates in 2021, Auburn has an average household size of 2.71 persons, a slight increase from 2.67 in 2010.
- The median household size is higher compared to King County which has an average household size of 2.40 persons, and higher than Pierce County which has an average household size of 2.61 persons.

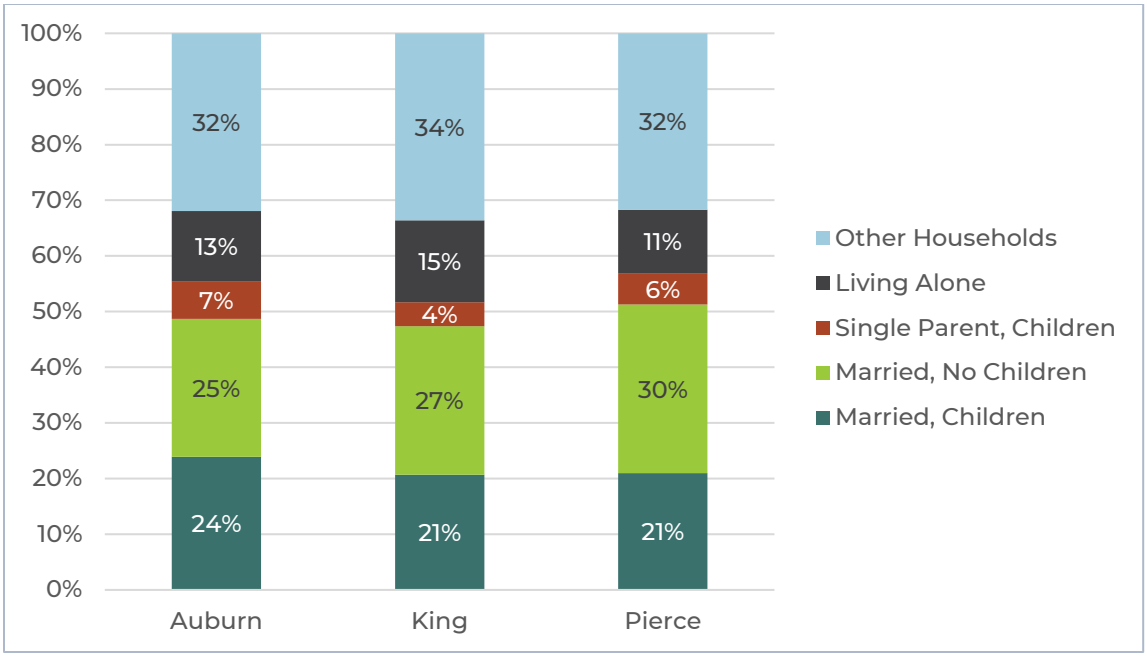

Figure 8. Household Size: Auburn, King County, and Pierce County

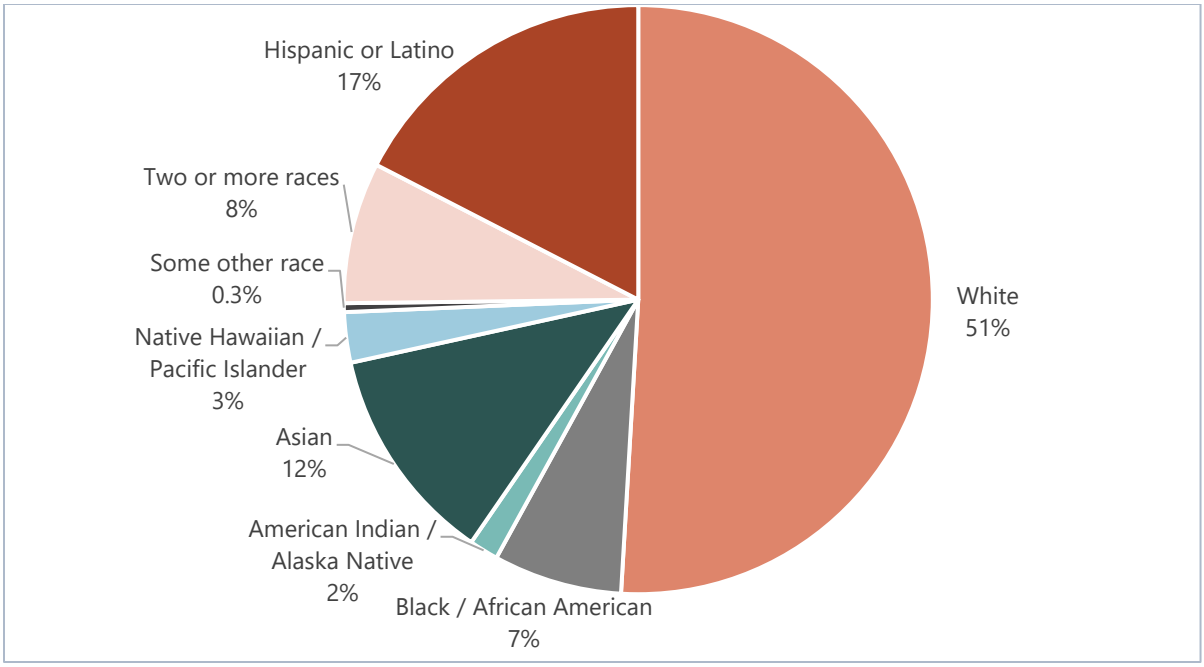
Household Size	Auburn	King	Pierce
1-person household	22.6%	29.9%	24.4%
2-person household	32.8%	34.0%	34.1%
3-person household	18.1%	15.1%	17.1%
4-or-more-person household	26.6%	21.1%	24.4%

Source: 2020 American Community Survey 5-Year Estimates, Table S2501

- Auburn has a lower percentage of 1-person households compared to King County but is similar to Pierce County.
- There is no significant difference in percentage between 2- and 3-person households in Auburn compared to King and Pierce counties.
- One-third of Auburn households are 2-person households.

Figure 9. Households and Families: Auburn, King County, and Pierce County



Source: 2017-2021 American Community Survey 5-Year Estimates, Table DP02

- A quarter of households in Auburn are married with no children.
- Auburn has a slightly higher percentage of those married with children compared to King and Pierce counties.
- In general, Auburn's household composition is similar to both King and Pierce Counties.
- Auburn has a slightly larger percentage of single parents with children households (7%) compared to King County (4%) and Pierce County (6%).

Racial Composition

Auburn's racial and ethnic makeup is more diverse than that of King County and of Washington as a whole, with 49% of residents identifying as BIPOC (Black, Indigenous, or People of Color), compared with 43% in King County and 34% statewide. The City has become increasingly diverse since 2010, with notable increases in the share of Hispanic/Latino residents from 10% to 17%, Black/African American residents from 5.7% to 7%, and Native American, Hawaiian, and Alaskan residents from 3% to 4.8%.

Figure 10. Race and Ethnicity in Auburn (2021)

Source: 2020 ACS 5-Year Estimates, Table DP05

An increasingly diverse population can present language accessibility issues. About 69% of Auburn residents speak only English at home, with 12% speaking Spanish, 9% speaking an Asian or Pacific Island language, 7% speaking other Indo-European languages, and 2% speaking other languages at home. Notably, around 45% of Auburn residents who speak a language other than English at home have limited English proficiency, an important consideration as the city continues to become more diverse.

	Auburn	King County	Pierce County
English Only	70.1%	71.6%	84.9%
Spanish	11.5%	6.6%	6.0%
LEP Spanish	42.6%	40.6%	33.7%
Other Indo-European Languages	7.1%	6.9%	2.7%
LEP Other Indo-European Languages	41.2%	26.0%	32.0%
Asian and Pacific Island Languages	9.2%	12.1%	5.5%
LEP Asian **and Pacific** Island Languages	47.1%	43.7%	44.5%
Other Languages	2.1%	2.8%	0.8%
LEP Other Languages	33.0%	38.0%	32.6%

Languages Spoken at Home

Figure 11. Languages Spoken at Home
Source: 2017-2021 American Community Survey 5-Year Estimates, Table S1601

- An increasingly diverse population can present language accessibility issues. About 70% of Auburn residents speak only English at home, with 11% speaking Spanish, 9% speaking an Asian or Pacific Island language, 7% speaking other Indo-European languages, and 2% speaking other languages at home.
- Notably, around 40% of Auburn residents who speak a language other than English at home have limited English proficiency (LEP), an important consideration as the City becomes more diverse.

Population Living with a Disability

Figure 12 compares Auburn, King County, and Pierce County populations living with a disability. Figure 13 shows characteristics of Auburn's population living with a disability.

Figure 12. Auburn, King County, Pierce County Population Living with a Disability

Total civilian non-institutionalized population		With Disability	% of Total
Auburn	84,846	10,160	**12.0%**
King County	2,238,712	216,031	**9.6%**
Pierce County	896,180	122,382	**13.7%**

Source: 2017-2021 American Community Survey 5-Year Estimates, Table S1810

Figure 13. Auburn's Estimated Population Living with a Disability

	Total	With a disability	Percent with a disability
Total civilian non-institutionalized population	84,846	10,160	12.0%
Population 5 to 17 years	16,204	1,345	8.3%
With a hearing difficulty	(X)	207	0.9%
With a vision difficulty	(X)	205	0.9%
With cognitive difficulty	(X)	731	4.5%
With ambulatory difficulty	(X)	46	0.3%
With a self-care difficulty	(X)	156	1.0%
Population 18 to 64 years	53,507	11,126	20.8%
With a hearing difficulty	(X)	920	1.7%
With a vision difficulty	(X)	1,008	1.9%
With cognitive difficulty	(X)	2,837	5.3%
With ambulatory difficulty	(X)	2,620	4.9%
With a self-care difficulty	(X)	1,374	2.6%
With an independent living difficult	(X)	2,367	4.4%
Population 65 years and over	9,439	6,709	71.1%
With a hearing difficulty	(X)	1,381	14.6%
With a vision difficulty	(X)	581	6.2%
With cognitive difficulty	(X)	834	8.8%

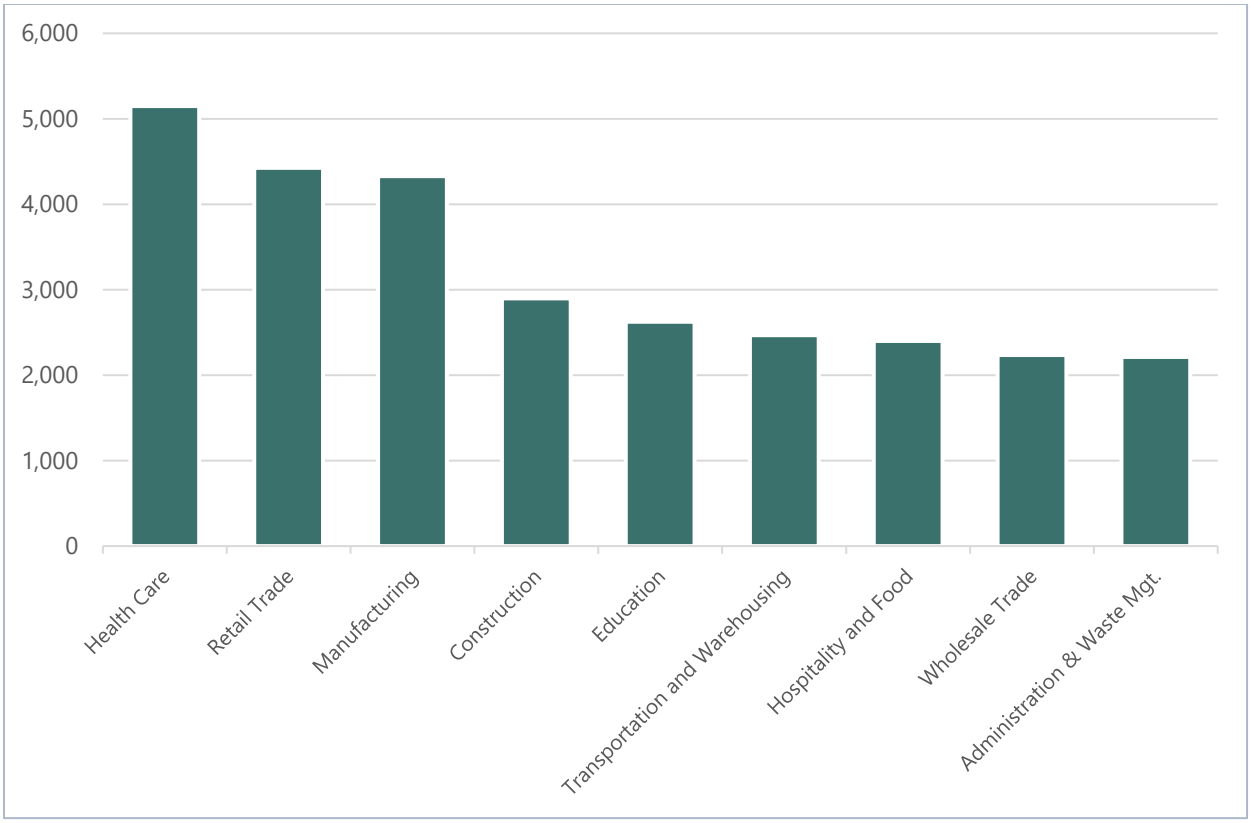
With ambulatory difficulty	(X)	2,385	25.3%
With a self-care difficulty	(X)	156	7.9%
With independent living difficulty	(X)	1,372	14.5%

Source: 2017-2021 American Community Survey 5-Year Estimates, S1810

- Approximately 12% of Auburn's total population is living with a disability. This is higher compared to King County (9.6%) and slightly lower than Pierce County (13.7%).
- About 20% of the adult population aged 18 to 64 are living with a disability.
- The most prevalent disability for those under 18 years is cognitive difficulty and also for those 18-64.
- A quarter of those over the age of 64 experience ambulatory difficulty (difficulty walking).

Workforce and Commuting Profile

Understanding future population and employment growth is essential for planning. King County, Pierce County, the Puget Sound Regional Council (PSRC), and the Washington State Office of Financial Management (OFM) are each involved in forecasting population and job growth in Auburn over the coming decades, and this section will summarize the currently available forecasts from these agencies which can be used to inform future actions on land use, infrastructure, housing, economic development, and transportation in Auburn.



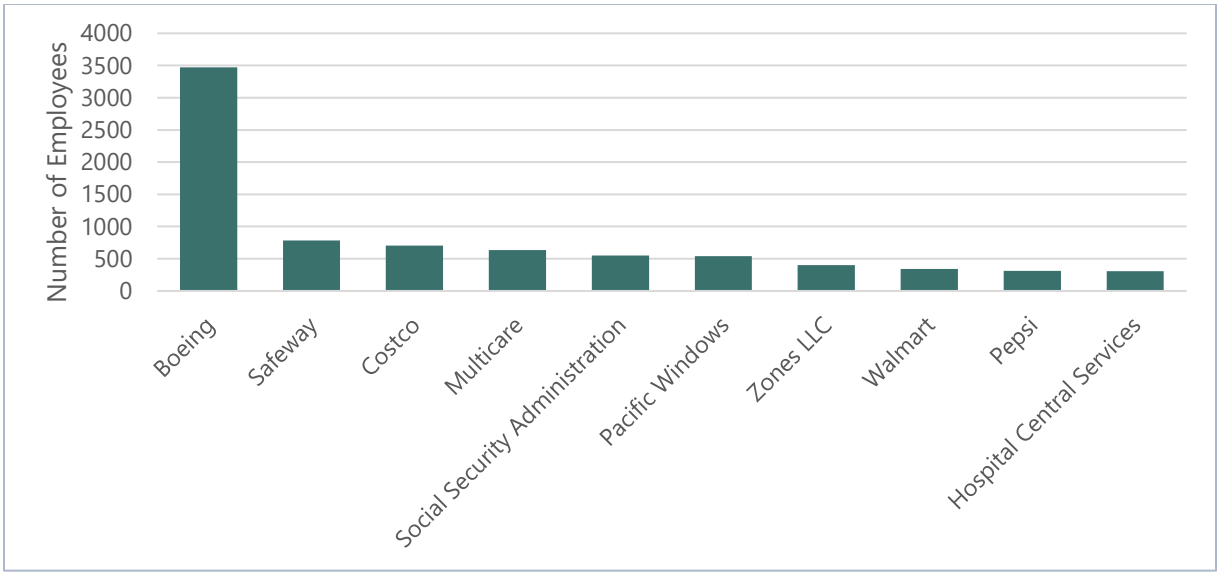
Jobs to Housing Ratio

The Jobs to Housing ratio in Auburn as of 2021 was 1.48. This is higher than the King County average of 1.34, showing Auburn's importance as a regional jobs center, particularly in Manufacturing and Health Care.

Major Employment Locations

The top ten industry sectors in which Auburn residents were employed in 2020 is shown in Figure 14. Auburn has traditionally been a blue collar community since its initial early 20th century population boom stemming from the construction of a railroad freight terminal. Despite a decrease in manufacturing employment in the 1990s and early 2000s, 12% of Auburn residents were currently employed in the industry in 2020. Since the recession of 2008, the number of Auburn residents employed in health care, retail, and construction have increased substantially and the overall diversity of jobs worked by Auburn residents has increased, reflecting the rapidly increasing population and shifts in demographics discussed previously. Between the 2019 and 2020 data, healthcare jobs overtook manufacturing for the highest share of jobs worked by Auburn residents.

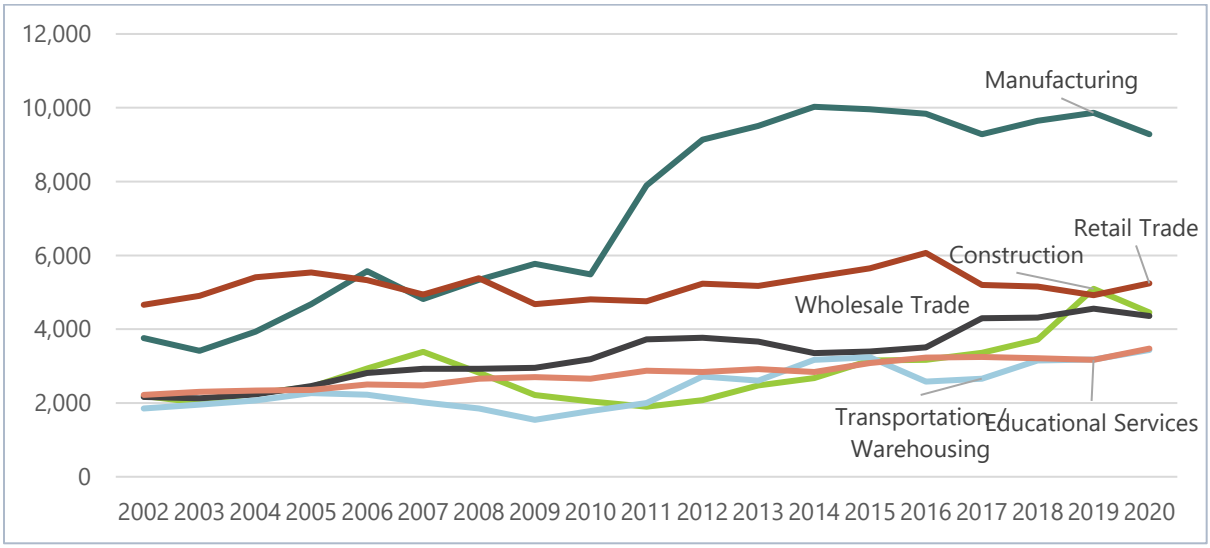
Figure 14. Auburn Workforce Top Industry Sectors (2020)



Source: US Census Longitudinal Employer Household Dynamics (LEHD), via Census On The Map

The top employers in Auburn are shown in Figure 15. Boeing is the largest employer in the City, as it has been for several decades, followed by a variety of retail, manufacturing, and wholesale businesses, as well as Multicare, the regional hospital and health care center in Downtown Auburn. The top ten employers in Auburn currently account for about 23% of the jobs in the City, down from 55% in 2011 and 85% in 2002,[3] further demonstrating the increasing diversity of business activity in Auburn in recent decades.

Figure 15. Top Ten Employers in Auburn (2022)

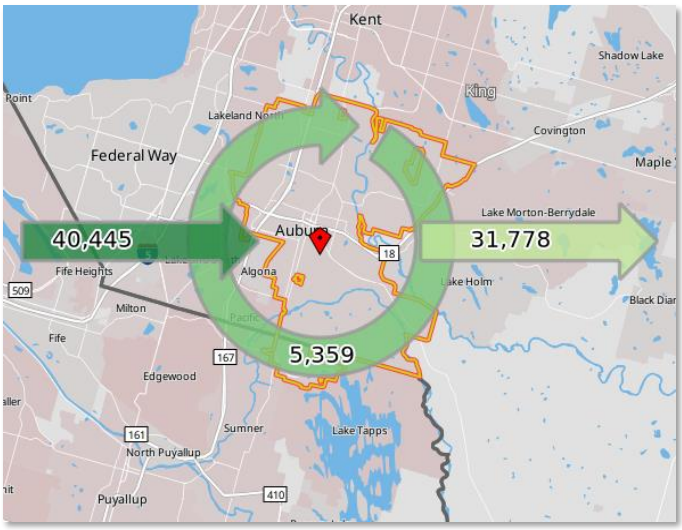


[3] 2015 Auburn Comprehensive Plan

Source: Washington Employment Security Department

As of 2020, there were 45,804 jobs located in Auburn. The top sectors are shown in Figure 16 along with their change over the past two decades. Despite decreases in the manufacturing industry from 1990 and 2000 noted in Auburn's previous (2014) comprehensive plan, the sector has seen rapid increases since the 2008 financial crisis and now accounts for over 20% of jobs in the City. There have been recent increases in construction jobs and interestingly in retail, even with the onset of the COVID-19 pandemic in the most recent data year. Full impacts of the pandemic on Auburn's job growth and distribution will become clearer when further years' data becomes available from the Census.

Figure 16. Top Industry Sectors in Auburn (2002-2020)



Source: US Census Longitudinal Employer Household Dynamics (LEHD), via Census On The Map

Daily Inflow and Outflow: The Auburn Commute

As of 2020, 5,359 Auburn residents, or 15% of the population both lived and worked in the City. The remaining 85% of those who worked in Auburn commuted from outside the City. As shown in Figure 17, there are more people who work in Auburn and live elsewhere than those who live in Auburn and work elsewhere. This results in an increased pool of residents and employees who engage with City services and businesses. Although this data predates the COVID-19 pandemic, the relatively large share of in-person manufacturing and retail jobs in the City suggests that the commuting patterns may have been less affected by the pandemic in Auburn compared with other areas which have a higher share of office jobs.

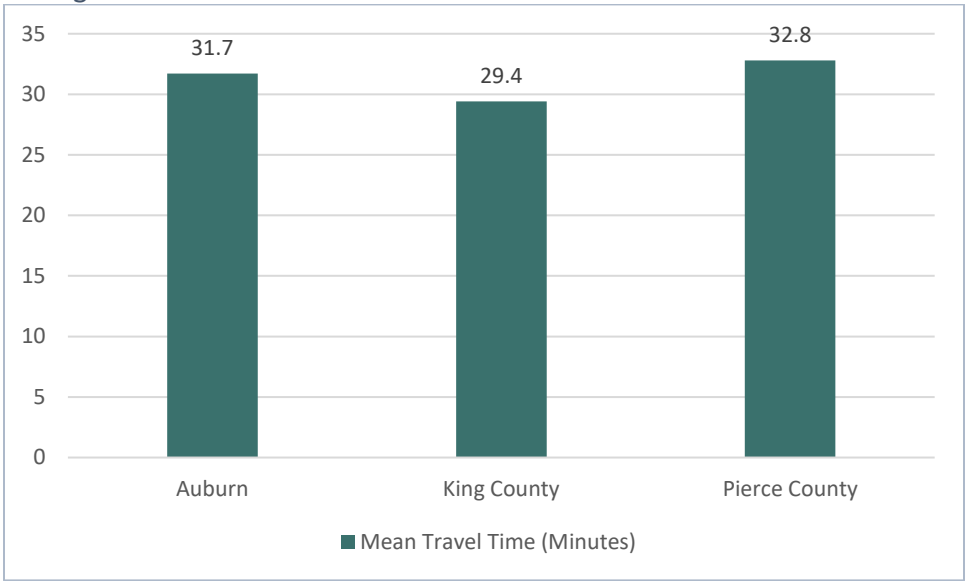
Figure 17. Auburn Daily Commuting Patterns (2020)

Source: US Census On The Map

Means of Transportation and Travel Time to Work

Means of transportation and travel time to work indicators provide a sense of how Auburn compares to both counties overall in terms of convenience and preference for using alternative modes of transportation (excluding car, truck, or van) and commute burden. Figure 18 shows the means of transportation for workers over 16 years old in Auburn, King County, and Pierce County, while Figure 19 provides mean travel time to work for workers over 16 years who do not work at home.

Figure 18. Means of Transportation to Work



Total Workers 16 and Older	Auburn	King	Pierce
Total Workers 16 and Older	42,071	1,203,566	439,523
Car, truck, or van - drove alone	72%	55%	75%
Car, truck, or van - carpooled	12%	9%	10%
Public transportation	5%	11%	3%
Walked	2%	5%	2%
Other means (bicycle, motorcycle, taxi, etc.)	1%	3%	1%
Worked from home	9%	18%	9%

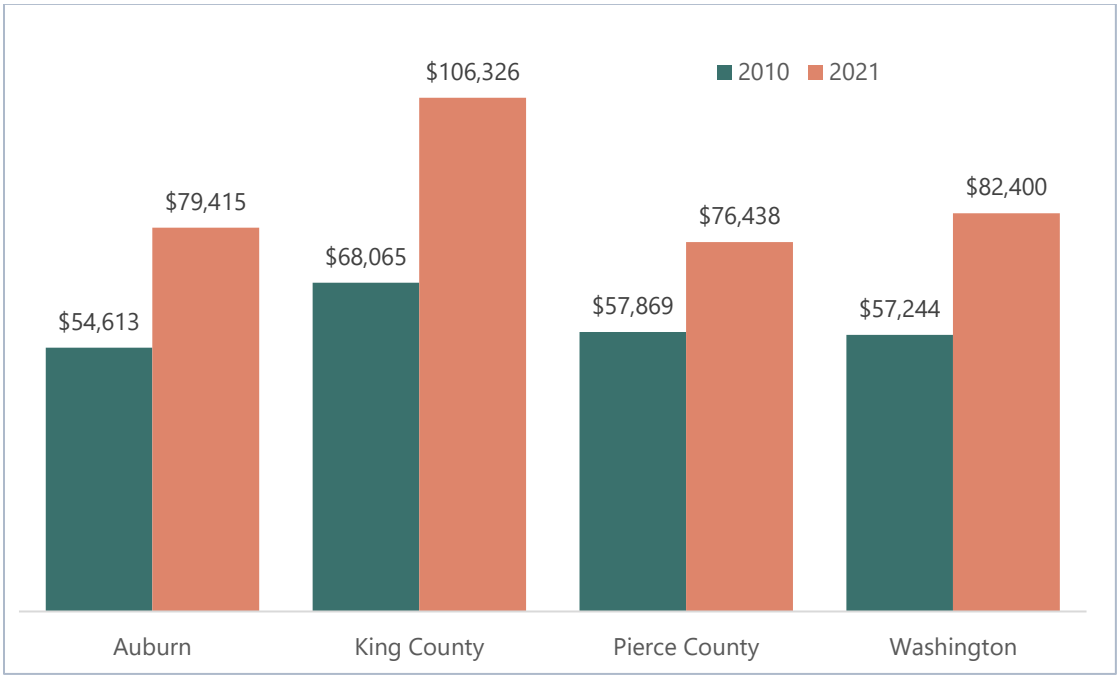
Source: 2017-2021 American Community Survey 5-Year Estimates, Table DP03

- The majority of workers in Auburn, King County, and Pierce County travel by car, truck, or van alone.

- More workers carpool in Auburn (12%) compared to King (9%) and Pierce (10%) counties.
- Only 1% of commuters travel by other means in Auburn such as by bicycle, motorcycle, or taxi.
- The mean travel time to work in Auburn is consistent with travel times in King and Pierce counties.

Figure 19. Mean Travel Time to Work

Source: 2017-2021 American Community Survey 5-Year Estimates, Table DP03



3 Household Economics

This section examines household incomes, and households' ability to provide food, shelter, and transportation. It helps estimate what portion of the population does not have the resources necessary to meet basic needs, as well as where assistance may be most beneficial.

Household Income

In 2021, Auburn was estimated to have 30,547 occupied households, an increase of 17% since 2010. The average household size was 2.77, larger than the King County average of 2.44. This is likely due to the larger share of family households in Auburn, at 72%, compared with 57% in King County, and a smaller share of householders living alone. This reflects Auburn's suburban development patterns compared with some of the denser urban areas in Seattle and its closer-in suburbs. About 59% of Auburn's households are homeowners and 41% are renters, a slightly lower share of homeowners than Washington as a whole, but higher than the King County average.

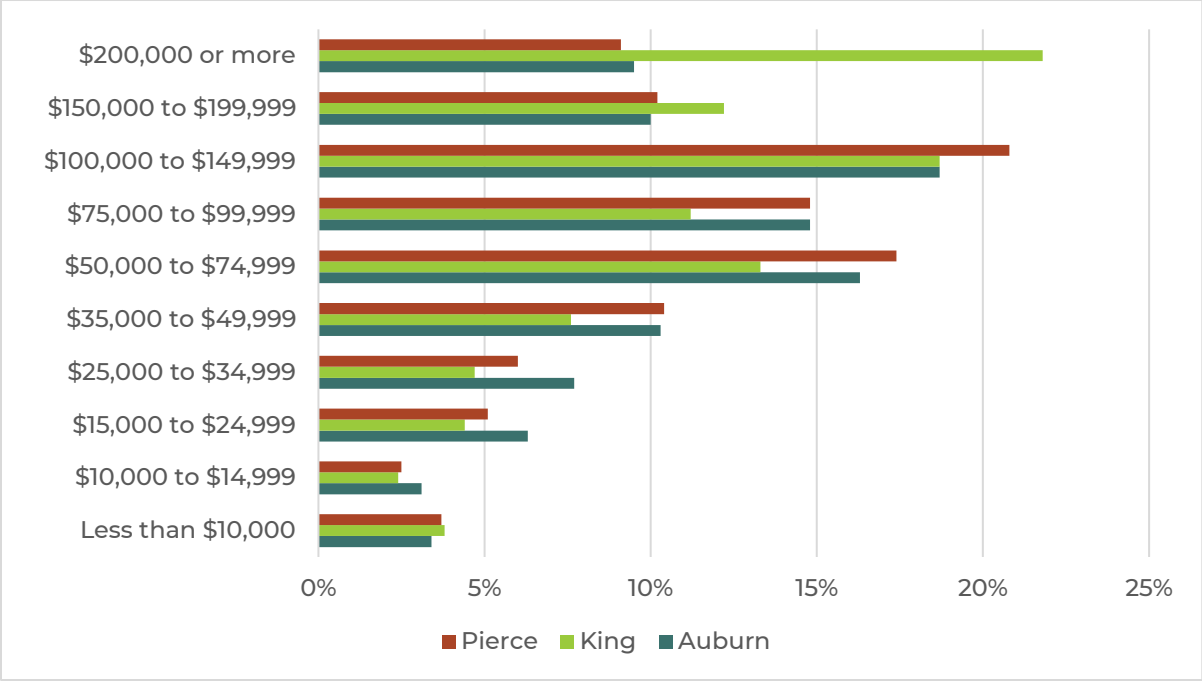


Figure 20. Inflation-Adjusted Median Household Income in Auburn with Regional Comparison (2021)

Source: 2010, 2021 ACS 5-Year Estimates, Table S2503

Auburn's median household income was $79,415 in 2021, an increase of 45% from $54,613 in 2010. As shown in Figure 20, Auburn's incomes are on par with statewide and Pierce County averages but lag behind the higher incomes of Seattle residents and other King County households. Rental households in Auburn earn significantly less than ownership households – the average renter household earns $50,091 compared with $106,521 for ownership households. Auburn's BIPOC households are more likely to be renters. Around 46% of renters are non-white residents, compared to 33% of homeowners. These types of intersections of income, race, and access to housing and wealth-building are important considerations when planning to accommodate the needs of all Auburn residents.

Figure 21. Household Income Segmentation

Source: 2017-2021 American Community Survey 5-Year Estimates, Table S1901

- Auburn is more similar to Pierce County in household income segmentation than it is to King County.
- 31% of households in Auburn earn less than $50,000 per year, compared to 28% in Pierce County and 23% in King County.
- The American Community Survey estimates that 9.6% of Auburn's population is below the poverty level (ACS 2017-2021). This is slightly higher than Pierce County (8.8%) and King County (8.4%).

Median Household Income by Size Estimates

Figure 22. Median Household Income by Household Size

	Auburn	King County	Pierce County
Average Median Income:	$79,415	$106,326	$82,574
1-person households	$36,164	$56,235	$43,374
2-person households	$81,881	$117,288	$86,479
3-person households	$103,806	$140,378	$101,655
4-person households	$111,504	$164,768	$109,688
5-person households	$102,773	$146,709	$111,186
6-person households	$114,849	$133,729	$116,300
7-or-more-person households	$102,332	$124,283	$132,707

Source: 2017-2021 American Community Survey 5-Year Estimates, Table B19019

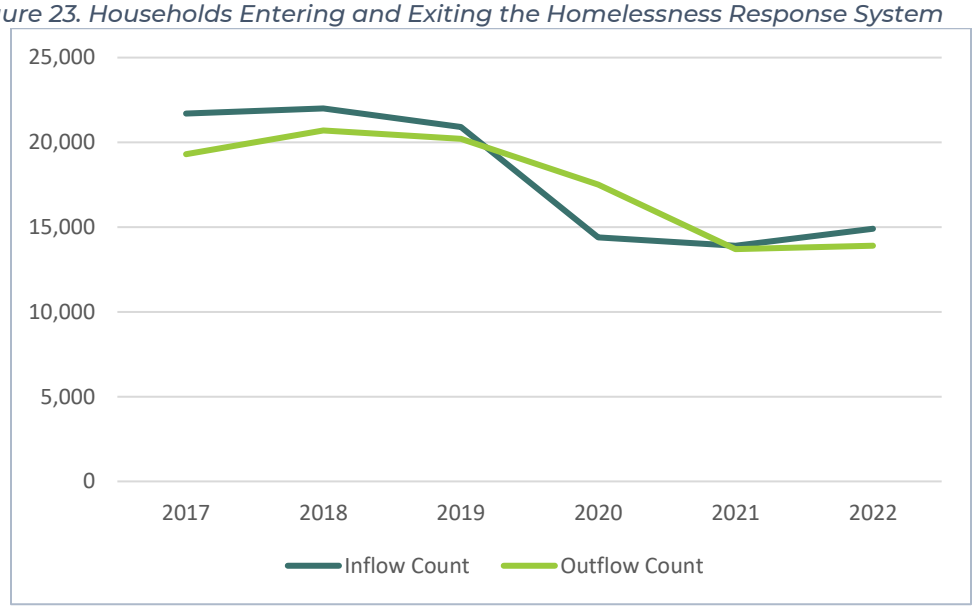
- The average median household income across all households is lower in Auburn ($79,415) than in King ($106,326) and Pierce ($82,574) counties.
- In Auburn 7-or-more-person households have a lower median income than those with 5 or 6-person households.
- King County households have significantly higher median income than Auburn households regardless of household size.

Food Stamps/SNAP Program

- Approximately 15.6% of households in Auburn receive food stamps (ACS, 2017-2021 Estimates, Table DP03).
    - This is higher compared to the percentage of households receiving food stamps in King and Pierce Counties, where 8% of households in King County receive food stamps, and 11.7% of households in Pierce County receive food stamps.
- Approximately 54% of households in Auburn receiving food stamps have children under 18 years old.
    - This is significantly higher compared with King County, where 40% of households receiving food stamps have children under 18, and higher compared with Pierce County, where 45% of households receiving food stamps have children under 18 years.
- 16.8% of households receiving food stamps in Auburn identify as being Hispanic or of Latino origin.
- 35% of households receiving food stamps in Auburn have had 2 or more workers in the past 12 months.
- According to the Office of Superintendent of Public Instruction Washington State as of October 2022, 71.3% of the Auburn School District student population are eligible for Free or Reduced- Price meals. This is significantly higher than the Washington State percent of 52% eligible students out of the total enrolled population.
    - 12,312 Auburn School District students out of a total of 17,165 enrolled were eligible for free lunches as of October 2022 for the 2022-2023 school year.

Homeless Population

Estimating the total homeless population is difficult. The U.S. Department of Housing and Urban Development requires jurisdictions to conduct a Point in Time (PIT) count, which is an estimate of people experiencing sheltered and unsheltered homelessness on a single night. In King County, the 2022 PIT count estimated 13,368 individuals experiencing homelessness, a significant increase since the reported 2014 count of 3,123. In prior years, the unsheltered PIT was conducted by volunteers on one night in January, using a combination of a census and a survey.



The PIT is widely understood to be an undercount, especially as it represents a single night rather than a full year. Some likely individuals and families are

improvising with camping, sleeping in their cars, rotating through weekly motels, and spending nights in someone's spare room or couch with no fixed living situation. The recent King County Department of Community and Human Services Cross Systems Homelessness Analysis found that at least 40,871 people experienced homelessness at some point in 2020 (KCRHA, 2022).

Unsheltered homeless counts illuminate the local gap in services for the homeless. Homelessness continues to have a disproportionate impact on communities of color. Based on the PIT analyses, 25% of people experiencing homelessness in King County identify as Black/African-American, but according to the 2020 U.S. Census, only 7% of King County's population identifies as Black/African-American. Similarly, 9% of people experiencing homelessness identify as American Indian, Alaskan Native, or Indigenous, but that group makes up only 1% of King County's population (KCRHA, 2022).

As shown in Figure 23. Households Entering and Exiting the Homelessness Response SystemFigure 23, in 2022 the number of households entering the homelessness response system was higher than the number of those exiting it, by about 1,000.

Figure 23. Households Entering and Exiting the Homelessness Response System

Source: Homeless Management Information System (HMIS) as of July 1, 2023

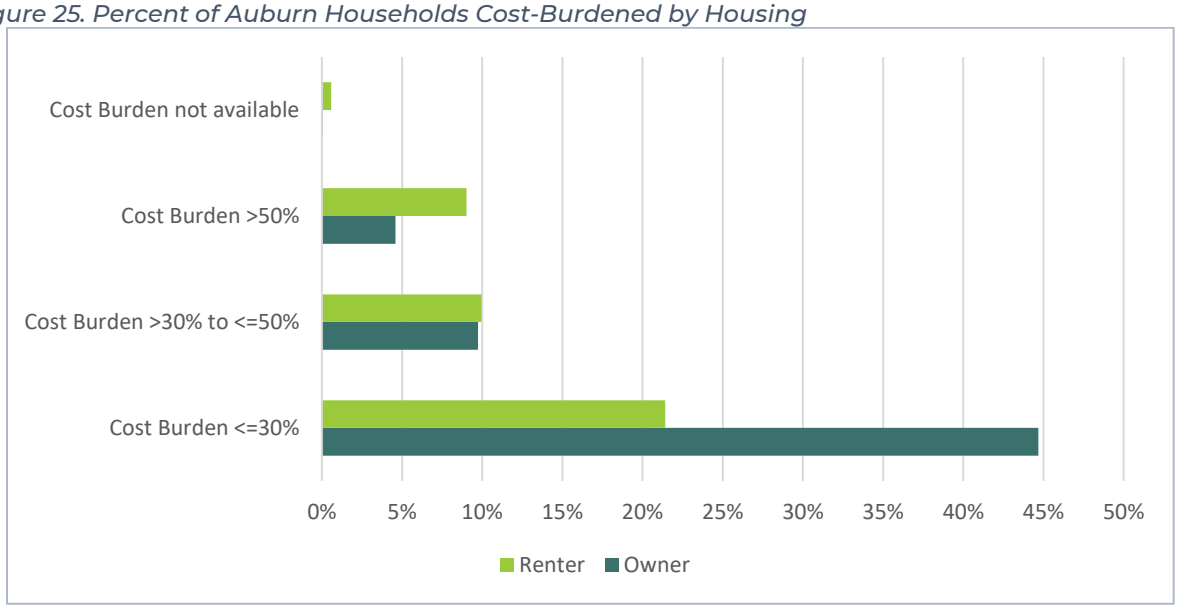
- According to the King County Regional Homelessness Authority (KRHA), when the number of households entering the homeless response system is higher than the number of those exiting it, the number of households becoming homeless and receiving services increases.
- More households are entering the system than exiting the system.
- Response efforts to COVID-19 decreased the number of those entering homelessness due to a combination of eviction moratoriums, stimulus

payments, unemployment insurance, emergency rental assistance, and drops in rental prices (King County DCHS, 2021).

Employment and Labor Force Participation

Figure 24. Labor Force Participation and Unemployment Rate

	Population 16+ Years Old	% in Civilian Labor Force	Unemployment rate	% of Civilian Labor Force Below the Poverty Level
Auburn	65,949	68.3%	5.0%	47.4%
King County	1,836,285	70.2%	4.6%	49.9%
Pierce County	718,566	66.1%	5.0%	43.8%



Source: 2017-2021 American Community Survey 5-Year Estimates, Table S2301

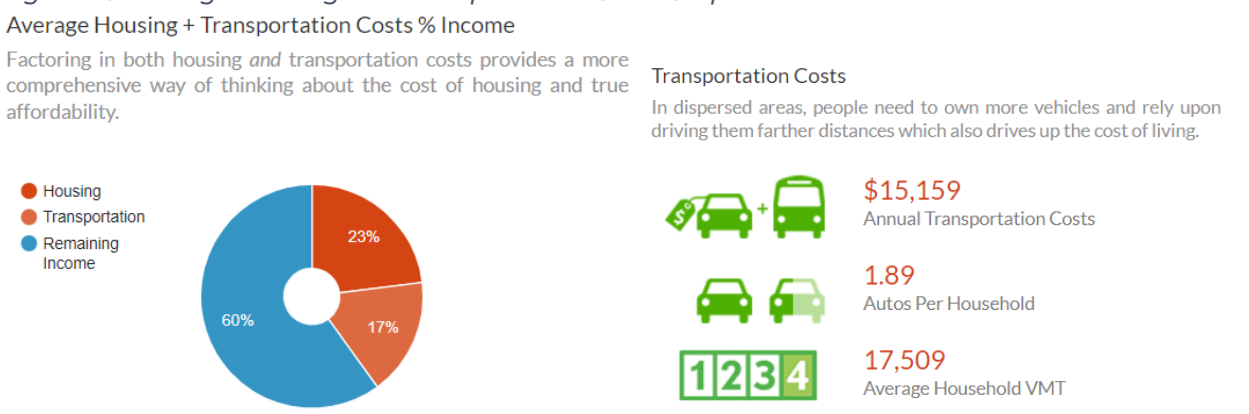
- Almost half (47.4%) of Auburn's labor force is below the poverty level. This is slightly lower than King County and slightly higher than Pierce County. This means about half of Auburn's population consists of the "working poor".
- Auburn's unemployment rate is consistent with King and Pierce counties and is exceptionally low at 5%.
- Historically, Auburn has had a higher percentage of labor force below the poverty level than King County, but this has changed in the past five years.

Housing Cost Burden

Households are considered "cost-burdened" if they spend more than 30 percent of their income on housing costs, including rent, mortgage, and utilities. Households that spend more than 30 percent of their monthly income on housing costs, including rent and utilities. A severely cost-burdened household spends more than 50 percent of its monthly income on housing costs. This metric can be used to analyze the gap between housing costs and affordability in Auburn.

Figure 25. Percent of Auburn Households Cost-Burdened by Housing

Source: 2006-2019 Comprehensive Housing Affordability Strategy, HUD



- About 45% of Auburn homeowners are not cost-burdened by housing costs compared to 21% of renters.
- One of every five renter households is either cost-burdened or severely cost-burdened by housing costs in Auburn.
- About 5% of Auburn homeowners are severely cost-burdened by housing.

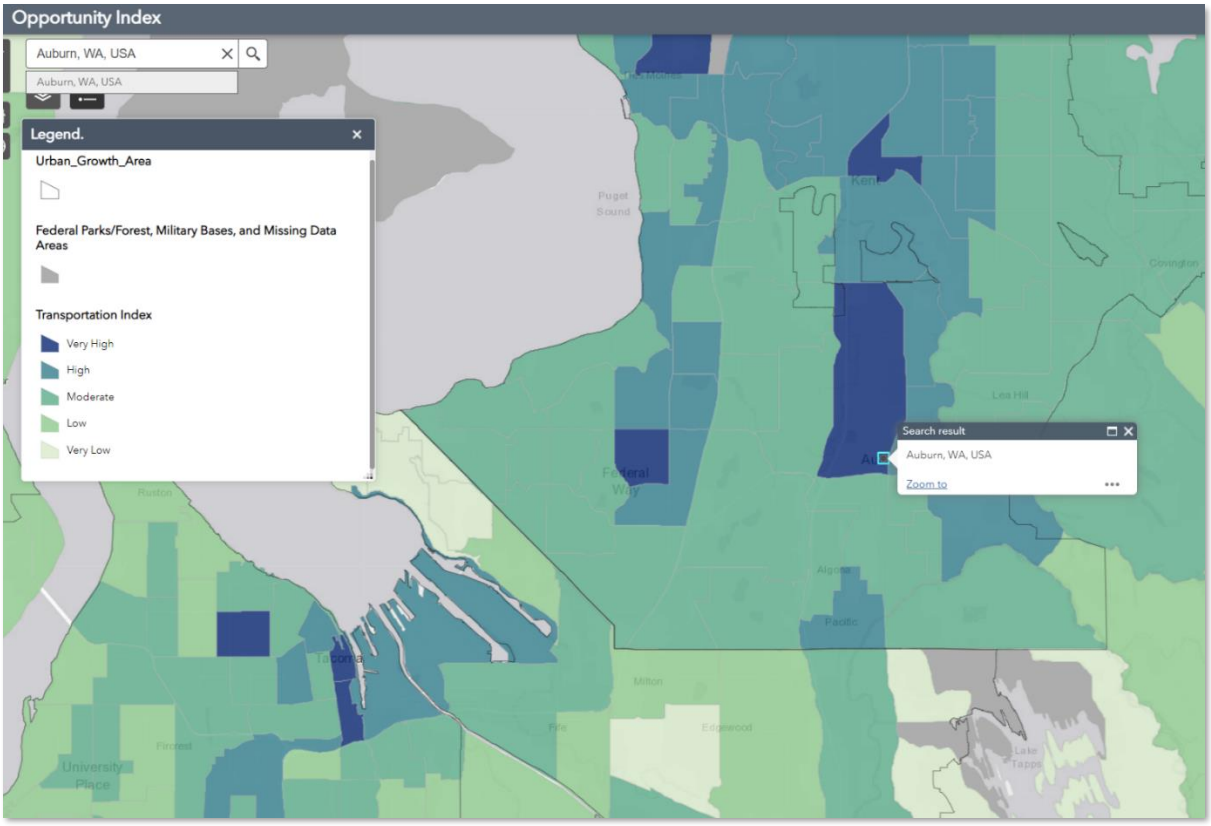
Housing and Transportation Costs

The standard definition of cost burden does not factor in transportation costs. However, today, housing advocates and researchers stress the importance of considering transportation costs in affordability analyses, because many households relocate to the outer edges of metro areas in search of affordable housing, thereby increasing their transportation costs. Housing costs combined with transportation costs can exacerbate households' ability to meet their basic living needs within their means.

Center for Neighborhood Technology publishes a Housing+ Transportation Affordability Index (H&T Index) (most recently as of 2022), providing a ready-made data source for assessing the possible transportation cost burdening of Auburn residents. The H+ T Index calculates, through a series of statistical models, the transportation and housing costs for the "regional typical" and "regional moderate" household; "typical" means a household earning the regional AMI with the regional average number of commuting workers and persons per household, and "moderate" meaning a household earning 80% of AMI (but having the same number of workers and persons per household). Figure 26 shows that households in Auburn spend a combined 40% of their income on housing and transportation costs. Most households in Auburn spend about $15,000 annually on transportation costs.

Figure 26. Average Housing and Transportation Costs Graphics

Source: Housing and Transportation Affordability Index, http://htaindex.cnt.org/, October 2022



Placing housing near multiple modes of travel can help reduce travel costs to some degree and is supportive of recent legislation with HB 1110 permitting denser middle housing in proximity to transit stops.

Growth in areas of opportunity is based on an "Opportunity Index," which combines measures of five key elements of neighborhood opportunity and positive life outcomes: education, economic health, housing and neighborhood quality, mobility and transportation, and health and environment. The level of opportunity score (very low, low, moderate, high, very high) is determined by sorting all census tracts into quintiles based on their index scores. Areas of opportunity that experience greater proportions of growth may experience an increased risk of displacement.

The Puget Sound Regional Council created an opportunity mapping tool that assesses the amount of opportunity that exists in neighborhoods. Areas with lower opportunity are defined as places that score "Very Low to Low" – which represents the bottom 40% of scores in the region. Areas with higher opportunity are defined as places that score "Moderate to Very High Opportunity" – which represents the top 60% of scores among all tracts.

Figure 27 shows the opportunity index indicates there are high to very high opportunities for improved transportation in Auburn.

Figure 27. PSRC Opportunity Index, Transportation in Auburn

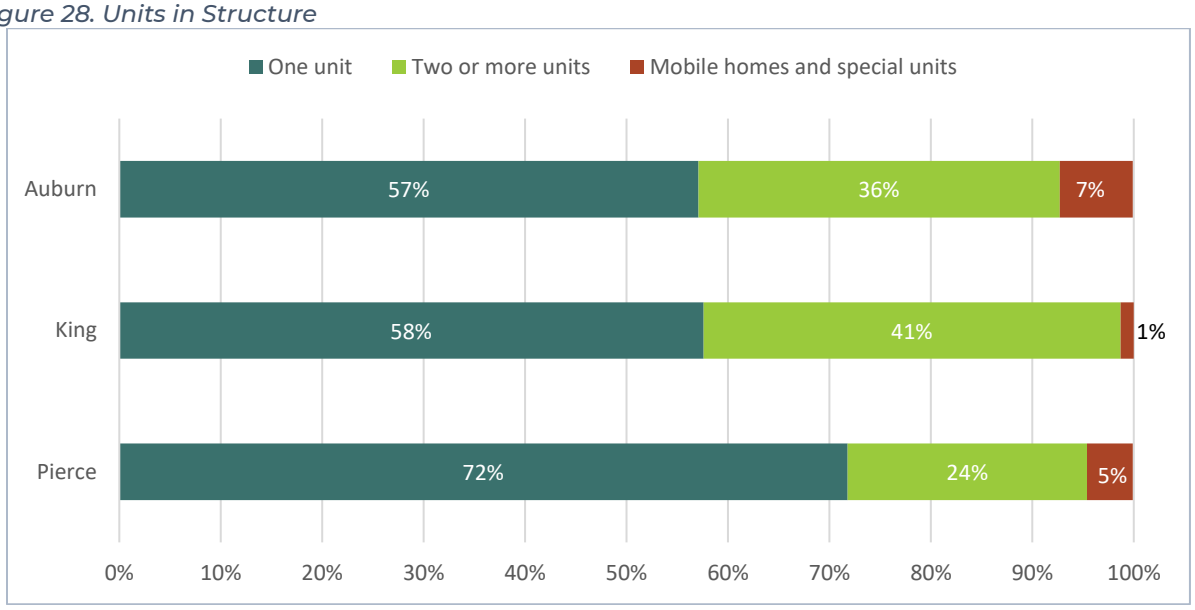
4 Housing Inventory and Affordability

This section describes the City's housing inventory including the proportion of housing that is affordable to segments of the City's population. The information shows information citywide and compares information to King County and Pierce County statistics.

Historically, the Growth Management Act, RCW 30.60A.070 required each fully planning city and county to prepare a housing element to meet the housing GMA goal. In 2022 with the passing of HB 1220, the housing GMA goal was amended to "plan for and accommodate housing affordable to all economic segments". With this change in the goal, the previous requirement to include an inventory and analysis of existing and projected housing needs was expanded to incorporate income-segment needs and emergency and permanent supportive housing.

VISION 2050, a regional growth strategy adopted by Auburn and PSRC jurisdictions, also identifies that the housing element should provide opportunities for a range of housing types and choices to meet the housing needs of all income levels and demographic groups.

Additionally, King County's Countywide Planning Policies provide a framework for all jurisdictions to plan for and promote a range of affordable, accessible, and healthy housing choices for current and future residents. In 2021, 76% of low-income households in King County spent more than 30% of their income on housing. Only 21 units are affordable and available for every 100 extremely low-income households in King County. The City of Auburn has about 500 income-restricted housing units through the King County Housing Authority.



Housing Units

The housing inventory changes daily as new units are built and older units are torn down. The Washington State Office of Financial Management estimates current housing units for all Washington jurisdictions over time.

Figure 28 shows the proportion of housing units by unit type. The types include:

- One unit,
- Two or more units, and
- Mobile homes and special units.
    - Special units include permanent residents living in travel trailers, RVs, boats, sheds, tents, and others.

Figure 28. Units in Structure

Source: 2017-2021 American Community Survey 5-Year Estimates, Table DP04.

- The majority of housing units in Auburn, King County, and Pierce County are single-family units (one unit). Auburn has fewer single-family units than Pierce and King Counties.
- Auburn has a larger proportion of housing units in mobile homes and special units (7%) compared to King County (1%).

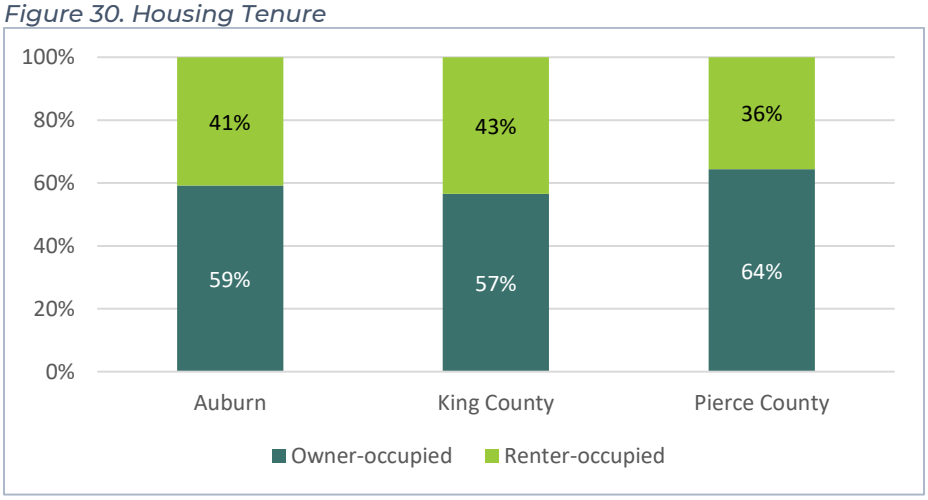
Housing Types and Sizes

Figure 29. Number of Bedrooms

	Auburn		King County	Pierce County
Bedrooms	*Housing Units*	*Percent*	*Percent*	*Percent*
No bedroom (studios)	774	2.4%	7.7%	2.5%
1 bedroom	4,572	12.4%	16.7%	9.2%
2 bedrooms	9,457	29.2%	23.9%	22.9%
3 bedrooms	8,930	27.5%	26.4%	41.6%
4 bedrooms	7,282	22.5%	19.1%	19.1%
5 or more bedrooms	1,405	4.3%	6.2%	4.7%
Total Housing Units	**32,420**	**100%**	**100%**	**100%**

- *Source: 2017-2021 American Community Survey 5-Year Estimates, Table DP04.*

- About half of Auburn's housing stock is 2-3-bedroom units, accounting for 56.7%



of housing units.

- Auburn's housing stock is about 26% large units with 4 or more bedrooms, which aligns with the approximately 26% of households with 4 or more persons (see Figure 8). This suggests Auburn does not have a shortage of larger units to accommodate its larger households.
- Auburn has a lower percentage of units with no bedrooms (studios) compared to King County, but similar in comparison with Pierce County.

Tenure

Tenure relates to the ownership status of a housing unit. A housing unit is "owned" if the owner or co-owner lives in the unit, even if it is mortgaged or not fully paid for. A cooperative or condominium unit is "owned" only if the owner or co-owner lives in it. All other occupied units are classified as "rented," including units rented for cash rent and those occupied without payment of cash rent.

Figure 30. Housing Tenure

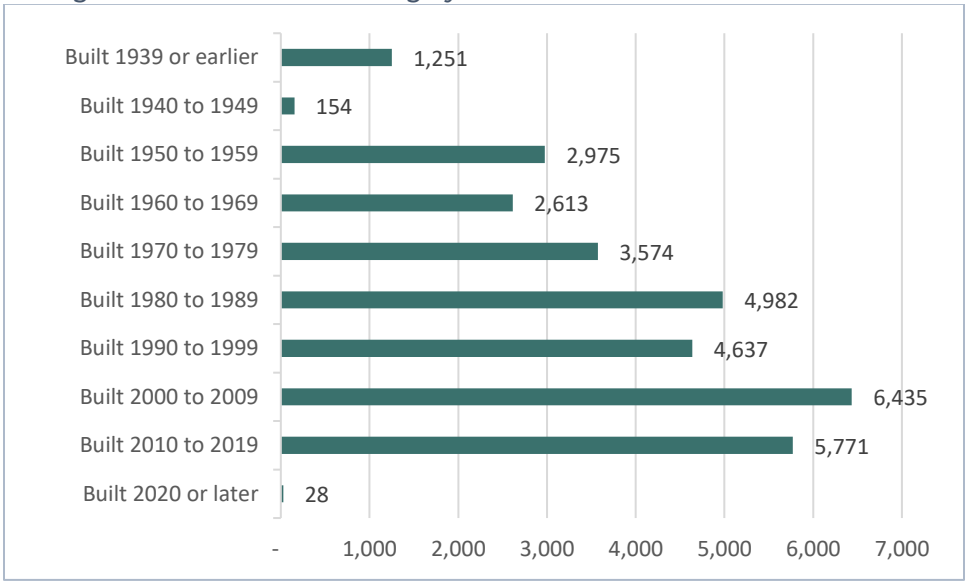
Source: 2017-2021 American Community Survey 5-Year Estimates, Table DP04

- Auburn is similar to both King and Pierce Counties in housing tenure rates. Approximately 60% of housing units are owner-occupied and about 40% are renter-occupied.

Vacancy Rates

Vacancy rates are a leading indicator of a housing market, which can indicate future changes in housing prices and demand.

Figure 31. Vacancy Rates



Unit Type	Auburn	King County	Pierce County
Homeowner	1.6%	0.8%	0.8%
Renter	5.5%	4.2%	3.7%
Vacant Housing Units	4.6%	5.7%	5.6%

Source 2017-2021 American Community Survey 5-Year Estimates, Table DP04

- Auburn's overall vacancy rate is 4.6%, which is lower than both King County and Pierce County and below the healthy market rate of 5-8%.
- Auburn's vacancy for owner-occupied units is 1.6%, higher than both King and Pierce counties. The homeowner vacancy rate is extraordinarily low for Auburn and both King and Pierce Counties, suggesting limited supply for those seeking to purchase a home.
- Auburn's renter vacancy rate is 5.5%. In general, a vacancy rate of 5% or less for rental units is considered a very tight market that will put upward pressure on prices and potentially stimulate investment in new housing stock.

Housing Units by Year Built

Figure 32. Residential Housing by Date Built in Auburn

Source: 2017-2021 American Community Survey 5-Year Estimates, Table DP04

Across all housing units, the age of structure is the single most important physical attribute in predicting the degree of structure quality. National research has demonstrated a negative correlation between the age of a unit and its condition. Generally speaking, a residential unit will have a functional life of around 40 years, at which point additional investments will be needed to maintain structural adequacy. Figure 32 presents the age of housing units for all residential structures in Auburn.

- Most of the new housing (built from 2001 to the present) has been concentrated mainly in the south and northeast regions of the city, particularly the Lakeland neighborhood and Lea Hill neighborhood.
- Most of the lots in the Downtown vicinity were developed before 1950. In South Auburn, housing was generally built in the 1950s. These structures are more than 50 years old, and many likely have structural deficiencies.

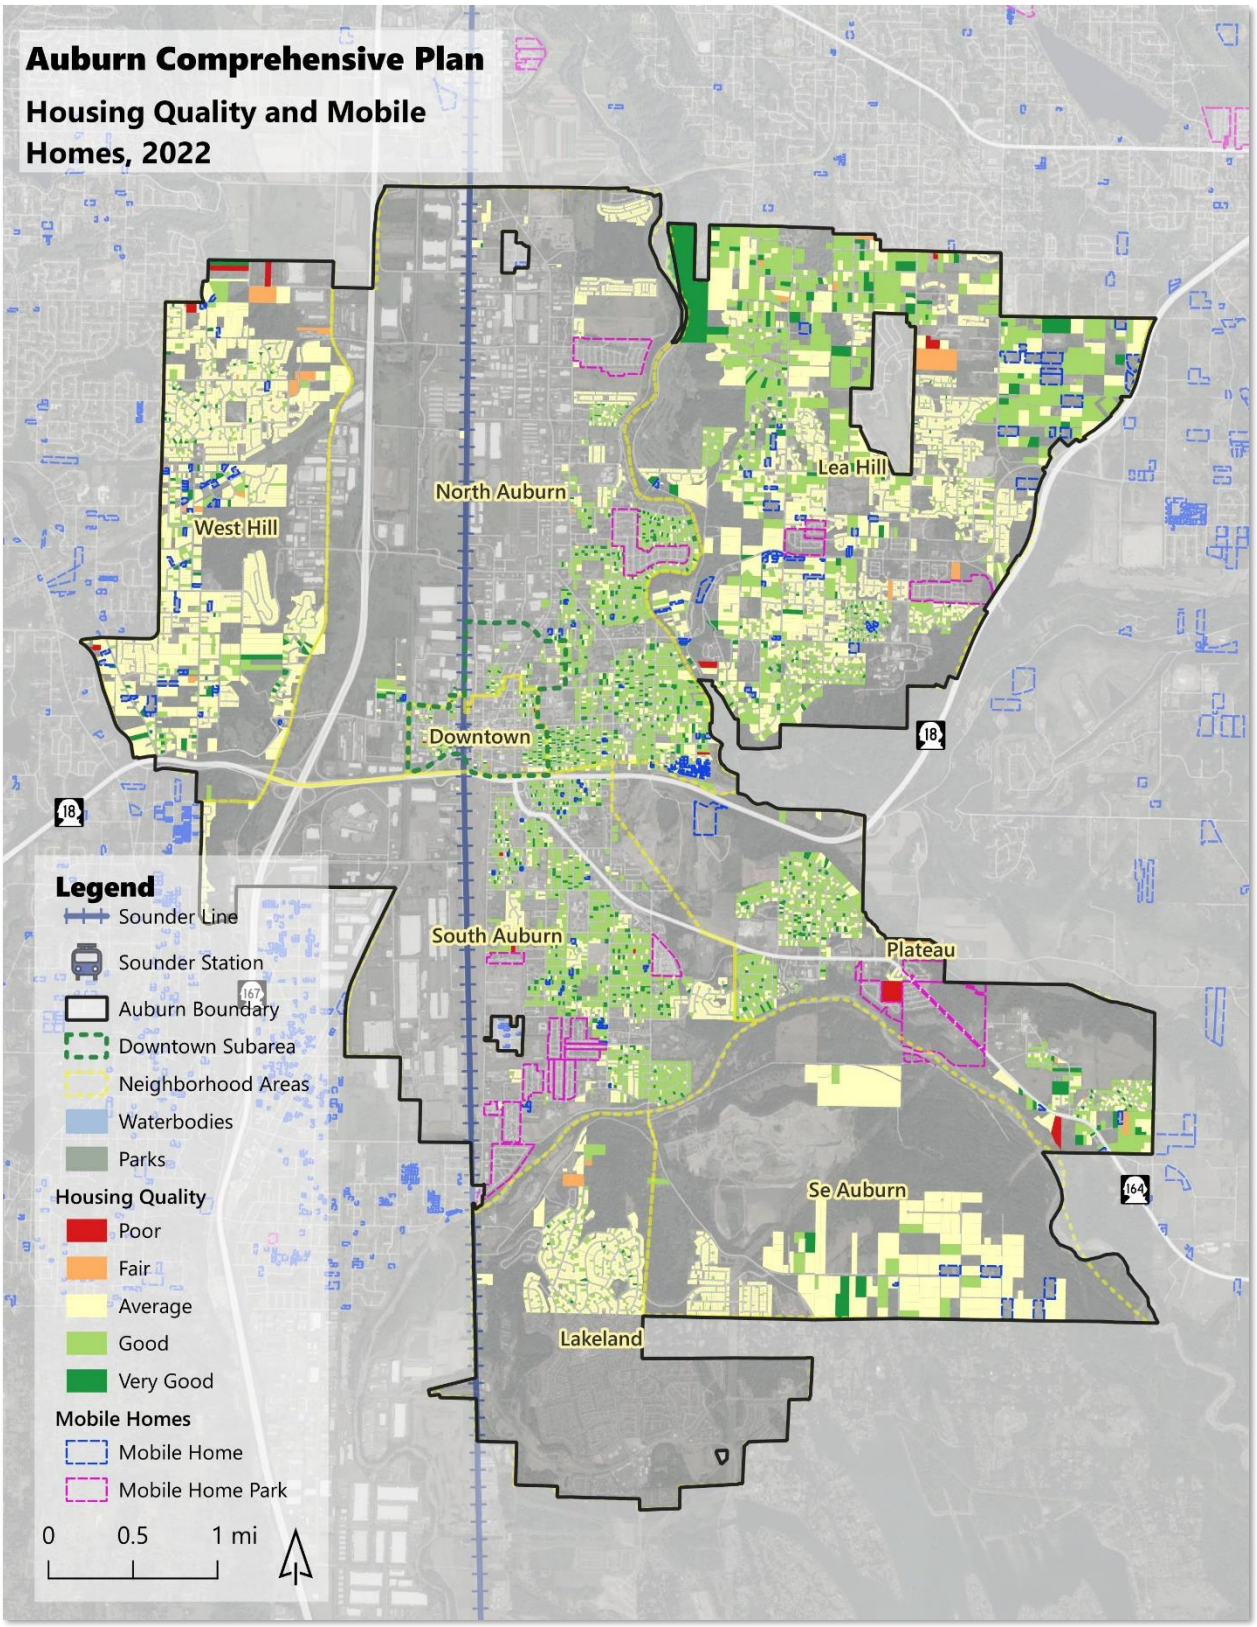
- There is some evidence of site-level redevelopment within these neighborhoods, which bodes well for future investment by property owners.
- Less than 20% of Auburn's housing stock was built in 2010 or later.

Housing Condition and Quality

Housing quality has many dimensions including structural integrity, energy efficiency, wear and tear, housing design, and relationship to amenities and services. There is no comprehensive data set that reports the quality of housing across all these domains. This analysis examines multiple dimensions of housing quality to ascertain the specific housing quality challenges experienced in Auburn.

County Assessors rate the building condition of each residential unit in their jurisdiction. The Building Condition values are rated relative to age and grade (that is, taking into account the age of the structure and the original building quality in terms of materials, craftsmanship, and design). They include:

1 = Poor- Worn out. Repair and overhaul needed on painted surfaces, roofing, plumbing, heating, and numerous functional inadequacies. Excessive deferred maintenance and abuse, limited value-in-use, approaching abandonment or major reconstruction; reuse or change in occupancy is imminent. Effective age is near the end of the scale regardless of the actual chronological age.



2 = Fair- Badly worn. Much repair is needed. Many items need refinishing or overhauling, deferred maintenance obvious, and inadequate building utility and systems all shortening the life expectancy and increasing the effective age.

3 = Average- Some evidence of deferred maintenance and normal obsolescence with age in that a few minor repairs are needed, along with some refinishing. All major components are still functional and contribute toward an extended life expectancy. Effective age and utility are standard for like properties of its class and usage.

4 = Good- No obvious maintenance required but neither is everything new. Appearance and utility are above the standard and the overall effective age will be lower than the typical property.

5 = Very Good- All items are well maintained, many having been overhauled and repaired as they have shown signs of wear, increasing the life expectancy and lowering the effective age with little deterioration or obsolescence evident with a high degree of utility.

Figure 33. Housing Quality and Mobile Homes in Auburn, 2022

Source: King County Assessor, Leland Consulting Group

- King County and Pierce County Assessors' ratings of residential structure quality show a large proportion of the residential structures are considered to have average conditions (depicted in yellow), suggesting Auburn has a significant amount of housing stock for which maintenance has been deferred. Much of the housing stock in Auburn is older than 40 years and many structures may be approaching the need for more comprehensive refurbishment and updates to keep structures in a useful condition.
- Areas close to the downtown are dominated by housing rated as "good" and show evidence of investment indicated by the intermixing of higher-rated quality buildings such as in the area around Auburn High School and Washington Elementary School. Areas that are both dominated by lower ratings (average and poor) and show more homogeneity (lacking newer or higher-rated- structures) are likely to have more significant housing quality deficiencies.
- Building conditions rated 'poor' represent housing that has the greatest quality deficiencies and may pose a health or safety risk to inhabitants. Exhibit 32 overlays the number of mobile homes, demonstrating areas with higher concentrations of mobile homes tend to show average to fair to poor conditions. Mobile homes differ from stick-on-site built homes and are more difficult to update incrementally due to both structural and financing constraints. As a result, full replacement is necessary for mobile units with deferred maintenance or outdated systems.

Code Enforcement

The City's Code Compliance is a division of the Department of Community Development. They are responsible for enforcing several City ordinances including property maintenance, public nuisance regulations which include junk vehicles and tall grass. The enforcement of these codes helps maintain the character and quality of neighborhoods. Approximately 2,500 complaints are received and investigated each year.

This also includes ensuring that the proper permits have been issued for construction of projects, land clearing, grading and filling of property, placement of signs, and that businesses are operating in compliance with the City of Auburn Zoning Code.

The City has also established more specific requirements for housing conditions, as City staff have seen tenants living in substandard conditions with mold, moisture, rodent, and insect problems.

Neighborhoods with Unique Housing Conditions or Amenities

The City is made up of several neighborhood districts, as described in the city's Comprehensive Plan. These districts indicate general geographic areas of the city and may not reflect the boundaries or naming conventions found in other sources, such as real estate records. A summary of housing conditions and amenities is included below.

Downtown

Downtown is the City's core and was developed in the late 1880s to early 1900s. Downtown is designated it as a Regional Growth Center by the Puget Sound Regional Council. It has a population of about 2,267 and an employment base of 3,162 as of 2022 (2024 Auburn Downtown Plan). About a quarter of the housing units downtown are single-unit detached homes, primarily in the western and eastern quadrants. Almost a third of housing units in the downtown are in large developments of 50 units or more. The share of multifamily units in Auburn's downtown is much higher than that in the city as a whole, which is about half of single-unit detached homes. In Auburn's downtown, there is a significantly higher age of housing when compared with the region. Almost a quarter of housing units downtown were built before 1940, compared with only 4 percent in the city as a whole. This reflects Auburn's longer history as a city at an important railway junction dating back to the early 20th century.

North Auburn

North Auburn has housing focused east of Auburn Way North. Many of the properties were developed prior to the 1950s, with others developed in the 1970s, and few after the year 2000. The majority of residential properties in North Auburn are in "good" or "average" condition (see Figure 34). There are a few concentrated areas of mobile home units in the northern part of the neighborhood near the river that are in "poor" condition. Park land is located in several locations, along the river, the freeway, as well as in the southern portions of this neighborhood.

South Auburn

South Auburn was largely developed before or during the 1950s and 1960s. The majority of residential properties in the South Auburn neighborhood are in "good" or "average" condition. There are large concentrated areas of mobile homes in the southern part of the neighborhood near the river that are in "poor", "fair" or "average" condition. The City's Les Gove Community Campus with the library and Senior Center, as well as other centers and play areas, is located in South Auburn.

West Hill

West Hill to the northwest has single-unit detached homes built in the 1980s predominantly, with some apartment complexes developed before the 1950s. Most of the residential properties in the West Hill neighborhood are in "average" condition. West Hill has few mobile home units dispersed throughout the neighborhood. There are a few properties near the northern city boundary that are

in “fair” or “poor” condition, representing units built in the 1950s. There is little park land in the West Hill Area, but there are some schools that provide some amount of open space and recreation opportunities.

Lea Hill

Lea Hill reflects development across many decades, with the central area developed pre-1950s to the present day. The northern area developed in the 1960s, and the northeast in the 1990s. The majority of residential properties in the Lea Hill neighborhood are in “good” or “average” condition.

Plateau

The Plateau neighborhood was developed in the 1960s and 1970s predominantly. The majority of residential properties in the Plateau neighborhood are in “good” or “average” condition.

Lakeland

Lakeland is a master-planned community at the City’s southern border and was developed between 1990 and 2010. The majority of residential properties in the Lakeland neighborhood are in “average” condition or are new. Parks are located in several places within the development.

Southeast Auburn

Southeast Auburn is more lightly populated than other areas of the City. Homes are focused to the south and were developed generally between 1950 and 1990. The majority of residential properties in Southeast Auburn neighborhood are in “average” condition. Open space is located along the river.

Source: Leland Consulting Group and City of Auburn, 2023

Projected Housing Needs by Income Band

Projected housing needs by income band in Auburn are set by both King and Pierce counties, respectively. Analysis describing how Comprhenisve Plan Land Use and Zoning adequately accommodates King and Pierce County housing units by income band is found in section 5 of this document.

King County

On August 15, 2023 the King County Council unanimously adopted the Housing-related Countywide Planning Policy amendments recommended by the Growth Management Planning Council in GMPC Motion 23-1. The amendments include implementation HB 1220 and housing availability by income band.

The County CPP states, “while significant new housing growth is necessary to reach overall King County housing growth targets, new housing growth will not sufficiently address the housing needs for lower-income households without

additional government support for the creation of units restricted to income-eligible households—both rent-restricted units and resale restricted homes ("income-restricted units"); and the preservation of homes currently affordable at or below 80 percent of area median income. Local jurisdictions can create enabling environments and generate local revenue to support new housing development and housing preservation, but successful implementation requires resources and involvement from other levels of government, nonprofits, and the private sector."

Figure 34 – Housing Need by Income and County

County		Total	0-30%		>30% to 50%	>50% to 80%	>80% to 100%	>100% to 120%	>120%	Net New Emergency Housing Needs
			Non-PSH	PSH						
King	Supply (2019)	28,049	1,076	237	8,029	8,075	4,427	3,302	2,903	58
	Net New Need (2044)	12,000	1,543	812	309	616	1,146	1,299	6,275	2,293
Pierce	Supply (2019)	3,963	0	33	134	493	1,141	680	1,482	8
	Net New Need (2044)	112	14	20	21	16	7	6	27	7
Total	Net New Need (2044)	12,112	1,557	892	330	632	1,153	1,235	6,302	2,300

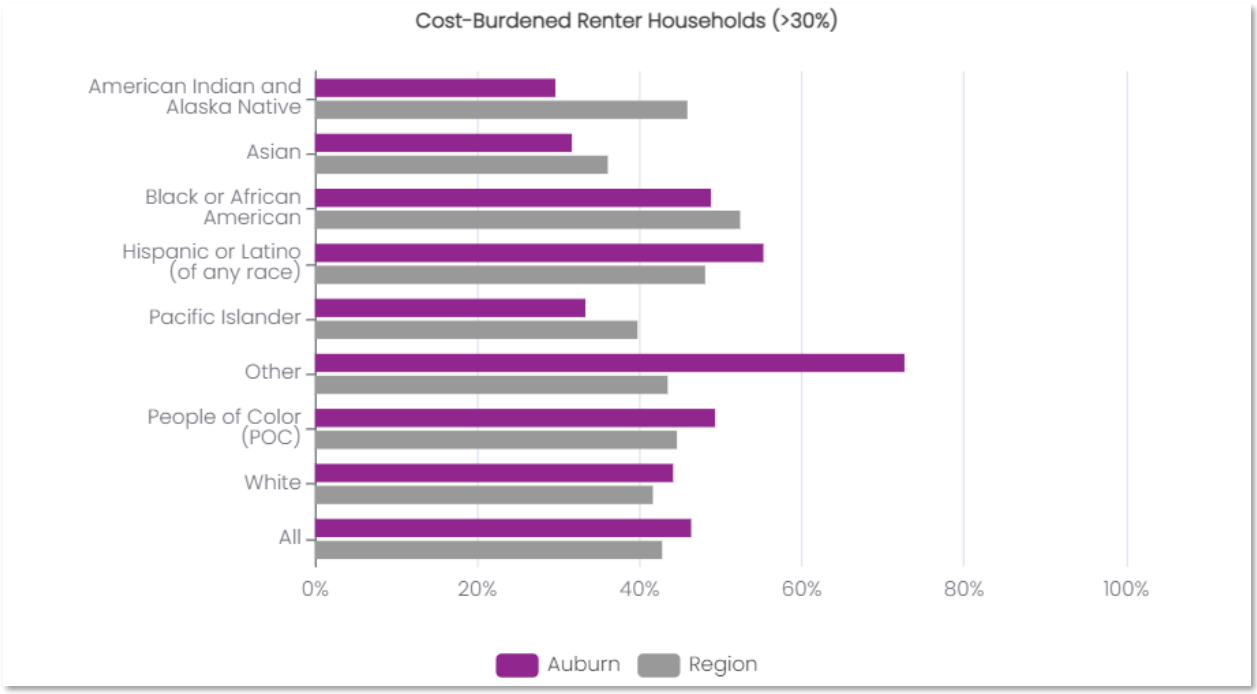
Source: King County Ordinance 19660, Countywide Planning Policies; Pierce County Ordinance 2023-22s, Countywide Planning Policies

Auburn is required to supply housing capacity for 12,000 new housing units, including 2,293 units of emergency housing. As shown in Figure 34, the greatest need for housing by affordability level is in the "extremely low" and "moderate" income levels. In addition to creating adequate capacity to accommodate the new housing units by 2024, goals and policies of the Comprehensive Plan were evaluated and amended where appropriate to assist in creating these new units.

Pierce County

Pierce County Council adopted new growth target allocations for Cities, Towns, and Unincorporated areas of Pierce County on July 7, 2023. Countywide Pierce County needs to accommodate 111,511 new housing units by 2044. This includes 112 new housing in the Pierce County portion of Auburn which is already nearly built out per Pierce County Buildable Lands Analysis. The greatest need for housing is in the 0-30% AMI range, accounting for nearly half of the 112 total units.

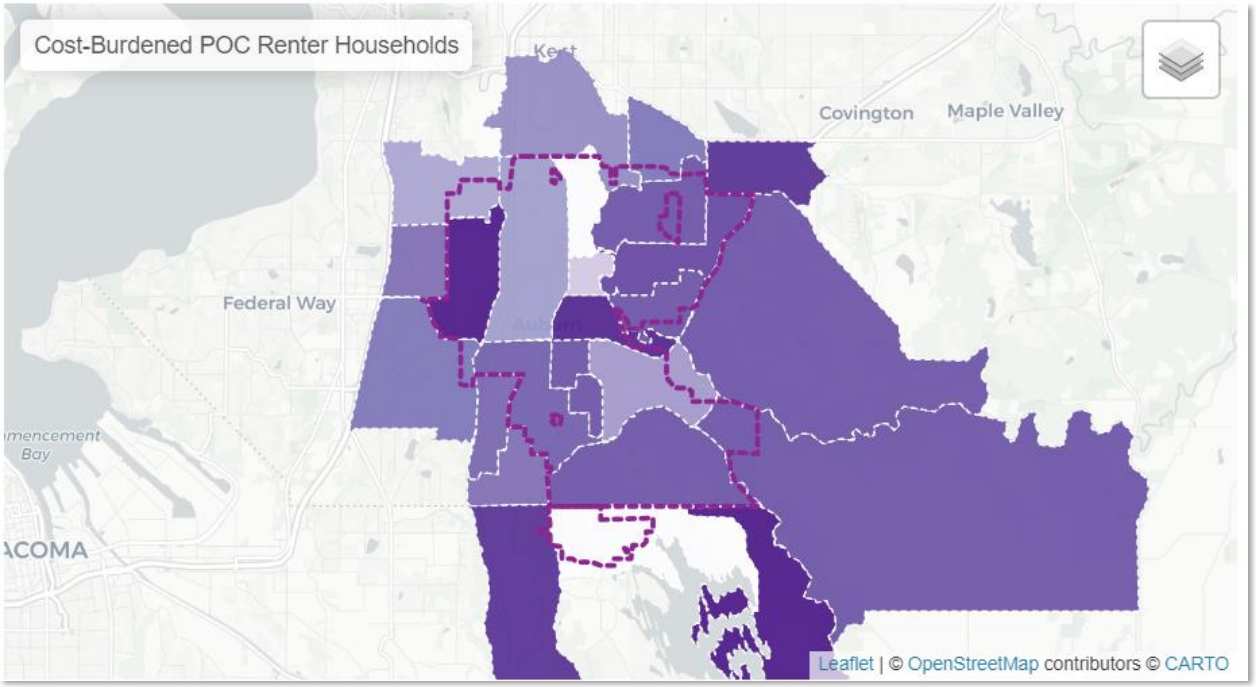
Racially Disparate Impacts



Racially Disparate Impacts

Racially disparate impacts occur when policies, practices, rules or other systems result in a disproportionate effect on one or more racial groups. The PSRC provides

community profiles for jurisdictions to keep a complete inventory of data from the U.S. Census Bureau. The profile includes housing and household level metrics to support analysis of racial disparate impacts in Auburn. As discussed in the demographics section and shown previously in Figure 10, Auburn is a highly-diverse city with 49% percent identifying as BIPOC.



According to CHAS Across races and ethnic groups, rental households are relatively equally cost-burdened. The “other” category, which includes those identify as two or more races is the highest where 72% of those identifying and renters are cost-burdened (see Figure 35). Owner households are also similarly cost-burdened across races and ethnic groups with less overly burdened compared to renters.

Figure 35. Cost-Burdened Renter Households by Race

As shown in Figure 36, the highest concentration of cost-burdened persons of color renter households is located in downtown Auburn. This is also consistent with the displacement risk analysis that shows downtown residents are at the highest risk of displacement overall. Another neighborhood with a higher concentration of cost-burdened POC renter households is West Hill. The city should prioritize affordable and diverse housing options in downtown and West Hill to mitigate displacement risks and disparate impacts to BIPOC communities.

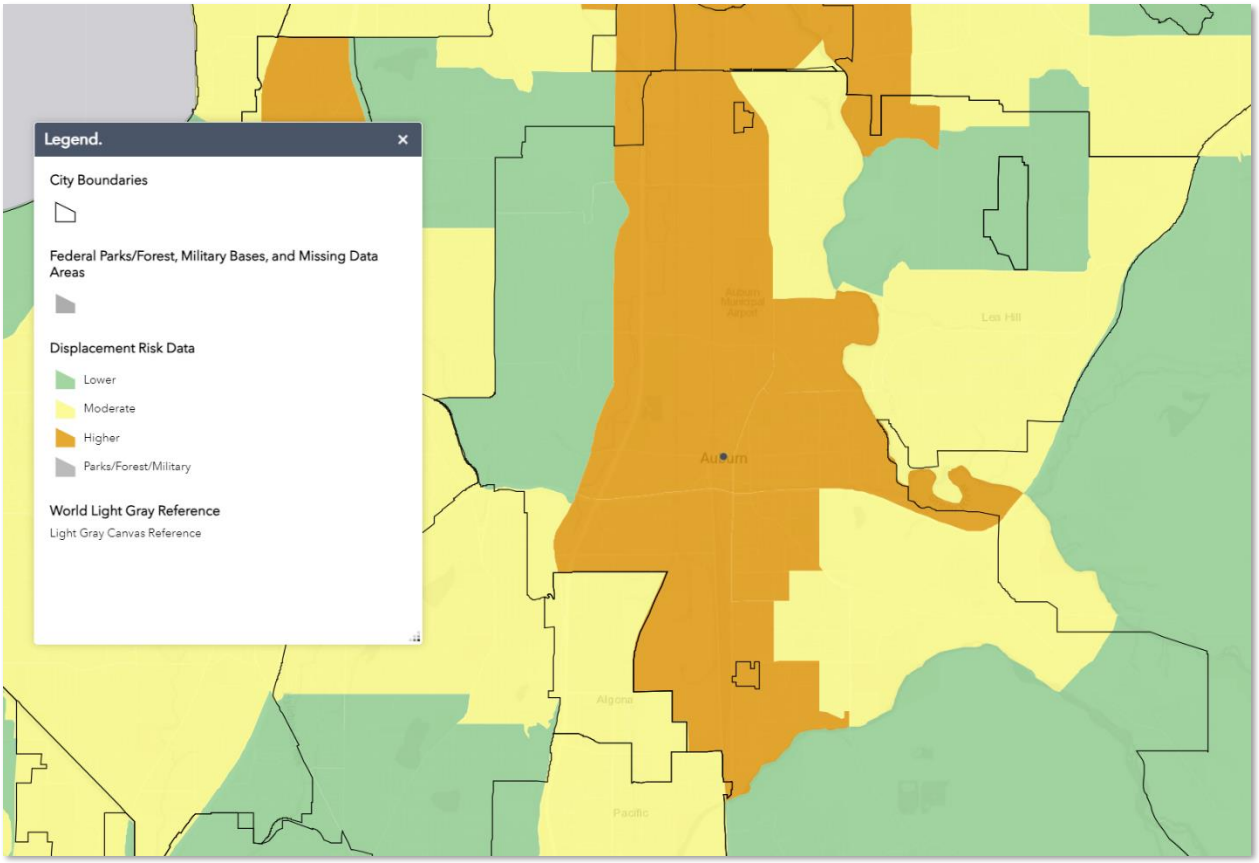
Figure 36. Cost-Burdened POC Renter Households Map

Overall, the diversity in Auburn increases the likelihood of racially disparate impacts, particularly displacement occurring citywide but especially in the downtown. The city has adopted several housing policies that aim to identify and prevent racially disparate impacts. Both the city's Downtown and Housing Action Plans propose actions that aim to promote equitable development and mitigate displacement risk, with consideration given to the preservation of historical and cultural communities as well as investments in low-, very low-, extremely low-, and moderate-income housing production and preservation.

Identification of Areas with Higher Risk of Displacement Potential

As described in the demographics section above, Auburn has a very diverse population – by age, race, ethnicity, and household composition (e.g., family or non-family household). The City has included housing preservation as a key goal driving this Housing Action Plan, particularly as it relates to preserving housing for low-income households. Housing preservation is an anti-displacement effort and can help mitigate and minimize the negative effects that often arise from new housing development.

The highest displacement risk in Auburn is the few housing units located in southwest Auburn where mostly industrial and commercial is located. In particular, a mobile home park located in this block group is particularly vulnerable to displacement. Downtown Auburn is also susceptible to moderate to high



displacement risk. The downtown area currently contains 426 subsidized affordable units in several developments, slightly more than a quarter of the housing units in the area. A full analysis is located in the Housing Needs and Characteristics Assessment.

Areas of Risk

The Puget Sound Regional Council (PSRC) has taken steps to analyze and map displacement risk in the region. According to PSRC, "In the central Puget Sound region, communities of color, low-income households, small businesses, and renters are recognized as being at higher risk of displacement." To visualize and help plan to mitigate these pressures, PSRC developed five key categories of metrics which can be used to help identify populations at risk of displacement:

- Socio-demographic indicators, including race, ethnicity, linguistic isolation, educational attainment, housing tenure, cost burden, and household income.
- Transportation Indicators, including access to jobs by car and transit and proximity to current and future transit service.
- Neighborhood Characteristics, including proximity to grocery stores, restaurants, parks, and schools.
- Housing Indicators, including development capacity and rental costs
- Civic Engagement, measured by voter turnout.

Figure 37. PSRC Displacement Risk in Auburn (2023)

Source: Puget Sound Regional Council

PSRC developed a mapping tool that aggregates these indicators into high, medium, or low displacement risk areas. As shown in Figure 37 the neighborhoods of West Hill and Southeast Auburn are primarily at lower risk of displacement. The neighborhoods of Lea Hill and South Auburn are primarily at moderate risk of displacement. Central Auburn including downtown and North Auburn are at the highest risk of displacement.

A recent meta-analysis of anti-displacement by researchers at UC Berkeley and UCLA found that neighborhood stabilization and tenant protection strategies in the short term and the production of subsidized housing in the long term had the highest potential to prevent displacement.[4] The Auburn downtown area currently contains 426 subsidized affordable units in several developments, slightly more than a quarter of the housing units in the area.

Historically Restrictive Housing

The lands of Auburn have been historically utilized by many different groups of people. Year 1920 census records showed that Japanese farmers operated 25,320

[4] Chapple, Karen and Loukaitou-Sideris, Anastasia. "White Paper on Anti-Displacement Strategy Effectiveness." Prepared for the California Air Resources Board. February 28, 2021.

acres and 699 farms. This number dropped to 7,030 acres and 246 farms in 1925 after the Alien Land Law of 1921 restricted “non-citizen aliens from sharecropping, leasing or renting land.” (It is important to note due to a series of Congress legislation (Naturalization Act of 1870, Chinese Exclusion Act of 1882, and The Immigrant Act of 1924) citizenship was a closed door for persons of Asian descent.

When considering historic and restrictive land use in Auburn, it is important to consider the official record keeping is very slim regarding restrictions as it wasn’t until 1920 when Auburn’s population rose above 2,500 (3,163) and was more detailed in its recording of population ratios in the census. (census 1920 vol 3 table 11, page 1092). 3096 persons of this population were recorded as white (Native white, foreign or mixed parentage, or foreign-born), with 67 persons being classified as non-white. As Auburn has grown certain covenants have been placed on plat maps and deeds within the county, with 759 recorded parcels containing/that have contained this restrictive language. These have been recorded on Auburn parcels from 1900 up to 1959, with many plat maps still containing the language. These restrictions were largely put in place by the developers, with many of them (464 or 61.1%) being placed by the Hillman Investment company, or Clarence Dayton Hillman.

These covenants were developed to only allow “members of the Caucasian race” the ability to purchase and use the land. There are different variations and verbiage depending on the plat or deed, but they all come to the same end, only white persons were eligible to own these properties. These restrictions shaped the sections of the city to where they are today, the growth in culture and development was stunted. The policies in this Housing Element create housing opportunities for all members of the community in an effort to undo historically documented racially disparate impacts and look forward to a more equitable Auburn.

Housing Attainability

A primary determinant of whether housing is attainable for a household is whether the household’s income can support the cost of the housing. King County’s Countywide Planning policies require each jurisdiction to assess the affordability of its housing inventory and to plan for meeting local needs for affordable housing as well as accommodating a share of the countywide need for affordable housing.

The Countywide Planning Policies provide guidelines for determining housing affordability using Area Median Income (AMI) to establish housing market segments ranging from Very-Low Income Housing Needs to Moderate Housing Income Needs. Area Median Income is the midpoint of all household income so

that half the households earn more than the median income and half the households earn less than the median.

The HUD median family income is $146,500 for the Seattle-Bellevue HUD Metro FMR Area, which includes Auburn (2023). The American Community Survey five-year estimates a median household income of $106,326. For purposes of determining housing affordability, this analysis uses HUD income limits. While Auburn's AMI is also reported and is lower, it is not the basis for the income analysis that follows as the analysis keys on the countywide information.

The Countywide Planning Policies require jurisdictions to analyze housing affordability using 0-30%, 31-50%, 51-80% and over 80% ratios to the HUD-published Area Median Income (2021 King County Countywide Planning Policies. Figure 38 represents the income limits for families of four to afford housing in each need category without becoming cost-burdened.

Figure 38. Income Ranges and Area Median Income

Income Limits	Seattle-Bellevue HUD Metro
Area Median Income (HUD)	$146,500
Moderate Income Housing Need (80% of AMI)	$100,900
Low Income Housing Need (50% of AMI)	$68,500
Very-Low Income Housing Need (30% of AMI)	$41,100
Area Median Income (ACS)	$79,415

Source: HUD, 2023 and 2017-2021 American Community Survey

Affordability of Renter-Occupied Housing

In general, attached housing, such as apartments, is less expensive partly owing to the lower cost of land per unit, and thus serves a greater proportion of lower-income households. To improve understanding of housing attainability for households with lower incomes, we examine the income distribution of households who rent compared to the supply of available rental housing. Breaking out renter-occupied housing units according to income levels, households that rent housing in Auburn and King County tend to have lower incomes.

Figure 39. Cost-burdened and Severely Cost-burdened Renters, Auburn, 2018

Income Category	Total Renter Households	Cost-Burdened	Severely Cost-Burdened
0-30%	4407	88%	72%
30-50%	4009	71%	25%
50-80%	4299	33%	0%
80-100%	1381	0%	0%
100%+	1411	0%	0%
Total	15,507	53%	27%

Source: PUMS (2018)

- In 2018, 88 percent of renters earning less than 30% of AMI were cost-burdened and 71 percent of renters earning between 30% to 50% of AMI were cost-burdened (see Figure 26).
- Cost burdening tends to decline as incomes go up because a household has more income to spend on housing. In Auburn, 33 percent of renters earning between 50% and 80% of AMI were cost burdened.
- Of the approximate 15,507 renter households in Auburn, more than half (53 percent) are cost-burdened, and more than one-quarter (27 percent) are severely cost-burdened.

In 2020, the average market rent for an apartment in Auburn was $1,393 (Costar and Zillow, 2020). Using 2018 income data from Figure 40, this average rent for a two-bedroom apartment would be affordable to a four-person household earning 50% of the AMI (which would be a relatively tight space), or to a two-person household earning between 50% and 80% of AMI.

Figure 40. Median Home Sales Price and Average 2-Bedroom Rent

	2010	2020
Average Rent	$934	$1,393
Median Sales Price	$222,750	$418,300

Source: Costar and Zillow. Not adjusted for inflation

- The average rent for a two-bedroom apartment in Auburn increased by 49 percent from 2010 to 2020, reaching $1,393 per month.
- Between 2010 and 2020, the average monthly rent in Auburn increased by 49 percent ($459 per month). In this same period, the median sales price for a home increased by 88 percent ($195,550).

Overcrowding

HUD defines an overcrowded housing unit as one where there is an average of more than 1 person living per room. Figure 41 shows the percentage of rental units that are overcrowded in Auburn, King County, and Pierce County.

Figure 41. Percentage of Rental Units that are Overcrowded, 2008-2012 5-Year Average

	Auburn	King County	Pierce
Occupants per room	12,452	391,756	119,698
0.50 or less	6,637	210,767	70,925
0.51 to 1.00	4,462	153,539	42,364
1.01 to 1.50	855	13,787	3,955
1.51 to 2.00	335	11,535	2,047

2.01 or more	163	2,128	407
Number of Overcrowded Units (>1)	1,353	27,450	6,409
Percent of Overcrowded Units (>1)	10.9%	7.0%	5.4%

Source: U.S. Census Bureau, 2017-2021 American Community Survey.

Auburn has a higher percentage of overcrowded rental units (10.9%) than King County overall (7%) and Pierce County overall (5.4%). This is likely somewhat driven by the larger average household size in Auburn.

Affordability of Owner-Occupied Housing

Homeownership helps create stability in neighborhoods and has historically been a significant driver of personal and household wealth for individuals and families. A key aspect of addressing a community's housing needs is to ensure there are opportunities for home ownership for moderate-income levels and first-time homebuyers. The exhibits below assess the opportunity in Auburn's owner-occupied housing market based on housing need category.

Auburn's housing stock primarily consists of ownership units (it has a 56 percent homeownership rate) compared to only about 44 percent of rental units. Due to demand outpacing the supply of homes in Auburn, prices have been rising. Since 2010, home prices in Auburn rose by 88 percent, from a median sales price of $222,750 in 2010 to $418,300 in 2020. Over this time, Auburn has seen somewhat lower median home sales price growth than nearby cities (see Figure 42), and the median sales price in Auburn did not overtake that of another city in the 2010-2020 time period.

- For both Auburn and King County, there is owner-occupied housing across all income categories. Given the age and current condition of a significant portion of Auburn's housing stock, some very low-income households may struggle to maintain their homes.
- Generally, Auburn has more households in the moderate and middle-income levels that can own a home compared to King County, suggesting that Auburn offers more affordable homeownership opportunities than available in other parts of King County.

Figure 42 provides median sales prices in Auburn over the last nine years by housing type.

Figure 42. Auburn Median Sales Prices

Area	Median Sales Price 2010	Median Sales Price 2020	Median Sales Price 2023	Increase from 2020 to 2023 Price
Auburn	$222,750	$418,300	$577,641	38%
Burien	$233,450	$470,300	$619,490	32%

Federal Way	$211,600	$414,700	$564,448	36%
Kent	$237,750	$447,700	$611,760	37%
Renton	$269,950	$516,800	$717,804	39%
Tukwila	$182,500	$412,000	$536,522	30%

Source: Auburn Median Sales Price 2010-2023, Zillow.com

- In 2023, Auburn's median sales price for housing units, was $577,641, a 38% increase since 2020. The Auburn housing market is similar to surrounding areas such as Federal Way and Tukwila.

5 Future Housing and Employment Capacity

Buildable Lands Reports Analysis

The City is required to provide capacity for its fair share of the population as determined through countywide planning with King and Pierce Counties. King County and Pierce County targets address the year 2044. The city is projected to need 12,112 additional housing units to accommodate growth.

Every five years approximately, a buildable lands report (BLR) is prepared by both counties to determine progress towards targets. Figure 43 shows the combined remaining growth target for the years 2035-2044 and the City's estimated growth capacity.

Figure 43. Land Capacity and Growth Target

	Capacity and Target Number of Dwellings
Total Capacity (units), King and Pierce Counties	9,264
King County Housing Growth Target (2020-2044)	12,000
Pierce County Housing Growth Target (2020-2044)	112
Total Target	12,112
Surplus/Deficit Capacity by 2044	**-2,848**

Source: King County 2021, Pierce County 2021

The BLR indicates the City can meet its remaining housing targets by the year 2035. If growth is carried forward to the full planning period 2020-2044 the City will be unable to meet its new housing growth target based on available land capacity with a deficit of 2,848 units. Upzoning residential zoning districts to increase density will enable the city to meet new housing unit needs without the need for additional land.

- Based on buildable lands report information for the portion of Auburn in King County, about half of the City's housing capacity is in low-density zones.
- Based on buildable lands report information for the portion of Auburn in Pierce County, Auburn's capacity is for dwellings in the R-5 zoning district, particularly in the Lakeland PUD. Terrace View is at capacity.
- The Pierce County portion of the City of Auburn has sufficient capacity to accommodate the 2044 targets and the King County portion does not have sufficient capacity to accommodate 2044 targets.

Land Capacity for Affordability and Growth Targets

Land Capacity – No Action Alternative

Through a land use alternative process, the city underwent a no action alternative analysis to determine the land capacity for housing units without any changes to zoning or land inventory. This analysis was completed at the Traffic Analysis Zone (TAZ) level.

Building capacity within each TAZ relies on a buildable land inventory layer produced in GIS form at the parcel level by King County. That layer included parcels deemed to be either vacant or redevelopable, along with an estimate of the net new housing units of capacity for each parcel. For non-residential building capacity, each parcel in that layer had a lot square footage and expected/typical floor area ratio (FAR), yielding a potential new commercial building square footage. Those square footages were converted into potential future jobs for purposes of the allocation model, using different assumptions for average square footage per job for each neighborhood, to reflect differences in industry mix across Auburn.

For the Pierce County portion of Auburn, the methodology included breakouts for Auburn from the Pierce County Buildable Lands Report, Fourth Edition (published in September, 2021).

Capacity for both new housing units and new jobs was aggregated to the neighborhood (District) level for purposes of determining future allocations. Neighborhood capacity shares were weighted by recent neighborhood growth shares to determine initial allocations. TAZ level capacity is used again as a basis for distributing growth allocations within each neighborhood to the various TAZs.

Capacity estimates at the TAZ level were then revised based on staff comments and inputs from ongoing Auburn Downtown Plan Update efforts. In both cases, it is assumed that those inputs reflected more detailed knowledge of parcel-level zoning and land conditions in downtown, and thus reflected a more accurate picture of real development capacity.

Figure 44. Neighborhood (District) No Action Employment and Household Growth Capacity

PLATEAU	100	1,097
SE AUBURN	0	1,428
SOUTH AUBURN	2,220	2,706
WEST HILL	809	477
Total	8,236	9,572

Neighborhood-Level Projected Population and Employment Growth

To calculate each neighborhood's share of recent growth, 2010 to 2020 block-level Census counts of housing units and 2009 to 2019 Census LEHD block-level job counts were used. Because census block boundaries do not match well with neighborhood boundaries or TAZs, those estimates are necessarily approximations based on assigning blocks to TAZs containing their centroids.

Neighborhood level growth was considered irrelevant to employment growth allocation decisions, since projected citywide job growth far exceeded total land capacity for employment uses. In other words, if this TAZ allocation is intended to reflect a no-action growth scenario, then regardless of growth momentum, job growth would be limited to what could be built on known vacant and underutilized parcels subject to current zoning – meaning that each TAZ would simply receive as much job growth as their identified capacity can accommodate (with no need to weighting based on prior growth).

For housing unit growth allocations, there was excess available capacity to work with (9,572 units of estimated capacity versus 7,774 units of projected growth). So, some weighting was required to determine which neighborhoods should receive that growth. Because Downtown capacity and allocations remain consistent,

weighting was only applied to non-downtown neighborhoods to arrive at growth allocation totals.

Figure 45. Neighborhood (District) No Action Employment and Household Growth Allocations

Total Allocated ***(to TAZs within neighborhoods based on revised TAZ capacities***	**8,236**	**7,774**
Comparisons		
Predictive Forecast (not capacity-constrained)	*22,623*	*7,774*
Adopted Growth Targets	*19,520*	*12,112*

No-Action Forecasts Compared to Adopted Policy Growth Targets

Predicted no-action housing growth is lower than adopted growth targets. According to the King County demographer, the adopted growth target for housing units from 2019 to 2044 was 12,000 units. Adjusting to 2021, this target calls for addition of 10,959 additional units by the 2044 horizon year. In contrast, the baseline, no-action predictive forecast is for 7,774 new units by 2044. Both King and Pierce Counties have since updated their projected housing unit allocations to an additional 12,112 housing units (July-August 2023).

For employment, the no-action growth forecast is for 22,623 new jobs by 2044, as compared to an adopted growth target of 19,520 jobs. However, because estimated capacity for new jobs is limited to 8,236 across Auburn's neighborhoods, the no-action TAZ allocations are constrained to that figure and will necessarily fall well short of the 19,520 target.

Draft Preferred Land Use Scenario

The future land use map accounts for housing and employment targets, legislative requirements, and growth centers in the city. The Draft Preferred scenario[5] is detailed in the Land Use Element.

Residential Capacity

A residential land capacity analysis evaluates whether jurisdictions have sufficient land capacity available to allow for the types and amount of new housing needed to meet identified housing needs is required as part of HB 1220 requirements. The 2021 Housing Element updates amended RCW 36.70A.070(2)(c) of the Growth Management Act to require the Housing Element to include explicit consideration of capacity for the following household needs and building types:

- Moderate, low, very low, and extremely low-income households;
- Permanent supportive housing;
- Emergency housing and emergency shelters; and
- Duplexes, triplexes and townhomes (within an urban growth area boundary

The intent of this analysis is to assess the City of Auburn's current capacity to accommodate different housing income brackets and whether that capacity is sufficient to meet Auburn's housing targets established by King and Pierce counties. In addition, this analysis considers implementing a preferred land use alternative through zoning changes and provides updated capacity calculations to ensure sufficient capacity of suitable land to meet growth targets.

Approach and Methodology

The Auburn Residential Land Capacity Analysis completed for the purpose of implementing HB 1220 requirements utilizes King County[6] and Pierce County[7] Buildable Lands Reports from 2021 as the baseline with minor adjustments based on input from city planning and departmental staff through the alternatives planning and growth allocations process. This analysis completes the following steps as outlined in the HB 1220 "Updating your Housing Element"[8] Book 2 guidance developed by the Department of Commerce:

[5] Draft preferred scenario represents city staff's intent to comply with all required regulations and serve as basis for modelling and evaluation used in the draft Comprehensive Plan. This scenario will be deemed "Preferred" after EIS process and Planning Commission evaluation and acceptance is complete.

[7] https://www.piercecountywa.gov/923/Buildable-Lands

[8] https://www.commerce.wa.gov/serving-communities/growth-management/growth-management-topics/planning-for-housing/updating-gma-housing-elements/

Step 1. Summarize developable residential land capacity by zone.

The first step is to identify the gross developable land acreage by zoning designation to summarize. This portion of the analysis involves a jurisdiction-wide scan to quantify all land available for residential or commercial/industrial development for the next 20-year planning period. “Land supply” is the phrase used to refer to an inventory of land “suitable for development” (King County). The land supply includes vacant and redevelopable lands with land supply inventories recorded in 2019. For this approach, the land supply acres were drawn from the land inventory layer produced in GIS form at the parcel level by King County. That layer included parcels deemed to be either vacant or redevelopable, along with an estimate of the net new housing units of capacity for each parcel. For non-residential building capacity, each parcel in that layer had a lot square footage and expected/typical floor area ratio (FAR), yielding a potential new commercial building square footage. For the Pierce County portion of Auburn breakouts for Auburn from the Pierce County Buildable Lands Report, Fourth Edition (published in September, 2021).

The 2019 data was cross-checked with 2023 King County and Pierce County parcel assessor data which was combined into a singular dataset for the city. This data set was joined with the city’s zoning designation to ensure zoning accuracy. In order to determine “developable” parcels the King County Technical Memo B. Land Capacity Supply for Buildable Lands Report process was followed similarly to the original 2021 process with changes since 2023. This process identified vacant parcels through querying for vacant as the existing land use (PRESUSE_DES) and underutilized parcels with an improvement value of $10,000 or less or existing use surface parking lot (see Technical B memo criteria). To quantify the developable land supply, the process:

- Assembled necessary data for the entire jurisdiction, including parcel/assessor data, critical areas, and zoning.
- Defined vacant and developable lands using a density and/or value threshold
- Exclude lands or parcels unlikely to develop including critical areas, public use, capital infrastructure, and environmentally constrained
- Applied vacant and redevelopable land definitions to the parcel data
- Reviewed and refine the resulting developable land supply

The outcome of this analysis is similar to the original 2021 analysis with reductions in available land due to new building permits. The city estimates 156 single-family units were built between 2019 and 2021 as well as 726 single-family units that were accounted for in the analysis. The baseline data is adjusted from the 2019 Buildable Lands Report with changes since 2019, including the Bridges annexation in 2024 of 13 vacant acres zoned as Residential 5 du/acre.

Figure 46. Gross Residential Capacity by Zone

Zone	Gross developable land (acres)		Infrastructure and Land Availability Deduction	Net developable land (acres)		Assumed Density (unit/acre)	Gross residential capacity (units)

	Under-developed	0		0			
Lakeland Hills South PUD	Vacant	12	45%	7	7	6	40
	Under-developed	0	45%	0			
	Under-developed	0		0			

After determining the gross developable land an infrastructure and development deduction factor was implemented. The market factor deductions were:

- Vacant properties: 15%
- Under-developed properties: 25%

The public purpose and right of way factors for infrastructure were applied from the Urban Growth Report as part of the King County Buildable Analysis and did not differ for vacant and under-developed properties. For residential zones RC through R-7 both deductions were 20% and for R-10, 14% respectively. R-10 and mixed-use zones were 12.5% respectively. The deduction factors reduce the amount of buildable land to determine net developable land in acres. Finally, the total capacity is calculated by multiplying the net developable acreage by the assumed density level expressed in units per acre. The density is based on Auburn Municipal Code.

Figure 47. Gross Development Capacity by Zone

Zone	Net developable land (acres)	Assumed density	Gross residential capacity (units)	Existing units on developable land (units)	Net capacity
Residential Zoning Districts		**Units/Acre**			**Residential Units**
Residential Conservancy (RC)	745	0.25	100	75	25
Residential 1 du/acre (R-1)	275	1	167	29	138
Residential 5 du/acre (R-5)	1230	4.4	2,603	541	2,062
Residential 7 du/acre (R-7)	294	7	1,207	146	1,061
Residential 10 du/acre (R-10)	22	10	153	26	127
Residential 16 du/acre (R-16)	0	16	421	-	421
Residential 20 du/acre (R-20)	79	21.1	1,044	118	926
Non-Residential Zoning Districts					
Mixed Use Commercial (C-4)	1	20	12	-	6

Downtown Urban Center (DUC)	11	100	1,123	1	561
	0	0	-		
Residential Office District (RO)	1	18.15	14	-	14
Residential Manufactured/Mobile Home Community (R-MHC)	27	10	273	-	273
Lakeland Hills South PUD	7	6	40	-	40
				Total	**5,652**

Based on current zoning, density, deduction factors, and mixed-use considerations minus existing buildings the city has an estimated capacity for 5,652 additional units.

Changes to the housing element in 2021 call for jurisdictions to consider the role of accessory dwelling units (ADUs) in meeting housing needs. Changes in 2023 resulting from HB 1337 require jurisdictions to allow up to two ADUs per lot in urban growth areas, with the option for separate sale. Although capacity for ADUs has not typically been measured in a residential land capacity analysis, they are very likely to become important in meeting housing needs.

Auburn implemented the optional methodology for potential developed ADUs on residential lots. The city estimates that there are about 14,000 developable residential lots with a participation factor of 10%. This adds another estimated 1,852 units. However, these units are not considered as part of the housing total needed to accommodate the 12,112 housing unit growth target.

Figure 48. Potential ADU Capacity

Lots available for ADUs	Participation factor	Potential ADU lots	Average ADUs per lot	Total ADU capacity
14,818	10%	1,482	1.25	1,852

Step 2. Categorize zones by allowed housing types and density levels.

This step identifies which housing types are allowed in each zone to facilitate relating each zone category to potential affordability levels. City planning staff implemented assigned zone categories recommended in the Department of Commerce guidance as low density, moderate density, high-density, and high density mixed use.

Figure 49. Classifying Zones by Housing Types Allowed

Residential Zoning Districts	Typical housing types allowed	Max density level allowed	Assigned zone category
Residential Conservancy (R-1)	Detached single-family homes, ADUs	0.25 du/1	Low Density
Residential 1 du/acre (R-1)	Detached single-family homes, ADUs	1 du/1	Low Density
Residential 5 du/acre (R-5)	Detached single-family homes, ADUs	5 du/1	Low Density
Residential 7 du/acre (R-7)	Detached single-family homes, ADUs, duplex	7 du/1	Moderate Density
Residential 10 du/acre (R-10)	Detached single-family homes, duplex, townhomes	10 du/1	Moderate Density
Residential 16 du/acre (R-16)	Detached single-family homes, duplex, supportive housing, townhomes, multi-family	16 du/1	High Density
Residential 20 du/acre (R-20)	Duplex, supportive housing, townhomes, multi-family	20 du/1	High Density
Light Commercial District (C-1)	Live/work unit, work/live unit	20 du/1	Low Density
Central Business District (C-2)	Live/work unit, work/live unit, multi-family dwellings part of mixed use development	20 du/1	High Density Mixed-use
Heavy Commercial District (C-3)	Live/work unit, work/live unit, multi-family dwellings part of mixed use development	20 du/1	Low Density
Mixed Use Commercial (C-4)	Live/work unit, work/live unit, multi-family dwellings part of mixed use development	20 du/1	High Density Mixed-use
Light Industrial District (M-1)	Live/work unit, work/live unit	20 du/1	Low Density
Residential Office District (RO)	Duplex, home occupation live/work, work/live, multi-family stand alone, detached single-family	20 du/1	Moderate Density

Residential Office District – Hospital (RO-H)	Home occupation, live/work, work/live	25 du/1*	Moderate Density
Institutional Use (I)	Home occupation, nursing home	20 du/1*	Low Density
Residential Manufactured/Mobile Home Community (R-MHC)	Manufactured/mobile homes	10 du/1	Moderate Density R-MHC
Downtown Urban Center (DUC)	Mixed-use, townhomes, multi-family	100 du/1	High Density Mixed-use
Lakeland Hills South PUD	Single family, condos, townhomes, apartments, accessory uses, home occupations, senior housing	6 du/1	Moderate Density

Step 3. Relate zone categories to potential income levels and housing types served.

This step relates zone categories to potential income levels and housing types served. This step assumes which income levels are to be served by new market-rate housing production in each zone category as well as new income-qualified affordable housing projects. A detailed market analysis was not completed but the moderate cost default assumed affordability level was implemented with adjustments based on the market analysis completed as part of the City's Housing Action Plan.

Figure 50. Relating Zone Category to Housing Types and Income Levels

Zone Category	Typical housing types allowed	Lowest potential income level served		Assumed Affordability level for capacity analysis
		Market rate	With subsidies and/or incentives	
Low Density	Detached single family homes	Higher Income (>120% AMI)	Not typically feasible at scale	Higher Income (>120% AMI)
Moderate Density	Townhomes, duplex, triplex, quadplex	Moderate income (>80-120% AMI)	Not typically feasible at scale	Moderate income (>80-120% AMI)

High-Density	Townhomes, multi-family, walk-up apartments	Low income (>50-80% AMI)	Extremely low and very low income (0-50%)	Low income (>50-80% AMI)
High-Density Mixed Use	Mixed-use multifamily, townhomes, multifamily	Low income (>50-80% AMI)	Extremely low and very low income (0-50%)	Very Low income (>0-30% AMI)
ADUs	ADUs	Low-Higher Income (50-120% AMI)	N/A	Low to Higher Income (>50 to >120% AMI)

Step 4. Summarize capacity by zone category.

This step summarized the land capacity for housing unit production by zone category from the findings of Steps 1-4. The total housing capacity is estimated at 5,652 citywide with the majority of housing accounted for in the low-density zone category excluding ADUs. The total capacity including potential ADUs is 7,504 units.

Figure 51. Capacity by Zone

Zone Residential Zoning Districts	Unit Capacity	Assigned Zone Category	Capacity in zone category
Residential Conservancy (R-C)	25	Low Density	2,225
Residential 1 du/acre (R-1)	138	Low Density	
Residential 5 du/acre (R-5)	2,062	Low Density	
Light Commercial District (C-1)	-	Low Density	
Light Industrial District (M-1)	-	Low Density	
Heavy Commercial District (C-3)	-	Low Density	
Residential 7 du/acre (R-7)	1,061	Moderate Density	1,241
Residential 10 du/acre (R-	127	Moderate Density	
Central Business District (C-2)	-	Moderate Density	
Residential Office District (RO)	14	Moderate Density	
Residential Office District - Hospital (RO-H)	-	Moderate Density	
Lakeland Hills South PUD	40	Moderate Density	
Residential Manufactured/Mobile Home Community (R-MHC)	273	High Density R-MHC	273
Residential 16 du/acre (R-16)	421	High Density	1,347
Residential 20 du/acre (R-20)	926	High Density	
Mixed Use Commercial (C-4)	6	High Density Mixed-Use	566

Downtown Urban Center (DUC)	561	High Density Mixed-Use	
		ADUs	1,852
Total Housing Capacity (no ADUs)			**5,652**
Total (with ADUs)			**7,504**

Accessory Dwelling Units (ADUs) are assumed to be primarily located in Moderate and Lower Density zones serving the 80-120% AMI income brackets.

Step 5. Compare projected housing needs to capacity.

The city's growth target for housing units is 12,112 units citywide. Based on the residential land capacity analysis, the city can expect a capacity deficit of 4,608 total units with current zoning and density regulations. The most significant deficit is providing housing for the 0-30% (supportive housing) and >80-100% income level brackets. The deficit indicates a need to implement actions to increase capacity including density increases and zoning reallocation. In comparison, the 2021 Buildable Land Reports indicates a deficit of 2,800 units. Since this is a summarized high-level process with assumptions, it is likely the true deficit is somewhere between the 2,800 to 4,600 estimated units. However, the city should plan for accommodating the high-end of the deficit to ensure growth targets are met.

Figure 52. Capacity Compared to Housing Needs Income Level (% AMI)	Zone Categories Servicing these Needs	Housing Needs	Capacity prior to Zoning Adjustment	Post-Rezone Capacity	Capacity surplus or deficit
King County					
0-30% PSH	High Density-Mixed Use	2,389	566	3,004	**615**
0-30% Other					
>30-50%	High-Density, ADU	962	1,532	4,823	**3,861**

Pierce County					
>80-100%	Moderate Density, ADU	112	100	500	***388***
Aggregated Total	-	12,112	7,504	46,070	*35,810*

Summary

The residential land capacity analysis is an estimate that projects future capacity for accommodating housing units based on current zoning and indicates there is a shortage in the land capacity availability for housing units needed. The city should plan for the highest capacity deficit to ensure adequate capacity to meet growth targets. The city needs to adjust zoning and density to account for an additional 4,608 units that the current capacity does not accommodate. Implementation actions to increase capacity and projected housing capacity changes are in the Housing and Land Use elements.

Assumptions and Limitations

The residential land capacity analysis process, as outlined by the Department of Commerce guidance, makes several assumptions regarding truly available developable land. The data is reliant upon accurate assessor data and estimated deduction factors for market, public purpose, and environmental considerations. The city assumes participation factors and markets, but these are variables outside of city control. The data used doesn't directly translate into specific Market Factor values, housing types, or income levels served. Instead, the process helps define ranges and suggest appropriate assignments. The King County and Pierce County Urban Growth Capacity reports also highlight limitations in conducting land capacity analyses.

Step 6. Implement actions to increase capacity to address deficiencies

Draft Preferred Alternative Implementation

To address the anticipated unit deficit of 4,600 Auburn has consolidated zoning districts, increased densities, and permitting additional housing types. The changes in zoning are based on the preferred alternative completed as part of the land use scenario process where centers and nodes are identified for increased density. The alternative also assumes citywide density increases to accommodate population, housing, and employment growth allocations at the TAZ level projected for 2044. The zoning changes are summarized below.

Figure 53. Draft Preferred Zoning Assumptions

Existing Zoning	Proposed Zoning	Typical development	Existing Density (du/acre)	Proposed New Density (DU/acre)	Assumed development
RC	*RC*	*Single-Unit Detached Houses (SUDs), Middle Housing,*	*0.25*	*1*	*Four units on 4ac*

R1	*R1*	*Single-Unit Detached Houses, Middle Housing,*	*1*	*4*	*Four units on 1ac*
R-5, R-7	*R2*	*SUD, Townhouse, Duplex, Triplex, Fourplex, Stacked Flats, Courtyard Apartments, Cottage Housing - 4-6 units/lot, ADUs*	*5, 7*	*25*	*Four townhomes on 8,000 sf*
R-10, R-16	*R3*	*R2 (No SF) + Fiveplex, Sixplex, Stacked Flats, Apartment Buildings and Mixed-Use up to 20 units, ADUs*	*10, 16*	*30*	*Ten units on 14,500 sf*
R-20	*R4*	*R3 + Apartment Buildings and Mixed-Use over 20 units, ADUs*	*20*	*50*	*100-unit complex on two acres*
N/A	*R-NM*	*R4 and C1 Uses + Mixed-Use (horizontal or vertical) Emphasis*	*N/A*	*30*	*Same as R4 but assumes 50% of parcels are non-residential*

Based on zoning data provided by the city that was provided by the city and understanding of the zoning shifts, particularly the creation of the new Neighborhood Mixed Use and DUC zoning designations, zoning changes were recorded. In summary:

- R-1 remains unchanged
- R-5 and R-7 become R-2 and 72 acres of R-7 is shifted to R-NM
- R-10 and R-16 become R-3
- R-20 shifts one acre to R-NM
- R-NM receives zone shifts from R-2, R-20, and Unclassified
- C-1 shifts 13 acres to DUC C-1
- C-2 shifts 8 acres to DUC C-2
- DUC is shifted into DUC-55, -75, and -125, and Flex Residential
- M-1 shifts 39 acres to DUC M-1 and 2 acres to DUC-75

In addition to the zoning shifts, densities were substantially increased for the zoning districts. With these adjustments the city's new capacity is estimated to accommodate 45,951 new housing units.

Figure 54. Adjusted Residential Capacity by Zone

Residential & Mixed-Use Zoning Districts	Zone category	Developable Acres	Net zoning changes (acres)	Assumed Density - DU/Acres	Residential Capacity (units)	Net New (Units)
King County						
Residential Conservancy (RC)	Low Density	745	0	1	745	-
R-1 Residential	Low Density	275	0	4	1,471	-
R2 – Residential Low	Moderate Density	294	1158	25	37,789	28,950
R3 – Residential Moderate	Moderate Density	0	22	30	660	660
R4 – Residential High	High Density	79	-1	50	3,890	-50
Neighborhood Mixed-Use (R-NM)	High Density Mixed-Use	0	89	30	2,670	2,670
Manufacture Home/Community (R-MHC)	Low Density	27	0	10	273	
DUC Downtown Urban Center - 125	High Density Mixed-Use	0	5	100	125	500
DUC Downtown Urban Center - 75	High Density Mixed-Use	0	5	95	119	475
DUC Downtown Urban Center - 55	High Density Mixed-Use	0	4	90	90	360
DUC Neighborhood Residential	High Density Mixed-Use	0	3	30	90	90
Total		1,420	1,285	-	47,422	35,310
Pierce County						
R2 – Residential Low	Moderate Density	20	20	**25**	500	500
Total		20	20	**-**	500	500
			Total New (2044) Housing Capacity		47,922	35,810

This analysis finds that there is sufficient residential zoned capacity in the Draft Preferred Alternative zoning map and related updates to accommodate the city's growth target of 12,112.

Geographic Distribution of Residential Zoning

Moderate and high-density residential zoning is prevalent throughout the city, with higher density residential occurring in downtown, in growth centers, and along key transit corridors. Moderate density residential zoning represents about 54% of total land zoned primarily for residential purposes, high-density represents 10%, around mixed-use 12% and around low-density 25%. Zones most suitable for the development of ADUs (moderate and low-density) represent 79% of total residential zoned areas, providing ample opportunities this type of housing.

Housing Capacity by Income Band

In addition to meeting the residential and employment capacity targets through zoning and policy decisions, the city meets the aggregate King and Pierce County housing needs for income level groups. The only exception is the >120% Average Median Income (AMI) category, which includes primarily low-density housing in the R-1 and RC zones. However, this AMI category is not required to be met under HB 1220 requirements as high-income earners are represented in this group and can also purchase moderate density housing options as well.

In Pierce County, the City's primary residential zone is R-2 Residential Moderate which for purposes of this capacity analysis aligns with the 80-120% AMI range. This zone can adequately accommodate the total housing need of 112, however AMI below 80% is not accounted for in this analysis. As indicated earlier, the housing target for the Pierce County portion of Auburn is only 112 housing units and as a result the city does not intend to rezone small areas of land in order to satisfy AMI requirements since actual development is unpredictable. The R-2 Residential Moderate zone can accommodate middle housing, single unit detached housing, and ADUs that can realistically serve a range of incomes, and the city will continue to provide flexibility in the development types allowed in this part of the city to best accommodate the full range of AMI levels.

An estimated 1,852 new Accessory Dwelling Units (ADUs) are accounted for prior to rezoning, as these developments are currently allowed in various zones are expected to occur naturally over the next 20-years. In total, 80% of new ADUs are planned for in the 80-120% AMI range, and 20% in the greater than 120% AMI range. ADUs are expected primarily in the low-density and moderate-density land uses found in throughout the city.

Figure 55. Adjusted Residential Capacity by Affordability Level

Income Level (% AMI)	Zone Categories Servicing these Needs	Housing Needs	Capacity prior to Zoning Adjustment	Post-Rezone Capacity	Capacity surplus or deficit
King County					
0-30% PSH	High Density-Mixed Use	2,389	566	3,004	**615**
0-30% Other					

>30-50%	High-Density, ADU	962	1,532	4,823	**3,861**
>50-80%					
>80-100%	Moderate Density, ADU	2,458	5,058	37,379	**35,033**
>100-120%					
>120%	Low-Density, ADU	6,303	348	2,217	***(4,086)***
Pierce County					
>80-100%	Moderate Density, ADU	112	100	500	***388***
Aggregated Total	-	12,112	7,504	46,070	*35,810*

Employment Capacity

The adjusted employment development capacity by zone is calculated by the square footage conversion from acres and then divided by the employment densities determined through the King County Buildable Lands Report process in 2021. Downtown mixed-uses expect a distribution of 75% residential and 25% commercial, whereas the Neighborhood Mixed Use expects a 50-50% split for mixed uses laterally and horizontally. The adjusted employment estimates accommodating 20,701 additional jobs at max buildable capacity. The city's employment target is 19,520 and these adjustments meet the growth target.

Figure 56. Adjusted Employment Capacity by Zone

Zone Non-Residential Zoning Districts	Zoning changes (developable acres)	Net zoning changes (acres)	Assumed density Max Buildable Area	Residential capacity adjustment (units) Jobs
Light Commercial (C-1)	32	-13	845,391	2,254
Heavy Commercial District (C-2)	8	-8	-	-
Auburn Gateway District	0	0	653,400	653
Light Industrial (M-1)	132	-41	3,945,338	3,945
Heavy Industrial (M-2)	81	-9	3,122,925	3,123
Airport Zone	5	0	233,038	233
Mixed-Use Districts	**Zoning changes (developable acres)**	**Net zoning changes (acres)**	**Max Buildable Area**	**Jobs**
Downtown Urban Center	11	-11	-	-
DUC Downtown Urban Center - 125	0	5	163,350	408

DUC Downtown Urban Center - 75	0	5	163,350	408

Neighborhood Mixed-Use (RNM)	0	89	1,938,420	5,169
			Total Jobs Capacity	**21,587**

APPENDIX O

2024 COMPRHENSIVE PLAN

Agency Checklists

Periodic Update Checklist for Fully-Planning Cities

Auburn
City

Alexandria Teague, Planning Services Manager, 253-931-3003, planning@auburnwa.gov
Staff contact, phone + email

Notice: This checklist has been updated with the new 2022-2023 GMA legislation. Rows that include new 2022-2023 legislative changes or updated Commerce guidance are marked with an orange dot ●. Statutory changes adopted since 2015 are emphasized in highlighted text to help identify new GMA requirements that may not have been addressed during the last periodic update or through other amendments outside of the required periodic update process. Additionally, amendments to the GMA, including those from the 2023 legislative session, are summarized in this document on Commerce's GMA Laws and Rules webpage.

Overview: This checklist is intended to help cities that are fully planning under the Growth Management Act (GMA) conduct the1 "periodic review and update" of ***comprehensive plans*** and ***development regulations*** required under RCW 36.70A.130 (5). This checklist identifies components of comprehensive plans and development regulations that may need updating to reflect the latest local conditions or to comply with GMA changes since the last periodic update cycle (2015-2018).

Local governments should review local comprehensive plan policies, countywide planning policies and multicounty planning policies (where applicable) to be consistent with the new requirements.

Checklist Instructions

With the most recent versions of your comprehensive plan and development regulations in hand, fill out each item in the checklist, answering the following questions:

Is this item addressed in your current plan or development regulations? If YES, fill in the form with citation(s) to where in the plan or regulation the item is addressed. Where possible, we recommend citing policy or goal numbers by element rather than page numbers, since these can change. If you have questions about the requirement, follow the hyperlinks to the relevant statutory provision or rules. If you still have questions, visit the Commerce Periodic Update webpage or contact the Commerce planner assigned to your region.

Is amendment needed to meet current statute? Check YES to indicate a change to your plan will be needed. Check NO to indicate that the GMA requirement has already been met. Local updates may not be needed if the statute hasn't changed since your previous update, if your jurisdiction has kept current with required inventories, or if there haven't been many changes in local circumstances.

Use the "Notes" column to add additional information to note where your city may elect to work on or amend sections of your plan or development regulations, to call out sections that are not strictly required by the GMA, or to indicate if the item is not applicable to your jurisdiction.

Submit your checklist! This will be the first deliverable under your periodic update grant.

PlanView system and instructions: Completed checklists can be submitted through Commerce's PlanView portal. The PlanView system allows cities and counties to submit and track amendments to comprehensive plans or development regulations online, with or without a user account. You can also submit via email: reviewteam@commerce.wa.gov Fill out and attach a cover sheet, a copy of your submittal and this checklist. *Please be advised that Commerce is no longer accepting paper submittals*.

For further information about the submittal process, please visit Commerce's Growth Management Act Laws and Rules webpage.

Need help?

Section I: Comprehensive Plan

Land Use Element

Consistent with countywide planning policies (CWPPs) and RCW 36.70A.070(1), amended in 2023

	In Current Plan? Yes/No If yes, cite section	Changes needed to meet current statute? Yes/No	Notes	
Notice: 2021-2022 legislation ESSB 5593: includes changes to RCW 36.70A.130 regarding UGA size, patterns of development, suitability and infrastructure. Coordinate these efforts with your county.	Yes. LU-128	No	Coordination with Pierce County on existing Potential Annexation Area occurred in 2023, with no changes necessary for the city. No other UGA boundaries have been identified or requested by King or Pierce County.	Completed: ☒Date: 2-28-2024
a. The element integrates relevant county-wide planning policies into the local planning process, and ensures local goals and policies are consistent. For jurisdictions in the central Puget Sound region, the plan is consistent with applicable multicounty planning policies. RCW 36.70A.210 WAC 365-196-305 Coordinate these efforts with your county.	Yes. Planning Framework. Page LUE-2	No	Planning framework notes alignment with CPPs and CPPs are referenced in relevant goals and policies though chapter.	Completed: ☒Date: 2-28-2024
b. A future land use map showing city limits and UGA boundaries. RCW 36.70A.070(1) amended in 2023 and RCW 36.70A.110(6), WAC 365-196-400(2)(d), WAC 365-196-405(2)(i)(ii)	Yes. Land Use Element Map 1.3	Yes	Draft map is shown, with potential changes expected as Plan moves through	Completed: ☒Date: 3/1/2024
c. Consideration of urban planning approaches that increase physical activity and reduce per capita vehicle miles 25 traveled within the jurisdiction, but without increasing greenhouse gas emissions elsewhere in the state. RCW 36.70A.070(1) (amended in 2023) and WAC 365-196-405(2)(j). Additional resources: Commerce's Climate guidance, Transportation Efficient Communities' guidance, and the WA Department of Health Washington State Plan for Healthy Communities and Active Community Environment Toolkit	Yes. LU-8.	No	New policy in compliance with RCW 36.70A.070. This was considered during development of future land use map.	Completed: ☒Date: 3/1/2024

Section I: Comprehensive Plan

d. A consistent population projection throughout the plan which should be consistent with the jurisdiction's allocation of countywide population and housing needs. RCW 36.70A.115, RCW 43.62.035 and WAC 365-196-405(f)	Yes. Map 1.1 and throughout comp plan.	No	Population projections incorporated in the Land Use Element and Core Plan	Completed: ☒ Date: 3/1/2024
e. Estimates of population densities and building intensities based on future land uses and housing needs. RCW 36.70A.070(1) (amended in 2023), WAC 365-196-405(2)(i) • For cities required to plan under the Buildable Lands Program, RCW 36.70A.215 amended in 2017, some jurisdictions may need to identify reasonable measures to reconcile inconsistencies. See Commerce's Buildable Lands Program page.	Yes. Map 1.1 and 1.2 align with Land Use Map. Housing Needs Assessment Figure 2 and Figure 3.	No	Planning for increased building density includes low-density designated residential areas that are projected to increase in density as market and availability of utilities increases. "The pattern of one single density in a zone or neighborhood will evolve into increased and mixed densities in exchange for amenities that enhance quality of life."	Completed: ☒ Date: 3/12024
f. Provisions for protection of the quality and quantity of groundwater used for public water supplies. RCW 36.70A.070(1) (amended in 2023), WAC 365-196-405(1)(c); WAC 365-196-485(1)(d)	Yes. In Utilities Element, Water Policy 6.4	No		Completed: ☒ Date: 3/1/2024
g. Identification of lands useful for public purposes such as utility corridors, transportation corridors, landfills, sewage treatment facilities, storm water management facilities, recreation, schools and other public uses. RCW 36.70A.150 and WAC 365-196-340	Yes. Land Use Element, pages LUE-28 Public/Quasi-Public Designation, plus Land Use Map 1.3. See also Utilities and Transportation Elements.	No	Land Use chapter highlights a lot of specific subarea plans and policies for those areas. More detailed information on some of these purposes will be found in other elements, like capital facilities, transportation, etc.	Completed: ☒ Date: 3/7/2024

	In Current Plan? Yes/No If yes, cite section	Changes needed to meet current statute? Yes/No	Notes	
h. Identification of open space corridors and green spaces within and between urban growth areas, including lands useful for recreation, wildlife habitat, trails and connection of critical areas, and urban and community forests within the UGA. RCW 36.70A.070(1) amended in 2023, RCW 36.70A.160 and WAC 365-196-335	Yes, page LUE-30 Open Space Designation. Map 1.3.	No	Open Space designation reflected on "Comprehensive Land Use" Map.	Completed: ☒ Date: 3/7/2024
i. If there is an airport within or adjacent to the city: policies, land use designations (and zoning) to discourage the siting of incompatible uses adjacent to general aviation airports. RCW 36.70A.510, RCW 36.70.547 Note: The plan (and associated regulations) must be filed with the Aviation Division of WSDOT. WAC 365-196-455	Yes, Policies LU-96-105	No.	Industrial Designation – airport specific policies Airport Master Plan is in appendix for further detail.	Completed: ☒ Date: 3/7/2024
j. Where applicable, a review of drainage, flooding and stormwater run-off in the area and nearby jurisdictions and provide guidance for corrective actions to mitigate or cleanse those discharges that pollute waters of the state. RCW 36.70A.070(1) (amended in 2023) and WAC 365-196-405(2)(e) Note: RCW 90.56.010(27) defines waters of the state. Additional resources: Commerce's climate guidance, Protect Puget Sound Watersheds, Building Cities in the Rain, Ecology Stormwater Manuals, Puget Sound Partnership Action Agenda	Yes. LUE-28 Open Space Designation and throughout document.	No	See Also Utilities Element, Utilities Systems Plans and Capital Facilities Element.	Completed: ☒ Date: 3/7/2024

	In Current Plan? Yes/No If yes, cite section	Changes needed to meet current statute? Yes/No	Notes	
k. Policies to designate and protect critical areas including wetlands, fish and wildlife habitat protection areas, frequently flooded areas, critical aquifer recharge areas and geologically hazardous areas. In developing these policies, the city must have included the best available science (BAS) to protect the functions and values of critical areas, and give "special consideration" to conservation or protection measures necessary to preserve or enhance anadromous fisheries. RCW 36.70A.030(6), RCW 36.70A.172, WAC 365-190-080. Best Available Science: see WAC 365-195-900 through -925	Yes. Critical Area Overlay Land Use specifically policies LU-136-139	No		Completed: ☒ Date: 3/7/2024
l. If forest or agricultural lands of long-term commercial significance are designated inside a city: a program authorizing Transfer (or Purchase) of Development Rights. RCW 36.70A.060(4), RCW 36.70A.170	N/A	N/A	N/A	Completed: ☒ Date: 3/7/2024
m. If there is a Military Base within or adjacent to the jurisdiction employing 100 or more personnel: policies, land use designations, (and consistent zoning) to discourage the siting of incompatible uses adjacent to military bases. RCW 36.70A.530(3), WAC 365-196-475	N/A	N/A	N/A	Completed: ☒ Date: 3/7/2024
n. New section RCW 36.70A.142 (2022), HB 1799: Development regulations newly developed, updated, or amended *after January 1, 2025* allow for the siting of organic materials (OM) management facilities as identified in local solid waste management plans (SWMP) to meet OM reduction and diversion goals. Siting must meet criteria described in RCW 70A.205.040(3). See also RCW 36.70.330. For applicability, see RCW 70A.205.540.	No	TBD	Addressed as appropriate in Utilities Element and related Systems Plans. Development regulations will be updated later in 2024.	Completed: ☒ Date: 3/7/2024

	In Current Plan? Yes/No If yes, cite section	Changes needed to meet current statute? Yes/No	Notes	
o. Give special consideration to achieving environmental justice in goals and policies, including efforts to avoid creating or worsening environmental health disparities. RCW 36.70A.070(1) amended in 2023.	Yes. LU-9 and Climate Element Goal 1 and 2	No	Described as a policy in Land Use Element and discussed at greater lengths in Climate Element.	Completed: ☒ Date: 3/7/2024
p. The land use element must reduce and mitigate the risk to lives and property posed by wildfires by using land use planning tools and through wildfire preparedness and fire adaptation measures. RCW 36.70A.070(1) amended in 2023. See also: International Wildland-Urban Interface Code	Yes. LU-10 and Climate Element Goal 4 and 5	No	Identified as policy in Land Use Element to incorporate into Climate Element work plan for 2029 deadline. Risk is assessed in Climate Element.	Completed: ☒ Date: 3/7/2024

Housing Element

New 2021 and 2022 legislation substantially amended the housing-related provisions of the Growth Management Act (GMA), RCW 36.70A.070 (2). Local governments should review local comprehensive plan policies and countywide planning policies to be consistent with the updated requirements. Please refer to Commerce's housing webpage for further information. See also Appendix A of this checklist for the new 2023 minimum housing unit requirements per city population.

	In Current Plan? Yes/No If yes, cite section	Changes needed to meet current statute? Yes/No	Notes	
Notice: For more information about what these housing element requirements involve and what Commerce staff will be reviewing for, please see the Expanded Housing Checklist located on the Updating GMA Housing Elements webpage.				
a. Goals, policies and objectives for: • the preservation, improvement and development of housing RCW 36.70A.070(2)(b); • moderate density housing options including, but not limited to, duplexes, triplexes, and townhomes, within an urban growth area boundary, RCW 36.70A.070(2)(b) and WAC 365-196-410(2)(a); and • Consideration of housing locations in relation to employment locations and the role of ADUs. RCW 36.70A.070(2)(d) new in 2021 Notice: *These items were separately listed in the previous version of the checklist. No content was changed.*	Yes. Throughout Housing Element and Housing Needs and Characteristics Assessment Update	No	These various bullets are addressed in the Housing Element and HNA. Preservation – HE Goal 3; Middle Housing – HE Planning Approach and Goals and Policies; ADUs - HE Planning Approach and Goals and Policies	Completed: ☒ Date:3/21/24
b. An inventory and analysis of existing and projected housing needs over the planning period, by income band, consistent with the jurisdiction's share of countywide housing need, as provided by Commerce. RCW 36.70A.070(2)(a) amended in 2021, WAC 365-196-410(2)(b) and (c)	Yes. HE-10	No	CPP sections are included in HE Housing Need by Income Level section	Completed: ☒ Date:3/21/24

	In Current Plan? Yes/No If yes, cite section	Changes needed to meet current statute? Yes/No	Notes	
c. Identification of capacity of land for housing including, but not limited to, government-assisted housing, housing for moderate, low, very low, and extremely low-income households, manufactured housing, multifamily housing, group homes, foster care facilities, emergency housing, emergency shelters and permanent supportive housing. RCW 36.70A.070(2)(c) amended in 2021, WAC 365-196-410(e) and (f)	Yes. HE Table 1 and Table 2. Section 5 of HNA.	No	Summary in Housing Element, technical evaluation of capacity in Housing Needs and Characteristics Assessment Update.	Completed: ☒ Date: 4/8/24
d. Adequate provisions for existing and projected housing needs for all economic segments of the community, including documenting barriers and actions needed to achieve housing availability. RCW 36.70A.070(2)(d) amended in 2021, WAC 365-196-010(g)(ii), WAC 365-196-300(f), WAC 365-196-410 and see Commerce's Housing Action Plan (HAP) guidance: Guidance for Developing a Housing Action Plan.	Yes. HE Table 2. HNA Section 5.	No	Summary in Housing Element, technical evaluation of capacity in Housing Needs and Characteristics Assessment Update.	Completed: ☒ Date: 4/8/24
e. Identify local policies and regulations that result in racially disparate impacts, displacement, and exclusion in housing, including: • Zoning that may have a discriminatory effect; • Disinvestment; and • Infrastructure availability RCW 36.70A.070 (2)(e) new in 2021	Yes. HE Racially Disparate Impacts section.	Yes.	Discussed in referenced section, goals and policies updated to reflect RDI findings. A lot of additional discussion and information in Housing Needs and Characteristics Assessment Update.	Completed: ☒ Date: 4/8/24
f. Establish policies and regulations to address and begin to undo racially disparate impacts, displacement, and exclusion in housing caused by local policies, plans, and actions. RCW 36.70A.070(2)(f) new in 2021	Yes. H-9, H10, H-16, H-21, H-22, H-28, H-41-43, H-68	No.	Addressed throughout policies. Certain policies are consistent with regional approach to housing preservation per SKHHP recommendations.	Completed: ☒ Date: 3/21/24

	In Current Plan? Yes/No If yes, cite section	Changes needed to meet current statute? Yes/No	Notes	
	In Current Plan? Yes/No If yes, cite section	Changes needed to meet current statute? Yes/No	Notes	
g. Identification of areas that may be at higher risk of displacement from market forces that occur with changes to zoning development regulations and capital investments. RCW 36.70A.070(2)(g) new in 2021 Establish anti-displacement policies, with consideration given to the preservation of historical and cultural communities as well as investments in low, very low, extremely low, and moderate-income housing; equitable development initiatives; inclusionary zoning; community planning requirements; tenant protections; land disposition policies; and consideration of land that may be used for affordable housing. RCW 36.70A.070(2)(h) new in 2021 See also: Support Materials for Racially Disparate Impacts, Exclusion and Displacement Work	Yes. HE-7 9 (Displacement Risk section) and HNA	No.	Located in Housing Element. Additional information in Housing Needs and Characteristics Assessment	Completed: ☒ Date: 3/21/24

Capital Facilities Plan (CFP) Element

To serve as a check on the practicality of achieving other elements of the plan, covering all capital facilities planned, provided and paid for by public entities including local government and special districts, etc. including water systems, sanitary sewer systems, storm water facilities, schools, parks and recreational facilities, police and fire protection facilities. Capital expenditures from park and recreation elements, if separate, should be included in the CFP Element. The CFP Element must be consistent with CWPPs, and RCW 36.70A.070(3) amended in 2023. Changes made to this element through HB 1181 (climate change and resiliency) are not required, although jurisdictions should make a good faith effort to incorporate these items to be consistent with the new legislation.

	In Current Plan? Yes/No If yes, cite section	Changes needed to meet current statute? Yes/No	Notes	
a. Policies or procedures to ensure capital budget decisions are in conformity with the comprehensive plan. RCW 36.70A.120	Yes. CFE-1	No	Note: Capital Facilities Plan is adopted by reference in CFE. A lot of information in this checklist is in CFP.	Completed: ☒ Date: 4/9/24
b. An inventory of existing capital facilities owned by public entities, including green infrastructure. RCW 36.70A.070(3)(a) amended in 2023 and WAC 365-196-415(1)(a)	No	Yes	This is included in Systems Plan and CFP, which are scheduled to be complete summer 2024.	Completed: ☐ Date:
c. A forecast of needed capital facilities. RCW 36.70A.070(3)(b) and WAC 365-196-415(1)(b) Note: The forecast of future need should be based on projected population and adopted levels of service (LOS) over the planning period.	No	Yes	This is included in Systems Plan and CFP, which are scheduled to be complete summer 2024.	Completed: ☐ Date:
d. Proposed locations and capacities of expanded or new capital facilities. RCW 36.70A.070(3)(c) and WAC 365-196-415 (1)(c) and (3)(c) Infrastructure investments should consider equity and plan for any potential displacement impacts.	No	Yes	This is included in Systems Plan and CFP, which are scheduled to be complete summer 2024.	Completed: ☐ Date:
e. A six-year plan (at minimum) that will finance such capital facilities within projected funding capacities and identify sources of public money to finance planned capital facilities. RCW 36.70A.070(3)(d), RCW 36.70A.120, WAC 365-196-415(1)(d)	No	Yes	See CFP.	Completed: ☒ Date: 4/9/24

	In Current Plan? Yes/No If yes, cite section	Changes needed to meet current statute? Yes/No	Notes	
f. A policy or procedure to reassess the Land Use Element if probable funding falls short of meeting existing needs. RCW 36.70A.070(3)(e) WAC 365-196-415(2)(d) Note: park and recreation facilities shall be included in the capital facilities plan element.	Yes CF-30	No		Completed: ☒ Date: 4/9/24
g. If impact fees are collected: identification of public facilities on which money is to be spent. RCW 82.02.050(5) and WAC 365-196-850(3)	Yes. CFP.	No	See CFP.	Completed: ☒ Date: 4/9/24
h. Identify and include information about all public entities, including special purpose districts that own capital facilities. RCW 36.70A.070 (3) amended in 2023	Yes. Utilities Element.		This is described in Utilities Element.	Completed: ☒ Date: 4/9/24
Utilities Element Consistent with relevant CWPPs and RCW 36.70A.070 (4) amended in 2023. Utilities include, but are not limited to: sanitary sewer systems, water lines, fire suppression, electrical lines, telecommunication lines, and natural gas lines. Changes made to this element through HB 1181 (climate change and resiliency) are not required, although jurisdictions should make a good faith effort to incorporate these items to be consistent with the new legislation.				
a. The general location, proposed location and capacity of all existing and proposed utilities, to include telecommunications. RCW 36.70A.070(4)(a) amended in 2023 and WAC 365-196-420	No	Yes	The current Utilities Element provides narratives for each of the utilities but does not provide location information. The new Utilities Element includes new graphical and narrative representations. The narratives are located in the Overview section of the Utilities Element. The graphical elements are shown immediately following the policy statements.	Completed: ☒ Date: 2/28/24
b. Identify and include information and contact information about all public entities, including special purpose districts that own utility systems. RCW 36.70A.070 (4)(b) new in 2023	No	Yes	The current Utilities Element does not provide contact information about all public entities or special purpose districts. The new Element includes this information. This information is located immediately following the policy statements.	Completed: ☒ Date: 2/28/24

Transportation Element

Consistent with relevant CWPPs and RCW 36.70A.070 (6) amended in 2023 by HB 1181. See also the new climate element below for jurisdictional requirements.

	In Current Plan? Yes/No If yes, cite section	Changes needed to meet current statute? Yes/No	Notes	
a. An inventory of air, water and ground transportation facilities and services, including transit alignments, active transportation facilities, state-owned transportation facilities and general aviation airports. RCW 36.70A.070(6)(a)(iii)(A) amended in 2023 and WAC 365-196-430(2)(c)	Chapter 2, Appendix A	No		Completed: ☒ Date: 3/21/24
b. Adopted multimodal levels of service standards for all locally owned arterials, locally and regionally operated transit routes that serve UGAs, state-owned or operated transit routes that serve urban areas if the department of transportation has prepared such standards, and active transportation facilities to serve as a gauge to judge performance of the system and success in helping to achieve environmental justice. RCW 36.70A.070(6)(a)(iii)(B) and (C) amended in 2023, WAC 365-196-430	Chapter 2	No		Completed: ☒ Date:3/21/24
c. Identification of specific actions to bring transportation facilities and services to established multimodal LOS. RCW 36.70A.070(6)(a)(iii)(D) amended in 2023, WAC 365-196-430	Chapter 2	No		Completed: ☒ Date:3/21/24
d. A forecast of multimodal transportation for at least 10 years including land use assumptions used in estimating travel. RCW 36.70A.070(6)(a)(i), RCW 36.70A.070 (6)(a)(iii)(E) amended in 2023, WAC 365-196-430(2)(f)	Chapter 2	No		Completed: ☒ Date:3/21/24

	In Current Plan? Yes/No If yes, cite section	Changes needed to meet current statute? Yes/No	Notes	
e. A projection of state and local system needs to equitably meet current and future demand and equitably implement the multimodal network. RCW 36.70A.070(6)(a)(iii)(F) amended in 2023, WAC 365-196-430(1)(c)(vi) and RCW 47.06	Chapter 2, Appendix B	No		Completed: ☒ Date:3/21/24
f. A transition plan for transportation as required in Title II of ADA. Perform self-evaluations of current facilities and develop a program access plan to address deficiencies and achieve the identification of physical obstacles, establish methods, perform modifications and identify leadership roles. RCW 36.70A.070(6)(a)(iii)(G) new in 2023.	Yes. CTP 1.4.2	No		Completed: ☒ Date: 4/9/24
g. An active transportation component to include collaborative efforts to identify and designate planned improvements for active transportation facilities and corridors that address and encourage enhanced community access and promote healthy lifestyles. RCW 36.70A.070(6)(a)(vii) amended in 2023, WAC 365-196-430(2)(j)	Chapter 2, Section 2.3	No		Completed: ☒ Date:3/21/24
h. A description of any existing and planned transportation demand management (TDM) strategies, such as HOV lanes or subsidy programs, parking policies, etc. RCW 36.70A.070(6)(a)(vi) and WAC 365-196-430(2)(i)(i)	Chapter 4, Goal 8	No		Completed: ☒ Date:3/21/24
i. An analysis of future funding capability to judge needs against probable funding resources. RCW 36.70A.070(6)(a)(iv)(A), WAC 365.196-430(2)(k)(iv)	Chapter 6, Section 6.1	No		Completed: ☒ Date:3/21/24

	In Current Plan? Yes/No If yes, cite section	Changes needed to meet current statute? Yes/No	Notes	
j. A multi-year financing plan based on needs identified in the comprehensive plan, the appropriate parts of which serve as the basis for the 6-year street, road or transit program. RCW 36.70A.070(6)(a)(iv)(B) and RCW 35.77.010, WAC 365-196-430(2)(k)(ii)	Chapter 6, Section 6.1			Completed: ☒ Date:3/21/24
k. If probable funding falls short of meeting identified needs of the transportation system, including state transportation facilities, a discussion of how additional funds will be raised, or how land use assumptions will be reassessed to ensure that LOS standards will be met. RCW 36.70A.070(6)(a)(iv)(C) amended in 2023, WAC 365-196-430(2)(l)(iii)	Chapter 6, Section 6.4			Completed: ☒ Date:3/21/24
l. A description of intergovernmental coordination efforts, including an assessment of the impacts of the transportation plan and land use assumptions on the transportation systems of adjacent jurisdictions and how it is consistent with the regional transportation plan. RCW 36.70A.070(6)(a)(v); WAC 365-196-430(1)(e) and 430(2)(a)(iii)	Chapter 1, Section 1.5			Completed: ☒ Date:3/21/24

Shoreline

For shorelines of the state, the goals and policies of the shoreline management act as set forth in RCW 90.58.020 are added as one of the goals of the Growth Management Act (GMA) as set forth in RCW 36.70A.480. The goals and policies of a shoreline master program for a county or city approved under RCW 90.58 shall be considered an element of the county or city's comprehensive plan.

	In Current Plan? Yes/No If yes, cite section	Changes needed to meet current statute? Yes/No	Notes	
a. The policies, goals, and provisions of RCW 90.58 and applicable guidelines shall be the sole basis for determining compliance of a shoreline master program with this chapter except as the shoreline master program is required to comply with the internal consistency provisions of RCW 36.70A.070, 36.70A.040(4), 35.63.125, 35A.63.105, 36.70A.480	N/A			Completed: ☐ Date:
b. Shoreline master programs shall provide a level of protection to critical areas located within shorelines of the state that assures no net loss of shoreline ecological functions necessary to sustain shoreline natural resources as defined by department of ecology guidelines adopted pursuant to RCW 90.58.060.	N/A			Completed: ☐ Date:
c. Shorelines of the state shall not be considered critical areas under this chapter except to the extent that specific areas located within shorelines of the state qualify for critical area designation based on the definition of critical areas provided by RCW 36.70A.030(5) and have been designated as such by a local government pursuant to RCW 36.70A.060(2)	N/A			Completed: ☐ Date:

	In Current Plan? Yes/No If yes, cite section	Changes needed to meet current statute? Yes/No	Notes	
d. If a local jurisdiction's master program does not include land necessary for buffers for critical areas that occur within shorelines of the state, as authorized by RCW 90.58.030(2)(f), then the local jurisdiction shall continue to regulate those critical areas and their required buffers pursuant to RCW 36.70A.060(2).	N/A			Completed: ☐ Date:
Provisions for siting essential public facilities (EPFs) Consistent with CWPPs and RCW 36.70A.200, amended 2021. This section can be included in the Capital Facilities Element, Land Use Element or in its own element. Sometimes the identification and siting process for EPFs is part of the CWPPs.				
a. A process or criteria for identifying and siting essential public facilities (EPFs). RCW 36.70A.200 and WAC 365-196-550(1) Notes: RCW 36.70A.200, amended 2021 regarding reentry and rehabilitation facilities. EPFs are defined in RCW 36.70A.200. Regional transit authority facilities are included in the list of essential public facilities.	Yes. CF Goal 5, CF-30-39	No	Addressed in Capital Facilities Element – Essential Public Facilities section.	Completed: ☒ Date: 4/8/24
b. Policies or procedures that ensure the comprehensive plan does not preclude the siting of EPFs. RCW 36.70A.200(5) Note: If the EPF siting process is in the CWPPs, this policy may be contained in the comprehensive plan as well. WAC 365-196-550(3)	Yes. CF 30, 31	No	Addressed in Capital Facilities Element – Essential Public Facilities section.	Completed: ☒ Date: 4/8/24

Tribal Participation in Planning new in 2022 (see HB 1717)

A federally recognized Indian tribe may voluntarily choose (opt-in) to participate in the local and regional planning processes.

	In Current Plan? Yes/No If yes, cite section	Changes needed to meet current statute? Yes/No	Notes	
a. Mutually agreeable memorandum of agreement between local governments and tribes in regard to collaboration and participation in the planning process unless otherwise agreed at the end of a mediation period. RCW 36.70A.040(8)(a) new in 2022, RCW 36.70A.190 new in 2022	No	No	Engagement with tribe on Comp Plan Elements and EIS will occur in April 2024 outside of Element goals and policies.	Completed: ☒ Date: 4/8/24
b. *Port elements*, if adopted, are developed collaboratively between the city, the applicable port and the applicable tribe(s), which shall comply with RCW 36.70A.040(8). RCW 36.70A.085 amended in 2022	N/A			Completed: ☐ Date:
c. *Urban Growth Areas:* counties and cities coordinate planning efforts for any areas planned for urban growth with applicable tribe(s). RCW 36.70A.110(1) amended 2022, RCW 36.70A.040(8)	No	No	Engagement with tribe on Comp Plan Elements and EIS will occur in April 2024 outside of Element goals and policies.	Completed: ☒ Date: 4/8/24

Climate Change and Resiliency

New in 2023, see HB 1181. RCW and WAC updates are forthcoming.
A new required element for comprehensive plans and new goal of the GMA. Designed to reduce greenhouse gas (GHG) emissions, plan for resiliency and support environmental justice. Climate elements must maximize economic, environmental and social co-benefits and prioritize environmental justice in order to avoid worsening environmental health disparities. A climate element can take the form of a single comprehensive plan chapter or be integrated into several chapters/elements such as housing, transportation and land use. Visit Commerce's Climate Program webpage for further guidance, grants, tools and staff contacts.

These requirements for GHG emission reductions and resiliency apply to the following counties and their cities with a population greater than 6,000 as of April 1, 2021. Please also review Appendix B for requirements due in the upcoming periodic update.

- June 30, 2025 Deadline: Clark, Skagit, Thurston, Whatcom
- June 30, 2026 Deadline: Benton, Franklin, Spokane
- June 30, 2029 Deadline: These jurisdictions are only required to update two elements this cycle – the transportation and climate elements

	In Current Plan? Yes/No If yes, cite section	Changes needed to meet current statute? Yes/No	Notes	
a. Greenhouse gas emissions reduction sub-element: must include goals and policies to reduce emissions and vehicle miles traveled. This sub-element is mandatory for the state's largest and fastest-growing counties and the cities within those counties. RCW 36.70A.070(9) new in 2023	Yes. C-43, C-45, C-47,	No		Completed: ☒ Date:3/21/24
b. Resiliency sub-element: must include goals and polices to improve climate preparedness, response and recovery efforts. This is mandatory for all counties and cities fully planning under the GMA and encouraged for others. RCW 36.70A.070(9) new in 2023	Yes. C-1, C-2, C-3, C-5, C-9, C-10, C-12	No		Completed: ☒ Date:3/21/24

Future required elements: pending state funding

As of 2022, these elements have not received state funding to aid local jurisdictions in implementation. Therefore, these elements are not required to be added to comprehensive plans at this time. Commerce encourages jurisdictions to begin planning for these elements, pending the future mandate.

	In Current Plan? Yes/No If yes, cite section	Notes	
Economic Development Although included in RCW 36.70A.070 "mandatory elements" an economic development element is not currently required because funding was not provided to assist in developing local elements when this element was added to the GMA. However, provisions for economic growth, vitality, and a high quality of life are important, and supporting strategies should be integrated with the land use, housing, utilities, and transportation elements. RCW 36.70A.070(7) amended in 2017	Yes	See Economic Development Element.	Completed: ☒ Date:3/21/24
Parks and Recreation Implements and is consistent with the capital facilities plan. Include a ten-year demand estimate, evaluation of service and facilities needs and evaluation of tree canopy coverage within UGAs. RCW 36.70A.070(8) amended in 2023 Although included in RCW 36.70A.070 "mandatory elements" a parks and recreation element is not currently required because the state did not provide funding to assist in developing local elements when this provision was added to the GMA. However, parks, recreation and open space planning are GMA goals, and it is important to plan for and fund these facilities.	Yes	See Parks Element and PROS Plan	Completed: ☒ Date:3/21/24

Optional Elements

Pursuant to RCW 36.70A.080, a comprehensive plan may include additional elements, items, or studies dealing with other subjects relating to the physical development within its jurisdiction, including, but not limited to:

	In Current Plan? Yes/No If yes, cite section	Notes	
Sub-Area Plans	Yes. LUE-39	Noted in Land Use Element	Completed: ☒ Date:3/21/24
Conservation			Completed: ☐ Date:
Recreation		See Parks and Recreation Element	Completed: ☒ Date: 4/8/24
Solar Energy			Completed: ☐ Date:

Consistency is required by the GMA

	In Current Plan? Yes/No If yes, cite section	Changes needed to meet current statute? Yes/No	Notes	
a. All plan elements must be consistent with relevant county-wide planning policies (CWPPs) and, where applicable, multi-county planning policies (MPPs), and the GMA. RCW 36.70A.100 and 210, WAC 365-196-305; 400(2)(c); 510 and 520	Yes. LUE-2, for instance.	No.	All Elements policies and data are consistent. References to this are found through Elements.	Completed: ☒ Date:3/21/24
b. All plan elements must be consistent with each other. RCW 36.70A.070 (preamble) and WAC 365-197-040	Yes.	No.	All Elements policies and data are consistent. References to this are found through Elements.	Completed: ☒ Date:3/21/24
c. The plan must be coordinated with the plans of adjacent jurisdictions. RCW 36.70A.100 and WAC 365-196-520	Yes. LUE-2, for instance.	No.	Also referenced in various Elements.	Completed: ☒ Date:3/21/24

Public Participation

a. Plan ensures public participation in the comprehensive planning process. RCW 36.70A.020(11), .035, and .140, WAC 365-196-600(3) provide possible public participation choices.	Yes.	No.	Public Participation Plan, Comprehensive Transportation Plan, and other Elements describe public participation process for Comprehensive Plan.	Completed: ☒ Date:3/21/24
b. If the process for making amendments is included in the comprehensive plan: • The plan provides that amendments are to be considered no more often than once a year, not including the exceptions described in RCW 36.70A.130(2), WAC365-196-640 • The plan sets out a procedure for adopting emergency amendments and defines emergency. RCW 36.70A.130(2)(b) and RCW 36.70A.390, WAC 365-196-650(4)	N/A		This is found in ACC 14.22.	Completed: ☒ Date:3/21/24

Consistency is required by the GMA	In Current Plan? Yes/No If yes, cite section	Changes needed to meet current statute? Yes/No	Notes	
c. Plan or program for monitoring how well comprehensive plan policies, development regulations, and other implementation techniques are achieving the comp plan's goals and the goals of the GMA. WAC 365-196-660 discusses a potential review of growth management implementation on a systematic basis. New 2021-2022 legislation HB 1241 provides that those jurisdictions with a periodic update due in 2024 have until December 31, 2024 to submit. The legislation also changed the update cycle to every ten years after the 2024-2027 cycle. Jurisdictions that meet the new criteria described in RCW 36.70A.130(9) will be required to submit an implementation progress report five years after the review and revision of their comprehensive plan.	Yes. LU-7.	Yes	Staff will determine approach for incorporating monitoring program into city code in 2024. This is referenced in LU-7.	Completed: ☒ Date:3/21/24
d. Considerations for preserving property rights. Local governments must evaluate proposed regulatory or administrative actions to assure that such actions do not result in an unconstitutional taking of private property. RCW 36.70A.370. For further guidance see the 2018 Advisory Memo on the Unconstitutional Taking of Private Property	Yes.	No.	This is addressed through concurrency, critical areas mitigation, and in CTP.	Completed: ☒ Date: 4/9/24
e. Encourage the involvement of citizens in the planning process, including the participation of vulnerable populations and overburdened communities, and ensure coordination between communities and jurisdictions to reconcile conflicts. HB 1181 (2023) revised RCW 36.70A.020 *Planning Goals* for inclusion of	Yes.	No.	See Public Participation Plan. Also in code.	Completed: ☒ Date:3/21/24

Consistency is required by the GMA				
vulnerable populations and overburdened communities. RCW 36.70A.035 *Public Participation* was not amended under HB 1181.				

Section II: Development Regulations

Must be consistent with and implement the comprehensive plan. RCW 36.70A.040, WAC 365-196-800 and 810

Critical Areas

Regulations protecting critical areas are required by RCW 36.70A.060(2), RCW 36.70A.172(1), WAC 365-190-080 and WAC 365-195-900 through 925.

Please visit Commerce's **Critical Areas webpage** for resources and to complete the **Critical Areas Checklist**. Critical areas regulations must be reviewed and updated, as necessary, to incorporate legislative changes and best available science. Jurisdictions using periodic update grant funds to update critical areas regulations must submit the critical areas checklist as a first deliverable, in addition to this periodic update checklist.

Zoning Code

Note: Please review the new 2023 housing laws in the Washington State Housing Laws of 2019 through 2023 guidance, on Commerce's Planning for Housing webpage and Appendix A of this checklist.

	In Current Regs? Yes/No If yes, cite section	Changes needed to meet current statute? Yes/No	Notes	
Notice: For more information about housing regulatory changes regarding supportive housing types, see Supportive Housing Types Review Checklist on the Updating GMA Housing Elements webpage. And for additional information on middle housing and ADU regulations, see the Middle Housing webpage.				
a. Zoning designations are consistent and implement land use designations that accommodate future housing needs by income bracket as allocated through the countywide planning process. (RCW 36.70A.070(2)(c) - amended in 2021 (HB 1220)		Yes	Yes zoning districts defined in Chapter 18.07 ACC. Middle housing and mobile/manufactured homes allowed within the zoning code (Title 18).	Completed: ☒ Date: **11/7/24**
b. Permanent supportive housing or transitional housing must be allowed where residences and hotels are allowed. RCW 36.70A.390 new in 2021, (HB 1220 sections 3-5) "permanent supportive housing" is defined in RCW 36.70A.030; "transitional housing" is defined in RCW 84.36.043(2)(c)		Yes	Permanent supportive housing has been defined in the Zoning Ordinance. Not yet included in the Residential or Commercial Use Tables.	Completed: ☐ Date:

	In Current Regs? Yes/No If yes, cite section	Changes needed to meet current statute? Yes/No	Notes	
c. Indoor emergency shelters and indoor emergency housing must be allowed in any zones in which hotels are allowed, except in cities that have adopted an ordinance authorizing indoor emergency shelters and indoor emergency housing in a majority of zones within one-mile of transit. RCW 35A.21.430 amended in 2021, RCW 35.21.683, amended in 2021, (HB 1220 sections 3-5) "emergency housing" is defined in RCW 84.36.043(2)(b)		Yes	Indoor emergency shelters and indoor emergency housing have been defined in the Zoning Ordinance. Not yet included in the Residential or Commercial Use Tables.	Completed: ☐ Date:
d. The number of unrelated persons that occupy a household or dwelling unit except as provided in state law, for short-term rentals, or occupant load per square foot shall not be regulated or limited by cities. (HB 5235), RCW 35.21.682 new in 2021, RCW 35A.21.314 new in 2022, RCW 36.01.227 new in 2021		Yes		Completed: ☐ Date:
e. Limitations on the amount of parking local governments can require for low-income, senior, disabled and market-rate housing units located near high-quality transit service. RCW 36.70A.620 amended in 2020 and RCW 36.70A.600 amended in 2019		Yes		Completed: ☐ Date:
f. Family day care providers are allowed in all residential dwellings located in areas zoned for residential or commercial RCW 36.70A.450. Review RCW 43.216.010 for definition of family day care provider and WAC 365-196-865 for more information.		Yes		Completed: ☐ Date:

	In Current Regs? Yes/No If yes, cite section	Changes needed to meet current statute? Yes/No	Notes	
g. Manufactured housing is regulated the same as site built housing. RCW 35.21.684 amended in 2019, RCW 35.63.160, RCW 35A.21.312 amended in 2019 and RCW 36.01.225 amended in 2019. A local government may require that manufactured homes: (1) are new, (2) are set on a permanent foundation, and (3) comply with local design standards applicable to other homes in the neighborhood, but may not discriminate against consumer choice in housing. See: National Manufactured Housing Construction and Safety Standards Act of 1974	Yes ACC 18.31.050	No		Completed: ☒ Date: **11/7/24**
h. Accessory dwelling units: cities (and counties) must adopt or amend by ordinance, and incorporate into their development regulations, zoning regulations and other official controls. RCW 36.70A.680 amended in 2023, RCW 36.70A.681 amended in 2023, RCW 36.70A.696 amended in 2023, RCW 36.70A.697 amended in 2020, RCW 36.70A.698 amended in 2020, RCW 36.70A.699 amended in 2020 See new Commerce guidance on the Middle Housing webpage	Yes ACC 18.31.120	Yes	Existing accessory dwelling units updated to comply with RCW 36.70A.681	Completed: ☒ Date: **11/7/24**
i. Residential structures occupied by persons with handicaps, and group care for children that meets the definition of "familial status" are regulated the same as a similar residential structure occupied by a family or other unrelated individuals. No city or county planning under the GMA may enact or maintain ordinances, development regulations, or administrative practices which treat a residential structure occupied by persons with handicaps differently than a similar residential structure occupied by a family or other unrelated individuals. RCW 36.70A.410, RCW 70.128.140 and 150, RCW 49.60.222-225 and WAC 365-196-860		Yes		Completed: ☐ Date:

	In Current Regs? Yes/No If yes, cite section	Changes needed to meet current statute? Yes/No	Notes	
j. Affordable housing programs enacted or expanded under RCW 36.70A.540 amended in 2022 comply with the requirements of this section. Examples of such programs may include: density bonuses within urban growth areas, height and bulk bonuses, fee waivers or exemptions, parking reductions, expedited permitting conditioned on provision of low-income housing units, or mixed-use projects. WAC 365-196-300 See also RCW 36.70A.545 and WAC 365-196-410(2)(e)(i) "affordable housing" is defined in RCW 84.14.010 Review RCW 36.70A.620 amended in 2020, for minimum residential parking requirements.		Yes		Completed: ☐Date:
k. Limitations on regulating: outdoor encampments, safe parking efforts, indoor overnight shelters and temporary small houses on property owned or controlled by a religious organization. RCW 36.01.290 amended in 2020		Yes		Completed: ☐Date:
l. Regulations discourage incompatible uses around general aviation airports. RCW 36.70.547 and WAC 365-196-455. Incompatible uses include: high population intensity uses such as schools, community centers, tall structures, and hazardous wildlife attractants such as solid waste disposal sites, wastewater or stormwater treatment facilities, or stockyards. For more guidance, see WSDOT's Aviation Land Use Compatibility Program.	Yes Chapter 18.38 ACC			Completed: ☒Date: 11/7/24

	In Current Regs? Yes/No If yes, cite section	Changes needed to meet current statute? Yes/No	Notes	
m. If a U.S. Department of Defense (DoD) military base employing 100 or more personnel is within or adjacent to the jurisdiction, zoning should discourage the siting of incompatible uses adjacent to military base. RCW 36.70A.530(3) and WAC 365-196-475. Visit Military One Source to locate any bases in your area and help make determination of applicability. If applicable, inform the commander of the base regarding amendments to the comprehensive plan and development regulations on lands adjacent to the base.	No.	No.	Not applicable.	Completed: ☐ Date:
n. Electric vehicle infrastructure (jurisdiction specified: adjacent to Interstates 5, 90, 405 or state route 520 and other criteria) must be allowed as a use in all areas except those zoned for residential, resource use or critical areas. RCW 36.70A.695	Yes Chapter 18.47 ACC	No.		Completed: ☐ Date:
Shoreline Master Program Consistent with RCW 90.58 Shoreline Management Act of 1971				
a. Zoning designations are consistent with Shoreline Master Program (SMP) environmental designations. RCW 36.70A.480	N/A		City's shoreline master program is adopted under Ordinance 6733	Completed: ☒ Date:3/**21/24**
b. If updated to meet RCW 36.70A.480 (2010), SMP regulations provide protection to critical areas in shorelines that is at least equal to the protection provided to critical areas by the critical areas ordinance. RCW 36.70A.480(4) and RCW 90.58.090(4) See Ecology's shoreline planners' toolbox for the SMP Checklist and other resources and Ecology's Shoreline Master Programs Handbook webpage	N/A			Completed: ☒ Date:3/**21/24**

Resource Lands

Defined in RCW 36.70A.030(3), (12) and (17) and consistent with RCW 36.70A.060 and RCW 36.70A.170

	In Current Regs? Yes/No If yes, cite section	Changes needed to meet current statute? Yes/No	Notes	
a. Zoning is consistent with natural resource lands designations in the comprehensive plan and conserves natural resource lands. RCW 36.70A.060(3), WAC 365-196-815 and WAC 365-190-020(6). Consider innovative zoning techniques to conserve agricultural lands of long-term significance RCW 36.70A.177(2). See also WAC 365-196-815(3) for examples of innovative zoning techniques.	Yes. 16.10	No		Completed: ☒Date:3/21/24
b. Regulations to assure that use of lands adjacent to natural resource lands does not interfere with natural resource production. RCW 36.70A.060(1)(a) and WAC 365-190-040 Regulations require notice on all development permits and plats within 500 feet of designated natural resource lands that the property is within or near a designated natural resource land on which a variety of commercial activities may occur that are regulations to implement comprehensive plan	Yes. 16.10.090	No		Completed: ☒Date:3/21/24
c. For designated agricultural land, regulations encourage nonagricultural uses to be limited to lands with poor soils or otherwise not suitable for agricultural purposes. Accessory uses should be located, designed and operated to support the continuation of agricultural uses. RCW 36.70A.177(3)(b)	Yes. 18.070.10	No		Completed: ☒Date:3/21/24
d. Designate mineral lands and associated regulations as required by RCW 36.70A.131and WAC 365-190-040(5). For more information review the WA State Dept. of Natural Resources (DNR)'s Geology Division site	Yes. 18.62	No		Completed: ☒Date:3/21/24

Siting Essential Public Facilities

Regulations for siting essential public facilities should be consistent with RCW 36.70A.200 and consider WAC 365-196-550. Essential public facilities include those facilities that are typically difficult to site, such as airports, state education facilities, state or regional transportation facilities, state and local correctional facilities, solid waste handling facilities, and in-patient facilities including substance abuse facilities, mental health facilities, group homes, and secure community transition facilities. Regulations may be specific to a local jurisdiction, but may be part of county-wide planning policies (CWPPs).

	In Current Regs? Yes/No If yes, cite section	Changes needed to meet current statute? Yes/No	Notes	
Regulations for CWPPs include a process for siting EPFs and ensure EPFs are not precluded. RCW 36.70A.200 amended in 2023, WAC 365-196-550(6) lists process for siting EPFs. WAC 365-196-550(3) details preclusions. EPFs should be located outside of known hazardous areas. Visit Commerce's Behavioral Health Facilities Program page for information on establishing or expanding new capacity for behavioral health EPFs. Note: RCW 36.70A.200 amended by SB 5536 to include EPFs for opioid treatment programs	Yes. See CFE and city code 14.11.02014.11.020.	Yes	References Capital Facilities Element Essential Public Facilities, which is aligned with RCW 36.70A.200. Text to be updated in CFE to align with 2023 RCW updates.	Completed: ☒Date:3/21/2024
Subdivision Code				
a. Subdivision regulations are consistent with and implement comprehensive plan policies. RCW 36.70A.030(8), RCW 36.70A.040(4)	Yes. Title 17.	No.		Completed: ☒Date: 11/7/24
b. Written findings to approve subdivisions establish adequacy of public facilities. RCW 58.17.110 amended in 2018 • Streets or roads, sidewalks, alleys, other public ways, transit stops, and other features that assure safe walking conditions for students. • Potable water supplies, sanitary wastes, and drainage ways. RCW 36.70A.590 amended 2018 • Open spaces, parks and recreation, and playgrounds • Schools and school grounds	Yes. Chapters 17.09, 17.10, 17.14, and 17.16	No.		Completed: ☒Date: 11/7/24

Other items related to the public health, safety and general welfare, WAC 365-196-820(1).				
	In Current Regs? Yes/No If yes, cite section	Changes needed to meet current statute? Yes/No	Notes	
c. Preliminary subdivision approvals under RCW 58.17.140 and RCW 58.17.170 are valid for a period of five or seven years (previously five years). Note: preliminary plat approval is valid for: seven years if the date of preliminary plat approval is on or before December 31, 2014; five years if the preliminary plat approval is issued on or after January 1, 2015; and ten years if the project is located within city limits, not subject to the shoreline management act, and the preliminary plat is approved on or before December 31, 2007.	Yes. Chapters 17.09 and 17.10	No.		Completed: ☐Date:
d. Include in short plat regulations procedures for unit lot subdivisions allowing division of a parent lot into separately owned unit lots. RCW 58.17.060 (3) new in 2023 by SB 5258 - section 11		Yes	Propose new unit lot subdivisions in Title 17 (proposed Chapter 17.27).	Completed: ☒Date: 11/7/24

Stormwater				
	In Current Regs? Yes/No If yes, cite section	Changes needed to meet current statute? Yes/No	Notes	
a. Regulations protect water quality and implement actions to mitigate or cleanse drainage, flooding, and storm water run-off that pollute waters of the state, including Puget Sound or waters entering Puget Sound. RCW 36.70A.070(1) Regulations may include: adoption of a stormwater manual consistent with Ecology's latest manual for Eastern or Western Washington, adoption of a clearing and grading ordinance –See Commerce's 2005 Technical Guidance Document for Clearing and Grading in Western Washington. Adoption of a low impact development ordinance. See Puget Sound Partnership's 2012 Low Impact Development guidance and Ecology's 2013 Eastern Washington Low Impact Development guidance. Additional Resources: Federal Grants to Protect Puget Sound Watersheds, Building Cities in the Rain, Ecology Stormwater Manuals, Puget Sound Partnership Action Agenda	Yes.13.48.210	No.		Completed: ☒Date:3/21/24
b. Provisions for corrective action for failing septic systems that pollute waters of the state. RCW 36.70A.070(1). See also: DOH Wastewater Management, Ecology On-Site Sewage System Projects & Funding	Yes.13.48.210	No.		Completed: ☒Date:3/21/24

Organic Materials Management Facilities

New in 2022, HB 1799 added a section to the GMA aimed at reducing the volumes of organic materials collected in conjunction with other solid waste and delivered to landfills, supporting productive uses of organic material waste and reduction of methane gas (a greenhouse gas).

	In Current Regs? Yes/No If yes, cite section	Changes needed to meet current statute? Yes/No	Notes	
New section RCW 36.70A.142; new in 2022 legislation HB 1799: Development regulations newly developed, updated, or amended *after January 1, 2025* allow for the siting of organic materials (OM) management facilities as identified in local solid waste management plans (SWMP) to meet OM reduction and diversion goals. Siting to meet criteria described in RCW 70A.205.040(3) See also RCW 36.70.330. For applicability, see RCW 70A.205.540	No	**Yes**	To be updated concurrent with other Development Regulations and code updates to implement Comprehensive Plan.	Completed: ☐Date:

Impact Fees

May impose impact fees on development activity as part of the financing for public facilities, provided that the financing for system improvements to serve new development must provide for a balance between impact fees and other sources of public funds; cannot rely solely on impact fees.

a. If adopted, impact fees are applied consistent with RCW 82.02.050 amended in 2015, RCW 82.02.060 amended in 2023 by SB 5258, .070, .080, .090 amended in 2018 and .100. WAC 365-196-850 provides guidance on how impact fees should be implemented and spent.	Yes. ACC Title 19	No		Completed: ☒Date:3/**21/24**
b. Jurisdictions collecting impact fees must adopt and maintain a system for the deferred collection of impact fees for single-family detached and attached residential construction, consistent with RCW 82.02.050(3) amended in 2016	Yes. ACC Title 19	No		Completed: ☒Date:3/**21/24**
c. If adopted, limitations on impact fees for early learning facilities RCW 82.02.060 amended in 2021	No		To be updated concurrent with other Development Regulations and code updates to implement Comprehensive Plan.	Completed: ☐Date:

	In Current Regs? Yes/No If yes, cite section	Changes needed to meet current statute? Yes/No	Notes	
d. If adopted, exemption of impact fees for low-income and emergency housing development RCW 82.02.060 amended in 2023. See also definition change in RCW 82.02.090(1)(b) amended in 2018	No	No	City will update as needed.	Completed: ☒Date:3/**21/24**
e. Ensure impact fees are not assessed on the construction of accessory dwelling units that are greater than 50 percent (50%) of the impact fees that would be imposed on the principal unit. RCW 36.70A.681 new in 2023 by HB 1337	**No**	Yes	To be updated concurrent with other Development Regulations and code updates to implement Comprehensive Plan.	Completed: ☐Date:
f. The schedule of impact fees reflects the proportionate impact of new housing units, including multifamily and condominium units, based on the square footage, number of bedrooms, or trips generated, in the housing unit in order to produce a proportionally lower impact fee for smaller housing units. RCW 82.02.060 amended in 2023 by SB 5258	**No**	Yes	To be updated concurrent with other Development Regulations and code updates to implement Comprehensive Plan.	Completed: ☐Date:
Concurrency and Transportation Demand Management (TDM) Ensures consistency in land use approval and the development of adequate public facilities as plans are implemented, maximizes the efficiency of existing transportation systems, limits the impacts of traffic and reduces pollution.				
a. The transportation concurrency requirement includes specific language that prohibits development when level of service standards for transportation facilities cannot be met. RCW 36.70A.070(6)(b) amended in 2023, WAC 365-196-840. Note: Concurrency is required for transportation, but may also be applied to park facilities, etc.	**Yes**	Yes	Mitigation may be provided by providing mode shift away from vehicles	Completed: ☒ Date:9/**1/23**

	In Current Regs? Yes/No If yes, cite section	Changes needed to meet current statute? Yes/No	Notes	
b. Measures exist to bring into compliance locally owned, or locally or regionally operated, transportation facilities or services that are below the levels of service established in the comprehensive plan. RCW 36.70A.070(6)(a)(iii)(B) and (D), RCW 36.70A.070(6)(b) amended in 2023 Levels of service can be established for automobiles, pedestrians and bicycles. See WAC 365-196-840(3) on establishing an appropriate level of service.	**Yes**	**Yes**	Level of service standards expanded to include pedestrian, bike, transit, and freight.	Completed: ☒ Date:9/2/23
c. Highways of statewide significance (HSS) are exempt from the concurrency ordinance. RCW 36.70A.070(6)(a)(iii)(C)	**Yes**	No		Completed: ☐ Date:
d. Traffic demand management (TDM) requirements are consistent with the comprehensive plan. RCW 36.70A.070(6)(a)(vi) Examples may include requiring new development to be oriented towards transit streets, pedestrian-oriented site and building design, and requiring bicycle and pedestrian connections to street and trail networks. WAC 365-196-840(4) recommends adopting methodologies that analyze the transportation system from a comprehensive, multimodal perspective.	**Yes**	**Yes**	MMLOS added	Completed: ☒ Date:9/1/23
e. If required by RCW 82.70, a commute trip reduction (CTR) ordinance to achieve reductions in the proportion of single-occupant vehicle commute trips has been adopted. The ordinance should be consistent with comprehensive plan policies for CTR and Department of Transportation rules.	**Yes**	No		Completed: ☐ Date:

Tribal Participation in Planning new in 2022 (see HB 1717)

A federally recognized Indian tribe may voluntarily choose to participate in the county or regional planning process. See Commerce's new Tribal Planning Coordination for GMA webpage for guidance and staff contacts.

	In Current Regs? Yes/No If yes, cite section	Changes needed to meet current statute? Yes/No	Notes	
a. Mutually agreeable memorandum of agreement between local governments and tribes in regard to collaboration and participation in the planning process unless otherwise agreed at the end of a mediation period RCW 36.70A.040(8)(a) new in 2022.	No	No	City did not receive notice in the form of a tribal resolution from a federally recognized Indian tribe whose reservation or ceded lands lie within the county, which indicates the tribe has a planning process or intends to initiate a parallel planning process, the county, cities, and other local governments conducting the planning under this chapter shall enter into good faith negotiations to develop a mutually agreeable memorandum of agreement	Completed: ☒Date: 3/21/24
b. Policies consistent with countywide planning policies that address the protection of tribal cultural resources in collaboration with federally recognized Indian tribes that are invited, provided that a tribe, or more than one tribe, chooses to participate in the process. RCW 36.70A.210(3)(j) new in 2022.	Yes. LUE-2	No.	Will consider if appropriate in code.	Completed: ☒Date:3/21/24
Regulations to Implement Optional Elements				
a. New fully contained communities are consistent with comprehensive plan policies, RCW 36.70A.350 and WAC 365-196-345	Yes. Land Use Element and Title 18.	No.		Completed: ☒Date:3/21/24
b. If applicable, master planned resorts are consistent with comprehensive plan policies, RCW 36.70A.360, RCW 36.70A.362 and WAC 365-196-460	N/A			Completed: ☐Date:
c. If applicable, major industrial developments and master planned locations outside of UGAs are consistent with comprehensive plan policies, RCW 36.70A.365, RCW 36.70A.367 and WAC 365-196-465	N/A			Completed: ☐Date:
d. Regulations include procedures to identify, preserve, and/or monitor historical or	Yes. ACC 15.76	No.		Completed: ☒Date:3/21/24

archaeological resources. RCW 36.70A.020(13), WAC 365-196-450				
	In Current Regs? Yes/No If yes, cite section	Changes needed to meet current statute? Yes/No	Notes	
e. Other development regulations needed to implement comprehensive plan policies such as energy, sustainability or design are adopted. WAC 365-196-445	Yes. Various locations.	Yes	Appropriate updates to code will be made to address this in 2025.	Completed: ☐Date:
f. Design guidelines for new development are clear and easy to understand; administration procedures are clear and defensible	Yes.	Yes.	Updates proposed to Zoning Ordinance related to design standards for middle housing and single unit-detached residences. Multi-family and mixed-use standards to be updated in 2025.	Completed: ☐Date:
g. Local design review includes one or more ascertainable guideline, standard or criterion by which an applicant can determine whether a given building design is permissible under that development regulation. May not result in a reduction in density, height, bulk or scale below the generally applicable development regulations for a development proposal in the applicable zone. RCW 36.70A.630 new in 2023 by HB 1293	No	Yes	Work in progress to update.	Completed: ☐Date:
Project Review Procedures In 2023, SB 5290 substantially amended local permit review processes. Codification and additional resources from Commerce are forthcoming.				
Project review processes integrate permit and environmental review. RCW 36.70A.470, RCW 36.70B and RCW 43.21C. Also: WAC 365-196-845, WAC 197-11(SEPA Rules), WAC 365-197 (Project Consistency Rule, Commerce, 2001) and Ecology SEPA Handbook. Integrated permit and environmental review procedures for: • Notice of application • Notice of complete application • One open-record public hearing	Yes. Chapter 16.10 ACC and Title 14	Yes	Updated Title 14 to be consistent with SB 5290. Ordinance No. 6957 passed on 11/5/24.	Completed: ☒Date: 11/5/24

• Combining public hearings & decisions for multiple permits • Notice of decision • One closed-record appeal				

Plan & Regulation Amendments

If procedures governing comprehensive plan amendments are part of the code, then assure the following are true:

	In Current Regs? Yes/No If yes, cite section	Changes needed to meet current statute? Yes/No	Notes	
a. Regulations limit amendments to the comprehensive plan to once a year (with statutory exceptions). RCW 36.70A.130(2) and WAC 365-196-640(3)	Yes. 14.22	No		Completed: ☒ Date:3/21/24
b. Regulations define *emergency* for an emergency plan amendment. RCW 36.70A.130(2)(b) and WAC 365-196-640(4)	No.	Yes	Definition needs to be included in 14.22.060	Completed: ☐ Date:
c. Regulations include a docketing process for requesting and considering plan amendments. RCW 36.70A.130(2), RCW 36.70A.470, and WAC 365-196-640(6)	Yes. 14.22.080	No		Completed: ☒ Date:3/21/24
d. A process has been established for early and continuous public notification and participation in the planning process. RCW 36.70A.020(11), RCW 36.70A.035 and RCW 36.70A.140. See WAC 365-196-600 regarding public participation and WAC 365-196-610(2) listing recommendations for meeting requirements.	Yes. 14.22.030	No		Completed: ☒ Date:3/21/24
e. A process exists to assure that proposed regulatory or administrative actions do not result in an unconstitutional taking of private property RCW 36.70A.370. See the 2018 Advisory Memo on the Unconstitutional Taking of Private Property	Yes. Throughout code.	No.		Completed: ☒ Date: 4/9/24

f. Provisions ensure adequate enforcement of regulations, such as zoning and critical area ordinances (civil or criminal penalties). See implementation strategy in WAC 365-196-650(1).	Yes. 18.02.020	No		Completed: ☒ Date:3/21/24

Appendix A: Housing unit minimums per population

See Commerce's Middle Housing webpage for more information and the Middle Housing Fact Sheet for the list of cities that must comply with the following requirements.

Cities with a population less than 25,000 but within the Contiguous UGA with the largest city in a county with a population greater than 275,000				
	In Current zoning? Yes/No If yes, cite section	Changes needed to meet current statute? Yes/No	Notes	
Zoning and development regulations allow at least two residential units per lot on all lots zoned predominantly for residential use, unless the lot is smaller than 1,000 square feet. RCW 36.70A.635 (1) and (6) HB 1110	N/A			Completed: ☐ Date:

Cities with a population between 25,000 and 75,000				
	In Current zoning? Yes/No If yes, cite section	Changes needed to meet current statute? Yes/No	Notes	
a. Zoning and development regulations allow at least: • two residential units on each lot, • four residential units on each lot if at least one unit is affordable, unless the lot is smaller than 1,000 square feet.	N/A			Completed: ☐ Date:

Cities with a population between 25,000 and 75,000				
b. Zoning and development regulations allow at least four residential units on each lot, within ¼ mile walking distance of a major transit stop.	N/A			Completed: ☐ Date:

Cities with a population greater than 75,000				
	In Current zoning? Yes/No If yes, cite section	Changes needed to meet current statute? Yes/No	Notes	
a. Zoning and development regulations allow at least: • four residential units on each lot, • six residential units on each lot if at least two units are affordable, unless the lot is smaller than 1,000 square feet.	Yes. Land Use Element.	No	Included in Land Use Element and in Land Use Map. Updates to Development regulations will begin in June 2024.	Completed: ☒ Date: **3/21/2024**
b. Zoning and development regulations allow at least six residential units on each lot, within ¼ mile walking distance of a major transit stop.	No	Yes	Zoning Ordinance updated to address RCW 36.70A.635. Proposed in new middle housing chapter in Zoning Ordinance.	Completed: ☒ Date: 11/7/24

Appendix B: Element updates per HB 1181

GMA Periodic Update Due Dates	Required Updates to GMA Elements per HB 1181						
	Greenhouse Gas Reduction Sub-element	Climate Resilience Sub-element	Transportation Element	Land Use Element	Capital Facilities Element*	Utilities Element*	Parks & Recreation Element*
For jurisdictions with a 2024 deadline and subject to GHG Emissions Reduction [Sec. 15 (10)]	Due 2029	Due 2029	Due 2029	Due in 2034			
For jurisdictions with a 2025 & 2026 deadline and subject to GHG Emissions Reduction [Sec. 4 (1) and (2)]	X	X	X	X	X*	X*	X*
Jurisdictions not subject to GHG Emissions Reduction (all years) [Sec. 4 (3) and 9(e)(i)]	Optional	X See RCW 36.70A.070(9)(e)	**	Only counties over 20k pop.	X*	X*	X*

Table notes: "X" indicates a GMA update requirement. One asterisk (*) indicates jurisdictions should make a good faith effort to update their elements to be consistent; refer to HB 1181 (Chapter 228, Laws of 2023) for specifics. Two asterisks (**) indicates 22 cities that need to update their transportation element based on population, not whether or not their county is among those that must develop a GHG emissions element.

King County Affordable Housing Committee

Housing-Focused Draft Comprehensive Plan Review Program
Draft Countywide Planning Policies (CPP) Completeness Checklist

Please complete and submit this completeness checklist as part of your submission to the King County Affordable Housing Committee's Housing-focused Draft Comprehensive Plan Review Program. You can review the full text of each Housing Chapter CPP and the Housing Technical appendix here. The Housing-focused Draft Comprehensive Plan Review Guide provides additional information about the program and this checklist. Please send questions and your submission to AHCplanreview@kingcounty.gov. AHC staff are available to assist you as you prepare your submission.

Include the full text and page number of each draft comprehensive plan policy that addresses each King County Countywide Planning Policies (CPP) Housing Chapter policy. One draft comprehensive plan policy may address multiple CPPs, and multiple draft comprehensive plan policies may address one CPP. Jurisdiction staff are encouraged to include additional information for reviewers to consider in the "notes" column of the checklist.

CPP Housing Chapter Policy *Summarized*	**Comprehensive Plan** *Policy or Inventory and Analysis Section*	*Page #*	**Notes** *Optional*
Plan for and Accommodate Housing Need			
H-1 Plan for and accommodate the jurisdiction's allocated share of countywide future housing needs for moderate-, low-, very low-, and extremely low-income households as well as emergency housing, emergency shelters, and permanent supportive housing. Sufficient planning and accommodations are those that comply with the Growth Management Act requirements for housing elements in Revised Code of Washington 36.70A.020 and 36.70A.070, that outline regulatory and nonregulatory measures to implement the comprehensive plan (Washington Administrative Code 365-196-650), and that comply with policies articulated in this chapter. Projected countywide and jurisdictional net new housing needed to reach projected future need for the planning period is shown in Table H-1.	Land Use Element, LUE-6; Housing Element, Table 1. See also Housing Needs and Characteristics Assessment Update.	LUE-6, HE-12	
H-2 Prioritize the need for housing affordable to households less than or equal to 30 percent area median income (extremely low-income) by implementing tools such as: a) Increasing capital, operations, and maintenance funding; b) Adopting complementary land use regulations; c) Fostering welcoming communities, including people with behavioral health needs; d) Adopting supportive policies; and e) Supporting collaborative actions by all jurisdictions.	H-9, H-10, H-16, H-22, LU-8	HE-14, LUE-12	
Conduct a Housing Inventory and Analysis			
H-3 Conduct an inventory and analysis in each jurisdiction of existing and projected housing needs of all segments of the population and summarize the findings in the housing element. The inventory and analysis shall include:			
a) The number of existing and projected housing units necessary to plan for and accommodate projected growth and meet the projected housing needs articulated in Tables H-1 and H-2, including: 1) permanent housing needs, which includes units for moderate-, low-, very low-, and extremely low-income households and permanent supportive housing,	Housing Needs and Characteristics Assessment Update, Chapter 5	HNA 48-61	

CPP Housing Chapter Policy *Summarized*	Comprehensive Plan *Policy or Inventory and Analysis Section*	*Page #*	Notes *Optional*
2) emergency housing needs, which includes emergency housing and emergency shelters			
b) Number of existing housing units by housing type, age, number of bedrooms, condition, tenure, and area median income limit (for income-restricted units)	Housing Needs and Characteristics Assessment Update, Table 29; Housing Element Figure 1	HNA-28	
c) Number of existing emergency housing, emergency shelters, and permanent supportive housing facilities and units or beds, as applicable	Housing Element	HE-10	
d) Percentage and geographic distribution of residential land zoned for moderate- and high-density housing and accessory dwelling units in the jurisdiction	Data not available.		
e) Number of income-restricted units and, where feasible, total number of units, within a half-mile walkshed of high-capacity or frequent transit service where applicable and regional and countywide centers[1]	Data not available.		
f) Household characteristics, by race/ethnicity: 1) income (median and by area median income bracket), 2) tenure (renter or homeowner), 3) housing cost burden and severe housing cost burden	Housing Needs and Characteristics Assessment Update, Chapter 3	HNA-19	
g) Current population characteristics: 1) age by race/ethnicity, 2) disability	Housing Needs and Characteristics Assessment Update, Chapter 2	HNA-6	
h) Projected population growth	Housing Needs and Characteristics Assessment Update, Figure 3	HNA-7	
i) Housing development capacity within a half-mile walkshed of high-capacity or frequent transit service, if applicable[1]	Assumed in zoning map. Not calculated separately. Data not available.		
j) Ratio of housing to jobs in the jurisdiction	Housing Needs and Characteristics Assessment Update	HNA-15	
k) Summary of existing and proposed partnerships and strategies, including dedicated resources, for meeting housing needs, particularly for populations disparately impacted	Housing Element, Goal 6	HE-58	
l) The housing needs of people who need supportive services or accessible units, including but not limited to people experiencing homelessness, persons with disabilities, people with medical conditions, and older adults	Housing Needs and Characteristics Assessment Update, Chapter 5	HNA-60	
m) The housing needs of communities experiencing disproportionate harm of housing inequities including Black, Indigenous, and People of Color	Housing Element, Racially Disparate Impacts	HE-6	

[1] AHC staff can provide a shapefile of frequent and high-capacity transit in King County. Contact AHC staff at AHCplanreview@kingcounty.gov.

CPP Housing Chapter Policy *Summarized*	Comprehensive Plan *Policy or Inventory and Analysis Section*	*Page #*	Notes *Optional*
n) Areas in the jurisdiction that may be at higher risk of displacement from market forces that occur with changes to zoning development regulations and public capital investments			
H-4 Evaluate the effectiveness of existing housing policies and strategies to meet the jurisdiction's housing needs. Identify gaps in existing partnerships, policies, and dedicated resources for meeting housing needs and eliminating racial and other disparities in access to housing and neighborhoods of choice.	Housing Element, Racially Disparate Impacts	HE-6	
H-5 Document the local history of racially exclusive and discriminatory land use and housing practices, consistent with local and regional fair housing reports and other resources. Explain the extent to which that history is still reflected in current development patterns, housing conditions, tenure, and access to opportunity. Identify local policies and regulations that result in racially disparate impacts, displacement, and exclusion in housing, including zoning that may have a discriminatory effect, disinvestment, and infrastructure availability. Demonstrate how current strategies are addressing impacts of those racially exclusive and discriminatory policies and practices. The County will support jurisdictions in identifying and compiling resources to support this analysis.	Housing Element, Racially Disparate Impacts	HE-6	
Collaborate Regionally			
H-6 Collaborate with diverse partners (e.g., employers, financial institutions, philanthropic, faith, and community-based organizations) on provision of resources (e.g., funding, surplus property) and programs to meet countywide housing need.	Housing Element, Goal 6	HE-58	
H-7 Work cooperatively with the Puget Sound Regional Council, subregional collaborations and other entities that provide technical assistance to local jurisdictions to support the development, implementation, and monitoring of strategies that achieve the goals of this chapter.	Throughout Comp Plan process and noted in HNA.	N/A	
Implement Policies and Strategies to Meet Housing Needs Equitably **Equitable Processes and Outcomes**			
H-8 Collaborate with populations most disproportionately impacted by housing cost burden in developing, implementing, and monitoring strategies that achieve the goals of this chapter. Prioritize the needs and solutions articulated by these disproportionately impacted populations.	Public Engagement Plan	All	
H-9 Adopt intentional, targeted actions that repair harms to Black, Indigenous, and other People of Color households from past and current racially exclusive and discriminatory land use and housing practices (generally identified through Policy H-5). Promote equitable outcomes in partnership with communities most impacted.	Housing Element, Racially Disparate Impacts	HE-6	
Implement Policies and Strategies to Meet Housing Needs Equitably **Increased Housing Supply, Particularly for Households with the Greatest Needs**			

DRAFT

CPP Housing Chapter Policy *Summarized*	Comprehensive Plan *Policy or Inventory and Analysis Section*	*Page #*	Notes *Optional*
H-10 Adopt policies, incentives, strategies, actions, and regulations that increase the supply of long-term income-restricted housing for extremely low-, very low-, and low-income households and households with special needs.	Housing Element, Housing Choices for All	HE-9	
H-11 Identify sufficient capacity of land for housing including, but not limited to income-restricted housing; housing for moderate-, low-, very low-, and extremely low-income households; manufactured housing; multifamily housing; group homes; foster care facilities; emergency housing; emergency shelters; permanent supportive housing; and within an urban growth area boundary, duplexes, triplexes, and townhomes.	HNA, Figure 56	HNA-60	
H-12 Adopt and implement policies that improve the effectiveness of existing housing policies and strategies and address gaps in partnerships, policies, and dedicated resources to meet the jurisdiction's housing needs.	Throughout Housing Element Goals and Policies.		
H-13 Implement strategies to overcome cost barriers to housing affordability. Strategies to do this vary but can include updating development standards and regulations, shortening permit timelines, implementing online permitting, optimizing residential densities, reducing parking requirements, and developing programs, policies, partnerships, and incentives to decrease costs to build and preserve affordable housing.	Housing Element	H-8-11	
H-14 Prioritize the use of local and regional resources (e.g., funding, surplus property) for income-restricted housing, particularly for extremely low-income households, populations with special needs, and others with disproportionately greater housing needs. Consider projects that promote access to opportunity, anti-displacement, and wealth building for Black, Indigenous, and People of Color communities to support implementation of policy H-9.	Housing Element	H-22	
Implement Policies and Strategies to Meet Housing Needs Equitably **Expanded Housing Options and Increased Affordability Accessible to Transit and Employment**			
H-15 Increase housing choices for everyone, particularly those earning lower wages, that is co-located with, accessible to, or within a reasonable commute to major employment centers and affordable to all income levels. Ensure there are zoning ordinances and development regulations in place that allow and encourage housing production at levels that improve jobs-housing balance throughout the county across all income levels.	Housing Element, Planning Approach	HE-9	
H-16 Expand the supply and range of housing types, including affordable units, at densities sufficient to maximize the benefits of transit investments throughout the county	Housing Element, Planning Approach	HE-9	
H-17 Support development and preservation of income-restricted affordable housing near high-capacity transit	Housing Element, Goal 3; H-26; H-42	HE-15, H-18	
Implement Policies and Strategies to Meet Housing Needs Equitably			

DRAFT

CPP Housing Chapter Policy *Summarized*	Comprehensive Plan *Policy or Inventory and Analysis Section*	*Page #*	Notes *Optional*
Expanded Housing and Neighborhood Choice for All Residents			
H-18 Adopt inclusive planning tools and policies whose purpose is to increase the ability of all residents in jurisdictions throughout the county to live in the neighborhood of their choice, reduce disparities in access to opportunity areas, and meet the needs of the region's current and future residents by: a) Providing access to affordable housing to rent and own throughout the jurisdiction, with a focus on areas of high opportunity; b) Expanding capacity for moderate-density housing throughout the jurisdiction, especially in areas currently zoned for lower density single-family detached housing in the Urban Growth Area, and capacity for high-density housing, where appropriate, consistent with the Regional Growth Strategy; c) Evaluating the feasibility of, and implementing, where appropriate, inclusionary and incentive zoning to provide affordable housing; and d) Providing access to housing types that serve a range of household sizes, types, and incomes, including 2+ bedroom homes for families with children and/or adult roommates and accessory dwelling units, efficiency studios, and/or congregate residences for single adults	Housing Element, Planning Approach	HE-9	
H-19 Lower barriers to and promote access to affordable homeownership for extremely low-, very low-, and low--income, households. Emphasize: a) Supporting long-term affordable homeownership opportunities for households less than or equal to 80 percent area median income (which may require up-front initial public subsidy and policies that support diverse housing types); and b) Remedying historical inequities in and expanding access to homeownership opportunities for Black, Indigenous and People of Color communities.	Housing Element, Housing Choices for All; H-16, H-25, H-54	HE-9, HE-14, HE-15; HE-18	
H-20 Adopt and implement policies that address gaps in partnerships, policies, and dedicated resources to eliminate racial and other disparities in access to housing and neighborhoods of choice.	Housing Element, Racially Disparate Impacts	HE-6	
H-21 Adopt policies and strategies that promote equitable development and mitigate displacement risk, with consideration given to the preservation of historical and cultural communities as well as investments in low-, very low-, extremely low-, and moderate-income housing production and preservation; dedicated funds for land acquisition; manufactured housing community preservation, inclusionary zoning; community planning requirements; tenant protections; public land disposition policies; and land that may be used for affordable housing. Mitigate displacement that may result from planning efforts, large-scale private investments, and market pressure. Implement anti-displacement measures prior to or concurrent with development capacity increases and public capital investments.	Housing Element, Racially Disparate Impacts	HE-6	
H-22 Implement, promote, and enforce fair housing policies and practices so that every person in the county has equitable access and opportunity to thrive in their communities of choice, regardless of their race, gender identity, sexual identity, ability, use of a service animal, age, immigration status, national origin, familial	Housing Element, H-36	HE-17	

DRAFT

CPP Housing Chapter Policy *Summarized*	Comprehensive Plan *Policy or Inventory and Analysis Section*	*Page #*	Notes *Optional*
status, religion, source of income, military status, or membership in any other relevant category of protected people.			
Expanded Housing and Neighborhood Choice for All Residents **Housing Stability, Healthy Homes, and Healthy Communities**			
H-23 Adopt and implement policies that protect housing stability for renter households; expand protections and supports for moderate-, low-, very low-, and extremely low-income renters and renters with disabilities.	Housing Element, H-28, H-32, H-38, H-42	HE-16, HE-17, HE-18	
H-24 Adopt and implement programs and policies that ensure healthy and safe homes.	Housing Element, Goal 1, Goal 3, H-1, H-2, H-6	HE-13-15	
H-25 Plan for residential neighborhoods that protect and promote the health and well-being of residents by supporting equitable access to parks and open space, safe pedestrian and bicycle routes, clean air, soil and water, fresh and healthy foods, high-quality education from early learning through K-12, affordable and high-quality transit options and living wage jobs and by avoiding or mitigating exposure to environmental hazards and pollutants.	Housing Element, H-2, H-21, Vision	HE-1, HE-15	

DRAFT

VISION Consistency Tool for Local Comprehensive Plans

Note: The tool shown here is for illustrative purposes. To fill out the tool, visit www.psrc.org/our-work/plan-review.

This tool is intended to help cities and counties integrate VISION 2050 into their local comprehensive plans. VISION 2050's multicounty planning policies serve as the adopted regional guidelines and principles required in state law to guide both regional and local planning. The tool also identifies transportation planning requirements of the Growth Management Act (GMA). The tool may be used at various times in the local planning process:

Plan Update Scoping: Use checklist items as guidance for scoping the extent of plan element updates. New or expanded issue areas in VISION 2050 are identified to support this process.

Draft Plan Review: Submit draft plans to PSRC prior to Planning Commission and Council review. Completing and submitting this tool and providing early drafts to PSRC help identify potential consistency issues early in the process.

Certification Review: Along with the adopted plan, the tool will assist in PSRC's review of the plan. Demonstrating inclusion of the necessary information in the checklist helps facilitate certification. *Note: The PSRC Executive Board is the final decision-making body for plan certification.*

Regional Collaboration: The tool provides cities and counties an opportunity to highlight innovative policies and programs. This supports sharing of best practices across the region and benefits jurisdictions as they apply for planning grants and awards.

Updates made in September 2022 integrate the GMA requirements of HB 1220 and countywide housing needs into PSRC's plan review process, including housing for all income levels and addressing racially disparate impacts.

Resources

- Regional Plans: VISION 2050, Regional Transportation Plan, and Regional Economic Strategy
- VISION 2040 to VISION 2050 – summary of what changed in VISION 2050
- VISION 2050 Policy Matrix – a comparison of multicounty planning policies and actions from VISION 2040 to VISION 2050
- Plan Review webpage – access more information about the review and certification process and find PSRC guidance and other resources by policy area. See previous certification reports for areas for future work.

Discussion Questions | Innovation, Engagement, and Racial Equity

Questions provide an opportunity to highlight the most noteworthy aspects of the plan and the planning process. Responses help tell PSRC boards how the plan is working to implement VISION 2050 and how the plan meets certification requirements.

- What aspects of the updated plan would you like to highlight? What was especially innovative, challenging, or noteworthy?
- What innovative public engagement strategies were used in the update process? Did you use strategies to reach communities that have not typically been engaged in planning? How were other agencies and governments, such as tribes, ports, and special purpose districts, engaged through this process? (MPP-RC-1, DP-8)
- Racial equity and access to opportunity have been elevated as critical regional issues in VISION 2050. How has your community addressed racial equity in the comprehensive plan update? Do you have lessons learned from your experience about how to advance racial equity? (MPP-RC-3)

Checklist at a Glance

Support regional collaboration	Page/Policy Reference
✓ Include a statem… policies, VISION 2050, and plan…	
⊖ Coordinate with other jurisdictions, agencies, tribes, ports, military installations, special purpose districts, and adjacent regions (RCW 36.70A.070(6)(a)(v), MPP-RC-1, RC-4-5)	
⊖ Prioritize services and access to opportunity for people of color, people with low incomes, and his… le can attain the resources and opportunities to improve quality of life and address past inequities (MPP-RC-2)	

Indicates new or expanded emphasis in VISION 2050

Provides relevant VISION 2050 policies or actions

Indicate where to find the best or most complete example. It is not necessary to list all relevant policies.

Regional Collaboration

The plan supports **collaboration for a healthy environment, thriving communities, and opportunities for all**, including coordination with other jurisdictions and agencies, tribes, ports, military installations, and adjacent regions.

Policies and programs should:

Support regional collaboration	Page/Policy Reference
✓ Include a statement about how the plan relates to countywide planning policies, VISION 2050, and planning requirements of the Growth Management Act	**Page L**UE-2
⊖ Coordinate with other jurisdictions, agencies, tribes, ports, military installations, special purpose districts, and adjacent regions (RCW 36.70A.070(6)(a)(v), MPP-RC-1, RC-4-5)	**LU-11**
⊖ Prioritize services and access to opportunity for people of color, people with low incomes, and historically underserved communities to ensure all people can attain the resources and opportunities to improve quality of life and address past inequities (MPP-RC-2)	**This is an overarching goal and is incorporated into all Elements. Specific language will be mentioned in Core Plan.**
⊖ Address land use, transportation, and housing opportunities and challenges related to military installations, when applicable (MPP-RC-6)	**N/A**
✓ Prioritize investments in centers, including regional centers, countywide centers, high-capacity transit areas with a station area plan, and other local centers (MPP-RC-8-9)	**LU-7, 8**
✓ Explore funding sources, changes to regulatory, pricing, taxing, and expenditure practices, and other fiscal tools to meet infrastructure and other needs (MPP-RC-10-11, RC-Action-7, RC-Action-9)	**LU-5, CTP P. 50, TR5-4-7**

Additional comments on Regional Collaboration or additional documents to share [optional]: _____

Regional Growth Strategy

The plan **focuses growth in designated centers and near transit stations** to create healthy, equitable, vibrant communities well-served by infrastructure and services. The plan **supports rural and resource lands** as vital parts of the region that retain important cultural, economic, environmental, and rural lifestyle opportunities over the long term.

The plan should:

Implement the Regional Growth Strategy	Page/Policy Reference
✓ Incorporate housing and employment targets (MPP-RGS-1-2)	
✓ Use land use assumptions substantially consistent with countywide growth targets (RCW 36.70A.070, WAC 365-196-430, VISION 2050 Regional Growth Strategy)	**LUE-2-7, LU-7**
✓ Demonstrate sufficient zoned development capacity to accommodate targets (RCW 36.70A.115)	**Land Use Element, Housing Needs and Characteristics Assessment Update**
✓ Use consistent land use assumptions throughout plan (RCW 36.70A.070, WAC 365-196-430)[1]	**LU-5**

Note: see Growth Target Guidance for additional information.

Population, Employment, and Housing Growth

(add information from local plan and insert/delete rows as needed, based on regional centers or county regional geographies)

	Adopted Growth Target*	Land Use Assumptions for Travel Demand Modeling (numbers/notes, as applicable)	Zoned Development Capacity (can be greater than target)	Page Reference
County or citywide**				
Employment	19,520	Land Use growth allocations were developed in coordination with Public Works for use in Transportation and Utilities models. Growth allocations and land use for alternatives are consistent.	21,587	LUE-6
Housing	12,112		46,070	LUE-5

[1] The Transportation Element must be based on the land use assumptions in the Comprehensive Plan - A problem sometimes encountered in the certification of transportation-related provisions in local comprehensive plans is the use of different planning assumptions in the transportation element from the land use element. Comprehensive plans are to be internally consistent, which means that the same land use assumptions must be used for planning for housing, transportation, and other provisions in the plan.

		More information in respective Elements and technical documentation.		
Centers ***(as applicable)***				
Employment		Will be detailed as part of Downtown Plan update		
Housing		Will be detailed as part of Downtown Plan update		

*Include targets as applicable. Some counties adopt only housing and employment targets, and not population targets. If more explanation would be helpful, provide additional information about land use assumptions for modeling in space provided below.

**Counties: Attach additional tables or add rows to address multiple regional geographies.

Policies and programs should:

Maintain a stable urban growth area with densities and capacity that support the Regional Growth Strategy	Page/Policy Reference
✓ Encourage infill development and increased density in locations consistent with the Regional Growth Strategy (MPP-RGS-6)	**LU-1**
⊙ Avoid increasing development capacity inconsistent with the Regional Growth Strategy in regional geographies not served by high-capacity transit (MPP-RGS-12)	**LU-7**
⊙ **Metropolitan Cities:** Provide additional housing capacity in response to rapid employment growth, particularly through increased zoning for middle density housing (MPP-RGS-7)	**N/A**
✓ **Counties:** Accommodate the region's growth first and foremost in the urban growth area (MPP-RGS-4)	**N/A**
✓ **Counties:** Ensure long-term stability and sustainability of the urban growth area (MPP-RGS-5)	**N/A**
Support growth in designated centers and near high-capacity transit	**Page/Policy Reference**
⊙ Where applicable, focus a significant share of growth in designated regional growth centers, high-capacity transit station areas, manufacturing/industrial centers, and countywide centers (MPP-RGS-8-11)[2]	**LU-7, LU-56**
✓ Include growth targets for designated regional growth centers and manufacturing/industrial centers (MPP-RGS-2)	**Assumed in land use map. Details will be in Auburn Downtown Plan update.**

[2] The region has a goal to attract 65% of new residential growth and 75% of employment growth to regional growth centers and high-capacity transit station areas.

Manage and reduce rural growth and protect resource lands	Page/Policy Reference
✓ **Counties:** Identify steps to reduce rural growth over time to maintain rural landscapes and lifestyles and protect resource lands and the environment (MPP-DP-40-43)	**N/A**
✓ **Counties:** Include a full range of strategies, including zoning and development standards, incentives, infrastructure investments, funding for conservation easements, housing tools, and economic development to reduce rural growth rates and protect natural resource lands over time (MPP-RGS-14-15, RGS-4, RGS-Action-7)	**N/A**
✓ **Counties:** Locate commercial, retail, and community services that serve rural residents in neighboring cities and existing activity areas (MPP-RGS-13, DP-37)	**N/A**
○ **Counties:** Avoid growth that cannot be sufficiently served by roads, utilities, and services at rural levels of service (MPP-DP-45)	**N/A**
✓ **Counties:** Address vested development that conflicts with regional and local growth management objectives (MPP-DP-36)	**N/A**

Additional comments on the Regional Growth Strategy or additional documents to share [optional]: _____

Environment

Local plans support the natural environment through policies on **protecting and restoring natural systems, conserving habitat, improving water quality, and reducing air pollutants**. The health of all residents and the economy is connected to the health of the environment. Planning at all levels should consider the impacts of land use, development, and transportation on the ecosystem and use the best environmental information available.

Policies and programs should:

Protect and restore the environment	Page/Policy Reference
✓ Protect critical areas, habitat, and water quality and coordinate planning with adjacent jurisdictions, tribes, countywide planning groups, and watershed groups (MPP-En-1, En-6, En-11-12, En-14, En-16, En-Action-3)	**LUE-33, LU-11**

✓ Advance integrated and interdisciplinary approaches for environmental planning and assessments (MPP-En-2)	**LUE-10, LUE-31**
✓ Promote innovative and environmentally sensitive development practices in siting, design, materials selection, construction, and maintenance (MPP-En-5)	**LU-18**
○ Support programs to ensure that all residents, regardless of race, social, or economic status, have clean air, clean water, and other elements of a healthy environment and prioritize the reduction of impacts to vulnerable populations that have been disproportionately affected (MPP-En-3-4, En-7-8, En-21)	**LU-12**
○ Support and incentivize environmental stewardship on private and public lands (MPP-En-10)	**LU-11**
○ Identify open space, trail, and park resources and needs, and develop programs for protecting and enhancing these areas (MPP-En-11-12, En-15, En-Action-4)	**Parks Goal 5**
✓ Protect and restore native vegetation and tree canopy (MPP-En-9, En-13)	**C-72**
○ Protect and restore hydrological functions and water quality, including restoring shorelines and estuaries, removing fish-blocking culverts, reducing use of toxic products, and retrofitting basins to manage stormwater (MPP-En-16-20)	**Water Policy UE-11**
✓ Ensure all federal and state air quality standards are met and reduce emissions of air toxics and greenhouse gases (WAC 173-420-080, MPP-En-22)	**C-50, C-55, C-57, and throughout Climate Element**

Additional comments on Environment or additional documents to share [optional]: _____Critical Areas Checklist and Documentation_____

Commented [JS1]: Attach Dinah's materials for Critical Areas checklist

Climate Change

The plan supports substantially **reducing emissions of greenhouse gases** that contribute to climate change in accordance with the goals of the Puget Sound Clean Air Agency and **preparing for climate change impacts**.

Policies and programs should:

Reduce greenhouse gas emissions in support of state, regional, and local reduction goals	Page/Policy Reference
○ Support achieving regional greenhouse gas emission reduction goals by: ○ Electrifying the transportation system, • Reducing vehicle miles traveled through increasing alternatives to driving alone and using land use strategies that reduce trips and trip length, and • Expanding the use of conservation, alternative energy sources, and energy management technology (MPP-CC-1, CC-3, CC-5, CC-11-12, CC-Action-3)	**C-45, C-46, C-47 C-48, CTP P. 50**
✓ Reduce building energy use through green building and retrofit of existing buildings (MPP-CC-2, CC-Action-3, DP-46)	**C-48, C-51, C-52, C-59, C-60**
○ Protect and restore natural resources that sequester and store carbon (MPP-CC-4)	**C-72, C-73**
○ Address impacts to vulnerable populations and areas that have been or will be disproportionately affected by climate change (MPP-CC-6, CC-8, CC-Action-3, CC-Action-4)	**C-3, C-4, C-5, C-44**
○ Identify and address the impacts of climate change and natural hazards on the region to increase resilience (MPP-CC-7-10, CC-Action-4)	**C-12, C-13, C-31, C-35**
○ Address rising sea water by siting and planning for relocation of hazardous industries and essential public services away from the 500-year floodplain (MPP-CC-10)	**C-31**

Additional comments on Climate Change or additional documents to share [optional]: _____Information contained in goals and policies as well as supplemental text within Climate Element. Additional strategies outlined in Climate Change Framework._____

Land Use/Development Patterns

The plan supports the further development of **healthy, walkable, compact, and equitable transit-oriented communities** that maintain unique character and local culture. The plan supports **conserving rural areas and creating and preserving open space and natural areas**.

Policies and programs should:

Build thriving urban communities	Page/Policy Reference
○ Support inclusive community planning (MPP-DP-2, MPP-DP-8)	LU-11
✓ Support the development of compact urban communities and central places with densities that support the Regional Growth Strategy, transit, and walking (MPP-RGS-6, DP-1, DP-3)	LU-7, LU-8
○ Reduce disparities in access to opportunity and expand employment opportunities to improve the region's shared economic future (MPP-DP-2, Ec-8, Ec-13)	
✓ Coordinate with local, state, and federal agencies to identify underused lands such as surplus public lands or environmentally contaminated lands and: ✓ Promote infill or redevelopment in growth centers and existing neighborhoods in a manner that supports the Regional Growth Strategy (MPP-DP-4) ✓ Develop strategies for cleaning up brownfield and contaminated sites (DP-Action-7)	LU-1, LU-16, LU-123, LUE-23
○ Preserve historic, visual, and cultural resources and consider potential impacts to culturally significant sites and tribal treaty fishing, hunting, and gathering grounds (MPP-DP-5-7)	Historic Preservation Element addresses this throughout.
○ Support inclusive engagement to ensure land use decisions do not negatively impact historically marginalized communities (MPP-DP-8)	LU-12
✓ Support the design of transportation and infrastructure projects that achieve community development objectives and improve communities (MPP-DP-12-15, DP-17)	LU-5
Promote healthy communities	**Page/Policy Reference**
○ Reduce health disparities and improve health outcomes (MPP-RC-3, DP-18)	LU-8,9,
Support centers as connections to opportunity	**Page/Policy Reference**
✓ Identify one or more central places as locations for more compact, mixed-use development (MPP-DP-22, DP-25)	LU-7, LU Map 1.4

Commented [JS2]: Add page reference

⊙ **Jurisdictions with or planning for high-capacity transit stations:** Identify high-capacity station areas and plan for densities[3] that maximize benefits of transit investments (MPP-DP-22, DP-Action-8)	**Considered in LU Map 1.4 of Growth Centers, TE Map**
⊙ **Jurisdictions with or planning for light rail stations:** Support the adoption of subarea plans for light rail station areas (DP-Action-8)	**N/A**
✓ **Jurisdictions with regional centers**: Support the update of regional center subarea plans to be consistent with the revised Center Plan Tools (DP-Action-8)	**LUE-20**
⊙ Evaluate planning in areas for potential residential and commercial displacement and use a range of strategies to mitigate displacement impacts (MPP-DP-23, Ec-12)	**LU-46**
Support annexation and incorporation	**Page/Policy Reference**
✓ Work towards annexation and the orderly transition of unincorporated urban areas by: • Joint planning and urban development standards for urban unincorporated areas • Affiliating all unincorporated urban growth areas with adjacent cities ⊙ Planning for phased growth of communities to be economically viable, supported by planned urban infrastructure, and served by public transit (MPP-RGS-16, DP-27-30)	**LUE-31**
Preserve rural areas and natural resource lands	**Page/Policy Reference**
✓ **Counties**: Work to ensure that development in rural areas is rural in character (MPP-DP-32-35, DP-37-38)	**N/A**
✓ **Counties:** Work to ensure the sustainability of designated resource lands through programs that support economic vitality, encourage conservation, and avoid incompatible adjacent land uses (MPP-DP-39, DP-41-43)	**N/A**
Conserve and enhance important uses	**Page/Policy Reference**
✓ **As applicable,** limit incompatible uses adjacent to: • Military lands (MPP-DP-49) • Manufacturing/industrial centers (MICs) and industrial zoning (MPP-DP-50) ⊙ Tribal reservation lands (MPP-DP-51)	**LU-11**

[3] VISION 2050 calls for transit-oriented development near stations located in or near manufacturing/industrial centers to function differently with different uses than other centers to maintain a focus on protecting industrial zoning, jobs, and the region's overall economic vitality.

Additional comments on Land Use/Development Patterns or additional documents to share [optional]: _____

Housing

The plan guides the **preservation, improvement, and expansion of the housing stock** to provide a range of **affordable, accessible, healthy, and safe housing choices** to every resident. It continues to **promote fair and equal access to housing for all people**.

Policies and programs should:

Assess housing needs	Page/Policy Reference
○ Address affordable housing needs by developing a housing needs assessment and evaluating the effectiveness of existing housing policies, and documenting strategies to achieve housing targets and affordability goals. This includes documenting programs and actions needed to achieve housing availability including gaps in local funding, barriers such as development regulations, and other limitations (H-Action-4)	Housing Needs Assessment is referenced on H-2. HNA is an appendix to the Comp Plan.
Increase housing supply and choices	**Page/Policy Reference**
✓ Increase housing supply and densities to meet the region's current and projected needs at all income levels consistent with the Regional Growth Strategy (MPP-H-1)	**HE-8-13**
✓ Expand the diversity of housing types for all income levels and demographic groups, including low, very low, extremely low, and moderate-income households (MPP-H-2-6, H-9)	**HE-9**
○ Expand housing capacity for moderate density housing, i.e., "missing middle" (MPP-H-9)	**HE-9, H-12**
○ Promote jobs-housing balance by providing housing choices that are accessible and attainable to workers. Include jobs-housing balance in housing needs assessments to better support job centers with the needed housing supply (MPP-H-1, H-6, H-Action-4)	**Housing Element and Ec Dev Element. Supported by Growth Centers and DUC designations, H-4.**
✓ Expand housing choices in centers and near transit (MPP-H-7-8)	**LU-7**

✓ Promote flexible standards and innovative techniques to encourage housing productions that keeps pace with growth and need (MPP-H-10)	**H-4**
Support the development and preservation of affordable housing	**Page/Policy Reference**
○ Use inclusionary and incentive zoning to provide more affordable housing when creating additional housing capacity (H-Action-5)	**LU-21, LU-29, LUE-13-16**
○ **Jurisdictions planning for high-capacity transit stations**: Create and preserve affordable housing near high-capacity transit[4] (MPP-H-8, H-Action-1)	**Land Use and Housing Elements.**
Address inequities in access to housing	**Page/Policy Reference**
○ Identify potential physical, economic, and cultural displacement of low-income households and marginalized populations and work with communities to develop anti-displacement strategies in when planning for growth (MPP-H-12, H-Action-6)	**HE-6, H-9, H-31**
○ Promote homeownership opportunities while recognizing historic inequities in access to homeownership opportunities for communities of color (MPP-H-5)	**H-16, H-10**
○ Identify and begin to undo local policies and regulations that result in racially disparate impacts, displacement, and exclusion in housing, including zoning that may have a discriminatory effect and areas of disinvestment and infrastructure availability	**H-9**

Additional comments on Housing or additional documents to share [optional]: ___Technical and supplemental housing information is contained in the Housing Needs and Characteristics Assessment_____

Economy

The plan includes an **economic development element (Ec-Action-5)** that promotes a **prospering and sustainable economy** by supporting **businesses and job creation and investing in all people**.

Policies and programs should:

[4] Transit-oriented development near stations located in or near manufacturing/industrial centers need to function differently with different uses than other centers to maintain a focus on protecting industrial zoning, jobs, and the region's overall economic vitality.

Promote a prosperous and sustainable economy for all people	Page/Policy Reference
✓ Identify and enhance industry clusters, including those recognized in the Regional Economic Strategy that provide goods and services for export (MPP-Ec-3, Ec-4)	**Policies ED-17, ED-18, ED-19, and ED-20**
✓ Focus retention and recruitment efforts and activities to foster a positive business climate and diversify employment opportunities by specifically targeting: • Businesses that provide living wage jobs ○ Locally, women-, and minority-owned small businesses and start-up companies ○ Established and emerging industries, technologies, and services that promote environmental sustainability, especially those addressing climate change and resilience (MPP-Ec-1, Ec-3, Ec-4, Ec-7, Ec-9, Ec-16)	**Policies ED-5, ED-6, ED-7, ED-12, ED-13, ED-14, ED-50, ED-51, ED-52, ED-53, and ED-54**
○ Promote strategies and policies that expand access to opportunity and remove barriers for economically disconnected communities (MPP-Ec-13-14)	**Policies ED-5, ED-6, ED-22,**
○ Address and prevent potential physical, economic, and cultural displacement of existing businesses that may result from redevelopment and market pressure (MPP-Ec-12)	**Policies ED-46, ED-47, ED-48, and ED-49**
✓ Develop a range of employment opportunities to create a closer balance between jobs and housing (MPP-Ec-18)	**Policies ED-46, ED-47, ED-48, and ED-49**
○ Promote environmental and socially responsible business practices, especially those addressing climate change, resilience, and improved health outcomes (MPP-Ec-8, Ec-16)	**ED-7, ED-10**
○ Support, recognize, and empower the contributions of the region's culturally and ethnically diverse communities, institutions, and Native Tribes (MPP-Ec-15, Ec-17, Ec-20)	**Policies ED-3, ED-5, ED-22, ED-50, ED-51, ED-52, ED-53 and ED-54**

Additional comments on Economic Development or additional documents to share [optional]: _____

Transportation

The plan promotes a **sustainable, equitable, affordable, safe, and efficient multimodal transportation system**, with specific emphasis on an **integrated regional transit network that supports the Regional Growth Strategy** and promotes vitality of the economy, environment, and health.

Policies and programs should:

Implement the Regional Transportation Plan	Page/Policy Reference
✓ Promote the development of an efficient, multimodal transportation system that supports the Regional Growth Strategy in collaboration with other jurisdictions and agencies (MPP-T-7)	TR-4
✓ Work to develop and operate a safe and convenient system for all users and the movement of freight and goods (MPP-T-11)	TR-5-1-4
✓ Reduce the need for new capital improvements through investments in operations, pricing programs, demand management strategies, and system management activities that improve the efficiency of the current system (RCW 36.70A.070(6)(a)(vi), MPP-T-3)	TR8-3
✓ Emphasize transportation investments that provide alternatives to single occupancy vehicle travel, increase travel options, especially to and within centers, and support compact, pedestrian- and transit-oriented densities and development (MPP-T-12-13, T-15)	TR8-4
○ Increase the resilience of the transportation system and support security and emergency management (MPP-T-31)	TR5-2-15
○ Prepare for changes in transportation technologies and mobility patterns (MPP-T-33-34)	TR10-15
Support the Regional Growth Strategy	**Page/Policy Reference**
✓ Focus system improvements to connect centers and support existing and planned development as allocated by the Regional Growth Strategy (MPP-RC-7-9, T-7-8, T-15)	TR1-4
○ Prioritize multimodal investments in centers and high-capacity station areas (MPP-RC-7-10, T-12-13, T-19)	Chapter 2, Section 2.4.1, Chapter 4, Goal 1, 5, and 6,Policies TR1-3 and TR1-4; TR5-1-1; TR6-3-1 and TR6-3-2
✓ Promote the design of transportation facilities that support local and regional growth centers and high-capacity transit station areas and fit the community in which they are located (MPP-T-19-21)	Chapter 2, Section 2.4, Chapter 4, Goal 5, Multimodal Accessible Network Policies (Transit), Chapter 4, Goal 6, MMLOS Standards Policies (Transit)

✓ Support a safe and welcoming environment for walking and bicycling (MPP-DP-15): • Include a pedestrian and bicycle component and collaborative efforts to identify planned improvements for pedestrian and bicycle facilities and corridors (RCW 36.70A.070(6)(a)(vii)) • Improve local street patterns and design to promote walking and biking (MPP-T-16-17)	**Chapter 4, Goal 5 (page 62-66); Chapter 2, Section 2.3; Chapter 4, Goal 5**
✓ Support alternatives to driving alone, including walking, biking, and transit use, through design of local streets, land use development tools, and other practices (MPP-T-16-18)	**Chapter 4, Goal 8, Policy TR8-4**
✓ **Counties**: Avoid construction of major roads or capacity expansion on existing facilities in rural and resource areas (MPP-T-22, DP-38)	**N/A**
Support people	**Page/Policy Reference**
⊖ Identify racial and social equity as a core objective when planning and implementing transportation improvements, programs, and services (MPP-T-9)	**Chapter 4, Goal 2**
✓ Ensure mobility choices for people with special needs (MPP-T-10)	**Chapter 4, Goal 2**
Support the economy	**Page/Policy Reference**
✓ Recognize the critical role of safe, reliable, and efficient movement of people and goods (MPP-Ec-6, T-1, T-23)	**Chapter 4, Goal 5, Policy TR5-1-4**
✓ Identify and support key facilities and improvements that connect the region to major transportation hubs such as ports, airports, and designated freight routes (MPP-T-24-25)	**Appendix A**
✓ Promote coordination with providers of major regional infrastructure, such as freight rail and commercial aviation (MPP-Ec-4-5, T-27-28)	**Chapter 4, Goal 5, Multimodal Accessible Network Policies and Supporting Actions (Freight, Air Transportation)**
Protect the environment	**Page/Policy Reference**
⊖ Promote clean transportation programs and facilities, including actions to reduce air pollution and greenhouse gas emissions from transportation (MPP-CC-3, CC-12, T-29-30)	**Chapter 4, Goal 4, Policy TR4-2**
⊖ Reduce stormwater pollution from transportation facilities and improve fish passage (MPP-T-32)	**Chapter 4, Goal 4, Policy TR4-3**
✓ Incorporate environmental factors into transportation decision-making, including attention to human health and safety (MPP-DP-44, T-4-5, T-29-32)	**Chapter 4, Goal 4, Supporting Actions**

The plan should:

Provide facilities inventories and identify service needs	Page/Policy Reference
✓ Include mapped inventories for each element of the transportation system, including roadways, transit, cycling, walking, freight, airports, and ferries (RCW 36.70A.070, RCW 36.70A.108, MPP-T-7, T-15-17)	**Appendix A**
✓ Include state facilities and reflect related (regional/state) level-of-service standards (RCW 36.70A.070, RCW 36.70A.108)	Chapter 2, Section 2.2
✓ Develop a comprehensive concurrency program that addresses level-of-service standards for multimodal types of transportation and include implementation strategies (RCW 36.70A.070, RCW 36.70A.108, MPP-DP-52-54)	**Chapter 4, Goal 7**
✓ Provide travel demand forecasts and identify state and local system projects, programs, and management necessary to meet current and future demands and to improve safety and human health (RCW 36.70A.070, MPP-T-4-5)	**Chapter 2, Section 2.2.8**
✓ Identify maintenance and system preservation projects and programs necessary to maintain the ability of the transportation system to provide safe, efficient, and reliable movement of people, goods, and services (RCW 36.70A.070, MPP-T-1-2, T-4)	**Chapter 4, Goal 10, Chapter 6**
Finance transportation investments	**Page/Policy Reference**
✓ Identify stable and predictable funding sources for maintaining and preserving existing transportation facilities and services (MPP-RC-11-12, T-6)	**Chapter 6, Section 6.3**
✓ Pursue alternative transportation financing methods, such as user fees, tolls, and other pricing mechanisms (MPP-T-6)	**Chapter 6, Section 6.5**
✓ Include a 20-year financing plan, as well as an analysis of funding capability for all transportation modes (RCW 36.70A.070(3), RCW 36.70A.070(6)(a)(iv), WAC 365-196-415, WAC 365-196-430, MPP-RC-11-12, T-6, T-15)	**Chapter 6, Section 6.1**
✓ Include a reassessment strategy to address the event of a funding shortfall (RCW 36.70A.070(3), RCW 36.70A.070(6)(a)(iv), WAC 365-196-415, WAC 365-196-430, MPP-RC-11-12, T-6)	**Chapter 6, Section 6.4**
Address land uses adjacent to airports	**Page/Policy Reference**
✓ **Airport-adjacent communities:** Identify and address any airports within or adjacent to the jurisdiction (RCW 36.70.547, 36.70A.070(6)(a)(iii)(A), MPP-DP-48)	**Chapter 2, Section 2.5**
✓ **Airport-adjacent communities:** Describe existing and planned uses near the airport, as well as policies and regulations that discourage incompatible uses (RCW 36.70.547, 36.70A.070(6)(a)(iii)(A), MPP-DP-48)	**Existing and planned uses are described in Land Use Element. Chapter**

	4, Goal 5, lists an action under Actions to Support Multimodal Accessible Network Goal and Policies (Air Transportation) that calls the agency to do so
⊙ **Airport-adjacent communities:** Promote coordinated planning and effective management to optimize the region's aviation system in a manner that minimizes health, air quality, and noise impacts to communities, including historically marginalized communities (MPP-T-28)	**Chapter 4, Goal 5, Multimodal Accessible Network Policies (Air Transportation)**

Additional comments on Transportation or additional documents to share [optional]: _____

Public Services

The plan supports development with adequate **public facilities and services in a timely, coordinated, efficient, and cost-effective manner** that **supports local and regional growth planning objectives**.

Policies and programs should:

Provide adequate public facilities and services to support growth	Page/Policy Reference
✓ Protect and enhance the environment and public health and safety when providing services and facilities (MPP-PS-1)	**UE-11**
✓ Promote coordinated planning for services and facilities with counties, cities, tribes, and special purpose districts in a manner that supports the Regional Growth Strategy, including addressing long-term needs, supply, and the use of conservation and demand management (MPP-PS-3-4, PS-8-9, PS-13-14, PS-23-25)	**LU-11, LU-153,**

✓ Protect water quality by replacing failing septic systems and serving new urban development with sanitary sewer systems (MPP-PS-10-12)	**UE-3, UE-150, UE-172**
⊖ Consider the potential impacts of climate change on public facilities and support the necessary investments to move to low-carbon energy sources (MPP-PS-13-15, PS-20-21)	**Climate Element, Goal 2, 4**
⊖ Promote affordable and equitable access of public services, including drinking water and telecommunication infrastructure, to provide access to all communities, especially underserved communities (MPP-PS-2, PS-16, PS-22)	**UE-2**
✓ Encourage planning and coordination of emergency management and public safety programs (MPP-PS-17, T-31)	**CF-5, CF-29**
⊖ Locate community facilities and services, including civic places like parks, schools, and other public spaces, in centers and near transit, with consideration for climate change, economic, social and health impacts (MPP-PS-18, PS-20, PS-29, DP-11)	**CFE Goal 5**
⊖ Promote working with school districts on school siting and design to support safe, walkable access, including strategies to provide adequate urban capacity for new schools and to avoid serving urban students with schools in the rural area (MPP-PS-26-28)	**CFE Goal 5**
✓ **Counties**: Avoid providing urban services and regional facilities in rural areas. Facilities and utilities in rural areas should be at a size and scale appropriate for rural locations. (MPP-PS-5-7, PS-30)	**N/A**

City of Auburn Periodic Update of the Comprehensive Plan

Public Participation Plan

INTRODUCTION

The City of Auburn is undergoing the periodic update of the Comprehensive Plan. Under the Washington State Growth Management Act (GMA) cities and counties in Washington are required to adopt and periodically update their comprehensive plans and development regulations. Auburn's comprehensive plan is required to be consistent with GMA, the Puget Sound Regional Council (PSRC), the King County Countywide Planning Policies, and the Pierce County Countywide Planning Policies.

Often referred to as the "Comp Plan" for short – the plan articulates a series of goals, policies, actions, and standards that are intended to guide local development regulations and the day-to-day decisions of elected officials and local government staff on how the community wishes to grow and develop. The Auburn comprehensive plan will be organized into the following elements:

1. Land Use
2. Housing
3. Capital Facilities
4. Private Utilities
5. Transportation
6. Economic Development
7. Parks and Recreation
8. Historic Preservation
9. Climate

The GMA requires that local governments encourage the involvement of residents in the planning process and provide opportunities for early and continuous public participation in the development of comprehensive land use plans and associated development regulations (RCW 36.70A.020(11); RCW 36.70A.140). A public participation program must involve the "opportunity for written comments, public meetings after effective notice, provision for open discussion, communication programs, information services, and consideration of and response to public comments" (RCW 36.70A.140). This document provides the approach for this effort and includes details on the different types of opportunities that will be available.

PUBLIC PARTICIPATION PLAN GOALS

The City of Auburn has the following public participation goals:

Inform residents of the comprehensive plan update, the planning process, and outcomes. Utilize outreach methods to inform residents and property owners of the variety of participation opportunities.

Exchange information by conducting collaborative events that engage in conversation and the exchange of ideas and information. By exchanging information, we can give participants more ownership in the outcome of planning processes leading to buy-in, a sense of ownership, and higher-quality planning documents.

Be inclusive of a range of perspectives, engaging residents in unique ways to reach a broader audience and understand their goals, needs, and desires that may be implemented through the comp plan process. The comp plan aims to include communities at risk, vulnerable populations, and groups who have historically been left out of community planning processes. Inclusivity includes things like, and is not limited to, lowering barriers to participation by offering food or childcare, translation of materials into a variety of languages, and outreach to groups who historically do not participate.

Diversity and equity, embrace a variety of perspectives, experience, backgrounds, and interests in the participation of public engagement and consideration of comments and feedback. Provide access to engagement opportunities, events, and participation online for disadvantaged groups, individuals, and all residents of Auburn.

Be transparent and openly reflect a variety of viewpoints within the community and the City's process for the development and implementation of the comp plan.

Build support for the comp plan and work with the community of Auburn, elected officials, and other agencies toward success in implementing its goals, policies, and actions.

This document outlines the public participation opportunities the City of Auburn will use to develop its Comprehensive Plan, including engagement methods, timeline, and implementation strategy. This is a working document that may be updated as needed to respond to community needs.

PUBLIC PARTICIPATION PLAN MESSAGING

The public participation plan program was founded on three messages:

1. The Auburn Comprehensive Plan is the long-range policy document that guides the City's evolution and growth over the next 20 years.
2. The city needs and values community input on the Comprehensive Plan, ensuring the Vision and Goals driving the Plan are consistent with the community's priorities.
3. The community's involvement helps ensure that the new plan reflects the needs of Auburn's families, neighborhoods, diversity, and the city as a whole.

COMMUNICATION CHANNELS, BARRIERS, & INCLUSIVITY

The City of Auburn is a diverse community, and the racial and ethnic makeup is more diverse than that of King County. For this reason, the channels by which we communicate and the events we hold need to incorporate an inclusive engagement approach.

The table below identifies the engagement options for this plan, including the barriers of each as well as how the method achieves inclusivity.

	**Project Website.** A central location for status updates, draft documents, meeting schedules and related information, official notices, and feedback/comment portal. Website: https://speakupauburn.org/comprehensive-plan	**Barrier(s).** ▪ Getting visitors to the website ▪ Reaching non-English-speaking residents ▪ Uploading materials in a timely manner ▪ Avoid static presentation	**Inclusivity Method.** ▪ Ease of access through virtual outreach on social media and email correspondence directing public to website. ▪ Providing materials in a variety of languages ▪ Materials prepared in advance and available to the client for publishing and distributing to the public ▪ Keep participants informed of results/progress. ▪ Display information in multiple formats (images, charts, graphs, videos, etc.)
	**Social Media.** Sharing of public events, surveys, and other opportunities to participate.	▪ Posting and noticing in a timely manner ▪ Creating postings that appeal to a wide audience ▪ Reaching non-English-speaking residents	▪ Materials provided in a variety of languages ▪ Links to surveys and other web-based platforms provided
	**Public Meetings, Civic Events, and Presentations.**	▪ Identifying appropriate events ▪ Availability of food/childcare ▪ Engaging non-English-speaking residents ▪ Requires high level of coordination	▪ Work with city departments to identify appropriate events to reach a diverse audience ▪ Designate 1–2-point people for coordination/communication to ensure clarity and efficiency ▪ Materials provided in a variety of languages

		and communication	▪ Host virtual Public Meetings with a 1-2 week open timeframe ▪ Tailor events to various size audiences ▪ Opportunities to use community ambassadors
	**Printed Materials.** describing the update process. • The city of Auburn magazine Press releases • Mailer	▪ Reaching non-English-speaking residents ▪ Potential for low participation	▪ Materials provided in a variety of languages ▪ Identify a variety of outlets with relevant contact information for notifying and distributing materials to (newspapers, neighborhoods, churches, and other community-oriented organizations/groups) ▪ Include website link and QR code for access
	**Community Workshops.**	▪ Engaging non-English speaking residents ▪ Potential for low participation	▪ Provide options for non-English speaking participants and ensure ADA accessibility ▪ Incentivize participation with food and/or childcare
	**Planning Commission and City Council Meetings and Hearings.**	▪ Reaching non-English speaking residents ▪ Potential for low public participation ▪ May be intimidating	▪ Provide ample time for the public to speak and/or provide written comments and questions ▪ Provide options for non-English speaking participants and ensure ADA accessibility

Engagement activities

This section dives deeper into each engagement method, describing the tool or activity, the implementation lead whether it's the City or SCJ, what the needs are to implement successfully, what success looks like, the anticipated timeframe for implementing each, and relevant resources.

Project Webpage

The project webpage is hosted through the Speak Up Auburn platform, which provides a secure way for the public to participate, engage, and provide feedback when and where it's convenient for Auburn's residents. The comp plan webpage was designed to be a clearinghouse- a central location for all interested parties to access the latest information related to the update. Planning staff need to routinely assure that webpage does not reduce in priority that it is difficult to access/locate.

The project webpages allow all interested parties to:

- access and review the project status and timeline
- review draft and final documents, comp plan deliverables, and community workshop materials
- provide background information concerning the update, including materials in multiple languages
- virtual public open houses will be accessible via a link
- see Planning Commission and City Council's schedules related specifically to the update process

Printed Materials

These materials include a Frequently Asked Question (FAQ) that was translated into Spanish, Russian, Ukrainian, and Taglog as well as a suite of postcards, including a set for mailing and a postcard to be used as a general handout, along with posterboards for the community workshops/events. Staff distributed the general handout postcard at key locations across the City including:

- Auburn YMCA
- Auburn City Hall & City Hall Annex
- Auburn Public Library
- Auburn Food Bank Multi-Service Center
- Auburn Youth Resources
- Auburn Senior Activity Center
- Parks Dept & Gymnasium at Les Gove Park
- Fred Meyer
- Lea Hill Market
- Marvel Food and Deli
- Lakeland Hills Community Center
- Valley Cities Counseling Services
- Outlet Collection Seattle Mall
- EuroDeli
- Downtown Auburn Cooperative & Chamber Offices
- Farmers Market
- Sounder Station
- Utility Bill Inserts

Social Media

Social media will be utilized to broadcast public events, surveys, and other engagement activities for the public to participate in. To run a successful social media campaign, materials must be published on time and updated regularly. There should also be regularly scheduled postings leading up to events, and each

post should include a clickable image that redirects people to the website or event link. Comments posted on social media posts should be compiled and delivered to City Staff and consultants regularly. Social media postings will correspond with the event dates listed under Public Events, Survey Series, and Community Workshops listed below.

Surveys

Two surveys conducted during the engagement window. Surveys include:

1. **Vision Mini Poll:** The purpose of the mini poll is to collect public comments on the vision for the City of Auburn.
2. **Community survey:** This survey will collect topical information from the public on various elements of the comprehensive plan. The survey may also include visual preferencing and the collection of comments and ideas on the land use scenarios/alternatives.

Citywide Comprehensive Plan Events

The comprehensive plan update process will include several City-wide Comp Plan Events that will inform residents of the update process and collect feedback on the plan. The Planning Department will coordinate with other city departments as necessary. The events will also incorporate public outreach as part of the EIS, details are specified below.

Four (4) City-wide events are planned as part of the update process and include.

1. **City-wide event 1:** Comp Plan Open House – April 2023

- ***Purpose:*** Present the comprehensive planning update and introduce the Draft EIS to the public, share alternatives two and three and collect public feedback.

2. **City-wide event 2:** Comp Plan Draft – April-July 2024

- ***Purpose:*** Each element can be presented to the public to inform and provide context regarding the future land use scenario, updates on each element update/element specific plan updates, input and feedback on each element of the comprehensive plan, and scoping meeting(s) for the EIS. Conducted with Planning Commission as Special Meetings.
- **EIS Objective:** The EIS process requires at least one (1) scoping meeting. The purpose of the scoping meeting is to provide the public the opportunity to give public input on the proposed changes and comprehensive plan.

i. ***EIS Scoping Meeting 1*** *– November 2023*

1. Provide the opportunity for the public to provide public input on what we should be analyzing on the EIS. Identifying pieces of alt 2 and 3.

3. **City-wide event 3:** Comp Plan DEIS Meeting Rollout –May 2024

- ***Purpose:*** Present the DEIS to the public.

i. EIS Objective:

1. Share with the public the findings from the scoping meeting(s)
2. Provide information on the Draft EIS.
3. The event should be scheduled within the public comment period and will provide the opportunity for the public to give comment(s).
4. Summarize all public comments, responses and then publish the comments along with the DEIS. Initiate the appeal period.

4. **City-wide event 4:** Comp Plan Rollout - December 2024

- ***Purpose:*** Present the Comprehensive Plan and FEIS to the public.

Events options include and are not limited to:

Comp Plan Event	Date	Community Event	Location	City Dept. Participation
Event 1 – Open House	April 2023	Comprehensive Plan Open House	Washington Elementary School	Planning Department
Event 2 – Comp Plan Draft	**SUMMER 2023 Mid-Late July**	Summer Concert Series runs July 6 – August 31	Sunset Park	Planning Department
Event 3 – Comp Plan Rollout	**FALL 2023 September (after Labor Day)**	Auburn Farmers Market runs from June 4-September 17 (Sunday's). Set-up from 9AM-11AM Tear-down from 1PM-3:30PM Application fee $20 regardless of acceptance Booth fees are $40 per 10'x10' space per Sunday	Les Grove Park	Planning Department
Event 4	**October 23**	Civics Academy – Education and Presentation Event	Les Gove Park	Community Development Department

Planning Commission and City Council Meetings and Hearings

The City of Auburn Planning Commission (a volunteer advisory body appointed by the City Council) is required to review amendments to the Comprehensive Plan and provide a recommendation to the City Council for consideration and potential adoption. The city planning staff will lead the workshops and public hearings with the Planning Commission and City Council.

1. **Planning Commission Workshops and Public Hearings – April to December 2024**

- ***Purpose:*** Present the draft Comprehensive Plan to the Planning Commission via 3 meetings per subject, consisting of a 1) Public Meeting, 2) Public Hearing, and 3) Action and Deliberation.

2. **City Council Workshops**

- ***Purpose:*** Hold City Council workshops to rollout the Planning Commission recommended draft of the City of Auburn Comprehensive Plan. Provide an overview of the planning process, public feedback and final draft of the plan, collect final feedback from Council and incorporate substantive comments into the final draft while achieving their buy-in and alignment of adoption at the final hearing.

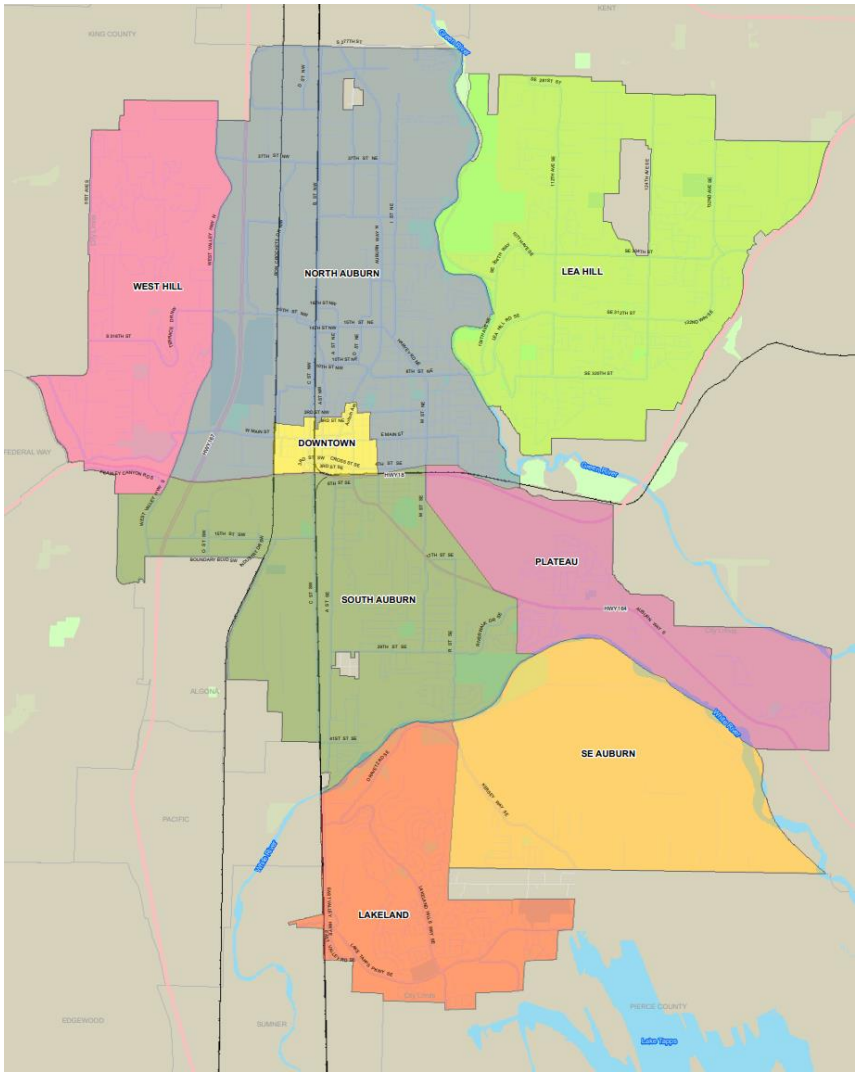
Additional workshops and hearings will be held with the Planning Commission and City Council throughout the update timeframe and lead by the City Planning Department.

Summary of Public Engagement

Public engagement consisted of attending each of the events noted in the previous section in addition to drop-in sessions at various events. Information was shared at each of these events as well as on the project's website and Planning Commission public hearing dates were shared via citywide utility mailers. The following is a compilation of materials presented and feedback received. Feedback and information received for specific Elements, such as Transportation, is found in the respective document.

A - IMAGINE AUBURN 2044 COMPREHENSIVE PLAN VISION MINI-POLL

In one to two words, what makes Auburn great today?



In the next 20 years, what would make Auburn even better?

Identify what you think the top five (5) priorities should be for Auburn in the next 20 years.

1. Increase bicycle and pedestrian amenities
2. Enhance regional transportation networks
3. Address roadway congestion
4. More affordable housing
5. More diverse types of housing
6. Continue to develop and improve downtown
7. Revitalize/ redevelop under used-vacant sites
8. Create strong neighborhood identities
9. Parks and natural lands areas maintained
10. More parks and recreation opportunities provided
11. Maintain a high level of public services and utilities
12. Maintain a safe community
13. Ensuring downtown and neighborhood cores are walkable
14. Quality education opportunities from pre-school to collegiate
15. Historic preservation
16. More opportunities for arts and culture
17. Keep the community engaged
18. Environmental stewardship
19. Providing affordable utilities
20. Other: _____

Where do you live or work in Auburn? (see map for reference)

- Downtown
- West Hill
- North Auburn
- Lea Hill
- South Auburn
- Plateau
- Lakeland
- Southeast Auburn

With the neighborhood you identified in mind, what could the City do to enhance your neighborhood area?

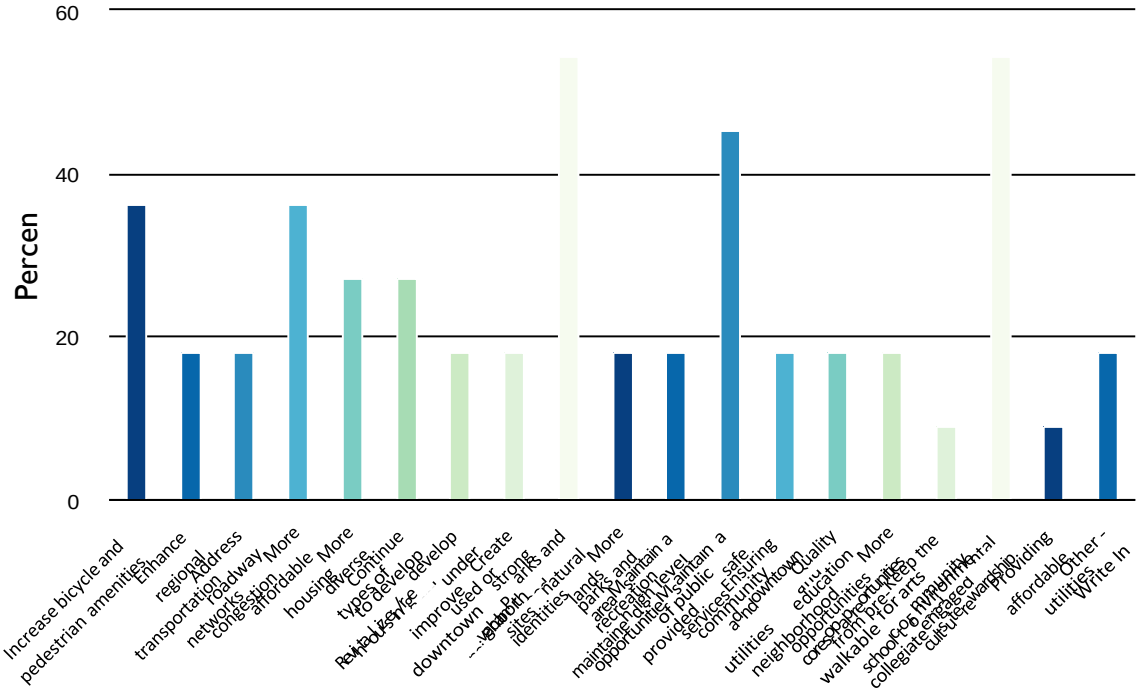
Please provide any other thoughts that you would like to share for the development of Auburn's Comprehensive Plan.

Report for Auburn Comprehensive Plan Poll

Response Counts

Completion Rate:	**50%**		
	Complete		16
	Partial		16

Totals: 32



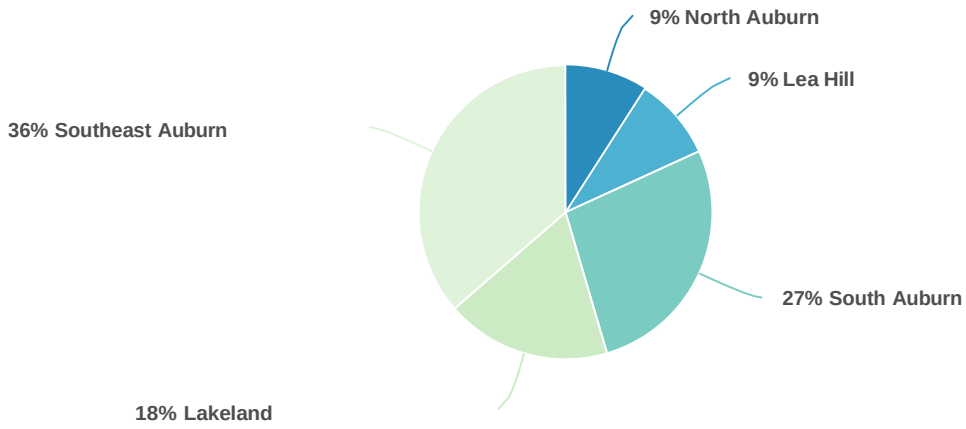
In one to two words, what makes Auburn great today?

Response ID	Response
13	safe environment
15	location & amenities
18	People; Services
20	Diversity
22	Affordable housing
23	Access to the two large parks, Game Farm & Game Farm Wilderness Park. Two large parks with many amenities.
24	Shopping
25	Access to the wilderness and the city
26	Rural community
34	History caring
35	People

1. In the next 20 years, what would make Auburn even better?

Response ID	Response
15	Active participation of residents in Auburn to live, work, play and thrive right here. By better communication and interaction with City operations. Better flow of citizens moving without cars in the city and connecting to neighboring cities.
18	Creating enough affordable and market-rate housing to accommodate population growth.
22	Keep living affordable
23	More trees. Protecting the existing urban forest and replanting for the future forest. The urban heat island effect is very high outside the natural areas.
24	More tree cover in industrial areas
25	More trees and tree canopy
26	Larger urban canopy coverage to mitigate heat
34	Preserve open space, trees, trails. Enhance gathering places. Work hard to ensure people with no place to live find shelter, food and opportunities for self help
35	Crime reduction - make it known Auburn is tough on criminals. Litter management, proactive maintained of public property bridge painting, litter removal, more public art murals, building sidewalks in critical missing areas directly in front of busy elementary schools. Further collaboration with Muckleshoot to enhance Auburn way south from Hwy 18 to the resort for the benefit of both communities.

2. Identify what you think the top five (5) priorities should be for Auburn in the next 20 years.



Value	Percent	Responses
Increase bicycle and pedestrian amenities	36.4%	4
Enhance regional transportation networks	18.2%	2
Address roadway congestion	18.2%	2
More affordable housing	36.4%	4
More diverse types of housing	27.3%	3
Continue to develop and improve downtown	27.3%	3
Revitalize/redevelop under used or vacant sites	18.2%	2
Create strong neighborhood identities	18.2%	2
Parks and natural lands areas maintained	54.5%	6

Value	Percent	Responses
More parks and recreation opportunities provided	18.2%	2
Maintain a high level of public services and utilities	18.2%	2
Maintain a safe community	45.5%	5
Ensuring downtown and neighborhood cores are walkable	18.2%	2
Quality education opportunities from pre-school to collegiate	18.2%	2

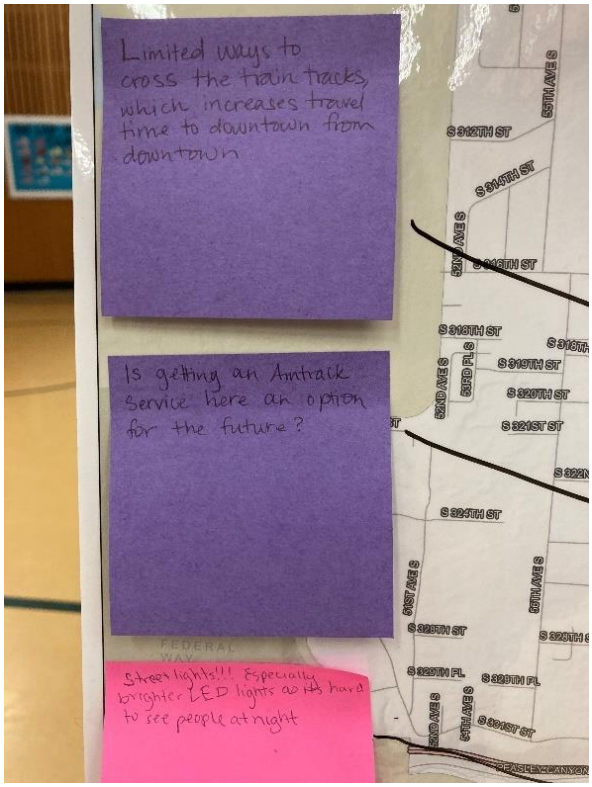
3. Which neighborhood do you live/work in? Click here to see a neighborhood map.

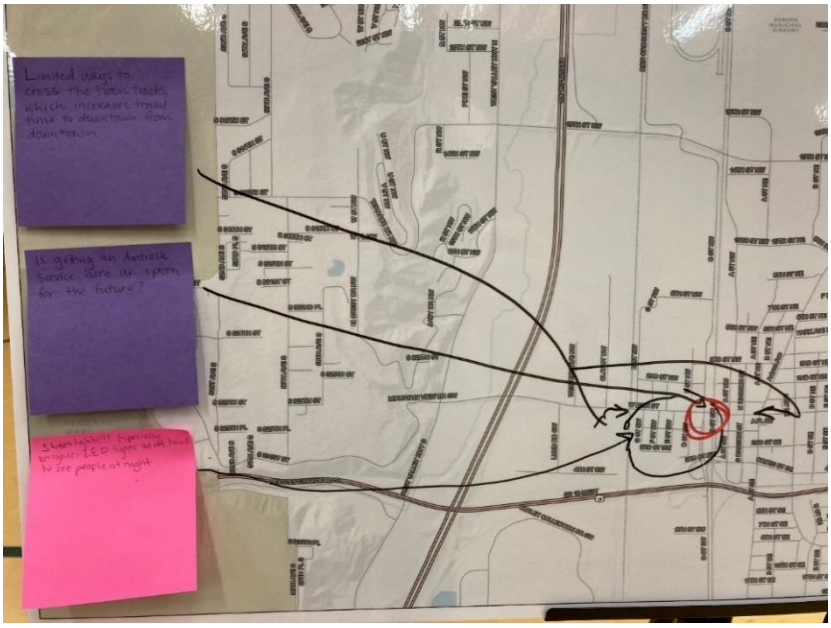
Value	Percent	Responses
North Auburn	9.1%	1
Lea Hill	9.1%	1
South Auburn	27.3%	3
Lakeland	18.2%	2
Southeast Auburn	36.4%	4

Totals: 11

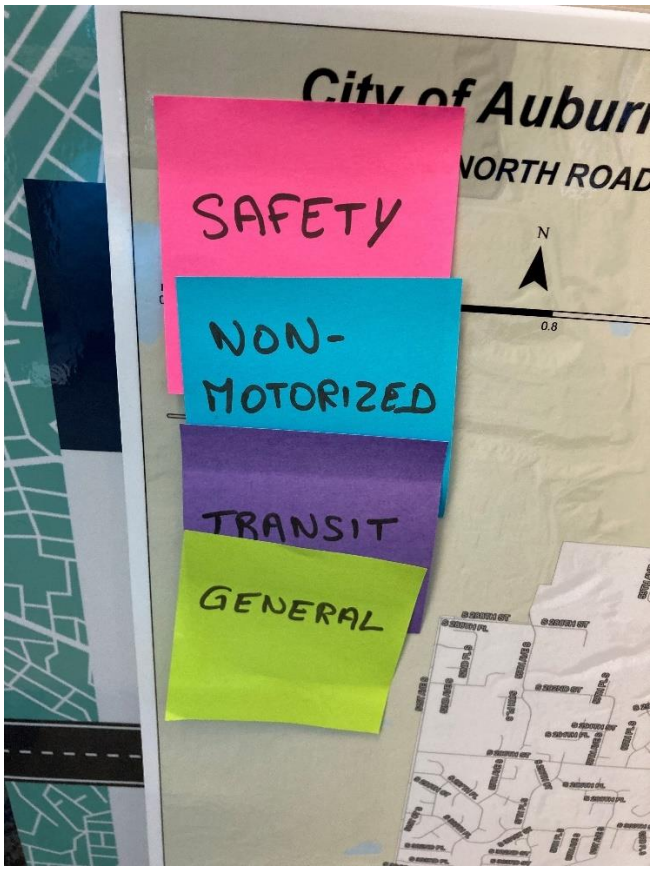


4. With the neighborhood you identified in mind, what could the City do to enhance your neighborhood area?

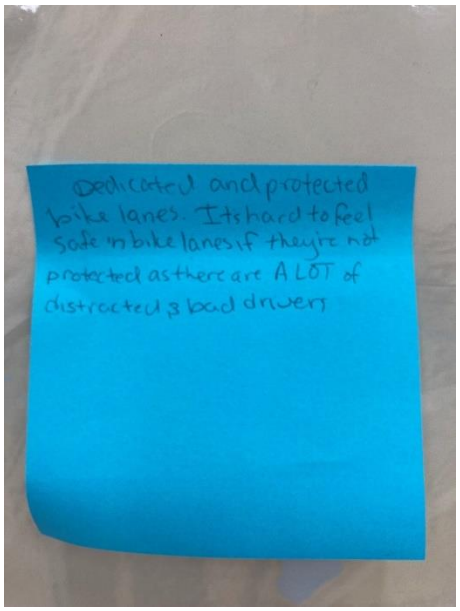
Response ID	Response
13	More public restrooms at parks and trails. More locations for picnics in parks, more walking trails, and more maintenance of trails and parks.
15	Improve safe road crossings. Encourage neighborhood cohesion and interaction with volunteer activities, benches, bulletin boards, signs.
20	Pedestrian and bike paths from Adventist Academy to M street. Better lighting along 164 for pedestrians. Improving traffic congestion and unsightly businesses/vacant lots along Auburn Way. Improve the visuals at the exit on Auburn Way.
22	Improve safety and reduce crime.
23	Proactive management of the trees. There are many aging and dying large trees that should be removed and pruned. Tree canopy is decreasing throughout the city and large healthy trees are being removed and not adequately replaced.
24	More trees
26	Plant more street trees
34	Preserve forest land with trails. Restore Bowman Creek Protect neighborhoods from traffic
35	Litter removal, more traffic calming, building sidewalks.



5. Please provide any other thoughts that you would like to share for the development of Auburn's Comprehensive Plan.



Response ID	
15	Find a way to house the homeless and remove them from the riverbanks. Become a model of creativity by creating transitional housing shelters that puts the residents to work in the area by maintaining open spaces ie: garbage collecting, blackberry and reed canary grass removal. There is a wonderful field near Brannon Park or near the Auburn Environmental Park where a "work camp" arrangement could serve the homeless who don't like restrictive housing, who like the outdoors and who just need basics and a job. By removing invasive species, cleaning up garbage and improving land with restoration plantings and remediation practices and maybe even producing food could provide value to the people and the environment.
18	Auburn should plan for more affordable housing, near transit and job centers to create more opportunities for people. More affordable housing for people near services will improve the overall wellbeing of the city.
22	More needs to be done to improve safety and reduce crime to keep this a family friendly neighborhood.
23	Auburn should acquire at least one full-time urban forestry specialist that can adequately maintain, enhance, and grow their urban forest.
24	Revisions to the tree ordinances
25	Please review and enhance the tree code for more tree protection and planting requirements. It takes decades to grow big trees.
26	Please consider growing the urban forestry program to include tree planting, watering, and maintenance. Have the city take ownership all ROW trees.
34	Continue to work with the region to ensure people living on the street find shelter, explore rent control, expand mass transit. Preserve history and open space. Vibrant recreation opportunities for all. Expand partnerships.
35	Listen to your citizens, continue to advocate us to state level agency's that the current status quo is not acceptable in regards to crime punishment and WSDOT maintenance issues within the city among other things.



2 – April 2023 Comprehensive Plan Public Open House at Washington Elementary School

SAFETY
NON-MOTORIZED

Dedicated and protected bike lanes. Its hard to feel safe in bike lanes if they're not protected as there are A LOT of distracted & bad drivers

IMAGINE AUBURN
~COMPREHENSIVE PLAN UPDATE 2024~

An Open House, free for all in the community to attend, is scheduled for **Tuesday, April 25th from 4-7 PM at Washington Elementary gymnasium** (20 E St NE), which is the first of multiple planned events in 2023.

2023 is shaping up to be a busy year for development of the Comprehensive Plan, with technical and policy analysis underway. The community's input and feedback on the Plan, policies, and vision is important, and public meetings and activities are currently being scheduled to meet the community where they are.

speakupauburn.org/comprehensive-plan

For more information on the project, to sign up for updates, and to participate in a visioning survey, please visit the QR code or website link, or contact Josh Steiner, Senior Planner, at jsteiner@auburnwa.gov.

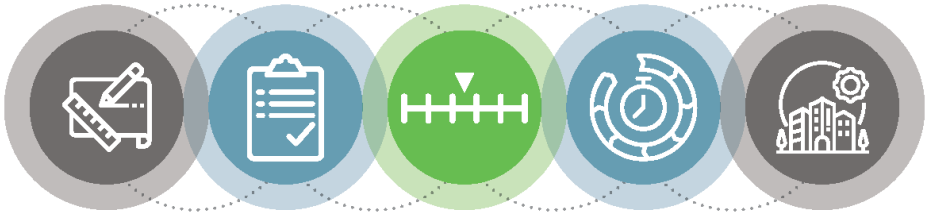
For residents with speech, sight or hearing disabilities wishing to review documents pertaining to this hearing, should contact the City of Auburn within 10 calendar days prior to the meeting, as to the type of service or equipment needed. Each request will be considered individually according to the type of request, the availability of resources, and the financial ability of the City to provide the requested services or equipment.

Plan Integral **Imagina Auburn** 2044

La ciudad de Auburn se está embarcando en la actualización periódica del Plan Integral Imagina Auburn, el cual deberá aprobarse en 2024. De conformidad con la Ley de Gestión del Crecimiento del estado de Washington (Growth Management Act, GMA), capítulo 36.70A del Código Revisado de Washington (Revised Code of Washington, RCW), las ciudades y condados de Washington deben aprobar y actualizar periódicamente sus planes integrales cada 8 años, y todas las ciudades de los condados de King, Pierce, Snohomish y Kitsap deben hacerlo en 2024.

IMAGINE AUBURN
~COMPREHENSIVE PLAN UPDATE 2024~

speakupauburn.org/comprehensive-plan



¿Qué es un Plan Integral?

La actualización del Plan Integral de la Ciudad de Auburn proporcionará una visión general del futuro de la comunidad y una hoja de ruta para los próximos veinte años. En él se describe el aspecto que la comunidad quiere que tenga de aquí a 2044 y cómo hacer realidad esa visión colectiva. El Plan también contempla los requisitos de crecimiento regional establecidos por el Consejo Regional del estrecho de Puget.

¿Por qué es importante una planificación a 20 años?

Se trata de un Plan "Integral", lo que significa que es amplio e inclusivo, tiene en cuenta múltiples temas, elementos, aportes de la comunidad, datos e historia. Si vive, trabaja o juega en Auburn, ahora es el momento de dar su opinión. A fin de cuentas, contribuirá a definir los objetivos del plan, lo que se reflejará en las políticas para alcanzarlos. Al disponer de un plan, se proporciona una guía para garantizar que las futuras decisiones sobre el uso del suelo, las viviendas, el transporte, los servicios públicos y la acción climática reflejen la visión reconocida de la comunidad, tal y como se identificó a través de la participación durante el proceso de planificación.

Un Plan Integral es:

GENERALIZADO

Proporciona orientación y pautas generales para el crecimiento y el desarrollo de la ciudad.

INTEGRAL

Abarca todos los elementos o componentes que se consideran determinantes para influir en las preocupaciones físicas, económicas y sociales de la Ciudad.

DE LARGO ALCANCE

Presenta una visión a largo plazo para la comunidad.

NO ES FIJO

Debe evolucionar con el tiempo mediante su revisión y actualización. Auburn cuenta con un proceso de revisión anual para modificar el Plan Integral.

NO ES UNA ORDENANZADE ZONIFICACIÓN

El Plan Integral no es una ordenanza, pero informa directamente sobre las decisiones relacionadas con los códigos de uso del suelo, los modelos de desarrollo y la priorización de los fondos municipales.

CITY OF AUBURN WASHINGTON

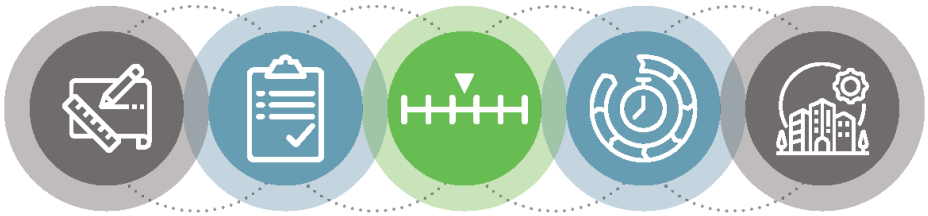
«Auburn будущего»
комплексный план до 2044 года

City of Auburn приступает к периодическому обновлению комплексного плана «Auburn будущего» (Imagine Auburn), которое должно быть принято в 2024 году. В соответствии с Законом штата Washington об управлении ростом (Growth Management Act, GMA), разделом 36.70A Свода законов штата Washington с поправками (Revised Code of Washington, RCW), города и округа штата Washington обязаны принять и периодически обновлять свои комплексные планы каждые 8 лет, причем все города в округах King, Pierce, Snohomish и Kitsap должны сделать это в 2024 году.

IMAGINE AUBURN
~COMPREHENSIVE PLAN UPDATE 2024~

speakupauburn.org/comprehensive-plan

Что такое комплексный план?



Обновление комплексного плана города Auburn обеспечит общее видение будущего сообщества и план действий на следующие двадцать лет. План определяет то, каким сообщество хочет видеть себя к 2044 году и как воплотить это коллективное видение в реальность. Он также учитывает требования по региональному росту, установленные региональным советом Puget Sound.

Почему важно планирование на 20 лет?

«Комплексность» означает, что этот план является широкомасштабным и инклюзивным, учитывает широкий спектр тем, элементов, вкладов сообщества, данных и истории. Если вы живете, работаете или отдыхаете в городе Auburn, сейчас самое время внести свой вклад. Вы поможете сформировать цели плана, которые будут воплощены в политике, направленной на достижение этих целей.

Наличие плана является ориентиром, который гарантирует, что будущие решения по землепользованию, жилью, транспорту, коммунальным услугам и мерам защиты от угроз, связанных с изменением климата, будут отражать общепризнанное видение сообщества, определенное в процессе планирования.

Комплексный план:

ОБОБЩЕННЫЙ

Дает общие рекомендации и определяет направление для роста и развития города.

КОМПЛЕКСНЫЙ

Охватывает все элементы или компоненты, которые считаются важными для решения физических, экономических и социальных проблем города.

ДОЛГОСРОЧНЫЙ

Представляет долгосрочное видение сообщества.

НЕ ЯВЛЯЕТСЯ НЕИЗМЕННЫМ

Должен развиваться со временем путем пересмотра и обновления. Город Auburn предусматривает ежегодный процесс пересмотра комплексного плана для внесения изменений.

НЕ ЯВЛЯЕТСЯ ДИРЕКТИВНЫМ РАСПОРЯЖЕНИЕМ

Комплексный план не является директивным документом, но непосредственно влияет на принятие решений относительно кодексов землепользования, схем застройки и определения приоритетов использования городских средств.

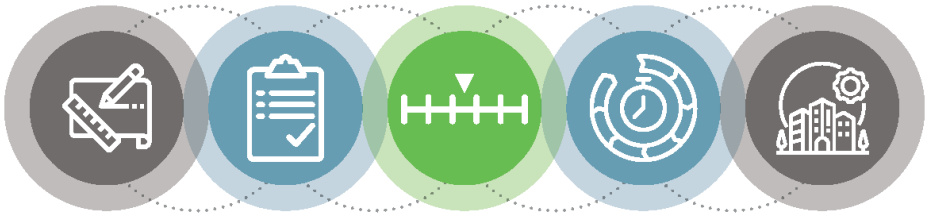
CITY OF AUBURN WASHINGTON

Imagine Auburn
Komprehensibong Plano 2044

Sinisimulan na ng Lungsod ng Auburn ang pana-panahong pag-update nito ng Komprehensibong Plano – Imagine Auburn – na kailangang pagtibayin sa 2024. Sa ilalim ng Batas sa Pamamahala ng Paglago (Growth Management Act, GMA) ng Washington State Chapter 36.70A RCW, ang mga lungsod at lalawigan sa Washington ay kinakailangang magpatibay at pana-panahong mag-update ng kanilang mga komprehensibong plano bawat 8 taon, na ang lahat ng mga lungsod sa lalawigan ng King, Pierce, Snohomish, at Kitsap hanggang 2024.

IMAGINE AUBURN
~COMPREHENSIVE PLAN UPDATE 2024~

speakupauburn.org/comprehensive-plan



Ano ang Komprehensibong Plano?

Ang pag-update ng Komprehensibong Plano ng Lungsod ng Auburn ay magbibigay ng pangkalahatang pananaw para sa kinabukasan ng komunidad at landasin para sa susunod na dalawampung taon. Binabalangkas nito kung ano ang gustong hitsura ng komunidad sa pagsulong patungo sa 2044, at kung paano gagawing katotohanan ang kolektibong pananaw na iyon. Tinutugunan din ng Plano ang mga kinakailangan sa paglago ng rehiyon na ibinigay ng Puget Sound Regional Council.

Bakit mahalaga ang 20 taong pagpaplano?

Ito ay isang "Komprehensibong" Plano, ibig sabihin ito, malawak ang saklaw nito at sakop lahat, isinasaalang-alang ang maraming paksa, bahagi, input ng komunidad, data at kasaysayan. Nakatira ka man, nagtatrabaho o naglalaro sa Auburn, oras mo na para ibigay ang iyong input. Sa huli, tutulong kang hubugin ang mga layunin ng plano na isasalin sa mga patakaran para maabot ang mga layuning iyon. Sa pamamagitan ng pagkakaroon ng plano, nagbibigay ito ng patnubay para matiyak ang paggamit ng lupa sa hinaharap, pabahay, transportasyon, utility, at mga desisyon sa aksyon sa klima na sumasalamin sa kinikilalang pananaw para sa komunidad, na natukoy sa pamamagitan ng pagsisikap sa panahon ng proseso ng pagpaplano.

Ang komprehensibong plano ay:

PANGKALAHATAN

Nagbibigay ng pangkalahatang patnubay at direksyon para sa paglago at pag-unlad ng Lungsod.

KOMPREHENSIBO

Tinutugunan ang lahat ng mga elemento o bahaging nadama na mahalaga sa pag-apekto sa pisikal, pang-ekonomiya at panlipunang alalahanin ng Lungsod.

PANGMATAGALAN

Naglalahad ng pangmatagalang pananaw para sa komunidad.

NAGPAPATULOY

Dapat umunlad sa paglipas ng panahon sa pamamagitan ng pagsusuri at pag-update. May taunang proseso ng pagsusuring ang Auburn upang amyendahan ang Komprehensibong Plano.

HINDI PANSONANG ORDINANSA

Ang Komprehensibong Plano ay hindi isang ordinansa, ngunit direktang nagpapaalam sa mga desisyon sa mga kodigo sa paggamit ng lupa, parisan ng pagpapaunlad, at pagbibigay-priyoridad ng mga pondo ng lungsod.

CITY OF AUBURN WASHINGTON

Compilation of Comments from 4/25/23 Kick Off Open House at Washington Elementary School

- A lot of interest in housing and ensuring affordable housing for future generations of residents.
- Interest in ensuring that housing meets affordability needs of residents.
- Interest in greater range of type of housing types. Where does have available space for new housing?
- What is city doing to attract job opportunities at all levels—not just lower income levels. How is the city attracting higher income jobs?
- How to fill vacant store fronts downtown. What incentives can city provide?
- Need more businesses downtown to attract patrons. Restaurants close too early in the evening. Missing restaurants that were the subject to fire destruction in downtown and the Sunbreak.
- City needs stores that residents need to travel of other communities to frequent/use. Doggy day care, dog parks, Trader Joes, Target, were given as examples
- How to ensure residents fee safe. Currently it does not feel safe to walk downtown in Auburn, especially at night. Too much drug use and litter is visible.
- City needs to practice equity, to implement its vision statements (walk the talk) . As an example, public restrooms in parks near downtown (City Park) are locked but not in city parks in other neighborhoods, Sunset Park in lakeland was given as an example. This results in persons using other open public areas for bathroom purposes.
- City seeks to promote alternatives to single occupant vehicles such as non-motorized modes but police do not enforce traffic law violations such as vehicles observing stop signs so it is unsafe for bicycle use. Speaker has multiple examples of nearly being hit and has complained to city's Traffic division and been told that the intersection of East Main and D St SE . that cross walks would be marked. The speaker said this was a non-sensical response that does not help to add to safety. Bus stops are not maintained and safe and lack sitting areas. Recognized this is a METRO responsibility. There is too much drug use and litter in bus stops.
- Need dedicated bike lanes and vehicle observance of bike lanes.
- How is city helping residents is to age in place. Is there requirements to make units accessible or convertible to accessibility? Is there city restricting the number of persons who can live in a household? How does this relate to extended families needs in a the same household.
- What is city doing to make this comprehensive plan update effort accessible to underrepresented groups in the community? Will the city come out and discuss by visit underrepresented groups if requested ?
- Auburn needs a unique identity to draw people from outside the region which will increase economic development. It will also give people who live in Auburn more things to do so they'll spend their money in Auburn. Ideas for identity included:
  - Sports fields for regional competition purposes (soccer, etc.), possibly an ice rink.

- Make Auburn an entertainment area (build on White River Amphitheater) and add other venues.
- Market Auburn more as the gateway to outdoor recreation areas (Mt. Rainier, Green River natural areas, etc.)

- The north portion of the Green River that is within King County should be annexed by Auburn and that area along the river could be developed with camping spots, yurts, and cabins. A company to provide float trips along the river with shuttle services back to their cars would be a great attraction for Auburn.
- Suggestion that there should be a transportation service from local hotels to White River Amphitheater for safety purposes and to eliminate traffic congestion to the venue.
- The downtown needs more places to go after work and on weekends, restaurants need to stay open later in the evening (past 8:00 pm) to prevent people from driving to Federal Way and Kent to dine out.
- Suggestion that the maps provided should include adjacent jurisdictions to show connections to those cities, particularly driving routes.
- There needs to be a better transportation connection between West Hill and Lea Hill. The opinion was that it's very cumbersome to drive from one area of the city to the other so they never go to the Lea Hill area. 277th Street didn't seem to be a good route.
- The Green River College area needs a walkable commercial node of restaurants, shops and higher density housing.
- To provide for people living in the older single-family residential zones that are retired and wanting to age in place -- the suggestion was those neighborhoods be developed with neighborhood "home-care" businesses and senior centers, so that people do not need to drive to get care or to socialize, versus building senior housing.
- A Need for the city to find its identity and use that identity to guide how future growth is going to occur
- More activities and things to do in the city (strong emphasis on entertainment and restaurants)
- A desire for higher density residential developments to include some type of open green spaces for gathering
- Safety concerns especially in downtown area
- Improve walkability in neighborhoods

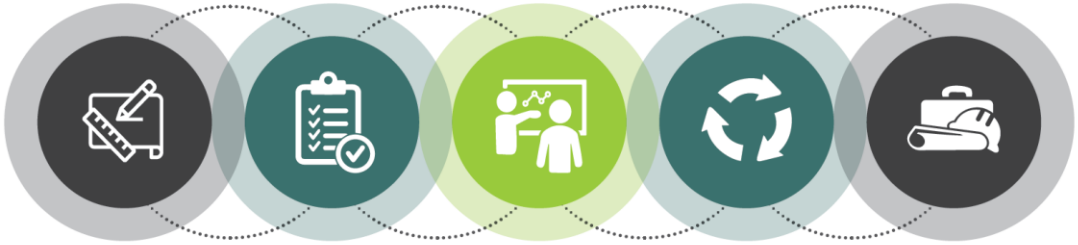
Imagine Auburn Comprehensive Plan 2044

The City of Auburn is embarking on its periodic update of the Comprehensive Plan – Imagine Auburn – required to be adopted in 2024. Under the Washington State Growth Management Act (GMA) Chapter 36.70A RCW, cities and counties in Washington are required to adopt and periodically update their comprehensive plans every 8 years, with all cities in King, Pierce, Snohomish, and Kitsap counties due in 2024.



www.speakupauburn.org/comprehensive-plan

What is a Comprehensive Plan?
Why is 20-year planning important?

The City of Auburn's Comprehensive Plan update will provide a general vision for the future of the community and a roadmap for the next twenty years. It outlines what the community wants to look like moving forward towards 2044, and how to make that collective vision a reality. The Plan also addresses regional growth requirements provided by Puget Sound Regional Council.

This is a "Comprehensive" Plan, meaning it is wide ranging and inclusive, considering a multitude of topics, elements, community input, data and history. Whether you live, work or play in Auburn, now is your time to give your input. Ultimately, you will help shape the goals of the plan which will translate to policies to reach those goals. By having a plan in place, it provides a guideline to assure future land use, housing, transportation, utilities, and climate action decisions reflect the recognized vision for the community, as identified through outreach during the planning process.

A COMPREHENSIVE PLAN IS:

GENERALIZED: Provides general guidance and direction for City growth and development.

COMPREHENSIVE: Addresses all the elements or components felt to be important in affecting the physical, economic and social concerns of the City.

LONG RANGE: Presents a long-term vision for the community.

NOT STAGNANT: Should evolve through time through review and updating. Auburn has an annual review process to amend the Comprehensive Plan.

NOT A ZONING ORDINANCE: The Comprehensive Plan is not an ordinance, but directly informs decisions in land use codes, development patterns, and prioritization of city funds.

Notice of Public Hearing

2024 Auburn Periodic Comprehensive Plan Update

The City of Auburn will be holding a series of Public Meeting presentations and Public Hearings to discuss the 2024 Periodic Comprehensive Plan Update. These Planning Commission meetings will occur on Tuesday evenings beginning at 6:00 pm. The first Public Hearing will be held on April 16, 2024, and Public Hearings are expected to continue through July 2024. The presentations and hearings are open to the public and will be held in-person in the City Council Chambers, 25 W Main St., Auburn, WA, 98001. Each meeting will consist of a Staff presentation on a specific Comprehensive Plan Element(s), a Public Hearing on an Element(s), and Planning Commission deliberation and action on an Element(s). The currently scheduled Public Meeting and Public Hearing dates are listed to the right.

A complete project schedule and more information on the 2024 Auburn Periodic Comprehensive Plan can be found at www.speakupauburn.org/comprehensive-plan. Specific dates for each Element presentation, public hearing, and deliberation and action are subject to change. Please contact planning@auburnwa.gov with questions.

The City of Auburn will be holding a series of Public Meeting presentations and Public Hearings to discuss the 2024 Periodic Comprehensive Plan Update. These Planning Commission meetings are held on Tuesday evenings beginning at 6:30 pm. The public meetings and hearings are expected to continue through October 2024. The presentations and hearings are open to the public and will be held in-person in the City Council Chambers, 25 W Main St., Auburn, WA, 98001. Each meeting generally consists of a Staff presentation on a specific Comprehensive Plan Element(s) or Plan, a Public Hearing on an Element(s) or Plan, and Planning Commission deliberation and action on an Element(s) or Plan.

The currently scheduled Public Meeting and Public Hearing dates are listed below:

Subject	Public Meeting	Public Hearing	PC Acceptance	Complete
Planning Commission - Package 1				
Land Use Element	April 2, 2024	April 16, 2024	April 16, 2024	Yes
Housing Element	April 2, 2024	April 16, 2024	April 16, 2024	Yes
Historic Preservation Element	April 16, 2024	April 30, 2024	April 30, 2024	Yes
Economic Development Element	April 16, 2024	April 30, 2024	April 30, 2024	Yes
Climate Element	April 30, 2024	May 7, 2024	May 7, 2024	Yes
Planning Commission - Package 2				
Sewer Plan	May 21, 2024	June 4, 2024	September 17, 2024	Yes
Stormwater Plan	June 4, 2024	June 18, 2024	June 18, 2024	Yes
Transportation Element	June 4, 2024	July 16, 2024	July 16, 2024	Yes
Capital Facilities Element	June 18, 2024	July 2, 2024	December, 2024	-
Water System Plan	July 2, 2024	December 3, 2024	December 3, 2024	
Utilities Element	July 2, 2024	July 16, 2024	October 23, 2024	-
Parks Element	April 30, 2024	May 7, 2024	May 7, 2024	Yes
Parks PROS Plan	September 17, 2024	October 8, 2024	October 23, 2024	Yes
Code Update	October 8, 2024	October 23, 2024	October 23, 2024	Yes
Planning Commission Action – Recommendation for Adoption to City Council				
Package 1 (Land Use, Housing, Historic Preservation, Economic Development, and Climate Elements)	-	-	July 16, 2024	Yes
Code Update	-	-	October 23, 2024	Yes
Package 2 (Capital Facilities Element, Utilities Element, Transportation Element, Parks Element, PROS Plan, Sewer Plan, Storm Plan, and Water Plan)			December 3, 2024	

Specific dates for each Element presentation, public hearing, and deliberation and action are subject to change. Any such change will be posted at least 10 days in advance of the scheduled meeting and can be found on this project website and here: https://www.auburnwa.gov/landuse(External link).

Planning Commission Public Meeting Materials

A Notice of Public Hearing, which contains information on how to participate in these meetings can be found in the Public Hearing Notices and Public Comments section to the right of this page. Public Comments can be submitted by emailing them to planning@auburnwa.gov(External link) or by attending the appropriate Public Hearing date. Please notify Planning Services Dept. prior to the meeting to provide comment virtually.

Agenda Packets containing meeting materials for each meeting are linked below. Packets include staff presentations, draft document updates, draft maps, and other relevant information being presented at the meeting.

Other Comprehensive Plan News and Updates:

Final Environmental Impact Statement (FEIS) - October 18, 2024

The City of Auburn is issuing its Notice of Availability of the Final Environmental Impact Statement (DEIS). This notice of availability is provided in accordance with WAC 197-11-460. Appeals shall be commenced in accordance with ACC 16.06.220 “Environmental appeals”, ACC 16.06.230 “Time limitation on appeals”, and ACC 16.06.240 “Fee to accompany notice of appeal”. The city will not take action on the proposal for 7 days following this notice. The FEIS can be accessed under "Project Documents" on this website.

Adoption of Existing Document - October 18, 2024

Adoption of the FEIS for the 2024 Comprehensive Plan Update. This adoption uses the existing FEIS to meet SEPA non-project action responsibilities required for the adoption of the development regulation update (text amendment). The purpose of the development regulation is to implement the goals, policies, and strategies identified in the draft Periodic Comprehensive Plan Elements, including concepts as middle housing, accessory dwelling units, and unit lot subdivisions. The Notice of Adoption can be accessed under "Project Documents" on this website. The draft regulations can be accessed in the Planning Commission Meeting 13: October 23, 2024 Special Meeting Agenda(External link).

Draft Environmental Impact Statement (DEIS) - June 6, 2024

The City of Auburn is issuing its Draft Environmental Impact Statement (DEIS) for a 30-day public comment period (WAC 197-11-455) beginning May 20, 2024. Written comments are due by 5:00 p.m. PST on June 19th, 2024. The public mat attend an in-person public meeting scheduled for June 5, 2024 at 6:00 p.m. PST in City Council Chambers or virtually on June 6, 2024 at 6 p.m. For information on the application and instructions on how to participate and provide comment please visit HERE(External link). The DEIS and Notice of Availability can be accessed under "Project Documents" on this website. The June 6, 2024 DEIS Meeting presentation can be found HERE.

Climate Element Framework Available - November 29, 2023

As part of the 2024 Periodic Comprehensive Plan, the City of Auburn will be incorporating the city's first Climate Element. In May 2023, The Washington State Legislature passed HB 1181(External link) which requires cities to plan for climate change in comprehensive plans through adoption of a Climate Element and Transportation Element by 2029. To begin building a foundation for future climate planning, contracted with Cascadia Consulting to develop a Climate Element Framework which provides recommendations on information to include in our Climate Element as well as address future state requirements.

The Climate Element Framework is available to view under the "2023 Planning Commission Presentations" widget to the right of this page. The draft Climate Element, in addition to other Comprehensive Plan Elements, are scheduled to be out for public review in Q1/Q2 2024.

Environmental Impact Study (EIS) Scoping Notice Available - October 23, 2023

Invitation to Comment and Notice for the 2024 Auburn Comprehensive Plan. Scoping Period October 23, 2023 to November 13, 2023 for the 2024 Periodic Comprehensive Plan Update. The proposal is a non-project action to update the Comprehensive Plan per state requirements. The previous Periodic Comprehensive Plan was adopted in 2015 and has provided the framework for development of the city for the past 8-years. The revised 2024 Comprehensive Plan is envisioned to supplement the existing plan by providing a refreshed perspective of the land use, development, and transportation options serving the city while complying with state, regional, and county requirements.

More information on this Scoping Notice can be found here: https://www.auburnwa.gov/cms/one.aspx?portalId=11470638&pageId=19873246(External link)

Comprehensive Plan Public Open House - April 25, 2023

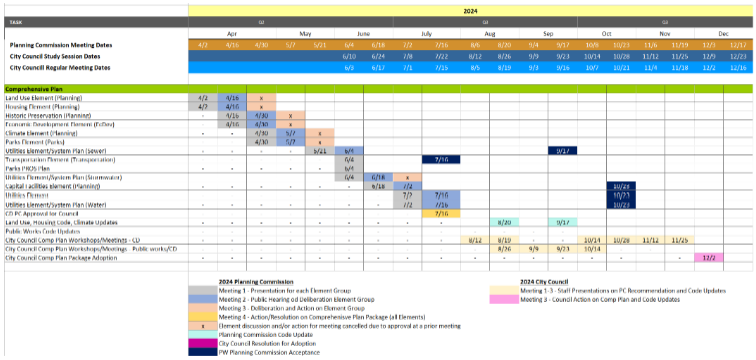
Staff will be at Washington Elementary gymnasium (20 E St NE) on April 25th from 4-7 PM presenting on the Comprehensive Plan, talking with residents on topics such as the vision for the city, plan goals, land use and housing, and other information. The community can drop-in at any point between 4-7 pm to learn more about the project and provide interactive feedback. This meeting is open to any and all who wish to attend. The community can drop-in at any point between 4-7 pm to learn more about the project and provide interactive feedback. For more information or questions, please contact Planning Services at planning@auburnwa.gov(External link).

2024-2044 Periodic Comprehensive Plan Update Overview

The Growth Management Act requires that each city and county in Washington state conduct a periodic update of its comprehensive plan and development regulations per, RCW 36.70A.130 every eight (8) years. The City's previous plan was substantially revised in December 2015, and Community Development is beginning the process of leading the periodic Comprehensive Plan update, which is

currently due in June 2024. The Comprehensive Plan is a "long-range" 20-year plan that provides direction on how and where the city will grow through 2044. The City's is required to accommodate specific growth targets provided by regional and state authorities in the plan.

The City's Comprehensive Plan must be consistent with recently adopted regional documents such as as Puget Sound Regional Council Vision 2050, King County Urban Growth Capacity Report, King and Pierce County Countywide Planning Policies. In addition, the Plan must address any state requirements adopted since the previous periodic plan that has not yet been addressed during the yearly annual comprehensive plan amendment process.



Concurrent with this process, Community Development staff is leading two other projects: the Auburn Downtown Plan & Planned Action project and Housing Action Plan (HAP) Implementation project, which will provide additional analysis to be included in the comprehensive plan.

What is the Timeline for the Comprehensive Plan Update?

In 2022-2024, the City is conducting a major update of the Comprehensive Plan, which is required to be adopted by December 2024. The City will be conducting community engagement throughout the update entire update process. A draft project timeline which covers anticipated efforts through 2023 can be seen below and will be refined as the project progresses. Dates are subject to change - please see table above for the most up-to-date meeting dates and subjects.

Current Comprehensive Plan Elements (External link)

The Comprehensive Plan consists of "Elements", which are similar to chapters in a book. City departments are responsible for updating each of their own respective Elements (Transportation, Parks, Utilities, Housing, etc.),

which are then combined into one cohesive document for adoption near the end of the project. Throughout the Comprehensive Plan Update process, data, plans, and other information are shared among the departments to ensure consistency across all of the Elements. In addition, the Comprehensive Planning team will look for opportunities to coordinate on public outreach opportunities to ensure the community is able to be informed, and heard, throughout the process. You can view the current Comprehensive Plan elements here(External link).

2021 KING COUNTY URBAN GROWTH CAPACITY REPORT

June 2021 ▪ FINAL DRAFT

King County

Acknowledgements

This 2021 Urban Growth Capacity (UGC) Report was prepared by King County and its cities under RCW 36.70A.215 amendment to the Washington State Growth Management Act. Every jurisdiction in King County has participated in collecting and evaluating development information to prepare this Report. Thanks to the following cities and towns for participation:

City of Algona
City of Auburn
Town of Beaux Arts Village
City of Bellevue
City of Black Diamond
City of Bothell
City of Burien
City of Carnation
City of Clyde Hill
City of Covington
City of Des Moines
City of Duvall
City of Enumclaw
City of Federal Way
Town of Hunts Point
City of Issaquah
City of Kenmore
City of Kent
City of Kirkland
City of Lake Forest Park
City of Maple Valley
City of Medina
City of Mercer Island
City of Milton
City of Newcastle
City of Normandy Park
City of North Bend
City of Pacific
City of Redmond
City of Renton
City of Sammamish
City of SeaTac
City of Seattle
City of Shoreline
Town of Skykomish
City of Snoqualmie
City of Tukwila
City of Woodinville
Town of Yarrow Point

This Report was compiled by the King County Office of Performance, Strategy, and Budget in collaboration with BERK Consulting and Heartland LLC. Thanks to the following individuals and groups who contributed greatly to this effort.

King County:	Rebeccah Maskin, Ben Larson, Karen Wolf, Ivan Miller, Lauren Smith, Jeffrey Linn, Paul McCombs, Jacqueline Reid, Kevin LeClair, David Goodman
Interjurisdictional Team:	Hayley Bonsteel, Michael Hubner, Angie Mathias, Nicholas Matz, Beverly Mesa-Zendt, Brian Parry, Jesse Reynolds, Liz Underwood-Bultmann, Adam Weinstein
UGC Technical Committee:	Jeff Dixon, David Johanson, Miryam Laytner, Andrew Leon, Katherine Nesse, Kaelene Nobis, Chris Pasinetti, Jennifer Pettyjohn, Robin Proebsting, David Pyle, Aaron Raymond, Jaimie Reavis, Jesse Reynolds
BERK Consulting:	Kevin Ramsey, Lisa Grueter, Ben Silver, Josh Linden, Andrew Bjorn, Jessie Hartmann, Lisa Johnson, Dawn Couch
Heartland LLC:	Mark Goodman, Chris Fiori, Tyson Heriot

The development of this report and the data and assumptions throughout it was generously supported by a grant from the Washington State Department of Commerce.

Executive Summary

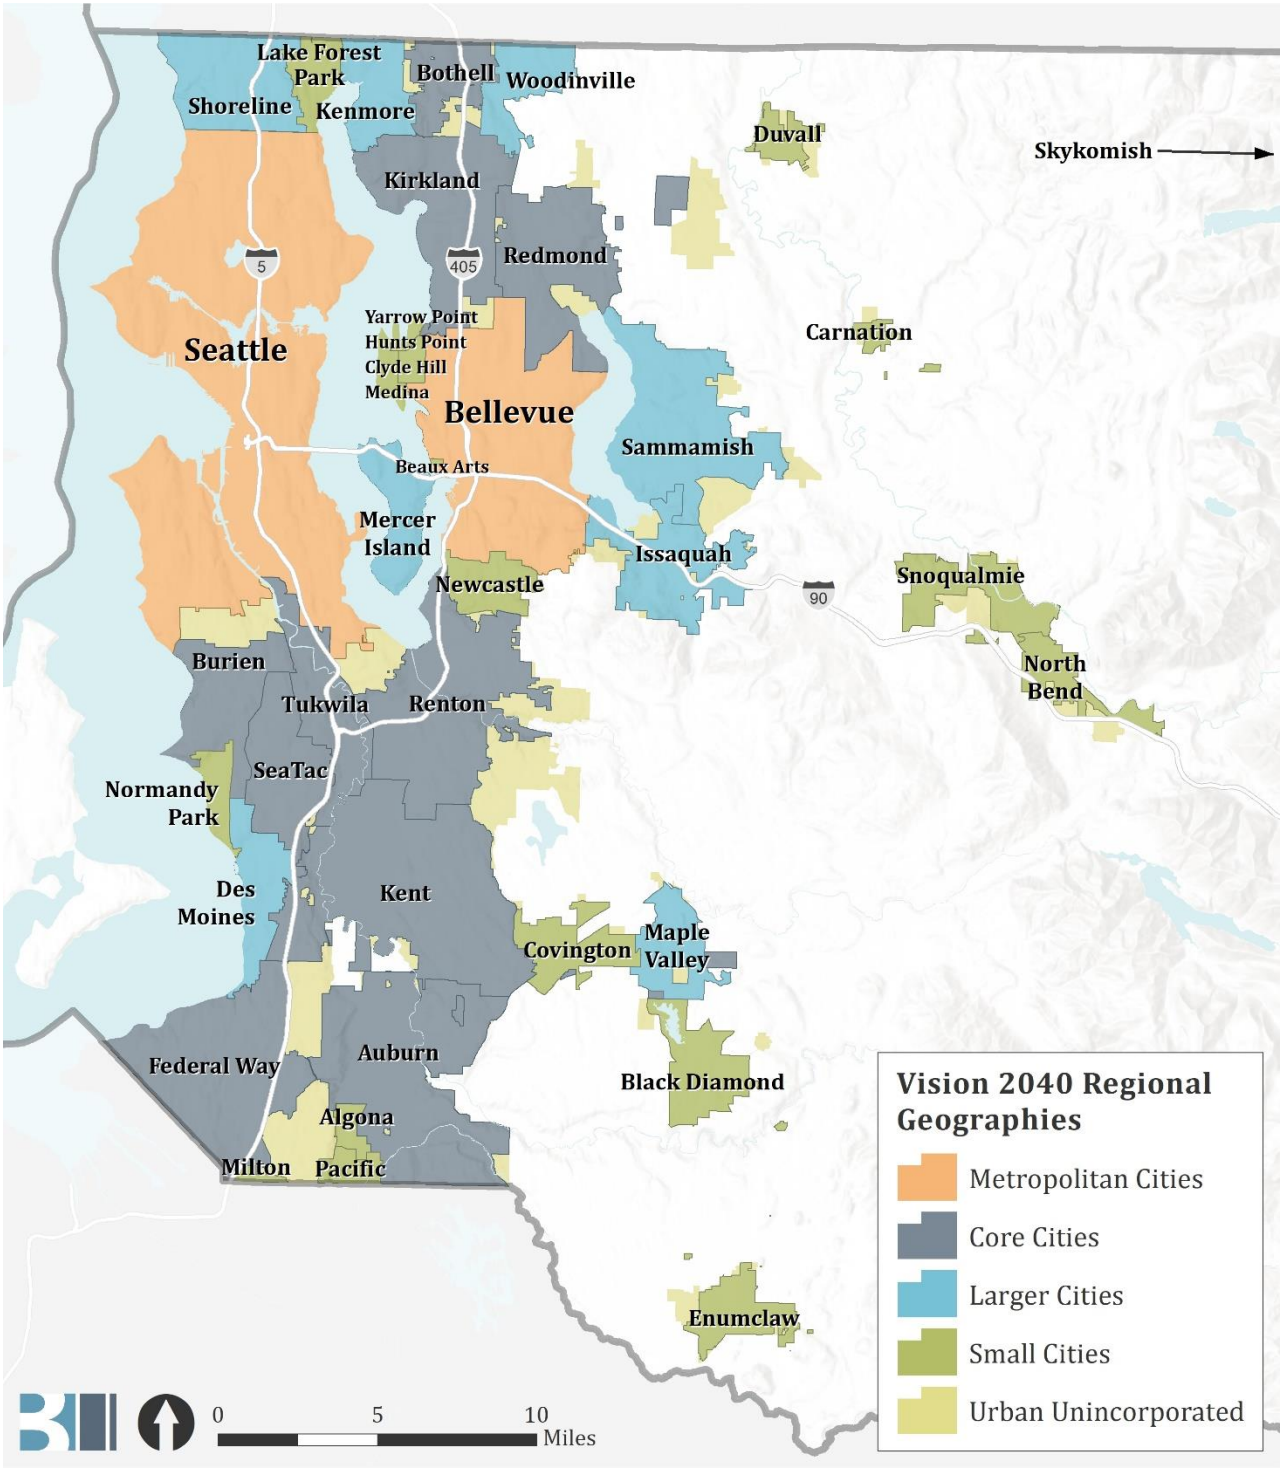
About the Urban Growth Capacity Report

The 2021 Urban Growth Capacity Report is King County's periodic assessment of development capacity for future housing and employment. The report is a mid-planning cycle assessment on how jurisdictions are achieving the planning goals of their 2035 comprehensive plans. The report is a culmination of the county's Review and Evaluation Program, commonly referred to as "Buildable Lands," as required by the Growth Management Act in RCW 36.70A.215, and it is King County's fourth buildable lands report. It is a collaborative production of the 40 jurisdictions across King County, and analyzes the form, quantity, and density of residential and non-residential development observed between 2012 and 2018, to estimate capacity for accommodating 2035 growth targets, with consideration for market and infrastructure constraints.

Amendments to the Growth Management Act in 2017 expanded the purview of the report beyond measuring capacity for projected growth, requiring the seven buildable lands counties to more broadly examine how jurisdictions are achieving targets and density goals. A finding that a jurisdiction has insufficient capacity for its target, or that a jurisdiction is not achieving its growth targets or urban densities could necessitate Reasonable Measures to be adopted in the next periodic update of comprehensive plans. In response to this amendment, the 2021 Urban Growth Capacity Report compares estimated housing and employment growth from 2006-2018 relative to 2006-2035 growth targets, and the achieved densities of 2012-2018 development to the densities allowed in zoning and development regulations.

The 2017 GMA amendments also call for Buildable Lands counties to scrutinize market constraints, infrastructure gaps, and development regulation assumptions utilized in the report to ensure more meaningful market-based assumptions guide the capacity calculations.

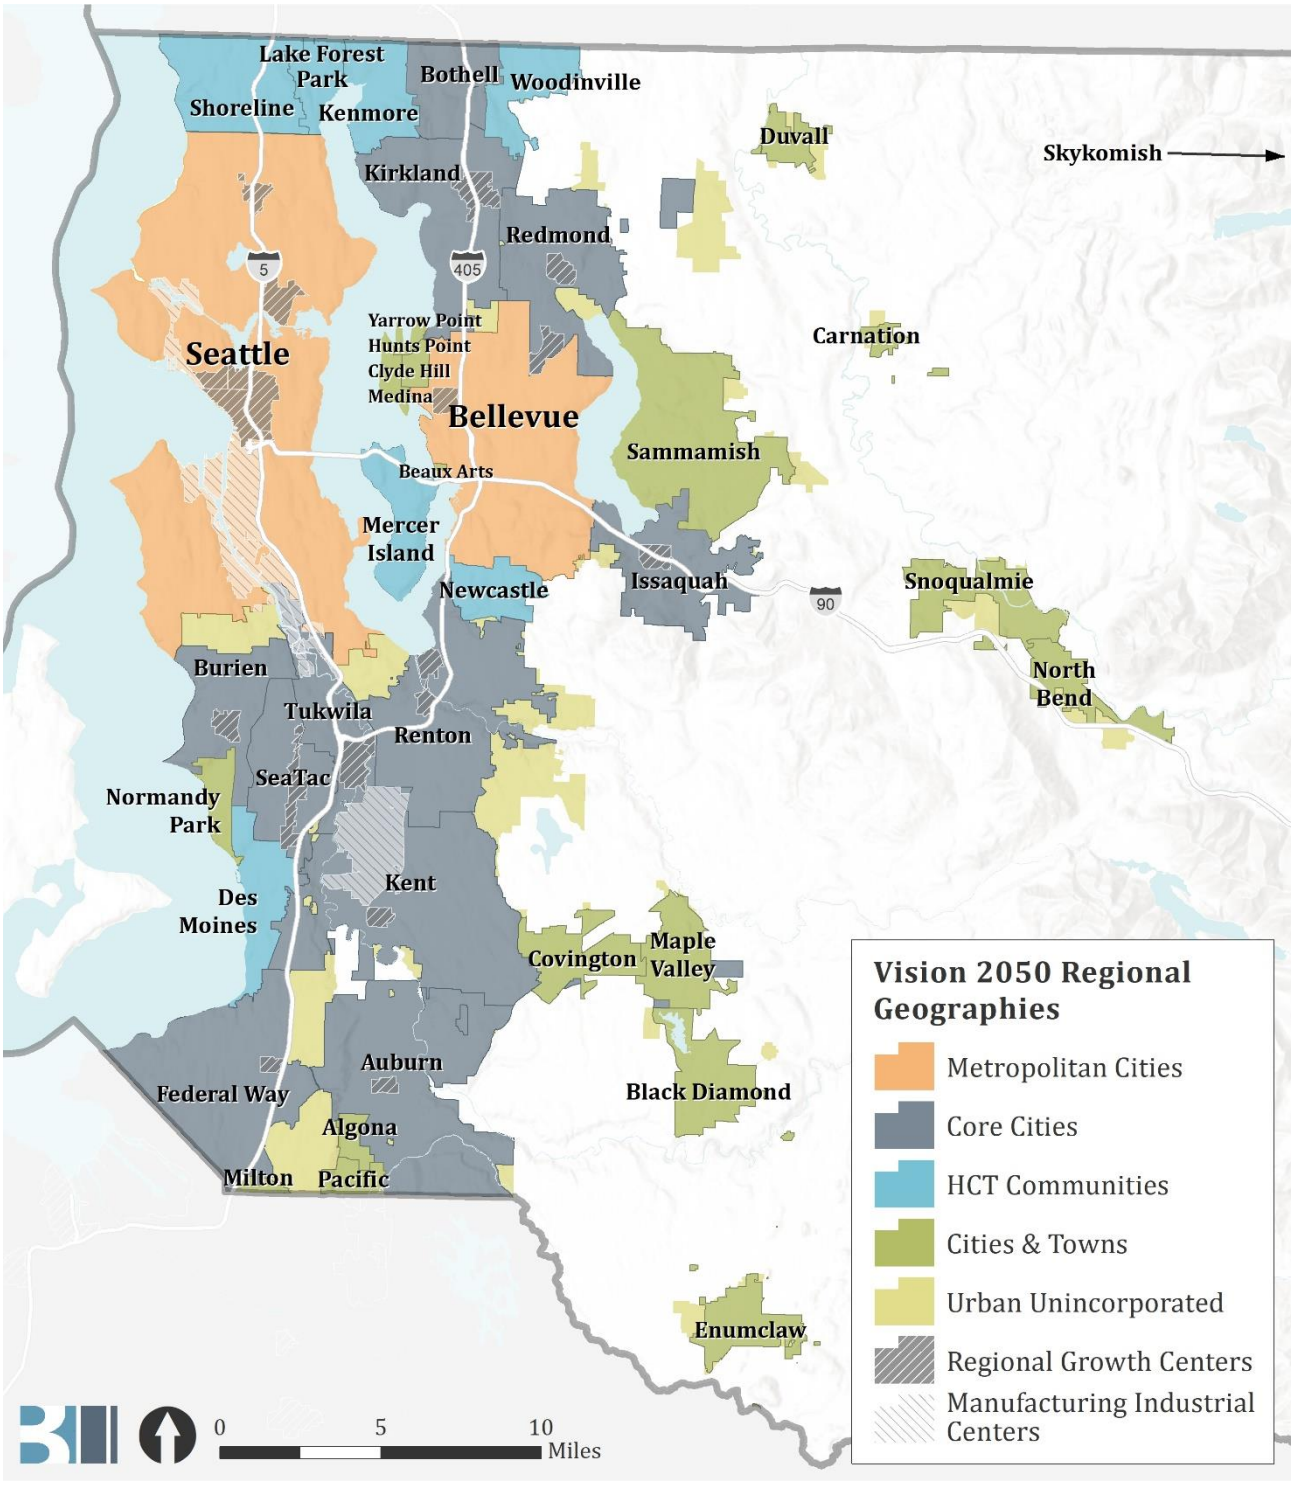
Regional Planning Context



The 2021 Urban Growth Capacity Report implements King County's Review and Evaluation Program as set out in the King County Countywide Planning Policies. The Report analyzes King County jurisdictions' progress toward meeting adopted planning goals expressed in the 2012 King County Countywide Planning Policies growth targets and 2015 Comprehensive Plans. The Report examines capacity and growth assumptions for 2035, the 20-year planning period established by the 2015 comprehensive plans.

The 2015 comprehensive plans and 2012 Countywide Planning policies implement the VISION 2040

policy framework and Regional Growth Strategy, developed by the Puget Sound Regional Council (PSRC). While PSRC has since adopted VISION 2050 and a revised Regional Growth Strategy, because the Urban Growth Capacity Report looks back to the 2012 countywide planning policies and 2015 comprehensive plans implementing VISION 2040, most of the report's analysis is organized by the VISION 2040 Regional Geographies, shown in Exhibit 1. Final capacity results and city profiles are grouped by VISION 2050 Regional Geographies (shown in Exhibit 2), to emphasize how the data can be used while updating comprehensive plans for the 2024 periodic update.



Findings from the Urban Growth Capacity Report underscore how cities and King County are planning for growth focused on a network of designated Regional Growth Centers and high capacity transit station areas. Growth patterns have been consistent with growth targets implementing the Regional Growth Strategy. Capacity exists to support new growth across the density spectrum, and much of it is concentrated in higher density areas in Metropolitan and Core Cities with Regional Growth Centers and Manufacturing/Industrial Centers. Development trends in the county have been evolving toward the higher densities many jurisdictions have planned for, as the high capacity transit network builds out and demand for higher density development expands to new communities.

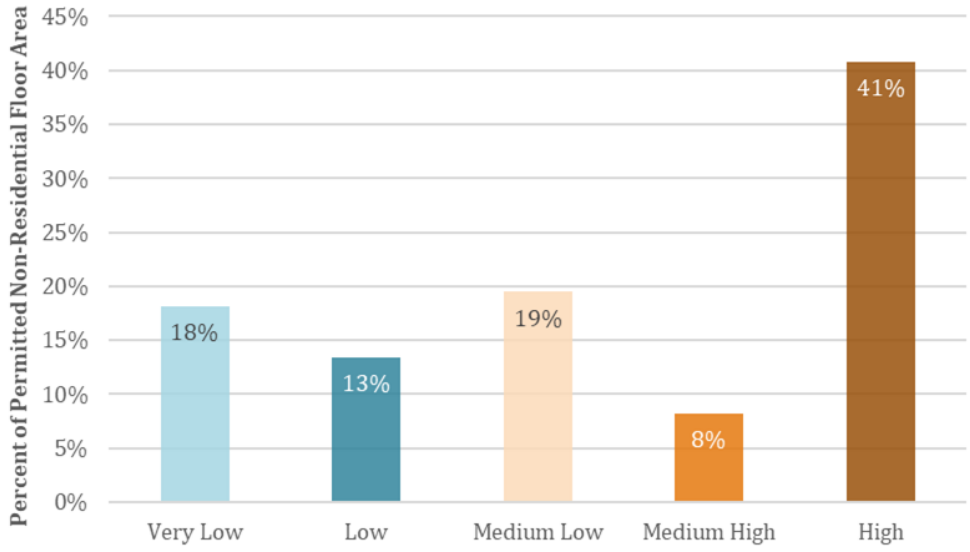
Summary of Findings

Development Activity

The Urban Growth Capacity Report summarizes the densities and locations of urban development between 2012-2018. This period was marked by significant multifamily and higher density development, reflecting King County's continued progress towards directing growth towards cities and efficient land uses. As shown in Exhibit 3, nearly 70% of the housing permitted during the evaluation period was developed at densities of at least 48 dwelling units per acre, and 17% of permitted housing during this period was constructed at below 10 dwelling units per acre. Development in middle density formats was much more limited. These findings demonstrate how residential development during this period trended towards the high and low ends of the density spectrum.

Exhibit 3. Permitted Housing Units by Achieved Density, 2012-2018



Density Level	Units per Net Acre
Very low	Less than 4
Low	4-10
Medium-Low	10-24
Medium-High	24-48
High	48+

Source: BERK, 2021, based on permit data summarized by King County jurisdictions.

Non-residential development was more evenly distributed across density levels. Just over 40%, of non-residential built space was developed at the highest density level, a reflection of the large volume of dense office and mixed use development during the time period. Half of observed non-residential

development developed at densities less than 1 FAR.[1]

Exhibit 4. Permitted Non-Residential Development by Achieved Density, 2012-2018

Density Level	FAR
Very low	<0.35
Low	0.35-0.5
Medium-Low	0.5-1.0
Medium-High	1.0-3.0
High	>3.0

Source: BERK, 2021, based on permit data summarized by King County jurisdictions.

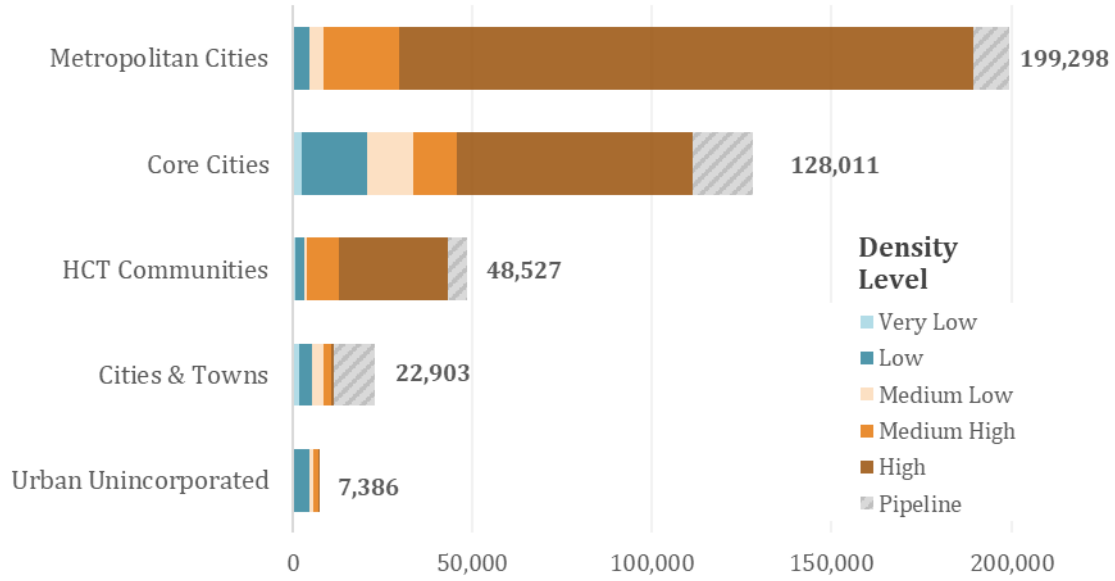
This study also included analysis comparing the achieved densities to maximum as-of-right densities allowed by zoning. Findings varied significantly by jurisdiction. Some jurisdictions saw average achieved residential densities that were higher than their planned max within lower or middle density zones. Other saw achieved densities that were much lower than planned, particularly in zones that allow for the highest densities. This later finding was particularly true for non-residential development. One key reason for this outcome is communities that have zoned for higher density development in anticipate of future market shifts that had not yet occurred in the 2012-2018 evaluation period.

Progress Toward Growth Targets

King County has experienced historic population and economic growth in recovery from the Great Recession. Guided by the Regional Growth Strategy and adopted growth targets, this growth has been overwhelmingly urban; less than 3% of the population growth in King County since 2006 has occurred in the rural area. The Urban Growth Capacity Report analyzes progress cities and urban unincorporated King County have made towards achieving 2006-2035 growth targets. Because past buildable lands reports have not focused on this specific outcome before, the 2021 report examines growth since 2006 and through 2018.

[1] FAR stands for Floor Area Ratio, a measure comparing the area of built space to the land area of the associated lot or parcel. Higher FAR values reflect more dense development, and values higher than 1.0 indicate that the built space surpasses the land area of the associated parcel (as can occur in multi-story buildings).

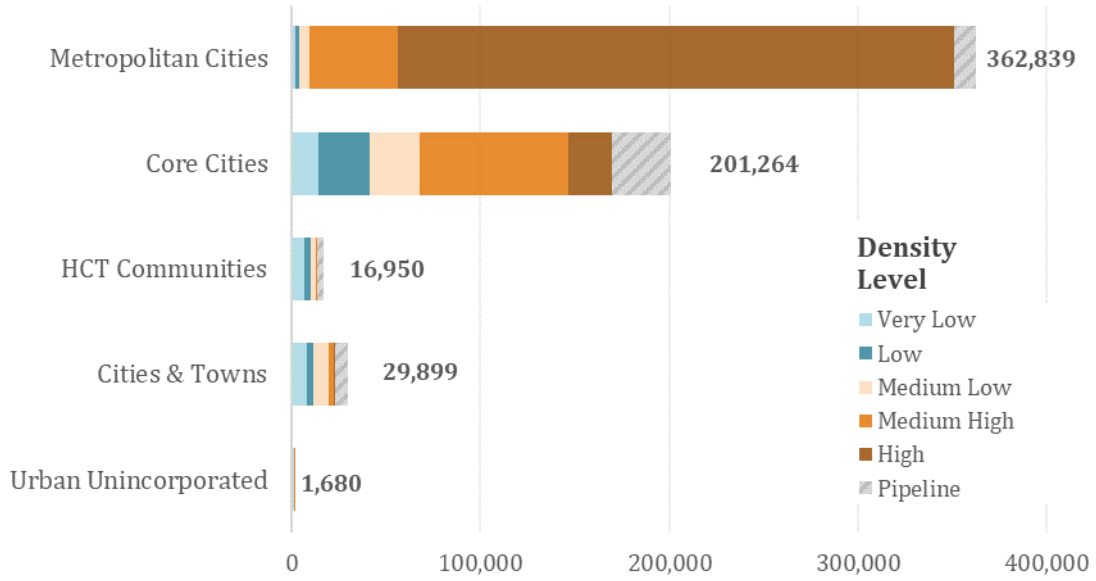
Urban King County is growing at a rate to successfully achieve its adopted growth targets. Approximately 41% of the target period has elapsed 2006-2018. As a whole, urban King County has achieved 47% of its housing and employment targets, growing slightly faster than this prorated pace. These growth rates are particularly notable given that the time period spans the Great Recession, which diminished population and housing growth to a near standstill, and netted out most of the employment gained during the 2000s.



The effects of the recession and rates of recovery were not uniform across King County. At a Regional Geography level, Metropolitan, Larger, and Small Cities grew faster than the pace needed to achieve growth targets. Job growth compared to targets was also strong in Metropolitan and Small Cities. While housing growth has been less strong in Core Cities and the urban unincorporated area, these geographies are still on track to achieve their residential growth targets. Employment growth in Core and Larger Cities was slower than pace but meets the countywide definition of consistency with growth targets 2006-2018. The urban unincorporated area was slightly ahead of pace to achieve its employment growth target. More information on growth trends and achieving targets is in Chapter 3 of the Report.

Development Capacity

The 2021 Urban Growth Capacity Report finds that urban King County has capacity for over 400,000 housing units and 600,000 jobs, sufficient capacity to accommodate the remainder of its 2035 housing and employment growth targets, and looking ahead, for projected future growth during the next planning period. See Exhibit 5 and Exhibit 6 for summaries of residential and employment capacity by Regional Geography and density level.



Approximately 50% of residential and 60% of employment capacity in King County is in Metropolitan Cities. Additionally, nearly a third of residential and non-residential developable capacity is in the eleven Core Cities. Residential capacity in Metropolitan and Core Cities is overwhelmingly at the county's highest density levels and drives the finding that 83% of the county's developable residential capacity exists at densities greater than 24 dwelling units per acre. Nearly 80% of King County's employment capacity is zoned at 1 FAR or higher. At the other end of the density spectrum, approximately two-thirds of King County's developable residential land is zoned for ten dwelling units or less, making up 10% of residential capacity. More findings and detail on capacity is contained in Chapters 4 and 7.

Exhibit 5. Dwelling Unit Capacity by Density Level

Implementing Urban Growth Capacity Findings

As a mid-planning cycle check on development trends and achievement of growth management goals, the Urban Growth Capacity Report contains a host of information useful for the upcoming periodic 2024 comprehensive plan update. Most directly, the Urban Growth Capacity Report contains

recommendations that some jurisdictions adopt Reasonable Measures in their comprehensive plans to address specific inconsistencies identified in the report. More information about the evaluation of when and where Reasonable Measures may be necessary is provided in Chapter 5. Data about achieved density and capacity by density level can help jurisdictions identify where shortfalls in development capacity may impede achieving targeted planning goals, like encouraging the production of "missing middle" housing or mixed use development near transit station areas. Chapter 6 contains more information on applying or using Urban Growth Capacity Report data or findings for future planning efforts.

Ch. 1 Introduction

This report presents the findings of King County's Urban Growth Capacity Study. King County is a Growth Management Act (GMA) jurisdiction and must plan to accommodate projected growth within its boundaries, with most growth focused into urban growth areas (UGAs) where urban services are available or can be made available. The purpose of the Urban Growth Capacity Study is to provide a periodic evaluation to determine whether projected growth can be accommodated within the UGA. In previous cycles, this product was referred to as the King County Buildable Lands Report (BLR). Past Buildable Lands Reports were completed by King County in 2002, 2007, and 2014.

This report includes findings from three key components of King County's Buildable Lands Program which are required under RCW 36.70A.215 and WAC 365-196-315:

- Analysis of countywide and jurisdictional growth trends between 2006 and 2018 compared to 2035 growth targets.
- Analysis of achieved densities by jurisdiction based on growth that occurred between 2012 and 2018, and comparison to planned densities.
- Capacity for housing and job growth through the year 2035.

This report was developed by King County in collaboration with each of its 39 cities through the Growth Management Planning Council (GMPC). The findings are used to inform the development of new growth targets by jurisdiction for the 2019-2044 planning period. The data findings will also be used by cities to inform the next round of comprehensive plan updates and subsequent implementation work.

Regulatory and Policy Framework

The Washington State Growth Management Act (GMA) was adopted to address the need for rapidly growing cities and counties to adequately plan for future growth while protecting natural resource lands and environmentally sensitive areas. A key component of the GMA is the Review and Evaluation Program (also known as the Buildable Lands Program), a requirement which applies to King County and all of the cities within it. This program mandates the review and evaluation of urban growth capacity to ensure each jurisdiction has designated adequate supply of residential, commercial, and industrial lands to meet growth allocations developed by the counties in consultation with their cities.

In 2017, the Washington State Legislature passed the first major revision to the program (SB 5254). This update to GMA includes new requirements related to infrastructure gap analysis, market factor assumptions, and Reasonable Measures. This update to GMA specifies the following:

- Reasonable Measures: Under SB 5254, these measures that are adopted to address inconsistency between forecasted and experienced growth are no longer required to be monitored and adjusted annually by buildable lands counties and cities.

- Land Suitable for Development: Under SB 5254, the required evaluation of suitable land must include land use or zoning regulations, environmental regulations impacting development, other regulations that might inhibit the achievement of assigned densities, and infrastructure gaps. The evaluation of suitable land must also include development of a reasonable market supply factor that identifies reductions in land suitable for development and redevelopment.
- Buildable Lands Report Timing: Under SB 5254, the buildable lands report must be completed no later than 2 years prior to a jurisdiction's next comprehensive plan update for those comprehensive plans due to updated prior to 2024,

Countywide Planning Policies

The Proposed 2021 King County Countywide Planning Policies (CPPs) establish the county's Urban Growth Area (UGA) and allocate projected countywide growth in the form of growth targets for each city as well as urban and rural unincorporated areas. CPPs also establish the Review and Evaluation Program for King County and guide the development of the Urban Growth Capacity Study through policies DP-19, DP-20, and DP-X2.[2] Components of the Buildable Lands Program include annual data collection, periodic evaluation reports, and adoption of Reasonable Measures, where needed, to ensure sufficient capacity to accommodate projected growth within the county's UGA. These Reasonable Measures are to be adopted in comprehensive plans, and jurisdictions will collaborate to provide data periodically about the effectiveness of those measures.

In King County, growth targets are adopted in the King County Countywide Planning Policies.[3] Countywide growth targets are derived from population projections released by the State Office of Financial Management (OFM) and an economic forecast developed by the Puget Sound Regional Council. Population growth is converted to housing units and the projected housing and employment growth is then allocated to jurisdictions within the Regional Geographies established in the VISION 2050. Jurisdictions within Regional Geographies then collaboratively distribute their allocated growth to create city and urban unincorporated growth targets.

Local Comprehensive Plans

Under GMA, jurisdictions must plan and provide for both household and job growth to meet their targets through designation of sufficient land suitable for development in their comprehensive plans and regulations. This Urban Growth Capacity Report presents estimated capacity for housing and employment growth by jurisdictions based on a methodology informed by actual achieved densities from recent development activity. The results enable the evaluation of whether counties and cities can

[2] The Proposed 2021 CPPs include temporary numbering. Policy numbers could change when the final CPP are adopted.
[3] The Urban Growth Capacity Report evaluates the growth targets adopted in the 2012 Countywide Planning Policies. The adopted targets cover a period of 2006-2031. For the Urban Growth Capacity Report, these targets were updated for major annexations and extended on a pro rata basis to 2035, to be consistent with the 2015-2035 planning period for 2015 comprehensive plans. This method was recommended to jurisdictions to extend their 2031 targets to 2035, as the periodic comprehensive plan update deadline was delayed to 2015 after the Great Recession.

actually meet the adopted targets. Any deficiencies identified in this study must be addressed by the jurisdiction in their next comprehensive plan update.

Department of Commerce Guidelines

In 2017, the Washington State Legislature passed E2SSB 5254, which constituted the first major revision to the buildable lands program since its inception in 1997. In 2018, the Washington State Department of Commerce (Commerce) published a revised Buildable Lands Guidelines report for use by counties and cities responsible for carrying out a Review and Evaluation Program under GMA. These Guidelines summarize requirements of RCW 36.70A.215 and WAC 365-196-315, and provide best practices and methodologies for carrying out those requirements. King County used these Guidelines as a resource when developing its own policies and procedures for carrying out the Urban Growth Capacity Study.

Countywide Coordination

This report is the result of nearly two years of coordination and collaboration between King County and the 39 cities within King County. King County facilitated development of the report by establishing a methodology, creating standardized data collection and assumption guidelines, and completing the final report. King County also lead an interjurisdictional group of planners and data technicians through the Technical Committee, to develop and vet assumptions in the study methodology. Individual cities and King County supply development and land supply data and select assumptions appropriate to their jurisdictions to complete the report. Exhibit 7 below describes the roles and responsibilities for King County and cities in developing the Urban Growth Capacity Report.

Exhibit 7. Roles and Responsibilities

	King County	Individual Jurisdictions
Interjurisdictional coordination	Facilitator of the UGC and report preparation.	Volunteer and participate in Technical Committee methodology review.
Developing guidance for data collection and analysis	Develop standardized guidance and templates for data collection and analysis, with input from the UGC Technical Committee.	Review and offer feedback on draft guidance.
Conduct analysis of achieved densities	Review data shared by jurisdictions for consistency with guidance. Work with jurisdictions to resolve any inconsistencies.	Gather and analyze data in accordance with guidance and share results with County for review.
Conduct land capacity analysis	Review data shared by jurisdictions for consistency with guidance. Work with jurisdictions to resolve any inconsistencies.	Identify developable land supply, select local development assumptions to calculate capacity in accordance with guidance.
Reasonable Measures	Identify inconsistencies between growth, capacity, and planning goals using standard criterial.	Review inconsistencies and determine whether Reasonable Measures are necessary. Implement Reasonable Measures in 2024 comp plan updates.

Changes from the 2014 Buildable Lands Report

While the overall purpose of this report is identical to the 2014 King County Buildable Lands Report, there are several changes in the 2021 Urban Growth Capacity Report. Highlights of the primary changes are listed below.

- **New analysis of capacity and achieved density for all jurisdictions.** Unlike the 2014 Buildable Lands Report, which carried forward several key assumptions and findings from the previous 2007 edition, this study conducted a new and complete analysis of both development trends and growth capacity for all jurisdictions.
- **New regional geographies for summarizing capacity and growth targets.** VISION 2050 was adopted by PSRC in 2021. This regional plan updates the Regional Growth Strategy, including the organization of cities and unincorporated areas into five Regional Geographies each with population and employment growth targets for 2019-2044. Ch. 4 summarizes growth capacity for by these new VISION 2050 regional geographies. However, Ch. 3 summarized historic development

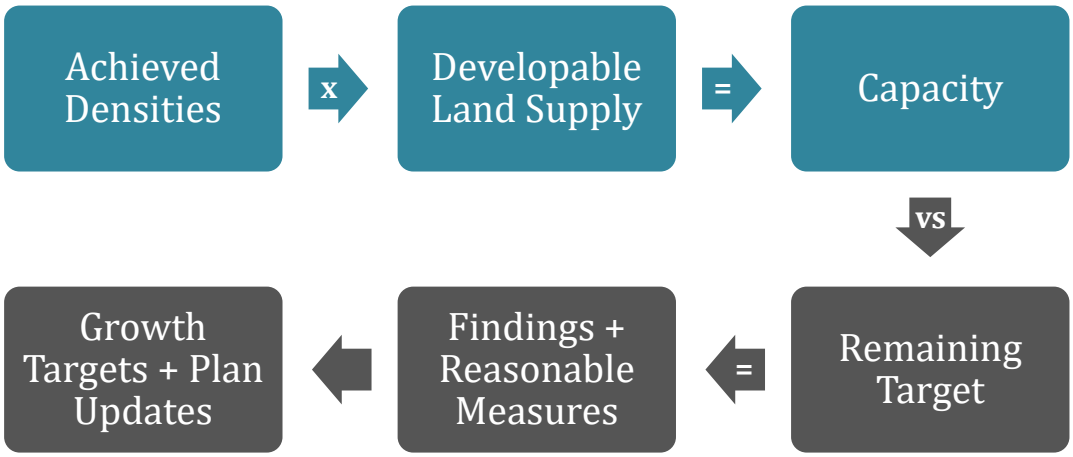
trends using the older VISION 2040 regional geographies because that growth is being compared to targets developed when those older geographies were in use.

- **Infrastructure gap analysis.** The methodology used in this study includes a formal evaluation of infrastructure gaps and their effects on urban growth capacity. While consideration of infrastructure availability had long been a component of King County's buildable lands analysis, this change included more specific guidance and up front analysis to address a new requirement added by the legislature in 2017.
- **Updated approach to "market factor" assumptions.** 2017 legislative changes also called for a more rigorous approach to developing "market factor" assumptions that account for the estimated percentage of developable land that is likely to remain undeveloped over the course of the planning period due to market barriers.
- **Reasonable Measures.** The 2017 legislative changes added additional points of analysis for which jurisdictions would need to adopt Reasonable Measures. Under past buildable lands analyses, jurisdictions experiencing a shortfall of capacity for their adopted target could be subject to Reasonable Measures. The 2017 legislation indicated that jurisdictions not achieving their growth targets or planned densities, and unlikely to achieve them by the planning horizon, would also be required to adopt Reasonable Measures to overcome these circumstances. The 2021 Urban Growth Capacity Report presents an analysis against the three Reasonable Measures tests and note jurisdictions that will adopt Reasonable Measures in their 2024 comprehensive plans.

Report Components and Organization

This report is organized into the following components.

- **Executive Summary**
- **Ch. 1. Introduction:** This chapter describes the regulatory and policy framework for Buildable Lands reporting in Washington State and King County. It provides an overview of the coordination process between the County and cities to prepare this report. It identifies key changes from the 2014 Buildable Lands Report. And it outlines the report components and organization.
- **Ch. 2. Methodology and Guidance Overview:** This is an overview of the methodologies used by individual jurisdictions for evaluating historic development trends as well as future growth capacity. The full guidance provided to jurisdictions are included in appendices to this report.
- **Ch. 3. Development Trends:** This chapter begins with a summary of residential and employment growth that occurred between 2006 and 2018. These trends are compared to adopted targets for jurisdictions and PSRC Vision 2040 Regional Geographies. This chapter also summarizes new development that occurred between 2012 and 2018 by achieved density level.
- **Ch. 4. Growth Capacity:** This is a summary and discussion of urban growth capacity within jurisdictions and aggregated by PSRC Vision 2050 Regional Geographies. Capacity is also summarized by assumed density level to provide an indicator of how much capacity may be available for different kinds of development and housing types – from new towers in dense downtown areas to lower density single family neighborhoods and middle-density typologies in between.



- **Ch. 5 Reasonable Measures:** This chapter explains how the county, in collaboration with cities, evaluated whether historic growth trends in each jurisdiction have been consistent with local comprehensive plans. It also presents the results of this assessment and a summary of jurisdiction responses that provide context for the quantitative assessment. Finally, this chapter identifies instances where "Reasonable Measures" are recommended to improve consistency.
- **Ch. 6 Applying Urban Growth Capacity Findings:** This chapter describes how jurisdictions can use this study and its findings to inform the next round of local comprehensive plan updates. It also presents a set of new population and employment growth targets by jurisdiction for the 2019-2044 period.
- **Ch. 7. Profiles of Cities and Unincorporated Areas:** This chapter presents detailed profiles summarizing growth trends and capacity findings for each individual jurisdiction, organized by PSRC Vision 2050 Regional Geographies.

Ch. 2 Methodology and Guidance Overview

Overview

This chapter provides an overview of the methodology used by King County and its cities to calculate urban growth capacity for residential and non-residential development. Exhibit 8 shows the three major steps in this process in blue, as well as three major steps following this process in grey. These steps highlight how capacity analysis results will be used to inform the development of potential Reasonable Measures, new growth targets for jurisdictions, and eventually comprehensive plan updates.

Exhibit 8. Urban Growth Capacity Analysis Overview

Source: Graphic adapted from King County Urban Growth Capacity Guidance, 2019.

This process for data collection to support urban growth capacity analysis was split into four phases:

- **Phase One** – Achieved Densities
- **Phase Two** – Land Supply
- **Phase Three** – Initial Capacity
- **Phase Four** – Final Capacity

Throughout the 2021 Urban Growth Capacity Report data development process, King County provided guidance documents to jurisdictions that walked through the analytical steps required in each phase, and when relevant, provided data to support the analysis. Along with the guidance documents, jurisdictions were asked to fill out standardized data tables to support data aggregation as well as comparisons across different jurisdictions and Regional Geographies. The remainder of this chapter

summarizes the process required of each jurisdiction throughout the phases of data collection and analysis. It also describes additional analyses King County and a consultant team developed to update and add rigor to data assumptions used in the analysis, or to develop new processes embedded in the data collection guidance. The individual guidance documents are attached to the end of this report in the Technical Appendices.

Phase 1 - Achieved Densities

The goal of this phase was to calculate the achieved densities of new development that occurred between 2012 and 2018. For residential development, density is typically measured in dwelling units per acre. For non-residential development, density is typically measured as floor-area ratio, or the amount of building floor area divided by the total parcel area. Achieved densities form the basis for determining the assumed density of future development in urban growth capacity calculations. That process is described in more detail in Phase 3.

During Phase 1, King County jurisdictions collected the necessary data to calculate achieved density for each zone where development occurred during the six-year review and evaluation period of 2012 to 2018. An initial parcel-based analysis by King County was supplied to the jurisdictions to streamline reporting on achieved densities, which was then supplemented by jurisdiction-led analysis. The portions of reporting are:

1. Reviewing and supplementing a parcel-based analysis of new residential development, and
2. Reporting on additional development permitted during the review period, particularly non-residential and mixed-use development.

The parcel-based analysis was the starting place for residential data collection in the Urban Growth Capacity Study. It was designed to replace the majority of plat and permit reporting by identifying new residential development on parcels that changed boundaries or added residential units during 2012-2018. Permit reporting on single family and multifamily/mixed-use development was still necessary for residential developments not identified in the parcel-based analysis data, and to review or supplement the parcel-based analysis with project data (for example, non-buildable critical areas area). New non-residential development was designed to be addressed through permit reporting.

Using the parcel-based analysis supplemented by permit data, jurisdictions filled out several data templates provided by King County to support the calculation of achieved densities in residential, non-residential, and mixed-use zones. For details see Appendix A: Guide for Local Government Reporting Template PART 1.

Data Review and Achieved Density Calculations

King County staff, with consultant support, reviewed permit data shared by jurisdictions for reliability and consistency with guidance. When necessary, jurisdictions were engaged to make corrections or refinements. This permit data provided the basis for calculating achieved densities for residential and non-residential development between 2012-2018.

Jurisdictions aggregated permits and reported residential and non-residential development by zone. For residential permits, this reported data included developed residential units, gross acreage, and several categories for acreage deductions: critical areas, public purpose area, and right of way area. After deducting these categories from gross acreage, jurisdictions reported net developed area for residential units within each zone. Residential achieved density is therefore measured as housing units per net acre, which accounts for area that is not suitable for residential development.

For non-residential development, achieved density is measured using floor area ratio (FAR). Jurisdictions calculated the gross developed non-residential area within each zone, and made similar deductions for critical areas, public purpose area, and right of way area. The total floor area of non-residential development within each zone was then divided by that zone's net developed area (in square feet), which produced a zone-wide achieved density for non-residential development.

Rural Development Trends Methodology

Residential development trends on rural and resource lands were measured by residential permits issued between 2012 and 2018. Permits were geocoded by their parcel identification number or address to identify their presence outside the Urban Growth Area.

Parcel quantities and area, and current use information was provided by the King County Assessor. Supplemental development related data (year built, residential units, and non-residential square feet), was derived from Assessor data on residential and commercial buildings. Parcels were identified as rural if their centroid was located outside of the Urban Growth Area. Parcels on resource land were identified by overlaying the parcels with current King County zoning shapefiles, and selecting parcels with centroids within Agriculture, Forest, or Mineral zoned land.

Phase 2 - Land Supply

The goal of Phase 2 was for jurisdictions to identify vacant and redevelopable land that has potential to see new development activity over the next 20 years. To quantify the developable land supply, jurisdictions followed the steps below. Results of this analysis were documented in standard data templates provided by King County.

- Assemble data, including parcel/assessor data, critical areas, and zoning (a set of 2019 parcel data and assessment information was provided to jurisdictions),
- Exclude land uses or parcels that are unlikely to develop for categorical reasons (e.g., parks, schools, public facilities, other institutions),
- Identify planned density by zone (see discussion below),
- Define thresholds for identifying vacant and redevelopable parcels (see discussion below),
- Identify vacant and redevelopable parcels using thresholds,
- Review and refine the resulting developable land supply,
- Remove area for environmentally sensitive lands (critical areas)
- Screen for infrastructure gaps, and

- Summarize developable land supply by zone.

Planned Density Reporting

Planned density typically refers to the maximum density allowed by zoning code and development regulations. Planned densities were collected for two reasons. First, as a part of new requirements to the Growth Management Act (GMA) buildable lands statute passed by the State Legislature in 2017, King County jurisdictions are required to evaluate whether planned densities are being achieved in the 2020 Urban Growth Capacity Study. Achieved densities (evaluated in Phase One reporting) are later compared to planned densities as one indicator of whether development is occurring as planned.

Second, planned densities are used in the identification of redevelopable lands. These are lands that have some development already, but which could reasonably be expected to see additional development during the planning period. Redevelopable parcels include **partially utilized** parcels, meaning the parcel is large enough to be subdivided to allow for the creation of additional residential lots. They can also include **under-utilized** parcels, which are parcels that could be converted to a more intensive use typically because the planned density is significantly higher than the existing density on the parcels. Since the 2007 Buildable Lands Report, King County has recommended jurisdictions identify both kinds of redevelopable lands by comparing the existing density of development to its planned, or potential, density (see additional discussion below).

Typically, planned densities for residential zones are reported in dwelling units per acre (du/acre), and in floor area ratio (FAR) for non-residential zones. In certain cases, residential planned density is reported in terms of FAR or minimum lot size. Non-residential planned density has more variation and is less frequently defined as explicitly as residential zones. For these zones, jurisdictions were asked to fill out a FAR calculator to assist with consistent comparisons later in the study.

Developable Land Supply Reporting

This portion of the analysis involved a jurisdiction-wide scan to quantify all land available for residential or commercial/industrial development for the next 20-year planning period. “Land supply” is the phrase used to refer to an inventory of land “suitable for development.” Land supply inventories for each jurisdiction ideally strive for a snapshot of land with development potential as of January 2019, approximating the end of the most recent evaluation period (2012-2018). The land supply is comprised of both vacant and redevelopable lands and is typically based on a parcel-based dataset provided by King County. In certain cases, individual jurisdictions maintain a land supply based on development site data in lieu of parcel data.

Vacant Definition

Vacant lands are devoid of development or contain only low value accessory structures. For this study, a recommended two-part test was used to determine if a parcel was vacant: query parcels with assessor present use codes indicating vacant land use *and* query parcels with improvement values less than $10,000. Selected parcels were then screened for known exclusions, such as school district land,

parking lots associated with condo buildings, government-owned land, and other land use types (see Appendix).

Redevelopable Definition (Residential)

For redevelopable residential land, a ratio of potential to existing density on a parcel was used to determine if a parcel was redevelopable. For example, if a city defined redevelopable land to be where existing development is less than two times the potential density for that property, then a single family property on an acre lot which is zoned for up to four units per acre, would be considered redevelopable.

Jurisdictions were recommended to choose a threshold between 2 to 3.5. The threshold a jurisdiction selected was influenced by development pressure and existing density, i.e., a lower threshold is more appropriate for denser, rapidly developing jurisdictions.

King County provided calculated residential density by parcel for this phase, and combined with planned density, jurisdictions were able to calculate the above ratio and test various thresholds. Once a given threshold was selected, results were queried and then screened through a variety of factors (for details see Appendix B: Phase 2 Guidance).

Redevelopable Definition (Non-Residential and Mixed-Use)

Two methods were provided to jurisdictions for identifying redevelopable non-residential and mixed-use parcels. While a density-based ratio, as is recommended for residential lands, can be informative in some areas, particularly those facing significant development pressure, an improvement-to-land-value based ratio may also accurately identify properties likely to redevelop.

Value-ratio method. In the parcel/assessor data table provided by King County, an improvement-to-land-value ratio was calculated for each parcel (appraised improvement value divided by land value). A low ratio indicates more potential for redevelopment. Theoretically, the ratio reflects the potential profitability of more intensive use of a site relative to the revenue generating potential of the existing use. Typical threshold ratios for determining redevelopability range from 0.25 to 1. A threshold of 0.5 was recommended for most areas within the county. Jurisdictions experiencing more intense development pressure were allowed to consider a higher ratio.

Density-ratio method. Since planned densities for all zones were being evaluated for this analysis, using a density-based filter is more possible than in past studies. The existing FAR-based density was calculated for every parcel (existing development divided by the parcel area) and included in the parcel data for each jurisdiction. Using the planned density of the parcel's related zoning, jurisdictions could calculate a potential density value for each parcel. By comparing the potential and existing densities, jurisdictions could create a ratio by which to judge a parcel's redevelopabllity. Starting with a ratio of 1.5 (potential-to-existing density) and testing a +/-0.5 tolerance was the recommended starting place for reviewing the redevelopable land supply results. Jurisdictions with less non-residential development

pressure were advised to set a higher threshold.

Screening

Regardless of method, queried parcels were screened and selectively removed from the analysis. Full documentation on the screening process can be found in Appendix B: Phase 2 Guidance. Two major factors in reducing land supply, critical areas and infrastructure gaps, bear additional description.

Critical Areas

Using the initial land supply, jurisdictions intersected and removed only non-buildable critical areas and critical area buffers in accordance with development standards, as described in Appendix B.

Infrastructure Gaps

Comporting with the new Department of Commerce Buildable Lands Guidance, the land supply was screened to remove or discount land supply experiencing significant water, sewer, stormwater, or transportation infrastructure gaps that would fully or partially impede development at planned levels. Jurisdictions were provided with a summary of infrastructure constraints identified in their comprehensive plan, and then performed a two-step analysis to further identify infrastructure constrained development: first identifying any areas with development potential outside existing service areas or affected by a significant, but unscheduled infrastructure need, and secondly removing or discounting specific parcels that were unserved and unlikely to be serviced in the next 20 years due to these gaps. Further detail on the infrastructure gaps guidance is contained in Appendix G.

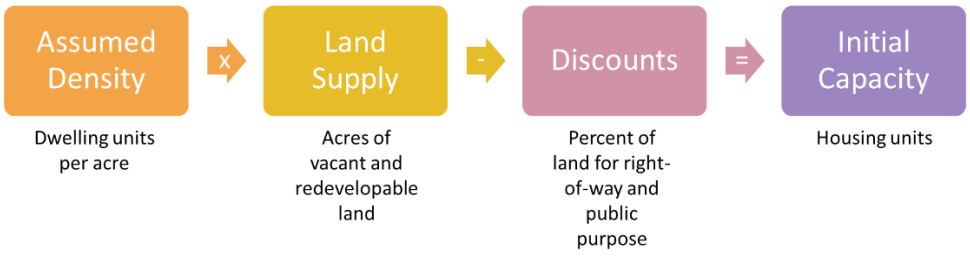
Final Land Supply

After critical area deductions and infrastructure constrained lands were removed, each jurisdiction reported net vacant and net redevelopable land by zone. This is the final land supply.

Major Planned Development – Pipeline

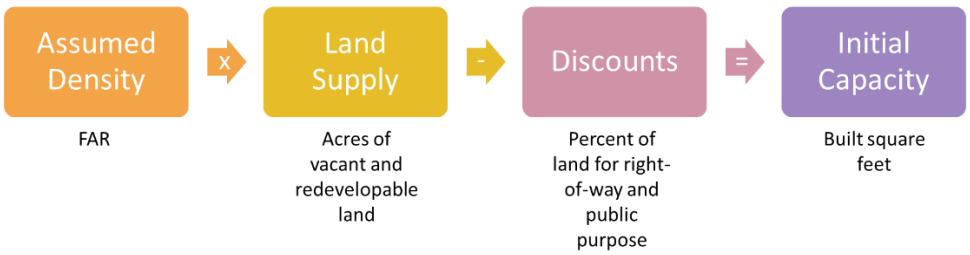
The last section of Phase 2 asked each jurisdiction to fill out permitted development already in the pipeline, and when possible, the corresponding parcel number. Pipeline development was considered separately in the capacity analysis, and this step was to ensure that parcels with permitted development were not double counted towards future capacity as well.

Phases 3 and 4 – Capacity



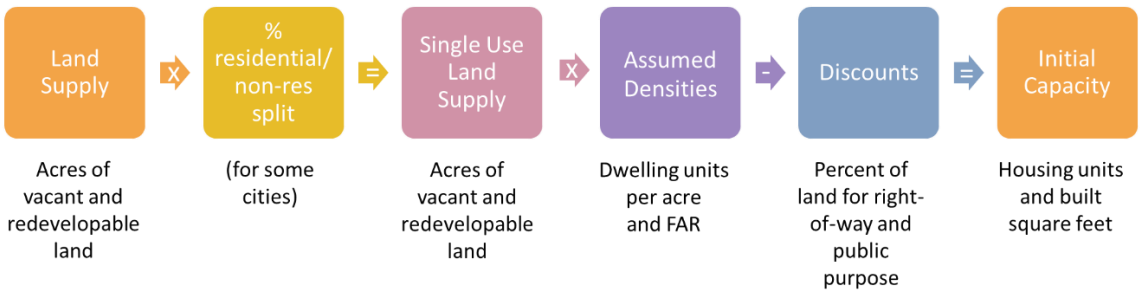
Calculating capacity was spread across two phases of data reporting. Phase 3 focused on an initial capacity calculation by zone, paired with local reporting on achieved growth and densities. Phase 4 data reporting finalized urban growth capacity calculations for each jurisdiction by applying market factor and employment density assumptions to the initial capacity calculated in Phase 3.

Capacity Overview



Generally, developable capacity is calculated by zone, and is the product of a zone's assumed density and the area of land supply, minus a percentage accounting for streets, sidewalks, and public purpose land. Achieved densities calculated in Phase 1 of data collection typically form the basis for the assumed densities, and the land supply was reported by zone in Phase 2. Jurisdictions selected discounts for right-of-way and public purpose lands, informed by recent development trends, to reduce the land supply for non-buildable, necessary infrastructure. This process is illustrated below in Exhibit 9.

Exhibit 9. Capacity Calculation Steps



Calculating Residential Capacity

Calculating Non-Residential Capacity

Calculating Mixed-use Capacity

Source: King County Phase 3 Guidance Document, 2020.

Calculating Capacity

The steps for calculating capacity are broken down in the following sections: reporting assumed density, determining mixed-use splits, taking discounts, and calculating capacity.

Assumed Densities

Assumed densities are an important part of developing capacity calculations. They are reported for each zone where development can occur. Assumed densities, except in limited circumstances, must be based upon the achieved densities observed in the 2012-2018 evaluation period reported in Phase 1 of Urban Growth Capacity data collection. This is specifically called out in RCW 36.70A.215(3)a, e.

Deviation from achieved density is only permitted for zones in the following circumstances:

- **Insufficient observed development in the evaluation period**. Some zones may have experienced limited or no development to draw reasonable conclusions for anticipated development densities, either in the types of development allowed in a mixed-use zone, or in the quantity of development.
- **Changes in regulations**. Densities achieved in development permitted during the five-year review period may reflect zoning and development regulations that have since changed. Where regulations have changed to effectively increase or decrease achievable net densities, assumed future densities should reflect the impact of those regulatory changes, and the specific changes should be documented.
- **Trends over time**. A trend of increasing dwelling units per acre or FAR over time could justify an assumed future density higher than indicated in the zonal average reported as achieved density in Phase 1. Annual reporting in Phase 1 data would indicate this trend.
- **Infrastructure gaps.** "Partial infrastructure gaps," where infrastructure limitations affected portions of zones from achieving planned densities were identified in Phase 2 data reporting.

In such cases, jurisdictions may look to the planned density to inform the assumed density. Documentation of the specific development circumstances that demand deviation from the achieved density, and the rationale for the selected assumed density are required in the reporting tools.

Assumed densities are the basis for calculating initial capacity below.

Mixed-Use Zone Splits

Mixed-use zones are defined as zones with capacity for both residential and non-residential development. In some cities, mixed-use zones require the achieved use splits observed in Phase 1 to apportion area to residential and non-residential uses to calculate capacity, but all cities were asked to report on differences between achieved density and planned density for mixed-use development.

Some mixed-use zones did not see development in the evaluation period. In these instances, jurisdictions were advised to draw from additional sources:

- Observed splits in zones in comparable zones in or outside of the given jurisdiction
- Expressed vision for these areas in comprehensive and neighborhood plan policies, or development regulations
- Local knowledge of market conditions, demand for space, projects in the development pipeline, and developer interest
- Existing development similar to that envisioned for a zone

Defining these splits is a key component in understanding the breakdown in land supply available to residential and non-residential development on mixed-use land.

Discounts

To estimate the actual developable capacity, the area of vacant and redevelopable land supply must be reduced or "discounted" to account for land that gets utilized for rights-of-way and other public purpose uses where people do not live or work. Public purpose uses are generally stormwater facilities, parks, or other open space. These amounts vary by type and density of development. The starting place for approximating these discounts is the observed development data used to calculate achieved densities in Phase 1.

Past buildable lands reports provide additional reference points, built from the development observed during those evaluation periods. As development becomes denser and occurs as infill, these discount rates reduce, as right-of-way and public purpose uses are already built into the urban fabric.

Jurisdictions were encouraged to tailor discount selections to major land use types (e.g., multifamily, or non-residential development) and to vacant or redevelopable land. Some jurisdictions varied discounts by zone, based on future development conditions.

Initial Capacity

In this step, capacity is calculated by combining all portions of the analysis up until this point. From here, capacity was calculated by the following steps:

1. Report land supply area by vacant/redevelopable and by zone.
2. Deduct the selected percentages for rights-of-way and public purpose, determining the actual buildable area.
3. Calculate initial capacity by multiplying assumed density by buildable area, resulting in either initial dwelling unit calculations for residential capacity, or square feet of developable floor area for non-residential capacity.
4. Subtract and existing units/development on redevelopable parcels in order to obtain the net capacity by zone.

It is important to note that in Phase 1 data collection, achieved densities were separately calculated for the residential and non-residential components of mixed-use projects. These achieved densities were generally calculated from the number of residential units or commercial/office square footage over the entire parcel area. Calculating density in this manner factors in a split between residential and non-

residential uses into the achieved density, making a separate apportionment of mixed-use zoned land before the assumed density is applied unnecessary. Some jurisdictions preferred to apportion mixed use land to single uses to calculate achieved densities. For these jurisdictions, it was necessary to apply the achieved mixed-use land split to the land supply before applying their assumed densities.

Final Capacity

Creating the final urban growth capacity calculations for each jurisdiction involves applying market factor and employment density assumptions to the general capacity calculation process outlined in Phase 3. This section describes those assumptions.

Market Factor

Market Factor is the estimated percentage of developable land contained within an urban growth area that is likely to remain unavailable over the course of a 20-year planning period and is, in practice, the final non-developable land deduction when calculating lands suitable for development and redevelopment. Appendix E: Market Factor Guidance details considerations jurisdictions used when selecting appropriate assumptions to apply in each zone based on local market conditions or other factors.

Employment Density

Estimating employment densities is the final step in estimating total capacity for new job growth in a jurisdiction. While there are various ways to convert land capacity to capacity for new employment, King County selected to use an approach that converts non-residential development capacity measured in square feet of floor area to capacity for new employment. This conversion requires assumptions for the average number of built square feet of floor area for each job. The lower the square foot per job, the higher the density of use. The calculation is simply:

Total job capacity *= Gross square footage[4] of floor area capacity / gross square footage per job*

Square footage per job can vary widely by building type or employment sector. For example, warehouses devote a great deal of square footage to storing inventory or other goods, and therefore typically require considerably more square footage per job than office uses. Average employment density assumptions should reflect the types of job growth that are expected in an area.

Many jurisdictions selected different employment density assumptions for commercial and industrial zones to reflect different expectations for the type of development and job growth expected in those zones. Some jurisdictions even varied employment density assumptions among different commercial zones. For example, a city may assume that average square footage per job is lower in a downtown zone than in other commercial zones further from the core. This decision could reflect expectations that a higher proportion of the downtown floor area capacity will be used as office space, compared to other commercial zones where lower density retail uses may be more common.

Appendix F: Employment Density Guidance provides additional details about considerations jurisdictions could use when selecting the assumptions.

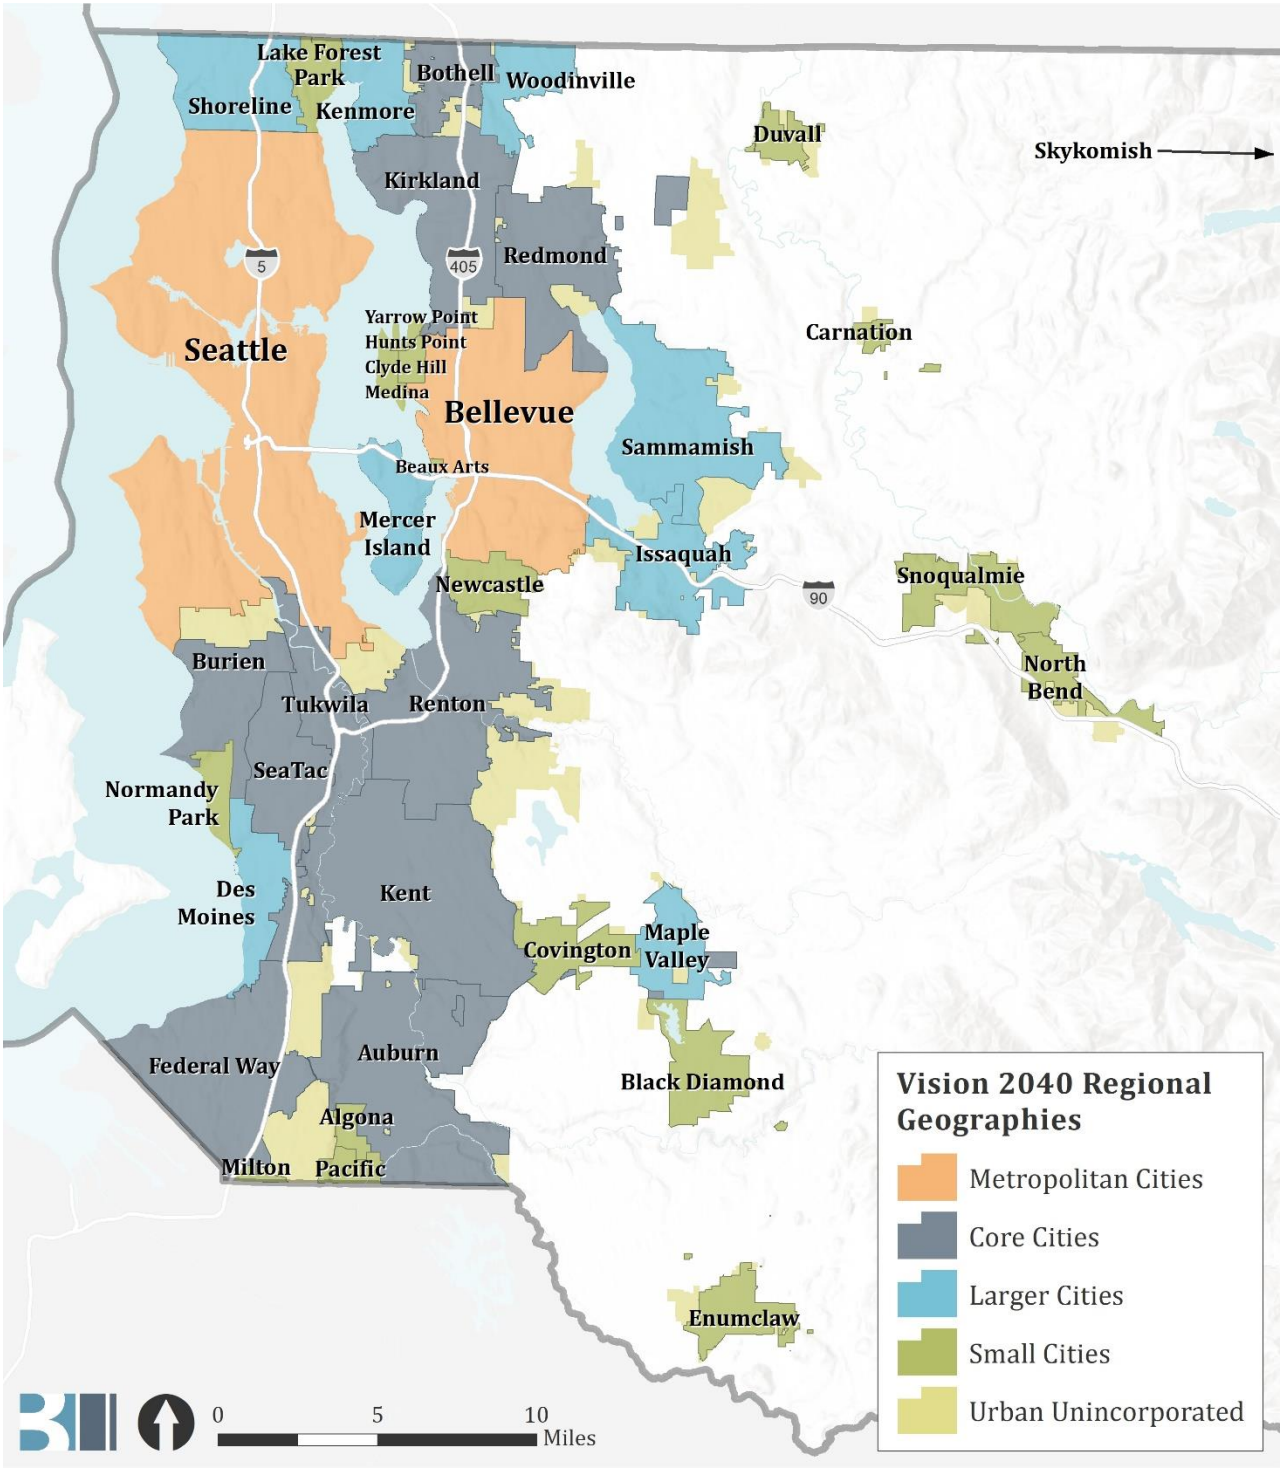
[4] Gross square footage simply refers to the total square footage of the building, including walls. Gross square footage capacity is calculated as the floor area ratio (FAR) * the parcel size in square feet.

Data Review, Land Supply, and Capacity Calculations

Throughout Phases 2 through 4, King County staff, with consultant support, reviewed and summarized data received from the jurisdictions for land supply and capacity. In certain cases, jurisdictions were asked to correct or recalculate portions of the analysis due to inconsistencies discovered in the review process. In other cases, King County staff along with the consultant team reviewed and corrected calculations and sent data back to the jurisdictions for review.

This was an important step for refining the data and providing greater consistency across the entire analysis. The jurisdictions were involved in all conversations when data was changed or corrected, and all data presented in this report have been reviewed and approved by each relevant jurisdiction.

Ch. 3 Development Trends



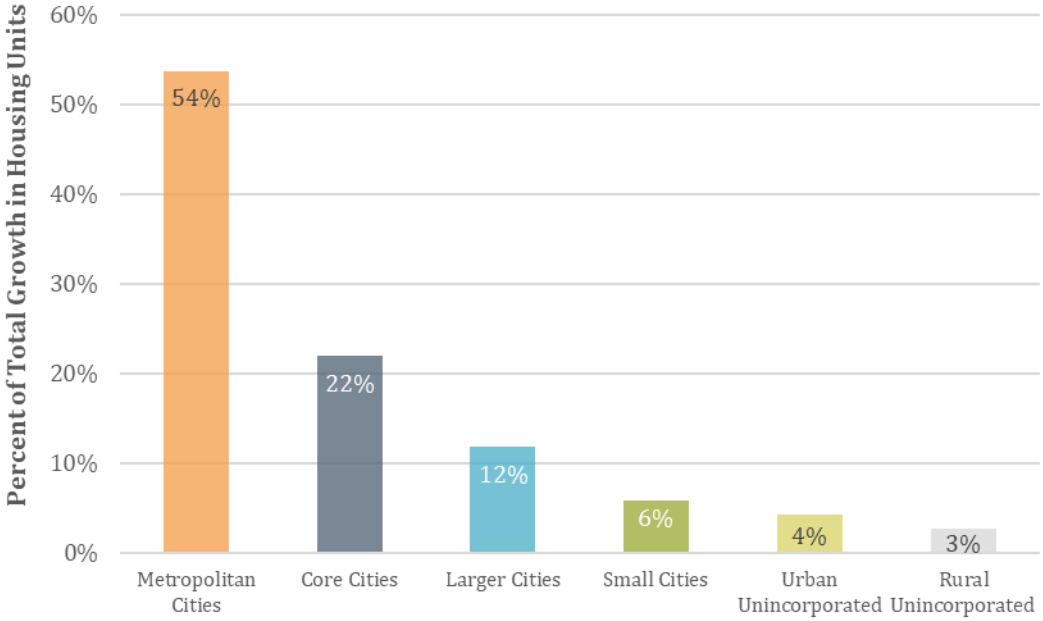
This chapter reviews residential and employment growth trends in King County between 2006 and 2018. It also compares these trends to growth targets set in the 2012 King County Countywide Planning Policies and subsequently extended to 2035.[5] These targets include growth for the Urban Growth Area as a whole, individual jurisdictions, and a set of five Regional Geographies for grouping individual jurisdictions: Metropolitan Cities, Core Cities, Larger Cities, Small Cities, and Urban Unincorporated areas (for a map, see Exhibit 10).

Regional Geographies used in this chapter are based on Puget Sound Regional Council's VISON 2040 regional plan, as the 2006-2035 targets were adopted using the VISION 2040 plan as a framework. They should not be confused with the new VISION 2050 Regional Geographies King County adopted in 2020. Chapter 6 will use the new Regional Geographies to summarize capacity with an eye towards planning for new 2019-2044 growth targets.

The final section of this chapter summarizes development trends in rural areas.

[5] King County extended the 2006-2031 growth targets out to 2035 using a linear projection based on continuing the same average annual growth rate. These 2035 targets may vary from land use assumptions used in local comprehensive plans for jurisdictions that selected a different method for extending their 2031 growth targets to 2035.

Exhibit 10. Map of VISION 2040 Regional Geographies Used for 2035 Growth Targets

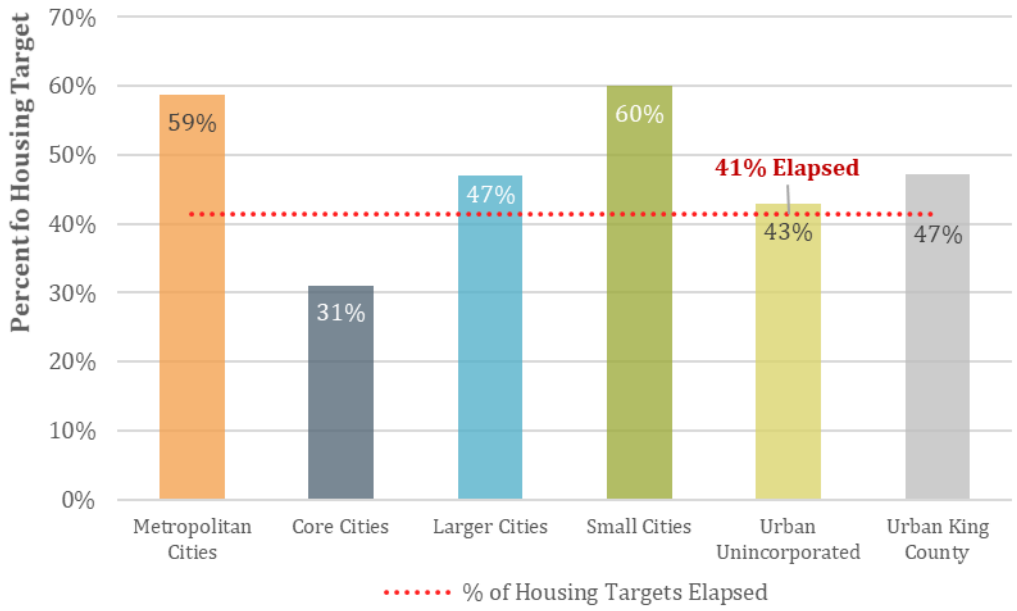


Source: PSRC VISION 2040; BERK, 2021.

Residential Growth Trends

Between 2006 and 2018, the county had a net gain of 415,591 new residents and 130,892 new housing units. The average annual rate of net new housing production was 1.4%. Exhibit 11 shows net new housing with break downs by Regional Geography. Over half of all new housing units were constructed in Metropolitan Cities, with the vast majority in the City of Seattle. During this period only 3% of all housing production was in rural unincorporated areas.

Exhibit 11. Net New Housing Units by Regional Geography, 2006-2018



Source: King County, 2021, based on Washington State Office of Financial Management (OFM) Small Area Estimates[6].

Consistency of Residential Growth with Adopted Targets

As a whole, King County is on pace to meet the 2035 countywide growth target of 276,604 net new units. Exhibit 12 shows progress toward the 2035 housing growth targets. As of 2018, King County was 47% of the way to achieving the 2035 target, compared to 41% of the growth period having elapsed (12 out of 29 years). The exhibit shows that progress by Regional Geography has varied. Collectively, Metropolitan Cities, Larger Cities, and Small Cities have all growth at a faster pace than needed to achieve their targets in 2035. On the other hand, Core Cities have grown more slowly than needed to achieve their 2035 targets.

[6] All 2006 and 2018 city and urban unincorporated area estimates in this chapter are sourced from block-level data from the WA Office of Financial Management (OFM) Small Area Estimates Program. This source was used to develop jurisdictional estimates for both years that reflect approximate current municipal boundaries to control for growth due to annexation. Some variation from OFM official April 1st population estimates for jurisdictions will be evident.

Exhibit 12. Progress Towards 2035 Housing Targets, 2006-2018

Source: King County, 2021, based on OFM Small Area Estimates.

Exhibit 13 compares housing growth to targets for each jurisdiction. The column with colored cells (% of 2035 Target Pace) measures the progress of each city and urban unincorporated King County compared to the pace needed to achieve their 2035 target. A value of 100% indicates the jurisdiction was growing at exactly the right rate to meet their 2035 target, while lower values indicate the jurisdiction was growing at a slower rate than implied in the growth target. For jurisdictions growing slower than the target pace, the color of the cell indicates how close the pace of growth is to target. Jurisdictions very close to the target pace are shown in green, while those further from the pace are in yellow, orange, or red. The number of jurisdictions that grew significantly slower than the target pace are relatively few. Cities that have significantly over paced their target rate were generally affected by having very small residential targets. Note that data for cities that straddle two counties include only the King County portion.

Exhibit 13. Residential Growth Compared to Targets, 2006-2018

City/Jurisdiction	2006 Total Housing Units	2006-2035 Housing Target	2006-2018 Housing Production	2018 Total Housing Units	% of 2035 HU target pace	Remaining 2035 Target	Annual Growth Needed to Achieve Target

Achieved Residential Density

This section evaluates achieved density in dwelling units per acre for residential construction that was permitted between 2012 and 2018. Achieved density varied significantly between Regional Geographies, as shown in Exhibit 14. Metropolitan Cities permitted housing at ~105 du/acre on average, while in the remainder of the county average density ranged between 6 and 21 units per acre.

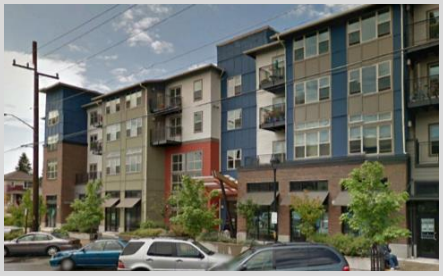
Exhibit 14. Average Achieved Density of Permitted Housing Units, 2012-2018

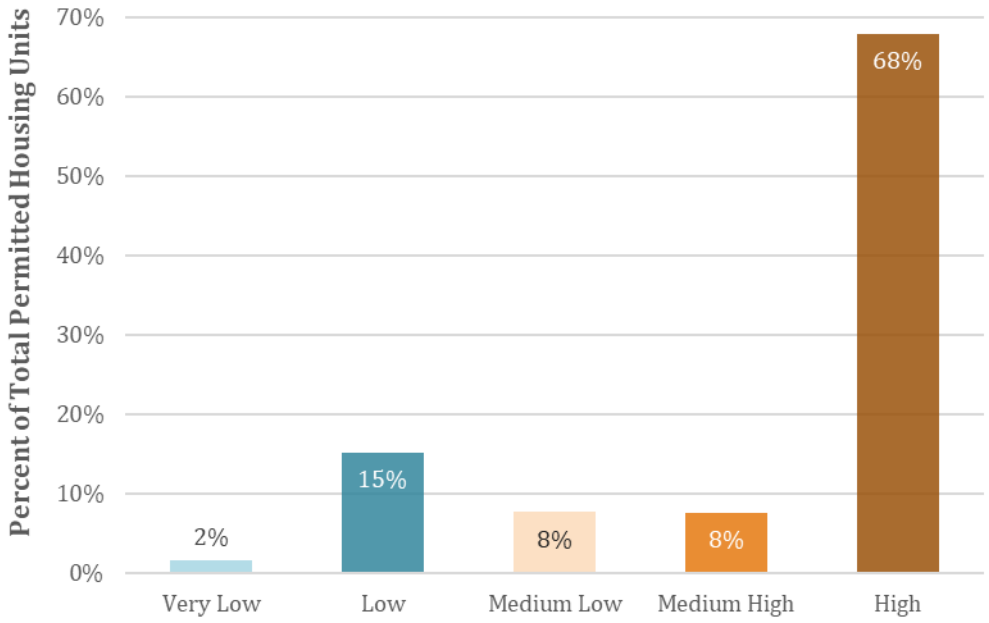
Source: BERK, 2021, based on permit data summarized by King County jurisdictions.

The density of new housing development is strongly related to the types of housing that are provided. This study summarizes development by density level categories[7] that correspond to typical residential development styles. Exhibit 15 shows the categories used in the study, as well as examples of development in King County which fall into each category. Allowing for, and encouraging, new housing development in a variety of housing types is an important way to increase housing diversity. When a community provides a greater diversity of housing options it can meet the housing needs of a greater diversity of household types.

[7] Note that these density levels are based on dwelling units per *net* acre. In other words, net density measures units per acre on individual buildable lots. It excludes street right of ways and common areas.

Exhibit 15. Categories for Summarizing Achieved Residential Density





Density Level	Units per Net Acre	Description	Example
Very low	Less than 4	Detached single family homes on large lots	
Low	4-10	Detached single family homes at typical suburban density level Image: Single family neighborhood in Snoqualmie, WA	
Medium-Low	10-24	Small lot single family homes, duplex, triplex, & lower-density townhouses Image: Triplex in Issaquah Highlands, WA	
Medium-High	24-48	Low-rise apartments and condominiums; higher-density townhomes. Image: 5th Avenue condominiums in Kirkland, WA.	
High	48+	Mid- and high-rise apartments and condominiums. Image: Nia apartments in White Center (King County), WA.	

Image sources: mschellhase/flickr.com (Very Low) and Bob Bengford/Google Street View, 2017 (other categories).

Over two-thirds of all newly permitted housing units were High density (48+ units per acre), as shown in Exhibit 16. Housing in this category would almost exclusively be in multifamily buildings such as apartments or condominiums. About 17% of all housing development was in the Low or Very Low categories, indicating single-family housing built at 10 units per acre or less. Only 15% of all housing production was built at Medium densities between 10 and 48 units per acre. Residences in these categories could include "missing middle" formats such as small lot single family, multiplexes, townhomes, and some low-rise apartments or condominiums.

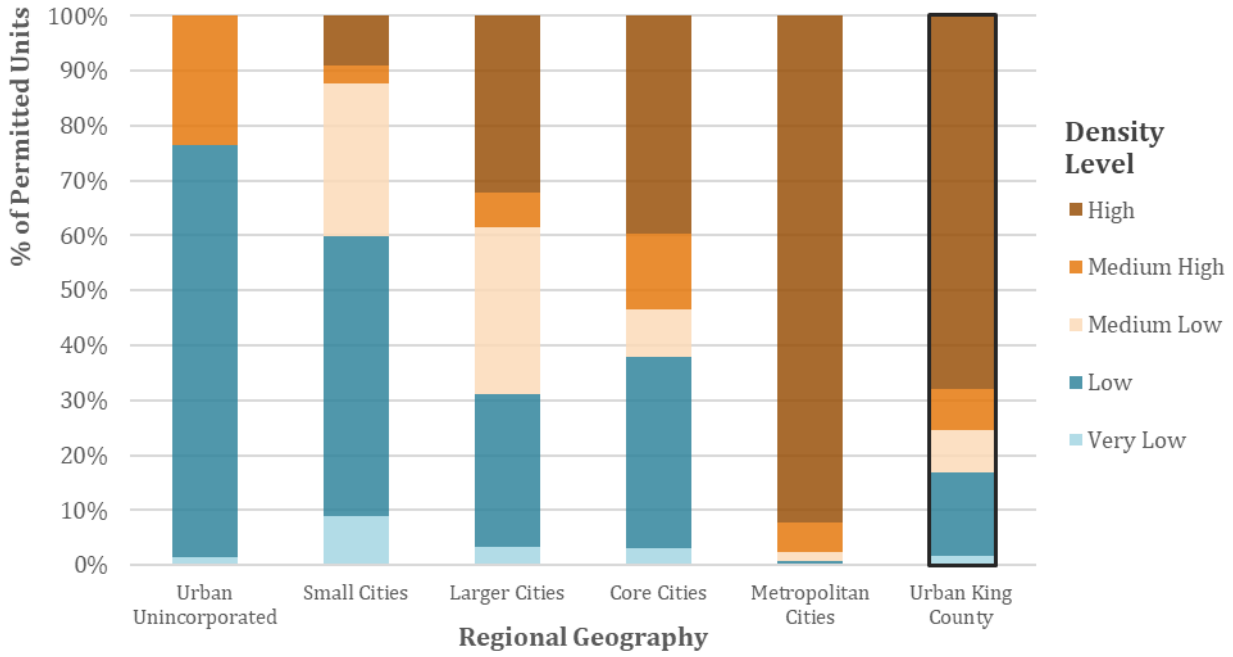


Exhibit 16. Countywide Permitted Housing Units by Achieved Density, 2012-2018

Source: BERK, 2021, based on permit data summarized by King County jurisdictions.

Exhibit 17 shows the distribution of achieved density for each Regional Geography. Over 90% of permitted units in Metropolitan Cities were in the High density housing range. High density housing also accounted for between 30% and 40% of permitted units in Core Cities and Larger Cities, both of which included a diversity of different density levels. In Urban Unincorporated and Small Cities, Low and Very Low density development was most common.

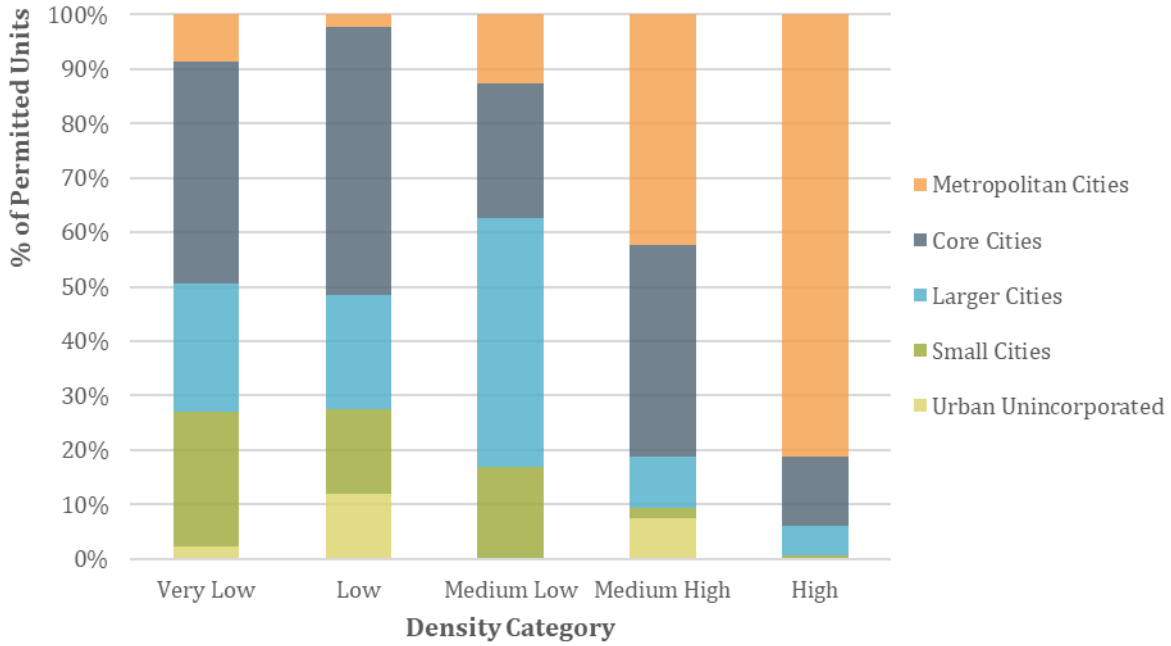

Exhibit 17. Permitted Housing Units by Regional Geography and Achieved Density, 2012-2018

Source: BERK, 2021, based on permit data summarized by King County jurisdictions.

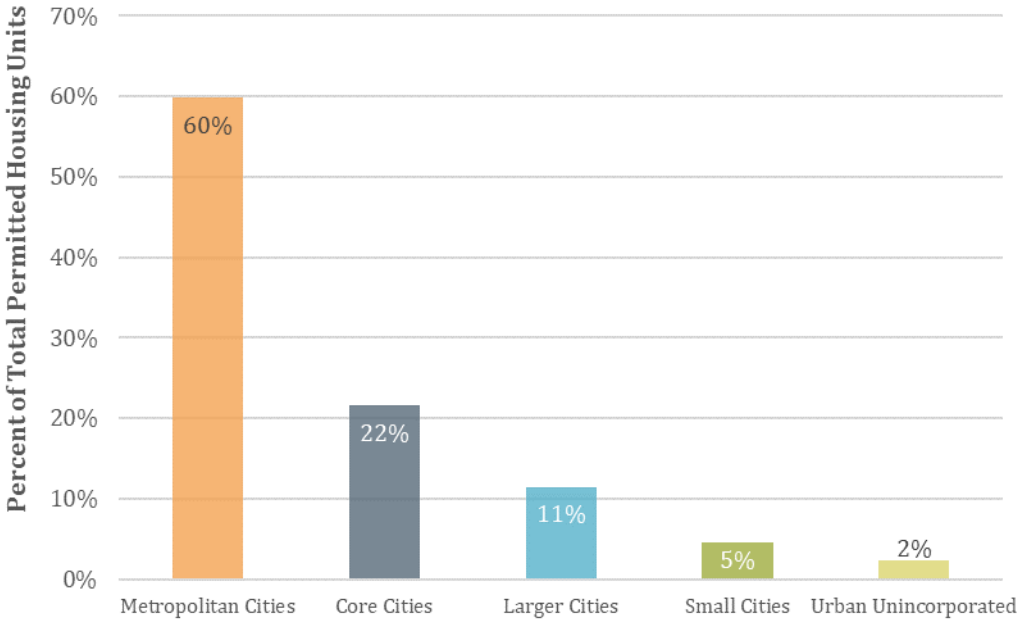

Exhibit 18 presents the same permit data transposed to show the distribution by Regional Geography for each achieved density level. Not surprisingly, the vast majority of the High density growth occurred in Metropolitan Cities. Most of the Medium-High density growth was split between Metropolitan Cities and Core Cities. About 70% of both Low and Medium-Low density growth occurred in Core Cities and Larger Cities.

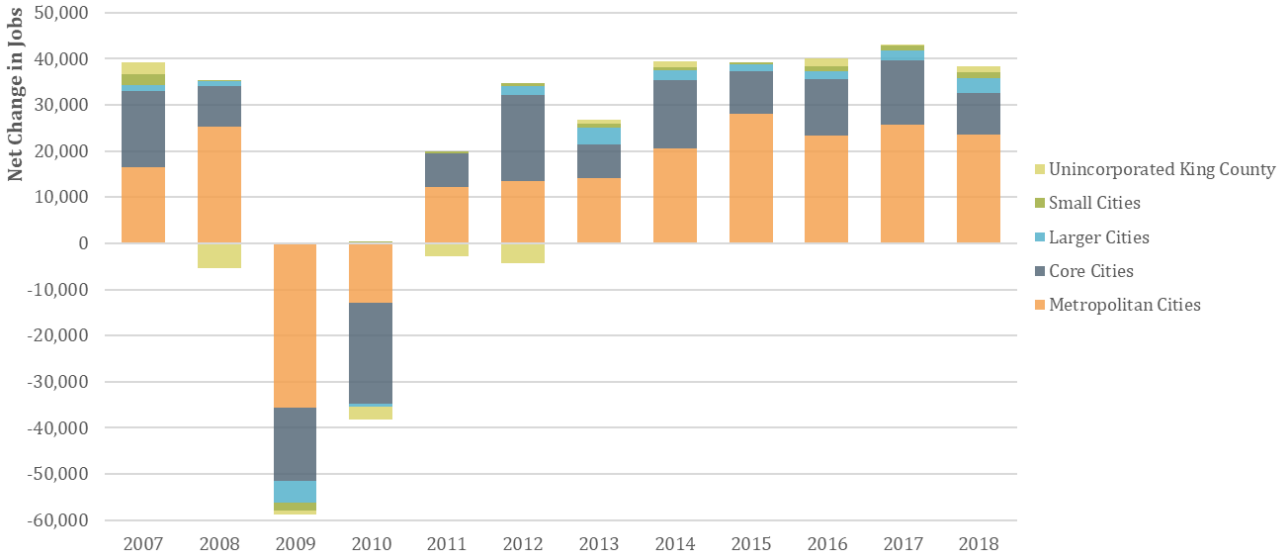
Exhibit 19. Permitted Housing Units by Regional Geography, 2006-2018



Source: BERK, 2021, based on permit data summarized by King County jurisdictions.

Employment Growth Trends

Between 2006 and 2018, the county had a net gain of 246,475 new jobs. The average annual rate of job growth was 1.8%. Exhibit 20 shows annual gain or loss of jobs by Regional Geography. It shows significant job losses during Great Recession in 2009 and 2010. It also shows smaller losses of jobs in Unincorporated King County in 2008, 2011, and 2012. These are likely due to annexations of unincorporated areas into cities, which would represent a shift of jobs from one Regional Geography category to another rather than actual job losses. With regards to job growth, these trends show annual gains highly concentrated in Metropolitan and Core Cities.

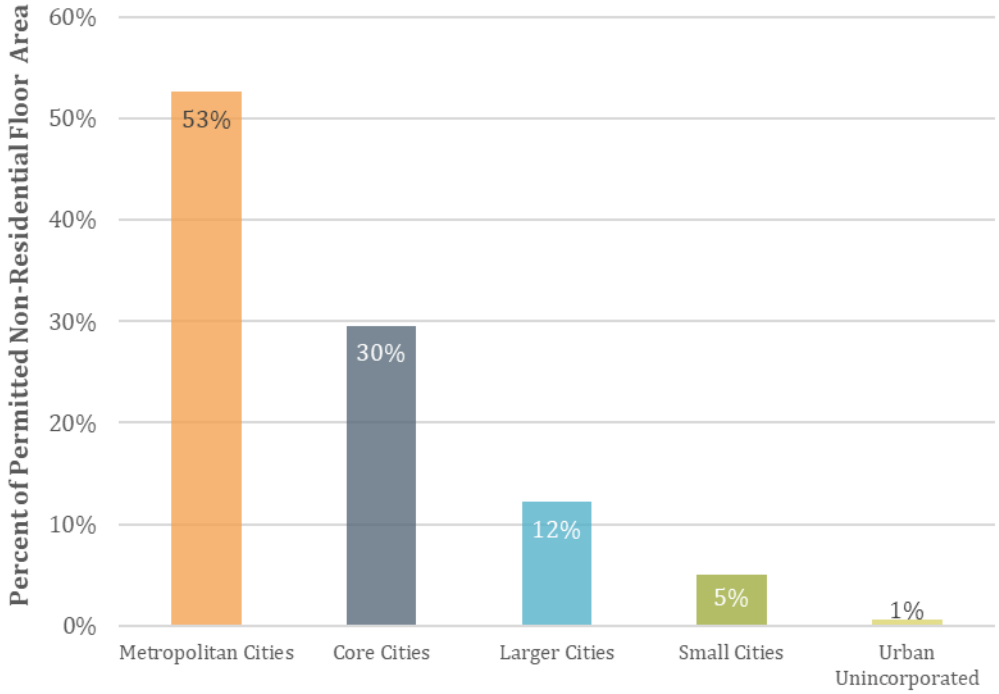


Exhibit 20: Annual Net Change in Jobs by Regional Geography, 2007-2018

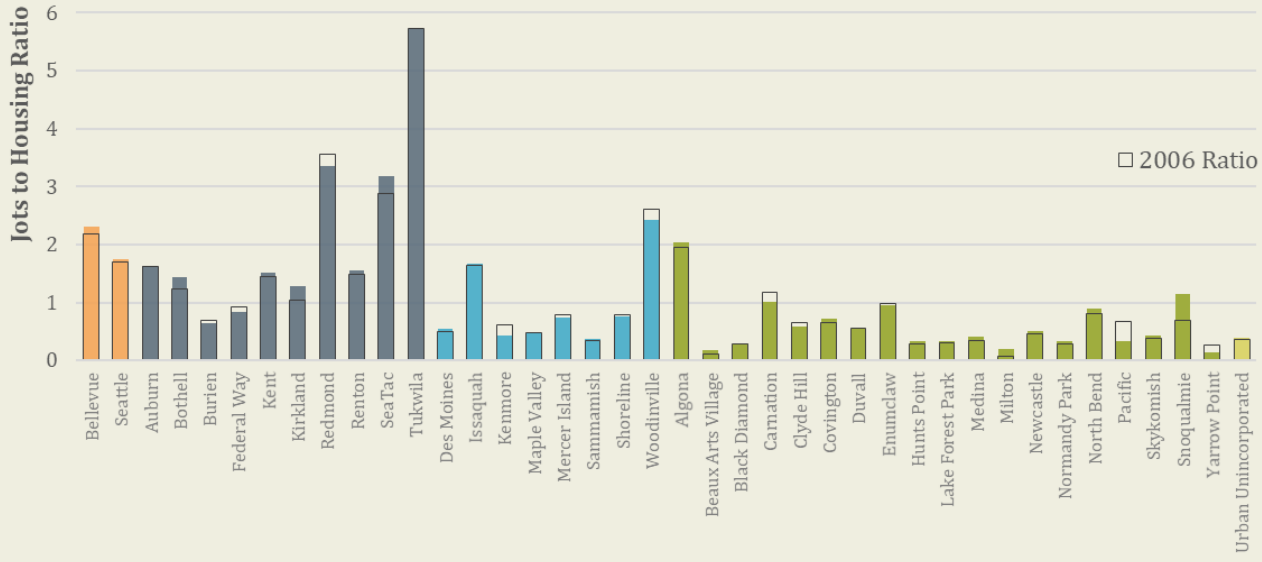
Source: PSRC, 2020.

Exhibit 21 breaks down all non-residential development permitted in urban King County by Regional Geography. Over half of this growth was within Metropolitan Cities, and nearly a third was in Core Cities. The other geographies had much smaller shares.

Exhibit 21. Permitted Non-Residential Floor Area by Regional Geography, 2012-2018

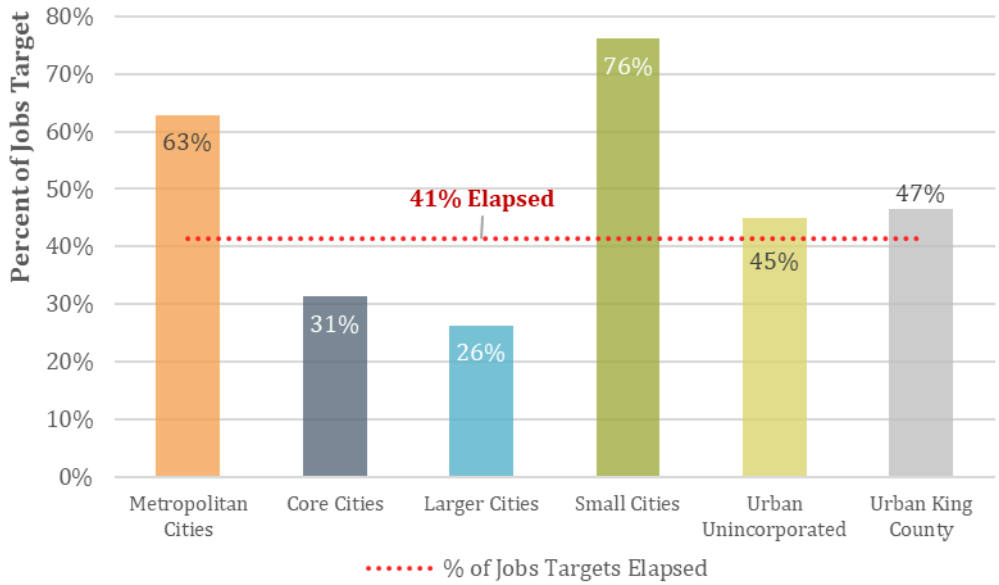


Source: BERK, 2021, based on permit data summarized by King County jurisdictions.

Jobs Housing Balance

The chart below shows the ratio of jobs to housing units for each Regional Geography. Metropolitan Cities and Core Cities are significantly higher than other geographies, reflecting their roles containing King County's primary employment centers. The following exhibit shows the same ratio calculated for each individual jurisdiction. There is significant variation, with Tukwila, SeaTac, and Redmond each standing out with relatively high ratios.

Exhibit 22. Jobs to Housing Ratio by Jurisdiction (2018 vs 2006)

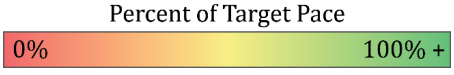


Source: PSRC, 2020; OFM, 2020.

Consistency of Employment Growth with Adopted Targets

As a whole, urban King County is on pace to hit the 2035 countywide growth target of 488,659 net new jobs. Exhibit 23 shows progress toward the 2035 job growth targets. As of 2018, King County was 47% of the way to achieving the 2035 target, compared to 41% of the growth period having elapsed (12 out of 29 years). The exhibit shows that progress by Regional Geography has varied. As a category, both Metropolitan Cities and Small Cities have grown at a faster pace than needed to achieve their targets in 2035. On the other hand, Core Cities and Large Cities have grown more slowly than needed to achieve their 2035 targets.

Exhibit 23. Progress Toward 2035 Jobs Target by Regional Geography, 2006-2018



Source: King County, 2021; PSRC, 2020.

Exhibit 24 compares job growth to targets for each jurisdiction. The column with colored cells (% of Jobs Target Pace) measures the progress of each city and unincorporated urban King County compared to the pace needed to achieve their 2035 target. A value of 100% indicates the jurisdiction was growing at exactly the right rate to hit their 2035 target while lower values indicate the jurisdiction was growing at a slower rate than implied in the growth target. For jurisdictions growing slower than the target pace, the color of the cell indicates how close the pace of growth is to target. Jurisdictions close to the target pace are shown in green, while those further from the pace are in yellow, orange, or red.

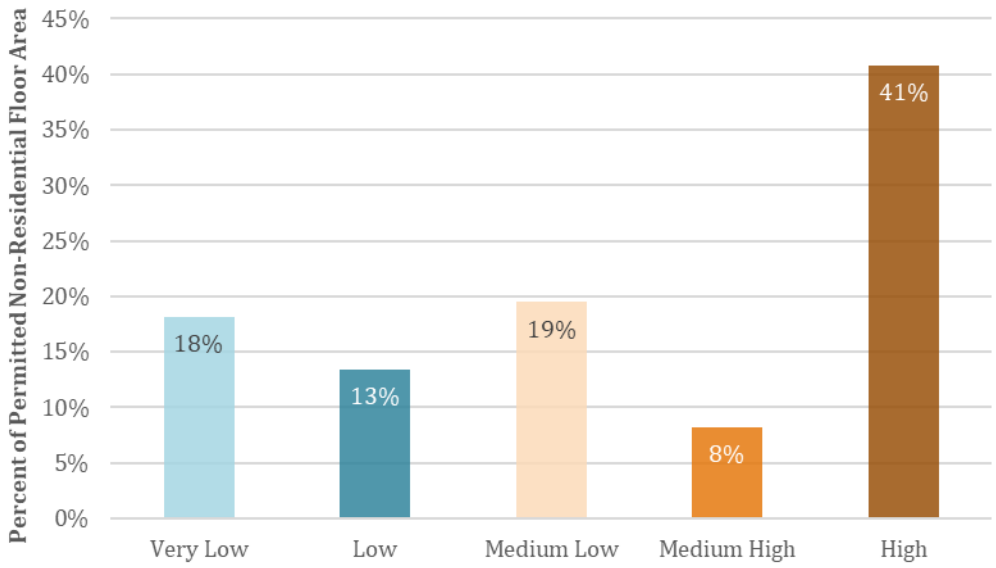
Achieved Non-Residential Density



For non-residential construction that occurred between 2012 and 2018, jurisdictions evaluated achieved density in floor area ratio (FAR). This metric compares the built floor area of structures to the total area of the parcel. For multistory buildings, this method sums floor area on each story. This can result in floor area ratios greater than 1.0. When presenting the results of this analysis, this report summarizes achieved density in five density categories, shown in Exhibit 25.

Exhibit 25. Categories for Summarizing Achieved Non-Residential Density (FAR)

Very Low	Low	Medium-Low	Medium-High	High
Less than 0.35	0.35 – 0.5	0.5 – 1.0	1.0 – 3.0	Greater than 3.0

During the six-year analysis period, about 41% of all newly permitted non-residential development was High density (greater than 3 FAR), as shown in Exhibit 26. Medium-Low and Very Low were the two next common density levels. Medium-High was the least common with only 8% of all development.

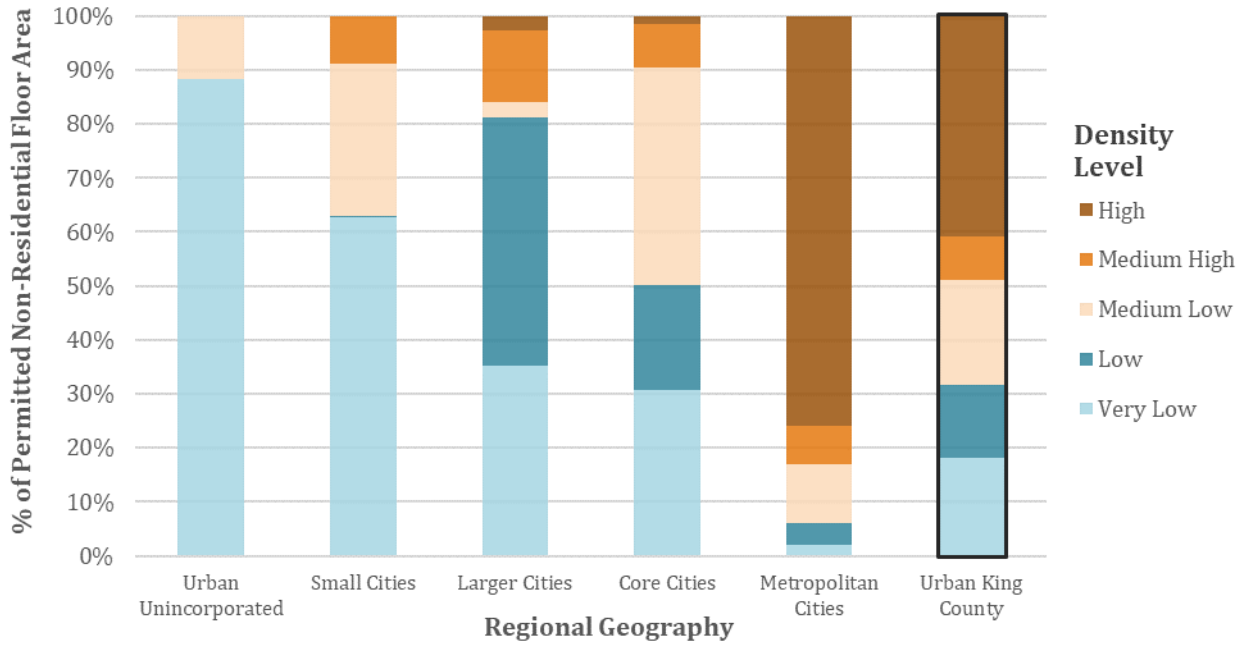


Exhibit 26. Permitted Non-Residential Development by Achieved Density Level, 2012-2018

Source: BERK, 2021, based on permit data summarized by King County jurisdictions.

Exhibit 27 shows the distribution of achieved non-residential density for each Regional Geography. About 75% of build square footage in Metropolitan Cities was developed at High density. In all other Regional Geographies, Low or Very Low development accounted for half or more of all square footage.

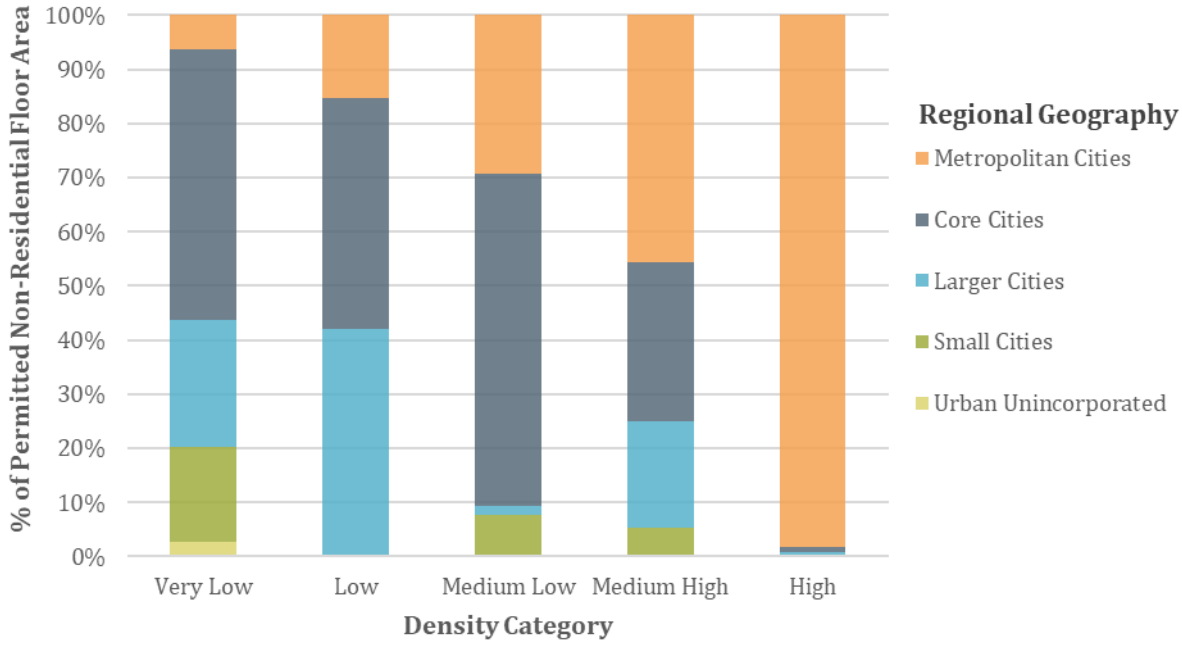

Exhibit 27. Permitted Non-Residential Development by Regional Geography and Achieved Density, 2012-2018

Source: BERK, 2021, based on permit data summarized by King County jurisdictions.

Exhibit 28 presents the same permit data transposed to show the distribution by Regional Geography for each achieved density level. Not surprisingly, nearly all High-density development occurred in Metropolitan Cities. Development at other density levels was spread out across different Regional Geographies. The one exception is Urban Unincorporated, which saw very limited development overall and mostly in Very Low density projects.

Exhibit 28. Permitted Non-Residential Development by Achieved Density and Regional Geography, 2012-2018

Source: BERK, 2021, based on permit data summarized by King County jurisdictions.

Rural Development Trends

While the purpose of the Urban Growth Capacity Report is analyze urban development trends and to determine whether King County and its cities have sufficient capacity within the Urban Growth Area to accommodate the county's forecasted population and job growth, RCW 36.70A.215 (2) requires analysis of land uses and development outside the UGA. Such information can be useful in analysis of residential trends and to assist the county in directing its programs to areas of greatest need. It is also helpful in analyzing linkages between urban and rural growth trends. This report examines growth trends on rural and resource lands during the 2012-2018 evaluation period.

Rural Areas and Resource Lands in King County

The landscape of King County's rural and resource areas is characterized by extensive forests, small-scale farms, free-flowing streams, and a variety of residential housing mostly at very low densities. There is no growth target for rural or resource areas. Their role is as supplier of resources including timber and agricultural products, and their primary characteristics include:

- Rural areas cover approximately 300 square miles of King County (15% of the land area) including all of Vashon Island and a band of territory east of the contiguous UGA.
- Resource lands, including designated Forest and Agricultural Production Districts and Mineral Lands, cover about 1,350 square miles or nearly 65% of King County's total land area.

- The entire King County UGA, by contrast, covers 460 square miles, less than 22% of the county's land area.
- Together, the rural- and resource-designated areas cover more than three-fourths of the county's land area but contain only 130,000 people, about 6% of the county's total population.
- The Countywide Planning Policies (CPPs) assume only a small fraction of King County's residential growth will occur in rural- and resource areas; staff projected about two percent of countywide growth for the 2006-35 planning period.

Growth Trends Outside the Urban Growth Area

A major goal of the King County Comprehensive Plan and the Countywide Planning Policies is to focus growth into the Urban Growth Area. As Ch. 4 Growth Capacity demonstrates, King County's Urban Growth Area has sufficient capacity to accommodate its entire growth target. Prior to the adoption of the Growth Management Act in 1991, about 10% to 14% of each year's new residential units were built outside the UGA. Following adoption of the county Comprehensive Plan in 1994, the percent of growth in rural areas has declined precipitously. As growth returned to King County following the Great Recession, permitting in rural King County increased, but remains a small percentage of the county's overall growth. Since 2012, only about 1.5% of new units have been developed outside the UGA, as shown in Exhibit 29. These findings demonstrate that King County is succeeding in directing growth to, and accommodating growth within, the Urban Growth Areas.

Exhibit 29. Permit Trends on Rural and Resource Lands

Year	Total Units Permitted	Units Permitted in the Rural Area	Rural Percent of County total
2012	12,191	92	0.8%
2013	11,688	138	1.2%
2014	13,350	201	1.5%
2015	13,620	215	1.6%
2016	13,300	244	1.8%
2017	14,700	278	1.9%
2018	17,400	260	1.5%

Source: King County/Puget Sound Regional Council, 2020

Key Development Findings on Rural and Resource Lands

The major findings regarding land uses and activities in the rural areas and on resource lands are as follows:

- There are approximately 48,300 existing housing units on rural and resource lands (approximately 43,500 units on rural, 4,800 units on resource lands).
- An average of about 200 of new residential units per year were permitted on rural and resource lands between 2012 and 2018.
- This small amount of growth is expected to continue, consistent with the assumption in the CPPs of a small fraction of residential growth occurring in rural areas and resource lands.
- Of approximately 66,000 total parcels in rural and resource areas, about 56,000 are developed with residential, commercial, public or open space use. Another 10,000 parcels are vacant or in an accessory use.
- Many parcels in rural areas are smaller than the minimum lot size, because they were created long ago, before current zoning was in place.
- At current rates of residential permitting, the rural area will still have undeveloped lots at the end of the planning period in 2035.

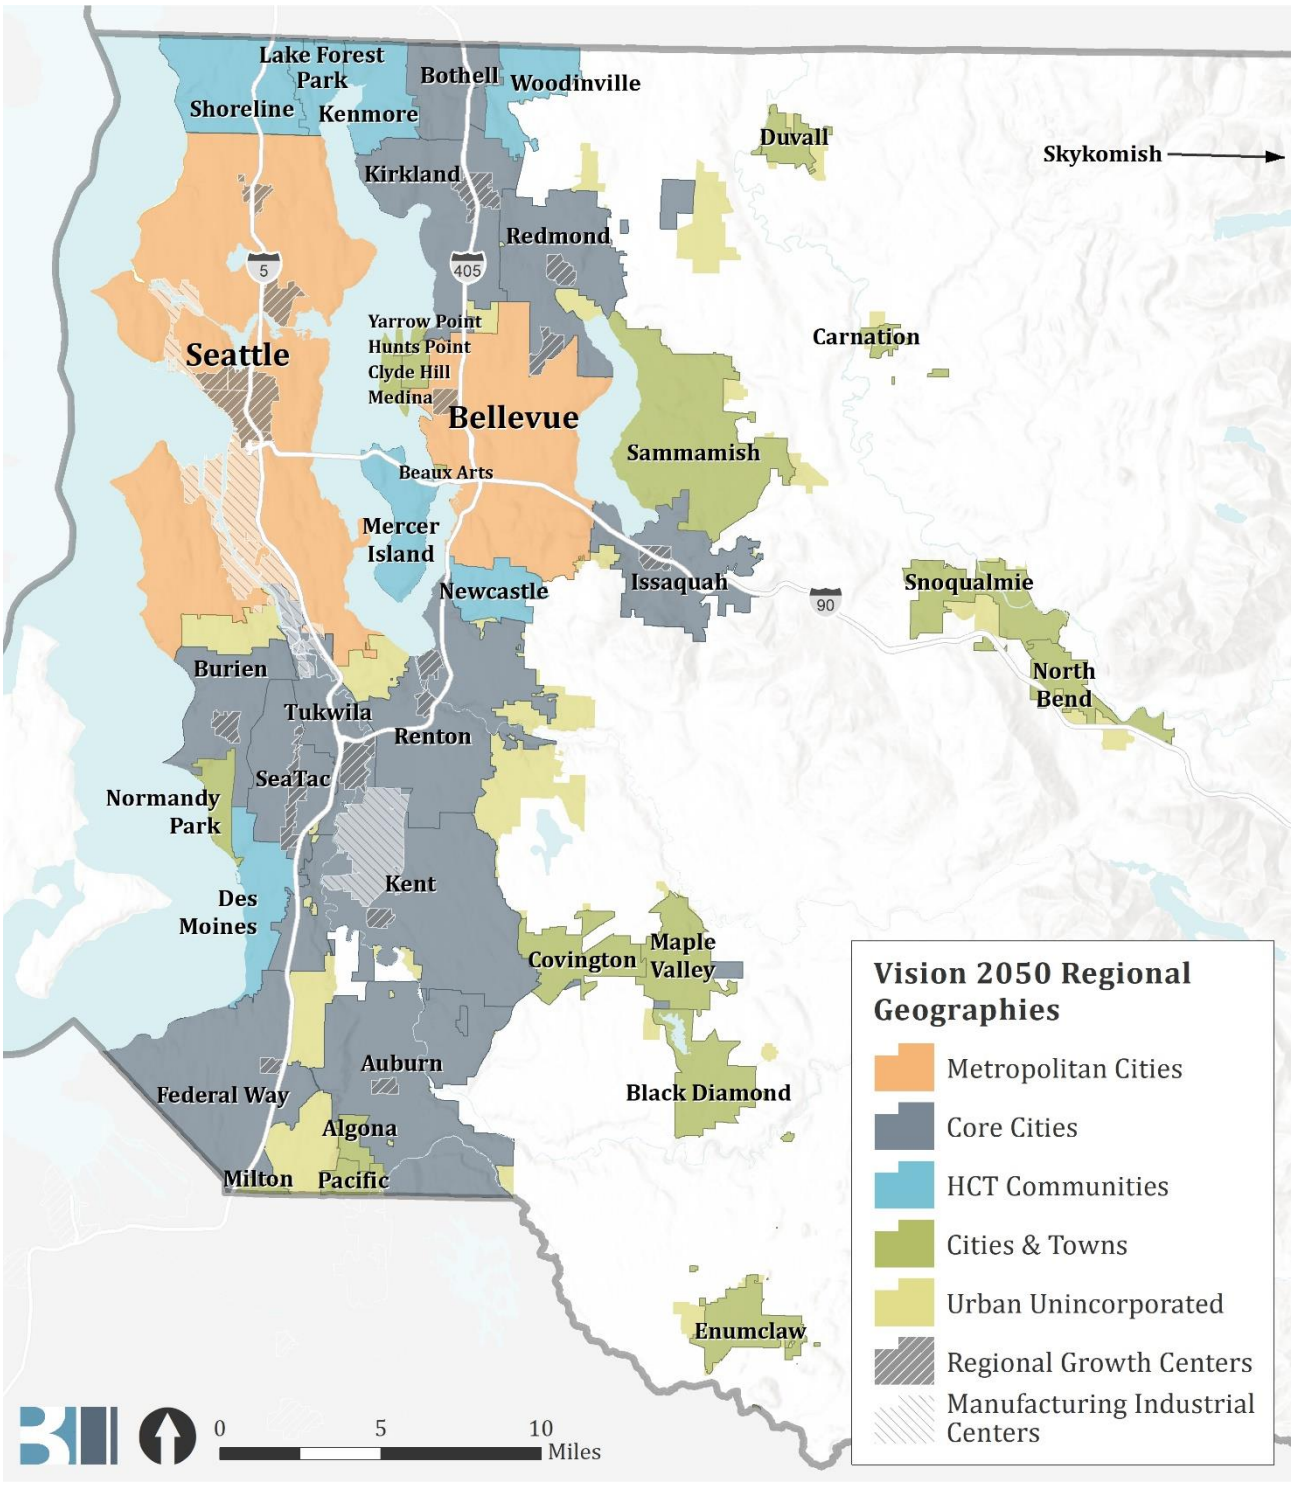
For commercial and industrial uses on rural and resource lands, the major finding was as follows:

- There are approximately 150 vacant parcels zoned for commercial or industrial uses in rural and resource lands, covering over 2,000 acres.
- Approximately 40 of these parcels are on designated resource land, accounting for over half of the vacant non-residential area, nearly 1,200 acres.
- A limited amount of non-residential development occurred on rural parcels from 2012-2018. A majority of the non-residential development was school or church buildings.
- Excluding the school, church and accessory development, approximately 50,000 square feet of development was constructed across 6 different developments.

Ch. 4 Growth Capacity

This chapter presents urban growth capacity for housing and jobs in King County. Summaries include capacity for the county as a whole, individual jurisdictions, and a set of five Regional Geographies for grouping individual jurisdictions based on the Puget Sound Regional Council (PSRC) VISION 2050 growth plan: Metropolitan Cities, Core Cities, High Capacity Transit (HCT) Communities, Cities & Towns, and Urban Unincorporated areas.

PSRC designated three unincorporated potential annexation areas (PAAs), Federal Way PAA, North Highline PAA, and Renton PAA, as HCT Communities. However, for capacity results in this chapter, data for HCT Communities excludes all unincorporated areas and groups the PAAs into the Urban Unincorporated areas. See Exhibit 30 for a map of jurisdictions by Regional Geography.



The Regional Geographies used in this chapter and in the jurisdictional profiles in Chapter 7 should not be confused with the older VISION 2040 Regional Geographies discussed in Chapter 4. These new geographies are consistent with those used in the VISION 2050 multicounty planning policies developed through PSRC in 2020, although all unincorporated urban areas are included in the urban unincorporated category.

General Findings

As a whole, King County has growth capacity of 406,124 housing units and 612,632 jobs in the urban areas of the county. This capacity is distributed within jurisdictions across the county, as shown in Exhibit 31. This exhibit breaks down both housing and employment capacity by VISION 2050 Regional Geography, and it shows the share of capacity by jurisdiction within each geography. Note that data for cities that straddle two counties include only the King County portion.[8]

[8] These cities include Auburn, Bothell, Milton, and Pacific.

Findings by Regional Geography

Exhibit 32 summarizes housing and job capacity in King County, with breakdowns by VISION 2050 Regional Geographies. Nearly half of all housing capacity is in the Metropolitan Cities (Seattle and Bellevue), with another 32% of capacity located in Core Cities. Job capacity is even more focused in Metropolitan Cities and Core Cities. Only 20% of housing capacity and less than 9% of all job capacity is located in the HCT Communities, Cities & Towns, or Urban Unincorporated categories. HCT Communities have a much higher relative share of housing capacity with 12% of countywide total, compared to only 3% of countywide job capacity.

Exhibit 32. Capacity Summary, King County – VISION 2050 Geographies

VISION 2050 Regional Geographies	Total Housing Capacity			Total Job Capacity		
	Units	Percent		Jobs	Percent

Residential Capacity

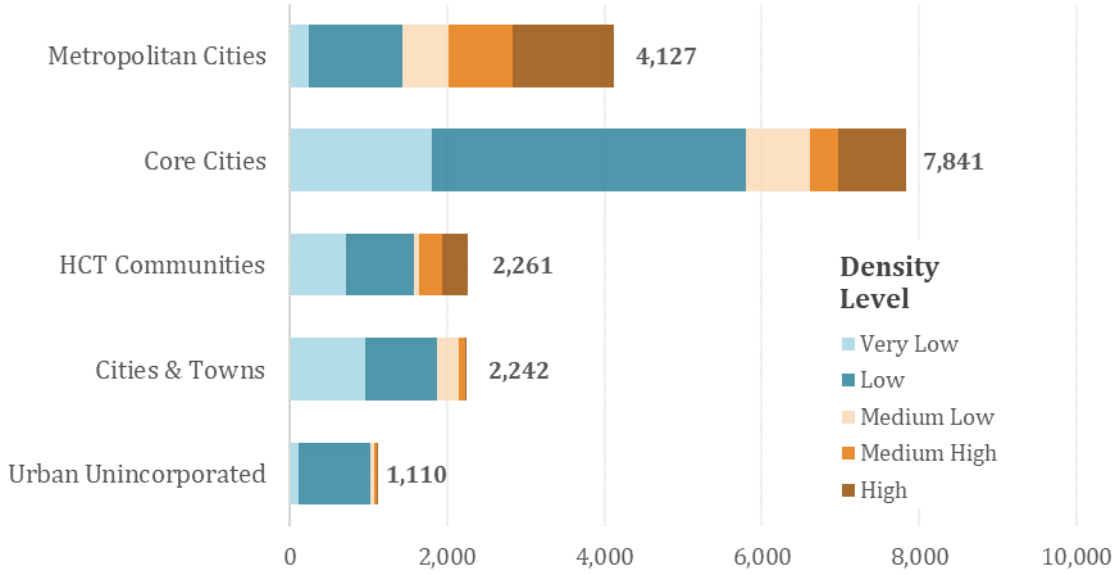
Exhibits in this section are grouped both by VISION 2050 Regional Geographies, as well as by assumed density level. For capacity calculations, individual jurisdictions selected an assumed density level for each zone based on a combination of factors, including the achieved density measured in historic development activity as well as current planned density. See Chapter 3 for more information about achieved density.

For residential capacity, each zone is categorized by density level according to the assumed dwelling units per acre (du/acre) for future development. Exhibits reporting residential capacity throughout the rest of this report rely on the following density levels, consistent with the categorization of achieved density levels in Ch. 3.

Exhibit 33. Assumed Density Levels – Residential Capacity (dwelling units per acre)

Very Low	Low	Medium-Low	Medium-High	High
Less than 4	4 - 10	10 – 24	24 – 48	Greater than 48

Source: BERK, 2021



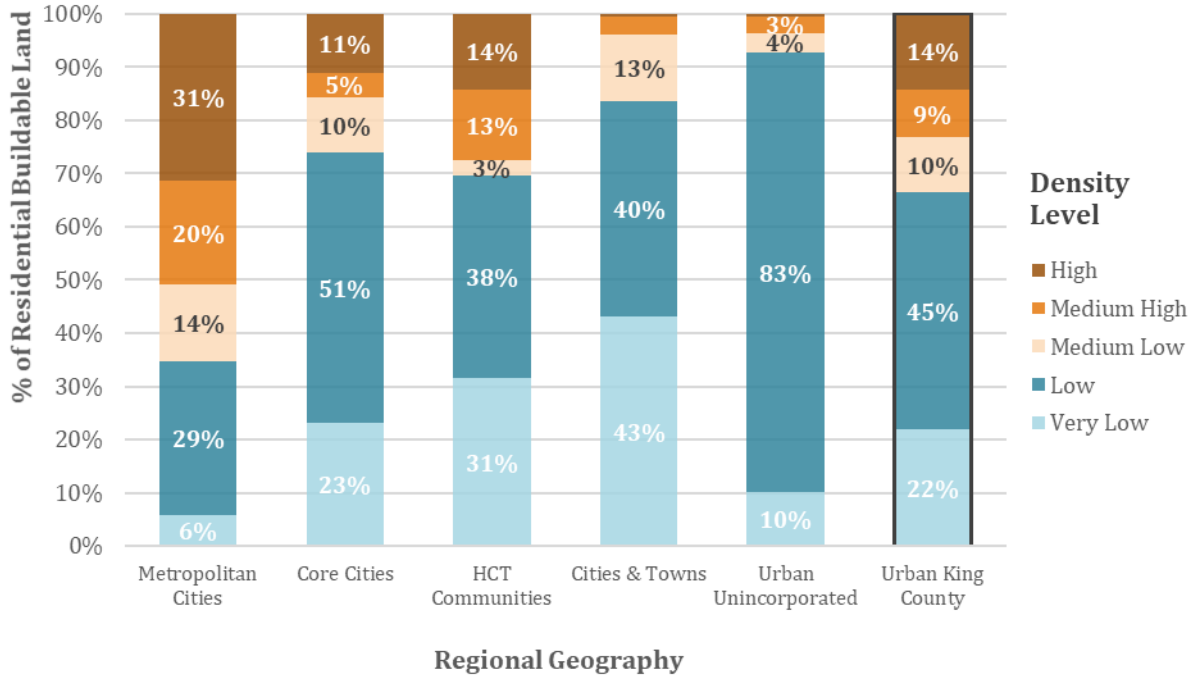
Residential Land Supply

Exhibit 34 and Exhibit 35 show the breakdown of the net buildable land for residential development after all deductions have been made. Deductions include the removal of non-buildable critical acres and critical area buffers, infrastructure constrained areas, future rights of way and usage for public purpose, and market factor. It is important to emphasize that these exhibits do not show growth capacity for new housing units, rather they show the acreage of land available for residential development.

There are 17,581 acres of buildable land available for residential development. Much of that land is grouped in the very low and low assumed density levels. This exhibit highlights the relative higher amount of land available in Very Low and Low density levels.

Exhibit 34. Buildable Residential Land by Assumed Density (acres)

Vision 2050 Geography	Assumed Density					Total	
	Very Low	Low	Medium Low	Medium High	High	#	%
Metropolitan Cities	244	1,190	590	810	1,293	4,127	23%
Core Cities	1,807	3,985	819	363	867	7,841	45%
HCT Communities	712	864	63	302	321	2,261	13%
Cities & Towns	965	906	284	76	11	2,242	13%
Urban Unincorporated	108	921	41	33	6	1,110	6%
Urban King County	**3,837**	**7,865**	**1,797**	**1,584**	**2,498**	**17,581**	**100%**



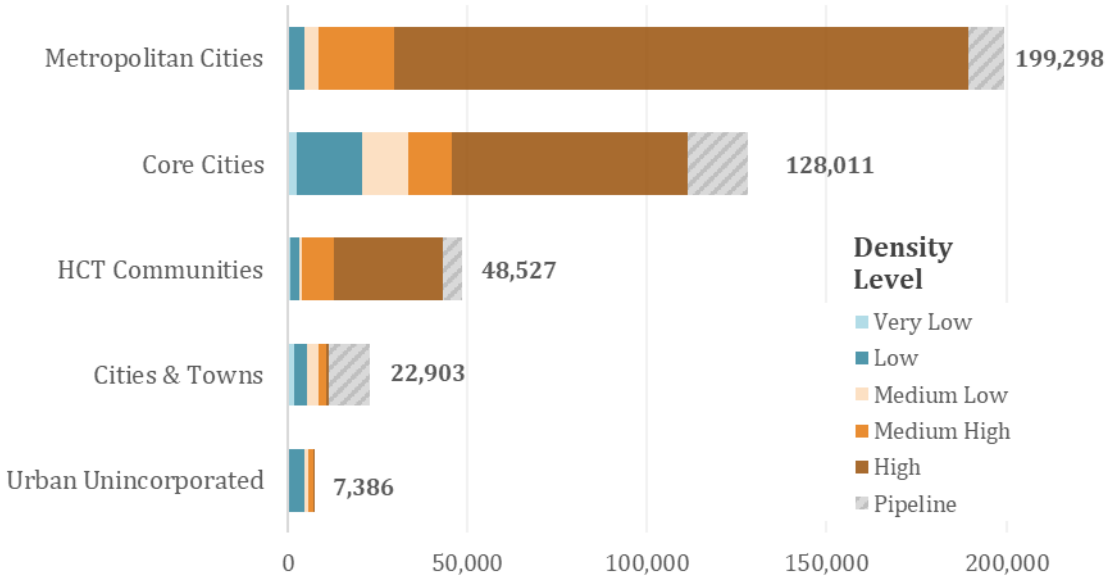
Sources: BERK, 2021; Data provided by individual King County jurisdictions, 2020-2021.

Exhibit 35 shows similar data presented by percent breakdown by geography by assumed density level as opposed to total acres of residential land supply. Metropolitan Cities have the greatest share of land supply allocated for higher density development, with 51% of available land for residential development falling into Medium-High or High density zones. The share of land in these density levels is much lower in the other Regional Geographies. HCT Communities have a somewhat higher share of Medium-High and High density land supply (27%) than Core Cities (16%), likely reflecting a relatively larger share of land in zones established to support transit-oriented residential and mixed-use development.

Across the entire county, two-thirds of residential land supply falls into the Low or Very Low density levels, with just 23% of land supply categorized as High density or Medium-High density. While there

is less residential land supply available at the higher density levels, the higher density levels allow for a far larger relative share of housing unit growth capacity, as discussed in the following section.

Exhibit 35. Percent of Residential Buildable Land by Regional Geography and Assumed Density



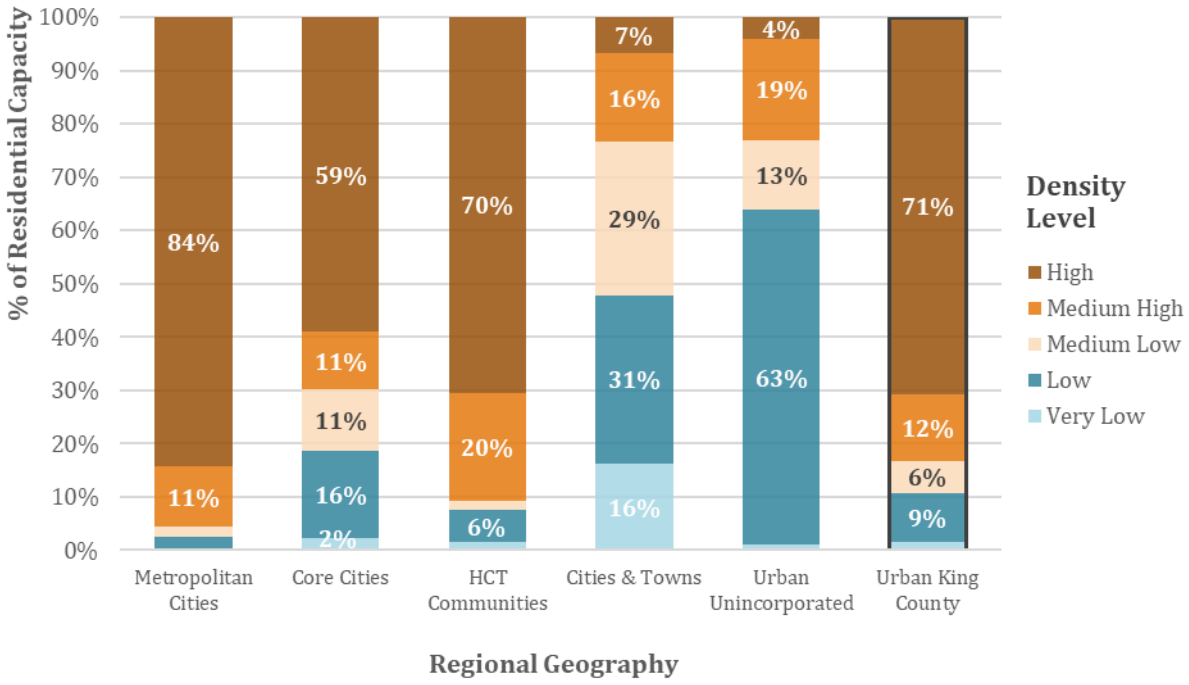
Sources: BERK, 2021; Data provided by individual King County jurisdictions, 2020-2021.

Residential Unit Capacity

Exhibit 36 and Exhibit 37 show residential growth capacity in terms of housing units, broken down by assumed density level and pipeline capacity. Pipeline capacity refers to housing units or non-residential development that has been permitted for construction, but not yet built as of the baseline for this study of January 1, 2019. Parcels with pipeline development are set aside and not counted in the remaining capacity broken down by assumed density level. See Chapter 3 for a more detailed discussion.

Exhibit 36. Housing Capacity by Assumed Density (units)

Vision 2050 Geography	Assumed Density						Total	
	Very Low	Low	Medium Low	Medium High	High	Pipeline	#	%
Metropolitan Cities	438	4,308	3,803	21,053	159,711	9,984	199,298	49%
Core Cities	2,555	18,307	12,778	11,991	65,645	16,734	128,011	32%
HCT Communities	622	2,649	679	8,851	30,486	5,239	48,527	12%
Cities & Towns	1,846	3,558	3,265	1,860	770	11,604	22,903	6%
Urban Unincorporated	68	4,656	964	1,400	298	0	7,386	2%
Urban King County	**5,529**	**33,479**	**21,490**	**45,155**	**256,910**	**43,561**	**406,124**	**100%**



Sources: BERK, 2021; Data provided by individual King County jurisdictions, 2020.

There is growth capacity for nearly 200,000 housing units in Metropolitan Cities, followed by capacity for roughly 128,000 housing units in Core Cities. These two VISION 2050 geographies make up about 80% of urban housing unit capacity in King County. The remaining 20% of capacity found in HCT Communities, with capacity for just under 50,000 housing units; Cities & Towns, with capacity for nearly 23,000 housing units; and the Urban Unincorporated areas, with capacity for nearly 7,400 housing units.

Exhibit 37 shows the percent breakdown of housing unit capacity by assumed density level. Countywide, 71% of urban housing capacity (nearly 257,000 units) is in High density zones (see also Exhibit 36). Almost all of the housing capacity in Metropolitan Cities is in High density zones, and in Core Cities and HCT Communities, the majority of capacity is in High and Medium-High density zones. Cities & Towns and Urban Unincorporated areas have a much greater share of capacity in Low and Very Low density zones.

Exhibit 37. Percent of Non-Pipeline Housing Unit Capacity by Assumed Density

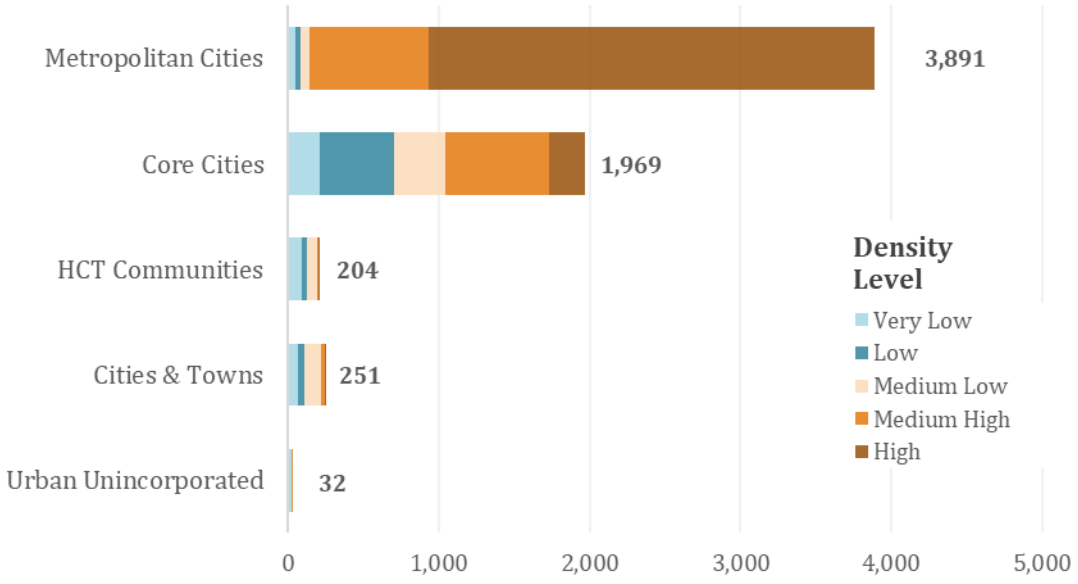
Sources: BERK, 2021; Data provided by individual King County jurisdictions, 2020.

Employment Capacity

Exhibits in this section are grouped both by VISION 2050 Regional Geographies, as well as by assumed density level. For non-residential capacity, each zone is categorized by density level according to the assumed floor area ratio (FAR) for future development. Exhibits reporting non-residential capacity throughout the rest of this report rely on the following density levels, consistent with the categorization of achieved density in Ch. 3.

Exhibit 38. Assumed Density Levels – Non-Residential Capacity (FAR)

Very Low	Low	Medium-Low	Medium-High	High
Less than 0.35	0.35 – 0.5	0.5 – 1.0	1.0 – 3.0	Greater than 3.0



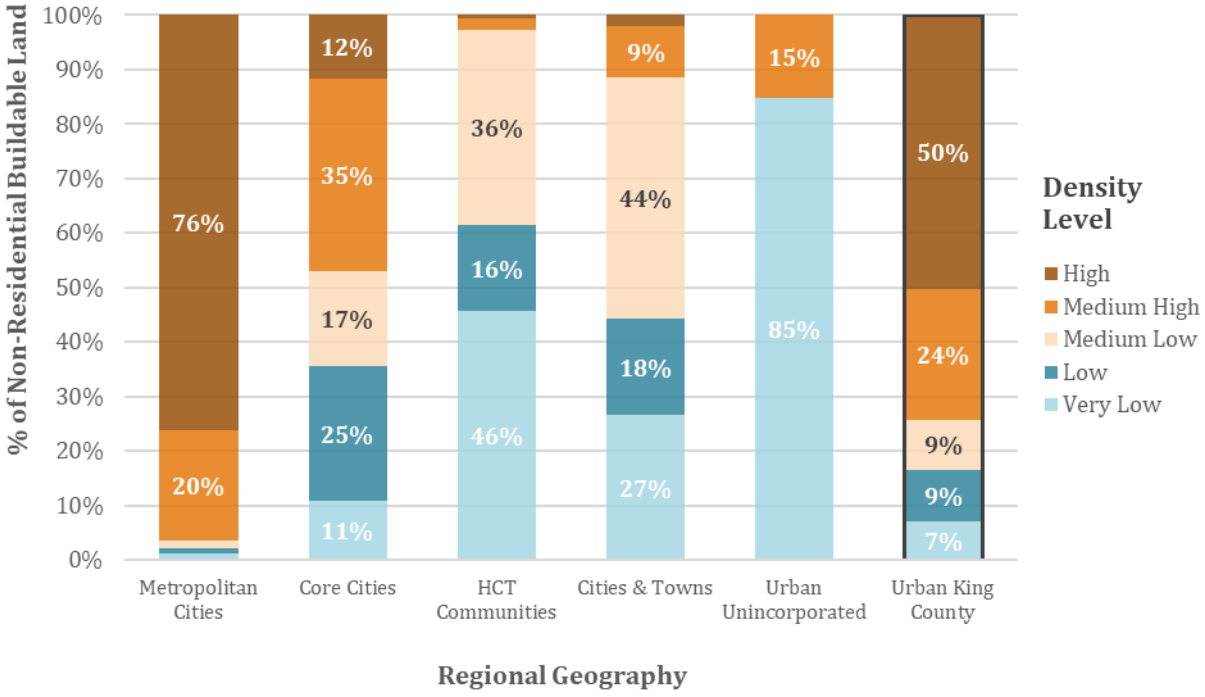
Source: BERK, 2021.

Nonresidential Land Supply

Exhibit 39 and Exhibit 40 show the breakdown of the net buildable land for non-residential development after all deductions have been made. This also includes removal of critical acres and critical area buffers, infrastructure constrained areas, future rights-of-way and usage for public purpose, and market factor. It is important to emphasize that these exhibits do not show growth capacity, rather they show the dispersion of land available for non-residential growth.

Exhibit 39. Buildable Non-Residential Land by Assumed Density (acres)

Geography	Assumed Density Level					Total	
	Very Low	Low	Medium Low	Medium High	High	#	%
Metropolitan Cities	51	35	58	788	2,960	3,891	61%
Core Cities	212	490	343	691	232	1,969	31%
HCT Communities	93	32	73	5	1	204	3%
Cities & Towns	67	45	111	24	5	251	4%
Urban Unincorporated	27	0	0	5	0	32	1%
Urban King County	**450**	**602**	**584**	**1,512**	**3,199**	**6,347**	**100%**



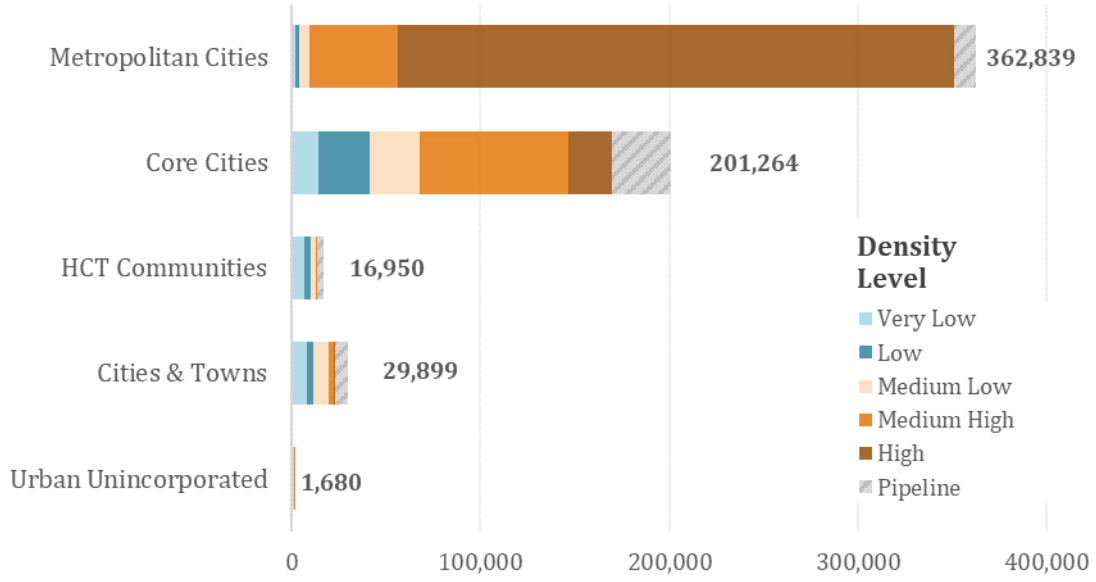
Sources: BERK, 2021; Data provided by individual King County jurisdictions, 2020-2021.

There are roughly 6,350 acres of buildable land available for non-residential development. The overwhelming majority of non-residential land supply is focused in Metropolitan Cities and Core Cities, consistent with the location of regional growth center (RGCs) and manufacturing-industrial centers (MICs) in the VISION 2050 plan (shown in Exhibit 30).

HCT Communities, Cities & Towns, and Urban Unincorporated areas have far less land available for non-residential development, totaling just 8% of total non-residential urban land supply across the county.

Exhibit 40. Percent of Non-Residential Buildable Land by Assumed Density

Note: Metropolitan Cities includes estimated breakdowns of residential/non-residential land supply in Seattle.
Sources: BERK, 2021; Data provided by individual King County jurisdictions, 2020-2021.



Across all of urban King County, half of land available for non-residential development is at the High assumed density level, with the 24% in the Medium-High level, and the remaining land supply spread across the lower assumed density levels. Similar to the residential side of land supply, the Metropolitan Cities have the highest share of buildable land in the High density level, with comparatively less land available for non-residential development available in the Medium-Low, Low, and Very Low density levels. The breakdown is more varied amongst the Core Cities, HCT Communities, and Cities & Towns, with Urban Unincorporated areas being comprised of almost entirely Very Low density land supply for non-residential development.

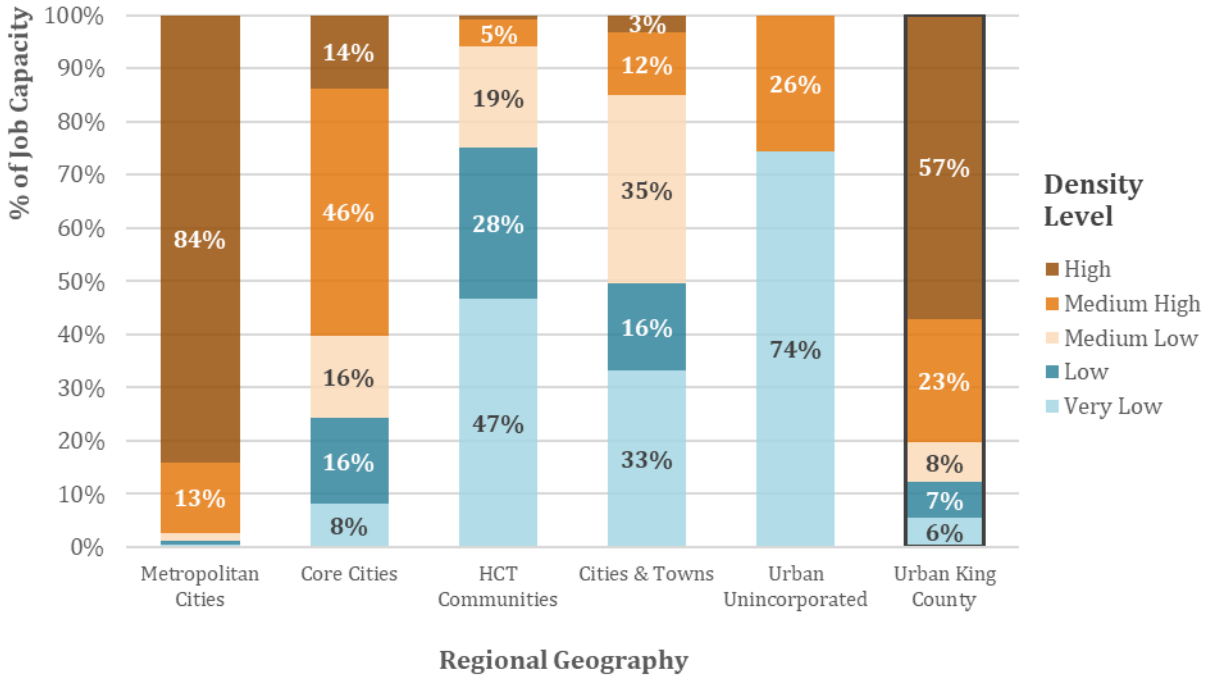
Capacity for Job Growth

Exhibit 41 and Exhibit 42 show non-residential growth capacity in terms of jobs, broken down by assumed density level and pipeline capacity.

Exhibit 41. Job Capacity by Assumed Density (jobs)

Geography	Assumed Density Level						Total	
	Very Low	Low	Medium Low	Medium High	High	Pipeline	#	%
Metropolitan Cities	1,699	2,114	5,517	46,636	295,230	11,645	362,839	59%
Core Cities	13,828	27,289	26,427	78,837	23,229	31,653	201,264	33%
HCT Communities	6,404	3,885	2,586	686	124	3,265	16,950	3%
Cities & Towns	7,668	3,761	8,113	2,725	747	6,884	29,899	5%
Urban Unincorporated	1,251	0	0	429	0	0	1,680	0%
Total	**30,850**	**37,049**	**42,643**	**129,313**	**319,331**	**53,446**	**612,632**	**100%**

Sources: BERK, 2021; Data provided by individual King County jurisdictions, 2020.



The Metropolitan Cities have capacity for over 360,000 jobs, 59% of total urban job capacity in King County. Most of this capacity in both Metropolitan Cities and countywide is in the High assumed density level. Countywide, there is capacity for 319,331 jobs in the High assumed density level, with 295,230 of those found in Metropolitan Cities.

Capacity for another 201,264 jobs is found in Core Cities, 33% of total urban job capacity in King County. This capacity is more evenly spread across the various assumed density levels, with a higher concentration in the Medium-High level.

There is comparatively less job capacity elsewhere in the county, with HCT Communities, Cities & Towns, and Urban Unincorporated areas only comprising roughly 8% of total job capacity, or just over 47,000 jobs.

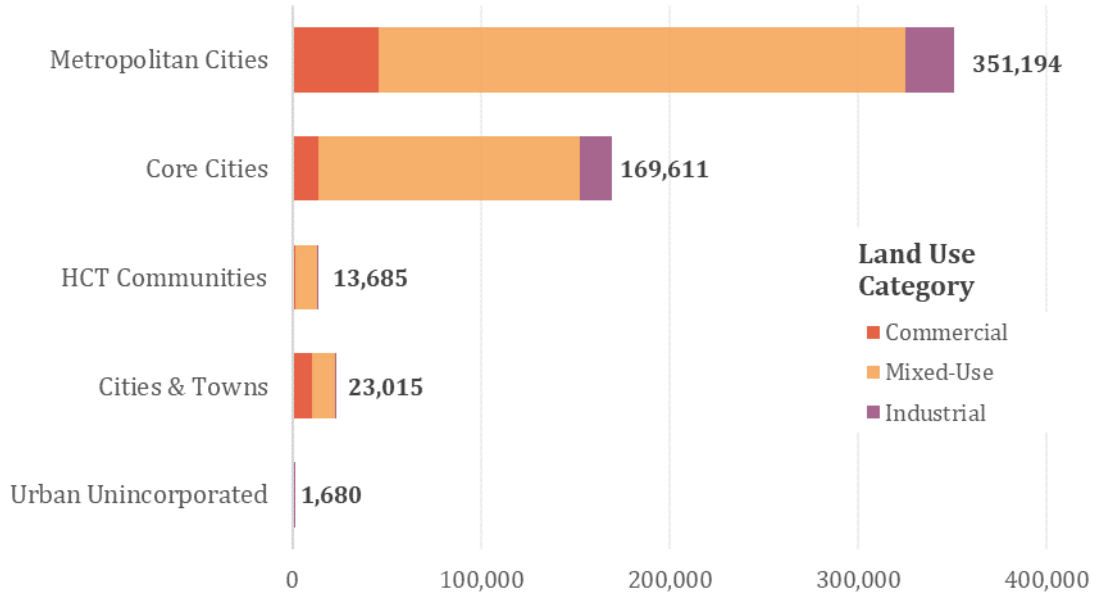
Exhibit 42 shows the percent breakdown of job capacity by density levels within the VISION 2050 Regional Geographies.

Exhibit 42. Percent of Non-Pipeline Job Capacity by Assumed Density

Sources: BERK, 2021; Data provided by individual King County jurisdictions, 2020.

Nearly all the job capacity in Metropolitan Cities is in the High or Medium-High density zones, similar to the residential capacity results. In Core Cities, the largest share of job capacity is in the Medium-High assumed density level, while in HCT Communities, Cities & Towns, and Urban Unincorporated areas, job capacity is more spread across the assumed density levels.

Countywide, 80% of job capacity in urban areas is found in High or Medium-High density zones, with remaining capacity spread somewhat evenly across Medium-Low, Low, and Very Low density zones.



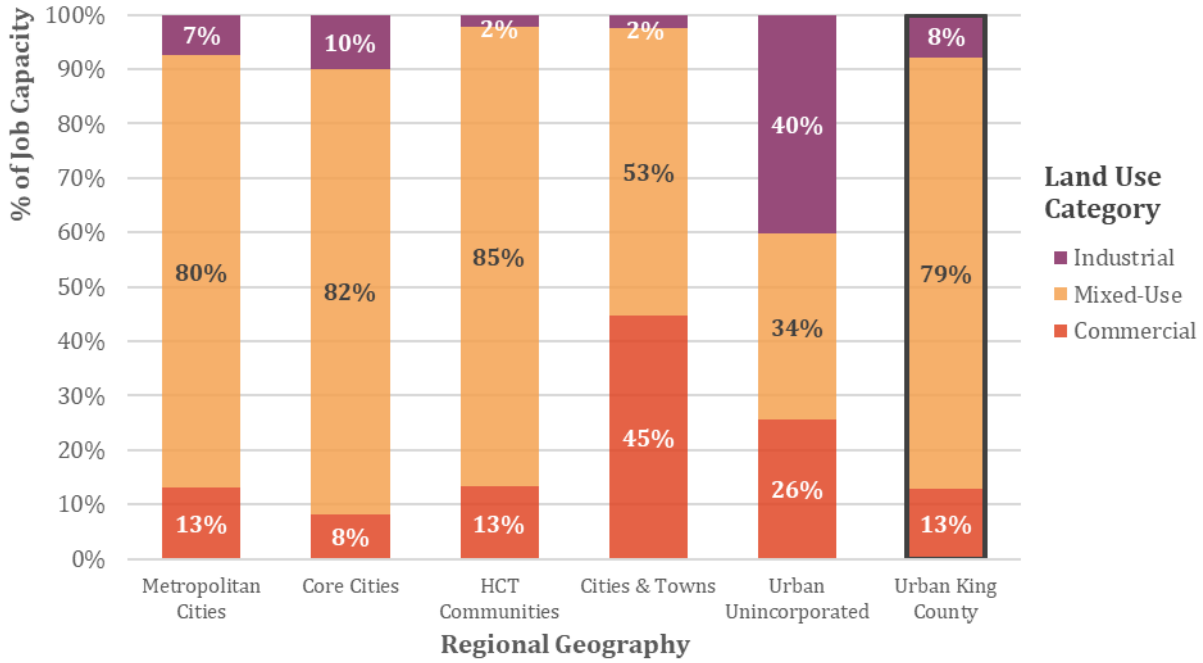
Job Capacity by Land Use Type

Throughout this study, jurisdictions were asked to categorize zones with potential for non-residential development by broad land use types: commercial, mixed-use, and industrial. The following section presents non-pipeline job capacity by those land use types and broken down by VISION 2050 Regional Geography. It is important to note that some jurisdictions allow for commercial development in industrial zones, industrial development in commercial zones, and multiple uses in mixed-use zones.[9]

[9] Since many jurisdictions allow for non-commercial uses in some commercial zones, a portion of job growth in commercial zones is likely to be from non-commercial jobs. Therefore, this study uses the phrase 'job capacity in commercial zones' instead of 'commercial job capacity' to describe job capacity by land use type.

Exhibit 43. Non-Pipeline Job Capacity by Land Use Type (jobs)

Geography	Land Use Type			Total
	Commercial	Mixed-Use	Industrial	
Metropolitan Cities	45,952	279,313	25,929	351,194
Core Cities	14,033	138,563	17,015	169,611
HCT Communities	1,813	11,564	308	13,685
Cities & Towns	10,271	12,180	565	23,015
Urban Unincorporated	429	574	677	1,680
Urban King County	**72,499**	**442,193**	**44,494**	**559,185**



Sources: BERK, 2021; Data provided by individual King County jurisdictions, 2020.

Across all geographies, the majority of job capacity is found in mixed-use zones. In urban King County, there is capacity for over 442,193 jobs in mixed-used zones, over 72,000 jobs in commercial zones, and nearly 45,000 jobs in industrial zones. In Metropolitan Cities alone, there is capacity for near 280,000 jobs in mixed-use zones.

Metropolitan Cities and Core Cities have the greatest amount of job capacity in industrial zones, with HCT Communities and Cities & Towns having a relative higher amount of job capacity in mixed-use and commercial zones.

Exhibit 44. Percent of Non-Pipeline Job Capacity by Land Use Type

Sources: BERK, 2021; Data provided by individual King County jurisdictions, 2020.

In Metropolitan Cities, Core Cities, and HCT Communities, over 80% of job capacity is found in mixed-use zones. Countywide, 79% of urban job capacity is found in mixed-use zones. HCT Communities and Cities & Towns have a small share of job capacity in industrial zones, just 2%. Cities & Towns have the highest share of job capacity in commercial zones, at 45%, whereas all other geographies have between just 8%-26% of job capacity found in commercial zones.

Ch. 5 Reasonable Measures

As discussed in Chapter 1, the GMA requires that certain counties and cities, including King County, conduct an analysis to determine if land is being used efficiently in urban growth areas (UGAs), and to determine if growth is occurring consistent with adopted comprehensive plans. If this review and evaluation demonstrates inconsistencies between actual growth and planning goals, the jurisdiction is required to identify Reasonable Measures that could be taken to improve consistency other than adjusting UGA boundaries. Examples of Reasonable Measures include rezones, subarea planning, permitting process streamlining, or development incentives. Any Reasonable Measures selected to address inconsistencies are required to be adopted in comprehensive plans and monitored annually. Prior to the Urban Growth Capacity study, King County and its jurisdictions did not have any adopted Reasonable Measures.

This chapter reviews findings of the Urban Growth Capacity Study to determine whether new Reasonable Measures are necessary to align growth trends with planning goals or to ensure there is sufficient capacity for accommodating growth. The process includes three steps. First, the County measured consistency between actual growth and planning goals using a set of standard criteria. Second, jurisdictions reviewed findings and considered circumstances that may have contributed to observed inconsistencies. Third, based on this review, jurisdictions determined if Reasonable Measures were necessary to address observed inconsistencies. The following sections describe this process and document outcomes.

Criteria for Evaluating Consistency

The first step was developing criteria for determining where there are potential inconsistencies between actual growth trends and planning goals. King County developed these criteria with input from the UGC Technical Committee and Interjurisdictional Team. Exhibit 45 presents each consistency check, as well as a summary of the method used to evaluate consistency.

Exhibit 45. Criteria for Identifying Potential Inconsistencies

Consistency Check	Evaluation Method/Criteria
Are achieved densities consistent with planned densities?	▪ Group all zones by planned/allowed density level. ▪ For each density level, calculate aggregate achieved density for all development observed 2012-2018. ▪ Compare aggregate achieved density to the range of allowed densities among all zones in that density level. There is a potential inconsistency if *both* of the following conditions are true: ○ Average achieved density is outside of this range of allowed density. ○ Average achieved density is below 50% of the max allowed density.
Is the rate of growth consistent with the 2035 growth target?	▪ Calculate the elapsed 2035 growth target for the period of 2006-2018: about 41% of the total growth target. ▪ Compare actual growth to elapsed target. If actual growth is less than 50% of the elapsed target, then there is a potential inconsistency.
Is there capacity for accommodating the 2035 growth target?	▪ Calculate the remaining growth needed to achieve the 2035 growth target. ▪ If capacity for growth is less than the remaining growth target, then there is a potential inconsistency.

Summary of Potential Inconsistencies

This section summarizes the findings of the consistency checks described above.

Achieved Densities

Exhibit 46 summarizes the analysis of potential inconsistencies between average achieved residential densities between 2012 and 2018, and density levels allowed under zoning. Consistency is evaluated for development within each of the five density levels used for summarizing growth trends and capacity throughout this report. The symbols indicate where there is and is not a potential inconsistency identified. A more detailed presentation of the data that backs up both of these exhibits can be found in Ch. 7 Profiles of Cities and Unincorporated Areas.

Exhibit 47 presents this same summarization for achieved non-residential densities. It shows many cities with average achieved densities below 50% of maximum allowed density for the zone category. When interpreting these findings, keep in mind that maximum allowed densities in this report are measured in terms of floor area ratio (FAR). Many jurisdictions do not use FAR as a standard of density, and reporting maximum allowed densities often involved converting development standards such as height, bulk, and/or setback requirements to very roughly estimate FAR. In reality, achievable FAR under these development standards may vary significantly by parcel. And some requirements such as building heights may be in place to accommodate portions of structures (e.g., facades, chimneys, or signage) and were never intended to accommodate multistory buildings. These kinds of issues were considered in the jurisdictional review of potential inconsistency findings, as discussed in the following section.

Growth Rates and Capacity

Exhibit 48 summarizes the evaluation of consistency between 2006-2018 growth rates and 2035 growth targets as well as capacity and remaining 2035 target growth. These findings are presented for both housing and employment. The symbols indicate where there is and is not a potential inconsistency identified. More detailed presentations of the data that backs up this evaluation can be found in Exhibit 13. Residential Growth Compared to Targets, 2006-2018, Exhibit 31. Housing and Job Capacity by VISION 2050 Regional Geography and Jurisdiction, and Ch. 7 Profiles of Cities and Unincorporated Areas.

Jurisdictional Review of Potential Inconsistencies

In May 2021, King County staff shared the criteria for identifying potential inconsistencies and preliminary findings with individual jurisdictions. They also shared guidance for reviewing these inconsistencies and determining whether Reasonable Measures are necessary. This review included consideration for circumstances that may help determine whether there was an actual inconsistency and explain why such an inconsistency occurred. If the jurisdiction determined that Reasonable Measures would not be necessary to overcome an inconsistency, then they were asked to provide documentation and analysis to explain how the inconsistency would be overcome to achieve the planning goal without adopting additional Reasonable Measures.

The guidance for determining whether potential inconsistencies necessitated Reasonable Measures was grounded in the Department of Commerce's Buildable Lands Guidelines. Jurisdictions were encouraged to consider the following kinds of questions to identify issues that could have impacted development outcomes during the evaluation period or provide context for interpreting potential inconsistencies:

- Are the developments permitted during the evaluation period a large enough sample and representative enough of development trends to serve as the basis for reliable findings?
- Have permitting and development trends after the evaluation period shifted in significant ways?
- Do code and development regulations promote unintended consequences that could impact development feasibility?
- Have there been any changes to code or development regulations during or following the evaluation period that address barriers to development consistent with planning objectives?
- Are there other relevant changes in market conditions such as infrastructure investment that could impact future development in the jurisdiction?

After completing this evaluation, jurisdictions provided King County with documentation of their findings regarding the potential inconsistencies, noting where Reasonable Measures are and are not necessary.

For the purpose of summarization in the Urban Growth Capacity Report, county staff and consultants reviewed these jurisdiction responses and categorized them by nine common themes. These themes are described in Exhibit 49. Individual jurisdiction responses to potential inconsistencies are summarized in Exhibit 50 through Exhibit 52. These tables only show cities in which a potential inconsistency was identified, where an observed trend fell short of the planning goal.

Exhibit 49. Theme Categories in Jurisdiction Responses to Potential Inconsistencies

Category Title	Definitions
Development aligned to planning framework	Response cited methodological issues related to translating their planning framework into an FAR-based density approach. The observed development reflects uses, forms, and densities allowed under a jurisdiction's planning framework.
Small development sample	The observed development sample included too few projects to reasonably determine whether development was achieving a planning goal, or included an unusual case causing inconsistency with the planning goal.
Additional development in pipeline	Additional specific projects are underway which represent a shift from trends observed during the evaluation period.
Expected market shift	There are indicators of shifts in market demand which would result in future development trends that do not resemble patterns observed during the evaluation period.
Addition of high capacity transit	High capacity transit such as light rail is coming in and is expected to shift market demand, resulting in future development that does not resemble patterns observed during the evaluation period.
Recent zoning or policy change	New zoning or policies have already been implemented either during or after the evaluation period. These changes are expected to shape future development trends.
Anticipated policy, zoning, or strategy updates	The jurisdiction anticipates adopting and implementing new policies, zoning, or strategies which are expected to shape future development trends.
Fully built out	The jurisdiction has no vacant land available for new development, and marginal redevelopable land maintains the existing growth pattern.
Environmental or utility constraints	Environmental or utility constraints are a barrier to new development.

Exhibit 50. Summary of Jurisdiction Responses - Residential Density Achieved

Reasonable Measures Recommendations

As a result of the review of potential inconsistencies, the Urban Growth Capacity Report recommends that some jurisdictions adopt Reasonable Measures in the 2024 periodic update to comprehensive plans. Exhibit 54 notes the jurisdictions where Reasonable Measures are recommended, the identified inconsistency that supports the finding, and the general type(s) of Reasonable Measures that will be needed to address the inconsistency.

Exhibit 54. Recommendations for Adoption of Reasonable Measures

Jurisdiction	Inconsistency	Type(s) of Reasonable Measure Recommended
Burien	▪ Insufficient employment capacity ▪ Employment growth rate inconsistent with target	▪ Action(s) to increase employment capacity ▪ Action(s) to encourage and/or incentivize non-residential development
Pacific	▪ Insufficient employment capacity	▪ Action(s) to increase employment capacity
Sammamish	▪ Insufficient housing capacity	▪ Action(s) to increase residential capacity
Shoreline	▪ Insufficient employment capacity	▪ Action(s) to increase employment capacity
Tukwila	▪ Housing growth inconsistent with target ▪ Employment growth rate inconsistent with target	▪ Action(s) to encourage and/or incentivize residential development ▪ Action(s) to encourage and/or incentivize non-residential development

Following the adoption of comprehensive plans in 2024, each jurisdiction will be required to monitor progress toward resolving the inconsistency, with regular reporting to the Growth Management Planning Council.

Ch. 6 Applying Urban Growth Capacity Findings

The findings of this study can be used to inform several kinds of policy and regulatory decisions in local jurisdictions. This chapter provides an overview of two keys applications: growth target setting and local comprehensive plan updates. Additional information will be available in the UGC User's Guide.

Regional Planning and Growth Targets

Growth capacity is one important input that King County uses to inform the allocation of projected countywide housing and employment growth by Regional Geography and jurisdiction. King County is currently in the process of developing new growth targets for the 2019-2044 time period. This process is guided by PSRC's VISION 2050 Regional Growth Strategy which allocates shares of regionally forecasted growth to King County and its Regional Geographies, creating control allocations for each of the urban Regional Geographies. Working in Regional Geography based subgroups, the 39 cities and King County collaborate through the Growth Management Planning Council (GMPC), to determine appropriate growth targets for each jurisdiction. Table DP-1 in the Proposed 2021 Countywide Planning Policies identifies the draft housing and job targets for each jurisdiction, sorted by Regional Geography, as specified in VISION 2050. These growth targets are policy statements of the amount of housing and job growth each jurisdiction is expected to accommodate and plan for in their comprehensive plan. The allocations of growth are consistent with the VISION 2050 Regional Growth Strategy, focusing growth primarily to the two "Metropolitan" cities (Seattle and Bellevue), within "Core" cities with designated Urban Centers, and within "High Capacity Transit" communities. Notably, growth targets for HCT Communities include three unincorporated potential annexation areas (PAAs): Federal Way PAA, North Highline PAA, and Renton PAA.

Exhibit 55 shows draft 2019-2044 growth targets for individual cities and urban unincorporated areas alongside growth capacity for context. In aggregate countywide and each Regional Geography, there is sufficient capacity to accommodate the target growth. However, in some individual jurisdictions the 2044 growth target exceeds available capacity. This is appropriate, as the primary purpose of measuring growth capacity in this report is confirming available capacity to accommodate remaining growth under the current 2035 growth target. Ultimately, jurisdictions will demonstrate zoned or planned capacity for their 2044 growth targets in the next round of comprehensive plan updates in 2024.

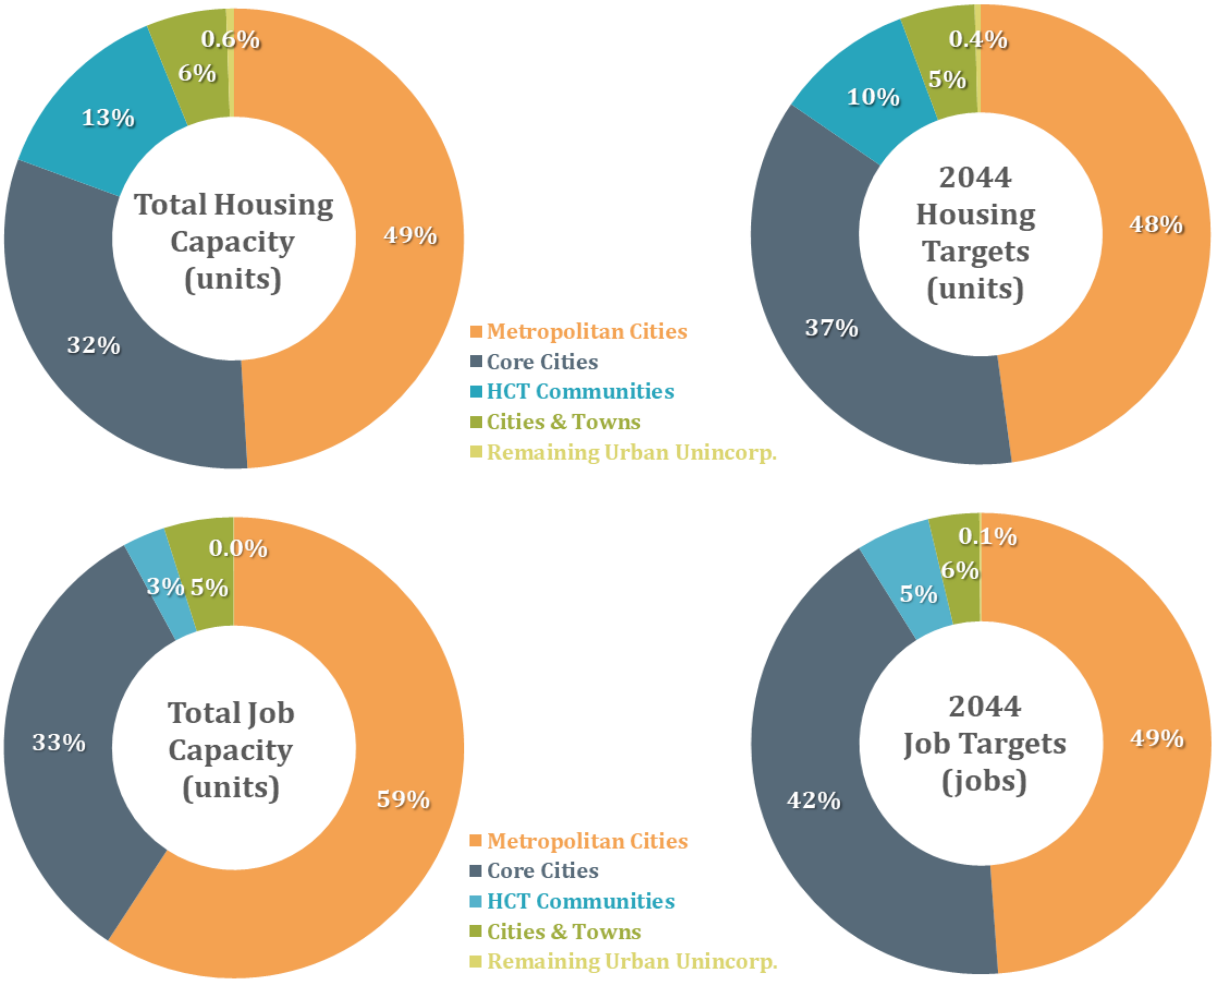

Exhibit 55. DRAFT King County Jurisdiction Growth Targets, 2019-2044

Jurisdiction	Total Housing Capacity (Units)	2044 Housing Target	Share of Housing Target in Regional Geography	Total Job Capacity (Jobs)	2044 Jobs Target	Share of Jobs Target in Regional Geography

Many jurisdictions may draw from the UGC Report to demonstrate sufficient capacity. However, capacity measured in the UGC is focused on the 2035 planning period and constrained by achieved densities. Therefore, some jurisdictions may use zoned densities or updated future land use assumptions to inform a land capacity analysis in the 2024 comprehensive plans update to demonstrate sufficient capacity for 2044 growth targets. Nonetheless, comparing the UGC Report capacity to the 2044 growth targets provides some context for the next planning cycle.

Exhibit 56 compares the share of countywide capacity as calculated in the Urban Growth Capacity Report for each VISION 2050 Regional Geography, with the share of growth allocated to Regional Geographies in the 2019-2044 growth targets. As a category, Core Cities have a higher share of countywide housing and employment growth targets than their share of housing and employment capacity. Conversely Metropolitan Cities and HCT Communities both have a greater share of housing capacity than their shares of housing target growth. This implies there is significant spare capacity for additional housing growth in those areas beyond the targets. Likewise, Metropolitan Cities have a significantly greater share of employment capacity than their share of target employment growth.

Exhibit 56. Share of Capacity and Share of Draft 2044 Growth Targets by Regional Geography

County and City Plans

All jurisdictions in King County are required to fully update their comprehensive plans by June 30, 2024. A comprehensive plan is a 20-year vision and roadmap for accommodated growth and development. It guides County or City decisions on where to build new jobs and houses, how to improve transportation systems, and where to make capital investments such as utilities, sidewalks, and libraries. Many cities are also in the process of completing Housing Action Plans which will be implemented in the years to come. These plans and implementing activities will be informed by housing and job growth targets discussed above. But there are many other ways in which the Urban Growth Capacity Report findings can inform these planning activities., as two examples: implementing Reasonable Measures findings from the Urban Growth Capacity Report and housing policy development.

Detailed jurisdiction-level information available in Ch. 7 Profiles of Cities and Unincorporated Areas, as well as resources available in the UGC User's Guide, can be used to focus the development of policies, development regulations, incentives, or other actions for shaping local development activity. The sections that follow provide examples and guidance for applying and building upon UGC findings.

Implementing Reasonable Measures

Ch. 5 includes a list of jurisdictions where Reasonable Measures were determined to be necessary. Each of these jurisdictions will need to identify actions in their 2024 comprehensive plan updates that are likely to reduce or mitigate the inconsistency between actual growth with planning goals. These actions could include changes to development regulations, new incentives, subarea planning, or reviewing processes to encourage development types that are consistent with local plans. Such changes are also required to be adopted in capital facility plans and development regulations when necessary for full implementation. In some cases, Reasonable Measures must be adopted in Countywide Planning Policies, but no findings from the 2021 UGC Report indicate this is necessary. Wherever a measure is implemented, it should be clearly identified as a Reasonable Measure that addresses a growth inconsistency identified in the UGC Report.

The findings of the UGC Report can help to inform the selection of appropriate Reasonable Measures. Jurisdictions can use this data to answer questions such as:

- In which zones have there been inconsistencies between growth trends and planning goals?
- Where are there infrastructure gaps that create barriers to new development at planned density levels?
- What other barriers may be preventing development that is consistent with local plans?

The King County UGC User's Guide will include a simple framework to help planners to zero in on potential answers to these last two questions, which lie at the heart of Reasonable Measure selection. Additional outreach to the development community, a market study, code audit, or example development feasibility analysis may to help ensure that the measures are both targeted and effective. For examples of Reasonable Measures see the Department of Commerce Buildable Land Guidelines

Appendix B (2018), Housing Memo: Issues Affecting Housing Availability and Affordability (2019), and Guidance for Developing a Housing Action Plan (2020) Chapter 4.

Following implementation, jurisdictions may develop a monitoring program to assess the effectiveness of the Reasonable Measures. This will help in determining when and where additional measures may be needed.

Housing Planning and Policy Development

Housing affordability is an urgent and complex challenge that has impacts throughout King County. This section draws upon the Washington State Department of Commerce Housing Memo: Issues Affecting Housing Availability and Affordability (2019), to discuss how to apply UGC findings to support efforts to address housing affordability.

Regional Housing Planning

Housing affordability is a regional challenge, and the most effective responses to this challenge will involve coordination between jurisdictions. An example includes the King County Regional Affordable Housing Task Force which developed a coordinated regional strategy and action plan to address housing needs for lower income households. Regional housing planning can also involve an assessment of countywide housing needs and setting jurisdictional goals for future housing growth by housing type or affordability level.

The UGC Report is an important resource to support this kind of regional collaboration within King County. By presenting data about housing capacity by density level for jurisdictions in a common format, it allows for the evaluation of aggregate countywide capacity to support different kinds of housing development. This information can be used to determine if there are any capacity limitations when compared to region housing needs. Moreover, UGC data also allows for the evaluation of how capacity is distributed geographically across the county by jurisdiction. Mapping UGC data can enable analysis to answer the following kinds of questions:

- Is there capacity for the kinds of new housing development that are called for in countywide housing needs assessments, such as multifamily or "missing middle" formats?[10]
- Is capacity located in high demand or amenity-rich locations, like near frequent transit, parks, schools, or employment centers?
- Are areas with housing capacity aligned with high opportunity areas, as defined by PSRC?
- What kinds of regional amenities or resources are missing in areas with significant capacity for new housing development?

[10] The summaries of capacity by density level in the UGC report provides a good proxy for capacity by housing type, with low density zones typically providing capacity for detached single family development, middle density zones often providing capacity for missing middle formats such as townhomes and multiplexes, and high density zones providing capacity for apartments and condominiums. More detailed analysis of the development code in individual jurisdictions can confirm what kinds of housing are allowed and what code barriers may hinder development in a desired format.

Local Housing Planning

The findings of the UGC Report can also inform the development of local housing policies and implementing actions during the next round of comprehensive plan updates. Several cities in King County have recently identified housing strategies for implementation through the process of developing Housing Action Plans with funding from Washington State Department of Commerce. The UGC findings can inform the implementation of these strategies as well. Key policy questions that the UGC can help answer include:

- Is there capacity for the kinds of new housing development that are called for in local housing needs assessments, such as multifamily or "missing middle" formats?[11]
- How does housing capacity compare to housing development trends? Are zones with available capacity seeing the kinds of housing development that is needed?
- What kinds of housing development does your plan call for but isn't being produced?

Similar to the selection of Reasonable Measures, additional outreach to the housing development community, a market study, code audit, or example development feasibility analysis may to help to identify and prioritize actions that are most likely to encourage the kinds of new housing development that are in greatest need. Resources for the selection of actions include Guidance for Developing a Housing Action Plan (2020) Chapter 4 and Housing Memo: Issues Affecting Housing Availability and Affordability (2019), both available from the Washington State Department of Commerce. Actions could include rezones or revisions to development standards to allow new housing types or density levels, actions to streamline the processing of permit applications, addressing infrastructure limitations (see below), or proving incentives to encourage the development of housing types or affordability levels in greatest need.

Targeting Anti-Displacement Efforts

Displacement is a complex and multifaceted problem that local planners are faced with as they plan for growing the housing supply in their communities. Housing supply shortage is a key driver of housing cost escalation across the county. When housing costs increase, so too does economic displacement pressures on existing residents. The best way to address this issue is increasing the housing supply, with an emphasis on housing formats that are in greatest need.

However, much of the capacity for new housing development is in the form of redevelopment. Many redevelopable parcels contain older housing stock or commercial space that is typically less expensive to buy or rent than the prevailing market. So, when these older existing buildings are demolished in favor of redevelopment it can result in physical displacement of residents or businesses who cannot afford prevailing market costs in the area.

[11] The summaries of capacity by density level in the UGC report provides a good proxy for capacity by housing type, with low density zones typically providing capacity for detached single family development, middle density zones often providing capacity for missing middle formats such as townhomes and multiplexes, and high density zones providing capacity for apartments and condominiums. More detailed analysis of the development code in individual jurisdictions can confirm what kinds of housing are allowed and what code barriers may hinder development in a desired format.

Parcel-level data developed through the UGC Study can be of use to support analysis of what kinds of uses are present on redevelopable parcels, including both residential uses as well as nonresidential uses that may include small local businesses or cultural institutions. This information, combined with outreach to local residents, community groups, businesses, or other stakeholders, can be essential to developing targeted strategies or partnerships to address physical displacement risks. A good resource for such efforts includes the Washington State Department of Commerce Guidance for Developing a Housing Action Plan (2020) Chapter 5: Strategies for Minimizing and Mitigating Displacement.

Addressing Infrastructure Gaps

As described in Appendix G: Approach for Identifying Infrastructure Gaps, each jurisdiction conducted an assessment to identify significant infrastructure gaps or capacity issues that present barriers to realizing development capacity. This information can support both local and regional capital facilities planning to provide timely infrastructure to facilitate housing development in locations and formats that are most needed to address housing affordability challenges.

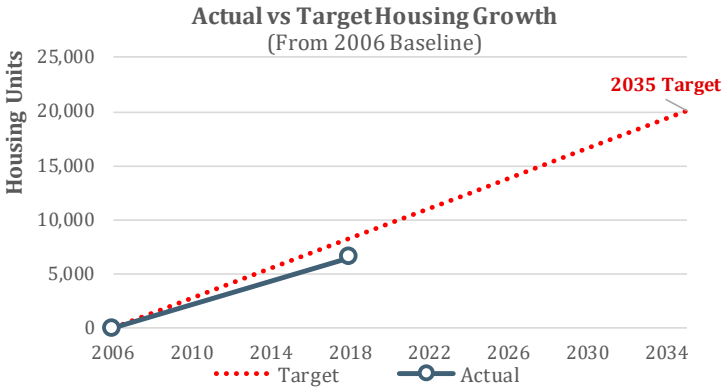
Ch. 7 Profiles of Cities and Unincorporated Areas

This chapter provides detailed profiles summarizing findings for each individual jurisdiction. The profiles are divided into four separate pages covering the following topics:

- Page 1: Housing Growth and Residential Development Trends
- Page 2: Residential Land Supply and Capacity
- Page 3: Employment Growth and Commercial/Industrial Development Trends
- Page 4: Commercial/Industrial Land Supply and Job Capacity

These jurisdictions are presented alphabetically by VISION 2050 Regional Geography, as shown in Exhibit 57.

Exhibit 57. Profiled King County Jurisdictions by VISION 2050 Regional Geography



Metropolitan Cities	▪ City of Bellevue	▪ City of Seattle	
Core Cities	▪ City of Auburn ▪ City of Bothell ▪ City of Burien ▪ City of Federal Way	▪ City of Issaquah ▪ City of Kent ▪ City of Kirkland ▪ City of Redmond	▪ City of Renton ▪ City of SeaTac ▪ City of Tukwila ▪
High Capacity Transit Communities	▪ City of Des Moines ▪ City of Kenmore ▪ City of Lake Forest Park	▪ City of Mercer Island ▪ City of Newcastle ▪	▪ City of Shoreline ▪ City of Woodinville
Cities and Towns	▪ City of Algona ▪ City of Beaux Arts ▪ City of Black Diamond ▪ City of Carnation ▪ City of Clyde Hill ▪ City of Covington ▪ City of Duvall	▪ City of Enumclaw ▪ Town of Hunts Point ▪ City of Maple Valley ▪ City of Medina ▪ City of Milton ▪ City of Normandy Park	▪ City of North Bend ▪ City of Pacific ▪ City of Sammamish ▪ Town of Skykomish ▪ City of Snoqualmie ▪ Town of Yarrow Point
Urban Unincorporated Areas	▪ All urban unincorporated areas combined, including those that are classified as HCT Communities in VISION 2050.

City of Bellevue

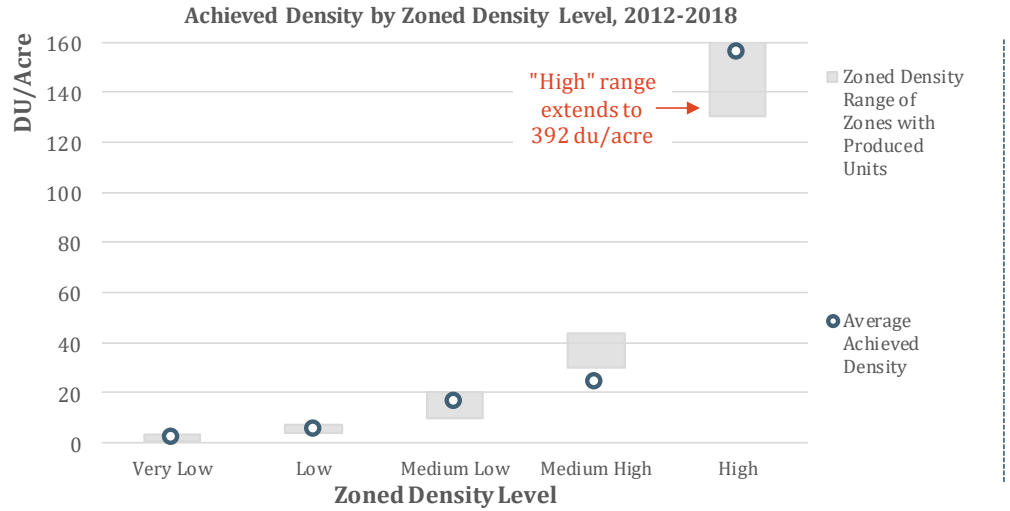
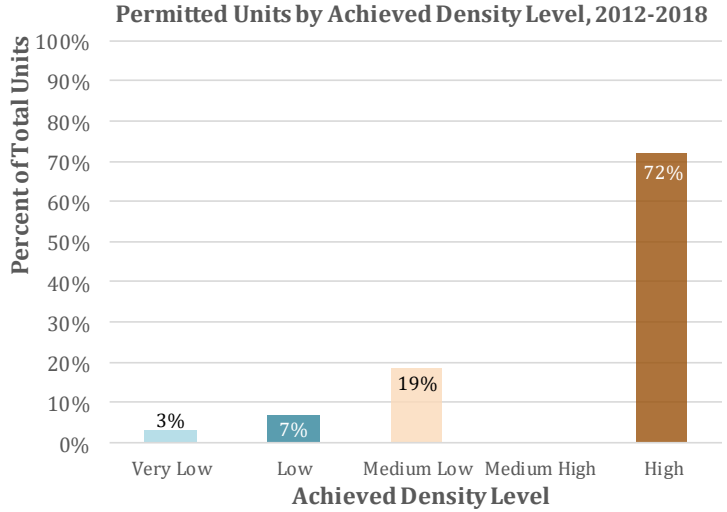
Housing Growth and Residential Development Trends

Bellevue Housing Growth Target: 2006-2035	20,056
2006 Estimated Housing Units	55,107
2018 Estimated Housing Units	61,698
Estimated Housing Growth	**6,591**
Remaining 2035 Target	13,465



% of Pace Needed to Achieve 2035 Housing Growth Target	Average Annual 2006-2018 Growth Rate	2018-2035 Avg. Annual Growth Needed to Meet 2035 Target
79.4%	**0.95%**	**1.17%**



Since 2006, Bellevue has grown at 79% of the pace needed to achieve its 2035 housing growth target of 20,056 units. During this period, the total number of housing units in Bellevue grew by roughly 12%. At this current rate, Bellevue is under the production pace needed to meet its 2035 growth target, and needs to grow at an annual rate of 1.2% to reach its remaining target by 2035.

Residential Achieved Densities

Zoned Density (du/acre)		Gross Area (acres)	Critical Areas (acres)	Public Purpose (acres)	ROWs (acres)	Net Area (acres)	Total Units	Achieved Density (DU/acre)

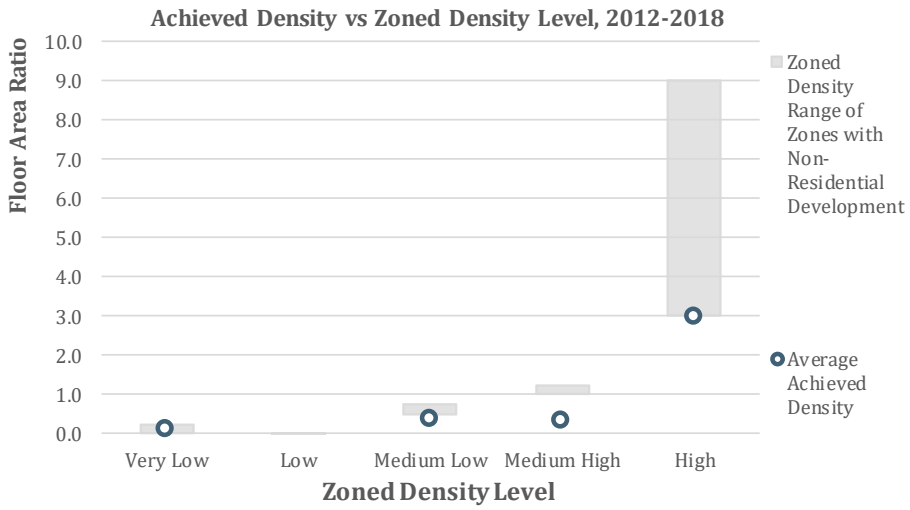
Capacity (units)	
Very Low Density Zones	438
Low Density Zones	573
Medium Low Density Zones	1,542
Medium High Density Zones	1,291
High Density Zones	19,529
Capacity in Pipeline	*3,484*
Total Capacity (Units)	**26,859**
Remaining Target (2018-2035)	13,465
Surplus/Deficit Capacity (Units)	**13,393**

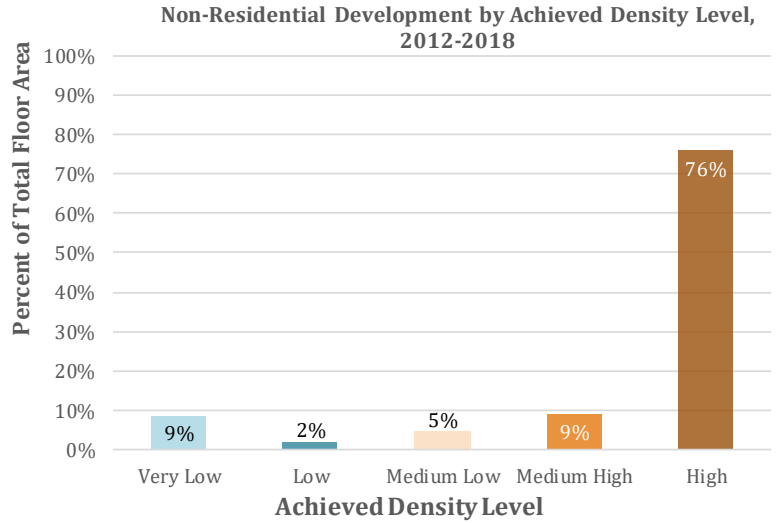
Note: Bellevue zone density is largely based on FAR. For these zones, a dwelling/unit per acre equivalent was calculated to categorize zone density level. Additionally, the development density/intensity of parcels with critical areas and their buffers as identified in Bellevue's Land Use Code section 20.25H.035 was calculated using Bellevue's development density/intensity formula specified in LUC 20.25H.45. This net acreage was carried forward when determining net vacant and redevelopable land.

Bellevue - Employment Growth and Commercial/Industrial Development Trends

Bellevue Jobs Growth Target: 2006-2035	61,480
2006 Jobs (PSRC)	120,494
2018 Jobs (PSRC)	143,023
Total Jobs Growth	**22,529**
Remaining 2035 Target	38,951



% of Pace Needed to Achieve 2035 Jobs Target	Average Annual 2006-2018 Growth Rate	2018-2035 Avg. Annual Growth Rate Needed to Meet 2035 Target
88.6%	1.44%	1.43%



Since 2006, Bellevue has grown at 89% of the pace needed to achieve its 2035 jobs growth target of 61,480 units. During this period, the total number of jobs in Bellevue grew by roughly 19%. At this current rate, Bellevue is under the pace needed to meet its 2035 jobs growth target, and needs to grow at an annual rate of 1.4% to reach its remaining target by 2035.

Non-Residential Achieved Densities

Zoned Density (FAR)		Net Area (sq. feet)	Total Floor Area (sq. feet)	Average Achieved Density (FAR)

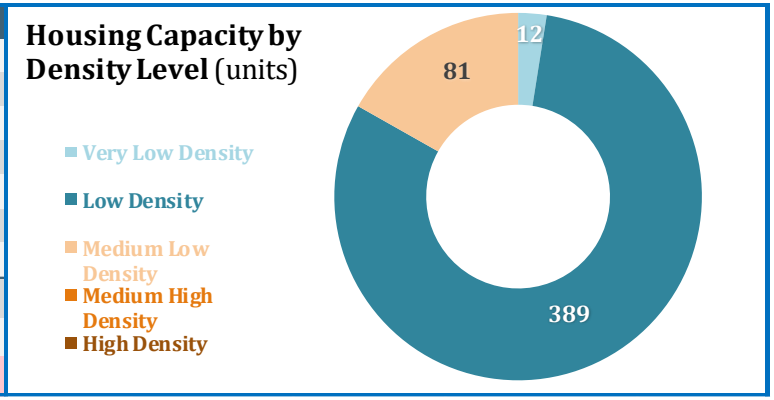
Very Low	15.1	21
Low	108.0	917
Medium Low	40.1	631
Medium High	2.2	92
High	2.1	222
Total	**167.5**	**1,883**



Note: Sammamish includes right-of-way or public purpose areas in the gross site area to calculate the net buildable area. While this report shows achieved density varying from planned density, if you adjust the approach to use Sammamish's formula for net buildable area, the densities are more comparable.

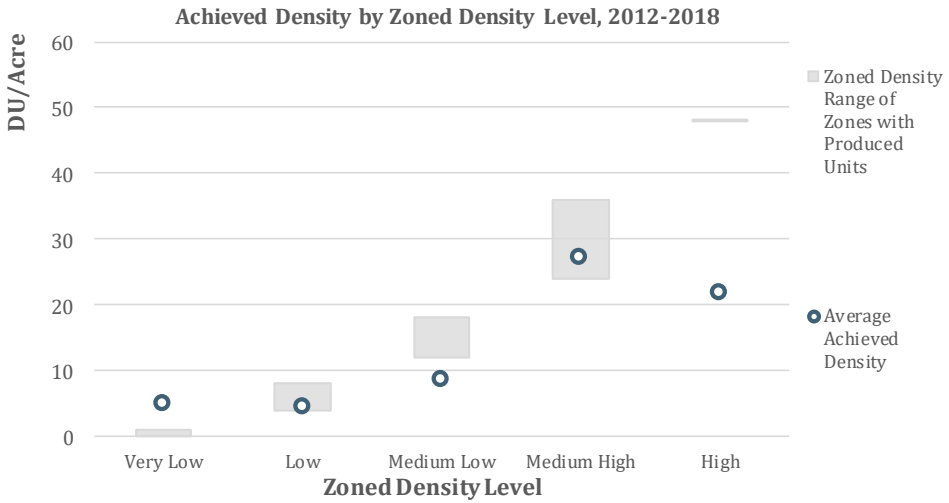
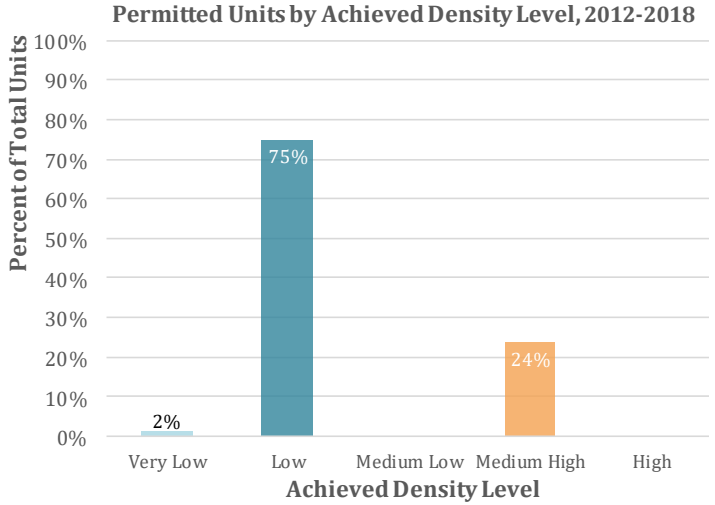
Unincorporated King County Housing Growth Target: 2006-2035	12,837
2006 Estimated Housing Units	35,910
2018 Estimated Housing Units	41,408
Estimated Housing Growth	**5,498**
Remaining 2035 Target	7,339



% of Pace Needed to Achieve 2035 Housing Growth Target	Average Annual 2006-2018 Growth Rate	2018-2035 Avg. Annual Growth Needed to Meet 2035 Target
103.5%	1.19%	0.96%



Since 2006, Unincorporated King County has grown at 104% of the pace needed to achieve its 2035 housing growth target of 12,837 units. During this period, the total number of housing units in Unincorporated King County grew by roughly 15%. At this current rate, Unincorporated King County is over the production pace needed to meet its 2035 growth target, and needs to grow at an annual rate of 1% to reach its remaining target by 2035.

Residential Achieved Densities

Technical Appendices

This section contains the guidance documents and methodologies provided to King County jurisdictions throughout this study.

Appendix A: Phase 1 Guidance - Achieved Density

King County 2020 Urban Growth Capacity Study
(Buildable Lands)
Guide for Local Government Reporting Template PART 1

This document describes the data reporting process and template for local governments in King County to use to report consolidated data and analysis results in compliance with the Review and Evaluation/Buildable Lands requirement of the Growth Management Act. Jurisdictions should send complete sections of the reporting template to Rebeccah Maskin, rmaskin@kingcounty.gov, at the King County Office of Performance, Strategy, and Budget, for inclusion in the 2020 Urban Growth Capacity Study (formerly Buildable Lands Report) to the State of Washington.

Standardized reporting is necessary to provide King County (and the state Legislature) with information that is comparable across jurisdictions, and that may be aggregated into a countywide evaluation report. King County and the cities will collaborate to draft a countywide report in 2020. That report will present jurisdiction-by-jurisdiction reporting of recent development and capacity, as well as summaries for the county and UGA as a whole and regional geographies. The template and guide include prompts for standardized technical documentation, which is crucial to making the Buildable Lands analyses both transparent and defensible to public officials, major stakeholders, and the public. An interjurisdictional group of planning and technical staff reviewed the Local Government Reporting Template and Guide in 2019 for both its content and format.

Under the current schedule, data reporting for the 2020 report will be phased over 2019. Reporting for Part 1 should be completed and submitted back to King County by June 1st, 2019. Part 2 will be sent out in mid-2019. Data will be reviewed and compiled by King County staff in coordination with local planning staff on the Interjurisdictional Team, and sent back to cities for review, in late fall 2019.

For staff that has worked on buildable lands reports in the past, this cycle's reporting will be different, particularly for residential development. The King County GIS Center is completing an initial analysis of residential development over the reporting period (2012-18) that aims to provide the bulk of residential reporting data. Cities will review this data, adding local detail from permits or development plans, to accurately calculate achieved densities over the reporting period. The GIS analysis, and further instructions, will be sent out after this guide, in March 2019.

This guidance is organized into two parts covering the three major questions the Urban Growth Capacity Study answers. Part 1 will cover reporting on the first question. Part 2 will cover the second and third questions, and will follow Part 1 reporting. The parts and their different sections are:

PART 1:

- ***I. Are Zoned Densities Being Achieved?***
  - ***A. Achieved Densities 2012-2018 (Reporting Tables 1-7)***
  - ***B. Achieved Density Documentation and Background (Reporting Tables 8-10)***

PART 2:

- ***II. Are Growth Targets Being Met?***
  - ***A. Demand for Development: Remaining Growth Targets***
- ***III. Is there Sufficient Capacity for Remaining Growth Targets?***
  - ***A. Land Supply and Capacity Inventory***

The template tables in the Excel workbook that accompanies this document are to be filled in by all jurisdictions, and returned to King County.[1]
This document describes these template tables and instructs on how to fill out the template and provide documentation on data sources and methodology. *Not all tables will apply to every jurisdiction*. Tables for data that are not relevant to local situations should be labeled to indicate "not applicable," with justification, e.g., "No multifamily development during reporting period."

Thank you for your assistance in completing the reporting template!

[1]Please email completed reporting documents to rmaskin@kingcounty.gov. If electronic submission is not possible, please contact Rebeccah Maskin at 206-263-0380.

I. Are Zoned Densities Being Achieved?

A. Measuring Achieved Densities (2012-2018)

Background

Section IA consists of Tables 1-6, and collects data on residential and non-residential development activity for the full 6-year review and evaluation period (2012-2018).[2] This data will come from a parcel-based analysis described below, and building permits for new development between 2012 and 2018. After compiling development data from the parcel-based analysis and building permits, residential units, square footage built, and net land area are aggregated by zone, and the densities achieved over the review period are calculated. These densities will be used in Part 2 to calculate capacity of developable land.

Local reporting on residential data has two steps: 1.) reviewing and supplementing a parcel-based analysis of new residential development, and 2.) reporting on any additional development permitted during the review period. The parcel-based analysis is the starting place for residential data collection in the Urban Growth Capacity Study. It was designed to replace the majority of plat and permit reporting by identifying new residential development on parcels that changed boundaries or added residential units 2012-2018. Permit reporting on single family and multifamily/mixed-use development may still be necessary for developments not identified in the parcel-based analysis data, and to review or supplement the parcel-based analysis with project data (for example, non-buildable critical areas area).

New non-residential development will be addressed through permit reporting.

Any reporting on permitted development should capture new residential units or non-residential space that came online between January 1st, 2012 and December 31st, 2018. Permits finaled or completed between these dates provide the best estimate of completed development. If your jurisdiction does not uniformly track completed permits, issued permits may be used, so long as the development was demonstrably completed between 2012 and 2018. Please document the basis for how permits are selected to cover the review period.

How to fill out the tables

Table 1 should be filled in with zone level data, summarized from the parcel-based analysis. The forthcoming parcel-based analysis packet will contain tables and maps of plat and parcel level (identified by parcel identification number (PIN)) development over the review period. Your review of the gross development area and residential units developed, and the provision of any constrained critical areas data, is essential for accurately estimating the net density achieved by recent development.

Because the source for this analysis is parcel data, public right-of-way, tract parcels, open water, and additional public purpose parcels commonly found in formal plats, have already been removed from the "gross" development site area presented in this analysis. However, additional constrained critical areas outside of tract or public purpose parcels need to be reported, so that they can be removed from the gross site area to calculate the net buildable area. For short plats or other residential development identified in the parcel-based analysis, constrained areas of developed parcels (for example, private roads or retention ponds), in addition to critical areas, *may* need to be reported to subtract from the gross site area.

A general flow for review the parcel-based analysis follows below. More specific instructions will be included with the parcel-based analysis when it is sent in March.

[2] Countywide analysis requires consistency across jurisdictions on the time frame of the development history data. Time frames for growth monitoring activities by individual jurisdictions will vary, based on the adoption date of comprehensive plans and other factors.

1. Review the parcel-based analysis for location, number of units built, and gross site area to verify the amount and location of development over the review period.
    a. The analysis is grouped by plat or parcel PIN.
    b. Shapefiles of the identified parcels are also available.
    c. Review the preliminary achieved densities, unit totals, or locations for anomalies (e.g., a density much higher or lower than expected for its zone)
    d. Correct any of the raw data in the parcel-based analysis (e.g., number of units, gross site area).
    e. If the parcel-based analysis captures development that should not be included (because it did not happen during the review period, or did not add residential units), note the parcels affected, and exclude that development from the reporting in Table 1.
2. Identify if there are other significant developments not included in the parcel analysis, from permit or other development sources.
    a. Add the number of units, gross site area, critical areas, public purpose area, right-of-way area, to the parcel-based analysis via Tables 2 and 3. Instructions follow Table 1 below.
3. Sum the number of residential units and gross area by zone and enter it into Table 1, columns A and B.
4. Calculate the square footage of constrained critical areas on developed plats/parcels included in the parcel-based analysis. Sum by zone and add to column C in Table 1.
5. Calculate the square footage of any other constrained area for developed parcels included in the parcel-based analysis, Sum by zone and add to the "D" columns in Table 1.
    a. Only complete this step as necessary. You do not need to compute public right-of-way and tract parcels that were already removed from the gross area as a part of the parcel-based analysis. Just include any additional constrained areas. Be mindful of short plats or subdivisions that might have private roads or environmentally constrained areas outside of tract parcels.
    b. "Public Purpose Area" refers to drainage/retention areas, open space, or other public facilities, outside of tract parcels.
6. If the zone has mixed-use development, please indicate "yes" in the "mixed-use development" column.
    a. Reporting on the share of mixed use development in residential/non-residential use will be captured the non-residential permit analysis in Table 6.

If the parcel-based analysis does not serve as a helpful starting point for reporting residential development accurately, please contact rmaskin@kingcounty.gov.

Table 1: Residential Parcel-based Analysis Summary

	A	B	C	D1	D2	E		
Zone	**2012-18 Developed Gross Site Area**	**2012-18 Developed Parcel Units**	**Critical Areas**	**Public Purpose Area**	**Right-of-way Area**	**Net Buildable Area**	**Achieved Density**	**Mixed-use Development?**
	Sq Ft	DU	Sq Ft	Sq Ft	Sq Ft	Acres	DU/acre	Y/N
	Summed from parcel-based analysis	Summed from parcel-based analysis	*REPORT HERE*	*REPORT HERE*	*REPORT HERE*	*Calculated:* (A-(C+Ds))/ 43,560	*Calculated: B/E*	

Tables 2 and 3 collect single family and multifamily/mixed-use residential projects, additional to the parcel-based analysis. Use these tables to document development not captured in the parcel-based analysis. Please report new units by zone, gross area from the developed parcels, critical areas, and other public purpose and right-of-way area. Reporting should be by year, by zone when possible.

Table 2: Single-Family Residential Building Permits*

		A	B1	B2	B3	C	D	
Zone	**Permit Year**	**Gross Area**	**Critical Areas**	**Public Purpose Area**	**Right-of-way Area**	**Net Buildable Area****	**Number Units**	**Achieved Density**
		Gross site Acres	Acres	Acres	Acres	Acres (calculated: A-(B1+B2+B3))	DUs	DUs/Acre (calculated: D/C)
Document permit data sources used here.								

* Each line in this table should represent all permits issued in a single year in a zone.
** Net buildable area equals parcel area, less critical areas and other constrained area. Be mindful of short plats and parcel subdivisions with right of way or other public purpose easements. These areas should be removed from the net buildable area.

Table 3 is for reporting on multifamily and mixed-use development. Reporting on multifamily permits is similar to reporting on single family development in Table 2. Mixed-use development refers to developments with both residential and non-residential components, and reporting requires a few more steps:

- Report only on the residential portions of mixed-use development here; non-residential portions will be captured in Table 6.
- To identify a mixed use project, mark "Yes" in the "Mixed-use Project" column.
- To assist with calculating mixed-use capacity later on, it is important to report the share of residential development in the mixed-use development in column A of Table 3.
    - Calculate this by dividing the total built square footage (floor area) of the mixed-use development by the amount of built square feet in residential use.
    - When totaling the development floor area for a mixed-use development, do not include the area of parking structures, public plazas or other amenity spaces in the gross or net floor area/built square feet.
    - It's ok if development is captured in the parcel-based analysis and does not appear in Table 3. The non-residential share will be captured in Table 6.

This table is designed to calculate achieved density in dwelling units per acre. If your city regulates density by Floor Area Ratio (FAR), instead of reporting dwelling units in column E, report the amount of residential floor area constructed, and convert the net buildable area acreage to square feet. Indicate the use of FAR densities in the table documentation.

Table 3: Multifamily Building Permits, Including Residential Portions of Mixed-Use Projects

				A	B	C1	C2	C3	D	E	
Zone	**Permit Year**	**Project Name**	**Mixed-use Project**	**% of Mixed-use in Residential**	**Gross Area**	**Critical Areas**	**Public Purpose Area**	**Right-of-way Area**	**Net Buildable Area**	**Number Units**	**Achieved Density**
		(If applic.)	Y/N	%	Acres	Acres	Acres	Acres	Acres (calc'd: B-(C1+C2+C3))	DUs	DUs/Acre (calc'd: E/D)
Document permit data sources or FAR densities used here.											

Table 4 tallies demolitions, plus accessory dwelling units (ADUs) and conversions. For projects adding units through ADUs or conversion, include the number of units already existing on the parcel and the parcel area, to calculate an achieved density for these types of developments. For demolitions, report the number of units demolished, where no replacement or additional units were constructed.

Table 4: Other New Units and Demolitions*

	A	B	C	D		E	
Zone	**Number of ADUs**	**Number of Units Added through Conversion**	**Pre-existing Units**	**Parcel Area**	**ADU/Convert Achieved Density**	**Number of Demolished Units**	**Net Other New Units**
			For ADUs and Conversions	For ADUs and Conversions	DUs/Acre (calc'd: [A+B+C]/D)		Calc'd: A + B - E

* Each line in this table represents all permits completed in a zone, single year.

Table 5 summarizes the permit data and parcel-based analysis (Tables 1, 2, and 3), and calculates achieved density in each zone.

Table 5: Residential Achieved Densities—Consolidation by Zone*

	A	B	
Zone	**Total Residential Units**	**Total Net Buildable Area**	**Overall Achieved Density**
	Table 1 column B + Table 2 column D + Table 3 column E	Table 1 column E + Table 2 column C + Table 3 column D	A/B

* Aggregate by zone for all years

Table 6 reports data on building permits for employment-based uses by zoning type, including the non-residential components of mixed-use development. The types of uses to include in this table are commercial and industrial developments where employees are located, and are broadly referred to as "commercial" or "non-residential," for simplicity. This includes developments on publicly owned lands, so long as they are employment sites (like a school or office building). Do not report on any tenant improvements or temporary/moveable structures. "Mixed-use" developments include residential and non-residential components. Commercial developments with different non-residential uses (e.g., a hotel and office), are not counted as mixed-use developments.

Purely commercial or industrial developments should be reported by zone, by year, with the gross parcel/site area of the development, constrained critical areas, right-of-way, and public purpose areas, and floor area (the built square footage) of the development. Do not include parking structures, plazas, or amenity spaces as built floor area. The floor area ratio (FAR) is the measure of non-residential density, and is calculated from the floor area and the net site area fields. It expresses the ratio of the amount of built space to the area of the site/parcel.

Mixed-use development requires additional reporting on the portion of development in non-residential use. For mixed-use developments:

- To identify a mixed use project, mark "Yes" in the "Mixed-use Project" column.
- Report the total built square feet for the project in column F1
- Report the non-residential built square feet for the project in column F2
- To assist future mixed-use capacity calculation, report the share of commercial development in the mixed-use development in column A.
    - Divide the total built floor area (F1) of the mixed-use development by the amount of built square feet in commercial use (F2).

B. Achieved Density Documentation and Background

Background

Section IA presented data on recent development activity, particularly achieved densities averaged across the six-year review period. Section IB provides a space for further analysis of achieved densities to consider a range of factors responsible for the densities achieved. The objective is to consider on the causes leading to the densities achieved in preparation for Part 2 reporting, where "assumed" densities are selected to apply to vacant and redevelopable land to calculate remaining capacity.

This section provides a space to reflect on the densities achieved in each zone, whether they approximate expected densities, and why they may not.

Buildable lands legislation now requires jurisdictions to review their development regulations for changes during the evaluation period that have significantly affected the supply of developable land (either positively or negatively). Additionally, cities must account for circumstances where zoned densities are not achieved during the evaluation period. Non-achievement of zoned densities may necessitate the adoption of reasonable measures in 2023 comprehensive plans. These requirements will be addressed in Part 2 of reporting, but the context behind the achieved densities will be collected while it is freshly in mind.

How to fill out the tables

For Tables 8 and 9, for each zone, enter the achieved densities (from Tables 5 and 7), or for zones where no development occurred during the review period, enter "0" for achieved density. Then, use the documentation space to supply any information documenting or exploring factors responsible for the achieved density. Is the density higher or lower than expected? Have there been significant recent changes in the zone? Provide any qualitative or quantitative data that helps contextualize the densities achieved.

The following describes some factors that can influence achieved densities.

Inadequate Density Data

Some zones may have had little or no development activity during the review period. If no activity occurred, there is no direct data from which to project future densities. In these situations, describe why development has not occurred. In Part 2 of reporting, when it's time to select an assumed density, development in other similar land use categories, including similar zones from other cities, analysis of not-yet-built development projects, and assumptions from code, can help inform assumed densities. It may be helpful to note these any of these data points at this time.

Planned Development

Issued permits, preliminary plats, or developer agreements for permitted or under-construction development that will come online after the end of the review period (12/31/18) can provide a fuller story of development within a zone. Do these types of development add any detail to the achieved density of a zone? Summary analysis of data on planned development can be provided now.

Changes in Regulations

In several jurisdictions, significant changes to zoning and other land use regulations, like rezones, upzones, changes to setbacks or impervious surface requirements, occurred during the review period. The impacts of such changes will likely be reflected, in part, in the density trends analysis. Note whether any of these circumstances affecting achieved densities apply over the review period.

Shifting Jurisdiction

For cities that annexed large areas during the review period (2012-2018), a significant number of the development projects included Section 1 tables may have been approved under King County's jurisdiction. The type and density of development approved by the county may not be representative of what is likely to occur under municipal jurisdiction in these areas. Density findings that show significant differences between county and city approved development may support alternative future assumptions about the capacity of land that is now incorporated.

Infrastructure Gaps and Limitations

Limited infrastructure availability may keep densities low in the foreseeable future, despite zoning that allows for higher densities. In most cases, this will be reflected in the achieved density data. Alternatively, infrastructure deficits that may have depressed achievable densities during the review period, may be resolved in the near future, allowing for higher density development within the planning horizon. Note if these circumstances apply.

Table 8: Document Achieved Residential Densities

Zone	**Achieved DUs/Acre**	**Reasons/Documentation**
	From Table 5	Add any footnotes from Tables 1-5, and any supplemental documentation on the densities achieved in each zone.

Table 9: Document Achieved Non-Residential Densities

Zone	**Achieved FAR**	**Reasons/Documentation**
	From Table 7	Add any footnotes from Table 6-7, and any supplemental documentation on the densities achieved in each zone.

Table 10 is similar in intent as tables 8 and 9, but examines the split of uses in zones allowing mixed-use development. Are certain zones experiencing more residential or commercial development than expected? Is mixed-use development tilted towards one use? Have development regulations only recently allowed mixed use? Report any qualitative or quantitative data to describe your city's outcomes.

Appendix B: Phase 2 Guidance - Land Supply

I. Overview of the Urban Growth Capacity Study

The Urban Growth Capacity Study, also known as "buildable lands," is a collaboration between cities and King County to analyze recent land use development trends, and to compare those trends to comprehensive plans and growth targets, providing meaningful information on development and capacity for updating growth targets and comprehensive plans. King County coordinates the development of the report, and each city provides and a standardized set development data for their jurisdiction. In phase one of data collection, earlier in 2019, cities collected data on recent development 2012-18, in an effort to determine the zone-based achieved development densities. In phase two of data collection, cities and King County will review their urban land area to identify the supply developable land available over the next 20 years. This document will guide planners and analysts through that process. Phase three of data collection will take place in early 2020 and focus on calculating capacity and new requirements of the buildable lands process.

II. Purpose of Data Collection Phase 2

Phase one of data collection for the Urban Growth Capacity Study focused on calculating the achieved densities of recent development. Phase two will identify developable vacant and redevelopable lands to combine with the achieved density data to ultimately calculate capacity. Phase two also concerns the quantification of the planned density for each zone in your jurisdiction, to understand whether densities are being achieved as planned. Planned densities also help determine whether developable land is redevelopable or not. Planned densities are different from *achieved* densities (calculated in phase 1), in that they are expected densities based on your jurisdiction's code and development regulations. Planned densities will be detailed further in section III below.

This guidance will help you define vacant and redevelopable developable land, and identify the densities being planned for in each zone. Your task is then to use those definitions to quantify developable land and report planned densities. In the following sections we'll describe the details for the types of data to provide to complete phase two of data collection.

Ideally, you'll submit GIS-based zone- or parcel-level data identifying developable residential and non-residential land, and tabular data expressing the planned densities for each zone in your jurisdiction. Tables of data, in lieu of GIS data may be submitted as a last resort. If you do not have GIS to assist in this exercise, King County has resources available to support your efforts. Don't hesitate to request technical support by contacting Rebeccah Maskin, rmaskin@kingcounty.gov or 206-263-0380.

King County is requesting Phase two data to be returned by January 7, 2020.

III. Planned Density Reporting

Planned densities are collected for two reasons. First, as a part of new requirements to the GMA buildable lands statute[1] passed by the State Legislature in 2017, King County jurisdictions are now required to evaluate whether planned densities are being achieved in the 2020 Urban Growth Capacity Study. Achieved densities (evaluated in Phase one reporting) will be compared to planned densities to as one indicator of whether development is occurring as planned.

[1] RCW 36.70A.215

Second, planned densities are used in the identification of redevelopable lands. Since the 2007 Buildable Lands Report, King County has recommended jurisdictions identify redevelopable lands by comparing the existing density of development to its planned, or potential, density, particularly for residential and mixed use lands.

A planned density should be reported for each zone where people live or work in your jurisdiction. The next section will describe how King County is defining "planned densities."

Defining Planned Densities

For the Urban Growth Capacity Study, **planned densities will be defined as the "as-of-right" density granted by code for each zone, that is the maximum allowed density without any bonus or incentive density**. In many communities, residential densities are defined in dwelling units per acre (DU/acre) or by minimum lot size, while non-residential zones use development regulations or Floor Area Ratio (FAR) to define the allowed density. The following sections describe selecting or calculating DU/acre and FAR for each zone. While this guidance will provide instructions for relatively precise calculations, these should be reviewed with your professional judgement for the intent of your comprehensive plan and implementing code.

Residential Densities

For this analysis, we are requesting residential planned densities to be reported in terms of dwelling units per acre (DU/acre), unless your jurisdiction solely uses FAR to define density. Some jurisdictions use minimum lot sizes to define residential densities, particularly in single-family zones. Minimum lot sizes can easily be converted to DU/acre by dividing 43,560 square feet (one acre) by the minimum lot size. The result is the maximum dwelling units/acre allowed. Residential densities for mixed use zones should also be supplied.

Non-residential Densities

Densities in commercial and industrial zones are less frequently defined as explicitly as residential zones, typically relying on bulk, height, and use regulations to define the size or density of a development. Some jurisdictions have used floor area ratio (FAR) to define the density of non-residential development, and this is what is requested for non-residential planned density reporting. If your jurisdiction does not use FAR to define density, Table 1a in the data reporting tables template is a "FAR calculator" table and instructions to assist in determining a FAR-based density. Please provide non-residential densities for mixed use zones as well as residential densities.

Planned Density Template Table

Planned density data should be reported in Table 1: Planned Densities, which has the following format:

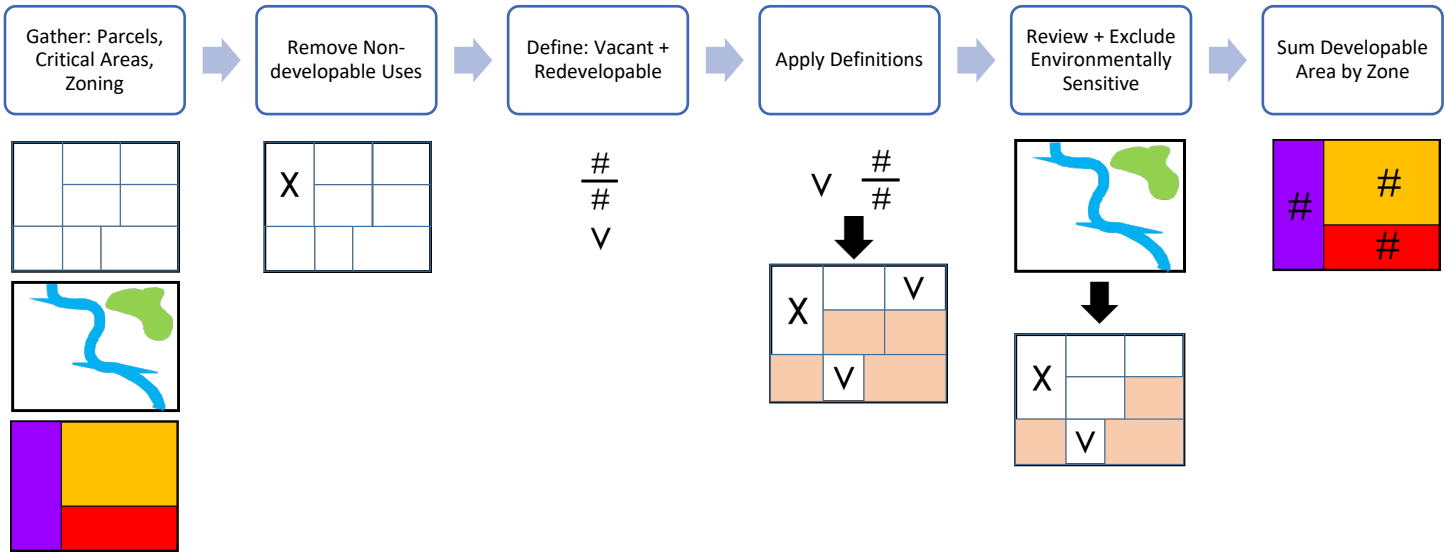
	Select:						Optional Fields (to assist with density calculation)						
Zone	Residential	Non-Residential	Mixed-use	Other	DU/acre	FAR	Minimum Lot Size	Maximum Height	Estimated Stories	Maximum Lot Coverage	Front Setback	Rear Setback	Side Setbacks

The following table describes the reporting table with field-level definitions and instructions for completing the table. Note that the optional fields duplicate fields in the FAR calculator. Store the values

used in the FAR calculator in Table 1, or by duplicating the FAR calculator in that tab of the template spreadsheet.

	Zone	Zone name/ID. Include all zones where people live and/or work
Select:	Residential	Characterize the zone by its dominant use, mark with an "x"
	Non-Residential	
	Mixed-use	
	Other	
	DU/acre	Where residential development is allowed, fill in the as-of-right maximum density allowed, per the guidance, in dwelling units per acre
	FAR	Where non-residential development is allowed, fill in the as-of-right maximum density allowed, per the guidance, in FAR. Use the following optional fields or the FAR calculator, as needed.
Optional Fields (to assist with density calculation)	Minimum Lot Size	Residential zones in particular. To convert to dwelling units per acre, divide the minimum lot size by 43,560.
	Maximum Height	Non-residential zones; maximum building height allowed in zone. Estimate a maximum height if "unlimited," not specified, or site specific.
	Estimated Stories	Non-residential zones; estimate from the maximum height. A rule of thumb to approximate: divide by 10 and round down (e.g, 35' = ~3 stories).
	Maximum Lot Coverage	Non-residential zones; as a percentage expressed in code as maximum lot coverage, impervious surface coverage, or a maximum building size/development site (if 1 story only)
	Front Setback	Non-residential zones, in feet
	Rear Setback	Non-residential zones, in feet
	Side Setbacks	Non-residential zones, in feet

IV. Developable Land Supply Reporting



This portion of the analysis involves a jurisdiction-wide scan to quantify all land available for residential or commercial/industrial development for the next 20-year planning period. "Land supply" is the phrase used to refer to an inventory of land "suitable for development." Land supply inventories for each jurisdiction should strive for a snapshot of land with development potential as of January 2019, approximating the end of the most recent evaluation period (2012-2018). The land supply includes vacant and redevelopable lands

To quantify the developable land supply, jurisdictions will:

- Assemble necessary data for the entire jurisdiction, including parcel/assessor data, critical areas, and zoning.
- Define vacant and developable lands using a density and/or value threshold,
- Exclude land uses or parcels that are unlikely to develop for categorical reasons (e.g., parks, schools, public facilities, other institutions),
- Apply vacant and redevelopable land definitions to the parcel data,
- Review and refine the resulting developable land supply,
- Remove area for environmentally sensitive lands,

- Screen for infrastructure gaps, and
- Summarize developable land supply by zone.

The graphic below illustrates the process:

Later on in Phase 3 of data collection, cities will discount lands for area deductions for right-of-way and public purpose uses and apply a "market factor," to quantify capacity for housing and employment.

Data Needs for Identifying Developable Land Supply

King County has supplied cities with a data package including a shapefile and spreadsheet of parcel and assessor data that contains land use, existing development, area, and valuation data. Cities should supply their own zoning and critical areas data to relate to the parcel data. Planned densities from Section II should also be related to the data for use in determining if land is redevelopable. More information on defining redevelopment and vacant land thresholds follows below.

Parcel Data

Parcel data comes from the King County Assessor. It was downloaded in September 2019, to account for lag in data transmission, and approximates valuation and development on the ground in January 2019. This data source was selected because it is comprehensive and relatively consistent across the county, but cities should feel free to supplement it with their own data, if it improves accuracy. King County has related tables from the assessor database and selected fields that will be helpful for the land supply analysis. A field dictionary was included with the initial guidance email and data package. Data fields in the spreadsheet include: (a * indicates key data fields and blue text indicates calculated fields):

EconomicUnitParcelList

To join the assessor data table to the parcel shapefile, use the PIN (parcel identification number) field. If you do not have staffing capacity to perform GIS analysis, please contact King County staff for assistance.

Zoning Data

While a zoning field is present in the parcel data, the value may not be the most current zoning for your jurisdiction. It is recommended that you overlay the parcel data with your current zoning to ensure that each parcel is related to the correct zone. While the parcel data represents early 2019, the zoning used should be the most current and forward looking as possible to reflect a truer picture of future development capacity over the planning period.

Critical Areas Data

Jurisdictions must deduct land from the set of potentially developable parcels that is constrained by environmentally sensitive areas. Environmental features associated with critical areas include wetlands, streams and other water bodies, steep slopes, geologic hazards, shoreline buffers and other features identified in a jurisdiction's update critical areas ordinance or other regulations. Ideally, jurisdictions maintain their own critical areas GIS data, and this should be used in the analysis. As a fallback for some areas of the county, cities may rely on critical areas GIS data provided by King County or state agencies. The parcel data also contains several fields that cities may be used as a backup for critical areas.

Uses to Exclude from Analysis

Certain development types or land uses should be removed from consideration as developable land supply. These include: public lands and facilities, religious institutions, cemeteries, golf courses, schools, landfills and quarries, railroads and utilities, and other miscellaneous institutional uses. These uses can be identified by the existing land use codes and other methods identified in the table below.

While these development types are generally not suitable for future development, exceptions exist, e.g., a churchyard might be planned for housing or a government agency might have plans to sell surplus property, and jurisdictions should use their best judgement to refine the results from a purely rule-based analysis. Red-colored comments in the table below identify cases to watch out for while broadly applying rules.

If your jurisdiction maintains a layer of parks and open space, consider using it to screen out parks or trail properties as well.

Use Type	Identification Methods	Comments
Public facility or public ownership	KC Assessor indicates property tax exemption. PropType = X. KC Assessor. Query Owner field for records containing strings, such as "CITY OF" or "SCHOOL." KC Assessor. Query PresentUse field for codes indicating various public uses (e.g., 184 for public schools). Individual jurisdiction parcel inventories of public facilities and parks.	Ownership may include city, school district, county, or state agencies. Watch out for multiple spellings or abbreviations used for public agency names (e.g., Dept. vs. Department vs. DNR). PropType query will select both "public" parcels as well as a number of additional parcels that fall into one of the categories below (e.g., church land, some railroad land, subsidized housing, and other non-profits). Exclusion of these parcels is consistent with additional categories described below. PropType query will also select some parcels owned by individual homeowners who qualify for tax exemption. Such parcels should not be excluded from the inventory.
Religious institution use or ownership	PropType screen (see above). Query for PresentUseCode = 165 (Church/Welfare/Relig. Srvc.) Query Owner field for records containing strings, such as "CHURCH."	Query for Present Use will select only those parcels in church use; parcels in church ownership will be more completely selected using Owner name query. Parcels in religious institution ownership, but not use, are more likely to be available for future development. Use discretion in selecting or excluding properties. Queries for strings in Owner name field (here and below) will select some parcels not intended for exclusion (e.g., "JOHN CHURCH"). Un-select these records by visually screening selected set.

Use Type	Identification Methods	Comments
Cemeteries	Query for PresentUseCode = 179 (Mortuary/Cemetery/Crematory) PropType screen (see above).	Will identify private mortuaries or other uses that may be redevelopable.
Golf courses	Query for PresentUseCode = 143 (Golf Course)	
Private schools	Query for PresentUseCode = 185 (Private School) Taxpayer name contains the string "SCHOOL"	Not all private school uses should be removed from the inventory. Use best judgment. Large institutions are more likely to be stable uses than small private ones, such as day care centers. PropType query (see above) will likely select many private, non-profit educational institutions, most of which should be excluded from the inventory. Some school uses may appear as vacant per Assessor's records (e.g., playfields).
Landfills and quarries	Query for PresentUseCode = 138 (Mining/Quarry/Ore Processing), or 266 (public utility).	
Other institutional uses and institutional campuses	Query by PresentUseCode (various).	Hospitals (173), nursing homes (59), colleges and universities (185, 184, 56) government services (172), etc.
Railroads and utilities	Query for PresentUseCode = 332 or 261 (Right of Way/Utility, Road, Rail Terminal) and = 266 (Utility, Public). Query Taxpayer Name field for records containing strings, such as "#RR#" or "BURLINGTON"	If not excluded from the inventory, many of these parcels will be misclassified as vacant. There are some parcels along RR ROWs that are of course, redevelopable. Make case-by-case determinations based on local knowledge.

Related Parcels

The parcel/assessor data includes fields titled or beginning with "EconomicUnit." These fields are intended to assist in identifying properties or developments that should be considered as a single development, such as a parking lot and a store on separate parcels, or a large development spanning several parcels. The data are linked by their *EconomicUnitName*. If a parcel is not connected with others, *EconomicUnit* fields will be blank. Economic unit data can be helpful in screening parcels that may be identified as vacant or redevelopable because of a low value or vacant land use, but are not functionally available as such. Conversely, this might identify parcels where aggregation (treating several individual parcels as a single unit) might render a site as redevelopable.

Major Planned Developments

Parcels where large known future developments are located may also be excluded from the land supply analysis. Please **record the parcel PINs, zone, planned number of units and/or square feet, and anticipated year of completion in Table 5: Major Planned Developments**. This step is optional; use only as necessary and supported by data.

Defining and Identifying Redevelopable and Vacant Lands

Jurisdictions' previously used definitions were included in the initial email with this guidance, in a PDF titled: "Past Vacant and Redevelopable Definitions." These definitions were used in the 2007 Buildable Lands Report, which what the last comprehensive compilation of developable land supply. Previous definitions for redevelopable and vacant lands are a good starting place for the 2020 Urban Growth Capacity Study, but jurisdictions should review and update assumptions for current circumstances. Generally, four definitions are recommended: a single definition for vacant lands (of all types), and separate thresholds for redevelopable single family, multifamily, and commercial/mixed-use lands. Fewer definitions are not recommended (unless a use is not applicable in your jurisdiction). **Record your selected definitions in template Table 3: Vacant/Redevelopable Definitions**.

Vacant Land

Vacant lands are devoid of development, or contain only low value accessory structures. King County advises using a two-part test of existing land use and an improvement value limit to define vacant land. Use the *Present Use* and *Improvement Value* fields in the parcel data, for example: *PresentUseCode* = 300, 301, 309, or 316 (Vacant), and/or *ImpValue* <$10,000, to query vacant parcels. A single-part test (only land use or only value) may alternatively be used.

Other undeveloped properties may not be classified with a vacant use code, like parking lots. These properties should be included as vacant land, unless local knowledge informs otherwise. Commercial parking lots have a present use code of 180, parking associated with other development is coded 159.

As another resource, the King County Assessor now includes a vacant lot table in the assessment data. Vacant lots are identified as those without any buildings present. These are identified in the field *VacantFlag* in the parcel data. Including a value-based screen to define vacant lands (to include parcels that are effectively vacant) is still recommended, and at least visually reviewing the results if using the *VacantFlag* field to identify vacant parcels.

After the vacant land definition has been applied to the data, review the results to identify that only vacant land has been included. In addition to reviewing the parcel attributes for identified vacant lands, aerial photography or site visits may be used to validate the results.

Redevelopable Land - Residential

Regardless of use, redevelopable land includes all developments that are not utilizing their full development potential. This can include partly developed land, infill development, properties that have been recently rezoned, or non-conforming uses.

There are multiple ways to classify redevelopable land. For residential lands, King County's preferred method uses a ratio of potential to existing density on a parcel to determine whether land is redevelopable. For example, if a city defined redevelopable land to be where existing development is less than two times the potential density for that property, a single family property on an acre lot is zoned for up to four units per acre, would be considered developable.

Drawing from King County studies of redeveloped land to inform redevelopable thresholds, defining a threshold between 2 and 3.5 is recommended. The threshold your jurisdiction selects may be influenced by development pressure and existing density, i.e., a lower threshold is be more appropriate for denser, rapidly developing jurisdictions. We recommend testing a 0.25-0.5 tolerance around your jurisdiction's past threshold and comparatively reviewing the resulting parcel output.

To use this method, follow these steps, using the provided assessor/parcel data:

1.) Review existing density. This has been calculated for parcels in the field *ResDensity*, by dividing the existing units by the parcel area to approximate the existing density.
2.) Calculate potential density. Using the Planned Density by zone reported in Table 1, and the parcel area from the assessor/parcel data, calculate the approximate potential units allowed on the parcel. Note: for this analysis, this is not the same as capacity. Capacity calculations for the Urban Growth Capacity Study are more refined and will be completed in Phase Three of data collection.
3.) Select a redevelopment threshold. Review the previous threshold, and make adjustments as described above.
4.) Query the results. Using the selected redevelopment threshold, query the parcel data to identify redevelopable lands.
5.) Review the results. Based on your professional judgement, local knowledge, site visits, or other screening factors listed below, exclude parcels that are unlikely redevelopment sites.

Screening Results

Consider the following additional rules and manual data screens to refine and finalize results from the redevelopable residential land supply identification.

Condo ownership. Condominium buildings may be excluded as redevelopable, as complex ownership makes redevelopment unlikely. Condo ownership is identified in the *PropType* field in the assessor data, with a value of "K."

Townhouse Plats. Townhouse plats or unit lot subdivisions are unlikely to redevelop on a parcel by parcel basis, and may be excluded from developable land supply.

Homeowner Association Properties. Covenant protected lands and structures (golf clubs, recreation centers, gyms) are unlikely to redevelop, and may be excluded from the developable land supply. These may be identified by a homeowner's association name in the *Owner* field.

Higher value homes. Crosscheck selected redevelopable parcels against value of single-family home. Highly valued homes may be less likely to subdivide. A recommended cut-off for this secondary screen is between $400,000 and $600,000—depending on the local market conditions. Consider your jurisdiction's, or the county median home value for reference. The King County Assessor's Local Scape tool can quickly provide this information for your jurisdiction.

Recently developed properties. Crosscheck selected parcels against year of construction (*YrBuilt*). Parcels with recently constructed residences are less likely to further subdivide over the remainder of the planning horizon. Year-built date cut-offs for this secondary screen should be made with respect to local development and market conditions.

Building Footprints. Visually inspect the location of existing buildings on smaller parcels (redevelopment ratio between 2 and 3) using GIS data for building footprints.

Ground checks. Spot check selected parcels against aerial imagery and/or field observations.

Redevelopable Land – Non-residential + Mixed Use

Setting redevelopable thresholds for mixed use, commercial, industrial zoned lands should be considered separately from residential lands. While a density-based ratio, as is recommended for residential lands, can be informative in some areas, particularly those facing significant development pressure, an improvement-to-land-value based ratio may also accurately identify properties likely to redevelop.

Value-ratio method. In the parcel/assessor data table, an improvement-to-land-value ratio has been calculated for each parcel (appraised improvement value divided by land value). A low ratio indicates more potential for redevelopment. Theoretically, the ratio reflects the potential profitability of more intensive use of a site relative to the revenue generating potential of the existing use. Typical threshold ratios for determining redevelopability range from 0.25 to 1. A threshold of 0.5 is recommended for most areas within the county. Jurisdictions experiencing more intense development pressure could consider a higher ratio.

Density-ratio method. Since planned densities for all zones are being evaluated for this analysis, using a density based filter is more possible than in the past studies. The existing FAR-based density is calculated and included in the parcel data, in the field *FARexist*. Relate this value to the planned FAR calculated for each zone to create a ratio of potential to existing density. Sorting and reviewing the range of results in GIS will be helpful to get a sense of the range in your jurisdiction. Starting with a ratio of 1.5 (potential-to-existing density), and testing a +/-0.5 tolerance is a good starting place for reviewing the redevelopable land supply that results. Jurisdictions with less non-residential development pressure would be advised to set a higher threshold.

Comparing density- and value-based methods is recommended in GIS, hard copy maps, or by site review.

Screening Results

Consider the following additional rules and manual data screens to refine and finalize results from the non-residential redevelopable land supply identification.

Low-intensity uses. Include additional parcels as redevelopable based on current land uses that are considered low intensity (e.g., surface parking, storage, single-family homes in commercial or industrial zones) relative to parcel size and location, and market demand for more intensive uses of these sites.

Parcel size and shape. Many parcels that turn up as redevelopable present challenges to redevelopment due to factors such as parcel size, shape, and fractured ownership with limited land assembly potential. Parcel data should be queried by size to identify and exclude sites that are too small to be redeveloped. Review maps of identified redevelopable parcels to identify potential parcel shape and assembly issues that warrant taking parcels out of the inventory.

Recently developed properties. Crosscheck selection against year of construction (*YrBuilt*). Parcels with recently constructed development are less likely to redevelop over the remainder of the planning horizon. Year built date cut-offs for this secondary screen should be made with respect to local development and market conditions.

Condo ownership. Condominium buildings may be excluded as redevelopable, as complex ownership makes redevelopment unlikely. Condo ownership is identified in the *PropType* field in the assessor data, with a value of "K."

Site contamination. Identify potentially redevelopable parcels that are constrained by on-site environmental contamination from current or historical land uses. Based on local knowledge, remove such parcels if site conditions effectively preclude further development within the planning horizon. Limited availability of information on the presence and extent of site contamination may hinder the ability of local governments to quantify its impact on future development potential. The *Contamination* field in the assessor data (value of "Y") can help identify contaminated properties.

Remove Environmentally Sensitive Lands

Once vacant and redevelopable parcels have been identified, environmentally constrained land should be deducted from the land supply inventory. Environmentally sensitive areas may include the following:

- Wetlands
- Streams and buffers
- Shoreline buffers
- Slopes and geologic hazards
- Fish and wildlife habitat
- Aquifer recharge areas
- Frequently flooded areas

The precise definitions for each constraint will vary across jurisdictions, depending on provisions of local updated critical areas ordinances and other regulations, local environmental features, and recent development history.

A recommended GIS-based methodology for deducting critical areas is as follows:

1.) Select relevant GIS layers and features (e.g., wetlands, streams).
2.) Apply buffers to these features, based on local ordinances, where applicable. Features should be sorted by type, class, and/or location in order to apply appropriate buffer widths consistent with regulations.
3.) Merge buffered features into a combined "critical areas" layer.
4.) Overlay this layer with selected parcels (vacant, redevelopable, etc.) to delineate and quantify areas that intersect with land subject to development restrictions. Deduct constrained areas from the aggregate supply of developable land within each zoning/land use category.

Reliability of GIS environmental data for the capacity analysis depends on their completeness in representing the extent of features on the ground, as well as the positional accuracy of the mapped features in relation to parcels. GIS data may be deemed so incomplete or inaccurate as to render them unreliable as the sole indicator of the extent of critical areas that constrain the land supply. Insufficient data may still be useful for the Buildable Lands analysis, particularly if utilized as a starting point for enhancements from field surveys, aerial imagery classification, and other secondary approaches.

For the jurisdictions that lack adequate GIS data on environmental features, constrained land may be deducted through the use of assumed % discounts. Due to differences in degree of urbanization, and due to differences in land base, the actual percentage of land constrained within individual cities will vary considerably. Determination of appropriate discounts should rely on best available GIS, hard copy, and other information about the type and extent of critical areas at the zoning district level within jurisdictions.

Screen for Infrastructure Gaps

A new requirement this cycle, jurisdictions must consider how lapses in infrastructure availability affect the amount of developable land supply. The buildable lands statue notes that this review shall include at least transportation, water, sewer, and stormwater infrastructure in the selection of developable land supply. Capital facilities and transportation plans will be key sources for this screen. King County is working with a consultant to recommend an approach for screening out infrastructure constrained, but otherwise developable, land supply. **Our recommended approach will follow in November.** This will be the last step in in identifying developable land supply, so please do not hesitate to begin the other steps first.

Summarize Data by Zone

After you have crafted definitions, queried the data, and screened the results, **summarize parcel-based developable land area by zone in template Table 4: Land Supply**, as illustrated below. Transmit any GIS-based land supply data to King County as well.

						Select:			
Zone	Gross Acres	Critical Areas	Infrastructure Constrained Area	Vacant Area	Redevelopable Area	Residential	Non-Residential	Mixed-use	Other

Field-level definitions and instructions for completing Table 4 follow below:

	Zone	Zone name/ID. Include all zones where people live and/or work
	Gross Acres	Total area of zone, summed from parcels (in acres)
	Critical Areas	Total area of critical or environmentally sensitive areas (in acres)
	Infrastructure Constrained Area	Total area of infrastructure constrained area (in acres) *more information on this field will be provided in November*
	Vacant Area	Total area of vacant land supply (acres) , summed from vacant parcel area
	Redevelopable Area	Total area of redevelopable land supply (acres), summed from redevelopable parcel area
Select:	Residential	Characterize the zone by its dominant use, mark with an "x"
	Non-Residential	
	Mixed-use	
	Other	

V. Wrapping Up and Next Steps

What to send to King County

When your jurisdiction's planned density and developable land supply identification are complete, **please send the completed phase two table template and GIS-based representations of developable land supply to King County**, via the contact information at the beginning of this guidance. If necessary, include any other accompanying materials to document methods or assumptions. King County staff will review your data and follow up with any questions.

What's next?

As laid out in the introduction, phase two data will be combined with achieved density data collected in phase one to calculate capacity in phase three of data collection. Phase three will begin in early 2020.

Stay in touch!

If you need assistance or have questions, get in touch with King County staff anytime. We are available for direct assistance if your jurisdiction does not have GIS software or other resources. King County is planning workshops in November to help with phase two data collection; more information will follow soon.

Thank you for your attention and partnership in completing the 2020 Urban Growth Capacity Study!

King County 2020 Urban Growth Capacity Study
Phase 2 Data Collection - Additional Guidance on Infrastructure Gaps

Background

This guidance supplements previous guidance from October 2019 on Phase 2 data reporting for the Urban Growth Capacity Study. The final step in completing the inventory of vacant and redevelopable land is a consideration of whether infrastructure availability will limit the developable land supply.

Formally identifying "infrastructure gaps" is a new requirement for the Urban Growth Capacity Study. To satisfy this requirement, King County is recommending the following process to identify any land unlikely to be serviced or achieve its planned density in the planning period, based on physical or ownership characteristics of the land, not because of service expense.

What Are Infrastructure Gaps?

For the Urban Growth Capacity Study, an infrastructure gap exists for a property when one or more critical types of infrastructure– transportation, water, sewer, or stormwater– will not be available over the 20-year planning horizon, and will prevent land development. An infrastructure gap can prevent development in two ways:

- A total preemption of development potential e.g., no improvement is planned to deliver necessary urban services to a piece of land
- A reduction of development potential, e.g., an improvement cannot be provided to serve land at its planned density

Process for Determining Gaps

The infrastructure evaluation process includes the following steps to identify parcels with long term infrastructure gaps significant enough to wholly or partially remove the land from the buildable lands supply:

1. Identify system capacity issues – are there gaps within the service area or capacity for water, sewer, or stormwater providers in your city?
2. Identify site-specific infrastructure gaps – are any parcels within a service area unlikely to be served because of their site characteristics?
3. Update developable land supply – remove parcels with infrastructure gaps from the land supply inventory.

Detailed instructions on how to complete these steps is provided in the next section.

Completing the Data Tables

In the reporting template tables spreadsheet, the tab labeled "Table 2: Infrastructure Gaps" provides three tables to complete this assessment. If you determine no infrastructure gaps to exist in your city, this will be indicated by the results of Tables 2.1 and 2.3

Step 1: Identify System Capacity Issues

1.1. Verify and update the data provided in the most recent Comprehensive Plan, documenting major changes in policy, service provision and other relevant details in Table 2.1.

1.2. List the providers serving your jurisdiction with essential infrastructure: water, sewer, and stormwater, in Table 2.1.

1.3. Collaborate with service providers, drawing from sewer and water district and comprehensive plans, to identify out-of-date planning information and any underserved portions of each city or the unincorporated urban area. Jurisdictions are advised to coordinate with public works staff to review, interpret and verify data. Note underserved areas or other gaps in the column "Service Deficiencies."

1.4. Document any future capital facilities investments planned to address these issues in Table 2.1. Determine if specific investments will resolve infrastructure gaps to "unlock" development potential and when it is expected to occur. Record these investments in column "Planned Investments."

1.5. Evaluate each system-wide capacity issue to determine if the issue is expected to stop or delay future development, or limit the types or densities of development that will be feasible. Record determinations in the column "Infrastructure Gap Present?" in Table 2.1

1.6. Preferably using GIS, overlay the service areas of providers with system capacity issues on the set of vacant and redevelopable parcels. Identify affected parcels in Table 2.2, noting the type of gap affecting development, whether it is a full or partial gap, and for partial gaps, the density restricted by the gap.

Example Table 2.1:

Service Provider	Infrastructure Type	Service Deficiencies	Planned Investments	Infrastructure Gap Present?
Westedge Water + Sewer District	*Sewer*	*Zone 3 - lift station required*	*Zone 3 lift station in CIP, planned completion by 2030*	*No*
Westedge Water + Sewer District	*Water*	*None*	*None*	*No*
Westedge Water + Sewer District	*Water*	*Comprehensive Plan last updated 2011*	*No update planned*	*No, but land use assumptions need updating*
West City	*Comprehensive Plan*	*Capacity project required to serve West Ridge neighborhood currently on septic*	*None for West Ridge*	*Yes*

Example Table 2.2:

PIN	Area	Infrastructure Type	Partial or Full Gap	Density Constraint	Density Type
1111111111	*0.32*	*Sewer*	*Full*		
1111111114	*1.15*	*Sewer*	*Part*	*2*	*DU/acre*

Step 2: Identify and Document Site-Specific Infrastructure Gaps

2.1. Review remaining vacant and redevelopable parcels to identify parcels with physical characteristics or locations that make them unlikely to be served with water, sewer, stormwater services, or roads, either completely, or to their planned density. Examples could include single parcels without road access, surrounded by other unrelated parcels lacking road access, or a parcel with site characteristics that would prevent sufficient sewer service for the planned highest and best use.

This review is most easily done through GIS. The previously supplied assessor data includes fields indicating whether a parcel currently has water, sewer, and transportation services. Suggested criteria for determining site-specific gaps for each utility are listed below. Jurisdictions may tailor these guidelines to meet local conditions. Please document any additional criteria used below Table 2.3:

- **Sewer:**
  - No pipe within 200'
  - Pipe within 200', but insufficient for highest and best use
  - Lift station required
- **Water:**
  - No pipe within 200'
  - Pipe adjacent, but insufficient for highest and best use
- **Stormwater:**
  - No adjacent public main
  - No available discharge point
  - No on-site infiltration capacity
- **Transportation:**
  - Inaccessible due to geographic constraints
  - No infrastructure to provide physical access to site
  - Infrastructure is aging, fails to meet adopted LOS or is otherwise out of compliance

2.2. Draw from code or adopted policy to determine if the issues are expected to stop or delay future development, or limit the types or densities of development feasible on vacant or redevelopable parcels. Review parcels with multiple gaps, regardless of severity, to consider if their combined impact will stop or delay development.

2.3. In Table 2.3, record identified site-specific infrastructure gaps, by documenting infrastructure constrained parcels in the developable land supply. List the parcel identification number, parcel area, type of infrastructure causing the gap, whether the gap fully removes the parcel from developable land supply or merely limits the density, and for partial gaps, the limit to the density, expressed in dwelling units per acre or floor area ratio. If no gaps exist, please write "NONE" in the table.

Example Table 2.3:

PIN	Area	Infrastructure Type	Partial or Full Gap	Density Constraint	Density Type	Note
1111113462	*0.48*	*Transportation*	*Full*	*(# if part)*	*(FAR or DU/ac)*	*surrounded by parcels without access*

Step 3: Update Developable Land Supply

3.1. Drawing from Tables 2.2 and 2.3, in Table 4 (Land Supply), update the field "Infrastructure Constrained Area" with the area of developable land supply affected by FULL infrastructure gaps. Subtract this area and the critical areas from the gross area for the net buildable redevelopable or vacant land supply.

3.2. For partially constrained parcels, in Table 4 create a new line for each affected zone, noting the infrastructure constraint in the "Zone" field (e.g., for zone R-6, create a row for R-6-constrained, or similar). Include the area of the affected parcels in the "Infrastructure Constrained Area" field.

3.3. Summarize vacant and redevelopable land supply by zone.

Appendix C: Phase 3 Guidance - Initial Capacity

2021 Urban Growth Capacity Report – DRAFT Phase 3 Reporting Guidance
June 2020

Introduction

The Urban Growth Capacity Study, also known as "buildable lands," is a collaboration between cities and King County to analyze recent land use development trends, and to compare those trends to comprehensive plans and growth targets. The study will provide meaningful information to cities and King County on development and capacity for updating growth targets and comprehensive plans. King County coordinates the development of the report, and each city provides a standardized set of development data for their jurisdiction.

In Phase 1 of data collection, conducted in 2019, cities collected data on recent development 2012-2018, in an effort to determine the zone-based achieved development densities. In Phase 2 of data collection, conducted in late 2019 and early 2020, cities collected data to identify the supply of available land over the next 20 years as well as information on planned densities for each zone. Phase 3 of the data collection process will build off the work of previous phases to determine assumed density and calculate an initial capacity for each zone. Phase 3 will also include review and reporting of housing and employment growth relative to cities' growth targets, as well as an opportunity to review achieved densities relative to planned densities. This document will guide planners and analysts through this process.

Cities will submit data for Phase 3 in a separate reporting template table accompanying this document. Due to circumstances and limited capacity caused by the COVID-19 Pandemic, King County is allocating resources and technical support for cities facing challenges meeting this data request. All previously submitted data relevant to Phase 3 has been entered into collection tables for each city (in tables 1, 2, and 4), and gaps in data collection have been noted or left as blank, but reviewing the completeness for the list of zones within your city, supplied densities, and land supply information is a great place to start. Any questions or requests for support can be forwarded to the Rebeccah Maskin rmaskin@kingcounty.gov or Ben Larson blarson@kingcounty.gov.

Reporting for Phase 3 data collection is due August 10th.

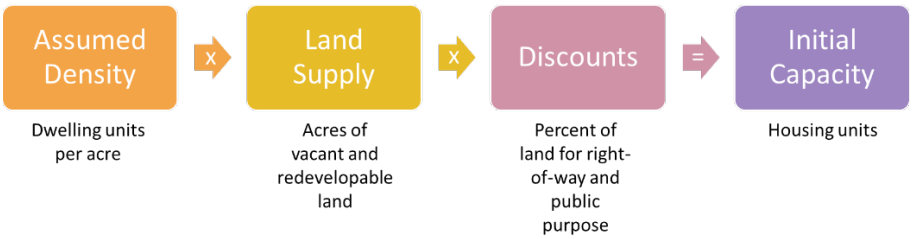
About Phase 3 Reporting

Phase 3 data reporting has three key components:

1. Calculating an initial capacity for each zone in your city
2. Reviewing and reporting on housing and employment growth relative to adopted growth targets
3. Reviewing and reporting on achieved densities relative to planned densities

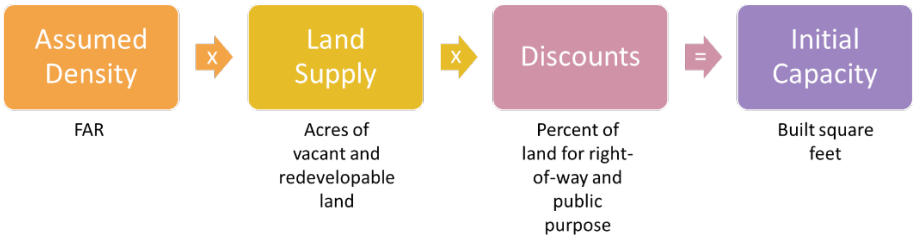
Why "Initial" Capacity?

Phase 3 will work towards calculating capacity, but two assumptions used within the process for calculating capacity are currently being updated to provide more up-to-date information and meet state requirements. In the autumn 2020, jurisdictions will incorporate these assumptions and calculate final capacity for the Urban Growth Capacity Report. The two assumptions are:



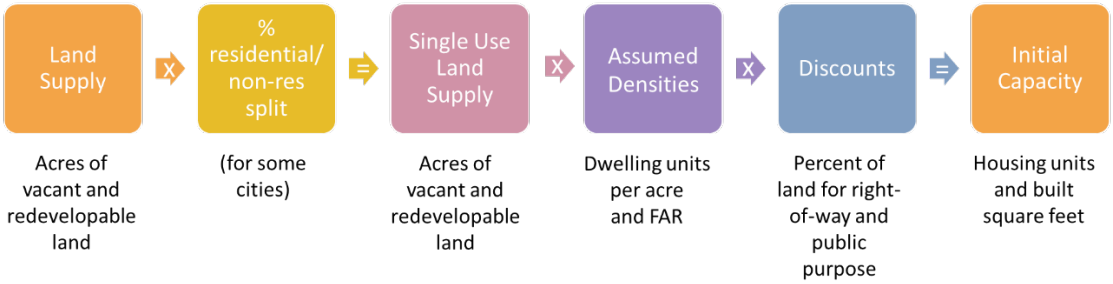
- Market Factor. An assumption that accounts for the amount of land kept out of development because of landowner preference not to develop.
- Square feet per Job Assumptions. These assumptions are used to convert non-residential capacity expressed in square feet to employees.

How Initial Capacity is calculated



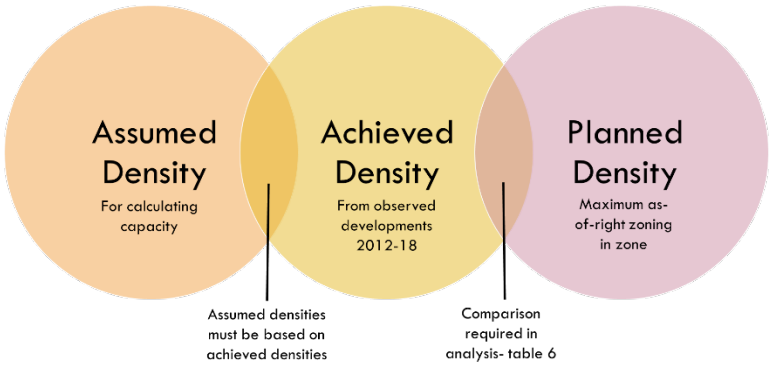
Generally, developable capacity is calculated by zone, and is the product of a zone's assumed density and the area of land supply, minus a percentage accounting for streets, sidewalks, and public purpose land. Achieved densities calculated in Phase 1 of data collection form the basis for the assumed densities, and the land supply was reported by zone in Phase 2. Jurisdictions will select discounts for right-of-way and public purpose lands, informed by recent

development trends, to reduce the land supply for non-buildable, necessary infrastructure. The following graphics illustrate the how capacity is calculated.



Calculating Residential Capacity

Calculating Non-Residential Capacity



Calculating Mixed-use Capacity

Reviewing Progress toward Targets and Densities

Reviewing and reporting on progress toward growth targets and planned densities provides context on how each jurisdiction is meeting its planning goals. Should a city or the unincorporated urban area of the county be found to not be achieving its growth target or planned densities, reasonable measures may need to be adopted in the 2024 comprehensive plan. Reasonable measures are policy or planning strategies selected by jurisdictions to bring growth or development into alignment with planning goals. This is a new requirement for the buildable lands program, and more information is provided in the guidance below. In Phase 3, we are asking cities to compare adopted targets and growth, and achieved and planned densities, and report on policy, code, or other planning circumstances that may explain or otherwise account for the difference. For reference, the graphic below illustrates the difference between the three types of densities that are referenced in developing the Urban Growth Capacity Report.

Types of Density Reported in the Urban Growth Capacity Report

How to Complete Phase 3 Reporting

There are six tables in the template spreadsheet in the reporting packet that must be filled out to complete Phase 3 reporting. Additional materials in the reporting packet email and reporting template spreadsheet will assist your completion of Phase 3 reporting including:

- Past right of way and public purpose assumptions to discount undevelopable land
- Recommendations on adjusting discounts based on recent development trends
- Your jurisdiction's data provided in Phases 1 and 2

The next sections of this guidance will explain how to fill out the template spreadsheet tables.

Table 1: Assumed Densities

Assumed densities are an essential component to calculating capacity. They are reported for each zone where development can occur. Assumed densities, except in limited circumstances, must be based upon the achieved densities observed in the 2012-2018 evaluation period reported in Phase 1 of Urban Growth Capacity data collection. This is specifically called out in RCW 36.70A.215(3)a, e.

Deviation from achieved density is only permitted for zones in the following circumstances:

- **Insufficient observed development in the evaluation period**. Some zones may have experienced limited or no development to draw reasonable conclusions for anticipated development densities, either in the types of development allowed in a mixed use zone, or in the quantity of development.
- **Changes in regulations**. Densities achieved in development permitted during the 5-year review period may reflect zoning and development regulations that have since changed. Where regulations have changed to effectively increase or decrease achievable net densities, assumed future densities should reflect the impact of those regulatory changes, and the specific changes should be documented.
- **Trends over time**. A trend of increasing dwelling units per acre or FAR over time could justify an assumed future density higher than indicated in the zonal average reported as achieved density in Phase 1. Annual reporting in Phase 1 data would indicate this trend.
- **Infrastructure gaps.** "Partial infrastructure gaps," where infrastructure imitations affected portions of zones from achieving planned densities were identified in Phase 2 data reporting.

In such cases, jurisdictions may look to the planned density to inform the assumed density. Documentation of the specific development circumstances that demand deviation from the achieved density, and the rationale for the selected assumed density are required.

Reporting for this section is completed in table 1, as described below. Rows in table 1 will be populated with jurisdictional data provided in Phases 1 and 2. Depending on the completeness of data provided, achieved or planned densities for some zones may still need to be provided. Please review data provided for completeness vis-à-vis the zones in your jurisdiction.

When filling out table 1 for mixed use zones, create an individual row for each use.

Carrying over from Phase 2 reporting, if a portion of a zone is partly constrained by an infrastructure gap, create a separate row for those subareas, and use the constrained density in the assumed density field, noting the infrastructure gap in the document differences field.

Table 1: Assumed Densities

Zone	Land Use Type	Achieved Density	Planned Density	Assumed Density	Document differences between Assumed and Achieved densities, and rationale for selected density

Table 1 Fields and Reporting Instructions

Field Name	Definition and Reporting Instructions
Zone	Gathered from Phase 2 reporting. Each zone where development may occur must have values for all three densities below. For zones that allow multiple land uses list that zone once for each use.
Land Use Type	Residential, non-residential, mixed use, or Other (e.g. public lands, park zones, etc. that are occasionally recorded).
Achieved Density (both DU/acre and FAR)	From Phase 1 reporting. The achieved density the observed density of development occurring in a zone during the evaluation period 2012-2018. It is expressed in dwelling units per acre (residential) or FAR (non-residential). If no development was observed in a given zone, mark with zero and document in the "Documenting Differences" field.
Planned Density (both DU/acre and FAR)	From Phase 2 reporting. The planned density is the as-of-right density granted by code for each zone, that is the maximum allowed density without any bonus or incentive density.
Assumed Density (both DU/acre and FAR)	The density used to calculate capacity in this zone. In most cases this will be the same as the achieved density. Exceptions to this rule are described in the above section.
Documenting Differences	Use this field to report on the circumstances that warrant deviation from using the achieved density as the assumed density to calculate capacity.

Table 2: Mixed Use Zone Use Splits

Mixed use zones are defined as zones with capacity for both residential and non-residential development. In some cities, mixed use zones require the achieved use splits observed in Phase 1 to apportion area to residential and non-residential uses to calculate capacity, but all cities should report on differences between achieved and planned mixed use development. Some mixed use zones did not see mixed use development in the evaluation period. In these instances, jurisdictions can draw from additional sources:

- Observed splits in zones in comparable zones in or outside of your jurisdiction
- Expressed vision for these areas in comprehensive and neighborhood plan policies, or development regulations
- Local knowledge of market conditions, demand for space, projects in the development pipeline, and developer interest
- Existing development similar to that envisioned for a zone

Be sure to document which sources of information were used to determine assumed mixed use splits. Reporting for this section is completed in table 2, as described below.

Table 2: Mixed Use Zone Use Splits

Zone	Achieved % of Residential Development	Achieved % of Non-residential Development	Assumed % of Residential Development	Assumed % of Non-residential Development	Document differences between Assumed and Achieved Residential/Non-residential %

Table 2 Fields and Reporting Instructions

Field Name	Definition and Reporting Instructions
Zone	Gathered from Phase 2 reporting.
Achieved % of Residential Development	From Phase 1 reporting; zones without observed mixed use development will be zero.
Achieved % of Non-residential Development	From Phase 1 reporting; zones without observed mixed use development will be zero.
Assumed % of Residential Development	The share of residential development that will be used to apportion land to residential use. Assumption is to be based off of achieved splits, unless circumstances described above apply.
Assumed % of Non-residential Development	The share of non-residential development that will be used to apportion land to non-residential use. Assumption is to be based off of achieved splits, unless circumstances described above apply.
Documenting Differences	Use this field to report on the circumstances that warrant deviation from using the achieved development splits as the assumed splits to calculate capacity. In cases where no development was observed, cite the sources used to estimate assumed use splits.

Table 3: Discounts

To more accurately estimate the actual developable capacity, the area of vacant and redevelopable land supply must be reduced or "discounted" to account for land that gets utilized for rights-of-way and other public purpose uses where people do not live or work. Public purpose uses are generally stormwater facilities, parks, or other open space. These amounts vary by type and density of development.

The starting place for approximating these discounts is the observed development data used to calculate achieved densities in Phase 1. Past buildable lands reports provide additional reference points, built from the development observed during those evaluation periods. As development becomes denser and occurs as infill, these discount rates reduce, as right-of-way and public purpose uses are already built into the urban fabric.

To support jurisdictional selection of discounts, King County has performed analysis of developments constructed 2012-2018 that informed Phase 1 reporting. Discounts used in the 2007 Buildable Lands Report are also provided to inform the discount selection for the 2021 report. There may be reasons to deviate from the observed or past discounts, including:

- Increasingly dense or infill development experienced or anticipated in the future, could lend to reduced discounts, as essential infrastructure is already present.
- Changes in development regulations could affect discounts in either direction. Development regulations requiring additional set asides for environmental protection, for example could suggest increased discounts, while upzones or increases in land use intensity would suggest decreased discounts.

While zone-specific discounts are not recommended, additional detail may be provided. Land use or density patterns in some cities may justify a single discount being applied across residential land supply, or for multifamily and mixed uses.

Table 3: Discounts

	Right of Way	**Public Purpose**
Parcel Analysis SF Discount	%	%
Parcel Analysis MF/MU Discount		
BLR 2007 SF Discount		
BLR 2007 MF Discount		
BLR 2007 MU/Comm/Ind Discount		
SF Discount Selected		
MF Discount Selected		
MU/Comm/Ind Discount Selected		

Table 3 Fields and Reporting Instructions

Field Name	Definition and Reporting Instructions
Parcel Analysis SF Discount	Drawing from the comparison of 2012 and 2018 parcels that supplied data for Phase 1 reporting, this is the calculated portion of single family parcels developed during that period that went to right-of-way or public purpose uses.
Parcel Analysis MF/MU Discount	Drawing from the comparison of 2012 and 2018 parcels that supplied data for Phase 1 reporting, this is the calculated portion of multifamily and mixed use parcels developed during that period that went to right-of-way or public purpose uses. Values are not jurisdiction specific, and draw from a sampling of development
BLR 2007 SF Discount	This is the discount used for single family land supply in the 2007 Buildable Lands Report. Note that formatting may differ based on how discounts were applied in 2007 report.
BLR 2007 MF Discount	This is the discount used for multifamily land supply in the 2007 Buildable Lands Report. Note that formatting may differ based on how discounts were applied in 2007 report.
BLR 2007 MU/Comm/Ind Discount	This is the discount used for mixed use, commercial, and industrial land supply in the 2007 Buildable Lands Report. Note that formatting may differ based on how discounts were applied in 2007 report.
SF Discount Selected	Fill in your jurisdiction's selected discount for single family land supply here. Selecting a single discount for multiple land uses is also possible depending on your city's circumstance.
MF Discount Selected	Fill in your jurisdiction's selected discount for multifamily land supply here. Selecting a single discount for multiple land uses is also possible depending on your city's circumstance.
MU/Comm/Ind Discount Selected	Fill in your jurisdiction's selected discount for non-residential and/or mixed-use land supply here. Selecting a single discount for multiple land uses is also possible depending on your city's circumstance.

Table 4: Initial Capacity

In the template spreadsheets, the two tables on the tab titled "Table 4" calculate residential and non-residential capacity. The tables are separated for clarity, but are filled out in a similar way, moving from left to right to calculate initial capacity.

In each table, you'll create separate rows for each zone, and for vacant and redevelopable lands within each zone. Mixed use zones should have rows in both residential and non-residential tables. Be mindful of capacity affected by partial infrastructure gaps identified in Phase 2 reporting. These areas should also have their own rows to reflect the constrained densities of the infrastructure gaps.

About Calculating Mixed Use Capacity

In Phase 1 data collection, achieved densities were separately calculated for the residential and non-residential components of mixed use projects. These achieved densities were generally calculated from the number of residential units or commercial/office square footage over the entire parcel area. Calculating density in this manner factors in a split between residential and non-residential uses into the achieved density, making a separate apportionment of mixed use zoned land before the assumed density is applied unnecessary.

A handful of cities calculated density in a different, but equivalent, way— either expressing density only in FAR, or calculating the achieved densities for each use over a portion of the parcel relegated to individual land uses. Cities that calculated mixed use achieved density in one of these alternative ways will need to use the assumed mixed use shares recorded in Table 2 to apportion mixed use land supply to residential and non-residential use in each zone before applying the achieved densities, and document this approach in notes on table 4.

Table 4: Initial Capacity (Residential)

Zone	Mixed Use Zone	Land Use	Vacant/ Redevelopable	Assumed Density	Land Supply Area	Right of Way %	Public Purpose %	Buildable Area	Initial Residential Capacity	Existing Units on Redevelopable Parcels
Phase 2/ table 1	Y/N	SF/MF/MU	Select	from table 1	Phase 2	from table 3	from table 3	Acres	Housing units	Housing units

Table 4: Initial Capacity (Non-residential)

Zone	Mixed Use Zone	Land Use	Vacant/ Redevelopable	Assumed Density	Land Supply Area	Right of Way %	Public Purpose %	Buildable Area	Initial Non-residential Capacity	Existing construction on Redevelopable Parcels
Phase 2/ table 1	Y/N	Com/Ind/MU	Select	from table 1	Phase 2	from table 3	from table 3	Square Feet	Square feet	Square feet

Table 4 Fields and Reporting Instructions (both sub-tables combined)

Field Name	Definition and Reporting Instructions
Zone	Gathered from Phase 2 reporting, copied from Phase 3, table 1.
Mixed Use Zone	Yes or no- indicate whether this is a mixed use zone. Mixed use zones should have a residential and a non-residential row.
Land Use	Residential or Non-residential.
Vacant/Redevelopable	Indicate whether this is redevelopable or vacant land supply.
Assumed Density	Copied from table 1.
Land Supply Area	Gathered from Phase 2 reporting, table 4.
Right of Way %	Copied from table 3.
Public Purpose %	Copied from table 3.
Buildable Area	Developable land area for zone, from which capacity is calculated. Calculated field: Multiplies the single use land supply by 1-right of way % and 1-public purpose % discount fields. Residential land is expressed in acres (to be multiplied by DU/acre), non-residential land is expressed in square feet (to be multiplied by assumed FAR).

Field Name	Definition and Reporting Instructions
Initial (Non-)Residential Capacity	Initial capacity for zone. Multiply the buildable area by the assumed density in DU/acre.
Existing construction on Redevelopable Parcels	Compile the existing development in housing units or built square feet on land identified as redevelopable.

Table 5: Achieving Growth Targets

The review and evaluation program of the Growth Management Act requires that the county and its cities evaluate how they are achieving urban densities by comparing growth and targets. Further analysis is required where county or city growth targets are not being achieved. This concept has long been a part of the review and evaluation program, but amendments to the statute in 2017 strengthened analysis and reporting requirements, making non-achievement of growth targets a potential trigger for reasonable measures in the subsequent periodic comprehensive plan update.

To achieve this aim, King County is comparing estimated housing unit and employment growth 2006-2018 to growth targets adopted in the 2012 Countywide Planning Policies, extended to 2035. The extended growth targets were first published in a 2013 memo to help develop 2015 comprehensive plans. The extended targets have been adjusted to account for major annexations that have occurred since 2013. The memo and adjusted 2006-2035 targets are included in this Phase 3 data reporting packet.

For the recent estimates used to compare to the growth targets, 2006-2018 housing unit growth is derived from block-level OFM Small Area Population Estimates, using consistent geographic boundaries for cities in 2019. 2006-2018 employment estimates derive from the PSRC Covered Employment estimates. Employment estimates reflect total employment, less construction/resource sector employment, to mirror the targets for this period.

For Phase 3 data reporting, King County is requesting cities review the estimates in comparison to growth targets. This data will support the assessment of whether targets are being achieved. This data is presented in Table 6 of the Phase 3 reporting template. In addition to reviewing this data, jurisdictions are requested to consider the observed growth over the 2006-2018 evaluation period relative to the target, and report mitigating circumstances that have landed to significant differences between growth and the target. Such circumstances may include (but are not limited to):

- Development moratoria
- Timing or financing of infrastructure investments
- Preexisting developer agreements or major planned developments
- Development occurring well below planned densities
- National economic trends or factors outside of local land use control

Reporting for this section is completed in Table 5a and 5b, and described below. Data for all cities is also contained in a Tableau dashboard available here: https://public.tableau.com/profile/arrmask#!/vizhome/CompareTargets2006-35_all

Table 5a: Housing

2006-2035 Extended Housing Target	2006-2018 Target Elapsed	% of Target Period Elapsed	2006-2018 Housing Growth	% of Target Achieved	Discussion

Table 5b: Jobs

2006-2035 Extended Job Target	2006-2018 Target Elapsed	% of Target Period Elapsed	2006-2018 Job Growth	% of Target Achieved	Discussion

Table 5 Fields and Reporting Instructions

Field Name	Definition and Reporting Instructions
2006-2035 Extended Housing/Job Target	This field is supplied by King County, and reflects the adopted 2006-2031 target, extended to 2035 per the memo provided in the Phase 3 reporting packet. Jobs data reflects total employment minus construction/resource sector employment. City geographic boundaries reflect major annexations current through 2019.
2006-2018 Target Elapsed	This field is supplied by King County. It is a time-based estimate of the amount of target that has elapsed from 2006-2018. 41% of the 2006-2035 period has elapsed, so it is equal to 41% of the housing or jobs target. Review this number and compare it to the 2006-2018 growth estimate.
% of Target Period Elapsed	This field is supplied by King County. It is a time-based estimate of the amount of target that has elapsed from 2006-2018. 41% of the 2006-2035 period has elapsed, so it is equal to 41% of the housing or jobs target.
2006-2018 Housing/Job Growth	This field is supplied by King County. Housing unit data is sourced from OFM Small Area Estimates; job data is sourced from PSRC's employment estimates, minus construction/resource sector employment. City geographic boundaries reflect major annexations current through 2019. Review this estimate and compare to the 2006-2018 target elapsed estimate.
% of Target Achieved	This field is supplied by King County, calculated from the housing or job growth estimates divided by the extended target.
Discussion	Use this field for reporting specific events or conditions during the 2006-2018 period that could allow for a slower or quicker rate of target absorption. Examples are described in the preceding section.

Table 6: Achieving Planned Densities

Reporting on densities has always been a part of the review and evaluation program, but the review plays a more prominent role in this iteration of the Urban Growth Capacity Report. Like reporting on growth targets, amendments to the buildable lands statute in 2017 strengthened analysis and reporting requirements, making non-achievement of growth of planned densities a potential trigger for reasonable measures in the subsequent periodic comprehensive plan update.

Phase 3 data reporting will build towards this requirement by requesting your jurisdiction's reflection on differences in the densities achieved during the 2012-2018 evaluation period, and those you are planning for. Achieved densities derive from Phase 1 data reporting. Planned densities were requested in Phase 2 data reporting. Determination of "achieving" planned densities will be made later in 2020 according to countywide standards. Further analysis will be required where cities are determined to not be achieving planned densities.

For this phase of data reporting, King County is requesting jurisdictions compare achieved and planned densities for each zone, and evaluate potential reasons why densities may not have been achieved by development during the evaluation period. Such circumstances may include (but are not limited to):

- Rezones that occurred during the evaluation period
- Significant development regulation changes
- Infrastructure or level of service limitations
- Lack of capacity for new development
- Limited quantity of development to draw a comparison
- National economic conditions or development trends outside of local control

- Development vested under preexisting development regulations
- Development moratoria in specific zones or neighborhoods

Reporting for this section is completed in Table 6, and described below.

Table 6: Density Reporting

Zone	Land Use Type	Planned Density	Achieved Density	Difference	Discussion

Table 6 Fields and Reporting Instructions

Field Name	Definition and Reporting Instructions
Zone	Supplied by King County- please review for completeness. Cities with complex zoning codes may aggregate zones to a more generalized zone category that makes sense for monitoring.
Land Use Type	Indicate the type of use, residential, non-residential, or mixed use. For mixed use zones, include two lines for both the residential and non-residential planned and achieved densities. If your jurisdiction only uses FAR densities, you may report a single FAR value instead of indicating non-residential and residential densities.
Planned Density	From Phase 2 reporting
Achieved Density	From Phase 1 reporting
Difference	Calculated as a percentage: Achieved Density / Planned Density
Discussion	Use this field for reporting specific events or conditions during the 2006-2018 period that could allow for a slower or quicker rate of target absorption. Examples are described in the preceding section.

Wrapping up and Next Steps

Thank you for taking the time to read this guidance and complete Phase 3 reporting. Your partnership is essential to completing the Urban Growth Capacity Report. When your tables have been completed, please email them back to King County, to both rmaskin@kingcounty.gov and blarson@kingcounty.gov. Submissions are due July 13th, 2020.

King County's goal is to have all Phase 1 and 2 data completely submitted in early August 2020. This will facilitate countywide estimates of initial capacity in early September 2020. After Phase 3 is complete, we will follow up with information on calculating final capacity, and determinations on target and density achievement.

If you have questions or need help at any time, do not hesitate to contact Ben and Rebeccah, via the emails above or at 205-263-9590 (Ben) and 206-263-0380 (Rebeccah).

Appendix D: Phase 4 Guidance - Final Capacity

Introduction

The Urban Growth Capacity Study, also known as "buildable lands," is a collaboration between cities and King County to analyze recent land use development trends, and to compare those trends to comprehensive plans and growth targets. The study provides meaningful information to cities and King County on development and capacity for updating growth targets and comprehensive plans. King County coordinates the development of the report, and each city provides a standardized set of development data for their jurisdiction.

In February 2021, King County cities will report on the final assumptions necessary to calculate final capacity for this project. The previous three phases of reporting have cumulatively built upon each other towards the goal of calculating final capacity for each jurisdiction, as shown in Figure 1 below.

FIGURE 1: FLOW OF URBAN GROWTH CAPACITY REPORTING PHASES

Phase 4 of data collection will again build off work from previous phases of data collection to calculate residential and non-residential capacity. Final capacity will be compared to the remaining 2006-2035 growth target to determine whether sufficient capacity exists for targeted growth.

To calculate final capacity, cities will select two assumptions for each zone: *Market Factor* and *Employment Density* (Employment Density applies to mixed use and non-residential zones only). This guidance and set of reporting tables aim to provide the information necessary for each city to select appropriate assumptions for each zone.

Cities will submit data for Phase 4 in a separate reporting table template accompanying this document. King County staff are pursuing an accelerated timeline for Phase 4 data collection to complete capacity data for a draft Urban Growth Capacity Report in March 2021. **Phase 4 data is requested by March 5, 2021**. Resources and direct technical support are available to help meeting this data request. All previously submitted data relevant to Phase 4 has been entered into collection tables for each city and gaps in data collection have been noted or highlighted. Capacity calculations hare been pre-programed to the extent possible to facilitate efficient reporting.

Additionally, staff are encouraged to schedule appointments with Ben Larson to facilitate data collection. Staff are invited to book time via Calendy, an online scheduling website linked to Microsoft Outlook. You can schedule an appointment by clicking the following link: https://calendly.com/kingcounty_ugc/phase-iv. No account is necessary

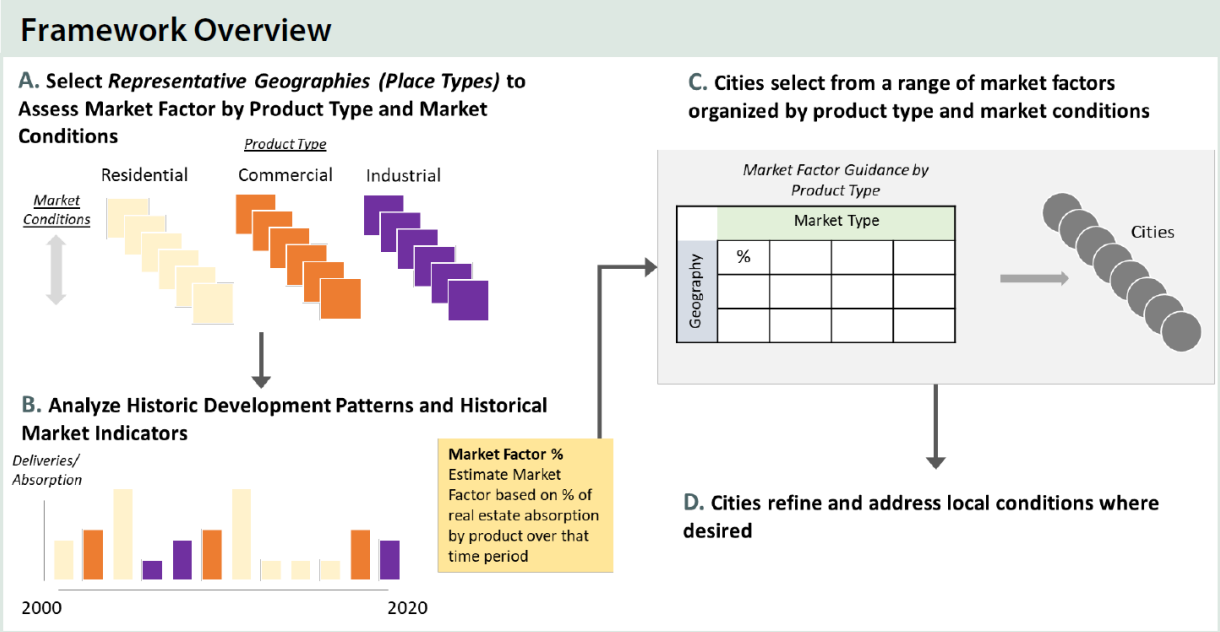
Any questions or requests for support can be sent to Rebeccah Maskin rmaskin@kingcounty.gov or Ben Larson blarson@kingcounty.gov. As always, we greatly appreciate your assistance and cooperation with this request. Do not hesitate to reach out to let us know how we can facilitate your involvement in completing Urban Growth Capacity reporting.

Background on Phase 4 Data Assumptions

Phase 4 data reporting will build directly upon the data your jurisdiction reported in Phase 3 (initial capacity). Cities will select **Market Factor** assumptions to discount the identified land supply for each developable zone. Then, for zones with non-residential development, cities will select **Employment Densities**, expressed as square feet per job ratios, to convert built space capacity into employment capacity. Through allocated buildable lands grant funding from the Department of Commerce, King County has performed an updated analysis to support recommended assumptions, to comport with new statute requirements and recent development trends. Documents detailing the new analysis are included in the Phase 4 reporting package.

Market Factor

The Market Factor, also known as the Market Supply Factor, is a final adjustment to the developable land supply that follows other deductions that account for critical areas, infrastructure gaps, right-of-way, and future public facilities. It accounts for the percentage of buildable land that, due to market constraints, will not be developed during the 20-year planning period. Traditionally, it has been used as a proxy to account for landowner preference to not develop, or inability to develop property over the planning period. Market Factor will be applied to both residential and non-residential zones to determine final housing and employment capacity for each city.



In general, land uses and zones where a *high* level of development or land conversion are expected over the planning period should assume a *low* market factor. Conversely, land uses and zones where development may be more difficult or slower to develop should assume a *high* market factor.

Through an updated analysis[1], recommended market factor ranges have been developed for residential and non-residential zones, varying by Regional Geography and relative market strength (market factor alignment). The analysis behind these recommended ranges compares historical development and land supply identified in the 2021 UGC study. Grouping cities by VISION 2050 Regional Geography, consultants analyzed the amount of development by "product type" (e.g., multifamily/mixed-use residential or industrial development) compared to the amount of capacity in zones linked to that product type, resulting in a distribution of rate of development for cities within a Regional Geography category.

Based on this distribution, cities were grouped into low, medium, and high market factor recommendation, with an associated range of market factors calculated from the relative amount of land left undeveloped in the product type classification. This process is illustrated in Figure 2, and detailed in pages 17-27 of the Market Factor Guidance document included in the reporting package

[1] *King County Urban Growth Capacity Market Factor Guidance* developed by Heartland, LLC and BERK Consulting, 2021. Excerpts from this guidance, including a step by step guide to selecting market factor are included in the reporting package. For the full draft guidance (includes appendices), please contact King County staff.

FIGURE 2: MARKET FACTOR RANGES DEVELOPMENT PROCESS OVERVIEW

The recommended ranges for product types by Regional Geography and market alignment are shown in Figure 3.

FIGURE 3: RECOMMENDED MARKET FACTOR RANGES

City Typology	Residential		Non-Residential	
Market Factor Alignment	Multifamily/ Mixed-Res	Single Family	Commercial (Office/Retail/Mix)	Industrial
Metropolitan Cities				
Low	5%-10%	1%-14%	1%-10%	1%-15%
Core Cities				
Low	5%-10%	1%-14%	1%-10%	1%-15%
Medium	11%-20%	15%-20%	11%-20%	16%-35%
High	21%-35%	21%-30%	21%-50%	36%-50%
High-Capacity Transit Communities				
Low	5%-10%	1%-9%	1%-14%	1%-19%
Medium	11%-15%	10%-20%	15%-25%	20%-30%
High	16%-30%	21%-35%	26%-50%	31%-50%
Cities and Towns				
Low	10%-24%	1%-10%	1%-10%	1%-15%
Medium	25%-35%	11%-40%	11%-20%	16%-35%
High	36%-50%	41%-50%	21%-50%	36%-50%

Selecting Market Factor for Your City

The first task of Phase 4 reporting will be to select the appropriate market factors for your city. For each zone, staff completing reporting will identify a market factor within the recommended ranges and update the reporting table. If the ideal market factor for a zone is determined to be outside of the recommended range, the specific rationale for selecting this market factor must be documented in the reporting table. Cities may vary their selected market factors by the relative complexity of zoning and available land within their jurisdiction. For smaller cities or less complex zoning, a single market factor by land use type may be appropriate, whereas larger cities or more complex development situations may require a more refined identification of appropriate market factors.

The following guidance describes the factors to weigh when selecting a value within the recommended ranges. More detail is included on pages 25-27 of the included Market Factor Guidance document, with the key factors to consider outlined here.

Redevelopable vs. Vacant Land

Cities are welcome to attune their market factors separately for vacant and redevelopable land stock. Be sure to consider how redevelopable lands were identified in calculating the land supply in phase 2 of data reporting. If in identifying the redevelopable land supply, a higher existing-to-planned density ratio or improvement-to-land value ratio was assumed for redevelopable lands, consider whether differentiating between redevelopable and vacant market factors is further required, as that definition already assumes a differentiation between these lands based on market forces.

Traditionally, redevelopable lands have assumed higher market factors than vacant lands to account for the relative ease of converting vacant land to development. As redevelopment takes more of the share of development, it could suggest the remaining vacant land could have significant development challenges that reduce this advantage.

Market Trends

If trends indicate growth in demand for a given product, consider a downward adjustment on market factor to reflect this demand. Alternatively, if the market data for a given product indicates more difficult market conditions, consider selection of a higher market factor within the recommended range.

Upzoned Existing Single-Family Areas

Market factor may be adjusted to account for relative uncertainty regarding how existing single-family zones that have been rezoned for greater intensity may redevelop. The age and value of the housing stock, presence of transit infrastructure, and recent sales or permitting activity can inform how to refine the appropriate market factor for these areas.

Restrictive Covenants

Some areas that have been rezoned or upzoned may still be subject to restrictive covenants that run with the land and limit how development may occur. This is most likely to exist in existing single-family neighborhoods but may also pose a challenge in business parks and other similar commercial districts. A higher market factor can account for this situation.

Fragmented Ownership and Parcel Size

Where capacity for a given product type is largely spread across fragmented or non-contiguous parcels and parcel sizes are generally smaller in size, a higher market factor may be considered to account for difficulties in parcel assemblage for future redevelopment.

Access to Transit

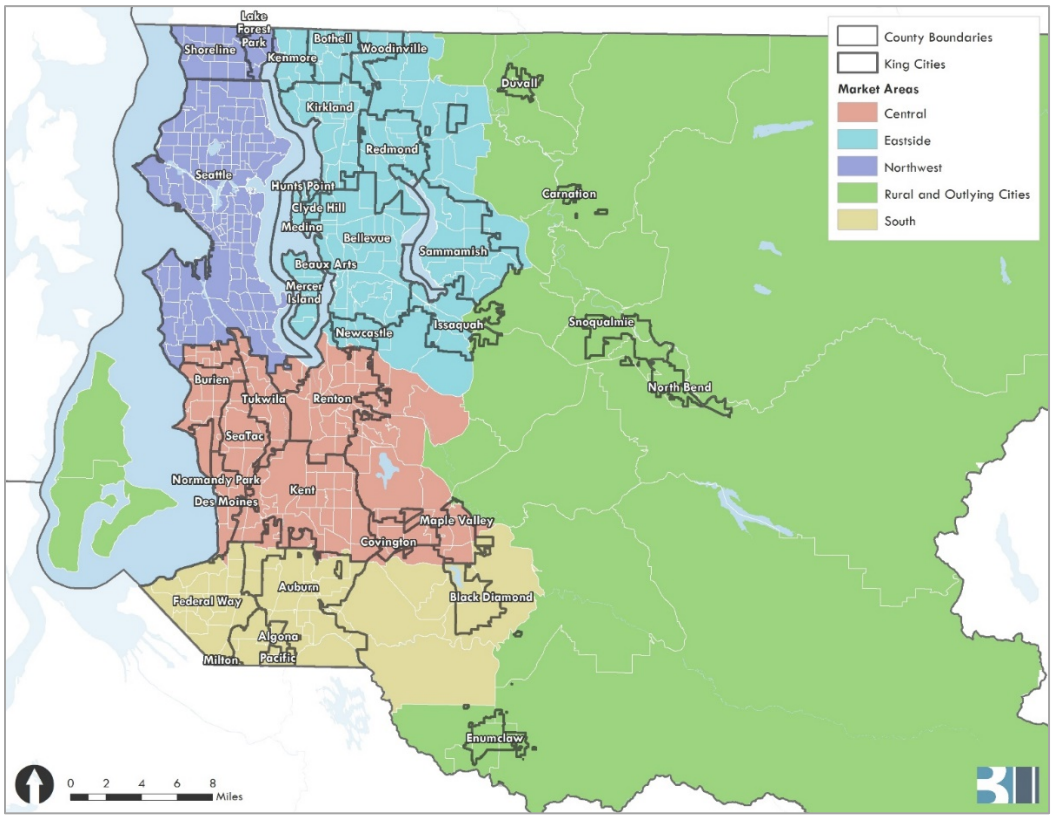
Planned transit infrastructure can greatly improve development feasibility and owner willingness to sell/redevelop land. Market factor assumptions can be tuned to reflect where such improvements exist or are planned in the future.

Infrastructure Cost

In phase 2 of data reporting, we examined the presence or availability of infrastructure in the identification of land supply. Market factor can build on this work, including selecting a higher factor to account for the cost or likeliness of significant infrastructure construction to support planned development.

Employment Densities

Selecting a square feet per job assumption, or employment density, per zone or land use is the last step of calculating non-residential capacity, converting built space capacity to jobs. Cities may vary their selected employment densities by the relative complexity of zoning and available land, or the sectors of employment that are likely to exist within their jurisdiction. Smaller cities or those with less complex zoning may consider a single value or values depending on the land use. Our most basic recommendation is differentiating between commercial and industrial jobs, because of the wide variance in employment density between these types.



To prepare for the 2021 Urban Growth Capacity Report, an analysis of recent employment densities compared to past densities across King County was performed.[2] The analysis compared the amount of industrial and other commercial jobs to the aggregated amount of similarly classified non-residential built space in subareas covering King County to calculate ranges in employment density. This analysis was performed on 2006 and 2019 data to observe if employment density patterns have changed over time. The recommended ranges by subarea and general land use type (commercial/mixed use or industrial) are shown in Figure 4. A map of cities by subarea is included in Figure 5 below, and a city-specific table is included in the reporting table template and the employment density guidance document.

Figure 4: Recommended Square Feet per Job Ranges by Subarea

Market Area	Average 2006 Employment Density (all zones)	Average 2019 Employment Density (all zones)	Recommended Range for Commercial and Mixed-Use Zones	Recommended Range for Industrial Zones
Central	655	608	300–600	700–1,200
Eastside	398	386	200–400	500–800
Northwest	445	415	200–400	500–800
Outlying Cities	669	630	300–600	700–1,200
South	701	724	300–600	700–1,200

[2] *2021 King County Urban Growth Capacity Report Employment Density Guidance*, BERK Consulting, 2021. Full guidance included in reporting package.

FIGURE 5: EMPLOYMENT DENSITY SUBAREAS

Selecting Employment Density for Your City

The final task for calculating employment capacity will be reporting selected employment densities in the phase 4 reporting tables. Recommended ranges for your city are supplied in the reporting table template. If you select employment density values outside of the recommended range, please record specific rationale or alternative methods for doing so in the reporting table. The employment density guidance contains additional detail on pages 8-9 for refining employment densities within the recommended range for your city.

Guidance for Filling Out the Reporting Tables

About the Reporting Tables

The Phase 4 reporting table template consists of four tables. The reporting tables have been populated with data from previous phases of data reporting and programed with calculations to facilitate completion of this round of reporting. Columns include a header with a description of the calculation used to trace how data is used in across the table. **Columns that require input values are highlighted in yellow.**

City staff completing reporting will input selected market factor values by zone on Table 1, column E; and Table 2, column K. Selected employment densities will be inputted by zone on Table 3, column C. Table 4 includes the final capacity calculation. This calculation is primarily automated from values in the reporting tables, but a few values need to be inserted as indicated in the Table 4 explanation below. **As a final step before submitting your tables, back to King County, please review calculated capacity in Table 4.**

Reporting Tables

The below copies of the tables in the reporting table template include mocked-up examples of completed reporting, but otherwise mirror the versions provided in the table template. Each city has a version unique to their jurisdiction that reflects inputted phase 3 data, and recommended market factor or employment density ranges based on the guidance described in previous sections.

FIGURE 6: REPORTING TABLE 1: MARKET FACTOR

Zone	Zone Type	Market Factor Alignment (Low, Med, High)	Market Factor Range (%) (Based on Place-Type, Zone Type, and Market Factor Alignment) (See Guidance)	Final Market Factor	Comments (if final market factor is outside of the suggested range)
Zone Name	SFR, MFR, MU, Comm, Ind	Selected from Market Factor Guidance	Selected from Market Factor Guidance	To be decided by city staff. Please consult market factor guidance.	Please provide comments if final market factor is outside of the suggested range
Example 1	MU	Med	10% - 20%	15%	N/A
Example 2	Comm	Low	5% - 10%	20%	Owner of only vacant land directly opposed to development

Table 1 includes all zones imported from phases 2 and 3 of data reporting, and their land use type (zone type) classification. Select a market factor within the given range in column D, and provide any documentation if selecting a value outside of the given range.

FIGURE 6: REPORTING TABLE 2: INITIAL CAPACITY

Zone	**Mixed Use Zone**	**Land Use**	**Vacant/ Redevelopable**	**Assumed Density (DU/Acre)**	**Land Supply Area**	**Right of Way %**	**Public Purpose %**	**Final Market Factor %**	**Buildable Area (Acres)**	**Initial Residential Capacity (Housing Units)**
Name of Zone	Y/N	SF/MF/MU	Select Vacant or Redevelopable	From Phase 3	From Phase 3	From Phase 3	From Phase 3	From Table 1	= Column F * (1 - Column G - Column H - Column I)	= Column E * Column J
Example1	N	MF	Vacant	24.2	9.7	15%	10.0%		7	176.6

Existing Units on Redevelopable Parcels (Housing Units)	**Initial Capacity summed by zone (Housing Units)**	**Existing units on redevelopable parcels summed by zone (Housing Units)**
From Phase 3	To help with calculations on Table 4	To help with calculations on Table 4
0	235.8	12.0

Table 2 has two sub-tables, one for initial residential capacity, and one for initial non-residential capacity. Only the residential table is shown above. The non-residential table has an identical format, but is tailored to calculating developable square footage, not housing units.

Table 2 is largely imported from the final table in phase 3 data reporting. It includes almost all the data necessary for calculating capacity. In column I, input the selected market factor by zone from Phase 4 Table 1.

FIGURE 7: REPORTING TABLE 3: EMPLOYMENT DENSITIES

Zone	Zone Type (Ind/Comm/MU)	Square Feet Per Job
Example 1	MU	

If you are uncertain about how many square feet per job should be selected for each zone, please consult our employment densities guidance.

Table 3 also includes the following reference table (nothing to be reported by the city)

Recommended Ranges for City

Recommended Range: Commercial and Mixed-Use Zones	Recommended Range: Industrial Zones
200–300	450–700

For more information on these ranges please consult attached guidance on employment densities.

FIGURE 8: REPORTING TABLE 4: FINAL CAPACITY

Zone	Zone Type	Initial Residential Capacity	Existing Dwelling Units on Redevelopable Parcels	Development in the Pipeline	Final Residential Capacity (Dwelling Units)
Name of the Zone	*SFR/MFR/MU*	*From Table 2*	*From Table 2*	*From Phase 2*	*= Column C + Column E - Column D*
Example 1	MU	1,809	0	0	1,809

Table 4 has two sub-tables, one for residential capacity, and one for non-residential capacity. Please review this table, as it records the final capacity to be compared to the remaining target. As you select market factors, the calculated initial capacity will change. It will be lower than the initial capacity from phase 3 data reporting, as market factor discounts the land supply.

Input values for employment densities selected in Table 3 into Table 4 column G (non-residential table only). Also add any information on major planned developments to their appropriate zones in column E.

Pay special attention to any zones that your city has that are specific to single developments, institutions, or master planned areas. If applicable, we recommend using any capacity values relating to developer agreements, master plans, plats, or any other controlling documents rather than calculating capacity for these types of zones.

Wrapping up

Once you have completed phase 4 reporting, send the completed table and all necessary documentation back to King County staff: Ben Larson blarson@kingcounty.gov and Rebeccah Maskin rmaskin@kingcounty.gov.

Quality capacity data is the central product of the Urban Growth Capacity Report, and we cannot complete it without your support. You have our most esteemed respect and gratitude for completing this portion of King County's growth management journey, and we look forward to continuing to work with you as we compile findings for the report and complete additional analysis on achieved densities and growth targets, in addition to overall capacity findings.

A hearty THANK YOU for reading this guidance and partnering to complete this report. Please schedule time if you need technical assistance, or get in touch if you have any questions.

Seattle Specific Guidance 40

1. Market Factor: Introduction

Intro and Purpose

The Market Factor, also known as the Market Supply Factor, is a final adjustment to the buildable land supply that follows other deductions that account for critical areas, infrastructure gaps, right-of-way, and future public facilities. It accounts for the percentage of buildable land that is unavailable or infeasible to develop during the 20-year planning period. Historically, it has been used as a proxy to account for landowner preferences and unwillingness to sell, with various methodologies and approaches employed to develop and inform the assumption. As stated in the Department of Commerce's 2018 Buildable Lands Guidelines:

> *Over a 20-year planning period, not all land will be available for development or redevelopment, no matter how suitable. One key constraint on property availability is market availability, or whether or not land will transact for purpose of development or redevelopment. Owners of property that could be developed or redeveloped may have no interest in selling or developing over an extended period of time for any number of reasons.*

E2SSB-5254 introduced new language regarding the overall buildable lands reporting requirements including new recommendations related to Market Factor assumptions. As part of King County's 2020/2021 updated Land Capacity Analysis the County is seeking guidance on development of Market Factor assumptions for municipalities across the County. King County, as mandated by GMA requirements, now seeks to develop a process and methodology for implementing Market Factors that comport with the revised buildable lands guidelines, and better reflect more current market realities present across the region.

Definition of Market Factor

Department of Commerce Guidelines. Several definitions of Market Factor are discussed in the Department of Commerce's 2018 Guidance Publication (see *Buildable Lands Guidelines, 2018).* Included are several references to the Revised Code of Washington (RCW) as well as the Washington Administrator Code (WAC). Overall, the guidelines describe Market Factor as:

> *Market Supply Factor is the estimated percentage of developable land contained within an urban growth area that is likely to remain unavailable over the course of a 20-year planning period and is, in practice, the final non-developable land deduction when calculating lands suitable for development and redevelopment.*

Process Overview

The following is an overview of the process utilized to develop Market Factor guidance for King County.

- Review Commerce guidance and past studies/methodologies
- Explore and evaluate potential methodologies, data sources and implementation frameworks
- Engage with planners and development community to inform methodology
- Conduct test fit analysis to inform Market Factor guidance (similar to case study examples to test data sources and results of the proposed methodology)
- Develop a framework for each City to evaluate and select a Market Factor assumption
- Recommended Market Factors for application across King County
- Create a "menu" of options organized by geography, product and market typologies
- Provide additional discussion and recommendations related to specific conditions that may impact the Market Factor assumption

Engagement

A critical component of the overall approach was the engagement with the public and private sector planning and development communities. The following groups were engaged throughout the development of the guidance document.

- King County Urban Growth Capacity (UGC) Technical Committee
- External Stakeholders (workshop and survey)
- City of Seattle

Engagement Process to Inform Market Factor

To inform development of a methodology for Market Factor, Heartland and Berk leveraged King County's UGC Technical Committee to discuss and review potential Market Factor methodologies. A survey was also distributed to the group of planners and feedback from the process was used to inform how the methodology and overall framework were developed.

In addition, a stakeholder focus group and survey were conducted to inform the development of the Market Factor Methodology as well as to validate conditions affecting the availability of land. A diverse list of professionals active throughout King County comprised primarily of developers and industry association representatives were invited to attend a discussion of the King County Land Capacity Analysis, and more specially, to discuss Market Factor. In attendance were a mix of representative including:

- Public sector representatives
- Industry/Association advocates
- Representation from both market-rate and income-restricted housing developers
- Developers/professional with expertise in multifamily, mixed use and single-family development
- Affordable Housing Advocacy Organizations

Below are highlights from the discussion. Bolded items are also discussed later in the guidance document.

Single Family Discussion

What We Heard:

- Political environment
- Reevaluate what is redevelopable
- **Issue of up-zones, resulting land price increase and impact on feasibility**
- **Slow turnover rate of SFR in MF or MU zones**
- Anticipate that regulations will only get tougher
- High degree of variability between cities in permit process/timing
- Lack of land zoned for townhomes
- On up zoned parcels, if too slow to convert large SFR lots into higher density, they will be redeveloped into more expensive SFR
- **Pricing expectations**

Multifamily and Mixed-Use Discussion

What We Heard:

- Permitting process and timing impacts matter
- **Access to transit** shapes project feasibility
- Missing/inadequate infrastructure in smaller communities to support higher density housing
- **Restrictive covenants impacts** newly up-zoned areas
- Emphasized need for predictability
- **Consider sale volume and growth as an indicator**
- Discussion of outlier communities:
  - **Mercer Island an example of a high price but limited growth community**
- Consider the existing land use mix and connections to employment centers
- **Consider physical parcel attributes**
- Include additional details for considering unique conditions and associated data sources to further evaluate

Approach

The guidance developed for King County focuses on a real estate product-type framework, wherein Market Factor assumptions/recommendations are organized by major real estate development typologies, also called product-types for the purposes of this report. Market Factor is to be selected by product-type and regional geography and applied to land capacity in areas of where the product type is projected to be the predominant use for a given zoning designation.

The approach to Market Factor for King County considers demonstrated supply, demand and projected capacity (projected for the 2021 UGC study). Demonstrated supply is informed by historical development deliveries. Relative demand for product is measured by both pricing and historical delivery by product type. All deliveries are measured in either residential units or non-residential square feet. The data referenced above were selected after a review of the Department of Commerce Buildable Lands Guidelines, review of former analysis of Market Factor conducted by King County as well as an evaluation of alternative data sources available at a County-wide scale.

This approach evaluates the recent demonstrated delivery rate for a certain product-type applied to a 20-year planning period as a ratio to the current projected capacity. This highlights the relationship between what is being developed by the market historically and the capacity a city is projecting into the future.

Rather than use the ratio to directly calculate a market factor, it is instead used to indicate and inform reasonable ranges of market factors and adjustments that cities in similar geographies and comparable market alignments can then choose to apply. These ranges serve as guidance and are recommended in Step 2 of the Market Factor Guidance Section. Additionally, cities can reference these ratio calculations for other cities to assess their own market factor assumptions and evaluate areas with different market conditions and historical development patterns.

Approach Considerations

The Market Factor assumption as applied in the Land Capacity Analysis framework is designed to account for a myriad of non-physical development conditions that would limit or prohibit the development of certain lands in the future. The approach, methodology and data sources in the guidance document are leveraged to inform the recommended ranges and selection framework, but are not meant to be directly translated to actual Market Factor percentages in a given City's estimates. *For example,* projecting a linear historical delivery trend does not necessarily represent the actual delivery trends for coming 20 years, but rather provides important context for how a City has grown historically versus how it expects to growth in the future.

Approach to City of Seattle

The City of Seattle, as one of two designated Metropolitan Cities in King County and the largest and most diverse City in the region, was analyzed at a more granular level than other Cities in King County. This is due to its geographic scale, total population and relative importance in terms of overall impact on capacity in King County. Seattle's distinct neighborhoods and zoning also allow for a more granular analysis and application of Market Factor. Seattle specific guidance is provided in the Appendix of document on page 40. It is important to note that the methodology for the City of Seattle is the same as the one used across the County, only at a neighborhood scale. The approach and framework herein does allow for more granular application of Market Factor in Cities where it may be appropriate, such as the City of Bellevue.

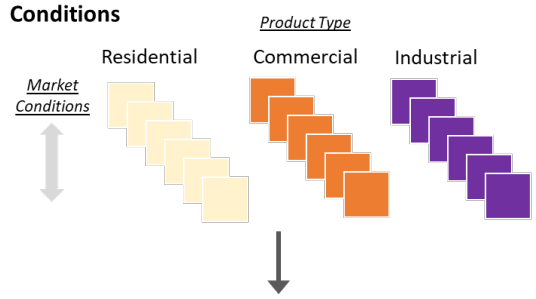
Why use this approach?

- Historical deliveries by product-type data is the best proxy for the nexus of real estate market conditions, willingness to sell and other factors that limit the development of land.
- This approach leverages readily available data from the King County Assessor to provide uniform analysis across all jurisdictions on existing supply, new deliveries, units and predominant use breakdowns to provide a historical and current market evaluation.
- The approach considers the demand for development land and attempts to account for the complexities associated with development economics that most often drive development decisions.
- The approach provides an empirical approach to deriving more realistic assumptions but also provides flexibility for Cities to address more qualitative and subjective conditions.
- The framework allows for a zone-by-zone approach for considering and selecting market factors for cities that wish to do so. Some cities may not have the complexity or need to apply Market Factor at that scale and may elect to apply at a City-wide scale.

The exhibit below depicts the overall process for selecting Market Factor deductions to apply to each City's capacity analysis.

Approach Summary

Analyze development patterns over the last 20 years by regional geography and product-type:



- What was delivered over the last 20 years by product type?
- How do historical rates of deliveries align with future capacity planned in the area?
- How does current supply for any given product type align with projected capacity?
- Leverage this data to inform Market Factor recommendations.

Provide recommendations for determining Market Factor based on:
