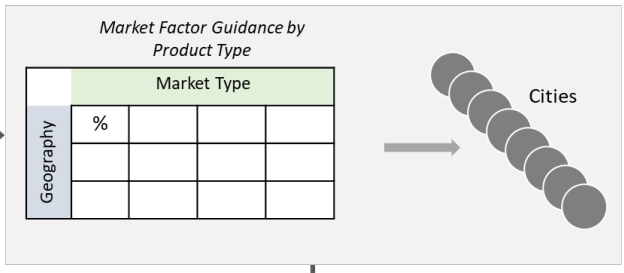
- Product-type
- Regional Geography
- Market conditions
- Other known market constraints

Methodology Overview

A. Select *Representative Geographies (Place Types)* to Assess Market Factor by Product Type and Market Conditions



B. Analyze Historic Development Patterns and Historical Market Indicators

Market Factor %
Estimate Market Factor based on % of real estate absorption by product over that time period

C. Cities select from a range of market factors organized by product type and market conditions

D. Cities refine and address local conditions where desired

Market Factor: Key Definitions and Reference Terms Explained

The following terms and definitions are key to understanding the methodology and using the guidance document.

Product-type:
This refers to the general type of product that new construction would deliver in a particular zone. Using the *Product-type* in this approach serves as a bridge in applying market data to a jurisdiction's capacity data. Detailed *Product-type* definitions are provided in Table 1A under the first step in the Market Factor Guidance Framework.

Regional Geography:
This represents the PSRC *Regional Geographies* outlined in the PSRC Vision 2050 document. These are used to serve as place-type groupings for cities based on shared characteristics.

Market Factor Indicators:
The methodology centers around calculating *Market Factor Indicator* values. These values provide an indication of how capacity would be absorbed based on the annual delivery rate of development (by Product-type) found over the past 5-years. The indicators are not meant to directly translate into market factors but are intended to inform *Market Factor Alignments* and the *Market Factor Ranges* (both defined herein). Note: the analysis evaluated both the 5-year annual average and 20-year annual average historical deliveries.

The *Market Factor Indicator* applies the 5-year average historical delivery rate to the estimated capacity of a given geography over a 20-year planning horizon. This calculation as it relates to the projected capacity is used to indicate what percentage of the capacity is not absorbed over the coming 20 years. The resulting percentage value serves as an indicator of the amount of buildable land that is unavailable or infeasible to develop during the 20-year planning period

Market Factor Alignments:
Three specific groupings for assigning *Market Factor Ranges* (low, medium, and high) are provided. These are assigned by *Product-type* and *Regional Geography.*

The *Market Factor Indicators* for all cities are compared to each other for each *Product-type*. Given the range of *Market Factor Indicator* values, Cities are then grouped into low, medium, or high *Market Factor Alignments* based on how the Cities' *Market Factor Indicator* rankings compared to other cities (see Tables A1-4 in the Appendix). The Cities are then segmented by their respective *Regional Geographies*.

Market Factor Ranges:
Market Factor Ranges represent the range of Market Factors derived for King County organized by *Product-type* and *Regional Geography.* The ranges are informed by *Market Factor Indicators* and available market data (see page 10 to learn more about how the ranges were informed).

- For each *Product-type* and the corresponding *Market Factor Alignment,* a city can use the Table of *Market Factor Ranges* to serve as initial guidance for selecting a Market Factor.
- The discretion to select a value within the informed range or outside the range is left to each individual City. The comparative approach of this methodology is intended to provide flexibility for cities and allow them to make informed assumptions based on this framework but also leverage their unique knowledge of local conditions affecting capacity and future availability of land.

Methodology Overview

A: Establish the Market Factor Indicator through analysis of historical deliveries and the planned capacity for the coming twenty-year planning period.

Measurements:	5-year avg. annual deliveries Cities' Planned capacity
Regional Geographies:	PSRC Regional Geographies classifications.
Data Sources:	- King County Parcel Data - Year 2020 King County Buildable Lands Data - PSRC Regional Geographies
Output:	Market Factor Indicators for all Geographies and product types

Process :

- Assemble and evaluate past deliveries by evaluating the 5-year and 20-year average annual deliveries. These are used to project trends into the future.
- Evaluate Assumed capacity estimated by King County cities using UGC Phase III data. Assign this capacity data by product type based on zoning.
- Create an indicator by extending the 5-year annual delivery trend over the 20-year forward planning period and express as a percent of projected capacity. This gives an indication of what percentage of the planned capacity will be absorbed over the coming years. This indication can also be used to calculate what percentage of capacity does NOT develop over the 20-year planning horizon, which serves in this analysis as an *indicator* for Market Factor. The values from this analysis informed Market Factor recommendations but were not used to directly calculate Market Factors.

B: Establish Market Factor Alignments for all cities and general product types in King County

In the next step, cities were sorted into Low/Med/High Market Factor Alignment categories, based on the relationship of their Market Factor Indicators for each Product-type.

C: Establish Market Factor Ranges for each Regional Geography, Product-type and Market Factor Alignment.

- The Market Factor Indicators from Part A inform a reasonable baseline for the Market Factor Ranges for each city type, product type and Market Factor Alignment – covering every combination of these segments.
- Market price data (rents, median house prices) are used to inform how these ranges should be distributed among Market Factor Alignments (Part B) for each Product-Type.
- The Market Factors used in previous buildable lands analyses (referenced in **Appendix Table A10**) helped inform the maximum market factor (50%) to be found in the menu of ranges and provided useful context when evaluating appropriate ranges for cities to consider.

D: Adjustments – Cities can refine and adjust the Market Factor based on local analysis.

- Cities should adjust their Market Factor within the either the range provided OR the range that aligns most closely with the cities' market conditions.
- Further discussion of these adjustments is provided in step 4 of the Market Factor Guidance Framework.
- Additional data are provided in the appendix to aid cities in adjusting and in potentially re-aligning with another range that may better represent market conditions anticipated over the 20-year planning horizon.

Methodology Summary

A: Establish the Market Factor *Indicators*

B: Establish Market *Alignments* for each City and each Product-Type

C: Establish Market Factor *Ranges* for each Regional Geography , product type and Market Factor Alignment.

D: Refine and Adjust Market Factor

Chosen test-fit Market indicators:

Product Type	PSRC Designation	Test Fit City	Test-Fit Market Factor Range Alignment	Market Factor Indicator
Multifamily	Core City	Kirkland	Low	0.08
Multifamily	HCT	Kenmore	Low	0.07
Multifamily	Cities and Towns	Covington	Medium	0.23
Multifamily	Metropolitan	Bellevue	Low	
Single Family	Core City	Kirkland	Medium	0.18
Single Family	HCT	Lake Forest Park	Medium	0.34
Single Family	Cities and Towns	Pacific	Medium	0.5
Single Family	Metropolitan	Bellevue	Low	
COM(off)	Core City	Federal Way	Medium	0.5
COM(off)	HCT	Mercer Island	Medium	0.5
COM(off)	Cities and Towns	Snoqualmie	Medium	0.48
COM(off)	Metropolitan	Bellevue	Low	
Industrial	Core City	Redmond	Medium	0.5*
Industrial	HCT	Woodinville	Low	0.5*
Industrial	Cities and Towns	Enumclaw	High	0.5*
Industrial	Metropolitan	Bellevue	Low	

The table to the left shows each test fit city for each Regional Geography grouped by each Product-type.

**NOTE: the Market Factor upper bound was limited to 0.5, if there was value greater than this value, it was reduced to 0.5*

Process:

This process leverages the calculated *Market Factor Indicators* and identifies a test-fit city in each Regional Geography that has a reasonable alignment of historical deliveries and projected capacity. The test-fit city's indicator value is used as the foundation for the market factor range. The Market Factor Alignment for the test fit geography serves as the starting point for deriving the range, and the bounds for the ranges found under the remaining Market Factor Alignments (low/med/high) are derived through examining market pricing data (median sales price for single-family, and average rents for all other product types as shown in the Appendix Tables A5-9). These adjustments to find the bounds consider both the average price points and the range of prices across cities in King County. With higher ranges of market price data, a wider range of Market Factors generally resulted.

To ensure that the recommended Market Factor Ranges provided in the Guidance Document are reasonable and not overly impactful to a given City's estimated capacity, historical Market Factor assumptions were reviewed to inform an upper limit on the ranges across all product types.

Summary:

In summary, the Market Factor Ranges provided later in this document are informed by a review of calculated Market Factor Indicators and selection from this dataset to establish baseline Market Factor assumptions by Product-type and PSRC Geography. Baseline values were selected from those cities that illustrate relative alignment between historical deliveries and the projected capacity.

Smaller Market Factor Ranges are found where pricing of a given Product-type is more clustered and the overall range of pricing is smaller. Where large differences in pricing for a given Product-type exists, the resulting Market Factor Ranges are larger. These larger Market Factor Ranges reflect the variability in market conditions found for a given Product-type across a particular Regional Geography. This is reflected in Exhibits 1b-3b on the following pages.

Historical Delivery Data

Analysis of historical development patterns across King County began with the compilation and detailed analysis of King County Assessor data. Assessor data provides detailed information on each parcel within the County as well as building specific attributes. Leveraging this information, Heartland established the following:

- Number of residential units by jurisdiction
- A county-wide time-series of delivery data, based upon year of building/unit completion
- Square footage of development by year completed
- Building predominant use, and total square footage of each sectional use.

Product Classifications Assigned to Assessor Data:

Residential	Non-Residential
Single Family	Industrial
Multifamily/Mixed Residential	Office
	Retail
	Commercial (non-industrial)

Exhibits 1 - 3 Charts on the following pages illustrate overall development patterns across the County organized by Regional Geography. The data illustrates overall development patterns by specific Product Type.

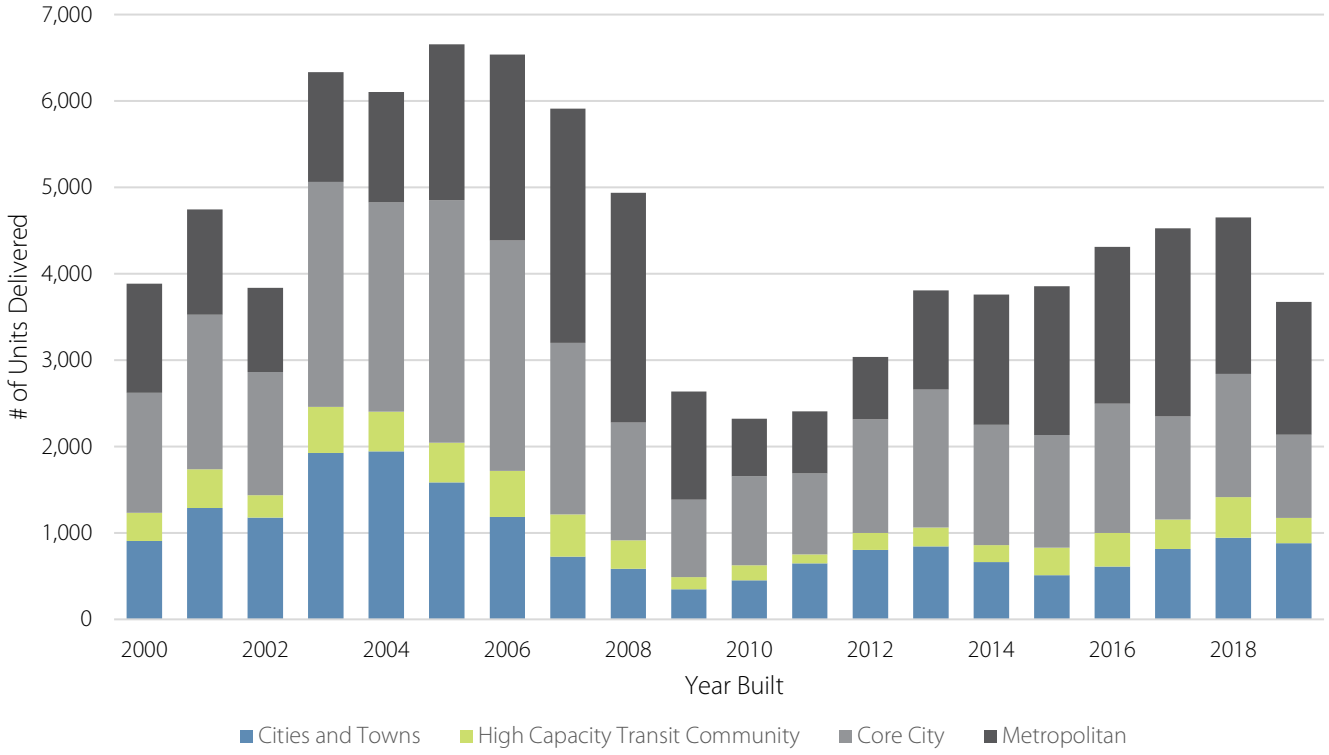
The historical delivery data provides a proxy for a number of issues raised in the Buildable Lands Guidelines to which Market Factor is meant to address. These data provide a valuable indicator of:

- Demand for a given product in any given geography.
- The efficiency of the market to deliver the product.
- Willingness to sell.
- Impacts of planned or completed infrastructure.
- Other factors impacting the availability and development of land.

Other Data Analyzed

Capacity Data: Another key data point used to help inform this methodology includes the capacity data projected by each city by zone for the 2021 Buildable Lands Report.

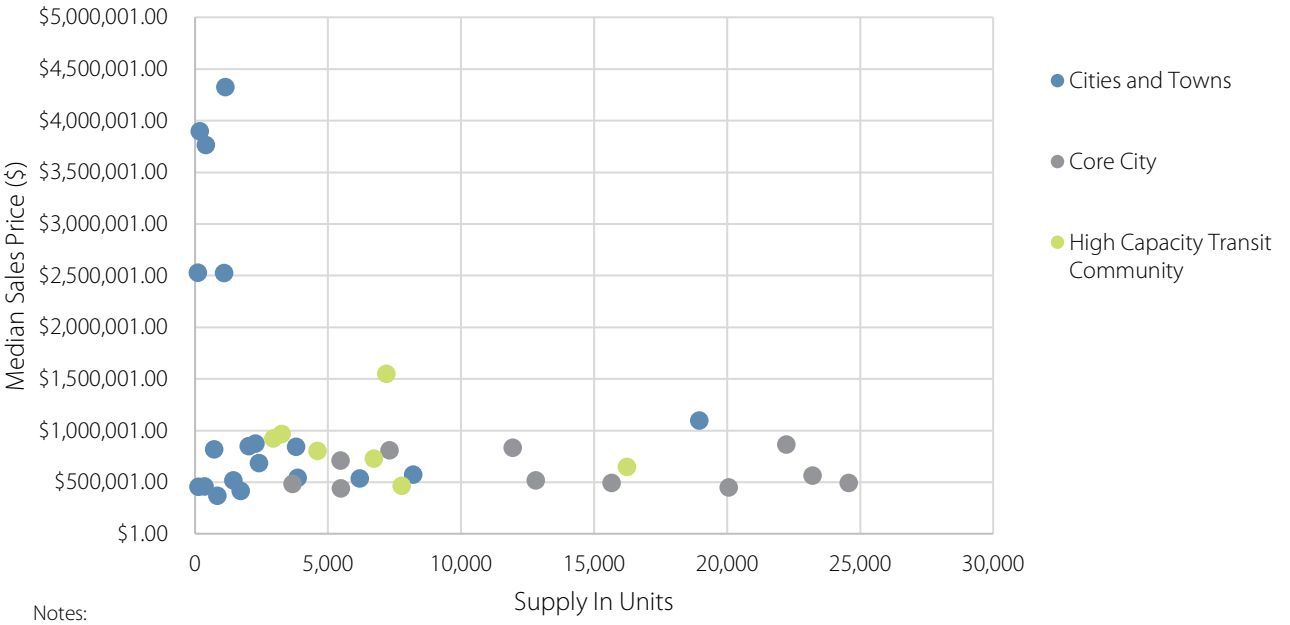
Historical Market Data: Historical pricing data, for each market product-type were also analyzed. Other market data includes rental rates, sale pricing, vacancy, and the growth/trends associated with each of these, which are also previewed in exhibits 1-3.



The three data sources combined provide a viewpoint of:

- Historical development deliveries by product type.
- Planned future capacity for a given Product-type.
- Current and past geography specific market conditions for the given product types.

Data Limitations:



Several limitations exist and are important to acknowledge in the context of their impact to inform the Market Factor assumptions contained later in the Guidance Document. None of the data discussed herein lend themselves to a directly translatable Market Factor value, rather they are used to inform ranges and recommended assignments. In addition, it is important to note that with historical delivery data the year-built attribute may not align directly with a City's permitting data. In addition, for the purposes of the analysis, assumptions were made in classifying the building's product type based upon the predominant uses and overall residential densities.

Connecting Market Factor and other UGC Assumptions

Key considerations

Market conditions also enter the capacity analysis through other assumptions in the Urban Growth Capacity analysis. These assumptions can affect the values of selected market factors. Below is additional commentary on other assumptions made within the capacity analysis framework and how these assumptions should be considered when using the Market Factor Guidance document. It is important to note that all of the assumptions discussed are calculated and applied outside of the application of the Market Factor deduction and represent stand alone assumptions estimated by each City.

- **Identifying Redevelopable Lands.** The approach to identifying redevelopable lands and the selected thresholds for determining what could be redeveloped in the future is of great importance to how a City's capacity relates to market conditions and future development economics and conditions. More conservative thresholds, i.e., those that anticipate that less redevelopable lands will develop over the planning period, would result in less redevelopable land being available. Less conservative thresholds would result in more land being available for redevelopment, and may warrant the selection of a market factor at the higher end of the suggested range, depending on market strength. Each City should evaluate how their redevelopment assumptions already incorporate market conditions (or not) when selecting a Market Factor to apply.
- **Assumed Densities.** The density at which property develops in the future is in part dependent on market conditions and greatly impacts overall capacity. Each City has studied historical achieved densities and planned densities to arrive at an assumed density assumption. Where appropriate, each City should evaluate whether their assumptions reflect more aspirational product types and densities versus historical development patterns and achieved densities in a given zone and consider this when selecting a Market Factor to apply.
- **Infrastructure.** Analysis and deductions have been completed to account for deficiencies in infrastructure which could limit the development of land in the future. Jurisdictions may want to consider higher Market Factors for zones or land supply included as capacity, but requiring infrastructure investments to serve the assumed density. This adjustment would be intended to reflect the cost of the infrastructure investment, which was not a component of the previous infrastructure gaps analysis. This would only be a valid consideration where Cities believe the initial applied infrastructure gap deductions do not fully represent the infrastructure challenges in a given area.

2. Market Factor Guidance: *Framework*

Framework Overview

The following provides an overview of the Market Factor guidance framework developed for King County. There are four distinct steps defined within the framework outlined below. Additional details and data are provided on the subsequent pages detailing each step.

Step	Explanation of step	Definitions and Reference	Details
Step 1. Identify Zoning by Predominant Product-Type	Identify the predominant Product-type in each zone of the City where capacity exists	Explanation of each Product-type (Table 1A)	• Select the Product-types that align with the zones within your City that have capacity • The Product-type would be the predominant use expected to develop in each corresponding zone
Step 2. Identify Regional Geography and Market Alignment	Identify and align PSRC Regional Geographies and Market Conditions	Menu of Regional Geographies (PSRC) and Market Factor Alignments (Tables 2A-2D)	• Select applicable Regional Geography based on the Menu • Select appropriate Market Factor Alignment from menu
Step 3. Select from Market Factor Ranges	For each Product-type select a Market Factor Range to apply to the capacity analysis	Market Factor Ranges (Table 3A)	• Find correct table, review and use the selected range to inform Market Factor assumption prior to adjustments in Step 4.
Step 4. Adjustments	Adjust selected Market Factor Range assumptions based on known conditions	Condition Considerations (Table 4A)	•Review known conditions that impact Market Factor (p. 12) •Evaluate applicability in your City •Adjust Market Factor assumption based on on-the-ground conditions in your jurisdiction, and document in table template.

Step 1 : Identify Zoning by Product Type	
Explanation of step	Identify the predominant Product-Type in each zone of the City where capacity exists
Definitions and Reference	• **Table 1A - Product-type Reference** Select applicable Product-types on the following page

Directions

In Step 1, assign the applicable Product-type to each zone based upon the anticipated predominant uses in the corresponding zone.

To better understand the Product-types used in this guidance, reference **Table 1A: Product-Type Reference**

The Product-type assigned to each zone should represent the predominant building typology and use that is likely to occur. This can be based on past buildout within a given zone *OR* the Product-type envisioned and supported by the zoning regulations and requirements.

Example

(MHC)	N		Single Family	
NB	Y	MU	Mixed Res	
CB	Y	MU	Mixed Res	
DR	Y	MU	Mixed Res	
			TOTALS	

Table 1A – Product-Type Reference

Product-type	Description/Application	Illustrative Examples
Residential		
Single Family	All areas where single family residential product inclusive of any of the following listed as the predominant use: detached, duplex, tri-plex four plex or townhouse plat.	Detached single family homes and subdivisions, attached townhomes and duplexes.
Multifamily/Mixed Residential	All areas where multilevel stacked residential product in the form of rental housing or condominium ownership is the predominant permitted use. Inclusive of high density multifamily and mixed-use developments.	Stacked flat apartment buildings, garden style apartment complexes, mid-rise multifamily podium projects, mid-rise multifamily podium projects with ground floor commercial uses, residential high-rise, residential condominium projects.
Non-Residential		
Industrial	Industrial facilities inclusive of manufacturing, warehousing, distribution and light industrial and facilities	Heavy industrial and manufacturing, warehousing and logistics development, light industrial and flex industrial facilities.
Office	Areas where the predominant use is office and zoning caters to office heavy commercial uses	Business Parks, Downtown CBDs.
Retail	Areas designated for standalone retail development.	Malls, power centers, lifestyle centers.
Commercial (non-industrial)	Inclusive of all nonindustrial commercial uses. Appropriate to apply in mixed use areas where the commercial use is the predominant use inclusive of instances where mixed residential is allowed but commercial component is primary.	Retail and office development (stand alone of mixed). Commercial components of residential mixed-use products.

Step 2 : Identify Regional Geographies mm and Market Factor Alignment	
Explanation of step	Use the following tables to identify the Regional Geography and to align with corresponding market conditions.
Definitions and Reference	• **Table 2A –** Metropolitan • **Table 2B –** High-Capacity Transit Market Factor Alignment Table • **Table 2C –** Core Cities Market Factor Alignment Table • **Table 2D –** Cities and towns Market Alignment Table

Directions

Regional Geography Designation

In addition to Product-type, this guidance segments different jurisdictions into like-kind Regional Geographies using the PSRC Designations. The four designations present in King County are given below:

- Metropolitan
- Core City
- High-Capacity Transit Community (HCT)
- Cities and Towns

Cities in these Regional Geographies share similar characteristics among peers. However, despite similarities amongst these Regional Geographies, market conditions still vary. To account for these variations amongst Regional Geographies peers, different *Market Factor Alignments* (high, medium, low) are be applied to the target cities to segment by these variations.

Use the Tables 2a -2d as a reference in selecting appropriate Market Factor Ranges by product type in Step 3. To review the Market Factor Indicators by City and Product type, refer to the **Appendix Tables A1-A4.** To review the methodology and explanation of Market Factor Indicators see Methodology Overview and Definitions section on page 8.

Market Factor Alignment

Each city's market conditions have been evaluated and *Market Alignment* has been assigned by Product-type. Use the rankings to select a *Market Factors Range* in Step 3.

- **Low** – market data and test fit analysis indicated that a lower Market Factor range is appropriate for the given Product-type.
- **Medium** – market data and test fit analysis indicated that a mid level Market Factor range is appropriate for the given Product-type.
- **High** – market data and test fit analysis indicated that a higher Market Factor range is appropriate for the given Product-type.

Further adjustments to the Market Factor, including how to select within the recommended range are completed in **Step 4**.

Yarrow Point	Cities and Towns	High	Low	NA	NA

Step 3 : Select From Market Factor Ranges	
Explanation of step	For each Product-type select a *Market Factor Range* suitable for your City
Definitions and Reference	• **Table 3A – Market Factor Ranges by Product-type**

Directions

Building upon Steps 1 and 2, Step 3 applies *Market Factor Ranges* by relating each Regional Geography and *Market Factor Alignment* (Step 2) to a specific Product-type which can then be applied to zoning through a given zoning designation's corresponding Product-type, which was identified in Step 1.

The following table contains *Market Factors Ranges* for all combinations of Regional Geographies, *Market factor Alignments, and* product-types.

Table 3A – Market Factor Ranges by Product-Type

	Product-Type			
Regional Geography	**Residential**		**Non-Residential**	
Market Factor Alignment	**Multifamily/ Mixed-Res**	**Single Family**	**Commercial (Office/Retail/Mixed)**	**Industrial**
Core City				
Low	5%-10%	1%-14%	1%-10%	1%-15%
Medium	11%-20%	15%-20%	11%-20%	16%-35%
High	21%-35%	21%-30%	21%-50%	36%-50%
High-Capacity Transit				
Low	5%-10%	1%-9%	1%-14%	1%-19%
Medium	11%-15%	10%-20%	15%-25%	20%-30%
High	16%-30%	21%-35%	26%-50%	31%-50%
Cities and Towns				
Low	10%-24%	1%-10%	1%-10%	1%-15%
Medium	25%-35%	11%-40%	11%-20%	16%-35%
High	36%-50%	41%-50%	21%-50%	36%-50%
Metropolitan				
Low	5%-10%	1%-14%	1%-10%	1%-15%

Methodology Reminder:
These ranges are informed by the Market Factor Indictor test-fit analysis. This relates historical delivery trends to projected capacity. These ranges were then further differentiated among peers in each Regional Geography by evaluating price data including both rents and median sale price (for single family product). Reference Methodology Overview on Page 10 for more detail.

Step 4 : Adjustments	
Explanation of step	Make selected adjustments to suggested *Market Factor Ranges* based on known conditions
Definitions and Reference	• **Table 4A – Adjustment Implementation**

Overview

Step 4 provides a framework for selecting a Market Factor from within the range selected in Step 3. Specific conditions are discussed that would influence future development and impact the Market Factor value assumed by a given City.

The conditions listed below reflect specific topics and questions flagged during the engagement process described earlier in the guidance document. Each city should carefully consider these conditions and how they might impact their assumptions related to Market Factor. The conditions discussed do not represent all the potential conditions and issues that Market Factor may address. Cities should adjust within the given ranges or deviate from it altogether to account for known conditions that impact the development of and availability of land in their jurisdiction. **Table 4A** on the following pages provides more detailed descriptions of theses conditions and how adjustment should be considered. Note that assumptions previously incorporated into the Land Capacity Analysis (see page 15 *UGC Assumptions*) may already account for the adjustments discussed in this section.

- Vacant versus redevelopable lands assumptions
- Strong market growth indicators (Reference appendix market **Tables A5-A9**)
- Single family uses in recently up-zoned areas
- Restrictive Covenants in planned communities
- Parcel size and assemblage challenges
- Transit accessibility

Selecting Within The Range Based on Market Conditions:

A range for each Product-type by each Regional Geography is provided in Step 3. In order to select within this range, each city must review their specific attributes, assumptions and market conditions and consider whether a higher or lower Market Factor is appropriate for that given Product-type (and therefore, applicable zone within the city). It is important to note that additional factors may need to be considered to account for unique circumstances influencing the market availability of land in any given jurisdiction.

Several sets of data may be leveraged to evaluate the adjustments outlined in **Table 4a**:

- **Appendix Tables A1-A4:** *Market Factor Indicators* and supporting data for each jurisdiction in King County (illustrating historical deliveries and planned capacity)
- **Appendix Tables A5-A9:** Market conditions by product-type (key indicators for all applicable jurisdictions within the County)
- **Appendix Table A10**: Past Market Factor assumptions

Table 4A – Adjustment Template

Condition	Explanation	Recommendation on Market Factor Adjustment	
		Select a lower value from the range if:	*Select a higher value from the range if:*
Assumption for Vacant versus Redevelopable Lands			
Where a City has a mix of vacant and redevelopable lands as part of their capacity and it is appropriate to differentiate the Market Factor assumption for vacant and redevelopable lands.	Consider the overall ratio of vacant land versus redevelopable land and the condition of said lands. For example, if >50% of capacity is on vacant land, consider adjusting Market Factor downward on vacant land upward on redevelopable land. The relative location of vacant and redevelopable lands is also an important consideration. Where redevelopable lands are located near or adjacent to important infrastructure and amenities, the need to differentiate between the two is less pronounced.	For vacant lands, select a value that is lower within the given range (or outside the low end of the range if deemed appropriate) when the supply of vacant lands represents a significant portion of overall capacity for a given product and the location and relative attributes of said supply do not represent barriers to redevelopment	For redevelopable lands, select a higher value in the Market Factor range if conditions are known that may limit or impact the turnover and availability of land with existing uses.
Market Trends			
Where recent real estate market trends for a given Product-type indicate more or less challenging conditions for development in the next 20 years.	If trends indicate growth in demand for a given product, consider a downward adjustment on Market Factor to reflect this demand. Such indicators include growth in pricing/lease rates and/or decreases. Alternatively, if the market data for a given product indicates more difficult market conditions in terms of ranking amongst jurisdictions, consider selection of a higher market factor within the given range.	Market trends align with trends amongst peer cities falling in a lower Market Factor Alignment indicates that a lower market factor may be appropriate.	Market trends suggest a downward trend in overall demand or overall rankings amongst peer cities suggesting that a higher market factor may be appropriate.

Table 4A – Adjustment Template

Condition	Explanation	Recommendation on Market Factor Adjustment	
		Select a lower value from the range if:	*Select a higher value from the range if:*
Single Family Up-zoned Areas			
Where significant capacity for higher density single family or multifamily/ mixed-use housing is assumed on existing single family uses	Where capacity exists on lands that currently house single family uses but greater densities are permitted, many cities have cited concern regarding how such areas will redevelop and if a specific Market Factor adjustment should be leveraged. The Cities of Shoreline and SeaTac serve as examples where single family areas were up-zoned around planned or completed transit facilities. The turnover and development of single family areas in these cities is captured in through the analysis of historical deliveries data and may be leveraged for reference or comparison on a county wide scale. Important indicators to consider when adjusting for such a condition include: – Whether home prices are below, on par or above median prices in the region – The age and quality of the housing stock – Recent transaction activity – Recent permitting activity	The conditions of the capacity lands with single family uses reflect the following conditions: – Home prices at or below median prices for the area – The housing stock is aging – There is a higher rate of recent transactions reflecting interest from developers	The conditions of the capacity lands with single family uses reflect the following conditions: – Home prices are above median prices for the area representing a potential market barrier to redevelopment – The housing stock includes recently constructed or updated structures – Recent transactions reflect value in use (meaning the highest and best use of the property is still considered the single family residence)
Restrictive Covenants in Planned Communities			
Where restrictive home-owner associations or other similar covenants may limit the redevelopment at a higher intensity/use	In some cases, areas that have been rezoned or up-zoned are still subject to restrictive covenants that run with the land and limit how development may occur. This is most likely to exist in existing single family neighborhoods but may also pose a challenge in business parks and other similar commercial districts.	If restrictive covenants are not known to exist or would have a limited impact on redevelopment in the future.	If restrictive covenants are known and would need to be removed/eliminated in order for redevelopment per new zoning allowances to occur (at a higher intensity).

Table 4A – Adjustment Template (Continued)

Condition	Explanation	Recommendation on Market Factor Adjustment	
		Select a lower value from the range if:	*Select a higher value from the range if:*
Fragmented Ownership and Parcel Size			
Where capacity in a given neighborhood or zone is fragmented and generally consists of smaller parcels (less than ..25 acres for multifamily site for example)	Where capacity for a given Product-type occurs on largely fragmented or non-contiguous parcels and the parcels are generally smaller in size, a higher market factor may be considered. Such conditions may limit options for parcel assemblage in the future and result in less land being redeveloped in the future.	Vacant and/or redevelopable lands consist of a mix of contiguous and non-contiguous properties and parcel sizes do not appear to represent a challenge to development in the future	Conditions are observed that reflect an abundance of capacity on smaller, non-contiguous properties in a given zone or neighborhood
Access to Transit			
Where planned or recently completed transit facilities may impact develop feasibility in the surrounding neighborhood/zone.	Planned infrastructure like Bus Rapid Transit, Light Rail and other major transportation improvement that improve access and mobility can greatly improve development feasibility and owner willingness to sell/redevelopment land. Market Factor assumptions should reflect where such improvements either exist or are planned in the future (within an impacted area such as a ¼ mile walk shed).	A significant transportation infrastructure investment is completed or planned that will greatly improve transit access in a given zone or neighborhood.	NA

3. Appendix A – Reference Tables

Appendix Tables Summary

The following tables are available for reference and were used to inform the Market Factor alignment for Cities (low, medium or high) by product and the Market Factor range value.

- **Table A1. Supply, Deliveries, & Capacity Table:** *Multifamily + Mixed Res*
- **Table A2. Supply, Deliveries, & Capacity Table:** *Single Family*
- **Table A3. Supply, Deliveries, & Capacity Table:** Non-residential - *Commercial (Office/Retail)*
- **Table A4. Supply, Deliveries, & Capacity Table:** *Non-Residential - Industrial*

Additional Market data is available in the following tables to further inform Market Factor selection and adjustments. Included is an overview of past Market Factor assumptions used across Washington State.

- **Table A5. Market Data – Multifamily Residential Product**
- **Table A6. Market Data – Single Family Product**
- **Table A7. Market Data – Retail Product**
- **Table A8. Market Data – Office Product**
- **Table A9. Market Data – Industrial Product**
- **Table A10. Market Factor – Past Assumptions**

Table A1. Supply, Deliveries, & Capacity Table:

4. Appendix B – City of Seattle Guidance

City of Seattle – Modified Market Factor Guidance Framework

Intro and Purpose

The City of Seattle stands as the employment and population center of the Puget Sound region and largest City in the State of Washington as well as the Pacific Northwest. It also serves an important role in accommodating population and employment growth in King County now and into the future. Seattle is unique in its geographic and economic diversity. The City is home to distinct neighborhoods and commercial districts at a scale not seen elsewhere in the County. As such, Market Factor guidance specific to the City of Seattle has been developed to account for the size, scale and regional importance of the City.

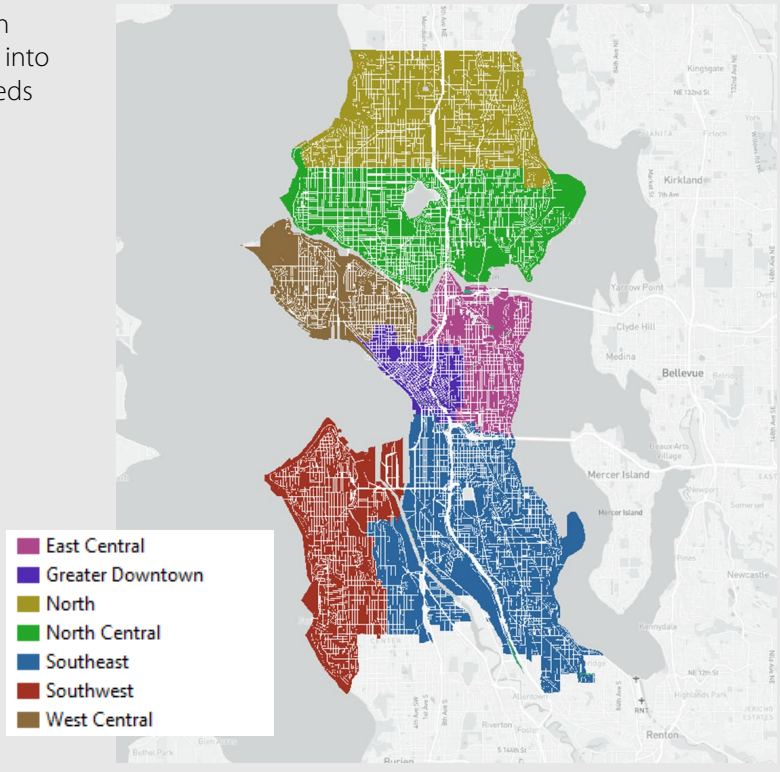
The guidance and recommendations in this section follow the same methodology and framework used for all jurisdictions in King County, but at a neighborhood level rather than at a citywide scale. This allows for a more granular view of historic and projected growth within the City, by Product-type. This also provides the City with a framework allowing for greater flexibility when applying Market Factor assumptions across disparate neighborhoods within the City.

Contents

Following guidance reflects the same guidance framework used across King County, the following pages provide a step-by-step overview of Market Factor recommendations for the City of Seattle followed by supporting data found in **Tables B3-B7**.

Data Sources

- King County Assessor Data
- City of Seattle Draft Capacity Data
- Costar Market Data
- Redfin Residential Sales Data



Sub-geographies

The City of Seattle is designated as a metropolitan regional Geography. The City was further divided into seven general areas based upon the Housing Needs Assessment (HNA) boundaries.

These are the following HNA boundaries and are indicated on the map to the right.

- North
- North Central
- West Central
- East Central
- Downtown
- Southwest
- Southeast

HNA Geographic Boundaries

Guidance Framework Modified –

The following diagram outlines key changes made to the overall Market Factor Guidance Framework to establish Market Factor for the City of Seattle. The following changes represent modifications to the Market Factor Guidance Framework set forth earlier in the report (page 17) .

Step	
Step 1. Identify Zoning by Predominant Product-Type	• This step remains largely unchanged for the city of Seattle, with the exception that attached single family units are addressed as their own product type (defined on following page). Reference Product-type definitions provided on page 19 (see **Table 1A**) for all other Product-types.
Step 2. Identify Market Factor Alignment for the Seattle Sub-Geographies	• Instead of using PSRC Regional Geographies to compare and classify Market Factor Indicators, the City of Seattle is broken down into sub-geographies (HNA boundaries, page 41). These sub-geographies are then compared against each other to inform a Market Factor Alignment. • The Market Factor Alignment Table has been updated to reflect these new geographies and their alignments.
Step 3. Select from Market Factor Ranges	• The market factor ranges have been updated to reflect the City of Seattle sub-geographies and the market metrics informing the range of Market Factors by Product-type. • The table has been updated to reflect the changes to the ranges and the additional Product-types.
Step 4. Adjustments	• This step remains unchanged, and the City of Seattle is encouraged to adjust the Market Factor guidance based on the City's perception and knowledge of each Product-type in each sub-geography.

Step 1 – Identify Zoning By Predominant Product Type

See additional Product-Type classification for the City of Seattle below

Product Type	Description/Application	Illustrative Examples
Residential		
Single Family Attached*	This category has been added for the City of Seattle to account for all attached single family dwelling units sharing walls separately.	These include townhouse plats, duplex, triplex and fourplex buildings.

** Note: for the City of Seattle, the single family attached Product-type, is accounted for separate of traditional single family detached product.*

Step 2 – Identify Market Alignment

Seattle Market Factor Alignments

The *Market Factor Alignments* (high/medium/low) identified in this step are applied in step 3 when selecting the appropriate Market Factor Ranges.

Each of the City's sub-geography market conditions have been evaluated and *Market Factor Alignment* has been assigned by Product-type. Use **Table B1** (below) as a reference in selecting appropriate Market Factor Ranges by product-type in Step 3. To review the Market Factor Indicators for the sub-geographies within the City of Seattle, refer to **Tables B3-B5** found later in this section.

Methodology Recap:

The Market Factor Alignments for the sub-geographies in the City of Seattle are informed by the Market Factor Indicators calculated for each sub-geography and Product-type.

Table B1 – Market Factor Alignments for City of Seattle Sub-Geographies

Seattle Sub-geography	**Product-Type Market Factor Indicator**				
City	*Multifamily/MU*	*Single Family Attached*	*Single Family Detached*	*Commercial (Office /Retail/Mixed-use)*	*Industrial*
East Central	Medium	Low	Medium	High	NA
Greater Downtown	Low	Medium	Low	Low	Low
North	High	Medium	High	High	NA
North Central	Low	Low	High	High	High
Southeast	High	High	High	High	High
Southwest	High	High	High	High	Medium
West Central	Low	Low	Medium	Medium	Low

Step 3 - Select from Market Factor Ranges

Market Factor Range

For each of the City's sub-geographies and Product-types, identify the Market Factor Range in the table below (**Table B2**) by using the Market Factor Alignments (low/medium/high) identified in Step 2.

Note: these informed ranges are intended to serve as initial guidance. It is expected that City of Seattle refines or departs from this range to arrive at the most appropriate market factor deduction.

Methodology Recap

A Market Factor Indicator from a test-fit sub-geography within the City of Seattle is selected to inform the market factor ranges.

Market price data is leveraged as the key metric to derive a range from the market factor indicator in the test fit geography. The range of prices among all the City of Seattle's sub-geographies (see **Tables B6-B7**) for each product type inform the magnitude of the market Factor Range for that product-type.

Table B2 – Market Factor Ranges by Product Type

	Residential				
	Multifamily/ Mixed-Res	**Single Family Attached**	**Single Family Detached**	**Commercial (Office/Retail/Mixed)**	**Industrial**

Appendix F: Employment Density Guidance

2021 King County Urban Growth Capacity Report

Employment Density Guidance

INTRODUCTION

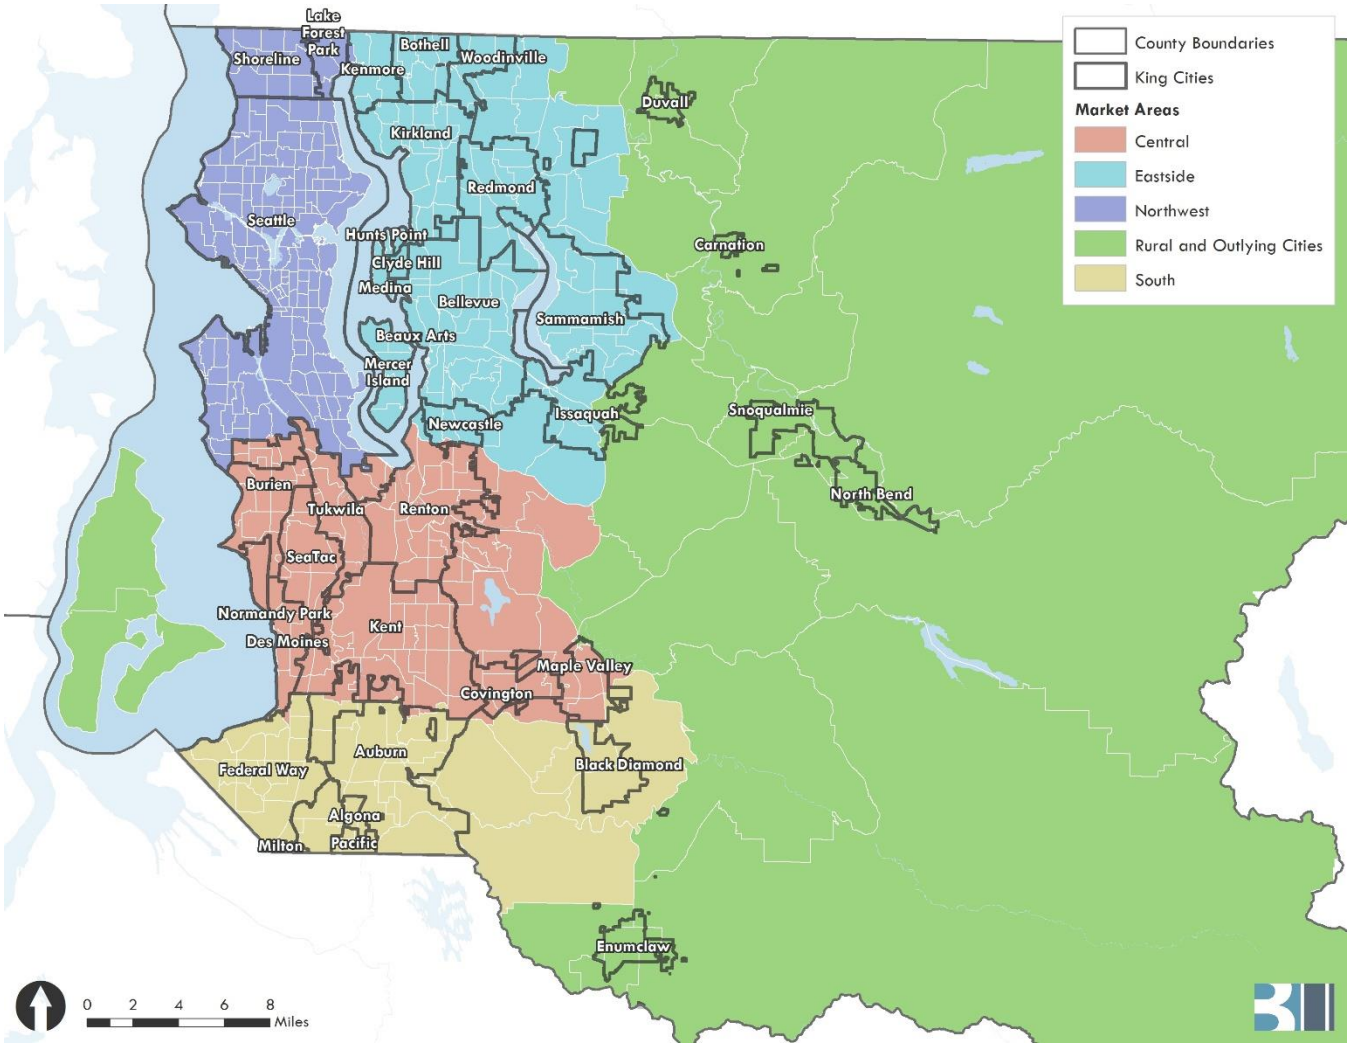
This document provides guidance on developing assumptions for converting non-residential building area expressed in gross square feet to expected capacity for employment in buildable lands calculations. This is the final step in estimating total capacity for new employment growth in a jurisdiction. Current statutes and regulations (RCW 36.70A.215 and WAC 365.196.315) do not provide specific requirements for these calculations. Jurisdictions have discretion to develop assumptions that are consistent with local circumstances, provided they document the rationale. Therefore, this guidance also includes rationale to draw upon in the process of selecting appropriate assumptions.

While there are various ways to convert land capacity to capacity for new employment, King County has selected to use an approach that converts non-residential development capacity measured in square feet of floor area to capacity for new employment. This conversion requires assumptions for the average number of built square feet of floor area for each job. The lower the square foot per job, the higher the density of use. The calculation is simply:

Total job capacity = *Gross square footage*[1] *of floor area capacity / gross square footage per job*

Square footage per job can vary widely by building type or employment sector. For example, warehouses devote a great deal of square footage to storing inventory or other goods, and therefore they typically require considerably more square footage per job than office space. Therefore, average employment density assumptions should reflect the types of job growth that are expected in an area.

Many jurisdictions select different employment density assumptions for commercial and industrial zones to reflect different expectations for the type of development and job growth that are expected in those zones. Some jurisdictions even vary employment density assumptions among different commercial zones. For example, a city may assume that average square footage per job is lower in a downtown zone than in other commercial zones further from the core. This decision could reflect expectations that a higher proportion of the downtown floor area capacity will be used as office space, compared to other commercial zones where lower density retail uses may be more common.



Jurisdictions have the discretion to choose whether to customize employment density assumptions for each zone or select broad assumptions. There is no single correct approach. The choice can depend upon local conditions, staff or consultant capacity for conducting analysis, and access to relevant data. This guidance provides several options for jurisdictions to choose from. Some of these options are grounded in new analysis of current employment density in market areas across King County. For a more detailed description of those findings, see Appendix A.

[1] Gross square footage simply refers to the total square footage of the building, including walls. Gross square footage capacity is calculated as the floor area ratio (FAR) * the parcel size in square feet.

APPROACHES FOR DEVELOPING EMPLOYMENT DENSITY ASSUMPTIONS

This section describes three main approaches for developing and selecting appropriate square feet per job assumptions for use in land capacity analysis calculations. A jurisdiction may choose only one option or a combination of options, depending on their needs and circumstances. The primary options draw upon analysis BERK Consulting conducted to estimate aggregate employment densities in five different market areas across King County. Those market areas are shown in Exhibit 1 for reference.

Exhibit 1. King County Market Areas

Source: BERK, 2020.

1. Select a single average employment density for all non-residential development

The simplest option is to assume the average square feet per job will follow recent trends in your city or market area. To support this option, BERK Consulting calculated average square feet per job in both 2006 and 2019 for most cities and the five market areas. The results for market areas are shown in Exhibit 2.[2] For most individual cities, see Exhibit 6 in Appendix A. Jurisdictions selecting this option can

[2] Details on the calculation of these densities are provided in Appendix A.

apply a single square feet per job assumption to all commercial and industrial zones. This option would be appropriate for jurisdictions that expect future job growth and non-residential development activity to be similar to the growth experienced in the past, or those that have limited non-residential zoning. It may also make sense in jurisdictions with very little diversity in the type of non-residential zoning available (for example: all commercial or all industrial).

The main limitation of this approach is that it does not allow for differentiating employment density assumptions by zone. A single employment density assumption would likely overestimate capacity in industrial areas (which tend to have lower relative employment densities) and underestimating capacity in some commercial zones where employment densities may be higher. This could significantly impact the accuracy of employment capacity estimates by zone and by these two different categories.

2. *Select separate commercial and industrial employment density assumptions*

Many cities select one assumed employment density for commercial zones and another for industrial zones. Others select unique employment density assumptions for each commercial and industrial zone. Either of these approaches is appropriate.

BERK conducted an analysis of recent non-residential development and job growth by market area to develop the recommended ranges shown in Exhibit 2. Jurisdictions should typically choose value within these ranges. When selecting density values, consider the types of uses that are expected to be most common:

- **Commercial and Mixed-Use:** Small-format commercial retail and food services are likely to have lower values for square feet per employee, with commercial office space and services at the middle of the range and large-format retail at the higher end.
- **Industrial:** Certain light manufacturing and flex space are likely to be at the lower end of this range, with heavy manufacturing and logistics in the mid-range and warehousing at the high end. Note that mini-warehouse/self-storage facilities tend to be at the highest end of the range.

Assumptions falling outside of the ranges shown in Exhibit 2 may be appropriate, but would require additional documentation of rationale to justify the variation.

For context, Exhibit 2 also shows the average employment density across all zones in 2006 and 2019. This average is affected by the proportion of total development in commercial or industrial zones, as well as differences in typical employer types and economic conditions. BERK's analysis in Appendix A indicates that employment density has increased somewhat in recent years in most market areas, primarily associated with redevelopment of lower-density commercial and industrial uses and shifts towards more intensive use of these spaces.

A benefit of this approach compared to Option 1 is that it does not presume the same mix of commercial and industrial development observed in the past will continue into the future, or that regional mixes of employment types would be applicable to a local area. This approach also allows jurisdictions to use different assumptions for zones in the city where alternative densities are more likely: differentiating between downtown and neighborhood commercial zones, for example.

Exhibit 2. Recommended Square Foot per Job Assumptions by King County Market Area

Market Area	Average 2006 Employment Density (all zones)	Average 2019 Employment Density (all zones)	Recommended Range for LCA: Commercial and Mixed-Use Zones	Recommended Range for LCA: Industrial Zones
Central	655	608	300–600	700–1,200
Eastside	398	386	200–400	500–800
Northwest	445	415	200–400	500–800
Outlying Cities	669	630	300–600	700–1,200
South	701	724	300–600	700–1,200

Notes: See Exhibit 3 in Appendix A for a map of jurisdictions included in the average density analysis for each market area.
Sources: BERK, 2020 (See Appendix A for details)

Appendix A includes an analysis that provides high-level city estimates for industrial and non-industrial uses using available real estate market data. Note that in this case, available real estate data for the entire county required aggregation of different non-industrial uses. These numbers can be helpful to see how a city compares to the market area as a whole and the ranges provided above.

In addition to the values in Appendix A, there are other sources of information that jurisdictions can use to help inform the selection of appropriate employment density assumptions from within the ranges shown in Exhibit 2. See the section below on using additional sources of information for more details.

3. *Select targeted employment density estimates for known pipeline development*

If a jurisdiction is aware of significant new growth within the development pipeline, such as through development agreements, master planned developments, or recent permit activity, consider applying targeted employment density assumptions for that portion of growth only. This may be particularly useful if this expected growth varies considerably from historic trends or other employment located within the market area.

Additional Sources of Information to Inform Employment Density Assumptions

The main approaches outlined above can be refined with other methods and sources of data. This can provide a more detailed estimate of the land required to accommodate future employment growth in a community. Although not every situation will require a more precise estimate, local trends may require some adjustments to these estimates. Examples of cases like this would include:

- Districts in a city dominated by the campus of a single employer or small number of large employers, where expected future employment growth could be linked to their expected expansion plans.
- Districts where the general types of employment within a category are expected to shift over time. This would include jurisdictions where industrial districts are expected to reflect a greater focus on warehousing and logistics over manufacturing uses.
- Districts where specific new uses are expected with densities different than citywide averages. A recent shift in the types of manufacturing businesses located in an industrial area towards activities requiring less space per employee may require adjustments of required floor area estimates.
- Other broad trends with space utilization may also be relevant: a greater focus of local businesses on online transactions versus physical sales or trends towards increasing employment density in offices may be changing the space needs for current and future businesses in the community, and should be reflected in estimates of future needs.

To this end, this section provides additional sources which could be used for refining calculated densities from the general methods discussed above. Additionally, this section also describes a general framework for considering whether this refinement is necessary for a community, so as to understand when choices should be made to deviate from the broader estimates.

Other Sources for Density Assumptions

Reference published employment density estimates by land use type

This guidance document only provides aggregate employment density estimates based on broad employment and land use categories. Other sources of information, such as the Institute of Transportation Engineers (ITE) *Trip Generation Manual*, provide square feet per job estimates for a detailed list of land use types such as hospitals, schools, or airports. Jurisdictions looking to develop more targeted employment density assumptions may draw upon ITE or other resources to come up with estimated future densities of development.

There are several situations where this approach may make sense:

- Referencing employment density by specific land use types may also be useful for jurisdictions adjusting regional estimates to better reflect the local mix of employment growth expected.
- Employment density assumptions by land use type can also be useful to cities developing separate square feet per job assumptions for different zones. For example, if there is a downtown zone where the vast majority of floor area is expected to be office space, it may be appropriate to use an assumed density that is consistent with the office land use type.

Leverage space planning work by major employers

Another source of information for use in determining employment density may be the programming coordinated by companies or other organizations with larger buildings or campuses and significant space needs. If these needs are identified through facilities planning or as part of subarea plans, the associated numbers could support assumptions about the development necessary to support expected employment growth.

Calculate previous densities achieved in the community

If the same type and format of development will likely continue to be sited in the community, cities could also rely on available data to calculate local employment density across meaningful categories. This can use a range of information sources: County assessor's data, real estate listings websites, discussions with brokers, and other sources can all be used to identify the uptake of new space within a community, while surveys, business license data, and aggregate employment statistics can help to understand the new employment accompanying these uses. Average values for employment density may be aggregated or detailed as required.

Identify potential future changes in densities

The most detailed consideration of future space usage would refine the calculation of previous densities described in Appendix A to focus on expected changes in the future. This would limit the calculations of employment densities to more recent tenants expected to be typical of future employers in an area, and even highlight expected trends that would impact the future use of space, such as the increase in telework or open-format offices. Establishing values in this way needs detailed documentation, especially if the resulting employment density estimates would vary significantly from the figures that would result from other methods.

Process for Evaluating Density Assumptions

When determining the best estimates for employment density in a community, a structured process can include some consideration of the three main methods previously reviewed, as well as the additional sources of information discussed in this section, to determine what assumptions would be best for future projections. Steps in the process can include the following:

- **Select a starting estimate.** Based on assumptions from previous Buildable Lands reporting and/or the estimates provided in this report, select an initial estimate to be used for employment density. This could be an overall estimate for all employment lands or could be divided on broader categories of use.
- **Evaluate densities achieved from a selection of recent development, if possible.** An effective way of determining whether the estimates used have been accurate is to test these assumptions on recent development data. Tax assessment data from the King County Assessor or building permit data on file can determine the effective square footage of new construction, and a survey of current businesses or data from third-party providers can be used to determine employee counts for a representative set of projects. If there are significant and consistent differences between these calculations and broader estimates, there may be a need to examine changes to employment density estimates.

- **Assess the mix of land uses found in recent development and compare to previous expectations.** Additionally, estimates may also be affected by changes in the types of development coming into a community. Significant differences in expected versus actual uses may have substantive impacts on achieved employment density. For example, a significant rise in self-storage facilities or warehouses, more development of larger- or smaller-format retail spaces than expected, a greater proportion of restaurant versus service uses in commercial spaces, and other differences can all impact actual versus expected employment densities, and may point to the need to adjust these assumptions.
- **Identify potential new uses that could challenge employment density assumptions in the future.** Together with generally evaluating the mix of uses in new development, there may also be a need to consider new uses that are starting to become more popular and may require more consideration in the future. An increase in cannabis production or mini warehouse uses in industrial areas, for example, could suggest trends that may change how many employees can be accommodated in these areas. Combined with evaluating the mix of uses in recent development, this should highlight potential changes that could happen with employment densities into the future.
- **Review potential assumptions with other experts in the community.** After identifying potential trends that could impact achieved employment densities, reviewing this information and the resulting revised assumptions with experts from the community can be very useful in testing these conclusions. Discussing changes in space needs with local commercial brokers, developers, large space users, other businesses, and other real estate professionals can be essential in determining if new assumptions reflect their experiences, and whether there are other trends they have identified that should also be considered in these results.

Using some or all of the steps in this process can be useful in determining whether additional detail is required to adjust the starting assumptions to better reflect current and future projections. At minimum, generally establishing whether previous targets were reached and whether these trends will continue will be extremely useful in establishing whether previous assumptions can still be used.

However, beyond the use of currently published figures, either in this report or from other resources, evaluating existing plans and information to calculate alternative local employment densities can be a very data-intensive task. It may also come under scrutiny if calculated employment densities differ significantly from regional averages, especially if these estimates suggest that far less land would be needed to support growth. Refinements to these methods are best considered only if there are specific local situations that could lead to differences in these values, and the results should be thoroughly documented and reviewed to confirm.

NOTES ON CALCULATING EMPLOYMENT DENSITY

If your jurisdiction is considering calculating achieved employment density in an area or specific building or campus, consider these tips for calculating square footage per job.

Generally, the calculation of total gross employment density is calculated as:

> ***Total gross square footage per employee*** =
> (*gross square footage for employment / number of employees*) x (1 + *expected vacancy*)

These calculations include the following variables:

- The **total gross floor area for employment**, calculated as the total amount of building area supporting employment uses, which includes common areas and walls.
- The **number of employees**, which is the total number of employees supported by this gross floor area.
- The **expected vacancy rate**, which is estimated as a target or long-term average vacancy rate in the local market.

For some communities, this could be considered in aggregate across all employment lands. In other cases, however, these assessments can be created by land use categories: office, retail, industrial, warehouse/logistics, mini-warehouse, etc.

Considerations with these calculations include the following:

- **The amount of square footage per employee will change according to type.** Previous research and existing guidance highlight that employment densities vary by use category. Generally, office uses would have different densities of employment than retail spaces or self-storage warehouses, but specifically, medical offices may have different densities than office uses on average.
- **Not all building types are interchangeable.** In addition to different employment densities, building types may be limited in the businesses that can be practically accommodated. Most office spaces are interchangeable, for example, but medical offices have distinct layouts and amenities that would require tenant improvement to be used for other office uses, and manufacturing or industrial uses may have specialized construction dedicated to specific functions.
- **Businesses may not be using their full capacity with the space they occupy.** Whether owner-occupied or leased space, commercial businesses and other organizations may own or lease space to accommodate expected future growth. Because of this, available statistics may include some slack capacity that is not currently occupied, but can be used by the occupying businesses in the future.
- **Vacancies are necessary for the local real estate market to function.** Vacancies are necessary to provide the slack capacity necessary for the space market in a local area to function. Over the long term, some businesses will start, expand, or relocate while others will shut down, downsize, or move out of an area. Even in a market without significant expected long-term growth, natural vacancy rates provide some capacity for the short-term space needs that move around this trend.
- **Employment is not only included in commercial- and industrial-zoned lands.** In addition to the employment found on commercial and industrial lands, there are other employment types that will need to be considered. Certain communities, primarily in rural areas, may need to consider

agricultural and resource uses in the community, such as with aggregate mining. Additionally, home occupation uses, including contractors and self-employed individuals working from home, will also contribute to local employment but will not occupy employment floor space in the community. Note that the PSRC covered employment estimates exclude the self-employed (as well as other types of employees, such as the military and railroad workers).[3]

[3] See https://www.psrc.org/sites/default/files/emp_data_series.pdf for more details on the PSRC covered employment dataset, based on the Quarterly Census of Employment and Wages (QCEW) from the Washington State Employment Security Department (ESD).

APPENDIX A: EMPLOYMENT DENSITY ESTIMATES BY CITY AND MARKET AREA 2006-2019

To support jurisdictions in selecting employment density assumptions, BERK Consulting estimated the average aggregate square foot per job in individual jurisdictions and market areas across King County. The analysis included summarizing non-residential square footage (all commercial, industrial, and public sector buildings that could reasonably accommodate employment) based on King County Assessor data obtained for the years 2006 and 2019. For each jurisdiction with employment data available, BERK calculated the gross square footage per job[4] in 2006 and 2019. The results were then aggregated by five separate market areas (shown in Exhibit 3) that group cities based on geography to reflect variation in local real estate market conditions. This analysis did not consider growth in unincorporated areas due to large variation in geographic context and lack of employment breakdowns for analysis by subarea.

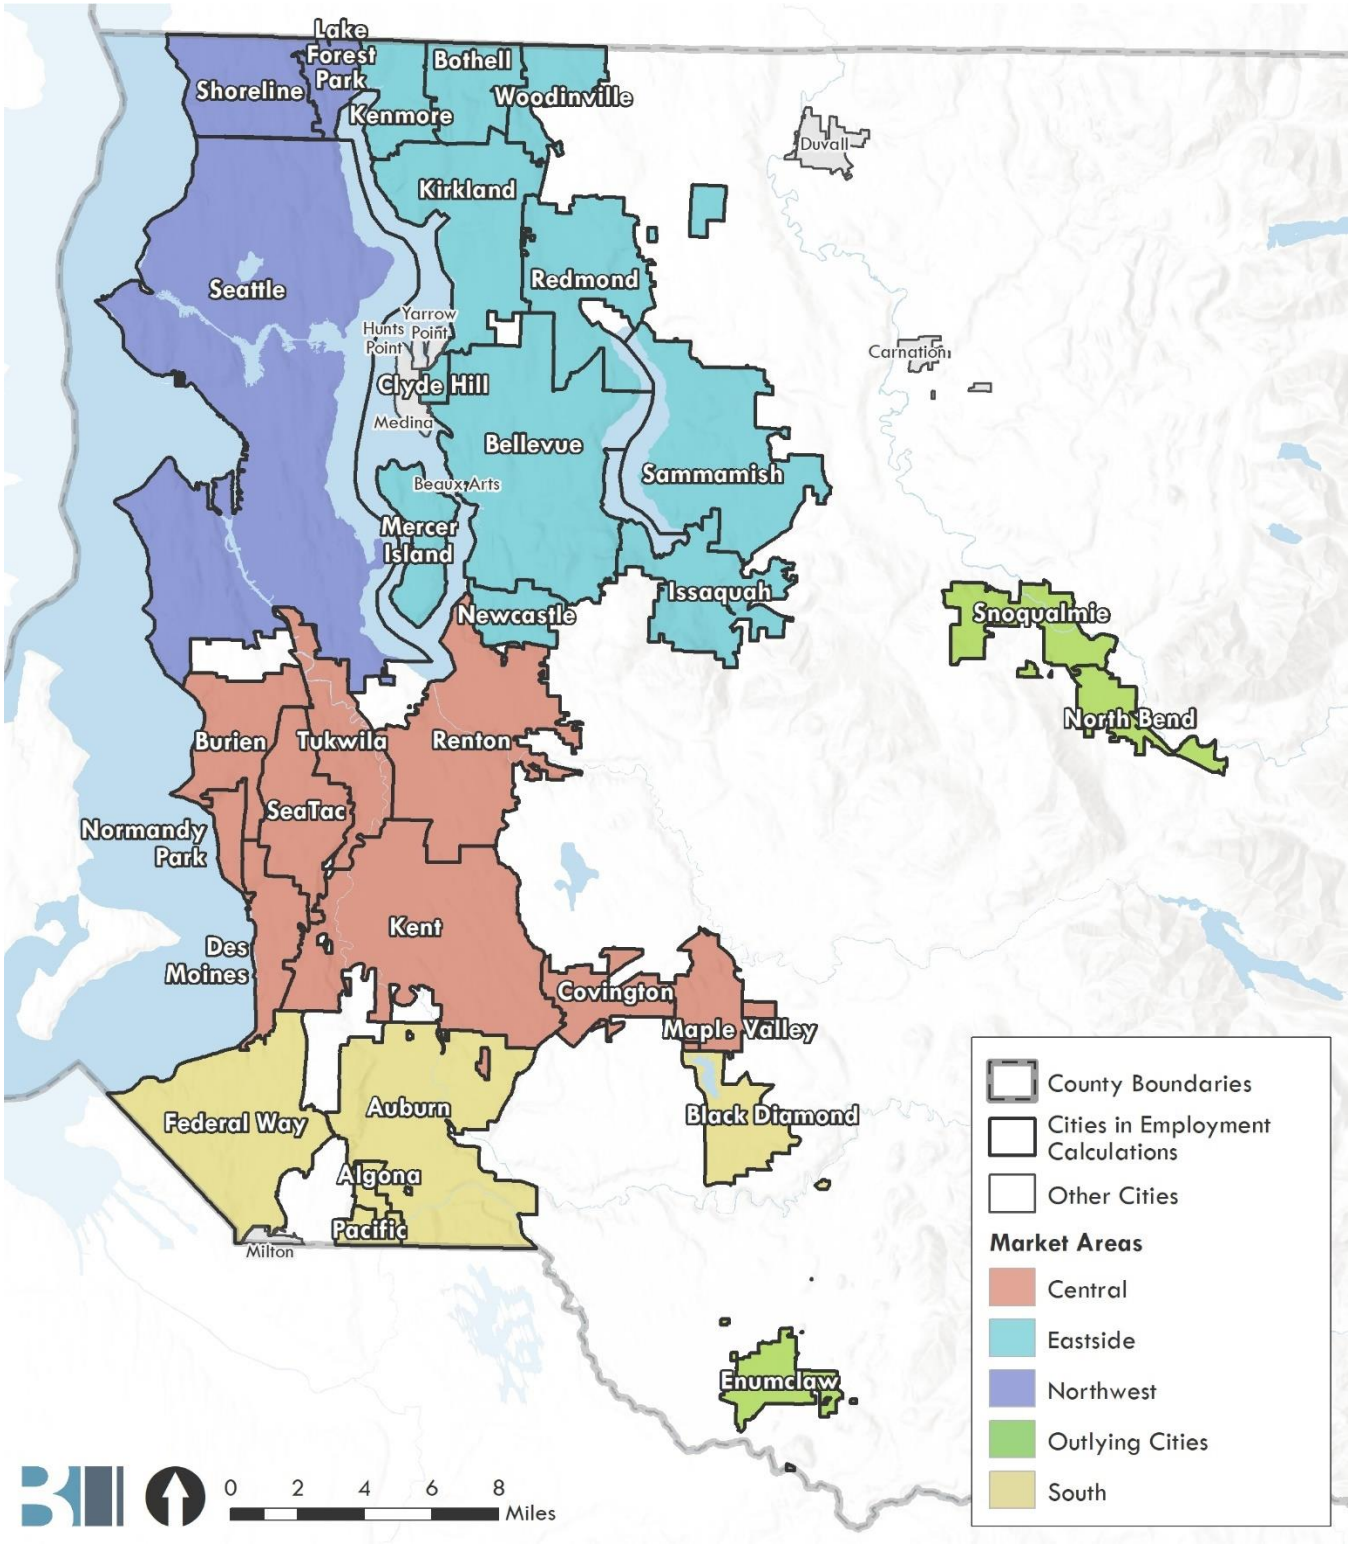


Exhibit 4 shows the total square feet per job in 2006 and 2019 for each of these market areas. While there was some variation between market areas, all areas except for South saw average square feet per job declines during this time period. In other words, employment density has been rising in most of King County. The different outcomes in the South appear to be due to strong gains in jobs associated with warehouse space, which typically require much more space per square foot.

Exhibit 5 adjusts the calculated employment density values on the basis of vacancy rates to determine the actual occupied space in the market and consider that future markets would normally have an average vacancy rate of around 5%. In most market areas, these estimates of square footage per job are somewhat different from the total aggregate square footage per job estimates shown in Exhibit 4. This step is important in cases where vacancy rates in employment areas are significantly higher or lower than expected.

Exhibit 6 provides gross employment density figures by jurisdiction, indicating the range of average densities found in communities across the region in 2006 and 2019. As noted previously, changes between 2006 and 2019 may be due to redevelopment as well as new development that supports employment uses at different densities than existing uses. For example, average densities may change with redevelopment of existing industrial areas for new office and retail uses, or development of new warehousing and distribution sites in communities that have not had these uses in the past.

[4] This analysis excluded construction and resource jobs, many of which are not tied to specific buildings and therefore not as relevant to employment capacity calculations.

Exhibit 3. Cities Included in the Employment Density Calculations by Market Area

Note: Cities with suppressed job counts were not considered in this analysis and therefore not symbolized on this map. Additionally, the 2019 job counts for Enumclaw, North Bend, and Snoqualmie include their respective unincorporated UGAs.

The analysis described above aggregates all commercial and industrial zones together when measuring employment density. BERK also analyzed assessor data in to help estimate aggregate employment density separately for different types of employment. Exhibit 7 provides estimates of the job densities by city for:

- **Non-industrial employment**, including spaces typically associated with employment in the Finance, Insurance, and Real Estate (FIRE); Retail; Services; Government; and Education major sector categories. This would include both commercial space as well as other public facility uses that may be accommodated elsewhere in land capacity studies but are difficult to distinguish without detailed analysis of individual buildings.
- **Industrial employment**, including Manufacturing and Wholesale Trade, Transportation, and Utilities (WTU) major sector categories.

The allocation of floor space to these categories is based on a classification of both site and building use for non-residential space as recorded in the King County Assessor's tax assessment database. Of course, there may be situations where jobs categorized as non-industrial are located in buildings classified as industrial. The opposite is also true. In most cases we expect this uncertainty would have a minor impact on aggregate calculations by city. However, there are some cases where the calculations in Exhibit 7 may be less reliable for an individual city, and surrounding market area characteristics should be used as a better guide.

Note as well that the non-industrial employment types include a wide range of uses, from recreation to education to government. Each of these types may have very different employment densities. Therefore, care should be used when interpreting these calculations and their relevance to land capacity assumptions.

INTRODUCTION

Background and Purpose

King County is in the process of beginning its Urban Growth Capacity Study, also known as the buildable lands or review and evaluation program. The purpose of this study is to review how actual recent growth compares with planning assumptions developed for the existing comprehensive plan, recalculate the quantity and capacity of buildable land available during the current planning period, and identify any issues to be addressed during the next comprehensive plan update. The Study must be complete and delivered to the Department of Commerce by June 30, 2021, but King County will complete its report in November 2020 to allow for a longer comprehensive plan update process.

King County completed Urban Growth Capacity Studies in 2007 and 2014. In 2017, several significant changes were made to the State legal requirements for the program. The County has identified two changes that will require additional analysis before the study can move forward. First, the County must include infrastructure gaps in the process of identifying lands available for development. Second, it must address several specific considerations in developing market supply factors applied to buildable lands.

This report recommends an approach to addressing infrastructure gaps in the Urban Growth Capacity Study. These methods reflect both state requirements and King County jurisdictions' infrastructure needs. A second report will recommend updated methods for market factors.

Methods and Approach

The recommendations in this report were developed in partnership with King County staff from the following resources:

- Washington State Department of Commerce "Buildable Lands Guidelines" (2018)
- King County cities' comprehensive plans

Organization of Report

This report includes the following sections:

- **Regulatory Context** explains how State requirements have changed and how King County's existing methods may need to be updated for consistency

- **Existing Infrastructure Conditions** outlines known infrastructure gaps identified within individual Comprehensive Plans to prepare for interjurisdictional coordination
- **Recommended Approaches** identifies how King County's methods could be updated to accommodate any infrastructure gaps

State Requirements and Recent Changes

The purpose of the Urban Growth Capacity Study is to review how actual recent growth compares with planning assumptions, recalculate the quantity and capacity of buildable land available during the current 20-year planning period, and identify any issues to be addressed during the next comprehensive plan update. King County's study fulfills the requirements for the "Review and Evaluation Program" as established under RCW 36.70A.215. In general, the State program is structured to allow for counties to use unique approaches to suit local conditions. State law sets basic requirements, and counties may meet those requirements as they see fit, provided their rationale is sound and well-documented.

In 2017, E2SSB 5254 was passed by the Washington State Legislature. This bill included the first revisions to the state review and evaluation requirements since the program began in 1997. These revisions included adding the requirement for counties to incorporate infrastructure gaps into their evaluation and identification of land suitable for development or redevelopment during the planning period. This will entail identifying lands that would otherwise be considered vacant or redevelopable and part of the land supply, but which have infrastructure gaps significant enough that they are deemed unlikely to be developed during the planning period, or that infrastructure development will unlock their capacity at a specific point partway through the planning period.

RCW 36.70A.215(3)(b) clarifies that infrastructure gaps include but are not limited to transportation, water, sewer, and stormwater. This report focuses on top ranking infrastructure systems and challenges that affect most or all cities in King County.

In some cases, infrastructure challenges may not warrant removing land from the developable supply for the 20-year planning period. Per the Department of Commerce's 2018 guidelines, jurisdictions should consider the following factors when evaluating whether or not an infrastructure gap exists:

- Is there a long-term lack of urban development in the area?
- How did the recent comprehensive plan address the needed infrastructure provision, and is that information still valid?
- If the infrastructure is anticipated to be provided later in the planning period, is development likely to occur quickly so that planned development is realized within the planning period, or will some of the area remain undeveloped?

King County's Current Methods

King County's past methods for quantifying its developable land informally addressed infrastructure gaps in land supply identification. The County has identified the following steps to update its process to meet new requirements:

1. Assemble necessary data for the entire jurisdiction, including parcel/assessor data, critical areas, and zoning.
2. Define vacant and redevelopable lands using a density and/or value threshold.
3. Exclude land uses or parcels that are unlikely to develop for categorical reasons (parks, schools, public facilities, other institutions, etc.).
4. Apply vacant and redevelopable land definitions established in Step 2 to the remaining parcel data.
5. Review and refine the resulting developable land supply.
6. Identify and remove environmentally sensitive lands.
7. Adjust for infrastructure gaps (New step to be defined).
8. Summarize developable land supply by zone.

This report will provide recommendations on how to accomplish step seven, adjusting for infrastructure gaps. This will include accommodating any lands which should be entirely removed from the land supply and adjusting for lands that will become "unlocked" at some point during the planning period.

EXISTING CONDITIONS

This section discusses the Capital Facilities Elements of King County cities to assess high-level infrastructure challenges, summarized in **Exhibit 1**. Most plans were developed in 2014 or 2015, and individual jurisdictions should review these findings for the County's Buildable Lands needs. This review focuses on infrastructure systems most likely to prevent development, including water, sewer service, and stormwater facilities. Site-specific infrastructure issues independent of system capacity might also limit development capacity; cities should identify site-specific concerns, as outlined in the subsequent section of this report, *Recommended Approach*.

Water

In King County, 18 cities acquire all their potable water through agreements with utility districts or other cities. Another 11 cities have their own water system and supply, but also have areas within their limits served by outside water districts or other cities. This leaves 10 out of 39 cities providing all their own water needs. These 10 cities are generally either very large, with systems that serve many other jurisdictions (Seattle and Bellevue), or very small (Five out of 10 have a population under 10,000). Overall, all indicate that these providers had sufficient water supply to accommodate growth through 2035, though Redmond and Woodinville cited a potential need for additional sources. Several cities with sufficient water rights still face other challenges such as in storing water and managing water quality over time, including Bothell, Black Diamond, and Milton. SeaTac's plan notes concerns about Seattle Public Utilities' ability to supply water to regional cities as Seattle continues to grow.

Sewer

Twenty cities receive sewer service from utility districts or another jurisdiction such as the City of Bellevue or King County. Another 8 cities have their own utility, but also have areas within their limits served by utility districts. At least 20 cities report having parcels with septic systems, and Burien reports areas that do not have access to sewer. Auburn and Kenmore are working to provide sewer to all remaining parcels on septic. Most of the sewer providers have capacity for growth through 2035, though Milton and Woodinville expressed capacity concerns.

Stormwater

All jurisdictions except Carnation have public stormwater infrastructure, though some such as Mercer Island rely heavily on natural systems. At the time of the plan update, Enumclaw did not have a public stormwater utility to fund expansion of its system. A common concern was the need for

additional capacity in stormwater pipes and drainage swales. Some communities require that new development install onsite stormwater detention and treatment, and require the use of low impact development techniques in all development. Numerous communities possess natural conditions that make stormwater management difficult, such as flat topography, high water table, and the presence of rivers, streams, and wetlands. Depending on the use and circumstances, such natural conditions can create site-specific infrastructure gaps that could impact land capacity.

Funding Concerns

Several plans note that the gap between projected future revenues and the cost of required future capital facilities will continue to widen without additional taxes or other revenue increases. One plan notes that cuts in services or increases in operating revenues may be necessary. Another states that funding to maintain the system has not changed over the years and that there is no dedicated fund to cover basic operation and maintenance expenses. Multiple plans cite the need to replace aging infrastructure as a future funding concern.

Awareness of the need for future funding does not necessarily limit anticipated growth. Funding concerns therefore, are only presented herein as prohibitive to redevelopment if the city cites the concern in their plan as critical and imminent.

Exhibit 1 summarizes high level water, sewer, and stormwater issues identified in individual cities' last comprehensive plan updates. These are described in greater detail in **Appendix A**. Cities in Exhibit 1 are grouped by geographic area within King County.

Exhibit 1. Infrastructure Issues Identified in 2015-Era Comprehensive Plans

Jurisdiction	Water	Sewer	Stormwater
North King County			
Shoreline	No issues	No issues	No issues
Lake Forest Park	No issues	No issues	**Infrastructure improvements required**

Auburn	No issues	No issues	No issues
Algona	No issues	No issues	**Infrastructure improvements required**
Black Diamond	**Infrastructure improvements required**	**Infrastructure improvements required**	No issues

RECOMMENDED APPROACH

This section proposes a process for King County and its cities to identify developable parcels with infrastructure gaps, make decisions about those gaps' impact on development potential, and adjust the land supply accordingly. At the beginning of the infrastructure evaluation process, each jurisdiction will have identified a set of vacant and redevelopable parcels. Environmentally sensitive areas and parcels or land uses unlikely to develop for categorical reasons will have already been excluded from this group. This potentially developable land supply will then be evaluated for infrastructure gaps.

An **infrastructure gap** exists for a property when one or more critical types of infrastructure is not available – transportation, water, sewer, or stormwater. Additional types of infrastructure may be critical in certain cases, and this should be assessed by each city. A gap may be temporary, meaning that a project has been identified in the CIP or TIP to address the gap and funding has also been identified. Or a gap may be long-term, meaning that there is no project funded within the planning period.

The infrastructure evaluation process includes the following steps to identify parcels which have long term infrastructure gaps significant enough to be wholly or partially removed from the buildable lands supply:

1. Identify system capacity issues
2. Identify site-specific infrastructure gaps
3. Update developable land supply

In some cases, this process will require the jurisdictions to work together with service providers to make informed decisions about whether or not lands with infrastructure gaps should be considered part of the buildable land supply. In determining whether there is an infrastructure gap, the Department of Commerce recommends that jurisdictions consider the following:

- Has there been a long-term lack of urban development in the area?
- How did the comprehensive plan address how the needed infrastructure would be provided, and is that analysis still valid?
- If the infrastructure is anticipated to be provided later in the planning period, is development likely to occur quickly enough for the planned development to be realized within the planning period, or will some of the area remain undeveloped?

The proposed approach adds additional rigor to Commerce's guidance through a stepwise scan of infrastructure capacity. Cities and King County

should use professional judgement and the best information available to make informed decisions, and clearly document their rationale.

Step 1. Identify System Capacity Issues

1.1. Each jurisdiction will verify and update the data provided in the most recent Comprehensive Plan, documenting major changes in policy, service provision and other relevant details.

1.2. Each jurisdiction will list the providers serving their jurisdiction with essential infrastructure: water, sewer, stormwater.

1.3. Each jurisdiction will collaborate with service providers, drawing from sewer and water district and comprehensive plans, to identify out-of-date planning information and any underserved portions of each city or the unincorporated urban area. Jurisdictions are advised to coordinate with public works staff to review, interpret and verify data.

1.4. Document any future capital facilities investments planned to address these issues. Determine if specific investments will resolve infrastructure gaps to "unlock" development potential and when it is expected to occur.

1.5. Document if funding has been identified for capital facilities investments.

1.6. Evaluate each system-wide capacity issue to determine if the issue is expected to stop or delay future development, or limit the types or densities of development that will be feasible.

1.7. Using GIS, overlay the service areas of providers with system capacity issues on the set of vacant and redevelopable parcels. Update data for impacted parcels to note system capacity issues.

Step 2. Identify and Document Site-Specific Infrastructure Gaps

2.1. Individual jurisdictions will review remaining vacant and redevelopable parcels to identify site-specific gaps. This review is best done with GIS data. **Appendix B** outlines a suggested process for assigning tiers to sites based on infrastructure availability, and using these tiers to identify site-specific gaps.

2.2. Draw from code or adopted policy to determine if the issues are expected to stop or delay future development, or limit the types or densities of development feasible on vacant or redevelopable parcels. Review parcels with multiple gaps, regardless of severity, to consider if their combined impact will stop or delay development. **Appendix B** provides additional guidance on evaluating multiple gaps.

2.3. Update parcel data to note identified site-specific infrastructure gaps, by documenting infrastructure constrained parcels in the developable land supply.

Step 3. Update Developable Land Supply

3.1. Update developable land supply by removing the developable area of fully constrained parcels from consideration. For partially constrained parcels, document the expected development to accurately convey capacity limitations due to infrastructure gaps.

3.2. Summarize developable land supply by zone.

APPENDIX A. SUMMARY OF INFRASTRUCTURE BY CITY

North King County Jurisdictions

Except for Seattle, North King County's cities are all currently midsize, between 12,400 and 56,400 in population. Woodinville is projected to grow by the largest percentage, while Shoreline and Kenmore will grow the most in absolute terms. There are several utility districts that serve all of these communities in various iterations, particularly the Northshore Utility District, Alderwood Water & Wastewater District, and Woodinville Water District. Seattle, on the other hand, serves as a regional utility provider. Seattle Public Utilities serves communities throughout King County.

Bothell

The City of Bothell's 2015 Comprehensive Plan, called Imagine Bothell, contains a Capital Facilities Element that inventories all of the City's capital facilities. The Element outlines planned improvements to ensure that the facilities have adequate capacity to meet level of service (LOS) standards. The Element also references relevant capital facilities plans, master plans and strategic plans to identify funding sources and other detail.

The City has contracted with Seattle Public Utilities for potable water, and has **sufficient supply to serve growth**. At the time the Plan was updated, the City had identified a **deficiency for water storage**. As of 2015, a project to address this deficiency was underway. In addition to the City water and sewer systems, certain areas are served by the Alderwood Water & Wastewater District, Northshore Utility District, and Woodinville Water District.

Kenmore

Kenmore's utilities and capital facilities elements were last updated in 2015. The City's water is provided by the Northshore Utility District, and it accounts for 31% of the District's connections. The District purchases water from Seattle Public Utilities and has **sufficient capacity to meet growth needs to 2026 and beyond**. At the same time, average day and peak season demands at build out **slightly exceed the SPU supply contract amount**. The city believes this shortfall may be eliminated as conservation measures and water-use habits decrease demand. The District has additional sources for water that it is not yet using.

The Northshore Utility District also provides sewer service. Its policy is to provide public sewer service to areas within its service area, which encompasses Kenmore. It set a goal in 2006 to **provide sewer to the majority of parcels on septic within eight years**. As of 2014, 877 parcels

in the District were on septic systems, and 550 of these had sewer service available but not yet connected.

Lake Forest Park

The Lake Forest Park 2015-2035 Comprehensive Plan was adopted in 2016. Water service is provided by four public water utilities: Lake Forest Park Water District, North City Water Utility District, Northshore Utility District, Seattle Public Utilities. These districts have capital improvement plans that address issues of **aging pump stations and main infrastructure, meter replacements, and reservoir upgrades**, as well as the need for an I-405 transmission main replacement by 2026.

The City owns and operates its sewer utility, though portions of the City are served by the Northshore Utility District. Lake Forest Park manages the City's stormwater drainage system, and has identified $8.7 million dollars in funding for required future projects.

Seattle

The City of Seattle's Comprehensive Plan was updated in 2016. The Capital Facilities Appendix identifies necessary upgrades to police and fire facilities, a need for continuing acquisition of land for parks and open space, demand for new government office and warehousing space, a need for expanding school capacity, and other facility needs that will be necessary to serve a growing city.

The City's utilities will also be taxed by growth. Specifically, Seattle City Light will require **additional resources** to "meet load growth and comply with I-937 over the next twenty years." While maintenance to the water system will be required in perpetuity, particularly for distribution and storage systems and to meet fire flow requirements, Seattle Public Utilities nonetheless indicates that the **water supply is currently sufficient to meet levels of service for anticipated growth in the next twenty years**. Outside of general maintenance, the **sewer system has adequate capacity** to serve the City's full buildout.

Shoreline

Shoreline's capital facilities and utilities elements were last updated in 2012. The elements **do not identify any specific utility gaps.**

Woodinville

Woodinville's Comprehensive Plan was updated in 2015. The Capital Facilities Element indicates that the Woodinville Water District "**projects a deficit** of 200 gpm of source availability for the West service area in 2027 [and] an additional storage capacity deficit of over 900,000 gallons […] in the

West area". The Plan identifies **general deficiencies for the sanitary sewer system**, indicating that the latest Woodinville Water District plans do not include improvements that would be required to meet the current level of service standard. There are also **deficiencies identified for the stormwater system**, with the Comprehensive Plan indicating that "There are areas of insufficient capacity located throughout the City [and] some of the more significant problem areas are within the Woodin Creek basin and in areas upstream of Lake Leota."

Eastside King County Jurisdictions

East King County's large cities are projected to accommodate strong growth, particularly Bellevue and Redmond. More East King County communities own their own utilities compared to other regions, or have service provided by the City of Bellevue.

Bellevue

The City of Bellevue's Comprehensive Plan was last updated in 2015. The Plan indicates that the City has little vacant land, so the focus of the Capital Facilities Element is maintaining and upgrading existing facilities to accommodate anticipated population growth in areas that have already been developed. The Plan provides a detailed inventory of the City's capital facilities and references to several more specific functional plans, which contain detailed information about planned improvements and available funding. While the City anticipates increased demand for services and facilities, the **Plan does not indicate any gaps that would preclude growth.**

Issaquah

The City of Issaquah's Comprehensive Plan was last updated in 2015. It identifies City-managed utilities and capital facilities and provides policy language that requires the City to meet minimum levels of service and provide utilities to serve new growth. **No capacity shortfalls** are identified for water, sewer, or stormwater, though the Capital Facilities Element, indicates that imminent growth may exceed the capacity of police services and parks provision.

Kirkland

Kirkland's capital facilities element was last updated in 2015. The most significant potential gap noted was a need to **replace and/or rehabilitate aging sewer pipelines** to maintain level of service. In addition, some **portions of the city are currently on septic systems** and may need to join the City's system as they become more urbanized. Portions of north

Kirkland have sewer and water service through the Northshore Utility District or Woodinville Water District.

Mercer Island

The City of Mercer Island Comprehensive Plan includes a Capital Facilities Element that identifies capital needs for streets, parks and open spaces, pedestrian and bicycle facilities, stormwater, sewer, water, and schools. The City owns and operates its water, sewer, and stormwater systems. There are **no deficiencies identified for the water system**.

Newcastle

The City of Newcastle's Comprehensive Plan includes a Capital Facilities Element that references several other related plans and advances goals and policies related to level of service, facility financing and other policy issues. The Plan also includes a Capital Facilities Appendix. The Appendix provides a detailed inventory of the City's capital facilities and a comprehensive list of funding mechanisms for capital facility needs. The Appendix also provides a list of needed improvements and anticipated funding levels and sources. Beyond these improvements, **no other gaps are indicated**.

Redmond

The Redmond 2030 Comprehensive Plan was adopted in December 2011. The City of Redmond provides water service to most areas within the City limits. Water is sourced from City wells and the Cascade Water Alliance (CWA). Redmond's well system draws from a shallow aquifer which is **susceptible to contamination**, especially as urbanization of the Aquifer Recharge zone continues. The City has implemented a Wellhead Protection Program to preserve water quality, in addition to implementing conservation measures to decrease demand for a new water supply.

A majority of Redmond is served by a sanitary sewer, however, **some areas still have on-site disposal** such as septic tank systems. King County provides wastewater treatment through the Brightwater facility which has sufficient capacity to meet Redmond's future needs. Most of the **proposed annexation areas lack sewer**. The City manages most stormwater facilities, although there are also some private facilities.

Sammamish

The City of Sammamish's Comprehensive Plan was updated in 2015. The Capital Facilities Element does not contain an inventory of capital facilities but does detail the required levels of service for each type of facility. **No gaps in service provision** are indicated in the Element. Additional background information is contained in another section of the Comprehensive Plan, including an inventory and forecast of future needs. This section identifies

needed improvements to parks, stormwater facilities, transportation facilities, and water and sewer facilities. These capital improvements are **not anticipated to hinder growth** or preclude the City from reaching the buildout envisioned in the Land Use Element.

Beaux Arts Village

The Town of Beaux Arts Village's Comprehensive Plan was **last updated in 2015**. The capital facilities element notes that urban facilities and services are in place and **there are adequate water, sewage and drainage systems to meet the foreseeable needs of a stable population**. The Town's water supply comes from a well within its limits. The Town operates the well and maintains the water delivery system. The City of Bellevue provides sewer service to all Beaux Arts residences. The Town manages and maintains a system of stormwater catch basins, storage and transmittal pipes, and outfalls. No future projects were identified in the Plan. The Transportation element notes that the only local transportation issues relate to road surface maintenance, all addressed in the Town's Capital Improvement Plan.

Clyde Hill

The Clyde Hill Comprehensive Plan was last updated in 2015. Potable water and sanitary sewer service are provided by the City of Bellevue. The Plan states that **all future needs can be accommodated** by the existing systems.

The City owns and maintains a storm drainage system but indicates that as remaining vacant parcels are developed and surface water runoff has increased, **existing underground development has made installation of new stormwater infrastructure more difficult**. The City indicates that a long-term goal is to develop a system able to collect and treat storm water generated by a 10-year average storm event.

While no immediate infrastructure deficiencies were identified in the City's Capital Facilities element, the Plan notes that due to a range of circumstances, there is a **growing gap between operating revenues and expenses** in the City, and that it may be necessary to initiate cuts in services or increases in operating revenues in the future.

Hunts Point

The Hunts Point Comprehensive Plan was last updated in 2015. The City of Bellevue provides both potable water and sanitary sewer service. The Town provides a stormwater system that connects non-shoreline properties to drainage pipes that discharge to Lake Washington. Properties along the lakeshore have private systems that discharge directly to the Lake.

The Plan **does not identify any water, sewer, or stormwater projec**ts in the six-year plan contained in its capital facilities element.

Medina

The Medina Comprehensive Plan was last updated in 2015. Water and sewer services are provided by the City of Bellevue, and King County maintains a sewage pumping station at the corner of NE 8th Street and 82nd Avenue. Bellevue has **adequate capacity to continue water and sewer service**. Non-potable water used at the golf course is pumped from Lake Washington under a "grandfathered" water use rights agreement with the State Department of Natural Resources.

Medina operates and maintains its own storm drainage system. **A range of deficiencies** have been identified in the system, attributed to poor on-site management of stormwater runoff on individual properties. The City adopted requirements for property owners to implement best management practices to control runoff and to better manage private stormwater facilities. In addition, the **City identified a number of upgrades to the municipal stormwater system** to increase flow capacity of individual sections of the system, recondition some of the open ditches, correct old or undersized lines, and to install pollution control devices (e.g., catch basins, oil separators). Current projects are identified in the annual six-year Capital Improvement Plan.

Yarrow Point

The Comprehensive Plan for the Town of Yarrow Point was adopted in 2015. Potable water service is provided by the City of Bellevue, which **can accommodate Yarrow Point's planned growth**. The sanitary sewer system is also operated by the City of Bellevue. New connections to the sewer main require a right of way permit from the Town and a sewer connection permit from the City of Bellevue.

The Town Stormwater Utility was developed in 2011. A comprehensive stormwater inventory and assessment identified several capital projects necessary to accommodate the Town's full land-use build out, supported in part through property tax, Real Estate Excise Tax and other fees. Five projects identified in the 2015 Capital Improvement Plan totaled $688,000. The Town is exempt from the National Pollution Discharge Elimination Permit System (NPDES) Phase II Permit.

Rural Eastside King County Jurisdictions

Rural Eastside King County jurisdictions are generally located further east and are more geographically separate from other Eastside jurisdictions. All have generally strong growth projections, particularly North Bend, which is

projected to grow by nearly 45% by 2040. Each jurisdiction generally provides its own utility services.

Carnation

The City of Carnation's Comprehensive Plan was last updated in 2015. The City owns and operates its water system. Its **water rights and capacity are sufficient** to serve forecasted demand. The City's sewer system was completed in 2008, previously the City was dependent on private septic systems. The sewer system currently has **excess capacity**, with a wastewater treatment plant design to serve a population greater than the project buildout for the City (and currently operating at only 25% of capacity). However, some capital facilities in Carnation appear to have capacity challenges. Specifically, the City has **no public stormwater system** and only two drainage basins. The Plan indicates that "stormwater from impervious surfaces must be infiltrated on-site, which can sometimes be difficult to achieve given localized areas of poorly drained soils and/or seasonal high-water tables."

Duvall

The City of Duvall's Comprehensive Plan was last updated in 2015. The Comprehensive Plan **does not identify any gaps in facility provision** and includes goal and policy language that supports the provision of utilities to support future growth. The City owns and operates its water, sewer, and stormwater systems. It purchases its water from Seattle Public Utilities. Most of the detailed analysis of capacity for each utility is contained in the individual facility and capital improvement plans, rather than the Comprehensive Plan. However, the Comprehensive Plan specifically indicates that the sewer system currently has **capacity to serve 9,000 residents, with expansion capacity up to 13,000 residents**.

North Bend

The City of North Bend's Comprehensive Plan was last updated in 2015. The Plan indicates that about **34% of the City's water pipe is nearing the end of its useful life,** and the City served by different water suppliers in its eastern and western areas. It also identifies several near-term and high-priority investments in the City's water and sewer systems, including expansion of the wastewater treatment plant and the resolution of water supply issues in Sallal. The Plan also indicates that flooding may occur due to several factors, including **"inadequate storm drain infrastructure in certain areas"**. No other capital facilities gaps are indicated, including to police, fire, school and other municipal facilities.

Skykomish

The most recent Skykomish Comprehensive Plan was completed in 2015. The Town owns, maintains, and operates its own water distribution system. The Comprehensive Water Plan for the Town was adopted in 1993, and the Town has responded to the new laws and regulations to the best of its abilities, using grants and loans to provide maintenance and upgrades to the system. Any updates to the plan made since 1993 have not been reviewed or approved by the County or state.

The Town of Skykomish provides municipal water service through two wells located east of town. The water system was originally constructed in the early 1900s, however the town has continued to upgrade the system over the years. Water quality levels, fire flow, and storage facilities are **all adequate at this time**, however a 1993 Water Comprehensive Plan identified numerous improvements and service upgrades that were necessary. Funding has been identified for some of the needed upgrades, and some projects have been completed since 1993.

The General Sewer and Facilities Plan prepared for the Town in 2007 identified a strategy for developing a centralized wastewater collection, treatment, and disposal system that would replace the substandard septic systems used in Skykomish. That **system was planned to be complete** in 2015.

The Skykomish Stormwater Management Plan was adopted in 2014. The **town's system has nearly doubled since 2006**, and has benefitted greatly by the BNSF cleanup, the design of the Town's sewer system, and the Maloney Creek Rehabilitation project. Funding to maintain the system has not changed over the years, and while the Plan identified financing alternatives, there is **no dedicated fund to cover basic operation and maintenance expenses**.

Snoqualmie

The City of Snoqualmie's Comprehensive Plan was updated in 2014. The plan indicates the following needs, based on anticipated 2010-2032 population growth and a more immediate six-year growth forecast:

- Satellite fire station if areas of the UGA are annexed into the City
- Water distribution pipe (about 10% of system) **nearing the end of its useful life**, particularly in the Canyon Springs area
- Energy efficiency and other upgrades to the sewer system, though **no expansions due to capacity constraints** are anticipated
- Improvements to stormwater infrastructure in older City areas, where infrastructure is less robust, with older pipes, and some sections lacking stormwater conveyance

Central King County Jurisdictions

Central King County is home to two cities of over 100,000 residents, and several midsize jurisdictions that are growing rapidly. While some of its cities own their utility services, there is a high level of utility district overlap between cities, even those with their own services. There is also a higher number of utility districts active in this area.

Burien

Burien's capital facilities element was last updated in 2015. Its water is provided by Seattle; King County Water Districts 20, 125, and 40; and the Highline Water District. Water supply is **currently sufficient**, though some improvements are required to improve fire flow. All of these districts purchase water from Seattle Public Utilities. The majority of Burien's sewer service is provided by the Southwest Suburban Sewer System, with other areas served by the Midway Sewer District and Rainier Vista/Val Vue Sewer District. The City has experienced some stormwater challenges in its Salmon Creek basin. The area is almost fully developed, and has experienced erosion and pollution tied to undetained runoff and lack of treatment in some areas.

The City's utilities are provided by utility districts with **extensions and improvements funded by users and local improvement districts**. As a result, to the extent there are utility gaps specific to developable sites, they depend on market conditions to justify extension costs.

Covington

Covington's capital facilities and utilities elements were last updated in 2016. The City's water is provided by the Covington Water District, King County Water District 111, and Ham Water Company. Sewer is provided by Soos Creek Water and Sewer District. **District 111 has minimal capacity for new growth compared to other providers**, but only serves a limited number of properties. Soos Creek has identified capital projects within City limits, but it is not clear if these projects could "unlock" capacity. The element has identified a $**76.4 million funding gap for parks, stormwater, and transportation**. The land use plan may need to be revisited if no new funding sources are identified and LOS standards are not revised.

Des Moines

The Des Moines 2035 Comprehensive Plan was adopted in 2015. Potable water and sanitary sewer service are provided to the city by water and sewer districts (Water: King County Water District 54, Highline Water District, and Lakehaven Utility District; and sewer: Midway, Southwest Suburban, and Lakewood Utility Districts). A **portion of the City is still served by**

septic systems, although future development is required to provide sanitary service.

The City provides stormwater management and requires new development to install onsite stormwater detention and treatment. No specific projects are identified in the Comprehensive Plan.

Kent

Kent's capital facilities element was last updated in 2015. **No infrastructure gaps** were identified. The City's municipal water system does not cover the entire incorporated area. Areas outside the system boundary are served by Water District 111, the Soos Creek District, and the City of Renton. There are several new streets planned which could enhance development potential.

Maple Valley

The City of Maple Valley Comprehensive plan was adopted in 2015. Potable water is provided by **two independent water districts**: the Covington Water District and the Cedar River Water and Sewer District, **plus one Group-A private water system**, Cherokee Bay Community Club, Inc. Both the Covington Water District and the Cedar River Water and Sewer District are seeking to update their intertie and partnership agreements, and in 2015, the Covington Water District identified $41.3 million dollars in projects to upgrade and maintain their facilities. They anticipate **only moderate water system improvements** within the ten-year planning horizon of the Comprehensive Plan.

Most of the City's sewer service is provided by the Soos Creek Water and Sewer District (SCWSD). The Plan prioritized $2.6 million in repairs to aging sewers and mains, some of which date back to the 1950s. **Annexing rural areas in the future could cause a significant impact** on the ability of the SCWSD to meet demand (e.g., through the County's 4-to-1 program that converts adjacent rural lands to urban).

The City of Maple Valley manages the majority of the City's stormwater system, which comprises catch basins, manholes, pipes, ditches, infiltration tanks, detention/retention vaults, and detention/retention ponds. The City continues to identify projects to resolve **chronic stormwater problems**, including areas where there is ongoing recurrent flooding.

Normandy Park

The Normandy Park Comprehensive Plan was adopted in 2016. Water service is provided by three separate large water districts: Highline Water District, Water District 49, and Water District 54. Service is **adequate for**

current needs and capable of responding to anticipated growth. At the time of the City's Comprehensive Plan development, the Highline Water District Capital Improvement Plan identified one project to replace old Asbestos-Concrete water mains, in part, to reduce the potential for water line breaks.

The City does not own or maintain any sanitary sewer system components. Sanitary sewer conveyance services are provided by the Southwest Suburban Sewer District (SWSSD) and the Midway Sewer District. Treatment from both these systems is treated by the Miller Creek Wastewater Treatment Plant (WWTP) in the City. The latest SWSSD plan was developed in 2014, and Midway's latest plan was developed in 2008. These plans indicate that the **current system has sufficient capacity** to accommodate forecasted growth.

A portion of the city, estimated to include 459 persons, **does not receive sewer service**. The Capital Facilities Element notes that it is a priority to provide service in this area, either through expansion of sewer district boundaries, or building of infrastructure and reaching agreement with one of the districts about its construction and maintenance. Capital projects identified by the two districts focus on increasing capacity of the conveyance system, but it is noted that the **proposed improvements may be unrelated to growth** in Normandy Park.

The City has adopted a current Stormwater Management Plan (SWMP). The City is coordinating with surrounding jurisdictions to evaluate surface water management for two contiguous basins, and beyond projects identified for 2015 and 2016, had not identified any new stormwater facilities or projects for 2022-2035 (as of the 2016 Comprehensive Plan adoption date).

Renton

Renton's capital facilities and utilities elements were last updated in 2015. The City provides water, wastewater, and surface water services to the City and some additional areas outside its boundaries. Some **recently annexed areas are currently served by other utility providers**, particularly in the southeast portion of the City. Additional water providers active in Renton are the Soos Creek Water and Sewer District, Cedar River Water and Sewer District, King County Water District 90, and the Coal Creek Utility District.

The City provides water to a 16 square-mile area. Of the City's water, 95% comes from City water sources and 5% from an agreement with Seattle Public Facilities to serve Boeing facilities. The Element states that future infrastructure projects developed to accommodate growth are identified in the Water System Plan Update.

Much of the City's wastewater infrastructure is **reaching the end of its useful life**. City models do not indicate any current capacity deficiencies, but **capacity may be an issue at various locations closer to 2030**.

SeaTac

The SeaTac Comprehensive Plan 2035 was adopted in 2015. Five water districts provide service to SeaTac: Sea-Tac Airport Water System; King County Water District #125; King County Water District #20; King County Water District #49; and Highline Water District #75.

The Plan indicates that the availability of water may be a concern in the future. Since water districts serving SeaTac have historically obtained their water largely from Seattle Public Utilities, the population and employment **growth anticipated in Seattl**e over the next 20 years will affect their continued ability to supply water. This future is further complicated by the impacts that climate change is likely to have as snowpack and warmer temperatures will likely mean drier summers and more stress on water resources. SeaTac has adopted a policy to work with water districts to ensure that other water sources are developed to address future water needs.

Four sewer districts provide service to SeaTac: Valley View Sewer District; Midway Sewer District; Southwest Suburban Sewer District; and Kent Sewer District. In addition, some developed areas of the City are **not connected to sanitary sewers**. Sewer treatment is provided through the SeaTac Airport, the Southwest Suburban Sewer District, and King County's secondary wastewater treatment facilities in Renton. Historically, the City has not required connection to sanitary sewer service even when it is available, although adopted policy requires new development to connect when service is available within 300 feet.

The City indicated that being served by multiple water and sewer districts **complicates interjurisdictional coordination and the ability to assess system capacity** in terms of forecast population and employment growth.

SeaTac owns and operates a surface water utility. The City has adopted a 2013 Surface Water Utility Plan, and a 2012 Stormwater Management Plan. The Comprehensive Plan notes that City's stormwater infrastructure is aging, with **some sections well beyond their expected lifespan**. The Surface Water Utility is evaluating this infrastructure with the goal of repairing or replacing it as appropriate.

Tukwila

The Tukwila Comprehensive Plan was adopted in 2015. Slightly more than 50 percent of Tukwila is served by the City's water system. The remainder is served by the King County Water Districts #125 and #20, Highline Water

District, the City of Seattle, and the City of Renton. The City purchases its water from the Cascade Water Alliance under a contract through the year 2064. Cascade's current primary source of water is through a contract with Seattle. Tukwila's Comprehensive Water Plan (2015) identifies areas of water supply and distribution deficiency, and the six-year Capital Improvement Plan proposes corrective improvements. A **citywide pipeline replacement program** is planned to extend over a 50-year period.

Similar to water service, slightly more than 50 percent of the City is served by the its sewer utility. The remining providers include the City of Seattle, City of Renton, and Valley View Sewer District, or the area is unserved by sewer. The Tukwila sewer system is exclusively a collector system with no treatment component. King County DNRP Wastewater Treatment Division provides Regional wastewater treatment at the South Treatment Plant in Renton. The 2014 Comprehensive Sewer Plan identifies deficiencies in the system, and corrective improvements are proposed in the six-year Capital Improvement Plan. The plan notes that, in order to provide infrastructure in the unserved portions of the City, **additional revenue is needed to extend service** to these areas.

Tukwila's surface water drainage system consists of both drainage improvements, public and private, and natural drainage. Except for a small area in the Ryan Way neighborhood, drainage is ultimately to the Green/Duwamish River. The 2013 Surface Water Comprehensive Plan evaluates the current inventory of existing facilities and identifies deficiencies and planned improvements. A range of surface water issues (**drainage, water quality, and aquatic habitat**) were identified and prioritized, and proposed improvements are included in the City's Six-Year Capital Improvement Program.

South King County Jurisdictions

South King County jurisdictions are generally less populous compared to Central King County, though Federal Way is projected to surpass 100,000 residents by 2040. Some communities are growing rapidly, particularly Black Diamond, which is projected to grow by 57%. While some of its cities own their utility services, there is a high level of utility district overlap between cities, even those with their own services. Several communities are served by Tacoma Public Utilities.

Algona

The Infrastructure and Public Services and Transportation elements of the Algona Comprehensive Plan were **last updated in 2015**. The plan noted that existing services in Algona fall within **acceptable levels of service**

and that future development projected through 2035 will be adequately served provided a systematic approach to facility maintenance is employed.

The City has an interlocal agreement with Auburn for water service and has identified **2.5 million dollars in needed reservoir and water main projects**. The City owns and maintains the local collection system for the sewer system, and the trunk lines and treatment facility are owned by King County Metro. The City bills customers for King County charges, as well as for local maintenance and operation costs. The County trunk line has capacity to 2035. Facility improvements are addressed in Metro's Capital Improvement Program

The City's 2010 stormwater documents identified the need to increase stormwater pipe sizes to 36" in several areas to better handle storm flows, as well as a need for drainage swales sized to address a 25-year/24-hour storm events, to be provided by development.

Auburn

Auburn's capital facilities element was **last updated in 2015**. The Element describes currently utility service but does not identify specific gaps or planned projects. The City provides **water, sewer, and stormwater service** to its limits and several external areas. The City's watershed sources are **supplemented by wells** and **two connections to Tacoma Public Utilities'** regional water system. There are **significant areas in the sewer service area which are currently on septic**, with plans to expand service in the Comprehensive Sewer Plan.

Black Diamond

The City of Black Diamond's Comprehensive Plan was **adopted in 2019**. The City provides water to most of its limits, while the Covington Water District serves its northeast corner. City water is sourced from springs which have **adequate supply** to serve growth, though the City has long term concerns about impacts to **water quality and reliability** due to erosion and steep slopes. It is working to address these concerns while also seeking a supplementary water source. The City otherwise has **sufficient water rights to serve future growth**. System infrastructure improvements will be required to accommodate growth, outlined in the City's Capital Improvement Plan.

Similar to water, the City serves most of its limits with sewer, while the northeast corner is served by the Soos Creek Sewer District. The sewer system must grow to accommodate significant growth anticipated in two planned developments, but these **improvements have been addressed with development agreements**. The Plan does not identify gaps related to stormwater, and reports no major flooding problems. The current Capital

Improvement Plan (2019-2024) identifies funded improvements for all City-operated utilities.

Enumclaw

Enumclaw's capital facilities element was last updated in 2015. The City owns and operates its water system, including its water sources. The City's sewer system requires **improvements to accommodate future capacity**, but the planned timing of these improvements is not noted. While the City has a stormwater system, it **does not currently have a stormwater utility to fund repair and maintenance of that system**. No gaps were otherwise noted for water or stormwater. There are several new roads planned which could enhance development potential in part of the City's unincorporated UGA.

Federal Way

Federal Way's Comprehensive Plan was last updated in 2015. Most of Federal Way's water and sewer service is provided by the Lakehaven Utility District. Small parts of the City receive water from Tacoma Public Utilities, Highline Water District, and the City of Milton. For sewer, small areas are served by the Midway Sewer District, Metro/King County, Pierce County, and the City of Tacoma. Lakehaven Utility District has sufficient resources to fund its capital projects along with current operations.

Milton

The majority of Milton's potable water supply is provided through **six City groundwater wells** located in the City's service area. Existing interties with the Lakehaven Utility District and an agreement with the Mt. View-Edgewood Water Company can provide fire flow.

Milton has **sufficient water rights** available to serve future projected populations, however **aquifer constraints** prevent the City from being able to provide that volume. The City's wells are operated at a volume output level at or near aquifer capacity production limits. Projected maximum day demands are **likely to exceed well and aquifer capacity by 2022**. The City will need to develop additional source capacity before this time. Coordination with Lakehaven Utility District and the Mt. View-Edgewood Water Company may help augment supply if needed.

The majority of Milton's sanitary sewer service is provided by Pierce County Public Works and Utilities, with small areas served by the Lakehaven Utility District, and septic systems. Over the next 20 years, it is anticipated that **improvements will be needed to the conveyance system in order to meet demand**, especially in the Hylebos area. Milton wastewater is treated at the Tacoma Central Wastewater Treatment Plant treats wastewater from

the City. Capacity at this facility is adequate to manage future needs, however commercial and industrial uses would be required to comply with industrial pretreatment and prohibited discharges regulations of the city's two wastewater utilities.

The City of Milton operates a small municipal separated storm sewer system. The City **routinely experiences flooding** during high flow events, most notably in the Hylebos Creek area. To address this, the City has purchased flood prone properties, and has identified projects to improve aging facilities and open channels that are better managed in pipes.

Pacific

Pacific's Comprehensive Plan was last updated in 2015, and its capital facilities element was based on information from the 2010 Sanitary Sewer Plan and the 2009 Water System Plan. The capital facilities element indicates that the City's potable water distribution system consists of **aging and undersized asbestos cement pipe**, buried at shallow levels now considered nonstandard; these conditions are slowly being remedied by the City. Sanitary sewer service and treatment is provided by King County Metro downstream from the main pump stations. The element notes that **industrial and commercial users may require higher levels of service** than currently provided. The element notes that **new sanitary facilities will be needed** to provide service to several infill sub-basins in areas along SR 167 and Valley West Highway

The City of Pacific's storm drainage system is challenged by topography, a high ground water table, and low soil permeability, which have created **drainage issues**, especially in the winter months. To avoid burdening City infrastructure, the City requires new development to incorporate low impact development approaches, on-site storm water management, and other drainage management techniques.

APPENDIX B. INFRASTRUCTURE TIERING

This framework provides a system of assigning tiers to sites for each essential infrastructure category. (Water, sewer, stormwater, and transportation.). The intent is to filter buildable sites to identify only those at risk of not being developable during the planning period due to infrastructure gaps. Once identified, cities should review the sites to determine which ones should be removed from the buildable land supply and document their rationale.

For commercial and industrial sites, including larger multifamily developments, the bar for infrastructure capacity can be higher. **Appendix C** offers a more technical assessment, in the event that this process is not sufficient.

Infrastructure Tiers

A. Infrastructure exists and has the capacity to accommodate planned development.
    - Requires affirmation from local public works departments and utility districts, as applicable

B. Infrastructure does not currently exist, but plans to add necessary improvements exist and funding is identified.
    - Requires affirmation from local public works departments and utility districts, as applicable
    - Requires affirmation from finance departments

C. Infrastructure does not currently exist, but plans to add necessary improvements exist. Funding is uncertain.

D. Infrastructure does not currently exist. No plans have been adopted to add necessary improvements.

Interpreting Tiers

If a site ranks A-B in all categories, it is likely to be available for development within the planning period. If a site has any C rankings, the city should evaluate whether the funding uncertainties are likely to be resolved during the planning period. If they are not, an infrastructure gap could exist. If funding is not likely to be resolved for an extended period, capacity assumptions for the site should reflect development delays. If a site is ranked D in any category, an infrastructure gap is likely. Unless there are likely scenarios under which the gap could be resolved during the planning period, sites with D rankings should be removed from the developable land supply.

APPENDIX C. ADVANCED INFRASTRUCTURE TIERS

Some uses, such as large industrial and commercial developments, will have more substantial infrastructure requirements than others. When a potential infrastructure gap has been identified in these cases, a more detailed review may be warranted. This section describes suggested standards for major industrial and commercial development. If a site ranks A-B in all categories, it is likely to be available for development within the planning period.

If a site is ranked C in any category, the City should evaluate whether a gap exists that will limit development during the planning period. This evaluation process can begin with identifying any existing plans and funding to address the gap, as outlined in **Appendix B.**

Sewer Tier Standards

- **A:** ≥ 8" main located adjacent to or stubbed to site or within ~200 ft of site with depth allowing gravity flow. No downstream pipe/treatment capacity issues.
- **B:** ≥ 8" main located within ~1,000 ft, with no downstream deficiencies. Private lift station may be needed.
- **C:** No nearby pipe and/or significant lift station and force main needed. Downstream deficiencies may be present.

Water Tier Standards

- **A:** ≥ 12" main adjacent or within ~200 ft, preferred loop system existing. No low-pressure issues.
- **B:** ≥ 8" adjacent, or ≥ 12" main within ~1,000 ft. No pump station or pressure/treatment deficiencies.
- **C:** No nearby pipe. System deficiencies present.

Stormwater Tier Standards

- **A:** ≥ 12" public main adjacent or within ~200 ft, or ability to discharge to managed surface waters or on-site infiltration. No capacity issues.
- **B:** ≥ 12" main within ~500 ft; possible outfall to nearby regulated surface channel or wetland, or limited on-site infiltration capacity.
- **C:** No adjacent public storm, no available discharge point to surface water, or no on-site infiltration capacity.

Transportation Tier Standards

Transportation infrastructure is evaluated based on two metrics: local access and system mobility.

Local Access

- **GOOD:** Property has direct connection and no off-site improvements or minor frontage improvements are necessary.
- **POOR:** Property does not have a direct connection and/or significant improvements are necessary to gain local access.

Transportation System Mobility

- **GOOD:** Mobility of adjacent system has a PM peak two-hour volume-to-capacity ratio (v/c) ≤ 0.99 (an approximate Level of Service [LOS] F or better).
- **POOR:** Mobility of adjacent system has a PM peak hour v/c ratio > 0.99 (an approximate LOS F or worse).

Combined Transportation Grade

- **A:** Highway Access and Transportation System Mobility are good.
- **B:** Highway Access is good and Transportation System Mobility is poor or highway access is poor and transportation system mobility is good.
- **C:** Highway Access and Transportation System Mobility are poor.

Appendix H: Documentation of Market Factor and Infrastructure Assumptions

Pierce County Buildable Lands Report

A Monitoring and Evaluation Analysis of Urban Growth and Development Capacity for Pierce County and its Cities and Towns

Pierce County Planning & Public Works

Fourth Edition
Revised Version

November 2022

REVISED VERSION NOTES

INTRODUCTION

The Pierce County 2021 Buildable Lands Report (2021 Report) was published by Pierce County on September 30, 2021, to meet obligations for the Buildable Lands Grant provided by the Washington State Department of Commerce.

The County had originally planned to only provide a supplemental to the 2021 Report with the detailed Consistency Evaluation and update to Pierce County's capacity consistent with new zoning. However, as the document was being updated, necessary corrections were discovered in the Excel files with the calculation tables and summary tables.

There are six major revisions to the document:

- Detailed consistency evaluation information
- Update to Pierce County's capacity to account for new zoning
- Update to 2044 Growth Targets to reflect the most recent version (ongoing until the targets are adopted)
- Correction to underutilized capacity shown in capacity summary tables to account for displaced housing units and jobs
- Correction to vacant capacity shown in employment capacity summary tables for jurisdictions with more than five zones (except Tacoma). All other zones were summarizing the critical area acreage rather than the employment capacity
- Corrections to Eatonville, Lakewood, Orting, Puyallup, and Steilacoom's capacity to address formulaic errors in capacity calculation tables

The scope of the revised version is limited to updates and corrections outlined above, it was not an opportunity to make new changes to the inventory or assumptions.

UPDATES

Consistency Evaluation

The updated version includes summarized data to complete consistency evaluations between the:

- Planned or assumed densities and observed development trends (new tables 10-13)
- Housing production and adopted growth targets (new table 14)
- Capacity and adopted growth targets (new table 15)

This information should be used in comprehensive plan updates to determine any reasonable measures that need to be taken to correct the inconsistencies shown in the consistency evaluation tables.

Pierce County Capacity

At the time the 2021 Report was developed, the intent was to provide a supplemental update to the unincorporated Pierce County section following the implementation of the County's Community Plan Updates, which included substantial zoning changes, and the 2021 Comprehensive Plan Amendments, which were effective on the same date (October 1, 2021). The analysis was not completed simultaneously with the 2021 Buildable Lands Report because the updates to the Frederickson, Mid-County, Parkland-Spanaway-Midland, and South Hill Community Plans were under appeal at the time.

The Community Plan Updates resulted in zoning changes to 7,389.8 urban acres, eliminated six urban zones, and created four new urban zones. The 2021 Comprehensive Plan Amendments resulted in zoning changes to 10 urban acres. The inventory was updated to account for the new assumptions for the new zones. Since the new zones do not have development trends to help establish assumptions, a combination of research was used: reviewing trends for similar zones within Pierce County jurisdictions, and considering the development regulations, active applications for development under the new zoning, and pre-application meeting materials for development inquiries under the new zoning.

This version of the report also includes a breakdown for the two regional geographies under VISION 2050's Regional Growth Strategy that apply to unincorporated Pierce County: Unincorporated Urban and High-Capacity Transit Communities (Mid-County urban, Parkland-Spanaway-Midland, and South Hill Community Plan areas).

2044 Growth Targets

The 2044 growth targets were not fully developed at the time the 2021 Buildable Lands Report was published. This version provides the most recent draft targets and will be updated in subsequent drafts as the targets move through the adoption process. When the targets are adopted, the final version of this report will be updated and published accordingly. References to the 2030 targets were retained for comparison to past housing production rates but were removed when comparing to the capacity.

CORRECTIONS

During the update to the Pierce County section, formulaic errors were found in summary tables for the capacity analysis that affected all jurisdictions. During the update to correct the summary tables, formulaic errors in four jurisdictions' capacity calculation tables were found and corrected, affecting the capacity totals for six zones. New versions of the calculation spreadsheets were created to avoid further errors. The updates and corrections are outlined below.

Underutilized Capacity/Displaced Housing Units and Jobs

Every jurisdiction's capacity summary tables in the September 30, 2021 Buildable Lands Report were displaying the incorrect totals for Underutilized capacity. The formula for summarizing the Underutilized capacity totals was pulling from a field that did not reduce the capacity based on existing units and jobs on Underutilized land. This version displays the correct totals for the Underutilized capacity. The correction affects tables 8 and 9 for each jurisdiction and tables 11 through 13 in the Countywide section.

Vacant Employment Capacity

The employment capacity summary tables for jurisdictions with more than five zones were displaying the critical area acreage deduction rather than the vacant land employment capacity due to a formula error. The error affected zones after the first five zones listed in the employment capacity summary table. All affected zones and the resulting changes are listed in the Notes tab of the updated Excel workbook.

The following jurisdictions were affected, with the number of affected zones listed in parentheses: Bonney Lake (5), Buckley (4), DuPont (7), Eatonville (3), Edgewood (5), Fife (5), Fircrest (3), Gig Harbor (12), Lakewood (16), Milton (1), Orting (1), Puyallup (18), Ruston (1), Steilacoom (2), Sumner (11), University Place (8), and Pierce County's previous capacity (16). The City of Tacoma had previously been corrected and was not impacted by the error in the September 30, 2021, report.

Most jurisdiction's totals showed a higher capacity than previously displayed in the summary tables. The following jurisdictions and zones have a lower capacity than previously displayed, with the deficit shown in parentheses: DuPont R-4 (-1) and R-5 (-28) with an overall change of +74 jobs for the city, Gig Harbor R-1 (-331) and R-2 (-421) with an overall change of -333 jobs for the city.

The actual capacities shown in the calculation tables for these zones have not changed, just the summary table was displaying an incorrect total that has been corrected.

Jurisdiction-Specific Corrections

The capacity tables of four jurisdictions have been corrected to display the actual capacity and the capacity summary table of one jurisdiction was further corrected. The following formulaic errors were found in eight zones, resulting in the noted change:

- **Eatonville MU zone** included an assumption for non-residential uses within a single-family zone; however, the MU zone is a mixed-use zone with a split between residential and commercial, so that assumption should not be applicable. The 5% non-residential assumption was corrected to 0%, resulting in a shift of jobs (-17) to housing units (+8).
- **Fircrest GC zone** was not included in the calculation tables and had pipeline development. Including the GC zone pipeline units increased capacity by 28 housing units.
- **Lakewood** formulas for four zones were pulling vacant and underutilized acreages for a different zone. The:
  - **ARC zone** was pulling the acreage from the AC2 zone, which was omitted from the analysis after determining the zone is not developable. The correction resulted in 127 housing units and zero jobs using the accurate ARC acreage, which is 127 more housing units than previously displayed and no change to employment capacity.
  - **C1 zone** was pulling the acreage from the ARC zone. The correction resulted in -12 housing units and 271 jobs using the accurate C1 acreage, which is 12 less housing units and 65 more jobs than previously displayed.

  - **C2 zone** was pulling the acreage from the C1 zone. The correction resulted in -2 housing units and 1,167 jobs using the accurate C2 acreage, which is 2 less housing units and 1,016 more jobs than previously displayed.
  - **C3 zone** was pulling the acreage from the C2 zone. The correction resulted in zero housing units and jobs using the accurate acreage, which is 1,969 less jobs than previously displayed and no change to housing unit capacity.
- **Orting PF zone** was pulling vacant and underutilized acreages from the OS zone, which has no developable land. The correction resulted in zero housing units and 615 jobs, which is 615 more jobs than previously displayed and no change to housing unit capacity.
- **Puyallup RMX zone** included an assumption for non-residential uses within a single-family zone; however, the MU zone is a mixed-use zone with a split between residential and commercial, so that assumption should not be applicable. The 3% non-residential assumption was corrected to 0%, resulting in a shift of jobs (-5) to housing units (+3).
- **Steilacoom MPD zone** was not included in the capacity summary totals and was showing displaced jobs on a property that is abandoned. The housing capacity summary total line did not include 226 housing units noted in the MPD Underutilized line. The MPD zone has no employment capacity, so the employment capacity summary table was not affected. The MPD Underutilized category was showing -7 in displaced jobs, which was corrected to zero since the property it was associated with is abandoned.
- **Tacoma**
  - **S2 and S11 zones** were not included in the calculation tables and had pipeline development. Including the S2 and S11 zone pipeline units increased capacity by 2 housing units (1 in each zone).
  - **R4 zone** was including acreage from the R4L zone. The correction resulted in 1,141 housing units and 30 jobs, which is 2,837 less housing units and 45 less jobs than previously displayed.

The corrected totals include the corrections noted in the previous section.

EXECUTIVE SUMMARY

The Washington State Growth Management Act (RCW 36.70A), enacted in 1990, requires all counties with a population of 50,000 or more with a high rate of population growth to designate urban growth areas (UGAs). The Act requires that these UGAs be of sufficient size to accommodate the anticipated population growth during the 20-year period following the adoption of the UGA. In accordance with the Growth Management Act (GMA), the Pierce County Council has adopted UGAs for Pierce County and its incorporated cities and towns.

In 1997, GMA was amended to require certain counties and their cities and towns to monitor development activities and conduct a coordinated housing unit and employment capacity analysis for each of the jurisdictions. Pierce County and its cities and towns are required by state law to participate in this "Buildable Lands" monitoring program. Since 1997, Pierce County and its 23 cities and towns have worked collaboratively in a program to collect annual development permitting data, inventory developable land, and enhance information relating to wetlands and steep slopes.

Commonly referred to as the Buildable Lands Program, this collaborative program is aimed at satisfying the GMA requirements and improving accuracy in the information used to determine the capacity of Pierce County's UGA. Pierce County published its first consolidated residential/employment capacity analysis in August 2002, second in September 2007, and third in June 2014. This 2021 Report represents the fourth published documentation of Pierce County and its cities and towns ability to accommodate future growth and is intended for use in the 2024 GMA Comprehensive Plan periodic update.

The Buildable Lands Report details the methodology, assumptions, and calculations for identifying the housing and employment capacity within the UGA. An important piece of the Buildable Lands Program is using the information in the Report to compare observed densities to the planned densities and growth assumptions, capacity to the growth targets, and housing production rates to the growth targets. This work is completed in a Consistency Evaluation, discussed in Section III of this Report.

Overall, there is adequate housing and employment capacity within the countywide UGA to accommodate the 20-year growth targets through 2044. There are no significant inconsistencies between the individual jurisdiction capacities and the 2044 growth targets that would warrant reasonable measures.

In addition to the capacity analysis, a 2017 update to the Buildable Lands requirements required an analysis of housing production compared to the growth targets. The intent is to monitor actual development in comparison to the number of homes needed to be built in the timeframe to identify any issues with implementing comprehensive plans. For example, a zone may have the capacity to absorb the growth targets, but the market is not producing those units.

The updated Buildable Lands Guidance from the Washington State Department of Commerce provides examples of how to address this type of inconsistency. Progress in aligning housing production with the growth targets should be monitored for jurisdictions with low housing production rates.

I. Overview

- General description and historical perspective of State and County legislation addressing development of the program

II. Methodology

- Information and data collected through the monitoring procedures.
- Inventory categories and process
- Methodology applied to calculate a residential and employment capacity.
- Factors and assumptions used in the calculations

III. Summary of Observations

  - Summary of development trends
  - Summary of assumptions used in analysis
  - Capacity results
  - Consistency evaluation

IV. Appendices

- Detailed development trend summaries, capacity calculations, and inventory maps for each jurisidiction
- Technical description of inventory model/process
- Employment density survey

SECTION I: OVERVIEW

INTRODUCTION

Pierce County and its 23 cities and towns began developing the Buildable Lands Program in 1997 in response to amendments to the Washington State Growth Management Act (GMA) enacted that same year. The program seeks to establish a coordinated system for collecting and monitoring data regarding growth and development occurring in Pierce County and its cities and towns.

The program primarily focuses on evaluating two aspects of growth management – accommodation of housing growth targets during the 20-year planning period and the availability of commercial and industrial land for employment purposes. The program is aimed at ensuring greater consistency between local planning efforts under GMA and the growth and development patterns actually occurring in the urban growth area (UGA).

History

The Washington State Legislature enacted the GMA in 1990. The GMA required local governments to develop rational policies to manage growth in the State and all urban counties and their cities and towns were required to plan under the GMA. This planning must address issues in land use, transportation, housing, capital facilities, utilities, and rural lands, and must ensure that the forecasted growth in population for the next 20 years can be accommodated in an efficient manner. An essential component of planning under the GMA is the designation of UGAs.

Each county required to plan under the GMA must designate a UGA within which urban growth shall be encouraged and outside of which urban growth shall be prohibited. These UGAs are to be based upon the projected 20-year population growth forecast for the county and its cities and towns as generated by the Washington State Office of Financial Management. To properly size UGAs such that this population could be accommodated, each jurisdiction planning under the GMA conducted a population capacity analysis. These capacity analyses sought to determine how much population could be accommodated in each area based upon availability of developable land.

In designating the UGA, the Pierce County Council worked closely with the individual cities and towns to ensure that the UGA was consistent with local comprehensive plans, urban population forecasts, and population capacity analyses. As a policy choice, each jurisdiction conducted its own independent residential capacity analysis through their GMA comprehensive plan. The County's analysis encompassed the unincorporated lands associated with the UGA and the cities and towns analyses encompassed the lands within their respective municipal boundaries. At this time, satellite cities and towns analyses also included the unincorporated lands within their respective urban growth areas. The methods, definitions, and assumptions incorporated in the analyses differed by jurisdiction and were not uniform or coordinated.

The jurisdictional variations in capacity analyses and the lack of specificity in the GMA led to statewide debate on the subject, with much of the debate focused on determining whether there were errors in the assumptions used by local governments in sizing their UGAs. In 1997, this debate resulted in the

GMA being amended through Senate Bill 6094, commonly referred to as the "Buildable Lands" amendment. The amendment requires certain counties and their cities and towns to monitor development activities and conduct a coordinated housing unit and employment capacity analysis for each of the jurisdictions. Pierce County and its cities and towns are required by state law to participate in this "Buildable Lands" monitoring program.

In July of 2001, the Pierce County Regional Council responded to Senate Bill 6094 by recommending the adoption of proposed amendments to Pierce County's Countywide Planning Policies (CPPs) that incorporated monitoring and evaluation policies related to Buildable Lands. The Buildable Lands legislation was most recently amended in 2017 to include an amended timeframe, a requirement to consider regulations affecting the achieved densities, and a requirement to monitor housing production rates in comparison to adopted growth targets or projections.

LOCAL AND REGIONAL FRAMEWORK

While the Growth Management Act (GMA) was silent on the details of urban density, sizing, and analyzing the sufficiency of urban growth areas, local planning policies and decisions by the Central Puget Sound Growth Management Hearings Board (GMHB) have established specific guidance on some of these issues. Additional guidance is provided through a document entitled "Buildable Lands Program Guidelines (2018)," published by the Washington State Department of Commerce. The Pierce County Comprehensive Plan also provides supporting policies specific to Buildable Lands.

Pierce County Countywide Planning Policies

The Pierce County Countywide Planning Policies are written statements that establish a countywide framework for the development of growth management guidelines adopted by the County and its cities and towns. The framework is intended to create consistency among all jurisdictions in addressing certain growth management issues. Pierce County adopted its CPPs on June 30, 1992.

The CPPs are currently being updated and include a section on Buildable Lands based on the original policies currently located in the "Urban Growth Areas, Promotion of Contiguous and Orderly Development and Provision of Urban Services to Such Development" chapter. Other related policies in the draft updated Urban Growth Area and Growth Targets sections address the sizing of the urban growth area, the allocation of targets, and appropriate average density within the UGA.

Per the CPPs and consistent with GMA, urban growth areas must be of sufficient size to accommodate the urban growth projected to occur over the succeeding 20-year planning period. In determining the appropriate size of the urban growth area, various components must be taken into account, such as critical areas, open space, and a market factor (i.e., maintaining a supply of developable land sufficient to allow market forces to operate).

The CPPs direct the County and cities and towns to plan for efficient land use patterns while conserving natural resources. The policies further define efficient land use as development with at least an average net density of four units per acre. Associated policies support the need for infill and compact development in achieving an efficient land use pattern. The CPPs direct the County and cities and towns to adopt plans that encourage concentrated development within the urban growth area which will accommodate the 20-year projected population and employment growth.

Housing and Employment Targets

Evaluating whether sufficient capacity exists in Pierce County's UGAs to accommodate the 20-year population target is one of the central components of the Buildable Lands Program. Adopted housing and employment targets are used in evaluating the success of growth management efforts. The Pierce County Council adopted the 2044 housing and employment targets through Pierce County Ordinance No. 2022-46s.

SECTION II: METHODOLOGY

DEVELOPMENT DATA

The development data provides information in three key areas:

1. Reveals if the urban growth area is developing at urban densities.
2. Assesses the integrity of assumptions incorporated in the capacity analysis.
3. Guides refinement of the build-out assumptions in the capacity analysis.

While in theory the use of development trend information in future capacity analyses is a valid measure and required by the "Buildable Lands" legislation, there could be some potential problems with doing this. Many jurisdictions have not experienced an amount or range of development necessary to establish a statistically valid trend. Accordingly, use of such data may not truly represent how development will occur in future years. In addition, a certain amount of "new" development being tracked in each jurisdiction is vested under older regulations or previous zoning that is no longer in effect. This vested development may be built to standards different than that occurring under the current regulations and may skew the trend information. These, among other potential problems, should be considered in reviewing the development trend information.

Annual Reporting

Jurisdictions are required to submit residential building permits, non-residential building permits, and platting activity. They must submit details of the permit data, including the parcel number, plan designation, zoning district, parcel size, and site address. For residential development they must also include the permitted units or lots, area used to calculate permitted number of units, and, if applicable to density calculations, the number of acres with environmental constraints, roads, and other land uses. For commercial development they must also include the total building size. Data on 100 percent of development activity occurring in each jurisdiction is sought. However, if a jurisdiction does not submit complete information for an individual project, that project is not incorporated in the reported information. The density information should not be compared among different jurisdictions since density calculations from the developments reflect locally adopted regulations.

Residential Building Permits	Residential Platting Activity	Commercial Building Permits
• Multifamily permits show the observed multifamily project density for each zone. • Single-family permit reporting is optional and not used to determine observed density. • Multifamily permits are used in conjunction with the residential platting activity to determine how much land is used for residential development in each zone.	• Used to determine the observed gross and net single-family project density for each zone. • Indicates how much land is used for non-residential purposes, (critical areas, roads, and other uses). • Used in conjunction with the multifamily building permits to determine how much land is used for residential development in each zone.	• Used to determine the amount of land consumed by commercial and industrial activity in each zone. • Indicates how much land is used for non-residential uses in residential zones. • Limitations: disconnect between commercial permits and available employment statistics.

BUILDABLE LANDS INVENTORY

Conducting an inventory of buildable lands, while not a complete representation of the "buildable land" in the county, is essential in the housing and employment capacity analyses and determining how much land is available and suitable for development. Accordingly, the Buildable Lands Program establishes a standard methodology to be used by all jurisdictions, including standard definitions and procedures to ensure reasonable accuracy and consistency. The inventory in this report represents the status of property as of January 2020 to align with Census data. There are six categories of land identified in the Buildable Lands inventory:

- Vacant (Subdividable)
- Vacant (Single Unit)
- Underutilized
- Pipeline
- Built Out
- Undevelopable

Vacant and underutilized lands are identified through a Geographic Information System (GIS) model using the assumptions and existing conditions as inputs. The GIS model process is outlined in Appendix B: Buildable Lands Inventory Process and the initial categorization of Assessor-Treasurer (ATR) land use descriptions is shown in Appendix Table 1 in Appendix B: Buildable Lands Inventory Process.

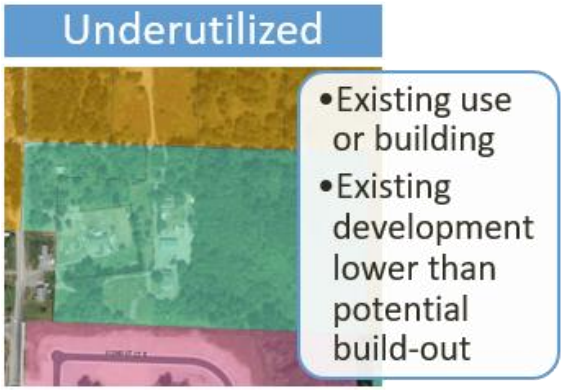
While the model is used to initially sort and categorize the parcels, the results are reviewed and refined by the applicable local jurisdictions to further improve the accuracy of the inventory by taking advantage of local knowledge, field visits, and the review of digital orthographic photography. The inventory provides the underlying basis for the housing and employment capacity analyses but is not a representation of the "buildable land" with capacity for development at a parcel level.

Four of the six inventory categories are identified as having additional housing or employment capacity: Vacant, Vacant (Single Unit), Underutilized, and Pipeline.

Vacant Land

Vacant lands include parcels without an established structure or land use activity, excluding those enrolled in a current use tax program. Vacant properties that are identified as being enrolled in a current use tax program are included in the Underutilized inventory because of the fiscal implications that are associated with developing those lands. Vacant parcels are categorized as either Vacant or Vacant Single Unit. Vacant parcels owned by a government entity or special district are flagged for local review.

- Vacant represents parcels that are assumed can be further subdivided and can accommodate more than one housing unit. These parcels are included in the capacity calculations where further assumptions are applied.



- Vacant Single Unit represents an individual building lot that is assumed to accommodate only one housing unit. These parcels are separated from the "acreage" capacity calculations and added in as one unit per parcel to the final capacity.

Underutilized Land

Underutilized lands include parcels that have an existing structure(s) or land use activity and can accommodate additional housing units or jobs. These lands include parcels in which excess space is available to build a new structure(s), or it is assumed that an existing structure(s) will be demolished and replaced with a larger structure or more structures.

Not all parcels that can theoretically accommodate additional growth are categorized as Underutilized. A specific ratio between the existing housing units or estimated jobs to the calculated assumed future build-out must be met. The ratio is different between housing units and jobs.

Existing Residential Use

Parcels with an existing residential use may be categorized as Underutilized if it meets one of the following:

1. **Residential or mixed-use zoning classification:**
   - The ATR use code is single-family, mobile home, multifamily, or mobile home park.
     - For existing single-family or mobile home units, the improvement value is less than $500,000.
     - For multifamily and mobile home parks, the improvement value is less than $1,500,000.
   - The ratio of assumed housing build-out to existing housing units is greater than or equal to 2.5.
2. **Commercial/industrial zoning classifications that prohibit residential units:**
   - An existing single-family housing unit, excluding parcels that are within platted subdivisions.

Calculation of Existing-to-Build-Out Housing Density Ratio

1. Determine the existing net housing units per acre for each parcel using ATR data for existing buildings/units.
2. Calculate the assumed housing units per acre using the established density assumptions (listed in the assumptions section for each jurisdiction).
3. Divide the assumed build-out density by the existing density (this is the existing density to build-out ratio).
4. If the existing housing unit to build-out ratio is 2.5 or greater, the property is categorized as Underutilized. If the build-out ratio is less than 2.5, the property is assumed not to have additional housing capacity and is identified as Built Out.

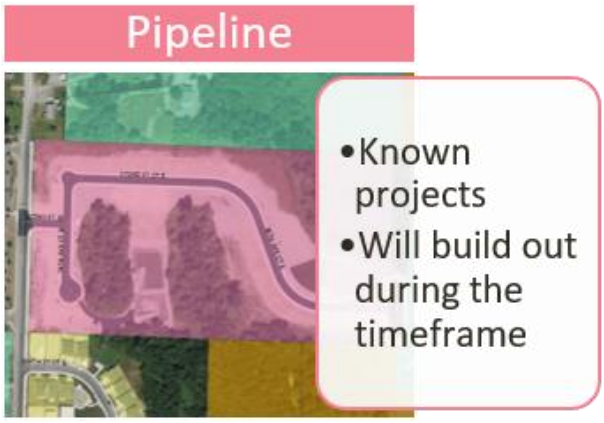
Existing Commercial or Industrial Use

Parcels with an existing commercial or industrial use may be categorized as Underutilized if it meets the following:

Parcels within commercial, industrial, or mixed-use zoning classifications:

- The ATR use code is non-residential.
- The parcel has an improvement value less than $1,500,000.
- The ratio of assumed future job build-out to estimated existing jobs is greater than or equal to 5.

Calculation of Existing-to-Build-Out Employment Density Ratio

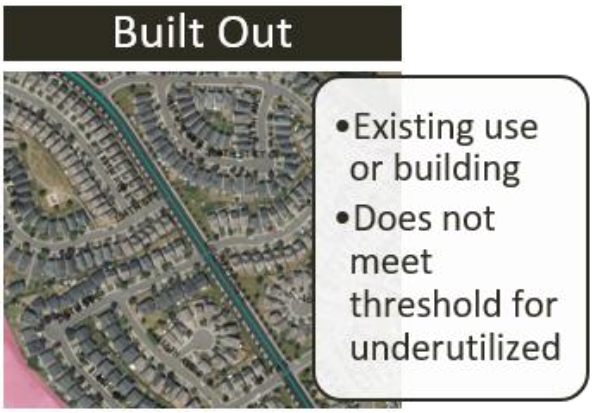


1. Determine the existing employment density for each parcel by dividing the square footage of the existing building(s) by the industry standard square footage assumption to estimate the existing number of employees using ATR data for existing building square footage.
2. Calculate the assumed future employment build-out for the parcel by multiplying the gross acreage of the parcel by the assumed employment density.
3. The assumed future employment build-out figure is divided by the estimated existing number of jobs (this is the existing employment to build-out ratio).
4. If the existing employment to assumed build-out ratio is 5 or greater, the property is categorized as Underutilized. If the build-out ratio is less than 5, the property is assumed not to have additional employment capacity and is counted as Built Out in the inventory.

Pipeline

For ease of use, the inventory categorizes pipeline projects and known development as Pipeline. Single-family residences that have been built or are planned to be built within the timeframe are captured in Vacant Single Unit category, not the Pipeline category.

Pipeline Projects



Projects that are currently in the "pipeline" may be counted separately from the vacant and underutilized land. Pipeline projects are those with an active development application and a known number of units or job estimate. The applicable parcels are identified as Pipeline in the inventory and the number of units applied for are counted toward the capacity to represent a more realistic representation of build-out and units or jobs available during the planning period.

Known Development

The next 20-year period for Growth Management Act periodic updates will span from 2024 to 2044. Since we do not have the ability to know the land available for development in 2024, 2020 is used as the initial baseline for both the Buildable Lands Report and the growth target setting for internal consistency. Using the same baseline data helps jurisdictions accurately track growth targets, and 2020 aligns with a U.S. Census data year, which helps with demographic data comparison in comprehensive planning.

Recognizing that parcels will be developed between 2020 and 2024, the analysis categorizes the parcels associated with these projects as Pipeline since it is known that they will be part of the housing inventory available during this timeframe.

Built Out

Parcels with existing uses that are categorized as Built Out are removed from the capacity calculations outright. Built Out parcels are those that did not meet the definition of Vacant or Underutilized but are not necessarily undevelopable.

Undevelopable

Parcels with existing uses that are categorized as Undevelopable are removed from the capacity calculations outright. It is assumed that certain uses (e.g., utilities, cemeteries, drain fields, landfills, and other protected uses) will not develop further or contribute to housing or employment capacity.

CAPACITY CALCULATION METHOD

The methodology used to calculate the residential and employment capacity in this report is similar to the methodology that was utilized in the 2014 analysis.

The methodology employed for the analysis includes various factors and assumptions. Each component directly influences the estimated capacity and needs' statistics. The assumptions reflect a conservative approach; therefore, the reported estimates are not maximum capacity or full build-out estimates. The analysis is based on the total gross acreage associated with each of the buildable land categories (Vacant and Underutilized) by zoning district. The estimated residential capacity is generated through acreage deductions to account for factors identified below and the application of an average residential density.

An explanation of the calculation table process is found in Appendix A: Full Data, Calculation Tables, and Maps with the full capacity calculations.

General Factors and Assumptions

Mixed-Use Zoning

Mixed-use zoning allows residential and commercial activity on the same parcel or on separate parcels within the same zoning classification. To account for this mixture of activity in both the housing and employment capacity analyses, a percentage of zoning classification's acreage is split between the housing and employment capacity calculations. This assumption is referred to as the "residential acreage" and "non-residential acreage" in the calculation tables shown in Appendix A: Full Data, Calculation Tables, and Maps.

In some instances where a vertical mixed-use is anticipated, 100 percent of the land area is assumed as both residential and non-residential. This recognizes buildings where the first floor is commercial and the additional stories are residential. In other cases, it is assumed that a specific mixed-use zone will produce 100 percent commercial on the first floor, but only a percentage of the land in that zone will produce residential on the second and above floors. A 100 percent non-residential and smaller percent residential assumption, depending on the jurisdiction and zone, is applied to accommodate this trend. Conversely, if it is assumed that a zone will develop as 100 percent residential uses, but only a portion will include commercial on the ground or other floor(s), a 100 percent residential and smaller percent non-residential assumption is used.

Future Capital Facilities

The employment capacity for Buildable Lands per RCW 36.70A.215 is limited to land available for commercial or industrial use. While some capital facilities generate jobs, the acreage associated with anticipated/planned public capital facilities is deducted from the total gross residential and commercial/industrial acreage. Any parcels documented as future capital facilities are considered Undevelopable or Built Out in the inventory and are excluded from the capacity calculations. In some instances, local jurisdictions choose to incorporate a specific percentage of future land to deduct from the gross acreage in each zone or specific zones for future public capital facilities if the specific sites are not yet known.

Market Factor

Although individual properties may meet the criteria for Vacant and Underutilized lands, not all properties are assumed available for development during the 20-year planning period. Property owners may not pursue development due to personal use, economic/investment, constraints associated with properties on private roads, or sentimental relationship with their surrounding environment. To account for the market availability and other factors, a percent of the net acreage is deducted from the inventory. A higher percentage is typically deducted for properties categorized as Underutilized to recognize the constraints of additional development or redevelopment of those properties. In previous reports, this market factor was identified as “land unavailable for development.”

Pipeline

Parcels with associated pipeline projects or known development (referred to as Pipeline in the inventory) are not included in the gross acreage shown in the capacity calculations. The associated housing unit or employment build-out total is added to the total capacity at the end of the process.

Residential-Specific Factors and Assumptions

Residential Density

The net buildable acreage is converted to housing unit capacity through the application of assumed density in the form of dwelling units per acre. The assumptions section for each jurisdiction identifies the density for each zoning district. Individual jurisdictions established the density assumptions while considering past trends and recent regulation changes. The assumptions are based on previous reports and refined using the observed development trends.

Plat Deductions

Individual jurisdictions apply different methods to calculate the maximum number of residential lots permitted within a plat. While some calculate units with a project's gross acreage, others employ a net acreage. The plat deductions reflect the type of approach the respective jurisdiction implements. These deductions may include land reserved for roads, critical areas, parks, recreation, open space, or stormwater facilities.

Non-Residential Uses

Zoning codes permit various types of non-residential development within residential districts, such as churches and day-care centers. To account for future non-residential development, a percentage of the net residential acreage is deducted from the residential capacity and moved to the non-residential capacity. The specific percentage differs between each jurisdiction and is only applied to residential-only zones. This process differs from the mixed-use zoning assumption to recognize that it is not truly a mixed-use zone.

Vacant Single Unit

If a parcel is categorized Vacant Single Unit, the parcel acreage is not included in the gross acreage and is incorporated in the analysis as one dwelling unit, which is added to the total capacity at the end of the process.

Displaced Units

In the analysis, existing housing units located on Underutilized parcels are categorized as displaced units. The existing number of units is derived from ATR data. Not all the gross acreage is considered to be developable; accordingly, the total number of displaced units per zone is adjusted down to reflect the same percent of deductions that was applied to the gross acreage. The adjusted displaced units are deducted from the total capacity to avoid double-counting. It is important to note that this calculation process differs from previous reports that added the displaced units back into the housing need, and instead reduces those units and jobs from the capacity itself.

Commercial and Industrial-Specific Factors and Assumptions

Employment Density

The net buildable acreage totals in the calculation tables are converted to employment capacity through the application of assumed employees per gross acre. An assumption for employment density (employees per acre) is necessary to calculate the capacity of the commercial and industrial lands.

Although the Buildable Lands legislation directs the County to use the average employment densities generated through the trending period, this approach is problematic because employment statistics are not readily available and many commercial/industrial buildings/complexes may not be 100 percent occupied within the first year of completion.

The 2014 report set an assumption of 19.37 employees per acre for commercial and services and 8.25 employees per acre for industrial warehousing and manufacturing. The County contracted with ABHL and ECONorthwest using grant funding through the Washington State Department of Commerce to evaluate the employment density assumptions used in the Buildable Lands Report. The findings of their study confirmed that the assumptions were still valid for this report (see Appendix C: Employment

Density Survey). The assumptions have been adjusted to whole numbers for this report and ease of use, updating them to 20 employees per acre for commercial/mixed use zones and 9 employees per acre for industrial zones. Jurisdictions with further analysis and applicable market studies have adjusted their employment assumptions on a case-by-case basis to reflect the market conditions in those areas.

Displaced Employees

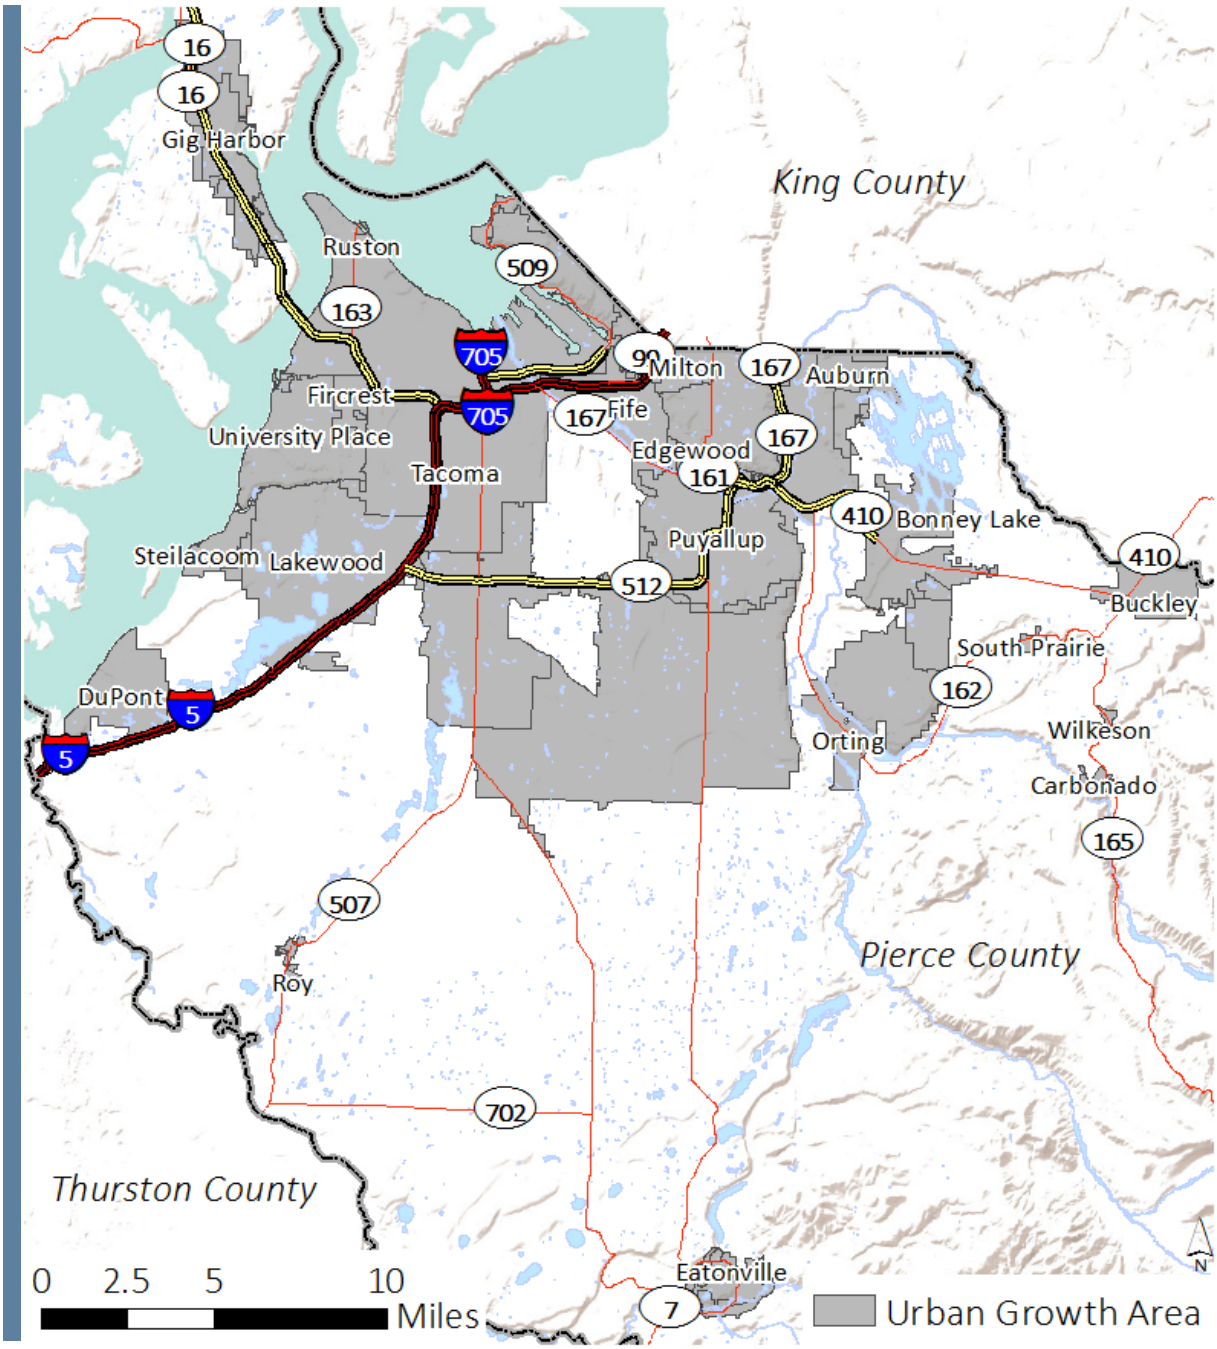
The Underutilized land category may include existing businesses that, if redeveloped as another business, are assumed to be displaced. Accordingly, the employment capacity figure is increased to account for the assumed displaced employees. To calculate the displaced employees, the locally observed density of 500 square feet per employee for commercial and 900 square feet per employee for industrial/warehousing is applied to the existing building square footage. Since not all the gross acreage is considered developable, the total number of displaced employees per zone is adjusted down to reflect the same percent of deductions that was applied to the gross acreage. The adjusted displaced job estimates are deducted from the total capacity to avoid double-counting. It is important to note that this calculation process differs from previous reports that added the displaced jobs back into the employment need, and instead reduces those units and jobs from the capacity itself.

SECTION III: SUMMARY OF OBSERVATIONS

GENERAL OVERVIEW

The Pierce County Buildable Lands Report is a milestone project in an on-going monitoring and evaluation program. This section represents a summary of the data and calculations shown in Appendix A: Full Data, Calculation Tables, and Maps, as well as supplemental data.

The development data represents urban development trends between 2013-2020. The development activity generally indicates that urban density housing is being constructed within the urban growth area. As with previous reports, it is impossible to conclude whether there is a trend that indicates an increase or decrease in observed density due to a low number of projects in various zoning districts within the cities, towns, and unincorporated urban areas. The Buildable Lands Report does not calculate capacity for the rural area, but development data is collected to compare to the rate of growth within the urban growth area. The development data summaries are not representative of all development and permitting activity that occurred during the timeframe, rather it is a summary of data that is used to determine or support the assumptions established in the capacity analysis.



The adopted 2044 housing and employment targets and assumptions applied in the housing and employment capacity analyses reflect a redirection of growth through redevelopment and achieving higher density residential projects in cities and towns based on the Puget Sound Regional Council's VISION 2050 Regional Growth Strategy.

There are 3 factors that the Buildable Lands analysis must analyze for consistency:

1. If the allowed and assumed densities are consistent with the observed densities.
2. If the housing and employment capacity is consistent with the adopted growth targets.
3. If actual housing production is consistent with the adopted housing growth target (new requirement as of 2017).

The consistency analysis is important to confirm that the assumptions are valid, the allowed zoning is building out within the range allowed, and if there is enough capacity and development occurring to meet the growth targets. If there is an indication that there is an inconsistency between these datapoints, there should be further review into the extent and cause of the inconsistency.

1 COUNTYWIDE

DEVELOPMENT TRENDS

The Buildable Lands Report also tracks the distribution of development between the urban and rural areas. Over time, the platting trend has been shifting toward creating the majority of new lots within the urban growth area, as shown in Table 1-4. However, there are still undeveloped lots within the rural area that can accommodate a housing unit, as shown in Table 1-1 below. The trends for platting and housing production in the rural area do not always match up due to the number of existing lots of record in the rural area. As those lots develop, it is expected that they will more closely align.

Housing Production

The residential data collected for the Buildable Lands Program tracks the density and other assumptions related to the capacity analysis. The Buildable Lands requirements that were amended in 2017 now require the tracking of housing production to compare to the necessary growth rates to achieve the housing targets. Due to the limitations of the permit data and lack of demolition permit data, Pierce County relies upon the Washington State Office of Financial Management (OFM) estimates to track the number of housing units built per year in each jurisdiction for the purposes of this Report. While capacity is a large factor in determining the ability to accommodate growth in the urban growth area, housing production rates are integral to achieving the housing growth target.

The following comparisons use the 2020 Census as a base year to estimate growth through 2044 to be consistent with the data used to set the targets. Since OFM data is now available through 2022, the information in the individual jurisdiction sections have been supplemented as available to contribute to the Consistency Evaluation. However, 2020 data for the unincorporated urban area is not yet available.

Table 1-1: Housing Production in Urban Growth Area vs. Rural and Resource Lands (Includes Incorporated)

		2013	2014	2015	2016	2017	2018	2019	2020	2013-2020

Source: Washington State Office of Financial Management Housing Unit Data (2020).

Table 1-2 shows the number and percent of housing units developed between 2010-2020 in comparison to the 2030 targets (Ordinance No. 2017-24s), and the remainder of growth needed between 2020-2030 to achieve the target.

While the 2030 targets have been updated to 2044 for the next planning horizon, the information shown here is to document the progress made by jurisdictions to accommodate the previous planning horizon. The most recent data is used, so it may not align with the data shown in the 2014 Buildable Lands Report.

Average Residential Density

The countywide net residential density is 6.42 dwelling units per net acre when the plat and multifamily data are combined. This average is above the required minimum of 4 units per acre for the countywide urban growth area per the Countywide Planning Policies.

Non-Residential Development

Non-residential building permits typically include commercial and industrial development; however, public use is often collected and summarized as well when the use type produces jobs. While the project acreage, building square footage, and floor-to-area ratio information is collected and summarized for the report in order to track non-residential development, the employment density is analyzed in a separate report using data other than building permits. The most recent employment

density study to support the assumptions in this Report is provided in Appendix C: Employment Density Survey.

Table 1-7: Countywide Non-Residential Development by Jurisdiction

Jurisdiction	Gross Acres	Building Square Feet (SF)	Floor-to-Area Ratio	Percent of Total Non-Residential Building SF Developed

Table 1-9 shows the observed employment growth and average annual rate between 2010-2020 in comparison to the draft 2020-2044 employment growth targets, and the increase needed for jurisdictions with an annual rate lower than the average annual rate needed to accommodate the 2020-2044 growth targets. Since comparing the employment growth and the employment target is not required for consistency, this data is provided as information only and is not analyzed in the Consistency Evaluation.

CAPACITY ANALYSIS

Inventory and Capacity Calculation Characteristics

A portion of the inventory is deducted from the gross acreage based on the assumptions identified in each jurisdiction's sub-section. Table 1-10 shows the characteristics of the initial inventory and Table 1-11 shows the amount of land that was reduced from that initial inventory to be included in the

capacity analysis, as documented in the tables and maps in Appendix A: Full Data, Calculation Tables, and Maps.

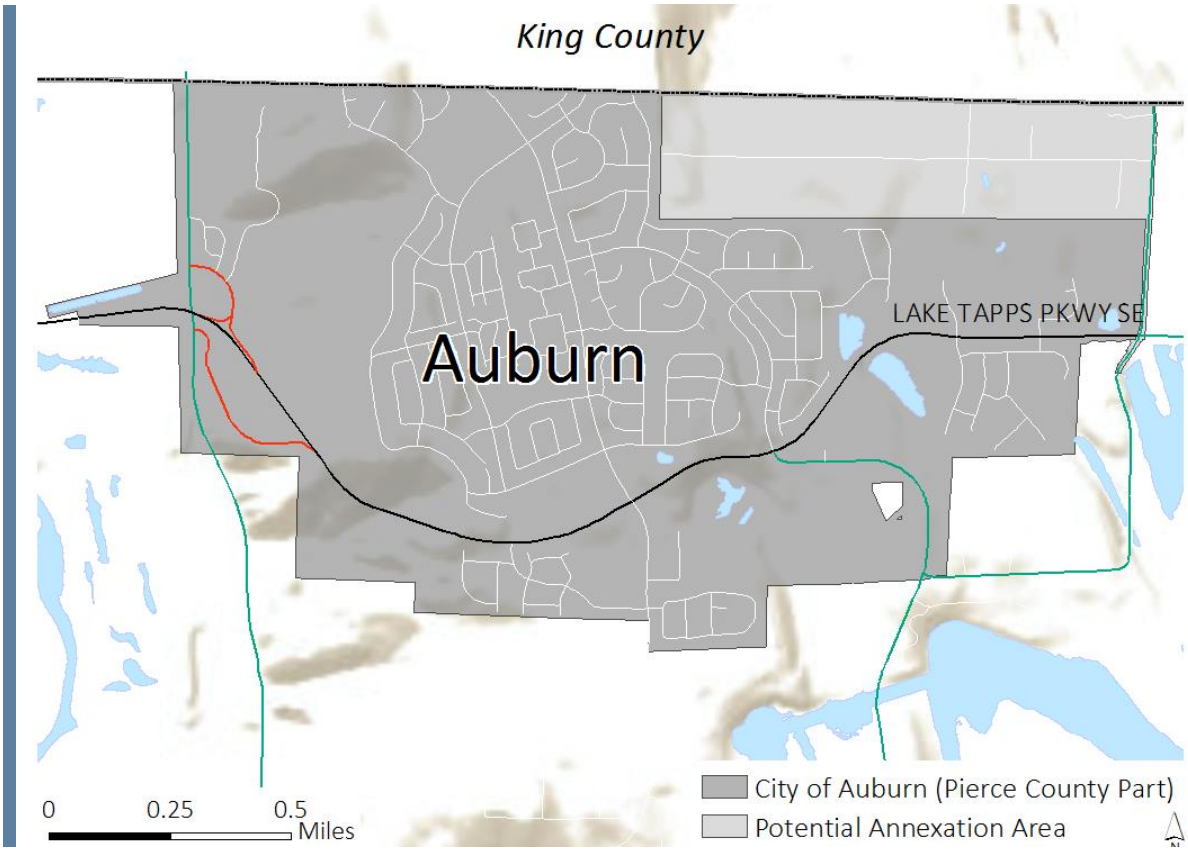
Table 1-10: Countywide Summary of Developable Land Characteristics

Characteristics/Category	Vacant	Underutilized	Vacant Single Unit	Pipeline
Total Acreage (Gross)	8,833.21	21,445.19	1,820.41	6,671.26
Average Lot Size (Gross)	2.33	1.14	0.29	8.94
Total Acreage (Net)	6,520.98	18,133.31	1,083.83	5,325.85
Average Lot Size (Net)	1.72	0.97	0.17	7.14
Percent Critical Areas	26%	15%	40%	20%

The parcel inventory is used to categorize land and the capacity calculations are intended to represent the land available for development; thus, the inventory maps alone do not represent the "buildable land" per the Buildable Lands requirements. Table 1-11 shows the overall percentage of land assumed available vs. not available as capacity in the 20-year planning period and the deductions made to account for constraints to the inventory and overall market conditions.

Table 1-11: Countywide Summary of Deductions

Deductions/Category	Vacant	Underutilized
Critical Areas	2,312.23	3,311.88
Infrastructure Gaps	1,660.82	4,997.74
Plat Deductions	442.53	1,453.41
Capital Facilities	63.28	45.39
Market Factor	772.24	4,937.76
Total Percent Reduction in Inventory Land	35%	45%
Percent of Vacant or Underutilized Land Available for Capacity	65%	55%



Housing and Employment Capacity

The housing and employment capacity totals in Table 1-12 are derived from the calculations shown in Appendix A: Full Data, Calculation Tables, and Maps. The draft 2044 growth targets are still under review and have not been adopted. An updated version of this draft report will be released when the growth targets are adopted.

Table 1-12: Countywide Capacity and DRAFT 2020-2044 Need

Jurisdiction	Housing Capacity	2020-2044 DRAFT Housing Need	Difference	Employment Capacity	2020-2044 DRAFT Employment Need	Difference
Auburn (part)	113	96	17	656	0	656

2 CITY OF AUBURN (PIERCE COUNTY PART)

The City of Auburn is primarily located within King County; however, a portion of the City is located within Pierce County. This section focuses solely on the Pierce County portion. In 2018, the City changed from a net density to gross density calculation. Most of the area within the City limits in Pierce County is associated with the Lakeland Hills South Planned Unit Development (PUD). Vested projects in the Lakeland Hills South PUD would continue to be based on the original regulations.

Table 2-1: City of Auburn Zone Classifications

Zone Classification		Zone Type[1]	Total Acres[2]
C1	Commercial	Commercial	19.6
I	Industrial	Industrial	11.7
OS	Lakeland Hills Planned Unit District	Other-Not Developable	19.8
PUD	Open Space	Mixed Use	780.8
R5	Residential 5	Residential	129.0
R7	Residential 7	Residential	0.0
TV	Terrace View District	Mixed Use	50.1

[1]For purposes of the Buildable Lands inventory and analysis; not a representation of the City zoning code.
[2]Represents parcel acreage, not zoning coverage.
Sources: City Zoning Code.

DEVELOPMENT TRENDS

This section summarizes permit data observed between **January 1, 2013 and December 31, 2018** and plat activity through December 31, 2020 that is used to monitor observed densities and update the assumptions for future development. The summaries in this section are designed to show the average statistics used to inform the report. Only data pertinent to the Buildable Lands requirements is collected, and incomplete or not-applicable data is omitted; therefore, this Report does not provide a full summary of all development within the jurisdiction. For more detailed summaries by zone/year, see Appendix A: Full Data, Calculation Tables, and Maps.

Table 2-2 shows the average residential density per zone and jurisdiction-wide and is not intended to show the total units/lots created or overall acres consumed. The results reflect the density calculation used by the jurisdiction, and only include a summary of plats and multifamily (3+ attached units) projects. Table 2-3 shows the average floor-to-area (FAR) ratio by zone and the amount of non-residential building square footage developed. The non-residential projects summarized only include new development and omit additions to existing businesses and non-building type improvements.

Table 2-2: City of Auburn 2013-2020 Residential Trends by Zone[1]

Zone	Acres	Lots/Units	Density
PUD	12.17	88	7.23
R-5	8.00	16	2.00
Total/Avg.	**20.17**	**104**	**5.16**

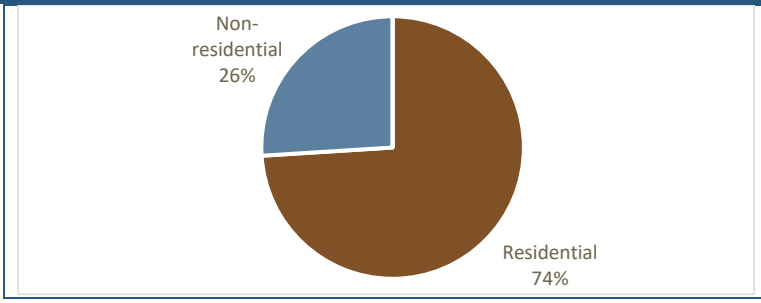

Table 2-3: City of Auburn 2013-2020 Non-residential Trends by Zone

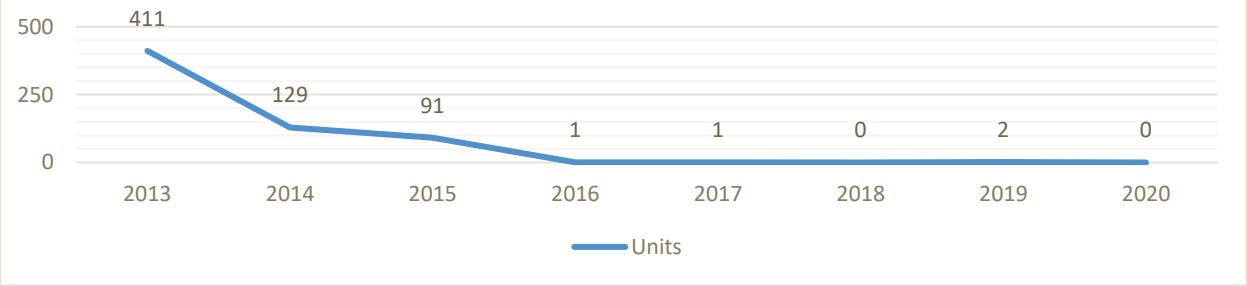
Zone	Acres	Sq. Ft.	FAR
PUD	3.90	24,377	0.14
TV	3.17	129,698	0.94
Total/Avg.	**7.07**	**154,075**	**0.50**

[1]Includes multifamily and plat data to represent the overall observed density by zone. Does not include single-family permits in order to accurately represent permitted densities; therefore, does not represent the total number of units developed in the timeframe.
Sources: City Permit Data, Pierce County Assessor-Treasurer Tax Parcels, Puget Sound Regional Council Housing Unit Permit Database.

While the non-residential development trends are informative to show the percent of land consumed for non-residential purposes (as shown in Figure 2-A), the employment densities used in the capacity assumptions are derived through employment density surveys, as documented in Appendix C: Employment Density Survey. Figure 2-A summarizes the split between residential and non-residential development between 2013-2020 by zone and the jurisdiction average. The percent split is based on the gross acres developed between 2013-2020 using the plat activity and multifamily permits for residential and non-residential permits for non-residential. The information is used to inform the percent split for mixed-use zones, as well as the percent of non-residential uses in residential-only zones.

Figure 2-A: City of Auburn Residential vs. Non-residential Development Split



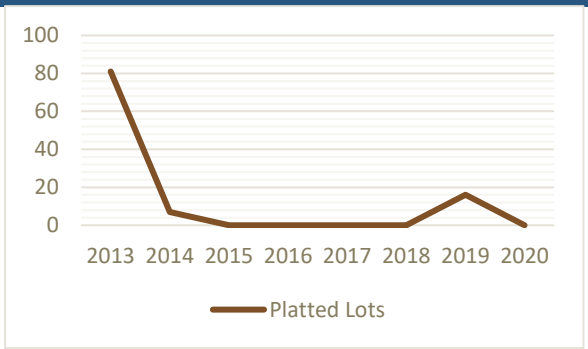
Zone	Use Type Split (Percent)[1]	
	Residential	Non-residential
PUD	76%	24%
R-5	100%	0%
TV	0%	100%
Avg.	**74%**	**26%**

[1]Does not include single-family permits in order to avoid double-counting acreage.
Sources: City Permit Data, Pierce County Assessor-Treasurer Tax Parcels, Puget Sound Regional Council Housing Unit Permit Database.

Housing Production Rate

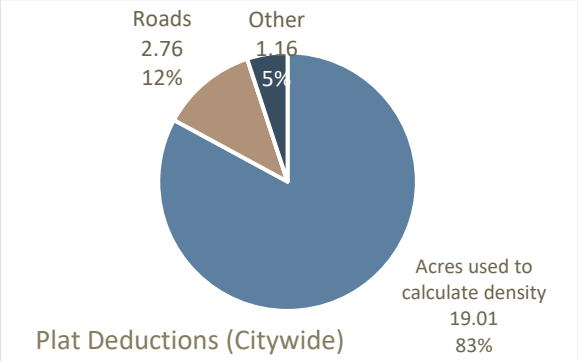
The residential data collected for the Buildable Lands Program tracks the density and other assumptions related to the capacity analysis. The Buildable Lands requirements that were amended in 2017 now require the tracking of housing production to compare to the necessary growth rates to achieve the housing targets. Due to the limitations of the permit data and lack of demolition permit data, Pierce County relies upon the Washington State Office of Financial Management estimates to track the number of housing units built per year in each jurisdiction for the purposes of this Report. The comparison of housing production and housing needs is shown in Table 1-3 (Countywide).

Figure 2-B: City of Auburn Housing Production Rates (OFM)



Source: Washington State Office of Financial Management Housing Unit Data (2020).

Platting Activity



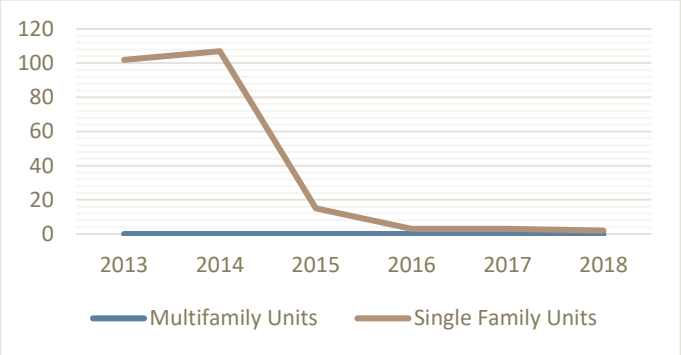
Platting activity is used to determine the achieved density for single-family residential zones and to identify the amount of land used for other purposes (whether netted out for density or applied by a regulation and affecting the achieved density). Plat data is used in conjunction with multifamily permits to determine the overall achieved density (as shown in Table 2-2).

Figure 2-C: City of Auburn Platting Trends

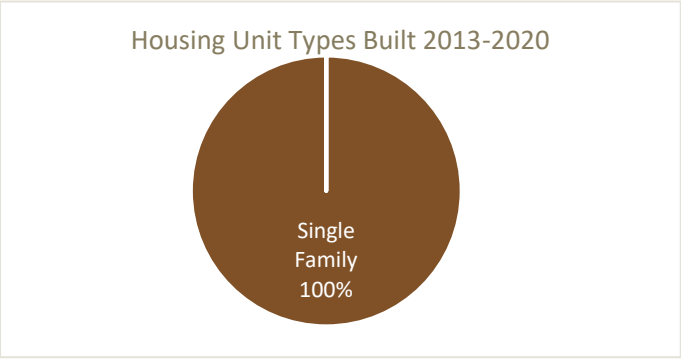
Plat Activity by Year

Year	Lots	Acres	Density (Net)
2013	81	10.80	7.50
2014	7	1.37	5.11
2015	-	-	-
2016	-	-	-
2017	-	-	-
2018	-	-	-
2019	16	8.00	2.00
2020	-	-	-
Total	**104**	**20.17**	**5.16**

Plat Deductions by Zone (Percent)



Zone	Roads	Critical Areas	Parks/Open Space	Storm -water
PUD	22.7%	0.0%	9.5%	0.0%
R-5	0.0%	0.0%	0.0%	0.0%
Avg.	**13.7%**	**0.0%**	**5.8%**	**0.0%**



Sources: City Permit Data, Pierce County Auditor Recorded Plats.

Residential Building Trends

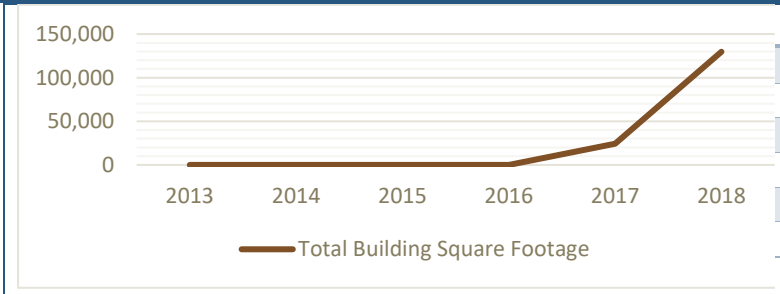
Both multifamily and single-family building permits are collected and summarized; however, single-family permit reporting is optional per the Pierce County Countywide Planning Policies and limited in use for tracking factors affecting development. The single-family permit data is useful for identifying the total number of units built and the average lot size per zone and is provided as supplemental information. The multifamily permit data is used to identify the observed density and amount of land used for residential purposes. Please note that this data differs from the data provided in Figure 2-B due to collection limitations and should not be used to represent housing production in the jurisdiction.

Figure 2-D: City of Auburn Residential Building Permit Trends

Multifamily Permits by Year

No multifamily permits were observed in the timeframe.

Single-Family Permits by Year (Optional)



Year	Units	Acres	Avg. Lot Size
2013	102	12.47	0.12
2014	107	13.30	0.12
2015	15	2.93	0.20
2016	3	0.65	0.22
2017	3	0.55	0.55
2018	2	0.74	0.37
Total	**232**	**30.63**	**0.13**

Sources: City Permit Data, Pierce County Assessor-Treasurer Tax Parcels, Puget Sound Regional Council Housing Unit Permit Database.

Non-residential Building Trends

Non-residential building permits typically include commercial and industrial development; however, public use is often collected and summarized as well when the use type produces jobs. While the project acreage, building square footage, and floor-to-area ratio information is collected and summarized for the report in order to track non-residential development, the employment density is analyzed in a separate report using data other than building permits. The most recent employment density study to support the assumptions in this Report is provided in Appendix C: Employment Density Survey.

Figure 2-E: City of Auburn Non-residential Permit Trends

Year	Acres	Bldg. SF	FAR
2013	-	-	-
2014	-	-	-
2015	-	-	-
2016	-	-	-
2017	3.90	24,377	0.25
2018	3.17	129,698	0.94
Total	**7.07**	**154,075**	**0.50**

ASSUMPTIONS

Assumptions vary by jurisdiction and zone. Table 2-4 and Table 2-5 provide a snapshot of the densities, mixed-use split, and deductions used in the inventory development and capacity calculation tables. The assumptions for each zone are shown in the assumptions column of the capacity calculation tables shown in Appendix A: Full Data, Calculation Tables, and Maps.

Table 2-4: City of Auburn Assumptions Summary

Zone	Residential		Employment		Residential Market Factor		Non-Residential Market Factor		Land for Capital Facilities
	Percent	Density	Percent	Density	Vacant	Underutilized	Vacant	Underutilized	
C1	0%	0	100%	20	0%	0%	1%	1%	1%
I	0%	0	100%	20	0%	0%	1%	1%	1%
PUD	0%	0	100%	20	0%	0%	1%	0%	1%
R-5	100%	5	0%	0	1%	1%	0%	0%	0%
R-7	100%	7	0%	0	1%	1%	0%	0%	0%
TV	Zone is Built Out – No Further Capacity								

The Vacant Single Unit size threshold listed below represents the parcel size used to determine if a vacant property is subdividable or only able to accommodate one unit. Parcels smaller than the size listed are considered Vacant Single Units unless otherwise determined by the jurisdiction during the parcel-specific review.

Table 2-5: City of Auburn Plat Deductions for Single-Family Residential Zones

Zone	Roads	Critical Areas	Parks/Open Space	Stormwater	Non-residential	Vacant Single Unit
R-5	7%	GIS	2%	0%	0%	<0.46 acres
R-7	7%	GIS	2%	0%	0%	<0.23 acres

HOUSING AND EMPLOYMENT CAPACITY

Inventory and Capacity Calculation Characteristics

A portion of the inventory is deducted from the gross acreage based on the assumptions identified in the previous section. Table 2-6 shows the characteristics of the initial inventory and Table 2-7 shows the amount of land that was reduced from that initial inventory to be included in the capacity analysis, as documented in the tables and maps in Appendix A: Full Data, Calculation Tables, and Maps.

Table 2-6: City of Auburn Summary of Inventory Characteristics

Characteristics/Category	Vacant	Underutilized	Vacant Single Unit	Pipeline
Total Acreage (Gross	27.66	28.36	4.08	0.00
Average Lot Size (Gross)	2.13	3.55	0.26	0.00
Total Acreage (Net)	21.94	17.22	3.35	0.00
Average Lot Size (Net)	1.69	2.15	0.21	0.00
Percent Critical Areas	21%	39%	18%	0%

The parcel inventory is used to categorize land and the capacity calculations are intended to represent the land available for development; thus, the inventory maps alone do not represent the "buildable land" per the Buildable Lands requirements. Table 2-7 shows the overall percentage of land assumed available as capacity in the 20-year planning period and the deductions made to account for constraints to the inventory and overall market conditions.

Table 2-7: City of Auburn Summary of Deductions

Deductions/Category	Vacant	Underutilized
Critical Areas	5.72	11.15
Plat Deductions	0.26	1.77
Capital Facilities	0.25	0.09
Market Factor	0.28	0.27
Total Percent Reduction in Inventory Land	3%	8%
Percent of Vacant or Underutilized Land Available for Capacity	97%	92%

Capacity Results

The housing and employment capacity totals in Table 2-8 and Table 2-9 are derived from the calculations shown in Appendix A: Full Data, Calculation Tables, and Maps. A summary of the countywide capacity results compared to need is shown in **Error! Reference source not found.** (2030 Housing Target), **Error! Reference source not found.** (2030 Employment Target), and Table 1-12 (DRAFT 2044 Targets).

Table 2-8: City of Auburn 2020-2044 Housing Capacity (Dwelling Units)

CONSISTENCY EVALUATION

Development Trends

The development trends evaluation compares development that has occurred and the planned and regulated characteristics of the applicable zone, as well as with the assumptions used in the report. Since the development trend evaluation window is a short period of time and the application of zoning may change periodically, it is often found that there is not enough information to make a statistically valid conclusion. Due to this, the information is provided but no conclusions have been made.

The development trends evaluation compares development that has occurred and the planned and regulated characteristics of the applicable zone, as well as with the assumptions used in the report. Since the development trend evaluation window is a short period of time and the application of zoning may change periodically, it is often found that there is not enough information to make a statistically valid conclusion. Due to this, the information is provided but no conclusions have been made.

Error! Not a valid bookmark self-reference. is provided to show the number of permits, units, and acres developed to identify which zones have experienced development in the timeframe.

Table 3-10 is provided to show the number of permits, units, and acres developed to identify which zones have experienced development in the timeframe.

Table 2-10: City of Auburn Permits Summary

Zone	Residential Permits	Non-Residential Permits	Dwelling Units	Acres Developed	% Zoned Acreage
C1	0	0	0	0.00	0.0%

R5	0	0	0	0.00	0.0%
R7	0	0	0	0.00	0.0%
TV	0	1	0	3.17	6.3%

Table 3-11 shows the observed residential density trends in comparison to the permitted density and assumed density for each zone with sufficient data. Both the plat and multifamily project average densities are shown in order to understand the source of the overall density.

Table 2-11: City of Auburn Density Evaluation

Zone	Observed Density (Overall)	Observed Plat Density (Single-Family)	Observed Multifamily Density	Assumed Density
C1	0	0	0	0
I	0	0	0	0
OS	0	0	0	0
PUD	7	7	0	0
R5	0	0	0	5
R7	0	0	0	7
TV	0	0	0	0

Table 3-12 shows the observed percent of developed acreage between residential and non-residential uses. Mixed-use project acreage is duplicated in each category, resulting in a 50/50 percent split. In these cases, further analysis would be needed to determine if vertical mixed-use is part of the trend, resulting in a 100/100 percent split. The observed trend is compared to the assumptions used in the report for both the mixed-use split and the assumption for non-residential in and single-family zone. The trend is also compared to the permitted uses to determine if the zone is developing as planned.

Table 2-12: City of Auburn Mixed Use Split and Non-residential in Single Family Zones Evaluation

Zone	Observed Residential Percent	Assumed Residential Percent	Observed Non-residential Percent	Assumed Non-residential Percent	Zone Type (Residential, Non-residential, Mixed-use)	Assumed Non-residential in Single-Family zones Percent
C1	0%	0%	0%	100%	Commercial	0%
I	0%	0%	0%	100%	Industrial	0%
OS	0%	0%	0%	0%	Other-Not Developable	0%

R5	0%	7%	0%	2%	0%	0%
R7	0%	7%	0%	2%	0%	0%
TV	0%	0%	0%	0%	0%	0%

Housing Production / Growth Targets

Table 3-14 shows the observed housing production and average yearly housing production rate between 2010-2020 in comparison to the 2020-2044 housing growth target need and average yearly housing production rate needed to accommodate the growth target.

Table 2-14: City of Auburn Housing Production Trends Compared to Growth Target Needs

Housing Units			Total Housing Growth		Average Yearly Housing Growth (Growth / Years)		
2010 Census	2020 OFM Estimate	2044 Target	2010-2020 Observed	2020-2044 Growth Target	2010-2020 Observed	2020-2044 Growth Target	Yearly Increase Needed
3,146	3,898	3,994	752	96	75	4	-

The past housing production trends in the Pierce County portion of the City of Auburn have been sufficient to accommodate the housing target and the current rate far exceeds the rate needed to accommodate the 2044 housing growth target.

Capacity / Growth Targets

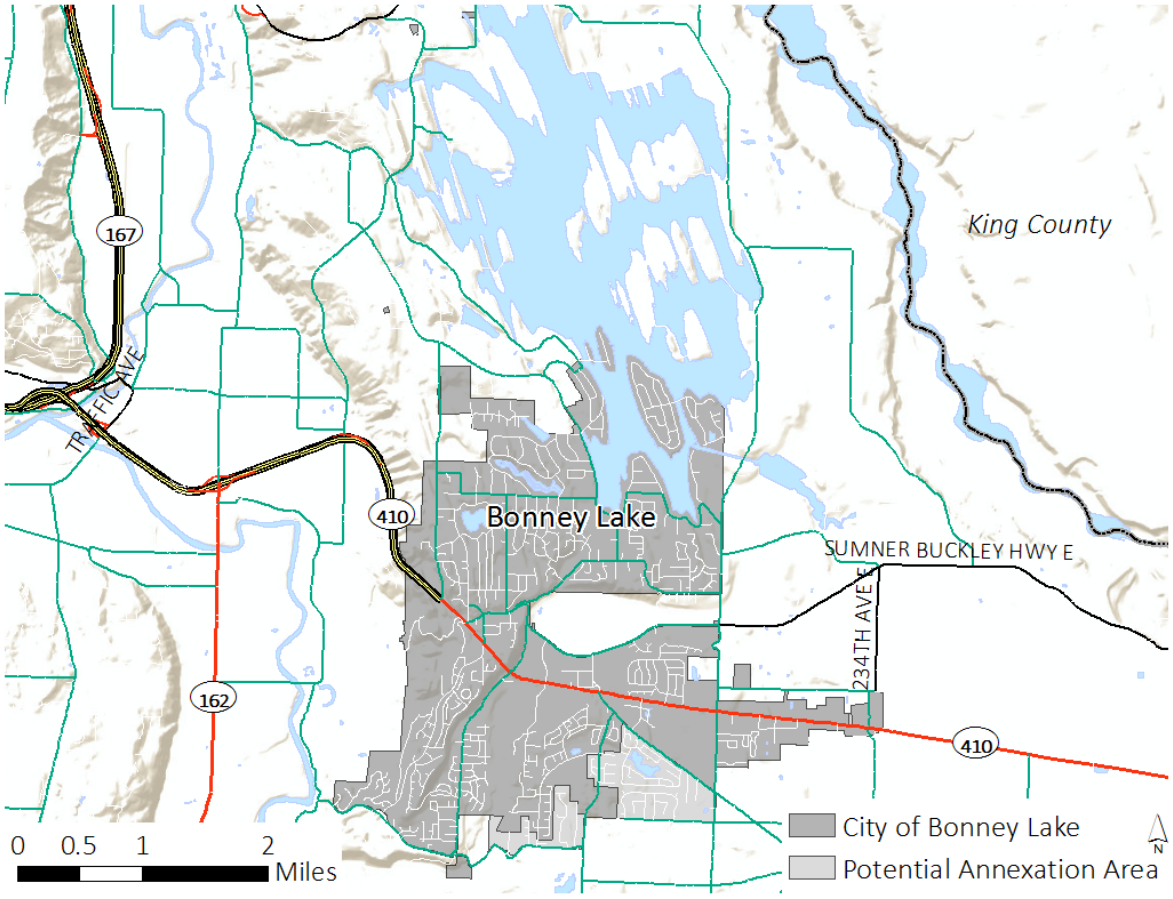

Table 3-15 shows the 2020-2044 housing and employment capacity in comparison to the housing and employment 2020-2044 growth target need.

Table 2-15: City of Auburn Housing and Employment Capacity Compared to Growth Target Needs

Housing Capacity	2020-2044 DRAFT Housing Need	Difference	Employment Capacity	2020-2044 DRAFT Employment Need	Difference
113	96	17	656	0	656

The Pierce County portion of the City of Auburn has sufficient capacity to accommodate the 2044 housing and employment targets.

3 CITY OF BONNEY LAKE

The City implements densities using a net acreage, deducting critical areas and buffers.

Table 3-1: City of Bonney Lake Zone Classifications

Zone Classification		Zone Type[1]	Total Acres[2]
C1	Neighborhood Commercial District	Mixed Use	0.2
C2	Commercial District	Commercial	51.0
DC	Downtown Core District	Mixed Use	8.7
DM	Downtown Mixed Use District	Mixed Use	23.3
E	Eastown District	Mixed Use	246.3
MC	Midtown Core District	Commercial	264.6
PF	Public Facility District	Commercial	484.1
R1	Low Density Residential	Residential	2,504.8
R2	Medium Density Residential	Residential	286.8
R3	High Density Residential	Residential	151.8
RC5	Residential/Conservation District	Residential	326.2

[1]For purposes of the Buildable Lands inventory and analysis; not a representation of the City zoning code.
[2]Represents parcel acreage, not zoning coverage.
Sources: City Zoning Code.

DEVELOPMENT TRENDS

This section summarizes permit data observed between **January 1, 2013 and December 31, 2020** that is used to monitor observed densities and update the assumptions for future development. The summaries in this section are designed to show the average statistics used to inform the report. Only data pertinent to the Buildable Lands requirements is collected, and incomplete or not-applicable data is omitted; therefore, this Report does not provide a full summary of all development within the jurisdiction. For more detailed summaries by zone/year, see Appendix A: Full Data, Calculation Tables, and Maps.

Table 3-2 shows the average residential density per zone and jurisdiction-wide and is not intended to show the total units/lots created or overall acres consumed. The results reflect the density calculation used by the jurisdiction, and only include a summary of plats and multifamily (3+ attached units) projects. Table 3-3 shows the average floor-to-area ratio (FAR) by zone and the amount of non-residential building square footage developed. The non-residential projects summarized only include new development and omit additions to existing businesses and non-building type improvements.

Table 3-2: City of Bonney Lake 2013-2020 Residential Trends by Zone[1]

Zone	Net Acres[2]	Lots/Units	Density
C2	18.05	408	22.61
R1	149.50	275	1.84
R3	9.76	207	21.21
Total/Avg.	**177.31**	**890**	**5.02**

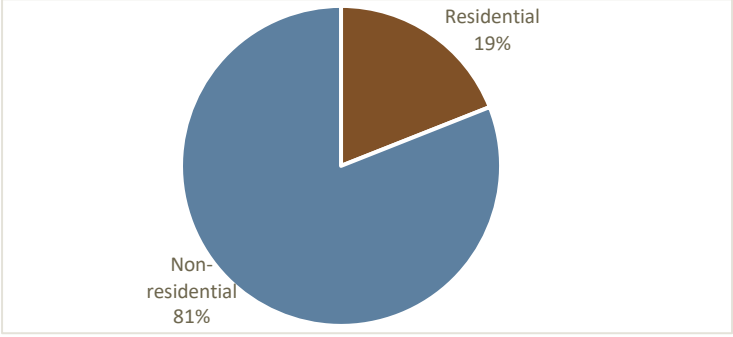

Table 3-3: City of Bonney Lake 2013-2020 Non-residential Trends by Zone

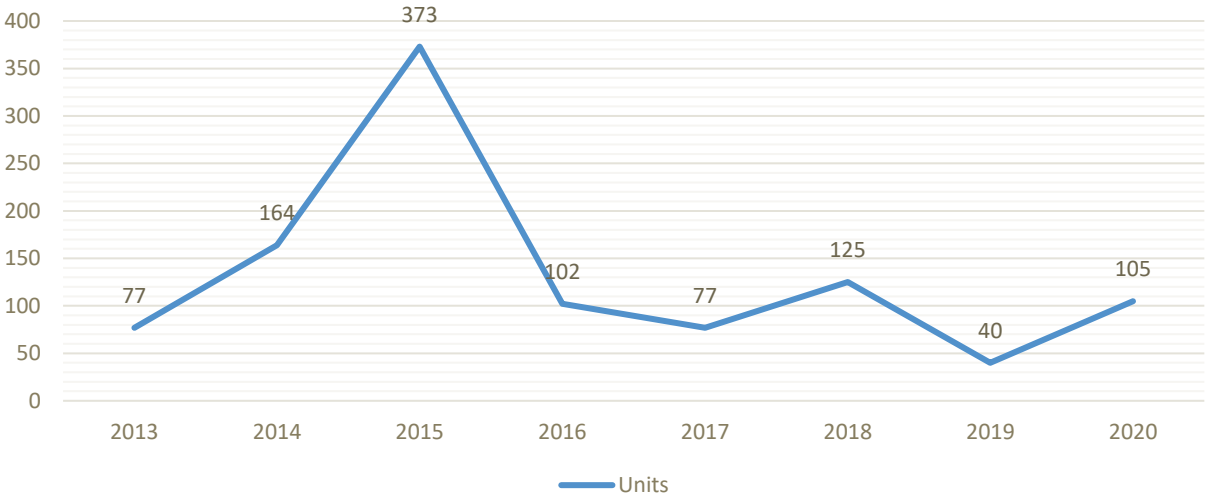
Zone	Acres	Sq. Ft.	FAR
C2	3.67	34,776	0.22
DC	0.77	20,915	0.62
DM	3.12	73,455	0.54
E	13.53	227,290	0.39
MC	20.76	190,306	0.21
Total/Avg.	**41.85**	**546,742**	**0.30**

[1]Includes multifamily and plat data to represent the overall observed density by zone. Does not include single-family permits in order to accurately represent permitted densities; therefore, does not represent the total number of units developed in the timeframe.
Sources: City Permit Data, Pierce County Assessor-Treasurer Tax Parcels, Puget Sound Regional Council Housing Unit Permit Database.

While the non-residential development trends are informative to show the percent of land consumed for non-residential purposes (as shown in Figure 3-A), the employment densities used in the capacity assumptions are derived through employment density surveys, as documented in Appendix C: Employment Density Survey. Figure 3-A summarizes the split between residential and non-residential development between 2013-2020 by zone and the jurisdiction average. The percent split is based on the gross acres developed between 2013-2020 using the plat activity and multifamily permits for residential and non-residential permits for non-residential. The information is used to inform the percent split for mixed-use zones, as well as the percent of non-residential uses in residential-only zones.

Figure 3-A: City of Bonney Lake Residential vs. Non-residential Development Split



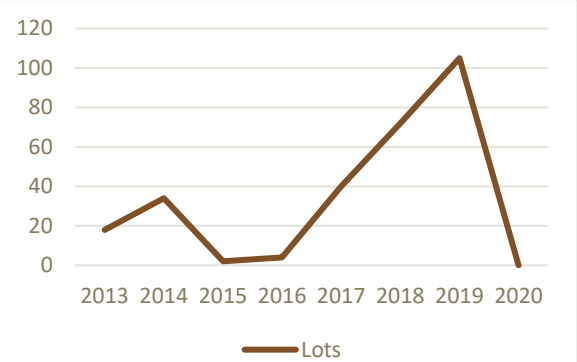
Zone	Use Type Split (Percent)[1]	
	Residential	Non-residential
C2	83%	17%
DC	0%	100%
DM	0%	100%
E	0%	100%
MC	0%	100%
R1	100%	0%
R3	100%	0%
Avg.	**81%**	**19%**

[1]Does not include single-family permits in order to avoid double-counting acreage.
Sources: City Permit Data, Pierce County Assessor-Treasurer Tax Parcels, Puget Sound Regional Council Housing Unit Permit Database.

Housing Production Rate

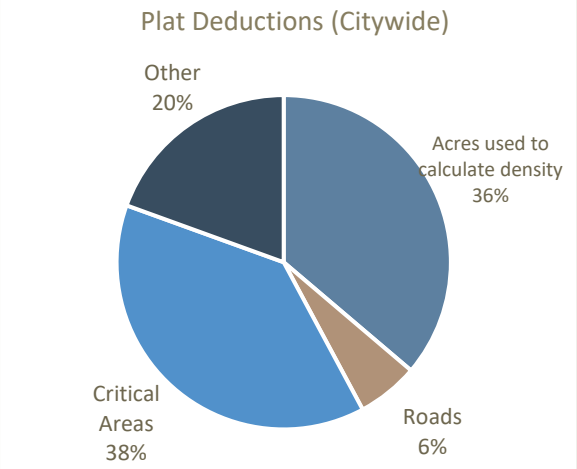
The residential data collected for the Buildable Lands Program tracks the density and other assumptions related to the capacity analysis. The Buildable Lands requirements that were amended in 2017 now require the tracking of housing production to compare to the necessary growth rates to achieve the housing targets. Due to the limitations of the permit data and lack of demolition permit data, Pierce County relies upon the Washington State Office of Financial Management estimates to track the number of housing units built per year in each jurisdiction for the purposes of this Report. The comparison of housing production and housing needs is shown in Table 1-2 and Table 1-3 (Countywide).

Figure 3-B: City of Bonney Lake Housing Production Rates (OFM)



Source: Washington State Office of Financial Management Housing Unit Data (2020).

Platting Activity



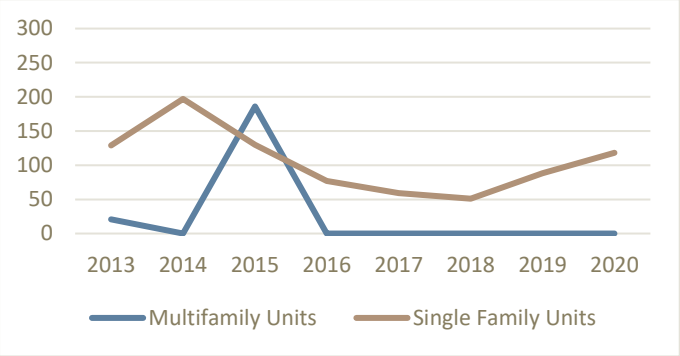
Platting activity is used to determine the achieved density for single-family residential zones and to identify the amount of land used for other purposes (whether netted out for density or applied by a regulation and affecting the achieved density). Plat data is used in conjunction with multifamily permits to determine the overall achieved density (as shown in Table 3-2).

Figure 3-C: City of Bonney Lake Platting Trends

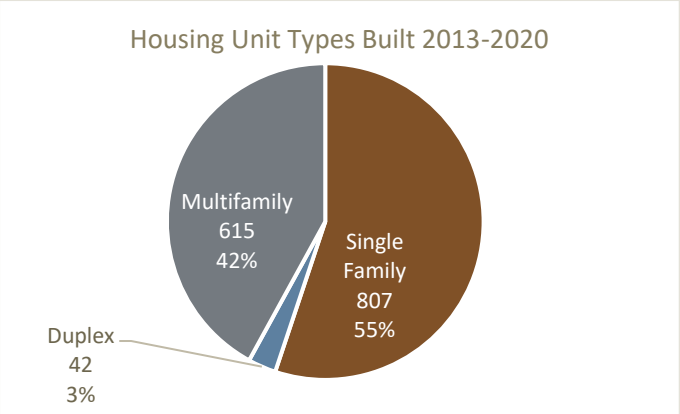
Plat Activity by Year

Year	Lots	Acres	Density
2013	18	3.18	5.67
2014	34	4.37	7.79
2015	2	0.40	5.03
2016	4	0.91	4.41
2017	40	10.83	3.69
2018	72	14.86	4.85
2019	105	19.37	5.42
2020	-	-	-
Total	**275**	**53.91**	**5.10**

Plat Deductions by Zone (Percent)



Zone	Roads	Critical Areas	Parks/Open Space	Storm -water
R1	5.9%	38.2%	16.3%	3.1%
R2	-	-	-	-
Average	**5.9%**	**38.2%**	**16.3%**	**3.1%**



Sources: City Permit Data, Pierce County Auditor Recorded Plats.

Residential Building Trends

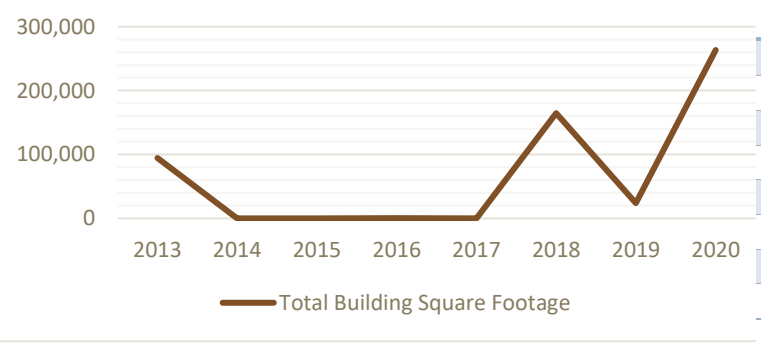
Both multifamily and single-family building permits are collected and summarized; however, single-family permit reporting is optional per the Pierce County Countywide Planning Policies and limited in use for tracking factors affecting development. The single-family permit data is useful for identifying the total number of units built and the average lot size per zone and is provided as supplemental information. The multifamily permit data is used to identify the observed density and amount of land used for residential purposes. Please note that this data differs from the data provided in Figure 3-B due to collection limitations and should not be used to represent housing production in the jurisdiction.

Figure 3-D: City of Bonney Lake Residential Building Permit Trends

Multifamily Permits by Year

Year	Units	Net Acres	Net Density
2013	21	1.08	19.44
2014	-	-	-
2015	186	8.68	21.43
2016	-	-	-
2017	-	-	-
2018	-	-	-
2019	-		-
2020	408	18.05	22.61
Total	**615**	**27.81**	**22.12**

Single-Family Permits by Year (Optional)



Year	Units	Acres	Avg. Lot Size
2013	129	32.83	0.28
2014	197	46.86	0.24
2015	130	25.29	0.20
2016	77	22.11	0.29
2017	59	15.17	0.26
2018	51	11.35	0.22
2019	88	24.33	0.29
2020	118	30.13	0.26
Total	**849**	**208.06**	**0.25**

Sources: City Permit Data, Pierce County Assessor-Treasurer Tax Parcels, Puget Sound Regional Council Housing Unit Permit Database.

Non-residential Building Trends

Non-residential building permits typically include commercial and industrial development; however, public use is often collected and summarized as well when the use type produces jobs. While the project acreage, building square footage, and floor-to-area ratio information is collected and summarized for the report in order to track non-residential development, the employment density is analyzed in a separate report using data other than building permits. The most recent employment density study to support the assumptions in this Report is provided in Appendix C: Employment Density Survey.

Figure 3-E: City of Bonney Lake Non-residential Permit Trends

Year	Acres	Bldg. SF	FAR
2013	3.89	94,370	0.56
2014	-	-	-
2015	-	-	-
2016	0.66	260	0.01
2017	-	-	-
2018	15.40	164,534	0.25
2019	2.54	24,113	0.22
2020	19.36	263,465	0.31
Total	**41.85**	**546,742**	**0.30**

Sources: City Permit Data, Pierce County Assessor-Treasurer Tax Parcels, Puget Sound Regional Council Housing Unit Permit Database.

ASSUMPTIONS

Assumptions vary by jurisdiction and zone. Table 3-4 and Table 3-5 provide a snapshot of the densities, mixed-use split, and deductions used in the inventory development and capacity calculation tables. The assumptions for each zone are shown in the assumptions column of the capacity calculation tables shown in Appendix A: Full Data, Calculation Tables, and Maps.

Table 3-4: City of Bonney Lake Assumptions Summary

Zone	Residential		Employment		Residential Market Factor		Non-Residential Market Factor		Land for Capital Facilities
	Percent	Density	Percent	Density	Vacant	Underutilized	Vacant	Underutilized	
C1	50%	6	50%	20	15%	35%	15%	35%	0%
C2	0%	0	100%	20	15%	35%	15%	35%	0%
DC	20%	15	80%	20	15%	35%	15%	35%	0%
DM	50%	15	50%	20	15%	35%	15%	35%	0%
E	0%	20	100%	20	15%	35%	15%	35%	0%
MC	0%	0	100%	20	15%	35%	15%	35%	0%
PF	0%	0	100%	20	15%	35%	15%	35%	0%
R1	100%	4	0%	20	15%	30%	0%	0%	0%
R2	100%	6	0%	20	15%	30%	0%	0%	0%
R3	100%	15	0%	20	15%	30%	0%	0%	0%
RC5	100%	0.15	0%	20	15%	30%	0%	0%	0%

The Vacant Single Unit size threshold listed below represents the parcel size used to determine if a vacant property is subdividable or only able to accommodate one unit. Parcels smaller than the size listed are considered Vacant Single Units unless otherwise determined by the jurisdiction during the parcel-specific review.

Table 3-5: City of Bonney Lake Plat Deductions for Single-Family Residential Zones

Zone	Roads	Critical Areas	Parks/Open Space	Stormwater	Non-residential	Vacant Single Unit
R-1	15%	GIS	0%	5%	5%	<0.50 acres
R-2	15%	GIS	0%	5%	5%	<0.49 acres
R-3	15%	GIS	0%	5%	5%	<0.30 acres
RC-5	15%	GIS	0%	5%	5%	<12.50 acres

HOUSING AND EMPLOYMENT CAPACITY

Inventory and Capacity Calculation Characteristics

A portion of the inventory is deducted from the gross acreage based on the assumptions identified in the previous section. Table 3-6 shows the characteristics of the initial inventory and Table 3-7 shows the amount of land that was reduced from that initial inventory to be included in the capacity analysis, as documented in the tables and maps in Appendix A: Full Data, Calculation Tables, and Maps.

Table 3-6: City of Bonney Lake Summary of Inventory Characteristics

Characteristics/Category	Vacant	Underutilized	Vacant Single Unit	Pipeline
Total Acreage (Gross	182.83	621.47	209.95	181.83
Average Lot Size (Gross)	2.13	1.46	0.66	4.23
Total Acreage (Net)	127.93	495.33	63.90	153.03
Average Lot Size (Net)	1.49	1.17	0.20	3.56
Percent Critical Areas	30%	20%	70%	16%

The parcel inventory is used to categorize land and the capacity calculations are intended to represent the land available for development; thus, the inventory maps alone do not represent the "buildable land" per the Buildable Lands requirements. Table 3-7 shows the overall percentage of land assumed available as capacity in the 20-year planning period and the deductions made to account for constraints to the inventory and overall market conditions.

Table 3-7: City of Bonney Lake Summary of Deductions

Deductions/Category	Vacant	Underutilized
Critical Areas	54.90	126.14
Infrastructure Gaps	13.63	40.84
Plat Deductions	13.37	76.54
Capital Facilities	0.00	0.00
Market Factor	21.87	137.94
Total Percent Reduction in Inventory Land	32%	52%
Percent of Vacant or Underutilized Land Available for Capacity	68%	48%

Capacity Results

The housing and employment capacity totals in Table 3-8 and Table 3-9 are derived from the calculations shown in Appendix A: Full Data, Calculation Tables, and Maps. A summary of the countywide capacity results compared to need is shown in **Error! Reference source not found.** (2030 Housing Target), **Error! Reference source not found.** (2030 Employment Target), and Table 1-12 (DRAFT 2044 Targets).

Table 3-8: City of Bonney Lake 2020-2044 Housing Capacity (Dwelling Units)

Zone	Vacant	Underutilized	Vacant Single Unit	Pipeline	Total

CONSISTENCY EVALUATION

Development Trends

The development trends evaluation compares development that has occurred and the planned and regulated characteristics of the applicable zone, as well as with the assumptions used in the report. Since the development trend evaluation window is a short period of time and the application of zoning may change periodically, it is often found that there is not enough information to make a statistically valid conclusion. Due to this, the information is provided but no conclusions have been made.

Error! Not a valid bookmark self-reference. is provided to show the number of permits, units, and acres developed to identify which zones have experienced development in the timeframe.

Table 3-10: City of Bonney Lake Permits Summary					
Zone	Residential Permits	Non-Residential Permits	Dwelling Units	Acres Developed	% Zoned Acreage
C1	0	0	0	0.00	0.0%
C2	1	1	408	25.56	50.1%
DC	0	1	0	0.77	8.8%
DM	0	1	0	3.12	13.4%
E	0	3	0	13.53	5.5%
MC	0	7	0	20.76	7.8%
PF	0	0	0	0.00	0.0%
R1	14	0	275	149.50	6.0%
R2	0	0	0	0.00	0.0%
R3	2	0	207	11.93	7.9%
RC5	0	0	0	0.00	0.0%

Table 3-11 shows the observed residential density trends in comparison to the permitted density and assumed density for each zone with sufficient data. Both the plat and multifamily project average densities are shown in order to understand the source of the overall density.

Table 3-11: City of Bonney Lake Density Evaluation

Zone	Observed Density (Overall)	Observed Plat Density (Single-Family)	Observed Multifamily Density	Assumed Density
C1	0	0	0	6
C2	23	0	23	0
DC	0	0	0	15
DM	0	0	0	15
E	0	0	0	0
MC	0	0	0	0
PF	0	0	0	0
R1	5	5	0	4
R2	0	0	0	6
R3	21	0	21	15
RC5	0	0	0	0

Table 3-12 shows the observed percent of developed acreage between residential and non-residential uses. Mixed-use project acreage is duplicated in each category, resulting in a 50/50 percent split. In these cases, further analysis would be needed to determine if vertical mixed-use is part of the trend, resulting in a 100/100 percent split. The observed trend is compared to the assumptions used in the report for both the mixed-use split and the assumption for non-residential in and single-family zone. The trend is also compared to the permitted uses to determine if the zone is developing as planned.

Table 3-12: City of Bonney Lake Mixed Use Split and Non-residential in Single Family Zones Evaluation

Zone	Observed Residential Percent	Assumed Residential Percent	Observed Non-residential Percent	Assumed Non-residential Percent	Zone Type (Residential, Non-residential, Mixed-use)	Assumed Non-residential in Single-Family zones Percent
C1	0%	50%	0%	50%	Mixed Use	0%
C2	86%	0%	14%	100%	Commercial	0%
DC	0%	20%	100%	80%	Mixed Use	0%
DM	0%	50%	100%	50%	Mixed Use	0%

DM	0%	0%	0%	0%	0%	0%
E	0%	0%	0%	0%	0%	0%
MC	0%	0%	0%	0%	0%	0%
PF	0%	0%	0%	0%	0%	0%
R1	6%	15%	16%	0%	3%	5%
R2	0%	15%	0%	0%	0%	5%
R3	0%	15%	0%	0%	0%	5%
RC5	0%	15%	0%	0%	0%	5%

Housing Production / Growth Targets

Table 3-14 shows the observed housing production and average yearly housing production rate between 2010-2020 in comparison to the 2020-2044 housing growth target need and average yearly housing production rate needed to accommodate the growth target.

Table 3-14: City of Bonney Lake Housing Production Trends Compared to Growth Target Needs

Housing Units			Total Housing Growth		Average Yearly Housing Growth (Growth / Years)		
2010 Census	2020 OFM Estimate	2044 Target	2010-2020 Observed	2020-2044 Growth Target	2010-2020 Observed	2020-2044 Growth Target	Yearly Increase Needed
6,394	7,605	10,455	1,211	2,850	121	119	**8**

The observed housing production rate is less than but very close to the rate needed to accommodate the 2044 housing target. It is expected that housing production fluctuates over time, and the current rate is consistent with the future need.

Capacity / Growth Targets

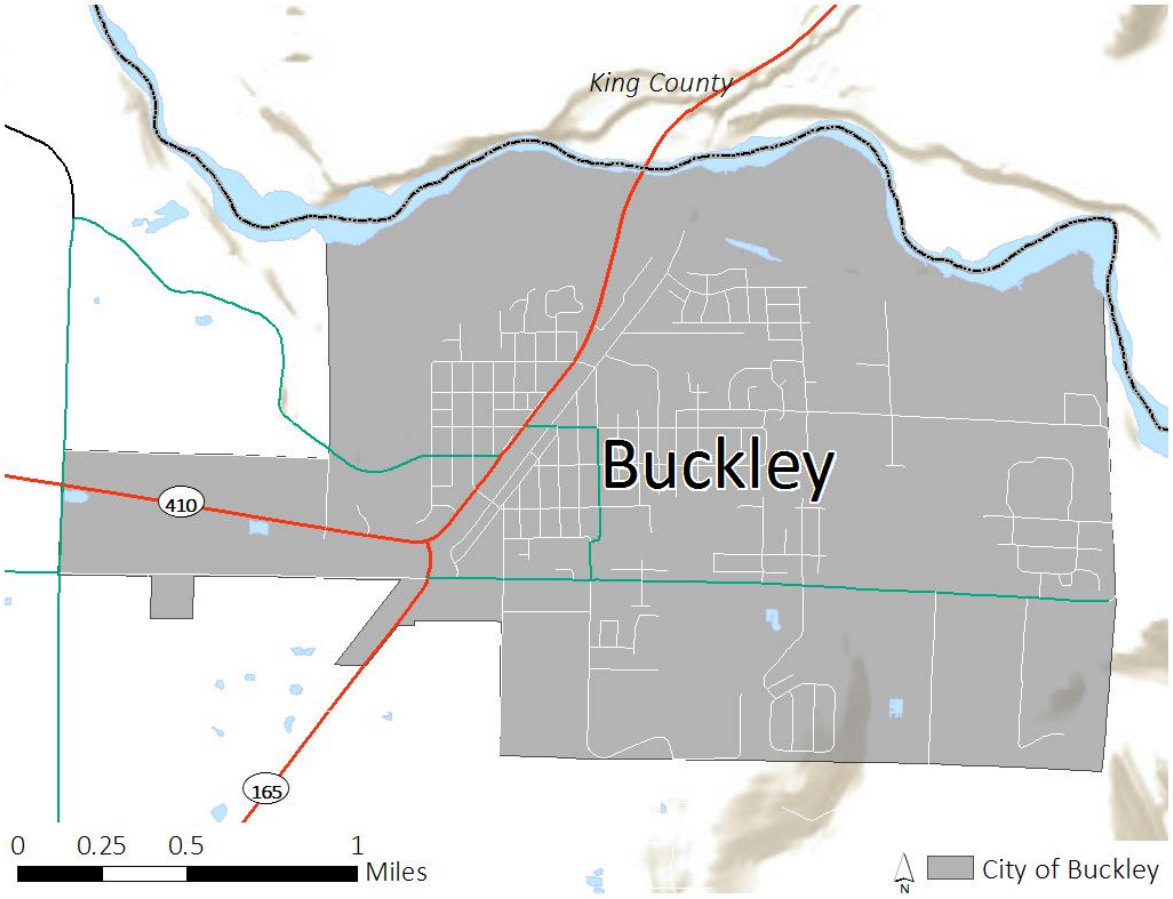

Table 3-15 shows the 2020-2044 housing and employment capacity in comparison to the housing and employment 2020-2044 growth target need.

Table 3-15: City of Bonney Lake Housing and Employment Capacity Compared to Growth Target Needs

Housing Capacity	2020-2044 DRAFT Housing Need	Difference	Employment Capacity	2020-2044 DRAFT Employment Need	Difference
2,682	2,850	-168	3,811	1,717	2,094

The 2044 housing target was developed using an older version of this report that displayed incorrect totals. Since the capacity summaries have been corrected, there is a slight difference between the housing needs and capacity, but it is not significant enough to warrant reasonable measures.

4 CITY OF BUCKLEY

The City of Buckley's Comprehensive Plan and regulations implement densities based on minimum lot size.

Table 4-1: City of Buckley Zone Classifications

Zone Classification		Zone Type[1]	Total Acres[2]
CC	Central Commercial	Mixed Use	61.0
GC	General Commercial	Commercial	100.7
HC	Historical Commercial	Mixed Use	2.7
HDR	High Density Residential	Residential	63.0
LI	Light Industrial	Industrial	44.1
NMU	Neighborhood Mixed-Use	Mixed Use	128.8
P	Public	Public Use	438.7
R-20,000	R-20,000 Residential	Residential	185.9
R-6,000	R-6,000 Residential	Residential	276.1

DEVELOPMENT TRENDS

This section summarizes permit data observed between **January 1, 2013 and December 31, 2020** that is used to monitor observed densities and update the assumptions for future development. The summaries in this section are designed to show the average statistics used to inform the report. Only data pertinent to the Buildable Lands requirements is collected, and incomplete or not-applicable data is omitted; therefore, this Report does not provide a full summary of all development within the jurisdiction. For more detailed summaries by zone/year, see Appendix A: Full Data, Calculation Tables, and Maps.

Table 4-2 shows the average residential density per zone and jurisdiction-wide and is not intended to show the total units/lots created or overall acres consumed. The results reflect the density calculation used by the jurisdiction, and only include a summary of plats and multifamily (3+ attached units) projects. Table 4-3 shows the average floor-to-area ratio (FAR) by zone and the amount of non-residential building square footage developed. The non-residential projects summarized only include new development and omit additions to existing businesses and non-building type improvements.

Table 4-2: City of Buckley 2013-2020 Residential Trends by Zone[1]

Zone	Net Acres[2]	Lots/Units	Density
HDR	0.93	4	4.30
R-6,000	81.96	245	2.99
R-8,000	25.78	72	2.79
Total/Avg.	**108.66**	**321**	**2.95**

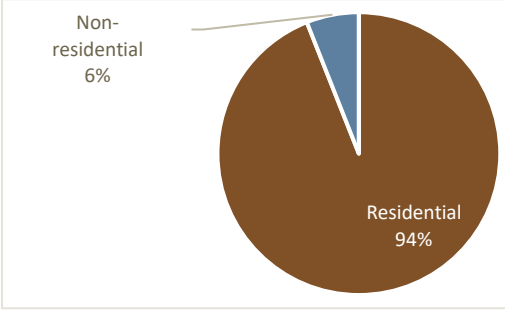

Table 4-3: City of Buckley 2013-2020 Non-residential Trends by Zone

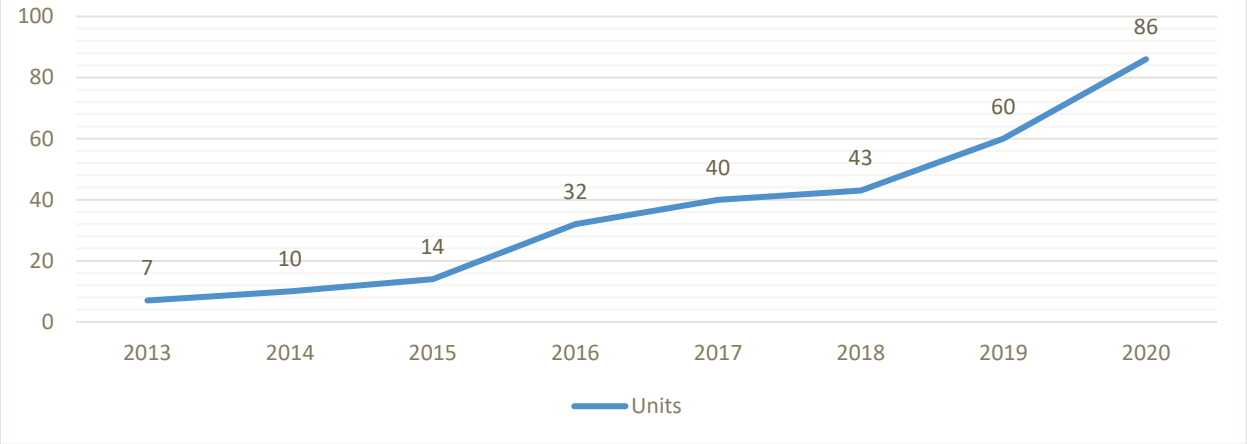
Zone	Acres	Sq. Ft.	FAR
CC	0.84	4,388	0.12
GC	4.17	32,012	0.18
LI	2.21	3,177	0.03
Total/Avg.	**7.22**	**39,577**	**0.13**

[1]Includes multifamily and plat data to represent the overall observed density by zone. Does not include single-family permits in order to accurately represent permitted densities; therefore, does not represent the total number of units developed in the timeframe.
Sources: City Permit Data, Pierce County Assessor-Treasurer Tax Parcels, Puget Sound Regional Council Housing Unit Permit Database.

While the non-residential development trends are informative to show the percent of land consumed for non-residential purposes (as shown in Figure 4-A), the employment densities used in the capacity assumptions are derived through employment density surveys, as documented in Appendix C: Employment Density Survey. Figure 4-A summarizes the split between residential and non-residential development between 2013-2020 by zone and the jurisdiction average. The percent split is based on the gross acres developed between 2013-2020 using the plat activity and multifamily permits for residential and non-residential permits for non-residential. The information is used to inform the percent split for mixed-use zones, as well as the percent of non-residential uses in residential-only zones.

Figure 4-A: City of Buckley Residential vs. Non-residential Development Split



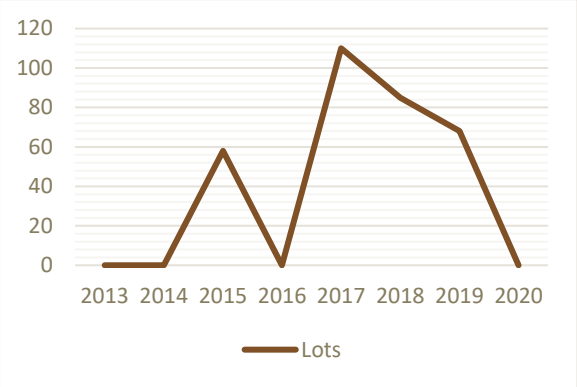
Zone	Use Type Split (Percent)[1] Residential	Non-residential
CC	0%	100%
GC	0%	100%
HDR	100%	0%
LI	0%	100%
R-6,000	100%	0%
R-8,000	100%	0%
Total	**94%**	**6%**

[1]Does not include single-family permits in order to avoid double-counting acreage.
Sources: City Permit Data, Pierce County Assessor-Treasurer Tax Parcels, Puget Sound Regional Council Housing Unit Permit Database.

Housing Production Rate

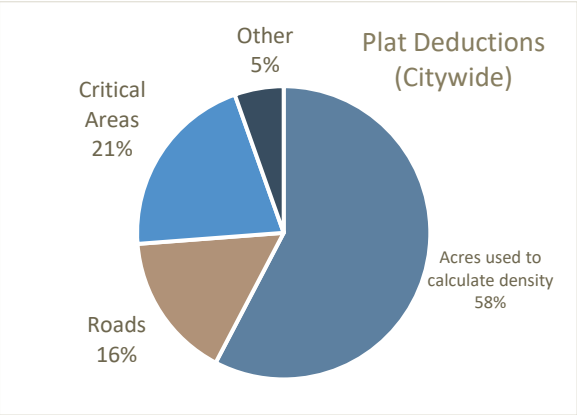
The residential data collected for the Buildable Lands Program tracks the density and other assumptions related to the capacity analysis. The Buildable Lands requirements that were amended in 2017 now require the tracking of housing production to compare to the necessary growth rates to achieve the housing targets. Due to the limitations of the permit data and lack of demolition permit data, Pierce County relies upon the Washington State Office of Financial Management estimates to track the number of housing units built per year in each jurisdiction for the purposes of this Report. The comparison of housing production and housing needs is shown in Table 1-2 and Table 1-3 (Countywide).

Figure 4-B: City of Buckley Housing Production Rates (OFM)



Source: Washington State Office of Financial Management Housing Unit Data (2020).

Platting Activity



Platting activity is used to determine the achieved density for single-family residential zones and to identify the amount of land used for other purposes (whether netted out for density or applied by a regulation and affecting the achieved density). Plat data is used in conjunction with multifamily permits to determine the overall achieved density (as shown in Table 4-2).

Figure 4-C: City of Buckley Platting Trends

Plat Activity by Year

Year	Lots	Acres	Density
2013	-	-	-
2014	-	-	-
2015	58	9.75	5.95
2016	-	-	-
2017	110	18.49	5.95

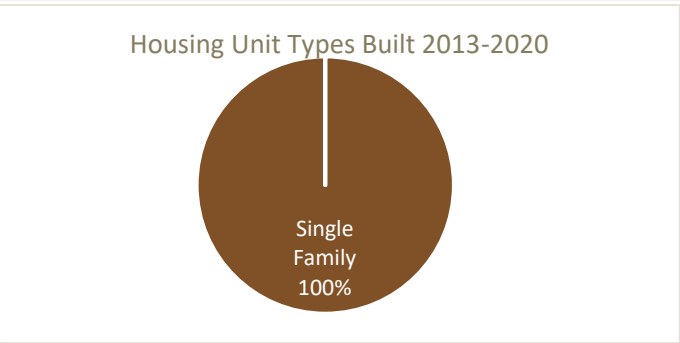
R-8,000	20.9%	-	0.6%	6.2%
Average	**17.2%**	**23.3%**	**0.5%**	**5.0%**



Sources: City Permit Data, Pierce County Auditor Recorded Plats.

Residential Building Trends

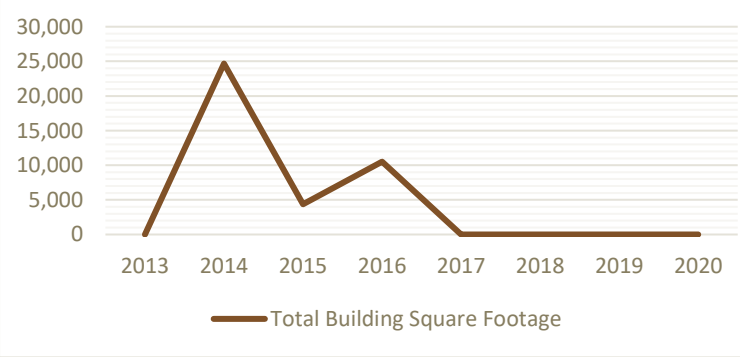
Both multifamily and single-family building permits are collected and summarized; however, single-family permit reporting is optional per the Pierce County Countywide Planning Policies and limited in use for tracking factors affecting development. The single-family permit data is useful for identifying the total number of units built and the average lot size per zone and is provided as supplemental information. The multifamily permit data is used to identify the observed density and amount of land used for residential purposes. Please note that this data differs from the data provided in Figure 4-B due to collection limitations and should not be used to represent housing production in the jurisdiction.

Figure 4-D: City of Buckley Residential Building Permit Trends

Multifamily Permits by Year

No multifamily permits were observed in the timeframe.

Single-Family Permits by Year (Optional)



Year	Units	Acres	Avg. Lot Size
2013	22	7.89	0.36
2014	-	-	-
2015	39	14.08	0.36
2016	51	16.23	0.32
2017	52	14.33	0.28
2018	57	11.18	0.20
2019	93	26.30	0.28
2020	92	26.34	0.29
Total	**406**	**116.35**	**0.29**

Sources: City Permit Data, Pierce County Assessor-Treasurer Tax Parcels, Puget Sound Regional Council Housing Unit Permit Database.

Non-residential Building Trends

Non-residential building permits typically include commercial and industrial development; however, public use is often collected and summarized as well when the use type produces jobs. While the project acreage, building square footage, and floor-to-area ratio information is collected and summarized for the report in order to track non-residential development, the employment density is analyzed in a separate report using data other than building permits. The most recent employment density study to support the assumptions in this Report is provided in Appendix C: Employment Density Survey.

Figure 4-E: City of Buckley Non-residential Permit Trends

Year	Acres	Bldg. SF	FAR
2013	-	-	-
2014	4.09	24,677	0.14

ASSUMPTIONS

Assumptions vary by jurisdiction and zone. Table 4-4 and Table 4-5 provide a snapshot of the densities, mixed-use split, and deductions used in the inventory development and capacity calculation tables. The assumptions for each zone are shown in the assumptions column of the capacity calculation tables shown in Appendix A: Full Data, Calculation Tables, and Maps.

Table 4-4: City of Buckley Assumptions Summary

Zone	Residential		Employment		Residential Market Factor		Non-Residential Market Factor		Land for Capital Facilities
	Percent	Density	Percent	Density	Vacant	Underutilized	Vacant	Underutilized	
CC	0%	5	100%	20	0%	0%	50%	50%	0%
GC	0%	0	100%	20	0%	0%	50%	50%	0%
HC	0%	5	100%	20	0%	0%	50%	50%	0%
HDR	100%	5	0%	0	0%	0%	50%	50%	0%
LI	0%	0	100%	9	0%	0%	50%	50%	0%
NMU	80%	6	20%	20	50%	50%	50%	50%	0%
P	0%	0	100%	20	0%	0%	50%	50%	0%
R-20,000	100%	2	0%	20	30%	50%	0%	0%	0%
R-6,000	100%	5	0%	20	30%	50%	0%	0%	0%
R-8,000	100%	4	0%	20	30%	50%	0%	0%	0%

The Vacant Single Unit size threshold listed below represents the parcel size used to determine if a vacant property is subdividable or only able to accommodate one unit. Parcels smaller than the size listed are considered Vacant Single Units unless otherwise determined by the jurisdiction during the parcel-specific review.

Table 4-5: City of Buckley Plat Deductions for Single-Family Residential Zones

Zone	Roads	Critical Areas	Parks/Open Space	Stormwater	Non-residential	Vacant Single Unit
R-20,000	10%	GIS	3%	0%	1%	<1.15 acres
R-6,000	10%	GIS	3%	0%	1%	<0.34 acres
R-8,000	10%	GIS	3%	0%	1%	<0.46 acres

HOUSING AND EMPLOYMENT CAPACITY

Inventory and Capacity Calculation Characteristics

A portion of the inventory is deducted from the gross acreage based on the assumptions identified in the previous section. Table 4-6 shows the characteristics of the initial inventory and Table 4-7 shows the amount of land that was reduced from that initial inventory to be included in the capacity analysis, as documented in the tables and maps in Appendix A: Full Data, Calculation Tables, and Maps.

Table 4-6: City of Buckley Summary of Vacant and Underutilized Land Characteristics

Characteristics/Category	Vacant	Underutilized	Vacant Single Unit	Pipeline
Total Acreage (Gross	211.84	560.73	52.25	120.72
Average Lot Size (Gross)	3.07	2.28	0.33	4.31
Total Acreage (Net)	166.99	462.64	33.95	71.62
Average Lot Size (Net)	2.42	1.88	0.21	2.56
Percent Critical Areas	21%	17%	35%	41%

The parcel inventory is used to categorize land and the capacity calculations are intended to represent the land available for development; thus, the inventory maps alone do not represent the "buildable land" per the Buildable Lands requirements. Table 4-7 shows the overall percentage of land assumed available as capacity in the 20-year planning period and the deductions made to account for constraints to the inventory and overall market conditions.

Table 4-7: City of Buckley Summary of Deductions

Deductions/Category	Vacant	Underutilized
Critical Areas	44.86	98.10
Plat Deductions	12.52	39.23
Capital Facilities	0.00	0.00
Market Factor	62.98	208.97
Total Percent Reduction in Inventory Land	51%	61%
Percent of Vacant or Underutilized Land Available for Capacity	49%	39%

Capacity Results

The housing and employment capacity totals in Table 4-8 and Table 4-9 are derived from the calculations shown in Appendix A: Full Data, Calculation Tables, and Maps. A summary of the countywide capacity results compared to need is shown in **Error! Reference source not found.** (2030 Housing Target), **Error! Reference source not found.** (2030 Employment Target), and Table 1-12 (DRAFT 2044 Targets).

CONSISTENCY EVALUATION

Development Trends

The development trends evaluation compares development that has occurred and the planned and regulated characteristics of the applicable zone, as well as with the assumptions used in the report. Since the development trend evaluation window is a short period of time and the application of zoning may change periodically, it is often found that there is not enough information to make a statistically valid conclusion. Due to this, the information is provided but no conclusions have been made.

The development trends evaluation compares development that has occurred and the planned and regulated characteristics of the applicable zone, as well as with the assumptions used in the report. Since the development trend evaluation window is a short period of time and the application of zoning may change periodically, it is often found that there is not enough information to make a statistically valid conclusion. Due to this, the information is provided but no conclusions have been made.

Error! Not a valid bookmark self-reference. is provided to show the number of permits, units, and acres developed to identify which zones have experienced development in the timeframe.

Table 3-10 is provided to show the number of permits, units, and acres developed to identify which zones have experienced development in the timeframe.

Table 4-10: City of Buckley Permits Summary					
Zone	**Residential Permits**	**Non-Residential Permits**	**Dwelling Units**	**Acres Developed**	**% Zoned Acreage**
CC	0	1	0	0.84	1.4%

R-8,000	4	4	0	4
S	0	0	0	0

Table 3-12 shows the observed percent of developed acreage between residential and non-residential uses. Mixed-use project acreage is duplicated in each category, resulting in a 50/50 percent split. In these cases, further analysis would be needed to determine if vertical mixed-use is part of the trend, resulting in a 100/100 percent split. The observed trend is compared to the assumptions used in the report for both the mixed-use split and the assumption for non-residential in and single-family zone. The trend is also compared to the permitted uses to determine if the zone is developing as planned.

Table 4-12: City of Buckley Mixed Use Split and Non-residential in Single Family Zones Evaluation

Zone	Observed Residential Percent	Assumed Residential Percent	Observed Non-residential Percent	Assumed Non-residential Percent	Zone Type (Residential, Non-residential, Mixed-use)	Assumed Non-residential in Single-Family zones Percent

Housing Production / Growth Targets

Table 3-14 shows the observed housing production and average yearly housing production rate between 2010-2020 in comparison to the 2020-2044 housing growth target need and average yearly housing production rate needed to accommodate the growth target.

Table 4-14: City of Buckley Housing Production Trends Compared to Growth Target Needs

Housing Units			Total Housing Growth		Average Yearly Housing Growth (Growth / Years)		
2010 Census	2020 OFM Estimate	2044 Target	2010-2020 Observed	2020-2044 Growth Target	2010-2020 Observed	2020-2044 Growth Target	Yearly Increase Needed
1,669	1,956	3,330	287	1,374	29	57	**29**

The average observed housing production rates are lower than the rate needed to accommodate the 2044 target.

Capacity / Growth Targets

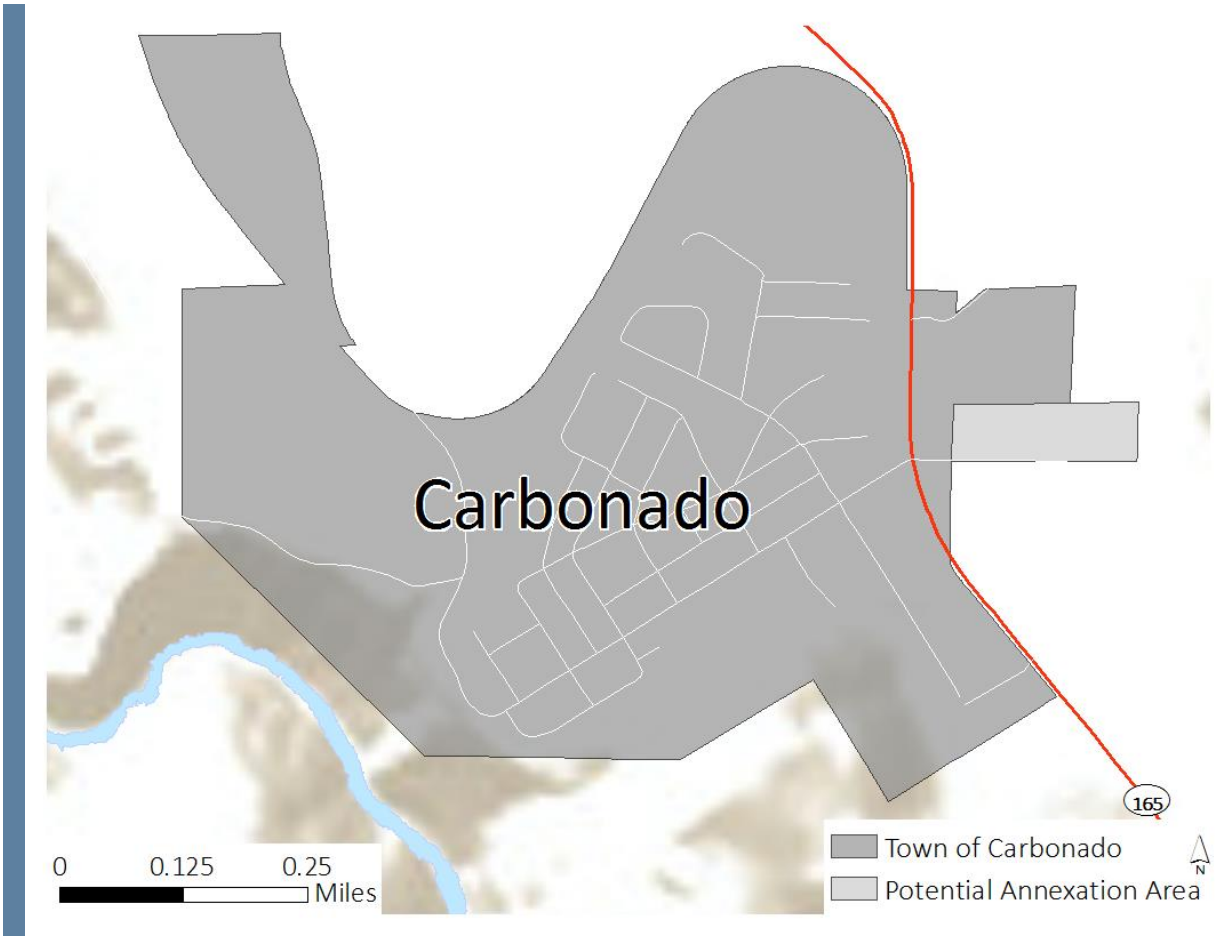

Table 3-15 shows the 2020-2044 housing and employment capacity in comparison to the housing and employment 2020-2044 growth target need.

Table 4-15: City of Buckley Housing and Employment Capacity Compared to Growth Target Needs

Housing Capacity	2020-2044 DRAFT Housing Need	Difference	Employment Capacity	2020-2044 DRAFT Employment Need	Difference
1,450	1,374	76	1,510	1,080	430

The City has sufficient capacity to accommodate the 2044 targets.

5 TOWN OF CARBONADO

The Town of Carbonado's Comprehensive Plan and regulations implement densities using gross acreage.

Table 5-1: Town of Carbonado Zone Classifications

Zone Classification		Zone Type[1]	Total Acres[2]
CF	Community Facilities District	Public Use	39.5
CMU	Commercial/Mixed-Use District	Mixed Use	4.5
POS	Parks & Open Space District	N/A	2.8
RLD	Residential Low Density District	Residential	173.2
RMD	Residential Moderate Density District	Residential	37.4

[1]For purposes of the Buildable Lands inventory and analysis; not a representation of the Town zoning code.
[2]Represents parcel acreage, not zoning coverage.
Sources: Town Zoning Code.

DEVELOPMENT TRENDS

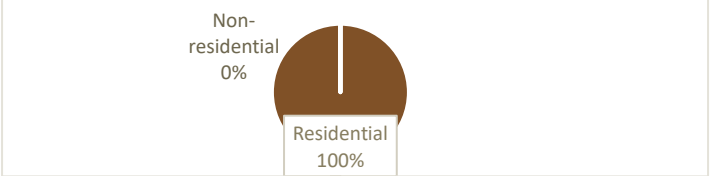
This section summarizes building and plat data obtained through the Pierce County Assessor-Treasurer and Auditor Departments observed between **January 1, 2013 and December 31, 2020** that is used to monitor observed densities and update the assumptions for future development. The summaries in this

section are designed to show the average statistics used to inform the report. Only data pertinent to the Buildable Lands requirements is collected, and incomplete or not-applicable data is omitted; therefore, this Report does not provide a full summary of all development within the jurisdiction. For more detailed summaries by zone/year, see Appendix A: Full Data, Calculation Tables, and Maps.

Table 5-2 shows the average residential density per zone and jurisdiction-wide and is not intended to show the total units/lots created or overall acres consumed. The results reflect the density calculation used by the jurisdiction, and only include a summary of plats and multifamily (3+ attached units) projects. Table 5-3 shows the average floor-to-area ratio (FAR) by zone and the amount of non-residential building square footage developed. The non-residential projects summarized only include new development and omit additions to existing businesses and non-building type improvements.

Table 5-2: Town of Carbonado 2013-2020 Residential Trends by Zone[1]

Zone	Net Acres[2]	Lots/Units	Density
RLD	7.06	16	2.27
RMD	9.09	2	0.22
Total/Avg.	**16.15**	**18**	**1.11**



[1]Includes multifamily and plat data to represent the overall observed density by zone. Does not include single-family permits in order to accurately represent permitted densities; therefore, does not represent the total number of units developed in the timeframe.
Sources: Town Permit Data, Pierce County Assessor-Treasurer Tax Parcels, Puget Sound Regional Council Housing Unit Permit Database.

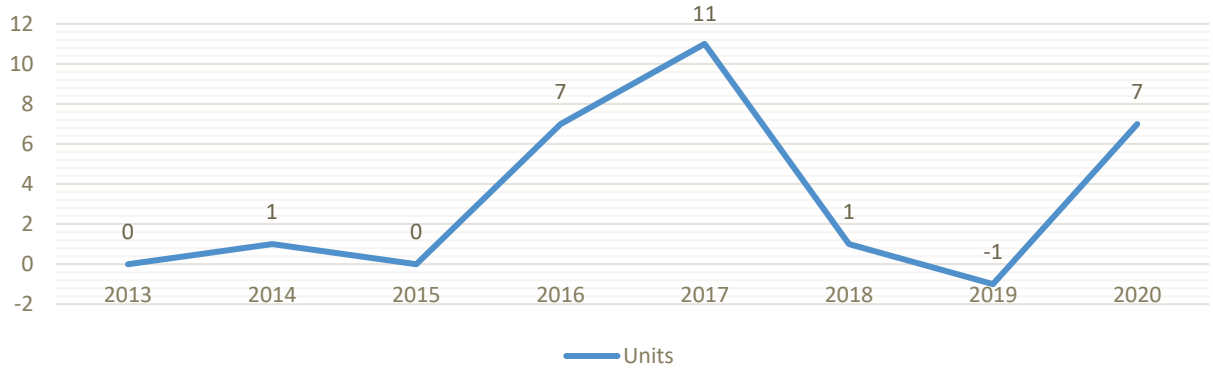
Table 5-3: Town of Carbonado 2013-2020 Non-residential Trends by Zone

No non-residential permits were observed in the timeframe.

While the non-residential development trends are informative to show the percent of land consumed for non-residential purposes (as shown in Figure 5-A), the employment densities used in the capacity assumptions are derived through employment density surveys, as documented in Appendix C: Employment Density Survey. Figure 5-A summarizes the split between residential and non-residential development between 2013-2020 by zone and the jurisdiction average. The percent split is based on the gross acres developed between 2013-2020 using the plat activity and multifamily permits for residential and non-residential permits for non-residential. The information is used to inform the percent split for mixed-use zones, as well as the percent of non-residential uses in residential-only zones.

Figure 5-A: Town of Carbonado Residential vs. Non-residential Development Split

Zone	Use Type Split (Percent)[1] Residential	Non-residential
RLD	100%	0%
RMD	100%	0%
Average	**100%**	**0%**



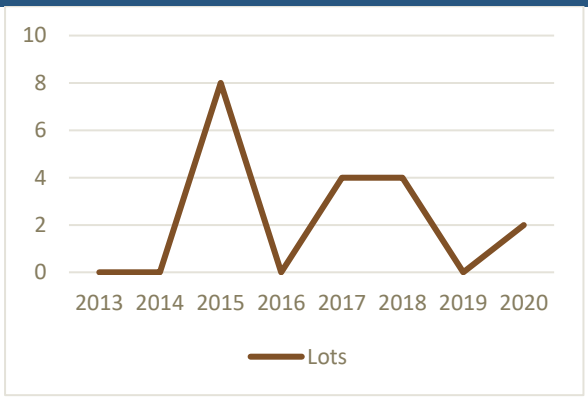
[1]Does not include single-family permits in order to avoid double-counting acreage.
Sources: Town Permit Data, Pierce County Assessor-Treasurer Tax Parcels, Puget Sound Regional Council Housing Unit Permit Database.

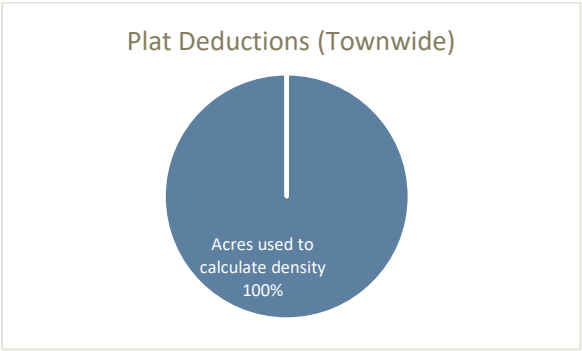
Housing Production Rate

The residential data collected for the Buildable Lands Program tracks the density and other assumptions related to the capacity analysis. The Buildable Lands requirements that were amended in 2017 now require the tracking of housing production to compare to the necessary growth rates to achieve the housing targets. Due to the limitations of the permit data and lack of demolition permit data, Pierce County relies upon the Washington State Office of Financial Management estimates to track the number

of housing units built per year in each jurisdiction for the purposes of this Report. The comparison of housing production and housing needs is shown in Table 1-2 and Table 1-3 (Countywide).

Figure 5-B: Town of Carbonado Housing Production Rates (OFM)





Source: Washington State Office of Financial Management Housing Unit Data (2020).

Platting Activity

Platting activity is used to determine the achieved density for single-family residential zones and to identify the amount of land used for other purposes (whether netted out for density or applied by a regulation and affecting the achieved density). Plat data is used in conjunction with multifamily permits to determine the overall achieved density (as shown in Table 5-2).

Figure 5-C: Town of Carbonado Platting Trends

Plat Activity by Year

Year	Lots	Acres	Density

Residential Building Trends

Both multifamily and single-family building permits are collected and summarized; however, single-family permit reporting is optional per the Pierce County Countywide Planning Policies and limited in use for tracking factors affecting development. The single-family permit data is useful for identifying the total number of units built and the average lot size per zone and is provided as supplemental information. The multifamily permit data is used to identify the observed density and amount of land used for residential purposes. Please note that this data differs from the data provided in Figure 5-B due to collection limitations and should not be used to represent housing production in the jurisdiction.

Figure 5-D: Town of Carbonado Residential Building Permit Trends

Multifamily Permits by Year

No multifamily permits were observed in the timeframe.

Single-Family Permits by Year (Optional)

Year	Units	Acres	Avg. Lot Size
2013	2	1.30	0.65
2014	1	0.44	0.44
2015	9	7.04	0.78
2016	9	8.22	0.91
2017	7	3.35	0.48
2018	2	1.27	0.64
2019	2	0.71	0.36
2020	1	0.23	0.23
Total	**33**	**22.56**	**0.68**

Sources: Town Permit Data, Pierce County Assessor-Treasurer Tax Parcels, Puget Sound Regional Council Housing Unit Permit Database.

Non-residential Building Trends

Non-residential building permits typically include commercial and industrial development; however, public use is often collected and summarized as well when the use type produces jobs. While the project acreage, building square footage, and floor-to-area ratio information is collected and summarized for the report in order to track non-residential development, the employment density is analyzed in a separate report using data other than building permits. The most recent employment density study to support the assumptions in this Report is provided in Appendix C: Employment Density Survey.

Figure 5-E: Town of Carbonado Non-residential Permit Trends

No non-residential permits were observed in the timeframe.

ASSUMPTIONS

Assumptions vary by jurisdiction and zone. Table 5-4 and Table 5-5 provide a snapshot of the densities, mixed-use split, and deductions used in the inventory development and capacity calculation tables. The assumptions for each zone are shown in the assumptions column of the capacity calculation tables shown in Appendix A: Full Data, Calculation Tables, and Maps.

Table 5-4: Town of Carbonado Assumptions Summary

Zone	Residential		Employment		Residential Market Factor		Non-Residential Market Factor		Land for Capital Facilities
	Percent	Density	Percent	Density	Vacant	Underutilized	Vacant	Underutilized	
CF	0%	0	100%	20	0%	0%	10%	50%	0%
CMU	80%	3	20%	20	25%	25%	10%	50%	0%
RLD	100%	3	0%	20	25%	25%	0%	0%	0%
RMD	100%	2	0%	20	25%	25%	0%	0%	0%

The Vacant Single Unit size threshold listed below represents the parcel size used to determine if a vacant property is subdividable or only able to accommodate one unit. Parcels smaller than the size listed are considered Vacant Single Units unless otherwise determined by the jurisdiction during the parcel-specific review.

Table 5-5: Town of Carbonado Plat Deductions for Single-Family Residential Zones

Zone	Roads	Critical Areas	Parks/Open Space	Stormwater	Non-residential	Vacant Single Unit
RLD	0%	0%	0%	0%	3%	<0.48 acres
RMD	0%	0%	0%	0%	3%	<0.48 acres

HOUSING AND EMPLOYMENT CAPACITY

Inventory and Capacity Calculation Characteristics

A portion of the inventory is deducted from the gross acreage based on the assumptions identified in the previous section. Table 5-6 shows the characteristics of the initial inventory and Table 5-7 shows the amount of land that was reduced from that initial inventory to be included in the capacity analysis, as documented in the tables and maps in Appendix A: Full Data, Calculation Tables, and Maps.

Table 5-6: Town of Carbonado Summary of Vacant and Underutilized Land Characteristics

Characteristics/Category	Vacant	Underutilized	Vacant Single Unit	Pipeline
Total Acreage (Gross	29.03	107.75	12.01	1.51
Average Lot Size (Gross)	5.81	1.86	0.50	1.51
Total Acreage (Net)	19.38	91.10	4.57	1.23
Average Lot Size (Net)	3.88	1.57	0.19	1.23
Percent Critical Areas	33%	15%	62%	19%

The parcel inventory is used to categorize land and the capacity calculations are intended to represent the land available for development; thus, the inventory maps alone do not represent the "buildable land" per the Buildable Lands requirements. Table 5-7 shows the overall percentage of land assumed available as capacity in the 20-year planning period and the deductions made to account for constraints to the inventory and overall market conditions.

Table 5-7: Town of Carbonado Summary of Deductions		
Deductions/Category	**Vacant**	**Underutilized**
Critical Areas	9.65	16.65
Plat Deductions	0.00	0.00
Capital Facilities	0.00	0.00
Market Factor	4.85	28.58
Total Percent Reduction in Inventory Land	50%	32%
Percent of Vacant or Underutilized Land Available for Capacity	50%	68%

Capacity Results

The housing and employment capacity totals in Table 5-8 and Table 5-9 are derived from the calculations shown in Appendix A: Full Data, Calculation Tables, and Maps. A summary of the countywide capacity results compared to need is shown in **Error! Reference source not found.** (2030 Housing Target), **Error! Reference source not found.** (2030 Employment Target), and Table 1-12 (DRAFT 2044 Targets).

Table 5-8: Town of Carbonado 2020-2044 Housing Capacity (Dwelling Units)					
Zone	**Vacant**	**Underutilized**	**Vacant Single Unit**	**Pipeline**	**Total**
CF	0	0	0	0	**0**
CMU	0	1	2	0	**3**

CONSISTENCY EVALUATION

Development Trends

The development trends evaluation compares development that has occurred and the planned and regulated characteristics of the applicable zone, as well as with the assumptions used in the report. Since the development trend evaluation window is a short period of time and the application of zoning may change periodically, it is often found that there is not enough information to make a statistically valid conclusion. Due to this, the information is provided but no conclusions have been made.

The development trends evaluation compares development that has occurred and the planned and regulated characteristics of the applicable zone, as well as with the assumptions used in the report. Since the development trend evaluation window is a short period of time and the application of zoning

may change periodically, it is often found that there is not enough information to make a statistically valid conclusion. Due to this, the information is provided but no conclusions have been made.

Error! Not a valid bookmark self-reference. is provided to show the number of permits, units, and acres developed to identify which zones have experienced development in the timeframe.

Table 3-10 is provided to show the number of permits, units, and acres developed to identify which zones have experienced development in the timeframe.

Table 5-10: Town of Carbonado Permits Summary

Zone	Residential Permits	Non-Residential Permits	Dwelling Units	Acres Developed	% Zoned Acreage
CF	0	0	0	0.00	0.0%
CMU	0	0	0	0.00	0.0%
PROS	0	0	0	0.00	0.0%
RLD	6	0	16	7.06	4.3%
RMD	1	0	2	9.09	24.9%

Table 3-11 shows the observed residential density trends in comparison to the permitted density and assumed density for each zone with sufficient data. Both the plat and multifamily project average densities are shown in order to understand the source of the overall density.

Table 5-11: Town of Carbonado Density Evaluation

Zone	Observed Density (Overall)	Observed Plat Density (Single-Family)	Observed Multifamily Density	Assumed Density
CF	0	0	0	0
CMU	0	0	0	3
PROS	0	0	0	0
RLD	2	2	0	3
RMD	0	0	0	2

Table 3-12 shows the observed percent of developed acreage between residential and non-residential uses. Mixed-use project acreage is duplicated in each category, resulting in a 50/50 percent split. In these cases, further analysis would be needed to determine if vertical mixed-use is part of the trend, resulting in a 100/100 percent split. The observed trend is compared to the assumptions used in the report for both the mixed-use split and the assumption for non-residential in and single-family zone. The trend is also compared to the permitted uses to determine if the zone is developing as planned.

Table 5-12: Town of Carbonado Mixed Use Split and Non-residential in Single Family Zones Evaluation

Zone	Observed Residential Percent	Assumed Residential Percent	Observed Non-residential Percent	Assumed Non-residential Percent	Zone Type (Residential, Non-residential, Mixed-use)	Assumed Non-residential in Single-Family zones Percent
CF	0%	0%	0%	100%	Commercial	0%
CMU	0%	80%	0%	20%	Mixed Use	0%
PROS	0%	0%	0%	0%	Other-Not Developable	0%
RLD	100%	100%	0%	0%	Residential	3%
RMD	100%	100%	0%	0%	Residential	3%

Table 3-13 shows the observed plat deductions for jurisdictions that use net acreage to calculate permitted density compared to the assumptions used in the report. Only zones with plat data are shown.

Table 5-13: Town of Carbonado Plat Deductions Evaluation

Zone	Observed Roads	Assumed Roads	Observed Parks/OS	Assumed Parks/OS	Observed Stormwater	Assumed Stormwater
CF	0%	0%	0%	0%	0%	0%
CMU	0%	0%	0%	0%	0%	0%
PROS	0%	0%	0%	0%	0%	0%
RLD	0%	0%	0%	0%	0%	0%
RMD	0%	0%	0%	0%	0%	0%

Housing Production / Growth Targets

Table 3-14 shows the observed housing production and average yearly housing production rate between 2010-2020 in comparison to the 2020-2044 housing growth target need and average yearly housing production rate needed to accommodate the growth target.

Table 5-14: Town of Carbonado Housing Production Trends Compared to Growth Target Needs

Housing Units			Total Housing Growth		Average Yearly Housing Growth (Growth / Years)		
2010 Census	2020 OFM Estimate	2044 Target	2010-2020 Observed	2020-2044 Growth Target	2010-2020 Observed	2020-2044 Growth Target	Yearly Increase Needed
218	244	261	26	17	3	1	-

The observed housing production trend is sufficient to accommodate the 2044 target.

Capacity / Growth Targets

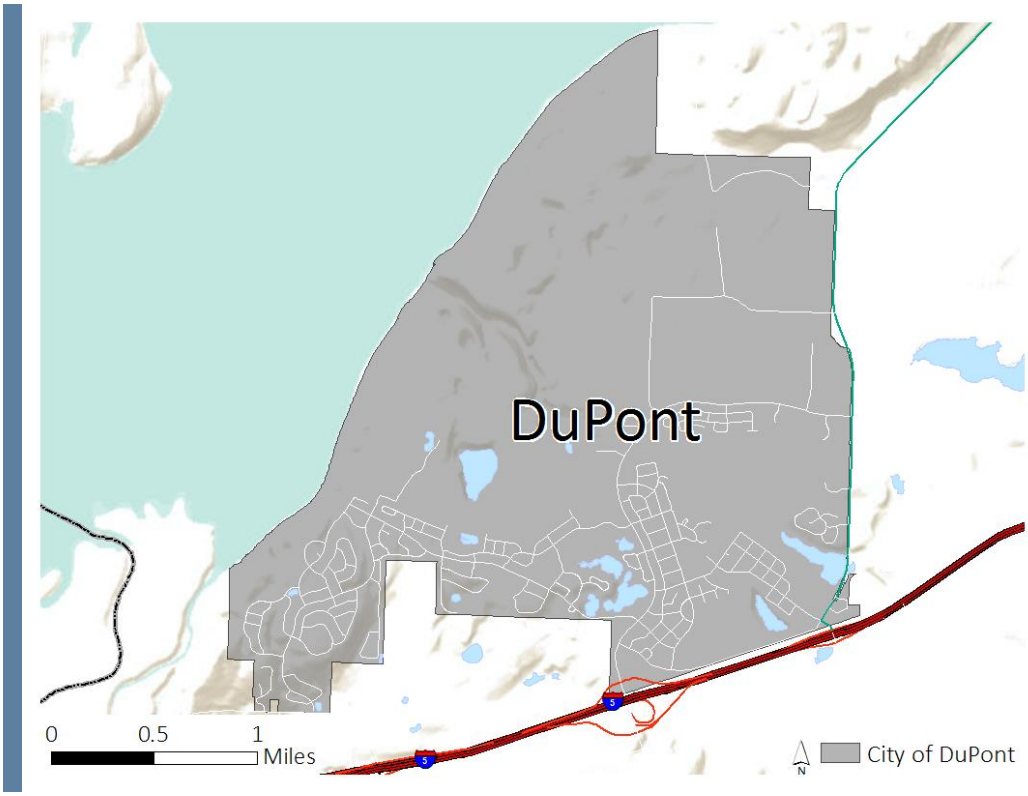

Table 3-15 shows the 2020-2044 housing and employment capacity in comparison to the housing and employment 2020-2044 growth target need.

Table 5-15: Town of Carbonado Housing and Employment Capacity Compared to Growth Target Needs

Housing Capacity	2020-2044 DRAFT Housing Need	Difference	Employment Capacity	2020-2044 DRAFT Employment Need	Difference
208	17	191	192	6	186

There is sufficient capacity to accommodate the 2044 targets.

6 CITY OF DUPONT

The City of DuPont's Comprehensive Plan and regulations implement densities using gross acreage.

Table 6-1: City of DuPont Zone Classifications

Zone Classification		Zone Type[1]	Total Acres[2]
CB	Community Business	Commercial	58.1
COM	Commercial	Commercial	18.2
CP	Community Park	N/A	59.1
IND	Industrial	Industrial	138.1
MRP	Manufacturing Research Park	Industrial	478.1
MUV	Mixed Use Village	Mixed Use	519.7
MXD	Mixed Use	Commercial	58.8
NP	Neighborhood Park	N/A	26.1
OFF	Office	Commercial	52.1
OS	Open Space	N/A	705.7
R-12	Residential-12	Residential	72.2
R-3	Residential-3	Residential	54.5
R-4	Residential-4	Residential	463.6
R-5	Residential-5	Residential	284.8
RR	Residential Reserve	Residential	207.2

[1]For purposes of the Buildable Lands inventory and analysis; not a representation of the City zoning code.
[2]Represents parcel acreage, not zoning coverage.
Sources: City Zoning Code.

DEVELOPMENT TRENDS

This section summarizes building and plat data obtained through the Pierce County Assessor-Treasurer and Auditor Departments observed between **January 1, 2013 and December 31, 2020** that is used to monitor observed densities and update the assumptions for future development. The summaries in this section are designed to show the average statistics used to inform the report. Only data pertinent to the Buildable Lands requirements is collected, and incomplete or not-applicable data is omitted; therefore, this Report does not provide a full summary of all development within the jurisdiction. For more detailed summaries by zone/year, see Appendix A: Full Data, Calculation Tables, and Maps.

Table 6-2 shows the average residential density per zone and jurisdiction-wide and is not intended to show the total units/lots created or overall acres consumed. The results reflect the density calculation used by the jurisdiction, and only include a summary of plats and multifamily (3+ attached units) projects. Table 6-3 shows the average floor-to-area ratio (FAR) by zone and the amount of non-residential building square footage developed. The non-residential projects summarized only include new development and omit additions to existing businesses and non-building type improvements.

Table 6-2: City of DuPont 2013-2020 Residential Trends by Zone[1]

Zone	Acres	Lots/Units	Density
R-12	10.04	240	11.95
R-5	7.18	2	0.28
Total/Avg.	**27.27**	**242**	**8.87**

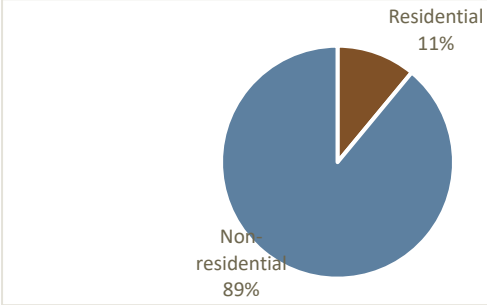

Table 6-3: City of DuPont 2013-2020 Non-residential Trends by Zone

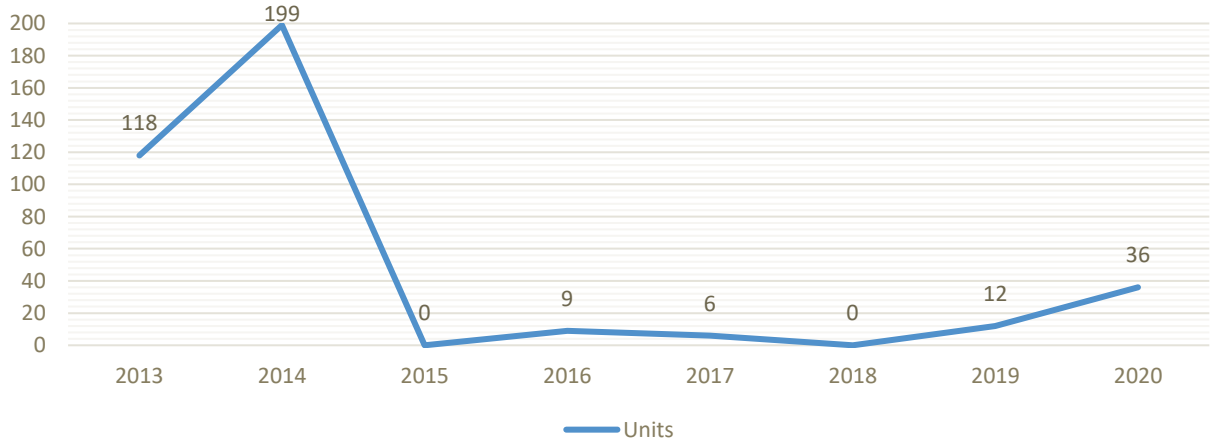
Zone	Acres	Sq. Ft.	FAR
CB	40.91	735,839	0.41
COM	3.33	93,611	0.64
MRP	165.92	2,979,789	0.41
MXD	4.80	146,719	0.70
Total/Avg.	**214.96**	**3,955,958**	**0.42**

[1]Includes multifamily and plat data to represent the overall observed density by zone. Does not include single-family permits in order to accurately represent permitted densities; therefore, does not represent the total number of units developed in the timeframe.
Sources: City Permit Data, Pierce County Assessor-Treasurer Tax Parcels, Puget Sound Regional Council Housing Unit Permit Database.

While the non-residential development trends are informative to show the percent of land consumed for non-residential purposes (as shown in Figure 6-A), the employment densities used in the capacity assumptions are derived through employment density surveys, as documented in Appendix C: Employment Density Survey. Figure 6-A summarizes the split between residential and non-residential development between 2013-2020 by zone and the jurisdiction average. The percent split is based on the gross acres developed between 2013-2020 using the plat activity and multifamily permits for residential and non-residential permits for non-residential. The information is used to inform the percent split for mixed-use zones, as well as the percent of non-residential uses in residential-only zones.

Figure 6-A: City of DuPont Residential vs. Non-residential Development Split



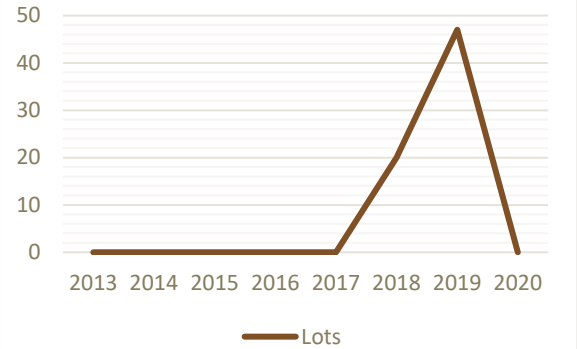
Zone	Use Type Split (Percent)[1]	
	Residential	Non-residential
CB	0%	100%
COM	0%	100%
MRP	0%	100%
MXD	0%	100%
R-12	100%	0%
R-5	100%	0%
Average	**11%**	**89%**

[1]Does not include single-family permits in order to avoid double-counting acreage.
Sources: City Permit Data, Pierce County Assessor-Treasurer Tax Parcels, Puget Sound Regional Council Housing Unit Permit Database.

Housing Production Rate

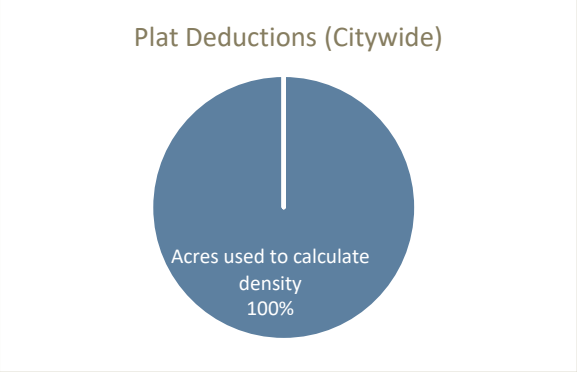
The residential data collected for the Buildable Lands Program tracks the density and other assumptions related to the capacity analysis. The Buildable Lands requirements that were amended in 2017 now require the tracking of housing production to compare to the necessary growth rates to achieve the housing targets. Due to the limitations of the permit data and lack of demolition permit data, Pierce County relies upon the Washington State Office of Financial Management estimates to track the number of housing units built per year in each jurisdiction for the purposes of this Report. The comparison of housing production and housing needs is shown in Table 1-2 and Table 1-3 (Countywide).

Figure 6-B: City of DuPont Housing Production Rates (OFM)



Source: Washington State Office of Financial Management Housing Unit Data (2020).

Platting Activity



Platting activity is used to determine the achieved density for single-family residential zones and to identify the amount of land used for other purposes (whether netted out for density or applied by a regulation and affecting the achieved density). Plat data is used in conjunction with multifamily to determine the overall achieved density (as shown in Table 6-2).

Figure 6-C: City of DuPont Platting Trends

Plat Activity by Year

Year	Lots	Acres	Density
2013	-	-	-
2014	-	-	-
2015	-	-	-

Residential Building Trends

Both multifamily and single-family building permits are collected and summarized; however, single-family permit reporting is optional per the Pierce County Countywide Planning Policies and limited in use for tracking factors affecting development. The single-family permit data is useful for identifying the total number of units built and the average lot size per zone and is provided as supplemental information. The multifamily permit data is used to identify the observed density and amount of land used for residential purposes. Please note that this data differs from the data provided in Figure 6-B due to collection limitations and should not be used to represent housing production in the jurisdiction.

Figure 6-D: City of DuPont Residential Building Permit Trends

Multifamily Permits by Year

Year	Units	Net Acres	Net Density
2013	160	10.95	14.61
2014	15	1.34	11.21
2015	-	-	-
2016	-	-	-
2017	-	-	-
2018	-	-	-

HOUSING AND EMPLOYMENT CAPACITY

Inventory and Capacity Calculation Characteristics

A portion of the inventory is deducted from the gross acreage based on the assumptions identified in the previous section. Table 6-6 shows the characteristics of the initial inventory and Table 6-7 shows the amount of land that was reduced from that initial inventory to be included in the capacity analysis, as documented in the tables and maps in Appendix A: Full Data, Calculation Tables, and Maps.

Table 6-6: City of DuPont Summary of Vacant and Underutilized Land Characteristics				
Characteristics/Category	**Vacant**	**Underutilized**	**Vacant Single Unit**	**Pipeline**
Total Acreage (Gross	81.05	532.94	3.15	28.92
Average Lot Size (Gross)	4.50	23.17	0.17	9.64
Total Acreage (Net)	75.97	509.77	2.79	28.79
Average Lot Size (Net)	4.22	22.16	0.15	9.60
Percent Critical Areas	6%	4%	11%	0%

The parcel inventory is used to categorize land and the capacity calculations are intended to represent the land available for development; thus, the inventory maps alone do not represent the "buildable land" per the Buildable Lands requirements. Table 6-7 shows the overall percentage of land assumed available as capacity in the 20-year planning period and the deductions made to account for constraints to the inventory and overall market conditions.

Table 6-7: City of DuPont Summary of Deductions

R-5	0	0	0	5
RR	0	0	0	0

Table 3-12 shows the observed percent of developed acreage between residential and non-residential uses. Mixed-use project acreage is duplicated in each category, resulting in a 50/50 percent split. In these cases, further analysis would be needed to determine if vertical mixed-use is part of the trend, resulting in a 100/100 percent split. The observed trend is compared to the assumptions used in the

report for both the mixed-use split and the assumption for non-residential in and single-family zone. The trend is also compared to the permitted uses to determine if the zone is developing as planned.

Table 6-12: City of DuPont Mixed Use Split and Non-residential in Single Family Zones Evaluation

Zone	Observed Residential Percent	Assumed Residential Percent	Observed Non-residential Percent	Assumed Non-residential Percent	Zone Type (Residential, Non-residential, Mixed-use)	Assumed Non-residential in Single-Family zones Percent

Housing Production / Growth Targets

Table 3-14 shows the observed housing production and average yearly housing production rate between 2010-2020 in comparison to the 2020-2044 housing growth target need and average yearly housing production rate needed to accommodate the growth target.

Table 6-14: City of DuPont Housing Production Trends Compared to Growth Target Needs

Housing Units			Total Housing Growth		Average Yearly Housing Growth (Growth / Years)		
2010 Census	2020 OFM Estimate	2044 Target	2010-2020 Observed	2020-2044 Growth Target	2010-2020 Observed	2020-2044 Growth Target	Yearly Increase Needed
3,241	3,791	5,751	550	1,960	55	82	**27**

The housing production rate would need to increase slightly to accommodate the 2044 target. The City of DuPont recently rezoned a large area of industrial zoning to mixed use zoning that hasn't started to develop. As that area develops it should close the gap on the housing production need.

Capacity / Growth Targets

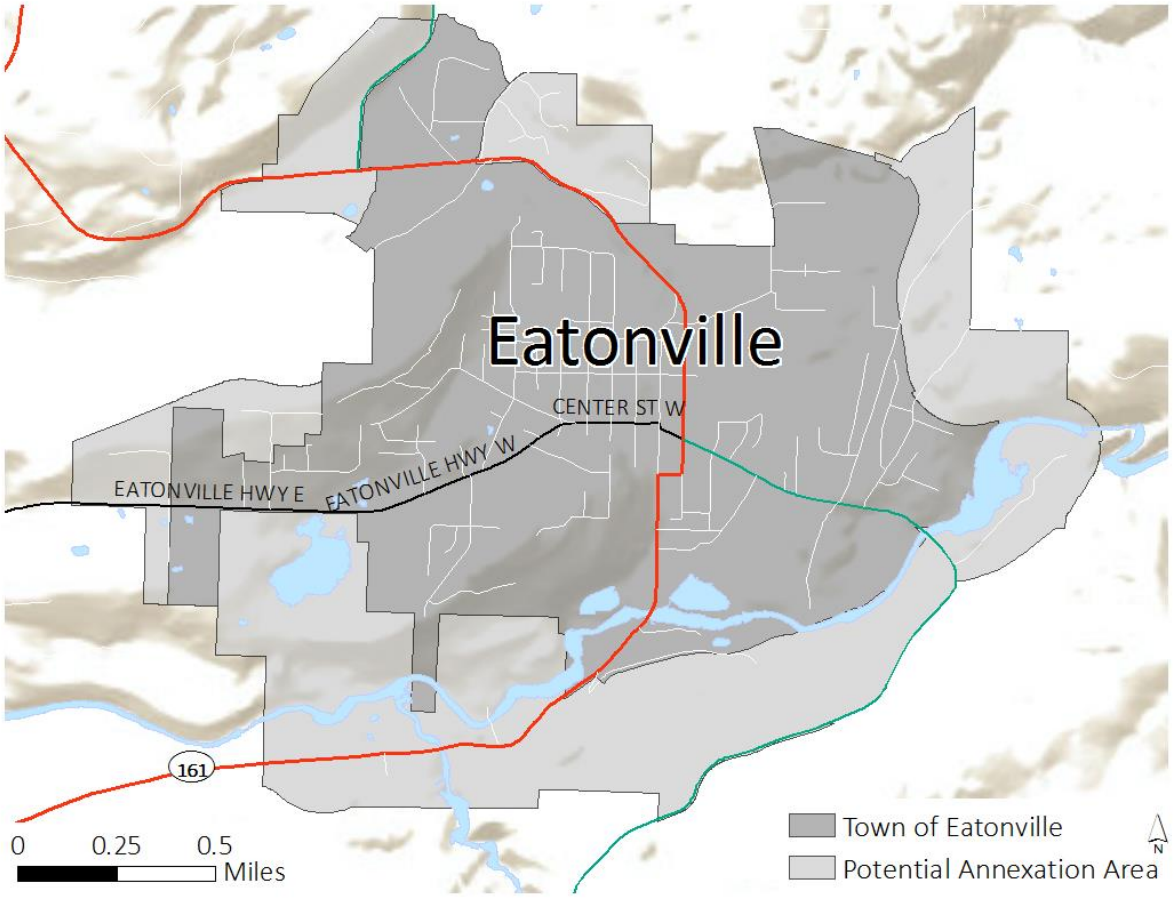

Table 3-15 shows the 2020-2044 housing and employment capacity in comparison to the housing and employment 2020-2044 growth target need.

Table 6-15: City of DuPont Housing and Employment Capacity Compared to Growth Target Needs

Housing Capacity	2020-2044 DRAFT Housing Need	Difference	Employment Capacity	2020-2044 DRAFT Employment Need	Difference
1,150	1,960	-810	4,165	1,177	2,988

The employment capacity is sufficient to accommodate the 2044 employment target. Since the City is now within the High Capacity Transit Communities regional geography, they will be planning for higher housing growth than previously allocated. Currently the housing capacity is not sufficient to accommodate the 2044 housing target. The capacity is just under 60 percent of the total need.

7 TOWN OF EATONVILLE

The Town of Eatonville's Comprehensive Plan and regulations implement density based on gross acreage netting out only roads. However, Planned Unit Developments (PUDs) are based on gross acreage.

Table 7-1: Town of Eatonville Zone Classifications

Zone Classification		Zone Type[1]	Total Acres[2]
AP	Aerospace District	Mixed Use	139.8
C-1	Downtown Commercial District	Mixed Use	35.9
C-2	General Commercia District	Commercial	102.7
MF-1	Multifamily Residential District – Medium Density	Residential	64.7
MF-2	Multifamily Residential District – High Density	Residential	13.8
MU	Mixed Use District	Mixed Use	45.7
SF-1	Single-Family Residential District – Low Density	Residential	317.6
SF-2	Single-Family Residential District – Medium Density	Residential	239.4
SF-3	Single-Family Residential District – High Density	Residential	76.5

[1]For purposes of the Buildable Lands inventory and analysis; not a representation of the Town zoning code.
[2]Represents parcel acreage, not zoning coverage.
Sources: Town Zoning Code.

DEVELOPMENT TRENDS

This section summarizes building and plat data obtained through the Pierce County Assessor-Treasurer and Auditor Departments observed between **January 1, 2013 and December 31, 2020** that is used to monitor observed densities and update the assumptions for future development. The summaries in this section are designed to show the average statistics used to inform the report. Only data pertinent to the Buildable Lands requirements is collected, and incomplete or not-applicable data is omitted; therefore, this Report does not provide a full summary of all development within the jurisdiction. For more detailed summaries by zone/year, see Appendix A: Full Data, Calculation Tables, and Maps.

Table 7-2 shows the average residential density per zone and jurisdiction-wide and is not intended to show the total units/lots created or overall acres consumed. The results reflect the density calculation used by the jurisdiction, and only include a summary of plats and multifamily (3+ attached units) projects. Table 7-3 shows the average floor-to-area ratio (FAR) by zone and the amount of non-residential building square footage developed. The non-residential projects summarized only include new development and omit additions to existing businesses and non-building type improvements.

Table 7-2: Town of Eatonville 2013-2020 Residential Trends by Zone[1]

Zone	Net Acres[2]	Lots/Units	Density
AP	14.54	21	1.44
MF-2	0.28	4	14.37
SF-3	0.30	2	6.75
Total/Avg.	**15.11**	**27**	**1.79**

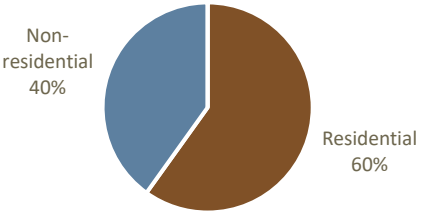

Table 7-3: Town of Eatonville 2013-2020 Non-residential Trends by Zone

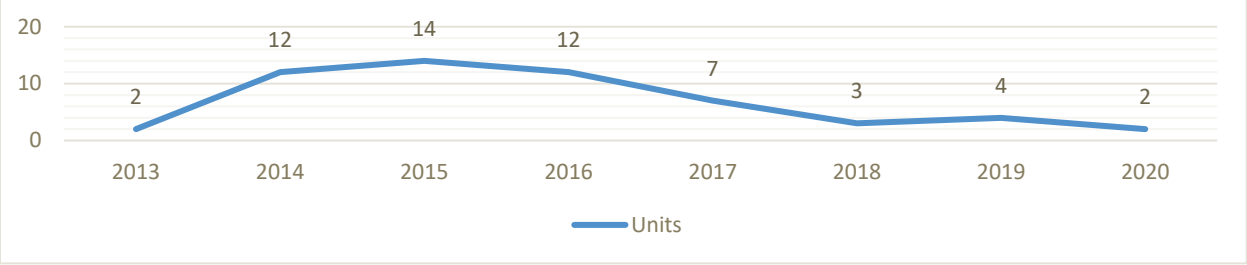
Zone	Acres	Sq. Ft.	FAR
MU	10.10	2,100	0

[1]Includes multifamily and plat data to represent the overall observed density by zone. Does not include single-family permits in order to accurately represent permitted densities; therefore, does not represent the total number of units developed in the timeframe.
Sources: Town Permit Data, Pierce County Assessor-Treasurer Tax Parcels, Puget Sound Regional Council Housing Unit Permit Database.

While the non-residential development trends are informative to show the percent of land consumed for non-residential purposes (as shown in Figure 7-A), the employment densities used in the capacity assumptions are derived through employment density surveys, as documented in Appendix C: Employment Density Survey. Figure 7-A summarizes the split between residential and non-residential development between 2013-2020 by zone and the jurisdiction average. The percent split is based on the gross acres developed between 2013-2020 using the plat activity and multifamily permits for residential and non-residential permits for non-residential. The information is used to inform the percent split for mixed-use zones, as well as the percent of non-residential uses in residential-only zones.

Figure 7-A: Town of Eatonville Residential vs. Non-residential Development Split



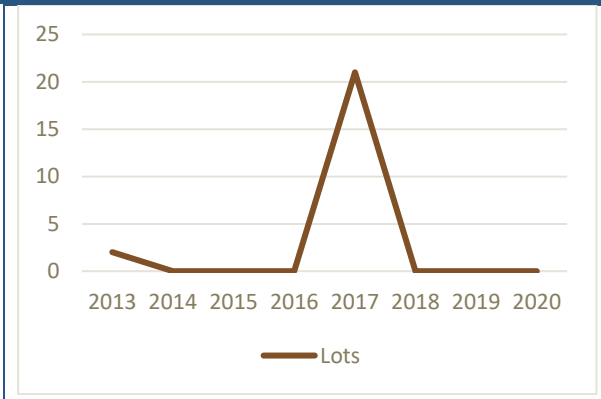
Zone	Use Type Split (Percent)[1] Residential	Non-residential
AP	100%	0%
MF-2	100%	0%
MU	0	100%
SF-3	100%	0%
Average	**60%**	**40%**

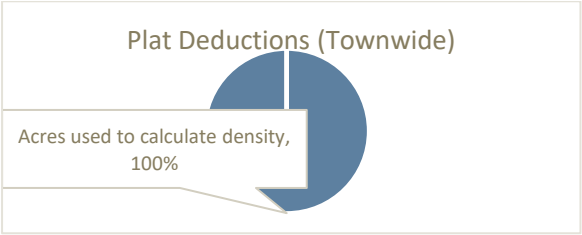
[1]Does not include single-family permits in order to avoid double-counting acreage.
Sources: Town Permit Data, Pierce County Assessor-Treasurer Tax Parcels, Puget Sound Regional Council Housing Unit Permit Database.

Housing Production Rate

The residential data collected for the Buildable Lands Program tracks the density and other assumptions related to the capacity analysis. The Buildable Lands requirements that were amended in 2017 now require the tracking of housing production to compare to the necessary growth rates to achieve the housing targets. Due to the limitations of the permit data and lack of demolition permit data, Pierce County relies upon the Washington State Office of Financial Management estimates to track the number of housing units built per year in each jurisdiction for the purposes of this Report. The comparison of housing production and housing needs is shown in Table 1-2 and Table 1-3 (Countywide).

Figure 7-B: Town of Eatonville Housing Production Rates (OFM)





Source: Washington State Office of Financial Management Housing Unit Data (2020).

Platting Activity

Platting activity is used to determine the achieved density for single-family residential zones and to identify the amount of land used for other purposes (whether netted out for density or applied by a regulation and affecting the achieved density). Plat data is used in conjunction with multifamily permits to determine the overall achieved density (as shown in Table 7-2).

Figure 7-C: Town of Eatonville Platting Trends

Plat Activity by Year

Year	Lots	Acres	Density
2013	2	0.30	6.75
2014	-	-	-

Residential Building Trends

Both multifamily and single-family building permits are collected and summarized; however, single-family permit reporting is optional per the Pierce County Countywide Planning Policies and limited in use for tracking factors affecting development. The single-family permit data is useful for identifying the total number of units built and the average lot size per zone and is provided as supplemental information. The multifamily permit data is used to identify the observed density and amount of land used for residential purposes. Please note that this data differs from the data provided in Figure 7-B due to collection limitations and should not be used to represent housing production in the jurisdiction.

Figure 7-D: Town of Eatonville Residential Building Permit Trends

Multifamily Permits by Year

Year	Units	Net Acres	Net Density
2013	-	-	-
2014	-	-	-
2015	-	-	-
2016	-	-	-
2017	-	-	-
2018	4	0.28	14.37
2019	-	-	-

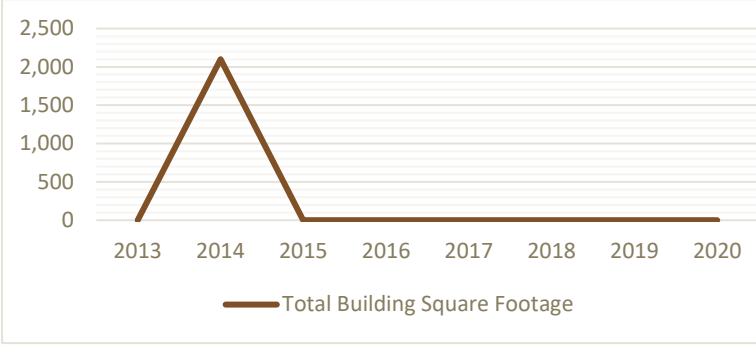
Total	**4**	**0.28**	**14.37**

Single-Family Permits by Year (Optional)



Year	Lots	Acres	Avg. Lot Size
2013	7	1.94	0.28
2014	16	3.90	0.24
2015	12	4.12	0.34
2016	-	-	-
2017	1	0.49	0.49
2018	6	2.45	0.41
2019	3	1.22	0.41
2020	6	3.86	0.64
Total	**51**	**17.99**	**0.35**

Sources: Town Permit Data, Pierce County Assessor-Treasurer Tax Parcels, Puget Sound Regional Council Housing Unit Permit Database.

Non-residential Building Trends

Non-residential building permits typically include commercial and industrial development; however, public use is often collected and summarized as well when the use type produces jobs. While the project acreage, building square footage, and floor-to-area ratio information is collected and summarized for the report in order to track non-residential development, the employment density is analyzed in a separate report using data other than building permits. The most recent employment density study to support the assumptions in this Report is provided in Appendix C: Employment Density Survey.

Figure 7-E: Town of Eatonville Non-residential Permit Trends

Year	Acres	Bldg. SF	FAR

ASSUMPTIONS

Assumptions vary by jurisdiction and zone. Table 7-4 and Table 7-5 provide a snapshot of the densities, mixed-use split, and deductions used in the inventory development and capacity calculation tables. The assumptions for each zone are shown in the assumptions column of the capacity calculation tables shown in Appendix A: Full Data, Calculation Tables, and Maps.

Table 7-4: Town of Eatonville Assumptions Summary

Zone	Residential		Employment		Residential Market Factor		Non-Residential Market Factor		Land for Capital Facilities
	Percent	Density	Percent	Density	Vacant	Underutilized	Vacant	Underutilized	
AP	25%	2	75%	20	25%	25%	10%	50%	0%
C-1	25%	8	75%	20	25%	25%	10%	50%	0%
C-2	0%	0	100%	20	0%	0%	10%	50%	0%
MF-1	100%	16	0%	20	25%	25%	0%	0%	0%
MF-2	100%	23	0%	20	25%	25%	0%	0%	0%
MU	65%	9	35%	20	25%	25%	10%	50%	0%
SF-1	100%	4	0%	20	25%	25%	0%	0%	0%
SF-2	100%	5	0%	20	25%	25%	0%	0%	0%
SF-3	100%	6	0%	20	25%	25%	0%	0%	0%

The Vacant Single Unit size threshold listed below represents the parcel size used to determine if a vacant property is subdividable or only able to accommodate one unit. Parcels smaller than the size listed are considered Vacant Single Units unless otherwise determined by the jurisdiction during the parcel-specific review.

Table 7-5: Town of Eatonville Plat Deductions for Single-Family Residential Zones

Zone	Roads	Critical Areas	Parks/Open Space	Stormwater	Non-residential	Vacant Single Unit
MF-1	N/A	N/A	N/A	N/A	5%	N/A
MF-2	N/A	N/A	N/A	N/A	5%	N/A
SF-1	15%	GIS	0%	0%	5%	<0.55 acres
SF-2	15%	GIS	0%	0%	5%	<0.48 acres
SF-3	15%	GIS	0%	0%	5%	<0.34 acres

HOUSING AND EMPLOYMENT CAPACITY

Inventory and Capacity Calculation Characteristics

A portion of the inventory is deducted from the gross acreage based on the assumptions identified in the previous section. Table 7-6 shows the characteristics of the initial inventory and Table 7-7 shows the amount of land that was reduced from that initial inventory to be included in the capacity analysis, as documented in the tables and maps in Appendix A: Full Data, Calculation Tables, and Maps.

Table 7-6: Town of Eatonville Summary of Vacant and Underutilized Land Characteristics

Characteristics/Category	Vacant	Underutilized	Vacant Single Unit	Pipeline
Total Acreage (Gross	199.30	367.53	50.68	0.65
Average Lot Size (Gross)	2.69	1.97	0.51	0.33
Total Acreage (Net)	133.56	276.80	21.35	0.65
Average Lot Size (Net)	1.80	1.48	0.21	0.33
Percent Critical Areas	33%	25%	58%	0%

The parcel inventory is used to categorize land and the capacity calculations are intended to represent the land available for development; thus, the inventory maps alone do not represent the "buildable land" per the Buildable Lands requirements. Table 7-7 shows the overall percentage of land assumed available as capacity in the 20-year planning period and the deductions made to account for constraints to the inventory and overall market conditions.

Table 7-7: Town of Eatonville Summary of Deductions

Deductions/Category	Vacant	Underutilized
Critical Areas	65.74	90.73
Plat Deductions	6.87	20.57
Capital Facilities	0.00	0.00
Market Factor	23.82	95.05
Total Percent Reduction in Inventory Land	43%	51%
Percent of Vacant or Underutilized Land Available for Capacity	57%	49%

Capacity Results

The housing and employment capacity totals in Table 7-8 and Table 7-9 are derived from the calculations shown in Appendix A: Full Data, Calculation Tables, and Maps. A summary of the countywide capacity results compared to need is shown in **Error! Reference source not found.** (2030 Housing Target), **Error! Reference source not found.** (2030 Employment Target), and Table 1-12 (DRAFT 2044 Targets).

Table 7-8: Town of Eatonville 2020-2044 Housing Capacity (Dwelling Units)

CONSISTENCY EVALUATION

Development Trends

The development trends evaluation compares development that has occurred and the planned and regulated characteristics of the applicable zone, as well as with the assumptions used in the report. Since the development trend evaluation window is a short period of time and the application of zoning may change periodically, it is often found that there is not enough information to make a statistically valid conclusion. Due to this, the information is provided but no conclusions have been made.

The development trends evaluation compares development that has occurred and the planned and regulated characteristics of the applicable zone, as well as with the assumptions used in the report. Since the development trend evaluation window is a short period of time and the application of zoning may change periodically, it is often found that there is not enough information to make a statistically valid conclusion. Due to this, the information is provided but no conclusions have been made.

Error! Not a valid bookmark self-reference. is provided to show the number of permits, units, and acres developed to identify which zones have experienced development in the timeframe.

Table 3-10 is provided to show the number of permits, units, and acres developed to identify which zones have experienced development in the timeframe.

Table 7-10: Town of Eatonville Permits Summary

Zone	Residential Permits	Non-Residential Permits	Dwelling Units	Acres Developed	% Zoned Acreage
AP	1	0	21	14.54	10.0%
C-1	0	0	0	0.00	0.0%
C-2	0	0	0	0.00	0.0%
MF-1	0	0	0	0.00	0.0%
MF-2	1	0	4	0.28	2.0%

ROW	0	0	0	0.00	0.0%
SF-1	0	0	0	0.00	0.0%
SF-2	0	0	0	0.00	0.0%
SF-3	1	0	2	0.30	0.4%

Table 3-11 shows the observed residential density trends in comparison to the permitted density and assumed density for each zone with sufficient data. Both the plat and multifamily project average densities are shown in order to understand the source of the overall density.

Table 7-11: Town of Eatonville Density Evaluation

Zone	Observed Density (Overall)	Observed Plat Density (Single-Family)	Observed Multifamily Density	Assumed Density
AP	1	1	0	2
C-1	0	0	0	8
C-2	0	0	0	0
MF-1	0	0	0	16
MF-2	14	0	14	23
MU	0	0	0	9
ROW	0	0	0	0
SF-1	0	0	0	4
SF-2	0	0	0	5
SF-3	7	7	0	6

Table 3-12 shows the observed percent of developed acreage between residential and non-residential uses. Mixed-use project acreage is duplicated in each category, resulting in a 50/50 percent split. In these cases, further analysis would be needed to determine if vertical mixed-use is part of the trend, resulting in a 100/100 percent split. The observed trend is compared to the assumptions used in the report for both the mixed-use split and the assumption for non-residential in and single-family zone. The trend is also compared to the permitted uses to determine if the zone is developing as planned.

Table 7-12: Town of Eatonville Mixed Use Split and Non-residential in Single Family Zones Evaluation

Zone	Observed Residential Percent	Assumed Residential Percent	Observed Non-residential Percent	Assumed Non-residential Percent	Zone Type (Residential, Non-residential, Mixed-use)	Assumed Non-residential in Single-Family zones Percent
AP	100%	25%	0%	75%	Mixed Use	0%

MF-1	0%	0%	0%	0%	0%	0%
MF-2	0%	0%	0%	0%	0%	0%
MU	0%	0%	0%	0%	0%	0%
ROW	0%	0%	0%	0%	0%	0%
SF-1	0%	15%	0%	0%	0%	0%
SF-2	0%	15%	0%	0%	0%	0%
SF-3	0%	15%	0%	0%	0%	0%

Housing Production / Growth Targets

Table 3-14 shows the observed housing production and average yearly housing production rate between 2010-2020 in comparison to the 2020-2044 housing growth target need and average yearly housing production rate needed to accommodate the growth target.

Table 7-14: Town of Eatonville Housing Production Trends Compared to Growth Target Needs

Housing Units			Total Housing Growth		Average Yearly Housing Growth (Growth / Years)		
2010 Census	2020 OFM Estimate	2044 Target	2010-2020 Observed	2020-2044 Growth Target	2010-2020 Observed	2020-2044 Growth Target	Yearly Increase Needed
1,059	1,127	1,404	68	277	7	12	**5**

The observed housing production rate is less than but very close to the rate needed to accommodate the 2044 housing target. It is expected that housing production fluctuates over time, and the current rate is consistent with the future need.

Capacity / Growth Targets

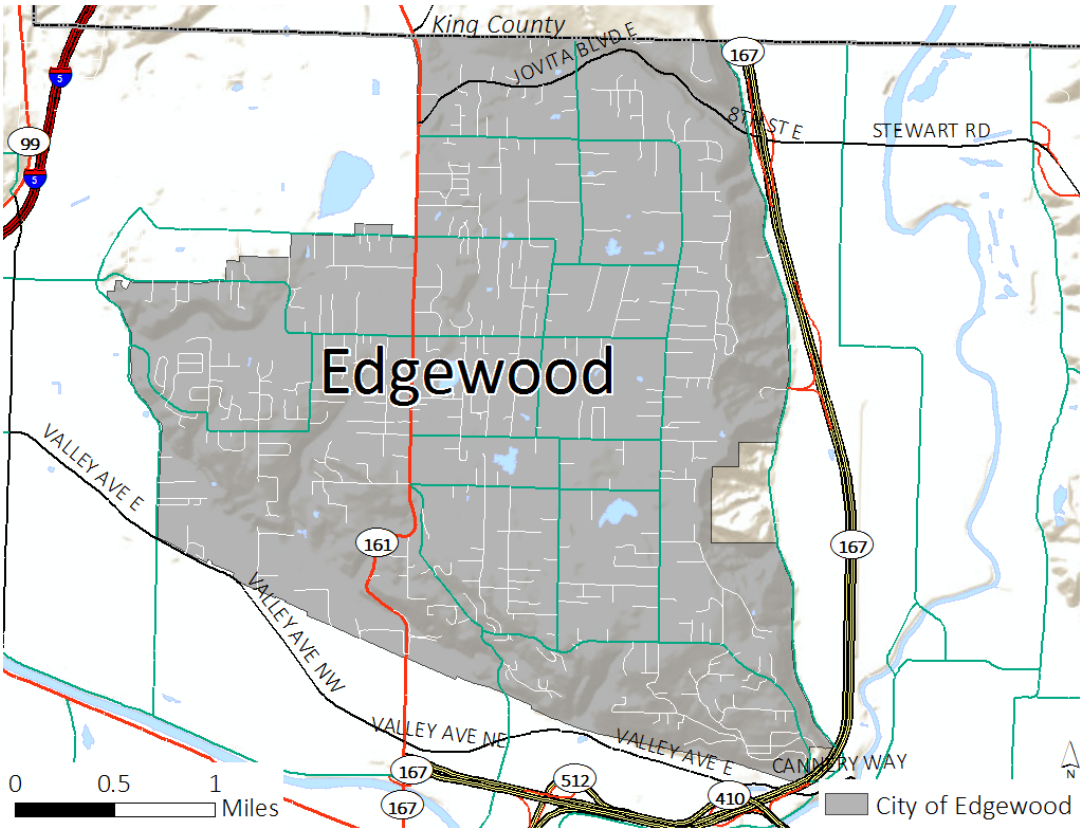

Table 3-15 shows the 2020-2044 housing and employment capacity in comparison to the housing and employment 2020-2044 growth target need.

Table 7-15: Town of Eatonville Housing and Employment Capacity Compared to Growth Target Needs

Housing Capacity	2020-2044 DRAFT Housing Need	Difference	Employment Capacity	2020-2044 DRAFT Employment Need	Difference
1,188	277	911	2,491	152	2,339

The capacity is sufficient to accommodate the 2044 targets.

8 CITY OF EDGEWOOD

The City of Edgewood's Comprehensive Plan and regulations implement densities based on acreage, subtracting critical areas and their associated buffers, including wetlands, streams, landslide hazard areas, and flood areas.

Table 8-1: City of Edgewood Zone Classifications

Zone Classification		Zone Type[1]	Total Acres[2]
BP	Business Park	Mixed Use	34.1
C	Commercial	Mixed Use	87.2
I	Industrial	Industrial	18.0
MR-1	Mixed Residential – Low	Residential	90.0
MR-2	Mixed Residential – Moderate	Residential	45.7
MUR	Mixed Use Residential	Mixed Use	110.6
P	Public	Public Use	186.7
SF-2	Single-Family – Low	Residential	1,938.7
SF-3	Single-Family – Moderate	Residential	2,241.8
SF-5	Single-Family – High	Residential	61.3
TC	Town Center	Mixed Use	76.9

[1]For purposes of the Buildable Lands inventory and analysis; not a representation of the City zoning code.
[2]Represents parcel acreage, not zoning coverage.

DEVELOPMENT TRENDS

This section summarizes permit data observed between **January 1, 2013 and December 31, 2019** and plat activity through December 31, 2020 that is used to monitor observed densities and update the assumptions for future development. The summaries in this section are designed to show the average statistics used to inform the report. Only data pertinent to the Buildable Lands requirements is collected, and incomplete or not-applicable data is omitted; therefore, this Report does not provide a full summary of all development within the jurisdiction. For more detailed summaries by zone/year, see Appendix A: Full Data, Calculation Tables, and Maps.

Table 8-2 shows the average residential density per zone and jurisdiction-wide and is not intended to show the total units/lots created or overall acres consumed. The results reflect the density calculation used by the jurisdiction, and only include a summary of plats and multifamily (3+ attached units) projects. Table 8-3 shows the average floor-to-area ratio (FAR) by zone and the amount of non-residential building square footage developed. The non-residential projects summarized only include new development and omit additions to existing businesses and non-building type improvements.

Table 8-2: City of Edgewood 2013-2020 Residential Trends by Zone[1]

Zone	Net Acres[2]	Lots/Units	Density
MR-1	54.55	90	1.65
MR-2	23.37	205	8.77
SF-2	53.70	77	1.43
SF-3	64.47	118	1.83
SF-5	20.45	80	3.91
TC	15.26	345	22.60
C	2.56	24	9.39
Total/Avg.	**234.37**	**939**	**4.01**

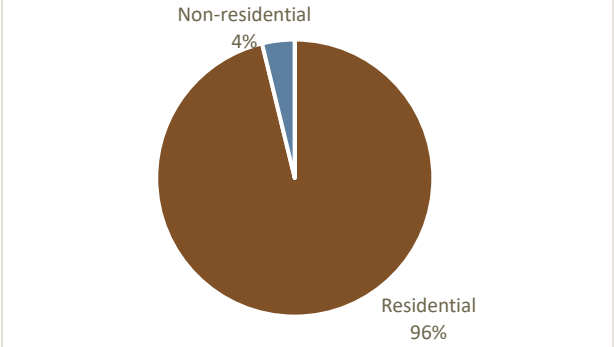

Table 8-3: City of Edgewood 2013-2020 Non-residential Trends by Zone

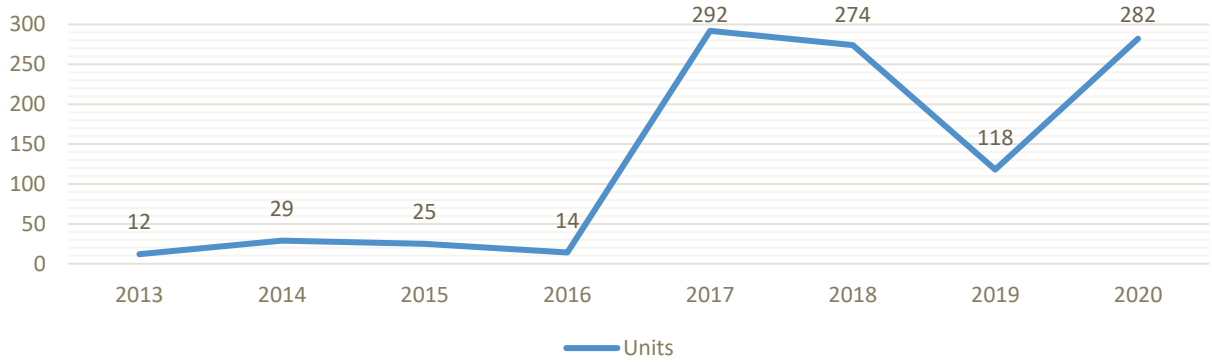
Zone	Acres	Sq. Ft.	FAR
C	7.36	97,090	0.30
TC	1.89	40,920	0.50
Total/Avg.	**9.25**	**138,010**	**0.34**

[1]Includes multifamily and plat data to represent the overall observed density by zone. Does not include single-family permits in order to accurately represent permitted densities; therefore, does not represent the total number of units developed in the timeframe.
Sources: City Permit Data, Pierce County Assessor-Treasurer Tax Parcels, Puget Sound Regional Council Housing Unit Permit Database.

While the non-residential development trends are informative to show the percent of land consumed for non-residential purposes (as shown in Figure 8-A), the employment densities used in the capacity assumptions are derived through employment density surveys, as documented in Appendix C: Employment Density Survey. Figure 8-A summarizes the split between residential and non-residential development between 2013-2020 by zone and the jurisdiction average. The percent split is based on the gross acres developed between 2013-2020 using the plat activity and multifamily permits for residential and non-residential permits for non-residential. The information is used to inform the percent split for mixed-use zones, as well as the percent of non-residential uses in residential-only zones.

Figure 8-A: City of Edgewood Residential vs. Non-residential Development Split



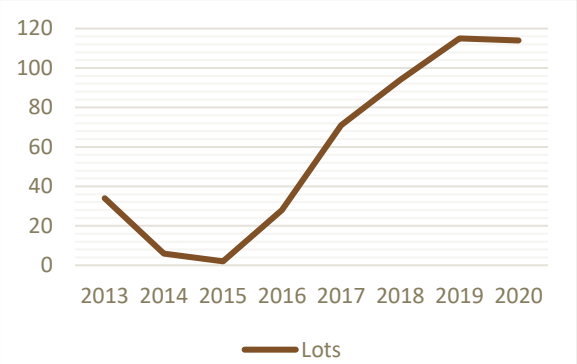
Zone	Use Type Split (Percent)[1] Residential	Non-residential
C	26%	74%
MR-1	100%	0%
MR-2	100%	0%
SF-2	100%	0%
SF-3	100%	0%
SF-5	100%	0%
TC	89%	11%
Average	**96%**	**4%**

[1]Does not include single-family permits in order to avoid double-counting acreage.
Sources: City Permit Data, Pierce County Assessor-Treasurer Tax Parcels, Puget Sound Regional Council Housing Unit Permit Database.

Housing Production Rate

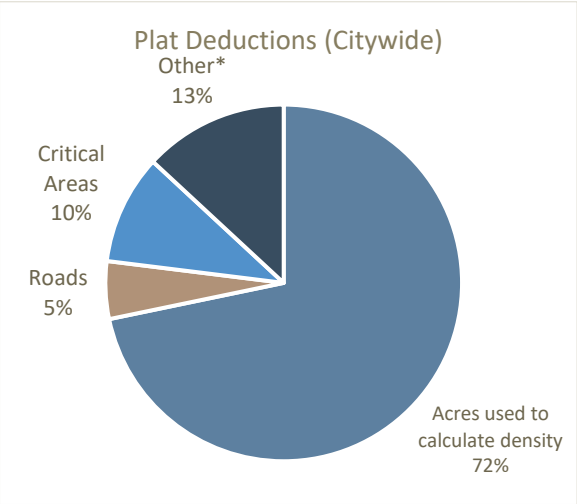
The residential data collected for the Buildable Lands Program tracks the density and other assumptions related to the capacity analysis. The Buildable Lands requirements that were amended in 2017 now require the tracking of housing production to compare to the necessary growth rates to achieve the housing targets. Due to the limitations of the permit data and lack of demolition permit data, Pierce County relies upon the Washington State Office of Financial Management estimates to track the number of housing units built per year in each jurisdiction for the purposes of this Report. The comparison of housing production and housing needs is shown in Table 1-2 and Table 1-3 (Countywide).

Figure 8-B: City of Edgewood Housing Production Rates (OFM)



Source: Washington State Office of Financial Management Housing Unit Data (2020).

Platting Activity



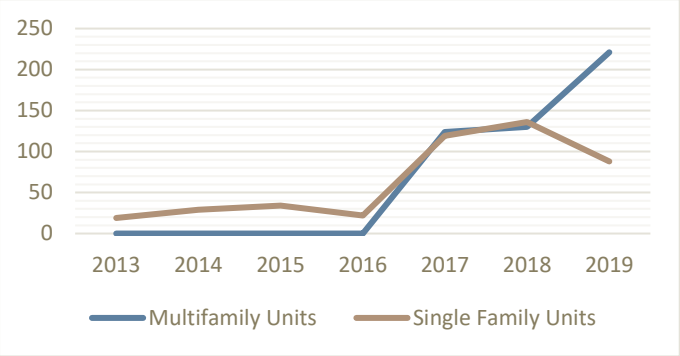
Platting activity is used to determine the achieved density for single-family residential zones and to identify the amount of land used for other purposes (whether netted out for density or applied by a regulation and affecting the achieved density). Plat data is used in conjunction with multifamily permits to determine the overall achieved density (as shown in Table 8-2).

Figure 8-C: City of Edgewood Platting Trends

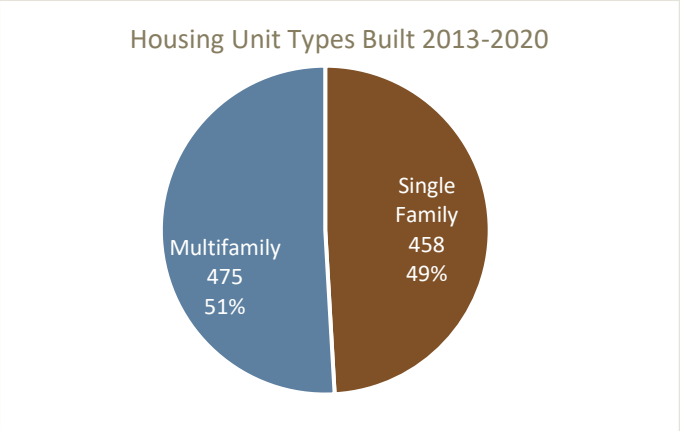
Plat Activity by Year

Year	Lots	Acres	Density
2013	34	26.08	1.30
2014	6	7.23	0.83
2015	2	1.01	1.98
2016	28	8.03	3.48
2017	71	17.67	4.02
2018	94	18.92	4.97
2019	115	35.98	3.20
2020	114	37.29	3.06
Total	**464**	**152.21**	**3.05**

Plat Deductions by Zone (Percent)



Zone	Roads	Critical Areas	Parks/Open Space	Storm -water
C	21.5%	6.7%	17.1%	0.0%
MR-1	1.8%	29.8%	1.3%	2.8%
MR-2	18.5%	19.5%	8.1%	7.1%
SF-2	4.8%	0.2%	1.7%	4.5%
SF-3	2.5%	2.1%	1.3%	1.6%
SF-5	11.0%	0.0%	0.0%	5.2%
Average	**5.2%**	**9.9%**	**2.0%**	**3.4%**



*Includes "other category" not shown in the plat deductions summary. See development data summaries for full data.
Sources: City Permit Data, Pierce County Auditor Recorded Plats.

Residential Building Trends

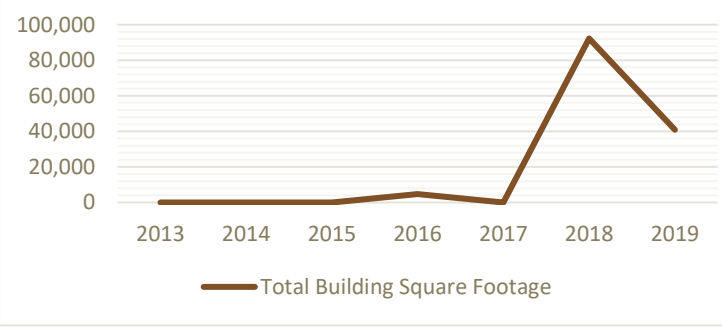
Both multifamily and single-family building permits are collected and summarized; however, single-family permit reporting is optional per the Pierce County Countywide Planning Policies and limited in use for tracking factors affecting development. The single-family permit data is useful for identifying the total number of units built and the average lot size per zone and is provided as supplemental information. The multifamily permit data is used to identify the observed density and amount of land used for residential purposes. Please note that this data differs from the data provided in Figure 8-B due to collection limitations and should not be used to represent housing production in the jurisdiction.

Figure 8-D: City of Edgewood Residential Building Permit Trends

Multifamily Permits by Year

Year	Units	Net Acres	Net Density
2013	-	-	-
2014	-	-	-
2015	-	-	-
2016	-	-	-
2017	124	6.63	18.70
2018	130	6.95	18.70
2019	221	8.63	25.59
Total	**475**	**22.21**	**21.38**

Single-Family Permits by Year (Optional)



Year	Lots	Acres	Avg. Lot Size
2013	19	10.43	0.55
2014	29	16.57	0.57
2015	34	34.86	1.03
2016	22	26.73	1.21
2017	119	24.46	0.21
2018	136	38.88	0.29
2019	99	30.29	0.31
Total	**458**	**182.21**	**0.40**

Sources: City Permit Data, Pierce County Assessor-Treasurer Tax Parcels, Puget Sound Regional Council Housing Unit Permit Database.

Non-residential Building Trends

Non-residential building permits typically include commercial and industrial development; however, public use is often collected and summarized as well when the use type produces jobs. While the project acreage, building square footage, and floor-to-area ratio information is collected and summarized for the report in order to track non-residential development, the employment density is analyzed in a separate report using data other than building permits. The most recent employment density study to support the assumptions in this Report is provided in Appendix C: Employment Density Survey.

Figure 8-E: City of Edgewood Non-residential Permit Trends

Year	Acres	Bldg. SF	FAR
2013	-	-	-
2014	-	-	-
2015	-	-	-
2016	1.29	4,823	0.09
2017	-	-	-
2018	6.07	92,267	0.35
2019	1.89	40,920	0.50
Total	**9.25**	**138,010**	**0.34**

Sources: City Permit Data, Pierce County Assessor-Treasurer Tax Parcels, Puget Sound Regional Council Housing Unit Permit Database.

ASSUMPTIONS

Assumptions vary by jurisdiction and zone. Table 8-4 and Table 8-5 provide a snapshot of the densities, mixed-use split, and deductions used in the inventory development and capacity calculation tables. The assumptions for each zone are shown in the assumptions column of the capacity calculation tables shown in Appendix A: Full Data, Calculation Tables, and Maps.

Table 8-4: City of Edgewood Assumptions Summary

Zone	Residential		Employment		Residential Market Factor		Non-Residential Market Factor		Land for Capital Facilities
	Percent	Density	Percent	Density	Vacant	Underutilized	Vacant	Underutilized	
BP	30%	8	70%	20	0%	10%	0%	0%	2%
C	40%	12	60%	20	0%	10%	0%	0%	2%
I	0%	0	100%	9	25%	25%	0%	0%	2%
MR-1	100%	4	0%	20	25%	25%	0%	0%	2%
MR-2	100%	8	0%	20	0%	10%	0%	0%	2%

P	0%	0	100%	20	25%	25%	0%	0%	2%
SF-2	100%	2	0%	20	25%	25%	0%	0%	2%
SF-3	100%	3	0%	20	25%	25%	0%	0%	2%
SF-5	100%	5	0%	20	0%	10%	0%	0%	2%
TC	70%	24	30%	20	0%	10%	0%	0%	2%

The Vacant Single Unit size threshold listed below represents the parcel size used to determine if a vacant property is subdividable or only able to accommodate one unit. Parcels smaller than the size listed are considered Vacant Single Units unless otherwise determined by the jurisdiction during the parcel-specific review.

Table 8-5: City of Edgewood Plat Deductions for Single-Family Residential Zones

Zone	Roads	Critical Areas	Parks/Open Space	Stormwater	Non-residential	Vacant Single Unit
MR-1	N/A	N/A	N/A	N/A	5%	N/A
MR-2	N/A	N/A	N/A	N/A	5%	N/A
SF-2	9.80%	GIS	5%	0%	5%	<1.50 acres
SF-3	9.80%	GIS	5%	0%	5%	<0.83 acres
SF-5	9.80%	GIS	5%	0%	5%	<0.50 acres

HOUSING AND EMPLOYMENT CAPACITY

Inventory and Capacity Calculation Characteristics

A portion of the inventory is deducted from the gross acreage based on the assumptions identified in the previous section. Table 8-6 shows the characteristics of the initial inventory and Table 8-7 shows the amount of land that was reduced from that initial inventory to be included in the capacity analysis, as documented in the tables and maps in Appendix A: Full Data, Calculation Tables, and Maps.

Table 8-6: City of Edgewood Summary of Vacant and Underutilized Land Characteristics

Characteristics/Category	Vacant	Underutilized	Vacant Single Unit	Pipeline
Total Acreage (Gross	374.35	1,647.73	232.25	67.97
Average Lot Size (Gross)	3.34	2.52	0.52	3.78
Total Acreage (Net)	229.10	1,261.88	95.52	62.08
Average Lot Size (Net)	2.05	1.93	0.21	3.45
Percent Critical Areas	39%	23%	59%	9%

The parcel inventory is used to categorize land and the capacity calculations are intended to represent the land available for development; thus, the inventory maps alone do not represent the "buildable land" per the Buildable Lands requirements. Table 8-7 shows the overall percentage of land assumed available as capacity in the 20-year planning period and the deductions made to account for constraints to the inventory and overall market conditions.

Table 8-7: City of Edgewood Summary of Deductions

Deductions/Category	Vacant	Underutilized
Critical Areas	145.25	385.86
Infrastructure Gaps	164.87	1,039.63
Plat Deductions	26.42	167.73
Capital Facilities	4.32	21.32
Market Factor	34.36	243.69
Total Percent Reduction in Inventory Land	49%	48%
Percent of Vacant or Underutilized Land Available for Capacity	51%	52%

Capacity Results

The housing and employment capacity totals in Table 8-8 and Table 8-9 are derived from the calculations shown in Appendix A: Full Data, Calculation Tables, and Maps. A summary of the countywide capacity results compared to need is shown in **Error! Reference source not found.** (2030 Housing Target), **Error! Reference source not found.** (2030 Employment Target), and Table 1-12 (DRAFT 2044 Targets).

Table 8-8: City of Edgewood 2020-2044 Housing Capacity (Dwelling Units)

Zone	Vacant	Underutilized	Vacant Single Unit	Pipeline	Total
BP	11	13	0	288	**312**

CONSISTENCY EVALUATION

Development Trends

The development trends evaluation compares development that has occurred and the planned and regulated characteristics of the applicable zone, as well as with the assumptions used in the report. Since the development trend evaluation window is a short period of time and the application of zoning may change periodically, it is often found that there is not enough information to make a statistically valid conclusion. Due to this, the information is provided but no conclusions have been made.

The development trends evaluation compares development that has occurred and the planned and regulated characteristics of the applicable zone, as well as with the assumptions used in the report. Since the development trend evaluation window is a short period of time and the application of zoning may change periodically, it is often found that there is not enough information to make a statistically valid conclusion. Due to this, the information is provided but no conclusions have been made.

Error! Not a valid bookmark self-reference. is provided to show the number of permits, units, and acres developed to identify which zones have experienced development in the timeframe.

Table 3-10 is provided to show the number of permits, units, and acres developed to identify which zones have experienced development in the timeframe.

Table 8-10: City of Edgewood Permits Summary					
Zone	**Residential Permits**	**Non-Residential Permits**	**Dwelling Units**	**Acres Developed**	**% Zoned Acreage**
BP	0	0	0	0.00	0.0%
C	1	2	24	9.92	11.1%
I	0	0	0	0.00	0.0%
MR-1	2	0	90	54.55	61.5%
MR-2	3	0	205	23.81	45.3%
MUR	0	0	0	0.00	0.0%
P	0	0	0	0.00	0.0%
SF-2	12	0	77	53.70	2.7%
SF-3	21	0	118	64.47	2.9%
SF-5	5	0	80	20.45	32.3%
TC	2	1	345	19.34	25.3%

Table 3-11 shows the observed residential density trends in comparison to the permitted density and assumed density for each zone with sufficient data. Both the plat and multifamily project average densities are shown in order to understand the source of the overall density.

Table 8-11: City of Edgewood Density Evaluation				
Zone	**Observed Density (Overall)**	**Observed Plat Density (Single-Family)**	**Observed Multifamily Density**	**Assumed Density**
BP	0	0	0	8
C	20	20	0	12
I	0	0	0	0
MR-1	5	5	0	4
MR-2	14	10	19	8
MUR	0	0	0	12
P	0	0	0	0
SF-2	2	2	0	2
SF-3	2	2	0	3
SF-5	5	5	0	5
TC	23	0	23	24

Table 3-12 shows the observed percent of developed acreage between residential and non-residential uses. Mixed-use project acreage is duplicated in each category, resulting in a 50/50 percent split. In these cases, further analysis would be needed to determine if vertical mixed-use is part of the trend, resulting in a 100/100 percent split. The observed trend is compared to the assumptions used in the report for both the mixed-use split and the assumption for non-residential in and single-family zone. The trend is also compared to the permitted uses to determine if the zone is developing as planned.

Table 8-12: City of Edgewood Mixed Use Split and Non-residential in Single Family Zones Evaluation

Zone	Observed Residential Percent	Assumed Residential Percent	Observed Non-residential Percent	Assumed Non-residential Percent	Zone Type (Residential, Non-residential, Mixed-use)	Assumed Non-residential in Single-Family zones Percent
BP	0%	30%	0%	70%	Mixed Use	0%
C	26%	40%	74%	60%	Mixed Use	0%
I	0%	0%	0%	100%	Industrial	0%

C	22%	0%	17%	0%	0%	0%
I	0%	0%	0%	0%	0%	0%
MR-1	2%	10%	1%	5%	3%	0%
MR-2	19%	10%	8%	5%	7%	0%
MUR	0%	0%	0%	0%	0%	0%
P	0%	0%	0%	0%	0%	0%
SF-2	5%	10%	2%	5%	5%	0%
SF-3	3%	10%	1%	5%	2%	0%
SF-5	11%	10%	0%	5%	5%	0%
TC	0%	0%	0%	0%	0%	0%

Housing Production / Growth Targets

Table 3-14 shows the observed housing production and average yearly housing production rate between 2010-2020 in comparison to the 2020-2044 housing growth target need and average yearly housing production rate needed to accommodate the growth target.

Table 8-14: City of Edgewood Housing Production Trends Compared to Growth Target Needs

Housing Units			Total Housing Growth		Average Yearly Housing Growth (Growth / Years)		
2010 Census	2020 OFM Estimate	2044 Target	2010-2020 Observed	2020-2044 Growth Target	2010-2020 Observed	2020-2044 Growth Target	Yearly Increase Needed
3,801	5,125	7,557	1,324	2,432	132	101	-

The observed housing production rates are sufficient to accommodate the 2044 target.

Capacity / Growth Targets

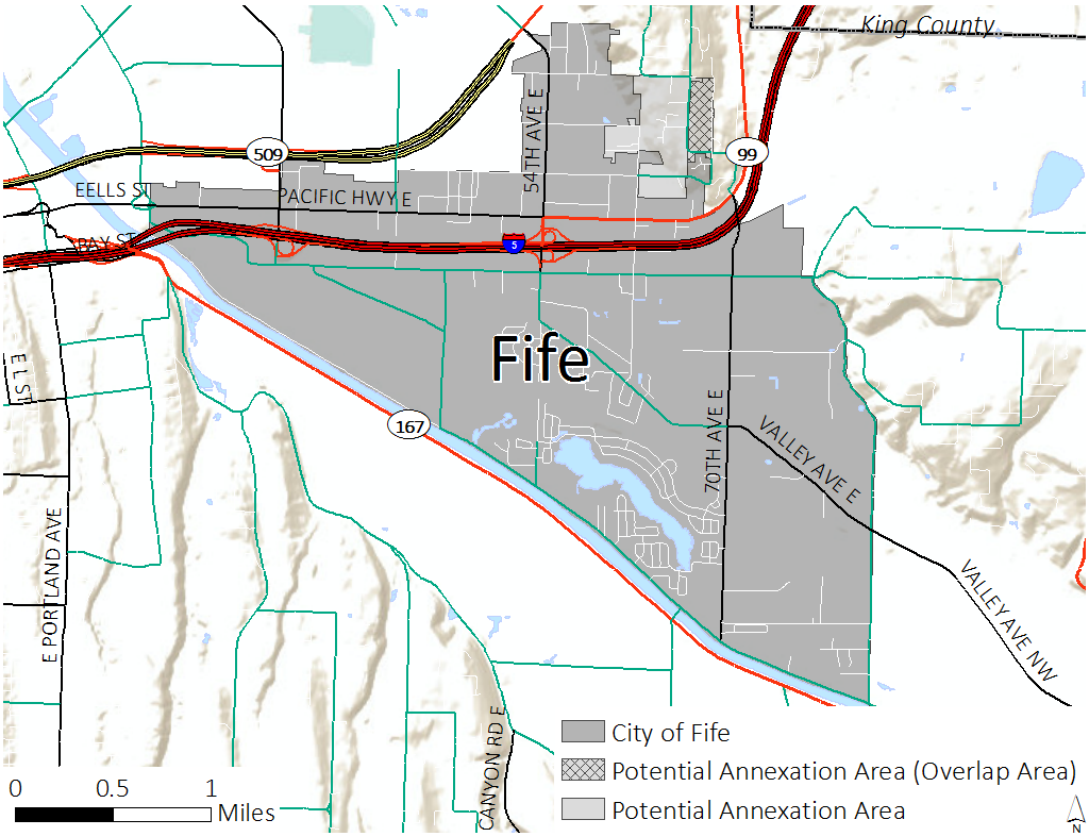

Table 3-15 shows the 2020-2044 housing and employment capacity in comparison to the housing and employment 2020-2044 growth target need.

Table 8-15: City of Edgewood Housing and Employment Capacity Compared to Growth Target Needs

Housing Capacity	2020-2044 DRAFT Housing Need	Difference	Employment Capacity	2020-2044 DRAFT Employment Need	Difference
3,584	2,432	1,152	4,047	1,962	2,085

The capacity is adequate to accommodate the 2044 targets.

9 CITY OF FIFE

The City of Fife's Comprehensive Plan and regulations implement densities using net acreage, deducting critical areas and buffers, roads, and public use space.

Table 9-1: City of Fife Zone Classifications

Zone Classification		Zone Type[1]	Total Acres[2]
BP	Business Park	Commercial	23.1
CC	Community Commercial	Mixed Use	194.1
CMU	Community Mixed Use	Mixed Use	193.6
HDR	High Density Residential	Residential	76.5
I	Industrial	Industrial	1,485.4
MDR	Medium Density Residential	Residential	154.4
NC	Neighborhood Commercial	Mixed Use	57.1
NR	Neighborhood Residential	Mixed Use	144.0
POS	Public Use/Open Space	N/A	153.6
RC	Regional Commercial	Mixed Use	379.3
SFR	Single-Family Residential	Residential	173.3
SLR	Small Lot Residential	Residential	11.3

[1]For purposes of the Buildable Lands inventory and analysis; not a representation of the City zoning code.
[2]Represents parcel acreage, not zoning coverage.

DEVELOPMENT TRENDS

This section summarizes permit data observed between **January 1, 2013 and December 31, 2019** and plat activity through December 31, 2020 that is used to monitor observed densities and update the assumptions for future development. The summaries in this section are designed to show the average statistics used to inform the report. Only data pertinent to the Buildable Lands requirements is collected, and incomplete or not-applicable data is omitted; therefore, this Report does not provide a full summary of all development within the jurisdiction. For more detailed summaries by zone/year, see Appendix A: Full Data, Calculation Tables, and Maps.

Table 9-2 shows the average residential density per zone and jurisdiction-wide and is not intended to show the total units/lots created or overall acres consumed. The results reflect the density calculation used by the jurisdiction, and only include a summary of plats and multifamily (3+ attached units) projects. Table 9-3 shows the average floor-to-area ratio (FAR) by zone and the amount of non-residential building square footage developed. The non-residential projects summarized only include new development and omit additions to existing businesses and non-building type improvements.

Table 9-2: City of Fife 2013-2020 Residential Trends by Zone[1]

Zone	Net Acres[2]	Lots/Units	Density
HDR	9.91	150	15.14
MDR	6.05	34	5.62
SFR	1.61	4	2.49
Total/Avg.	**17.56**	**188**	**23.25**

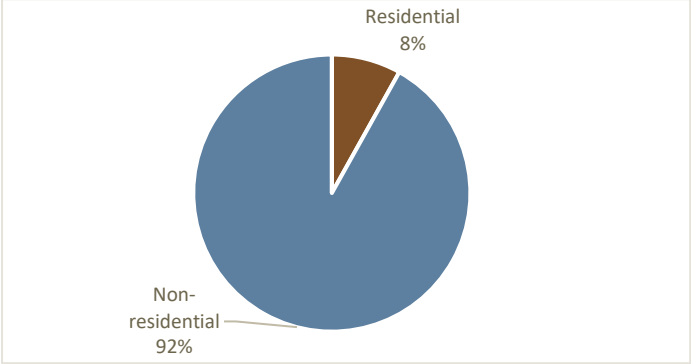

Table 9-3: City of Fife 2013-2020 Non-residential Trends by Zone

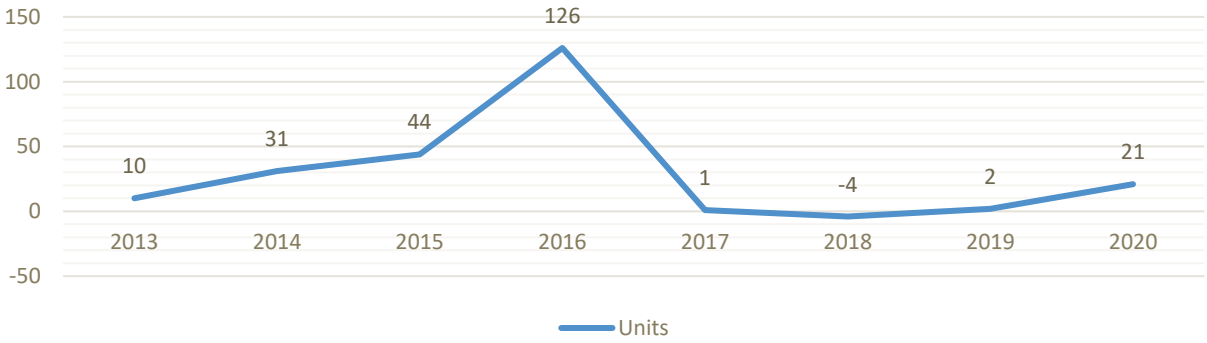
Zone	Acres	Sq. Ft.	FAR
CC	0.80	2,142	0.06
CMU	14.25	234,100	0.38
I	163.33	2,127,873	0.30
POS	15.67	3,480	0.01
RC	6.14	1,420	0.01
Total/Avg.	**200.18**	**2,369,015**	**0.27**

[1]Includes multifamily and plat data to represent the overall observed density by zone. Does not include single-family permits in order to accurately represent permitted densities; therefore, does not represent the total number of units developed in the timeframe.
Sources: City Permit Data, Pierce County Assessor-Treasurer Tax Parcels, Puget Sound Regional Council Housing Unit Permit Database.

While the non-residential development trends are informative to show the percent of land consumed for non-residential purposes (as shown in Figure 9-A), the employment densities used in the capacity assumptions are derived through employment density surveys, as documented in Appendix C: Employment Density Survey. Figure 9-A summarizes the split between residential and non-residential development between 2013-2020 by zone and the jurisdiction average. The percent split is based on the gross acres developed between 2013-2020 using the plat activity and multifamily permits for residential and non-residential permits for non-residential. The information is used to inform the percent split for mixed-use zones, as well as the percent of non-residential uses in residential-only zones.

Figure 9-A: City of Fife Residential vs. Non-residential Development Split



Zone	Use Type Split (Percent)[1] Residential	Non-residential
CC	0%	100%
CMU	0%	100%
HDR	100%	0%
I	0%	100%
MDR	0%	100%
POS	0%	100%
RC	0%	100%
SFR	100%	0%
Average	**8%**	**92%**

[1]Does not include single-family permits in order to avoid double-counting acreage.

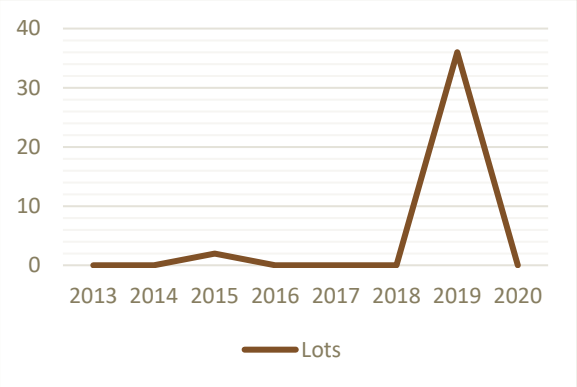
Housing Production Rate

The residential data collected for the Buildable Lands Program tracks the density and other assumptions related to the capacity analysis. The Buildable Lands requirements that were amended in 2017 now require the tracking of housing production to compare to the necessary growth rates to achieve the housing targets. Due to the limitations of the permit data and lack of demolition permit data, Pierce County relies upon the Washington State Office of Financial Management estimates to track the number of housing units built per year in each jurisdiction for the purposes of this Report. The comparison of housing production and housing needs is shown in Table 1-2 and Table 1-3 (Countywide).

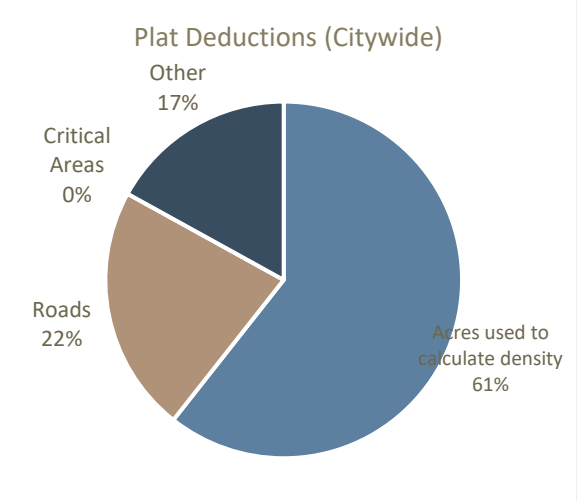
Figure 9-B: City of Fife Housing Production Rates (OFM)



Source: Washington State Office of Financial Management Housing Unit Data (2020).

Platting Activity

Platting activity is used to determine the achieved density for single-family residential zones and to identify the amount of land used for other purposes (whether netted out for density or applied by a regulation and affecting the achieved density). Plat data is used in conjunction with multifamily permits to determine the overall achieved density (as shown in Table 9-2).



The permit data shown in Figure 9-C for Plat Deductions by Zone for the MDR zone represents an anomaly and should not be used to establish the assumptions. The percentage represents a dedication of Levee Road which also included space for the levee and is not a typical occurrence.

Figure 9-C: City of Fife Platting Trends

Plat Activity by Year

Year	Lots	Acres	Density
2013	-	-	-
2014	-	-	-

Residential Building Trends

Both multifamily and single-family building permits are collected and summarized; however, single-family permit reporting is optional per the Pierce County Countywide Planning Policies and limited in use for tracking factors affecting development. The single-family permit data is useful for identifying the total number of units built and the average lot size per zone and is provided as supplemental information. The multifamily permit data is used to identify the observed density and amount of land used for residential purposes. Please note that this data differs from the data provided in Figure 9-B due to collection limitations and should not be used to represent housing production in the jurisdiction.

Figure 9-D: City of Fife Residential Building Permit Trends

Multifamily Permits by Year

Year	Units	Net Acres	Net Density
2013	-	-	-
2014	-	-	-
2015	150	9.91	15.14
2016	-	-	-

Total	**3**	**0.38**	**0.19**

Sources: City Permit Data, Pierce County Assessor-Treasurer Tax Parcels, Puget Sound Regional Council Housing Unit Permit Database.

Non-residential Building Trends

Non-residential building permits typically include commercial and industrial development; however, public use is often collected and summarized as well when the use type produces jobs. While the project acreage, building square footage, and floor-to-area ratio information is collected and summarized for the report in order to track non-residential development, the employment density is analyzed in a separate report using data other than building permits. The most recent employment density study to support the assumptions in this Report is provided in Appendix C: Employment Density Survey.

Figure 9-E: City of Fife Non-residential Permit Trends

Year	Acres	Bldg. SF	FAR
2013	19.73	272,914	0.32
2014	-	-	-

2017	47.48	703,802	0.34
2018	26.13	65,628	0.06
2019	4.56	480	0.00
Total	**200.18**	**2,369,015**	**0.27**

Sources: City Permit Data, Pierce County Assessor-Treasurer Tax Parcels, Puget Sound Regional Council Housing Unit Permit Database.

ASSUMPTIONS

Assumptions vary by jurisdiction and zone. Table 9-4 and Table 9-5 provide a snapshot of the densities, mixed-use split, and deductions used in the inventory development and capacity calculation tables. The assumptions for each zone are shown in the assumptions column of the capacity calculation tables shown in Appendix A: Full Data, Calculation Tables, and Maps.

Table 9-4: City of Fife Assumptions Summary

Zone	Residential		Employment		Residential Market Factor		Non-Residential Market Factor		Land for Capital Facilities
	Percent	Density	Percent	Density	Vacant	Underutilized	Vacant	Underutilized	
BP	0%	0	100%	20	0%	0%	30%	30%	5%
CC	15%	10	85%	20	30%	30%	30%	30%	5%
CMU	15%	10	85%	20	30%	30%	30%	30%	5%

I	0%	0	100%	9	0%	0%	30%	30%	5%
MDR	100%	10	0%	20	30%	30%	30%	30%	5%
NC	80%	8	20%	20	30%	30%	30%	30%	5%
NR	90%	10	10%	20	30%	30%	30%	30%	5%
RC	80%	10	20%	20	30%	30%	30%	30%	5%
SFR	100%	4	0%	20	30%	30%	30%	30%	5%
SLR	100%	7	0%	20	30%	30%	30%	30%	5%

The Vacant Single Unit size threshold listed below represents the parcel size used to determine if a vacant property is subdividable or only able to accommodate one unit. Parcels smaller than the size listed are considered Vacant Single Units unless otherwise determined by the jurisdiction during the parcel-specific review.

Table 9-5: City of Fife Plat Deductions for Single-Family Residential Zones

Zone	Roads	Critical Areas	Parks/Open Space	Stormwater	Non-residential	Vacant Single Unit
HDR	N/A	N/A	N/A	N/A	5%	N/A
MDR	N/A	N/A	N/A	N/A	5%	N/A
SFR	20%	16%	10%	5%	5%	<0.625 acres
SLR	20%	16%	10%	5%	5%	<0.350 acres

HOUSING AND EMPLOYMENT CAPACITY

Inventory and Capacity Calculation Characteristics

A portion of the inventory is deducted from the gross acreage based on the assumptions identified in the previous section. Table 9-6 shows the characteristics of the initial inventory and Table 9-7 shows the amount of land that was reduced from that initial inventory to be included in the capacity analysis, as documented in the tables and maps in Appendix A: Full Data, Calculation Tables, and Maps.

Table 9-6: City of Fife Summary of Vacant and Underutilized Land Characteristics

Characteristics/Category	Vacant	Underutilized	Vacant Single Unit	Pipeline
Total Acreage (Gross	514.66	424.48	4.07	7.63
Average Lot Size (Gross)	4.32	1.24	0.11	1.27
Total Acreage (Net)	479.30	367.10	3.84	7.63
Average Lot Size (Net)	4.03	1.08	0.10	1.27
Percent Critical Areas	7%	14%	6%	0%

The parcel inventory is used to categorize land and the capacity calculations are intended to represent the land available for development; thus, the inventory maps alone do not represent the "buildable land" per the Buildable Lands requirements. Table 9-7 shows the overall percentage of land assumed available as capacity in the 20-year planning period and the deductions made to account for constraints to the inventory and overall market conditions.

Table 9-7: City of Fife Summary of Deductions

Deductions/Category	Vacant	Underutilized
Critical Areas	35.36	57.38
Infrastructure Gaps	469.77	316.85
Plat Deductions	19.00	35.78
Capital Facilities	24.45	18.65
Market Factor	146.65	111.90
Total Percent Reduction in Inventory Land	38%	43%
Percent of Vacant or Underutilized Land Available for Capacity	62%	57%

Capacity Results

The housing and employment capacity totals in Table 9-8 and Table 9-9 are derived from the calculations shown in Appendix A: Full Data, Calculation Tables, and Maps. A summary of the countywide capacity results compared to need is shown in **Error! Reference source not found.** (2030 Housing Target), **Error! Reference source not found.** (2030 Employment Target), and Table 1-12 (DRAFT 2044 Targets).

CONSISTENCY EVALUATION

Development Trends

The development trends evaluation compares development that has occurred and the planned and regulated characteristics of the applicable zone, as well as with the assumptions used in the report. Since the development trend evaluation window is a short period of time and the application of zoning may change periodically, it is often found that there is not enough information to make a statistically valid conclusion. Due to this, the information is provided but no conclusions have been made.

The development trends evaluation compares development that has occurred and the planned and regulated characteristics of the applicable zone, as well as with the assumptions used in the report. Since the development trend evaluation window is a short period of time and the application of zoning may change periodically, it is often found that there is not enough information to make a statistically valid conclusion. Due to this, the information is provided but no conclusions have been made.

Error! Not a valid bookmark self-reference. is provided to show the number of permits, units, and acres developed to identify which zones have experienced development in the timeframe.

Table 3-10 is provided to show the number of permits, units, and acres developed to identify which zones have experienced development in the timeframe.

Table 9-10: City of Fife Permits Summary

Zone	Residential Permits	Non-Residential Permits	Dwelling Units	Acres Developed	% Zoned Acreage
BP	0	0	0	0.00	0.0%
CC	0	1	0	0.80	0.4%
CMU	0	5	0	14.25	7.3%
HDR	2	0	150	9.91	11.9%
I	0	15	0	163.33	10.9%
MDR	1	0	34	6.05	3.3%

SLR	0	0	0	0.00	0.0%

Table 3-11 shows the observed residential density trends in comparison to the permitted density and assumed density for each zone with sufficient data. Both the plat and multifamily project average densities are shown in order to understand the source of the overall density.

Table 9-11: City of Fife Density Evaluation

Zone	Observed Density (Overall)	Observed Plat Density (Single-Family)	Observed Multifamily Density	Assumed Density
BP	0	0	0	0
CC	0	0	0	10
CMU	0	0	0	10
HDR	15	0	15	14
I	0	0	0	0
MDR	11	11	0	10
NC	0	0	0	8
NR	0	0	0	10
POS	0	0	0	0
RC	0	0	0	10
ROW	0	0	0	0
SFR	2	2	0	4
SLR	0	0	0	7

Table 3-12 shows the observed percent of developed acreage between residential and non-residential uses. Mixed-use project acreage is duplicated in each category, resulting in a 50/50 percent split. In these cases, further analysis would be needed to determine if vertical mixed-use is part of the trend, resulting in a 100/100 percent split. The observed trend is compared to the assumptions used in the report for both the mixed-use split and the assumption for non-residential in and single-family zone. The trend is also compared to the permitted uses to determine if the zone is developing as planned.

Table 9-12: City of Fife Mixed Use Split and Non-residential in Single Family Zones Evaluation

Zone	Observed Residential Percent	Assumed Residential Percent	Observed Non-residential Percent	Assumed Non-residential Percent	Zone Type (Residential, Non-residential, Mixed-use)	Assumed Non-residential in Single-Family zones Percent
BP	0%	0%	0%	100%	Commercial	0%

CMU	0%	15%	100%	85%	Mixed Use	0%
HDR	100%	100%	0%	0%	Residential	5%
I	0%	0%	100%	100%	Industrial	0%
MDR	100%	100%	0%	0%	Residential	5%
NC	0%	80%	0%	20%	Mixed Use	0%
NR	0%	90%	0%	10%	Mixed Use	0%
POS	0%	0%	100%	0%	Other-Not Developable	0%
RC	0%	80%	100%	20%	Mixed Use	0%
ROW	0%	0%	0%	0%	Other-Not Developable	0%
SFR	100%	100%	0%	0%	Residential	5%
SLR	0%	100%	0%	0%	Residential	5%

Table 3-13 shows the observed plat deductions for jurisdictions that use net acreage to calculate permitted density compared to the assumptions used in the report. Only zones with plat data are shown.

Table 9-13: City of Fife Plat Deductions Evaluation

Zone	Observed Roads	Assumed Roads	Observed Parks/OS	Assumed Parks/OS	Observed Stormwater	Assumed Stormwater
BP	0%	0%	0%	0%	0%	0%
CC	0%	0%	0%	0%	0%	0%
CMU	0%	0%	0%	0%	0%	0%
HDR	0%	0%	0%	0%	0%	0%
I	0%	0%	0%	0%	0%	0%
MDR	28%	20%	14%	10%	8%	5%
NC	0%	0%	0%	0%	0%	0%
NR	0%	0%	0%	0%	0%	0%
POS	0%	0%	0%	0%	0%	0%
RC	0%	0%	0%	0%	0%	0%
ROW	0%	0%	0%	0%	0%	0%
SFR	0%	20%	0%	10%	0%	5%
SLR	0%	20%	0%	10%	0%	5%

Housing Production / Growth Targets

Table 3-14 shows the observed housing production and average yearly housing production rate between 2010-2020 in comparison to the 2020-2044 housing growth target need and average yearly housing production rate needed to accommodate the growth target.

Table 9-14: City of Fife Housing Production Trends Compared to Growth Target Needs

Housing Units			Total Housing Growth		Average Yearly Housing Growth (Growth / Years)		
2010 Census	2020 OFM Estimate	2044 Target	2010-2020 Observed	2020-2044 Growth Target	2010-2020 Observed	2020-2044 Growth Target	Yearly Increase Needed
3,895	4,326	6,199	431	1,873	43	78	**35**

The observed housing production rate is lower than the rate needed to accommodate the 2044 housing target. The City of Fife recently became part of the High Capacity Transit Communities regional geography and is anticipated to grow more than previously planned, so over time should adjust.

Capacity / Growth Targets

Table 3-15 shows the 2020-2044 housing and employment capacity in comparison to the housing and employment 2020-2044 growth target need.

Table 9-15: City of Fife Housing and Employment Capacity Compared to Growth Target Needs

Housing Capacity	2020-2044 DRAFT Housing Need	Difference	Employment Capacity	2020-2044 DRAFT Employment Need	Difference
1,065	1,873	-808	5,043	5,077	-34

The 2044 housing target was developed using an older version of this report that displayed incorrect totals. Since the capacity summaries have been corrected, there is a slight difference between the housing needs and capacity, but it is not significant enough to warrant reasonable measures.

10 CITY OF FIRCREST

The City of Fircrest's Comprehensive Plan and regulations implement densities using gross acreage.

Table 10-1: City of Fircrest Zone Classifications

Zone Classification		Zone Type[1]	Total Acres[2]
CMU	Commercial Mixed Use	Mixed Use	33.4
GC	Golf Course District	N/A	152.0
NC	Neighborhood Commercial District	Commercial	6.1
NO	Neighborhood Office District	Commercial	1.3
PROS	Park, Recreation and Open Space District	N/A	26.7
R10TCD	Residential-10 – Traditional Community Design District	Residential	30.2
R20	Residential-20 District	Residential	38.3
R4	Residential-4 District	Residential	261.8
R4C	Residential-4 – Conservation District	Residential	32.1
R6	Residential-6 District	Residential	186.1
R8	Residential-8 District	Residential	25.2

[1]For purposes of the Buildable Lands inventory and analysis; not a representation of the City zoning code.
[2]Represents parcel acreage, not zoning coverage.
Sources: City Zoning Code.

DEVELOPMENT TRENDS

This section summarizes permit data observed between **January 1, 2013 and December 31, 2019** and plat activity through December 31, 2020 that is used to monitor observed densities and update the assumptions for future development. The summaries in this section are designed to show the average statistics used to inform the report. Only data pertinent to the Buildable Lands requirements is collected, and incomplete or not-applicable data is omitted; therefore, this Report does not provide a full summary of all development within the jurisdiction. For more detailed summaries by zone/year, see Appendix A: Full Data, Calculation Tables, and Maps.

Table 10-2 shows the average residential density per zone and jurisdiction-wide and is not intended to show the total units/lots created or overall acres consumed. The results reflect the density calculation used by the jurisdiction, and only include a summary of plats and multifamily (3+ attached units) projects. Table 10-3 shows the average floor-to-area ratio (FAR) by zone and the amount of non-residential building square footage developed. The non-residential projects summarized only include new development and omit additions to existing businesses and non-building type improvements.

Table 10-2: City of Fircrest 2013-2020 Residential Trends by Zone[1]

Zone	Net Acres[2]	Lots/Units	Density
CMU	0.30	2	6.67
GC	3.03	22	7.26
Total/Avg.	**3.33**	**24**	**7.21**

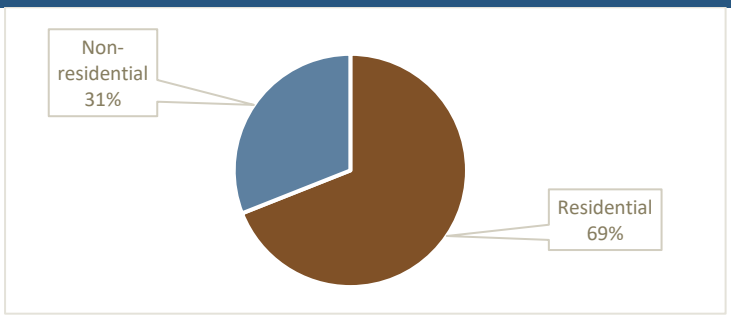

Table 10-3: City of Fircrest 2013-2020 Non-residential Trends by Zone

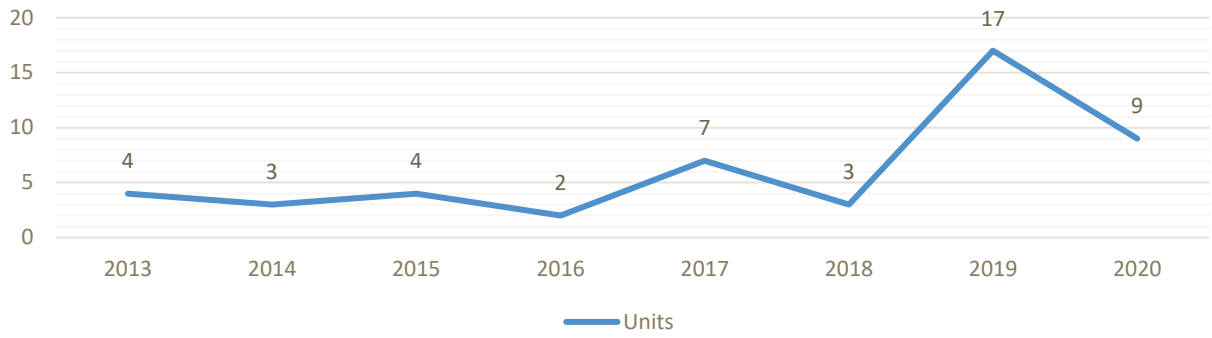
Zone	Acres	Sq. Ft.	FAR
CMU	1.49	8,334	0.13

[1]Includes multifamily and plat data to represent the overall observed density by zone. Does not include single-family permits in order to accurately represent permitted densities; therefore, does not represent the total number of units developed in the timeframe.
Sources: City Permit Data, Pierce County Assessor-Treasurer Tax Parcels, Puget Sound Regional Council Housing Unit Permit Database.

While the non-residential development trends are informative to show the percent of land consumed for non-residential purposes (as shown in Figure 10-A), the employment densities used in the capacity assumptions are derived through employment density surveys, as documented in Appendix C: Employment Density Survey. Figure 10-A summarizes the split between residential and non-residential development between 2013-2020 by zone and the jurisdiction average. The percent split is based on the gross acres developed between 2013-2020 using the plat activity and multifamily permits for residential and non-residential permits for non-residential. The information is used to inform the percent split for mixed-use zones, as well as the percent of non-residential uses in residential-only zones.

Figure 10-A: City of Fircrest Residential vs. Non-residential Development Split



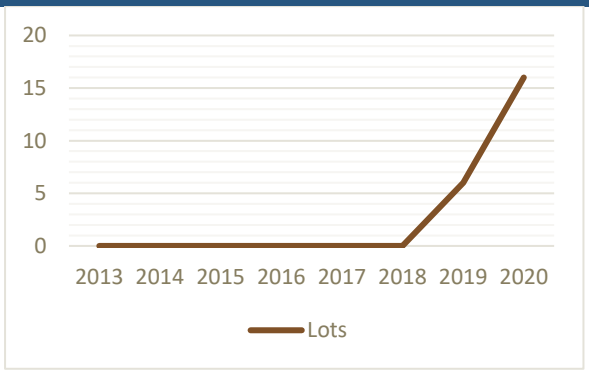
Zone	Use Type Split (Percent)1	
	Residential	Non-residential
CMU	17%	83%
GC	100%	0%
Average	**69%**	**31%**

[1]Does not include single-family permits in order to avoid double-counting acreage.
Sources: City Permit Data, Pierce County Assessor-Treasurer Tax Parcels, Puget Sound Regional Council Housing Unit Permit Database.

Housing Production Rate

The residential data collected for the Buildable Lands Program tracks the density and other assumptions related to the capacity analysis. The Buildable Lands requirements that were amended in 2017 now require the tracking of housing production to compare to the necessary growth rates to achieve the housing targets. Due to the limitations of the permit data and lack of demolition permit data, Pierce County relies upon the Washington State Office of Financial Management estimates to track the number of housing units built per year in each jurisdiction for the purposes of this Report. The comparison of housing production and housing needs is shown in Table 1-2 and Table 1-3 (Countywide).

Figure 10-B: City of Fircrest Housing Production Rates (OFM)



Source: Washington State Office of Financial Management Housing Unit Data (2020).

Platting Activity

Platting activity is used to determine the achieved density for single-family residential zones and to identify the amount of land used for other purposes (whether netted out for density or applied by a regulation and affecting the achieved density). Plat data is used in conjunction with multifamily permits to determine the overall achieved density (as shown in Table 10-2).

Figure 10-C: City of Fircrest Platting Trends

Plat Activity by Year

Year	Lots	Acres	Density

Residential Building Trends

Both multifamily and single-family building permits are collected and summarized; however, single-family permit reporting is optional per the Pierce County Countywide Planning Policies and limited in use for tracking factors affecting development. The single-family permit data is useful for identifying the total number of units built and the average lot size per zone and is provided as supplemental information. The multifamily permit data is used to identify the observed density and amount of land used for residential purposes. Please note that this data differs from the data provided in Figure 10-B due to collection limitations and should not be used to represent housing production in the jurisdiction.

Figure 10-D: City of Fircrest Residential Building Permit Trends

Multifamily Permits by Year

Year	Units	Net Acres	Net Density

Total	**19**	**3.07**	**0.16**

Sources: City Permit Data, Pierce County Assessor-Treasurer Tax Parcels, Puget Sound Regional Council Housing Unit Permit Database.

Non-residential Building Trends

Non-residential building permits typically include commercial and industrial development; however, public use is often collected and summarized as well when the use type produces jobs. While the project acreage, building square footage, and floor-to-area ratio information is collected and summarized for the report in order to track non-residential development, the employment density is analyzed in a separate report using data other than building permits. The most recent employment density study to support the assumptions in this Report is provided in Appendix C: Employment Density Survey.

ASSUMPTIONS

Assumptions vary by jurisdiction and zone. Table 10-4 and Table 10-5 provide a snapshot of the densities, mixed-use split, and deductions used in the inventory development and capacity calculation tables. The assumptions for each zone are shown in the assumptions column of the capacity calculation tables shown in Appendix A: Full Data, Calculation Tables, and Maps.

Table 10-4: City of Fircrest Assumptions Summary

Zone	Residential		Employment		Residential Market Factor		Non-Residential Market Factor		Land for Capital Facilities
	Percent	Density	Percent	Density	Vacant	Underutilized	Vacant	Underutilized

R8	100%	8	0%	20	5%	5%	0%	0%	0%

The Vacant Single Unit size threshold listed below represents the parcel size used to determine if a vacant property is subdividable or only able to accommodate one unit. Parcels smaller than the size listed are considered Vacant Single Units unless otherwise determined by the jurisdiction during the parcel-specific review.

Table 10-5: City of Fircrest Plat Deductions for Single-Family Residential Zones

Zone	Roads	Critical Areas	Parks/Open Space	Stormwater	Non-residential	Vacant Single Unit
R10TCD	0%	0%	0%	0%	1%	N/A
R20	0%	0%	0%	0%	1%	N/A

R4C	0%	GIS	0%	0%	1%	<0.46 acres
R6	0%	0%	0%	0%	1%	<0.29 acres
R8	0%	0%	0%	0%	1%	N/A

Inventory and Capacity Calculation Characteristics

A portion of the inventory is deducted from the gross acreage based on the assumptions identified in the previous section. Table 10-6 shows the characteristics of the initial inventory and Table 10-7 shows the amount of land that was reduced from that initial inventory to be included in the capacity analysis, as documented in the tables and maps in Appendix A: Full Data, Calculation Tables, and Maps.

Table 10-6: City of Fircrest Summary of Vacant and Underutilized Land Characteristics

Characteristics/Category	Vacant	Underutilized	Vacant Single Unit	Pipeline
Total Acreage (Gross	32.18	22.80	2.75	5.27
Average Lot Size (Gross)	1.61	1.14	0.16	1.76
Total Acreage (Net)	19.55	20.25	1.76	5.27
Average Lot Size (Net)	0.98	1.01	0.10	1.76
Percent Critical Areas	39%	11%	36%	0%

The parcel inventory is used to categorize land and the capacity calculations are intended to represent the land available for development; thus, the inventory maps alone do not represent the "buildable land" per the Buildable Lands requirements. Table 10-7 shows the overall percentage of land assumed available as capacity in the 20-year planning period and the deductions made to account for constraints to the inventory and overall market conditions.

Table 10-7: City of Fircrest Summary of Deductions

Deductions/Category	Vacant	Underutilized
Critical Areas	12.62	2.55
Plat Deductions	0.00	0.00
Capital Facilities	0.00	0.00
Market Factor	1.03	3.19
Total Percent Reduction in Inventory Land	40%	15%
Percent of Vacant or Underutilized Land Available for Capacity	60%	85%

HOUSING AND EMPLOYMENT CAPACITY

Capacity Results

The housing and employment capacity totals in Table 10-8 and Table 10-9 are derived from the calculations shown in Appendix A: Full Data, Calculation Tables, and Maps. A summary of the countywide capacity results compared to need is shown in **Error! Reference source not found.** (2030 Housing Target), **Error! Reference source not found.** (2030 Employment Target), and Table 1-12 (DRAFT 2044 Targets).

CONSISTENCY EVALUATION

Development Trends

The development trends evaluation compares development that has occurred and the planned and regulated characteristics of the applicable zone, as well as with the assumptions used in the report. Since the development trend evaluation window is a short period of time and the application of zoning may change periodically, it is often found that there is not enough information to make a statistically valid conclusion. Due to this, the information is provided but no conclusions have been made.

The development trends evaluation compares development that has occurred and the planned and regulated characteristics of the applicable zone, as well as with the assumptions used in the report. Since the development trend evaluation window is a short period of time and the application of zoning

may change periodically, it is often found that there is not enough information to make a statistically valid conclusion. Due to this, the information is provided but no conclusions have been made.

Error! Not a valid bookmark self-reference. is provided to show the number of permits, units, and acres developed to identify which zones have experienced development in the timeframe.

Table 3-10 is provided to show the number of permits, units, and acres developed to identify which zones have experienced development in the timeframe.

Table 10-10: City of Fircrest Permits Summary

Zone	Residential Permits	Non-Residential Permits	Dwelling Units	Acres Developed	% Zoned Acreage

R4	0	0	0	4
R4C	0	0	0	4
R6	0	0	0	6
R8	0	0	0	8

Table 3-12 shows the observed percent of developed acreage between residential and non-residential uses. Mixed-use project acreage is duplicated in each category, resulting in a 50/50 percent split. In these cases, further analysis would be needed to determine if vertical mixed-use is part of the trend, resulting in a 100/100 percent split. The observed trend is compared to the assumptions used in the report for both the mixed-use split and the assumption for non-residential in and single-family zone. The trend is also compared to the permitted uses to determine if the zone is developing as planned.

Table 10-12: City of Fircrest Mixed Use Split and Non-residential in Single Family Zones Evaluation

Zone	Observed Residential Percent	Assumed Residential Percent	Observed Non-residential Percent	Assumed Non-residential Percent	Zone Type (Residential, Non-residential, Mixed-use)	Assumed Non-residential in Single-Family zones Percent

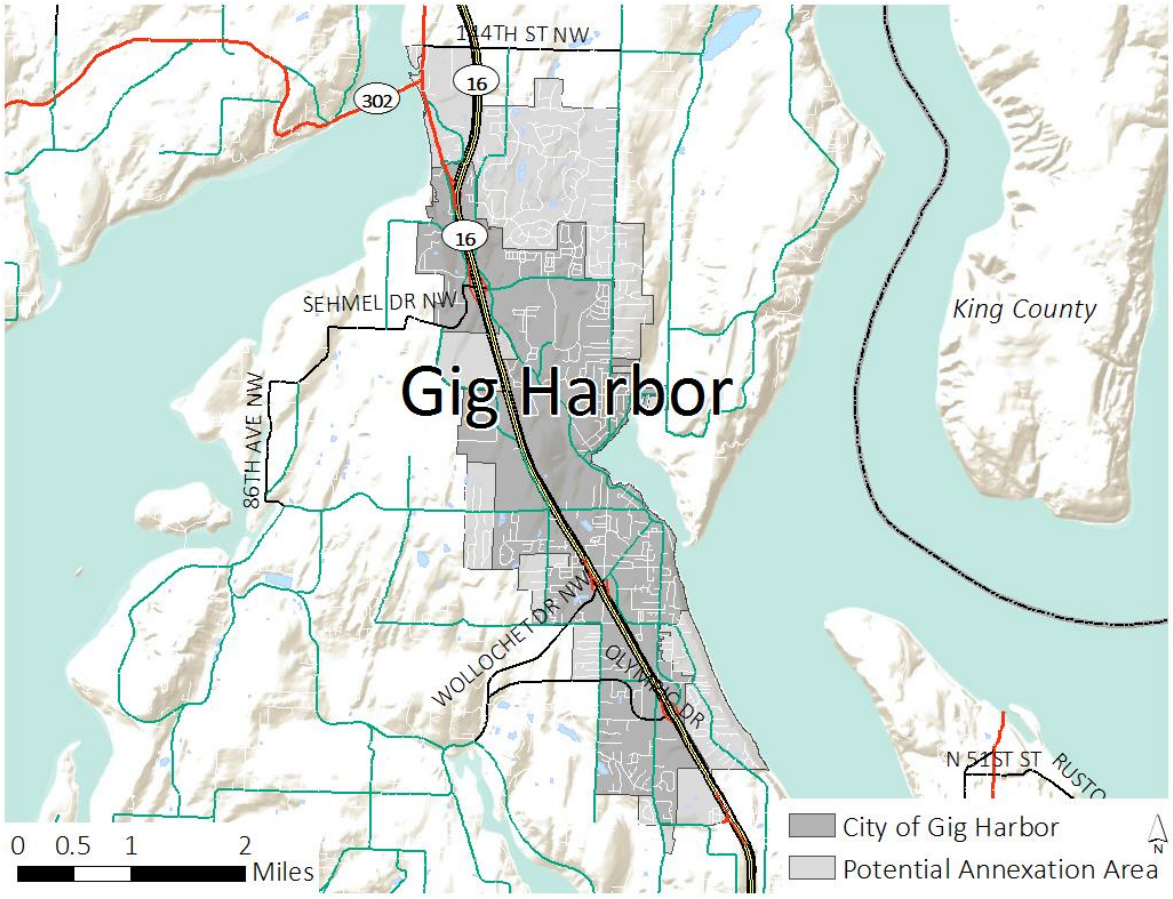
Housing Production / Growth Targets

Table 3-14 shows the observed housing production and average yearly housing production rate between 2010-2020 in comparison to the 2020-2044 housing growth target need and average yearly housing production rate needed to accommodate the growth target.

Table 10-14: Housing Production Trends Compared to Growth Target Needs

Housing Units			Total Housing Growth		Average Yearly Housing Growth (Growth / Years)		
2010 Census	2020 OFM Estimate	2044 Target	2010-2020 Observed	2020-2044 Growth Target	2010-2020 Observed	2020-2044 Growth Target	Yearly Increase Needed
2,847	2,926	3,714	79	788	8	33	**25**



Capacity / Growth Targets

Table 3-15 shows the 2020-2044 housing and employment capacity in comparison to the housing and employment 2020-2044 growth target need.

Table 10-15: Housing and Employment Capacity Compared to Growth Target Needs

Housing Capacity	2020-2044 DRAFT Housing Need	Difference	Employment Capacity	2020-2044 DRAFT Employment Need	Difference
114	788	-674	199	113	86

11 CITY OF GIG HARBOR

The City of Gig Harbor's Comprehensive Plan and regulations implement densities using net acreage, subtracting out streets, roads, access easements, wetlands, ravine sidewalls, bluffs, and tideland.

Table 11-1: City of Gig Harbor Zone Classifications

Zone Classification		Zone Type[1]	Total Acres[2]
B-1	Neighborhood Commercial District	Commercial	0.6
B-2	General Business District	Commercial	223.6
C-1	Commercial District	Commercial	52.3
DB	Downtown Business District	Commercial	30.2
ED	Employment District	Industrial	241.0
PCD-BP	Planned Community Development Business Park District	Planned	152.0
PCD-C	Planned Community Development Commercial	Planned	75.1
PCD-NB	Planned Community Development Neighborhood Business District	Planned	
PCD-RLD	Planned Community Development Low Density Residential	Planned	
PCD-RMD	Planned Community Development Medium Density Residential	Planned	39.3
PI	Public-Institutional District	Commercial	142.9
PRD	Planned Residential Development	Planned	205.3

Zone Classification		Zone Type[1]	Total Acres[2]
R-1	Single-Family Residential	Residential	1,173.0
R-2	Medium-Density Residential	Residential	372.8
R-3	Multiple-Family Residential	Residential	53.7
RB-1	Residential and Business District	Mixed Use	39.1
RB-2	Residential and Business District	Mixed Use	201.3
WC	Waterfront Commercial	Mixed Use	22.5
WM	Waterfront Millville	Mixed Use	12.2
WR	Waterfront Residential	Residential	16.4

[1]For purposes of the Buildable Lands inventory and analysis; not a representation of the City zoning code.
[2]Represents parcel acreage, not zoning coverage.
Sources: City Zoning Code.

DEVELOPMENT TRENDS

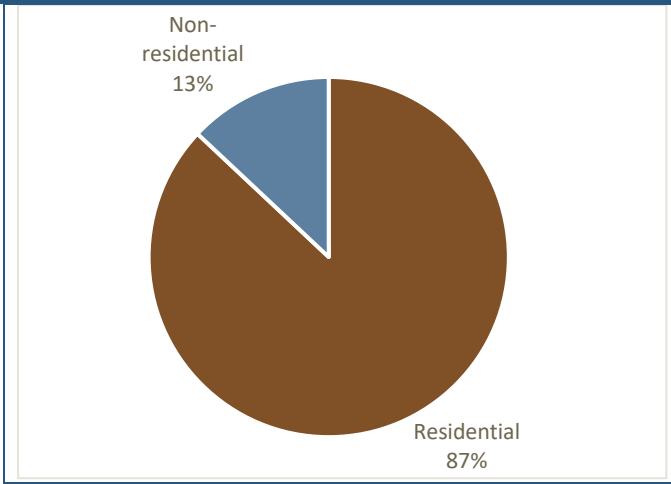
This section summarizes permit data observed between **January 1, 2013 and December 31, 2020** that is used to monitor observed densities and update the assumptions for future development. The summaries in this section are designed to show the average statistics used to inform the report. Only data pertinent to the Buildable Lands requirements is collected, and incomplete or not-applicable data is omitted; therefore, this Report does not provide a full summary of all development within the jurisdiction. For more detailed summaries by zone/year, see Appendix A: Full Data, Calculation Tables, and Maps.

Table 11-2 shows the average residential density per zone and jurisdiction-wide and is not intended to show the total units/lots created or overall acres consumed. The results reflect the density calculation used by the jurisdiction, and only include a summary of plats and multifamily (3+ attached units) projects. Table 11-3 shows the average floor-to-area ratio (FAR) by zone and the amount of non-residential building square footage developed. The non-residential projects summarized only include new development and omit additions to existing businesses and non-building type improvements.

Table 11-2: City of Gig Harbor 2013-2020 Residential Trends by Zone[1]

Zone	Net Acres[2]	Lots/Units	Density
B-2	2.51	66	26.29
PCD-RMD	14.58	63	4.32
PRD	235.04	1,007	4.28
R-1	43.31	141	3.26
R-2	51.13	174	3.40
R-3	2.15	10	4.65
RB-1	3.25	11	3.38
RB-2	23.39	220	9.41
Total/Avg.	**375.36**	**1,692**	**4.51**

Table 11-3: City of Gig Harbor 2013-2020 Non-residential Trends by Zone



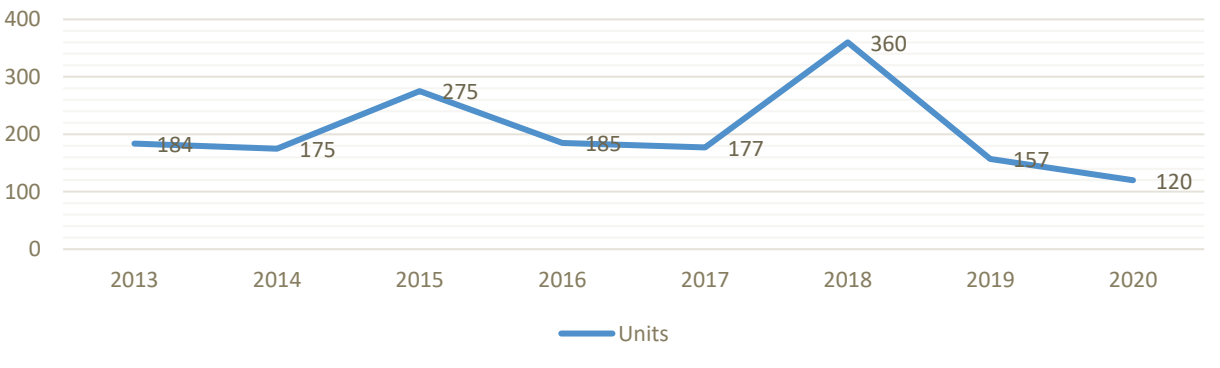
Zone	Acres	Sq. Ft.	FAR
B-2	9.38	95,187	0.23
C-1	14.00	175,497	0.29
PCD-BP	11.00	10,679	0.02
PRD	17.97	409,491	0.52
R-1	0.09	1,155	0.29
RB-1	1.00	8,952	0.21
RB-2	1.14	20,532	0.41
WM	0.66	5,600	0.19
Total/Avg.	**55.24**	**727,093**	**0.30**

[1]Includes multifamily and plat data to represent the overall observed density by zone. Does not include single-family permits in order to accurately represent permitted densities; therefore, does not represent the total number of units developed in the timeframe.
Sources: City Permit Data, Pierce County Assessor-Treasurer Tax Parcels, Puget Sound Regional Council Housing Unit Permit Database.

While the non-residential development trends are informative to show the percent of land consumed for non-residential purposes (as shown in Figure 11-A), the employment densities used in the capacity

assumptions are derived through employment density surveys, as documented in Appendix C: Employment Density Survey. Figure 11-A summarizes the split between residential and non-residential development between 2013-2020 by zone and the jurisdiction average. The percent split is based on the gross acres developed between 2013-2020 using the plat activity and multifamily permits for residential and non-residential permits for non-residential. The information is used to inform the percent split for mixed-use zones, as well as the percent of non-residential uses in residential-only zones.

Figure 11-A: City of Gig Harbor Residential vs. Non-residential Development Split



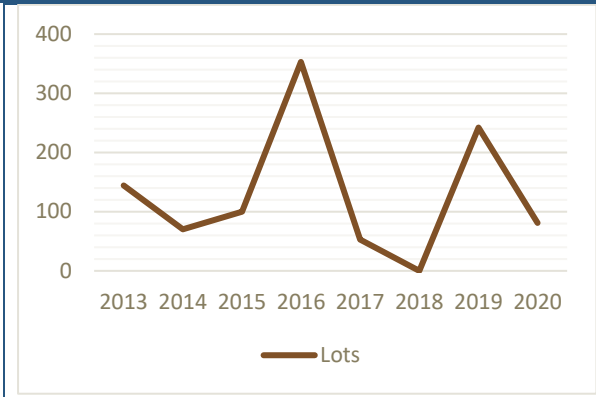
Zone	Use Type Split (Percent)[1] Residential	Non-residential
B-2	21%	79%
C-1	0%	100%
PCD-BP	0%	100%
PCD-RMD	100%	0%
PRD	93%	7%
R-1	100%	0%
R-2	100%	0%
R-3	100%	0%
RB-1	76%	24%
RB-2	95%	5%
WM	0%	100%
Average	**91%**	**9%**

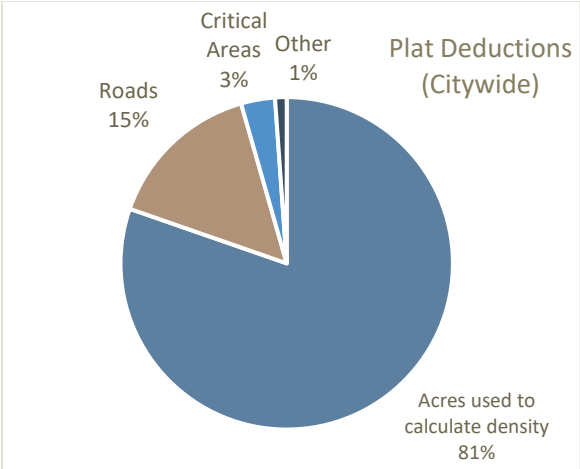
[1]Does not include single-family permits in order to avoid double-counting acreage.
Sources: City Permit Data, Pierce County Assessor-Treasurer Tax Parcels, Puget Sound Regional Council Housing Unit Permit Database.

Housing Production Rate

The residential data collected for the Buildable Lands Program tracks the density and other assumptions related to the capacity analysis. The Buildable Lands requirements that were amended in 2017 now require the tracking of housing production to compare to the necessary growth rates to achieve the housing targets. Due to the limitations of the permit data and lack of demolition permit data, Pierce County relies upon the Washington State Office of Financial Management estimates to track the number of housing units built per year in each jurisdiction for the purposes of this Report. The comparison of housing production and housing needs is shown in Table 1-2 and Table 1-3 (Countywide).

Figure 11-B: City of Gig Harbor Housing Production Rates (OFM)





Source: Washington State Office of Financial Management Housing Unit Data (2020).

Platting Activity

Platting activity is used to determine the achieved density for single-family residential zones and to identify the amount of land used for other purposes (whether netted out for density or applied by a regulation and affecting the achieved density). Plat data is used in conjunction with multifamily permits to determine the overall achieved density (as shown in Table 11-2).

Figure 11-C: City of Gig Harbor Platting Trends

Plat Activity by Year

Year	Lots	Net Acres	Net Density
2013	144	28.33	5.08
2014	70	15.03	4.66

Residential Building Trends

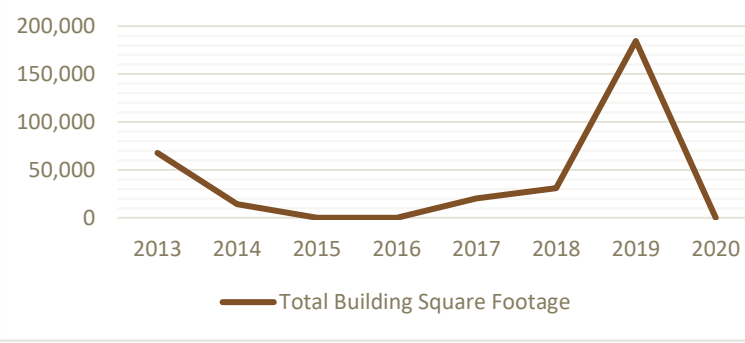
Both multifamily and single-family building permits are collected and summarized; however, single-family permit reporting is optional per the Pierce County Countywide Planning Policies and limited in use for tracking factors affecting development. The single-family permit data is useful for identifying the total number of units built and the average lot size per zone and is provided as supplemental information. The multifamily permit data is used to identify the observed density and amount of land used for residential purposes. Please note that this data differs from the data provided in Figure 11-B due to collection limitations and should not be used to represent housing production in the jurisdiction.

Figure 11-D: City of Gig Harbor Residential Building Permit Trends

Multifamily Permits by Year

Year	Units	Net Acres	Net Density
2013	80	15.50	5.16
2014	172	11.52	14.93
2015	64	1.92	33.33
2016	0	0.00	-
2017	46	9.64	9.64
2018	287	17.97	15.97
2019	0	0.00	-
2020	0	0.00	-
Total	**649**	**51.68**	**12.56**

Single-Family Permits by Year (Optional)



Year	Lots	Acres	Avg. Lot Size
2013	43	4.82	0.11
2014	78	9.13	0.12
2015	99	13.88	0.14
2016	142	19.79	0.14
2017	208	29.36	0.14
2018	211	29.11	0.14
2019	134	20.80	0.16
2020	63	11.62	0.18
Total	**978**	**138.51**	**0.14**

Sources: City Permit Data, Pierce County Assessor-Treasurer Tax Parcels, Puget Sound Regional Council Housing Unit Permit Database.

Non-residential Building Trends

Non-residential building permits typically include commercial and industrial development; however, public use is often collected and summarized as well when the use type produces jobs. While the project acreage, building square footage, and floor-to-area ratio information is collected and summarized for the report in order to track non-residential development, the employment density is analyzed in a separate report using data other than building permits. The most recent employment density study to support the assumptions in this Report is provided in Appendix C: Employment Density Survey.

Figure 11-E: City of Gig Harbor Non-residential Permit Trends

Year	Acres	Bldg. SF	FAR
2013	6.95	67,585	0.22
2014	11.37	14,240	0.03
2015	-	-	-
2016	-	-	-
2017	1.76	20,319	0.27
2018	20.16	440,500	0.50
2019	15.00	184,449	0.28
2020	-	-	-
Total	55.24	727,093	0.30

ASSUMPTIONS

Assumptions vary by jurisdiction and zone. Table 11-4 and Table 11-5 provide a snapshot of the densities, mixed-use split, and deductions used in the inventory development and capacity calculation tables. The assumptions for each zone are shown in the assumptions column of the capacity calculation tables shown in Appendix A: Full Data, Calculation Tables, and Maps.

The PCD and PRD zones have planned development assumptions represented as pipeline development in the capacity calculations, so they are not shown here.

Table 11-4: City of Gig Harbor Assumptions Summary

Zone	Residential		Employment		Residential Market Factor		Non-Residential Market Factor		Land for Capital Facilities
	Percent	Density	Percent	Density	Vacant	Underutilized	Vacant	Underutilized

The Vacant Single Unit size threshold listed below represents the parcel size used to determine if a vacant property is subdividable or only able to accommodate one unit. Parcels smaller than the size listed are considered Vacant Single Units unless otherwise determined by the jurisdiction during the parcel-specific review.

Table 11-5: City of Gig Harbor Plat Deductions for Single-Family Residential Zones

Zone	Roads	Critical Areas	Parks/Open Space	Stormwater	Non-residential	Vacant Single Unit
R-1	15%	GIS	0%	0%	2%	<0.625 acres
R-2	15%	GIS	0%	0%	2%	<0.420 acres
R-3	15%	GIS	0%	0%	2%	N/A

HOUSING AND EMPLOYMENT CAPACITY

Inventory and Capacity Calculation Characteristics

A portion of the inventory is deducted from the gross acreage based on the assumptions identified in the previous section. Table 11-6 shows the characteristics of the initial inventory and Table 11-7 shows the amount of land that was reduced from that initial inventory to be included in the capacity analysis, as documented in the tables and maps in Appendix A: Full Data, Calculation Tables, and Maps.

Table 11-6: City of Gig Harbor Summary of Vacant and Underutilized Land Characteristics

Characteristics/Category	Vacant	Underutilized	Vacant Single Unit	Pipeline
Total Acreage (Gross	411.92	351.37	50.85	174.18
Average Lot Size (Gross)	2.56	1.36	0.13	7.26
Total Acreage (Net)	397.81	343.88	48.17	171.26
Average Lot Size (Net)	2.47	1.33	0.13	7.14
Percent Critical Areas	3%	2%	5%	2%

The parcel inventory is used to categorize land and the capacity calculations are intended to represent the land available for development; thus, the inventory maps alone do not represent the "buildable land" per the Buildable Lands requirements. Table 11-7 shows the overall percentage of land assumed available as capacity in the 20-year planning period and the deductions made to account for constraints to the inventory and overall market conditions.

Table 11-7: City of Gig Harbor Summary of Deductions

Deductions/Category	Vacant	Underutilized
Critical Areas	14.11	7.49
Plat Deductions	33.93	32.94
Capital Facilities	0.00	0.00
Market Factor	35.46	156.15
Total Percent Reduction in Inventory Land	19%	56%
Percent of Vacant or Underutilized Land Available for Capacity	81%	44%

Capacity Results

The housing and employment capacity totals in Table 11-8 and Table 11-9 are derived from the calculations shown in Appendix A: Full Data, Calculation Tables, and Maps. A summary of the countywide capacity results compared to need is shown in **Error! Reference source not found.** (2030 Housing Target), **Error! Reference source not found.** (2030 Employment Target), and Table 1-12 (DRAFT 2044 Targets).

CONSISTENCY EVALUATION

Development Trends

The development trends evaluation compares development that has occurred and the planned and regulated characteristics of the applicable zone, as well as with the assumptions used in the report. Since the development trend evaluation window is a short period of time and the application of zoning may change periodically, it is often found that there is not enough information to make a statistically valid conclusion. Due to this, the information is provided but no conclusions have been made.

The development trends evaluation compares development that has occurred and the planned and regulated characteristics of the applicable zone, as well as with the assumptions used in the report. Since the development trend evaluation window is a short period of time and the application of zoning may change periodically, it is often found that there is not enough information to make a statistically valid conclusion. Due to this, the information is provided but no conclusions have been made.

Error! Not a valid bookmark self-reference. is provided to show the number of permits, units, and acres developed to identify which zones have experienced development in the timeframe.

Table 3-10 is provided to show the number of permits, units, and acres developed to identify which zones have experienced development in the timeframe.

Table 3-12 shows the observed percent of developed acreage between residential and non-residential uses. Mixed-use project acreage is duplicated in each category, resulting in a 50/50 percent split. In these cases, further analysis would be needed to determine if vertical mixed-use is part of the trend, resulting in a 100/100 percent split. The observed trend is compared to the assumptions used in the report for both the mixed-use split and the assumption for non-residential in and single-family zone. The trend is also compared to the permitted uses to determine if the zone is developing as planned.

Table 11-12: Gig Harbor Mixed Use Split and Non-residential in Single Family Zones Evaluation

DEVELOPMENT TRENDS

This section summarizes permit data observed between **January 1, 2013 and December 31, 2020** that is used to monitor observed densities and update the assumptions for future development. The summaries in this section are designed to show the average statistics used to inform the report. Only data pertinent to the Buildable Lands requirements is collected, and incomplete or not-applicable data is omitted; therefore, this Report does not provide a full summary of all development within the jurisdiction. For more detailed summaries by zone/year, see Appendix A: Full Data, Calculation Tables, and Maps.

Table 12-2 shows the average residential density per zone and jurisdiction-wide and is not intended to show the total units/lots created or overall acres consumed. The results reflect the density calculation used by the jurisdiction, and only include a summary of plats and multifamily (3+ attached units) projects. Table 12-3 shows the average floor-to-area ratio (FAR) by zone and the amount of non-residential building square footage developed. The non-residential projects summarized only include new development and omit additions to existing businesses and non-building type improvements.

Table 12-2: City of Lakewood 2013-2020 Residential Trends by Zone[1]

Zone	Net Acres[2]	Lots/Units	Density
ARC	0.78	15	19.23
CBD	1.45	15	10.34

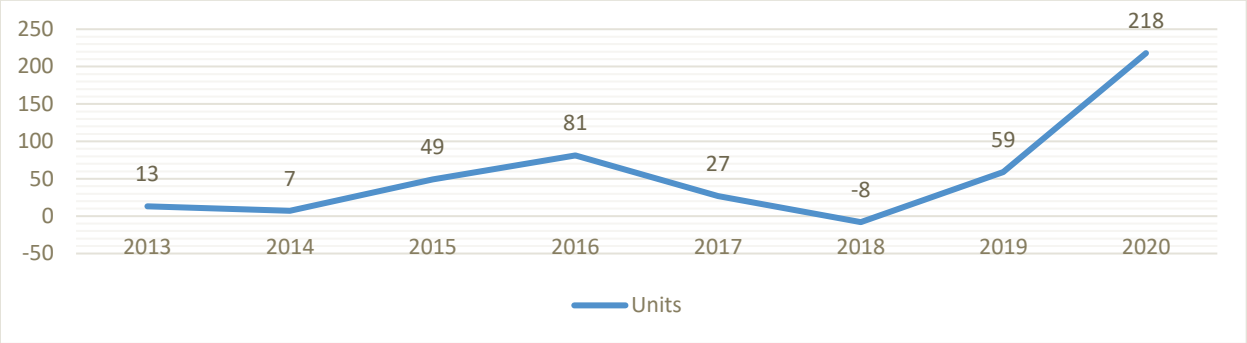
TOC	8.90	138,834	0.36
Total/Avg.	**169.58**	**2,071,492**	**0.28**

[1]Includes multifamily and plat data to represent the overall observed density by zone. Does not include single-family permits in order to accurately represent permitted densities; therefore, does not represent the total number of units developed in the timeframe.
Sources: City Permit Data, Pierce County Assessor-Treasurer Tax Parcels, Puget Sound Regional Council Housing Unit Permit Database.

While the non-residential development trends are informative to show the percent of land consumed for non-residential purposes (as shown in Figure 12-A), the employment densities used in the capacity assumptions are derived through employment density surveys, as documented in Appendix C: Employment Density Survey. Figure 12-A summarizes the split between residential and non-residential development between 2013-2020 by zone and the jurisdiction average. The percent split is based on the gross acres developed between 2013-2020 using the plat activity and multifamily permits for residential and non-residential permits for non-residential. The information is used to inform the percent split for mixed-use zones, as well as the percent of non-residential uses in residential-only zones.

Figure 12-A: City of Lakewood Residential vs. Non-residential Development Split



Zone	Use Type Split (Percent)[1] Residential	Non-residential
AC1	0%	100%
ARC	100%	0%

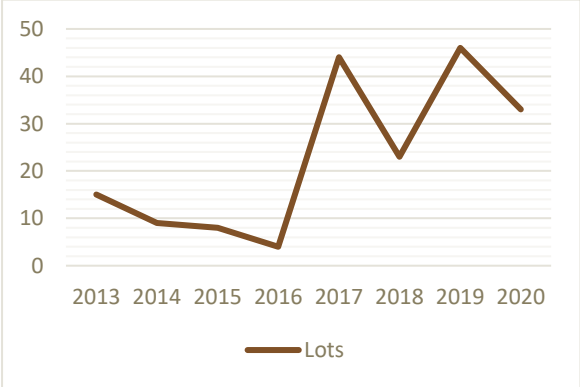
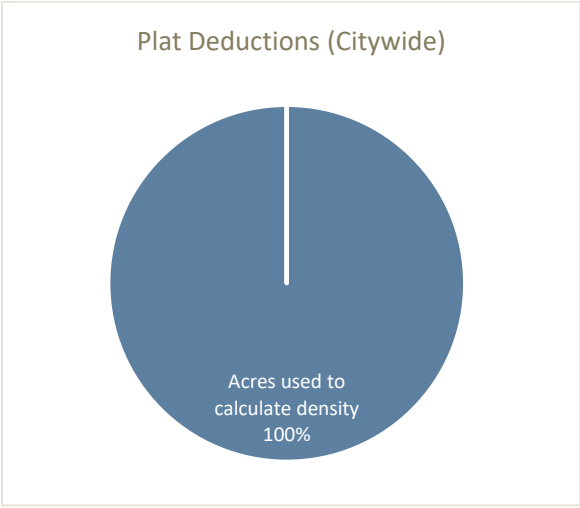
Housing Production Rate

The residential data collected for the Buildable Lands Program tracks the density and other assumptions related to the capacity analysis. The Buildable Lands requirements that were amended in 2017 now require the tracking of housing production to compare to the necessary growth rates to achieve the housing targets. Due to the limitations of the permit data and lack of demolition permit data, Pierce County relies upon the Washington State Office of Financial Management estimates to track the number of housing units built per year in each jurisdiction for the purposes of this Report. The comparison of housing production and housing needs is shown in Table 1-2 and Table 1-3 (Countywide).

Figure 12-B: City of Lakewood Housing Production Rates (OFM)





Source: Washington State Office of Financial Management Housing Unit Data (2020).

Platting Activity

Platting activity is used to determine the achieved density for single-family residential zones and to identify the amount of land used for other purposes (whether netted out for density or applied by a regulation and affecting the achieved density). Plat data is used in conjunction with multifamily permits to determine the overall achieved density (as shown in Table 12-2).

Figure 12-C: City of Lakewood Platting Trends

Plat Activity by Year

Year	Lots	Acres	Density
2013	15	43.01	0.35
2014	9	2.83	1.12
2015	8	2.57	3.11

Residential Building Trends

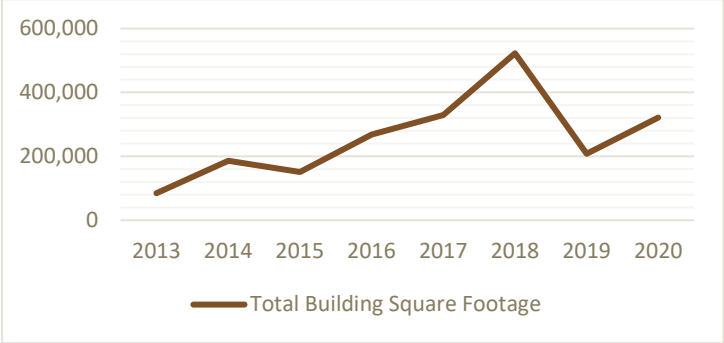
Both multifamily and single-family building permits are collected and summarized; however, single-family permit reporting is optional per the Pierce County Countywide Planning Policies and limited in use for tracking factors affecting development. The single-family permit data is useful for identifying the total number of units built and the average lot size per zone and is provided as supplemental information. The multifamily permit data is used to identify the observed density and amount of land used for residential purposes. Please note that this data differs from the data provided in Figure 12-B due to collection limitations and should not be used to represent housing production in the jurisdiction.

Figure 12-D: City of Lakewood Residential Building Permit Trends

Multifamily Permits by Year

Year	Units	Net Acres	Net Density
2013	-	-	-
2014	41	3.13	13.1
2015	15	0.78	19.23
2016	7	0.52	13.46
2017	4	0.21	19.05
2018	-	-	-
2019	-	-	-
2020	25	2.29	10.92
Total	**92**	**6.93**	**13.28**

Single-Family Permits by Year (Optional)



Year	Lots	Acres	Avg. Lot Size
2013	14	3.60	0.26
2014	19	6.43	0.34
2015	27	6.14	0.25
2016	40	9.73	0.28
2017	26	5.29	0.21
2018	74	13.80	0.23
2019	18	4.15	0.24
2020	20	8.94	0.47
Total	**238**	**58.96**	**0.27**

Sources: City Permit Data, Pierce County Assessor-Treasurer Tax Parcels, Puget Sound Regional Council Housing Unit Permit Database.

Non-residential Building Trends

Non-residential building permits typically include commercial and industrial development; however, public use is often collected and summarized as well when the use type produces jobs. While the project acreage, building square footage, and floor-to-area ratio information is collected and summarized for the report in order to track non-residential development, the employment density is analyzed in a separate report using data other than building permits. The most recent employment density study to support the assumptions in this Report is provided in Appendix C: Employment Density Survey.

Figure 12-E: City of Lakewood Non-residential Permit Trends

Year	Acres	Bldg. SF	FAR
2013	13.76	84,530	0.14
2014	14.05	186,454	0.30
2015	9.64	151,420	0.36
2016	12.72	268,014	0.48
2017	41.70	329,529	0.18
2018	49.33	522,499	0.24
2019	11.82	208,212	0.40
2020	16.56	320,834	0.44
Total	**169.58**	**2,071,492**	**0.28**

ASSUMPTIONS

Assumptions vary by jurisdiction and zone. Table 12-4 and Table 12-5 provide a snapshot of the densities, mixed-use split, and deductions used in the inventory development and capacity calculation tables. The assumptions for each zone are shown in the assumptions column of the capacity calculation tables shown in Appendix A: Full Data, Calculation Tables, and Maps.

Table 12-4: City of Lakewood Assumptions Summary

The Vacant Single Unit size threshold listed below represents the parcel size used to determine if a vacant property is subdividable or only able to accommodate one unit. Parcels smaller than the size listed are considered Vacant Single Units unless otherwise determined by the jurisdiction during the parcel-specific review.

Table 12-5: City of Lakewood Plat Deductions for Single-Family Residential Zones

Zone	Roads	Critical Areas	Parks/Open Space	Stormwater	Non-residential	Vacant Single Unit

HOUSING AND EMPLOYMENT CAPACITY

Inventory and Capacity Calculation Characteristics

A portion of the inventory is deducted from the gross acreage based on the assumptions identified in the previous section. Table 12-6 shows the characteristics of the initial inventory and Table 12-7 shows the amount of land that was reduced from that initial inventory to be included in the capacity analysis, as documented in the tables and maps in Appendix A: Full Data, Calculation Tables, and Maps.

Table 12-6: City of Lakewood Summary of Vacant and Underutilized Land Characteristics

Characteristics/Category	Vacant	Underutilized	Vacant Single Unit	Pipeline
Total Acreage (Gross	178.28	981.47	59.47	101.73
Average Lot Size (Gross)	0.88	0.57	0.26	1.88
Total Acreage (Net)	129.83	919.05	49.95	95.66
Average Lot Size (Net)	0.64	0.53	0.22	1.77
Percent Critical Areas	27%	6%	16%	6%

The parcel inventory is used to categorize land and the capacity calculations are intended to represent the land available for development; thus, the inventory maps alone do not represent the "buildable land" per the Buildable Lands requirements. Table 12-7 shows the overall percentage of land assumed available as capacity in the 20-year planning period and the deductions made to account for constraints to the inventory and overall market conditions.

Table 12-7: City of Lakewood Summary of Deductions

Deductions/Category	Vacant	Underutilized
Critical Areas	48.45	62.42
Plat Deductions	0.00	0.00
Capital Facilities	0.00	0.00
Market Factor	17.83	248.94
Total Percent Reduction in Inventory Land	10%	25%
Percent of Vacant or Underutilized Land Available for Capacity	90%	75%

Capacity Results

The housing and employment capacity totals in Table 12-8 and Table 12-9 are derived from the calculations shown in Appendix A: Full Data, Calculation Tables, and Maps. A summary of the countywide capacity results compared to need is shown in **Error! Reference source not found.** (2030 Housing Target), **Error! Reference source not found.** (2030 Employment Target), and Table 1-12 (DRAFT 2044 Targets).

CONSISTENCY EVALUATION

Development Trends

The development trends evaluation compares development that has occurred and the planned and regulated characteristics of the applicable zone, as well as with the assumptions used in the report. Since the development trend evaluation window is a short period of time and the application of zoning may change periodically, it is often found that there is not enough information to make a statistically valid conclusion. Due to this, the information is provided but no conclusions have been made.

The development trends evaluation compares development that has occurred and the planned and regulated characteristics of the applicable zone, as well as with the assumptions used in the report. Since the development trend evaluation window is a short period of time and the application of zoning may change periodically, it is often found that there is not enough information to make a statistically valid conclusion. Due to this, the information is provided but no conclusions have been made.

Error! Not a valid bookmark self-reference. is provided to show the number of permits, units, and acres developed to identify which zones have experienced development in the timeframe.

Table 3-10 is provided to show the number of permits, units, and acres developed to identify which zones have experienced development in the timeframe.

Table 3-12 shows the observed percent of developed acreage between residential and non-residential uses. Mixed-use project acreage is duplicated in each category, resulting in a 50/50 percent split. In these cases, further analysis would be needed to determine if vertical mixed-use is part of the trend, resulting in a 100/100 percent split. The observed trend is compared to the assumptions used in the report for both the mixed-use split and the assumption for non-residential in and single-family zone. The trend is also compared to the permitted uses to determine if the zone is developing as planned.

Table 12-12: City of Lakewood Mixed Use Split and Non-residential in Single Family Zones Evaluation

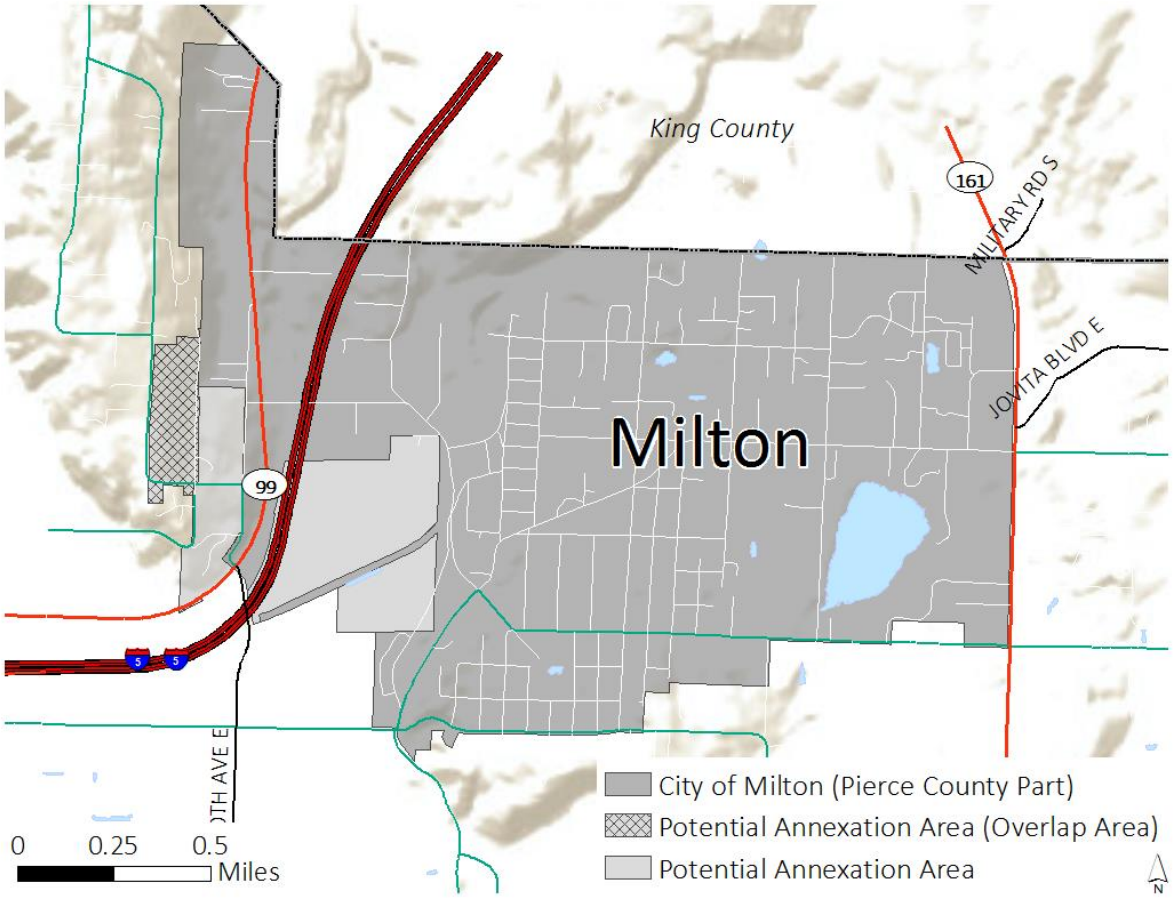
Housing Production / Growth Targets

Table 3-14 shows the observed housing production and average yearly housing production rate between 2010-2020 in comparison to the 2020-2044 housing growth target need and average yearly housing production rate needed to accommodate the growth target.

Table 12-14: Housing Production Trends Compared to Growth Target Needs

Housing Units			Total Housing Growth		Average Yearly Housing Growth (Growth / Years)		
2010 Census	2020 OFM Estimate	2044 Target	2010-2020 Observed	2020-2044 Growth Target	2010-2020 Observed	2020-2044 Growth Target	Yearly Increase Needed
26,548	26,999	36,713	451	9,714	45	405	**360**



Capacity / Growth Targets

Table 3-15 shows the 2020-2044 housing and employment capacity in comparison to the housing and employment 2020-2044 growth target need.

Table 12-15: Housing and Employment Capacity Compared to Growth Target Needs

Housing Capacity	2020-2044 DRAFT Housing Need	Difference	Employment Capacity	2020-2044 DRAFT Employment Need	Difference
10,242	9,714	528	12,212	9,863	2,349

13 CITY OF MILTON (PIERCE COUNTY PART)

A portion of the City of Milton is in King County; this section represents only the portion within Pierce County. The City of Milton's Comprehensive Plan and regulations implement densities using net acreage.

Table 13-1: City of Milton Zone Classifications

Zone Classification		Zone Type[1]	Total Acres[2]
B	Business District	Commercial	150.7
CF	Community Facilities District	Public Use	38.8
M-1	Light Manufacturing District	Industrial	114.7
MX	Mixed-Use Town Center District	Mixed Use	10.8
OS	Open Space District	N/A	36.2
RM	Residential Multi-Family District	Residential	171.1
RMD	Residential Moderate-Density District	Residential	40.3
RS	Residential Single-Family District	Residential	607.2

[1]For purposes of the Buildable Lands inventory and analysis; not a representation of the City zoning code.
[2]Represents parcel acreage, not zoning coverage.
Sources: City Zoning Code.

DEVELOPMENT TRENDS

This section summarizes permit data observed between **January 1, 2013 and December 31, 2019** and plat activity through December 31, 2020 that is used to monitor observed densities and update the assumptions for future development. The summaries in this section are designed to show the average statistics used to inform the report. Only data pertinent to the Buildable Lands requirements is collected, and incomplete or not-applicable data is omitted; therefore, this Report does not provide a full summary of all development within the jurisdiction. For more detailed summaries by zone/year, see Appendix A: Full Data, Calculation Tables, and Maps.

Table 13-2 shows the average residential density per zone and jurisdiction-wide and is not intended to show the total units/lots created or overall acres consumed. The results reflect the density calculation used by the jurisdiction, and only include a summary of plats and multifamily (3+ attached units) projects. Table 13-3 shows the average floor-to-area ratio (FAR) by zone and the amount of non-residential building square footage developed. The non-residential projects summarized only include new development and omit additions to existing businesses and non-building type improvements.

Table 13-2: City of Milton 2013-2020 Residential Trends by Zone[1]

Zone	Net Acres[2]	Lots/Units	Density
RM	0.57	4	10.81
RS	12.78	39	3.34
Total/Avg.	**13.35**	**43**	**3.22**

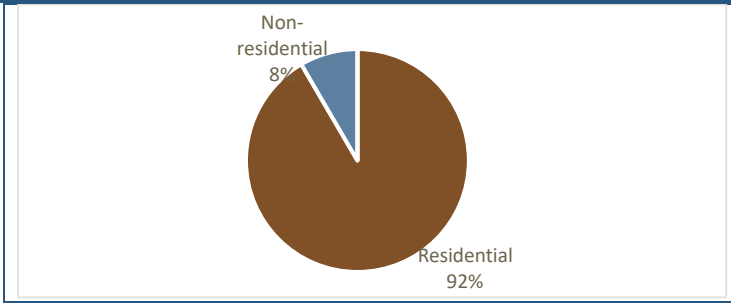


Table 13-3: City of Milton 2013-2020 Non-residential Trends by Zone

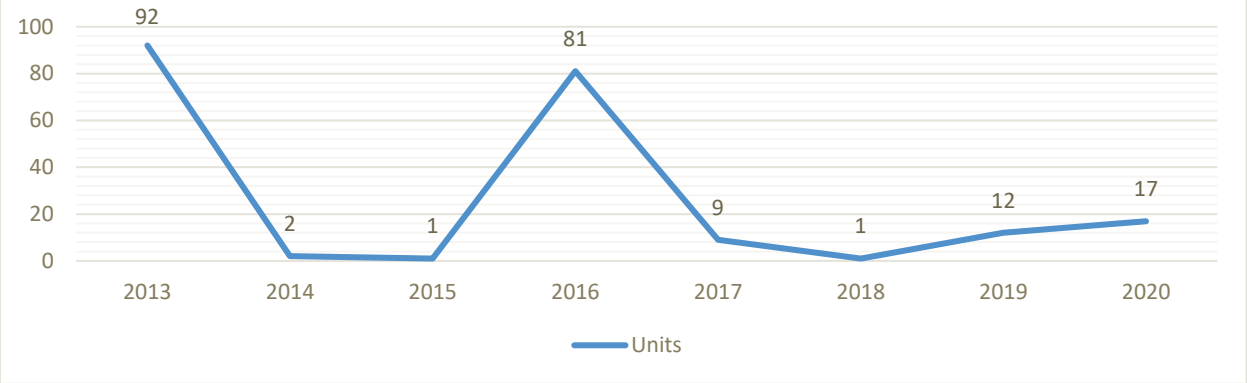
Zone	Acres	Sq. Ft.	FAR
B	1.01	4,483	0.10
TC	0.22	405	0.04
Total/Avg.	**1.23**	**4,888**	**0.09**

[1]Includes multifamily and plat data to represent the overall observed density by zone. Does not include single-family permits in order to accurately represent permitted densities; therefore, does not represent the total number of units developed in the timeframe.
Sources: City Permit Data, Pierce County Assessor-Treasurer Tax Parcels, Puget Sound Regional Council Housing Unit Permit Database.

While the non-residential development trends are informative to show the percent of land consumed for non-residential purposes (as shown in Figure 13-A), the employment densities used in the capacity assumptions are derived through employment density surveys, as documented in Appendix C: Employment Density Survey. Figure 13-A summarizes the split between residential and non-residential development between 2013-2020 by zone and the jurisdiction average. The percent split is based on the gross acres developed between 2013-2020 using the plat activity and multifamily permits for residential and non-residential permits for non-residential. The information is used to inform the percent split for mixed-use zones, as well as the percent of non-residential uses in residential-only zones.

Figure 13-A: City of Milton Residential vs. Non-residential Development Split



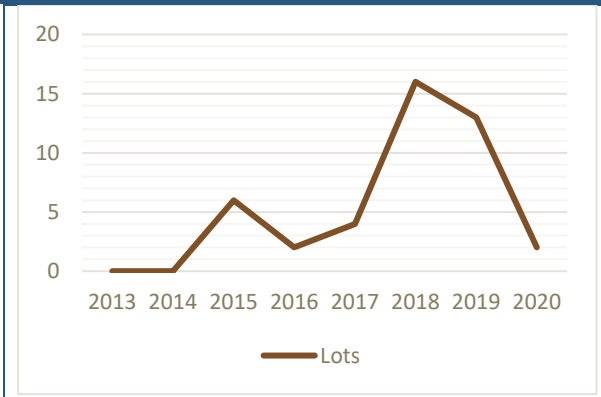
Zone	Use Type Split (Percent)[1] Residential	Non-residential
B	0%	100%
RM	100%	0%
RS	100%	0%
TC	0%	100%
Average	**92%**	**8%**

[1]Does not include single-family permits in order to avoid double-counting acreage.
Sources: City Permit Data, Pierce County Assessor-Treasurer Tax Parcels, Puget Sound Regional Council Housing Unit Permit Database.

Housing Production Rate

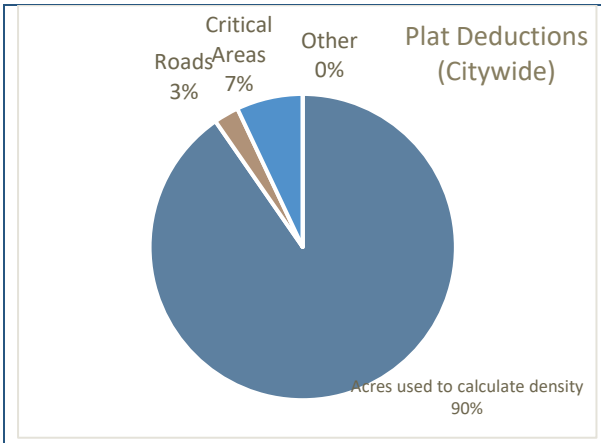
The residential data collected for the Buildable Lands Program tracks the density and other assumptions related to the capacity analysis. The Buildable Lands requirements that were amended in 2017 now require the tracking of housing production to compare to the necessary growth rates to achieve the housing targets. Due to the limitations of the permit data and lack of demolition permit data, Pierce County relies upon the Washington State Office of Financial Management estimates to track the number of housing units built per year in each jurisdiction for the purposes of this Report. The comparison of housing production and housing needs is shown in Table 1-2 and Table 1-3 (Countywide).

Figure 13-B: City of Milton Housing Production Rates (OFM)



Source: Washington State Office of Financial Management Housing Unit Data (2020).

Platting Activity



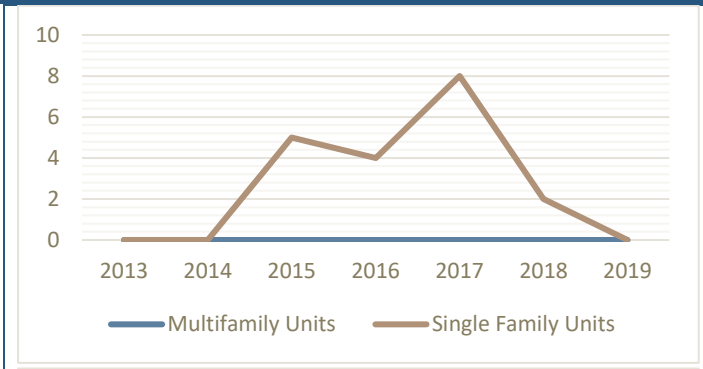
Platting activity is used to determine the achieved density for single-family residential zones and to identify the amount of land used for other purposes (whether netted out for density or applied by a regulation and affecting the achieved density). Plat data is used in conjunction with multifamily permits to determine the overall achieved density (as shown in Table 13-2).

Figure 13-C: City of Milton Platting Trends

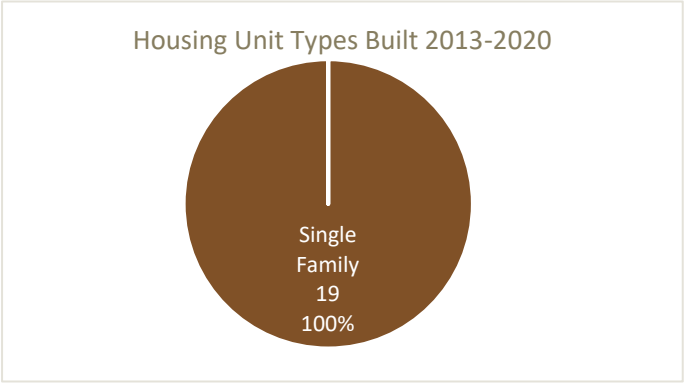
Plat Activity by Year

Year	Lots	Acres	Density
2013	-	-	-
2014	-	-	-
2015	6	1.25	4.80
2016	2	0.54	3.68
2017	4	0.80	5.01
2018	16	3.42	4.68
2019	13	3.70	3.51
2020	2	2.35	0.85
Total	**43**	**12.06**	**3.57**

Plat Deductions by Zone (Percent)



Zone	Roads	Critical Areas	Parks/Open Space	Storm -water
RM	35.1%	0.0%	0.0%	0.0%
RS	1.2%	7.3%	0.0%	0.0%
Average	**2.6%**	**7.0%**	**0.0%**	**0.0%**



Sources: City Permit Data, Pierce County Auditor Recorded Plats.

Residential Building Trends

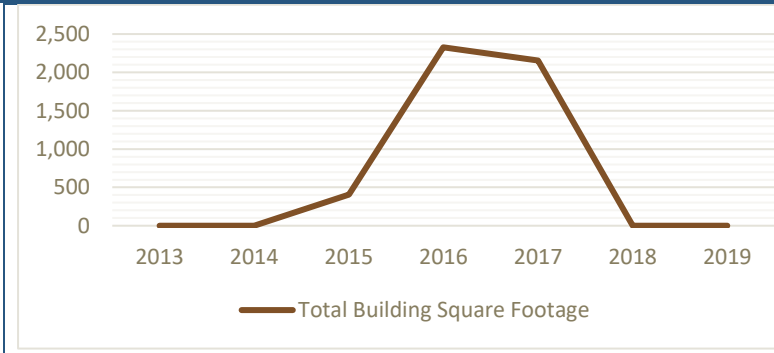
Both multifamily and single-family building permits are collected and summarized; however, single-family permit reporting is optional per the Pierce County Countywide Planning Policies and limited in use for tracking factors affecting development. The single-family permit data is useful for identifying the total number of units built and the average lot size per zone and is provided as supplemental information. The multifamily permit data is used to identify the observed density and amount of land used for residential purposes. Please note that this data differs from the data provided in Figure 13-B due to collection limitations and should not be used to represent housing production in the jurisdiction.

Figure 13-D: City of Milton Residential Building Permit Trends

Multifamily Permits by Year

No multifamily residential development was observed in the timeframe

Single-Family Permits by Year (Optional)



Year	Lots	Acres	Avg. Lot Size
2013	-	-	-
2014	-	-	-
2015	7	1.59	0.26
2016	4	0.96	0.32
2017	8	1.79	0.22
2018	2	0.61	0.31
2019	-	-	-
Total	**21**	**4.95**	**0.26**

Sources: City Permit Data, Pierce County Assessor-Treasurer Tax Parcels, Puget Sound Regional Council Housing Unit Permit Database.

Non-residential Building Trends

Non-residential building permits typically include commercial and industrial development; however, public use is often collected and summarized as well when the use type produces jobs. While the project acreage, building square footage, and floor-to-area ratio information is collected and summarized for the report in order to track non-residential development, the employment density is analyzed in a separate report using data other than building permits. The most recent employment density study to support the assumptions in this Report is provided in Appendix C: Employment Density Survey.

Figure 13-E: City of Milton Non-residential Permit Trends

Year	Acres	Bldg. SF	FAR
2013	-	-	-
2014	-	-	-
2015	0.22	405	0.04
2016	0.31	2,327	0.17
2017	0.70	2,156	0.07
2018	-	-	-
2019	-	-	-
Total	**1.23**	**4,888**	**0.09**

Sources: City Permit Data, Pierce County Assessor-Treasurer Tax Parcels, Puget Sound Regional Council Housing Unit Permit Database.

ASSUMPTIONS

Assumptions vary by jurisdiction and zone. Table 13-4 and Table 13-5 provide a snapshot of the densities, mixed-use split, and deductions used in the inventory development and capacity calculation tables. The assumptions for each zone are shown in the assumptions column of the capacity calculation tables shown in Appendix A: Full Data, Calculation Tables, and Maps.

Table 13-4: City of Milton Assumptions Summary

Zone	Residential		Employment		Residential Market Factor		Non-Residential Market Factor		Land for Capital Facilities
	Percent	Density	Percent	Density	Vacant	Underutilized	Vacant	Underutilized	
B	0%	0	100%	20	0%	0%	5%	35%	0%
CF	0%	0	100%	20	0%	0%	5%	35%	0%
M-1	0%	0	100%	9	0%	0%	5%	35%	0%
MX	60%	8	40%	20	5%	35%	5%	35%	0%
RM	100%	8	0%	20	5%	35%	0%	0%	0%
RMD	100%	8	0%	20	5%	35%	0%	0%	0%
RS	100%	3	0%	20	5%	35%	0%	0%	0%

The Vacant Single Unit size threshold listed below represents the parcel size used to determine if a vacant property is subdividable or only able to accommodate one unit. Parcels smaller than the size listed are considered Vacant Single Units unless otherwise determined by the jurisdiction during the parcel-specific review.

Table 13-5: City of Milton Plat Deductions for Single-Family Residential Zones

Zone	Roads	Critical Areas	Parks/Open Space	Stormwater	Non-residential	Vacant Single Unit
RM	15%	GIS	0%	0%	2%	<0.39 acres
RMD	15%	GIS	0%	0%	2%	<0.23 acres
RS	15%	GIS	0%	0%	2%	<0.39 acres

HOUSING AND EMPLOYMENT CAPACITY

Inventory and Capacity Calculation Characteristics

A portion of the inventory is deducted from the gross acreage based on the assumptions identified in the previous section. Table 13-6 shows the characteristics of the initial inventory and Table 13-7 shows the amount of land that was reduced from that initial inventory to be included in the capacity analysis, as documented in the tables and maps in Appendix A: Full Data, Calculation Tables, and Maps.

Table 13-6: City of Milton Summary of Vacant and Underutilized Land Characteristics

Characteristics/Category	Vacant	Underutilized	Vacant Single Unit	Pipeline
Total Acreage (Gross	178.28	981.47	59.70	101.73
Average Lot Size (Gross)	0.88	0.57	0.26	1.88
Total Acreage (Net)	129.83	919.05	50.18	95.66
Average Lot Size (Net)	0.64	0.53	0.22	1.77
Percent Critical Areas	27%	6%	16%	6%

The parcel inventory is used to categorize land and the capacity calculations are intended to represent the land available for development; thus, the inventory maps alone do not represent the "buildable land" per the Buildable Lands requirements. Table 13-7 shows the overall percentage of land assumed available as capacity in the 20-year planning period and the deductions made to account for constraints to the inventory and overall market conditions.

Table 13-7: City of Milton Summary of Deductions

Deductions/Category	Vacant	Underutilized
Critical Areas	48.45	62.42
Plat Deductions	4.50	17.76
Capital Facilities	0.00	0.00
Market Factor	3.49	66.97
Total Percent Reduction in Inventory Land	24%	44%
Percent of Vacant or Underutilized Land Available for Capacity	76%	56%

Capacity Results

The housing and employment capacity totals in Table 13-8 and Table 13-9 are derived from the calculations shown in Appendix A: Full Data, Calculation Tables, and Maps. A summary of the countywide capacity results compared to need is shown in **Error! Reference source not found.** (2030 Housing Target), **Error! Reference source not found.** (2030 Employment Target), and Table 1-12 (DRAFT 2044 Targets).

Table 13-8: City of Milton 2020-2044 Housing Capacity (Dwelling Units)

Zone	Vacant	Underutilized	Vacant Single Unit	Pipeline	Total

CONSISTENCY EVALUATION

Development Trends

The development trends evaluation compares development that has occurred and the planned and regulated characteristics of the applicable zone, as well as with the assumptions used in the report. Since the development trend evaluation window is a short period of time and the application of zoning may change periodically, it is often found that there is not enough information to make a statistically valid conclusion. Due to this, the information is provided but no conclusions have been made.

The development trends evaluation compares development that has occurred and the planned and regulated characteristics of the applicable zone, as well as with the assumptions used in the report. Since the development trend evaluation window is a short period of time and the application of zoning may change periodically, it is often found that there is not enough information to make a statistically valid conclusion. Due to this, the information is provided but no conclusions have been made.

Error! Not a valid bookmark self-reference. is provided to show the number of permits, units, and acres developed to identify which zones have experienced development in the timeframe.

Table 3-10 is provided to show the number of permits, units, and acres developed to identify which zones have experienced development in the timeframe.

Table 13-10: City of Milton Permits Summary					
Zone	Residential Permits	Non-Residential Permits	Dwelling Units	Acres Developed	% Zoned Acreage
B	0	2	0	1.01	0.7%
CF	0	0	0	0.00	0.0%
M-1	0	0	0	0.00	0.0%
MX	0	0	0	0.00	0.0%
OS	0	0	0	0.00	0.0%
RM	1	0	4	0.57	0.3%
RMD	0	0	0	0.00	0.0%
RS	11	0	39	12.78	2.1%

Table 3-11 shows the observed residential density trends in comparison to the permitted density and assumed density for each zone with sufficient data. Both the plat and multifamily project average densities are shown in order to understand the source of the overall density.

Table 13-11: City of Milton Density Evaluation				
Zone	Observed Density (Overall)	Observed Plat Density (Single-Family)	Observed Multifamily Density	Assumed Density
B	0	0	0	0
CF	0	0	0	0
M-1	0	0	0	0
MX	0	0	0	8
OS	0	0	0	0
RM	11	11	0	8
RMD	0	0	0	8
RS	3	3	0	3

Table 3-12 shows the observed percent of developed acreage between residential and non-residential uses. Mixed-use project acreage is duplicated in each category, resulting in a 50/50 percent split. In these cases, further analysis would be needed to determine if vertical mixed-use is part of the trend, resulting in a 100/100 percent split. The observed trend is compared to the assumptions used in the report for both the mixed-use split and the assumption for non-residential in and single-family zone. The trend is also compared to the permitted uses to determine if the zone is developing as planned.

Table 13-12: City of Milton Mixed Use Split and Non-residential in Single Family Zones Evaluation						
Zone	Observed Residential Percent	Assumed Residential Percent	Observed Non-residential Percent	Assumed Non-residential Percent	Zone Type (Residential, Non-residential, Mixed-use)	Assumed Non-residential in Single-Family zones Percent
B	0%	0%	100%	100%	Commercial	0%
CF	0%	0%	0%	100%	Commercial	0%
M-1	0%	0%	0%	100%	Industrial	0%

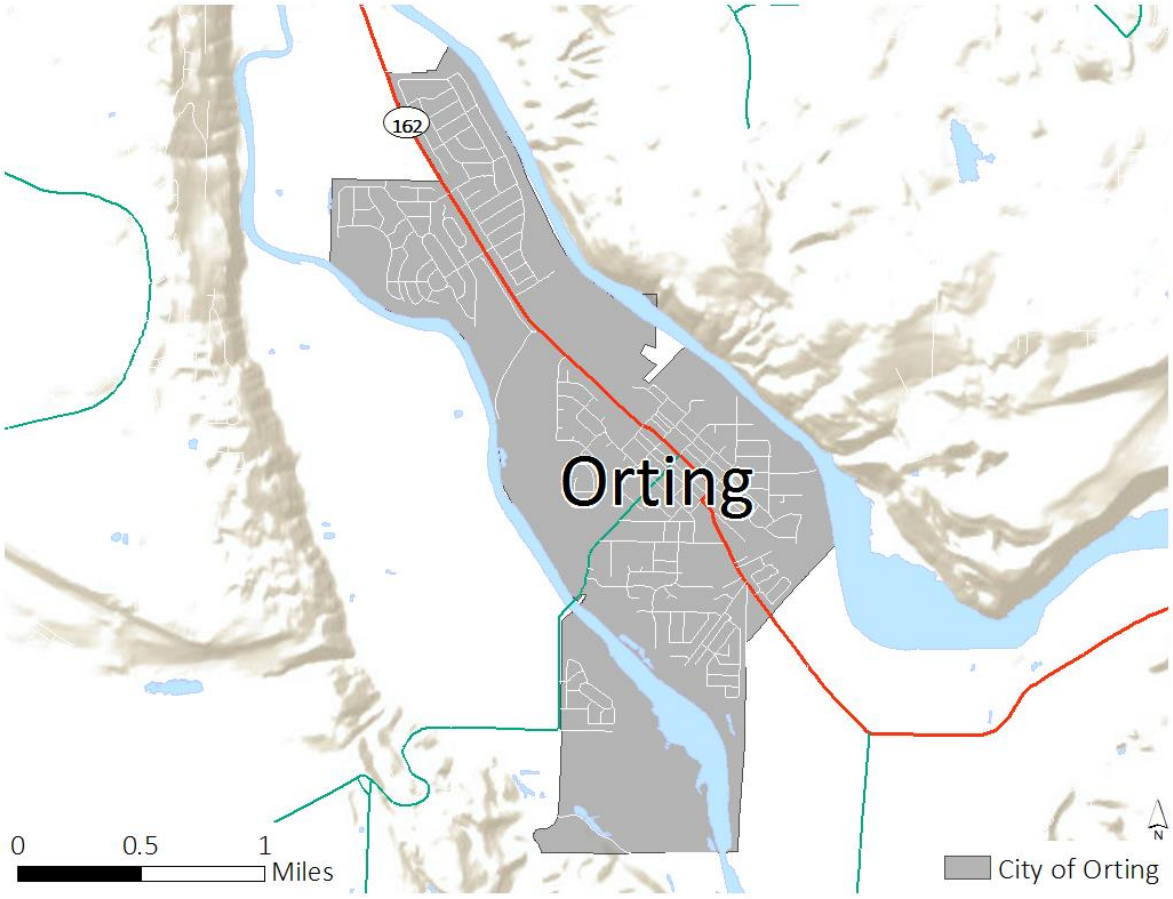
Housing Production / Growth Targets

Table 3-14 shows the observed housing production and average yearly housing production rate between 2010-2020 in comparison to the 2020-2044 housing growth target need and average yearly housing production rate needed to accommodate the growth target.

Table 13-14: Housing Production Trends Compared to Growth Target Needs

Housing Units			Total Housing Growth		Average Yearly Housing Growth (Growth / Years)		
2010 Census	2020 OFM Estimate	2044 Target	2010-2020 Observed	2020-2044 Growth Target	2010-2020 Observed	2020-2044 Growth Target	Yearly Increase Needed
2,724	2,963	3,222	239	259	24	11	-



Capacity / Growth Targets

Table 3-15 shows the 2020-2044 housing and employment capacity in comparison to the housing and employment 2020-2044 growth target need.

Table 13-15: Housing and Employment Capacity Compared to Growth Target Needs

Housing Capacity	2020-2044 DRAFT Housing Need	Difference	Employment Capacity	2020-2044 DRAFT Employment Need	Difference
432	259	173	1,486	441	1,045

14 CITY OF ORTING

The City of Orting's Comprehensive Plan and regulations implement densities using net acreage, subtracting out roads, critical areas, and parks.

Table 14-1: City of Orting Zone Classifications

Zone Classification		Zone Type[1]	Total Acres[2]
LM	c	Industrial	0.9
MUTC	Mixed Use – Town Center	Mixed Use	48.7
MUTCN	Mixed Use – Town Center North	Mixed Use	65.3
OS	Open Space & Recreation	N/A	87.3
PF	Public Facilities	Public Use	381.5
RC	Residential – Conservation	Residential	166.3
RMF	Residential – Multi-family	Residential	38.0
RU	Residential – Urban	Residential	729.0

[1]For purposes of the Buildable Lands inventory and analysis; not a representation of the City zoning code.
[2]Represents parcel acreage, not zoning coverage.
Sources: City Zoning Code.

DEVELOPMENT TRENDS

This section summarizes permit data observed between **January 1, 2013 and December 31, 2019 and plat activity through December 31, 2020** that is used to monitor observed densities and update the assumptions for future development. The summaries in this section are designed to show the average statistics used to inform the report. Only data pertinent to the Buildable Lands requirements is collected, and incomplete or not-applicable data is omitted; therefore, this Report does not provide a full summary of all development within the jurisdiction. For more detailed summaries by zone/year, see Appendix A: Full Data, Calculation Tables, and Maps.

Table 14-2 shows the average residential density per zone and jurisdiction-wide and is not intended to show the total units/lots created or overall acres consumed. The results reflect the density calculation used by the jurisdiction, and only include a summary of plats and multifamily (3+ attached units) projects. Table 14-3 shows the average floor-to-area ratio (FAR) by zone and the amount of non-residential building square footage developed. The non-residential projects summarized only include new development and omit additions to existing businesses and non-building type improvements.

Table 14-2: City of Orting 2013-2020 Residential Trends by Zone[1]

Zone	Net Acres[2]	Lots/Units	Density
MUTC	0.23	2	8.70
RU	106.34	418	3.93
Total/Avg.	**106.57**	**420**	**3.94**

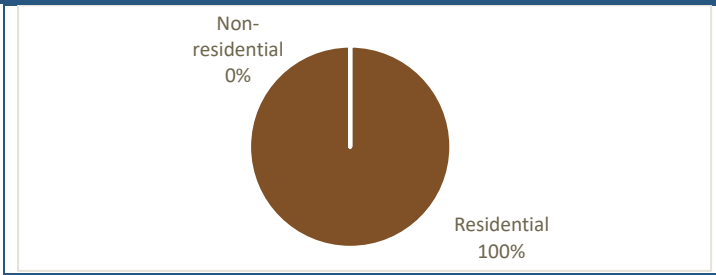


Table 14-3: City of Orting 2013-2020 Non-residential Trends by Zone

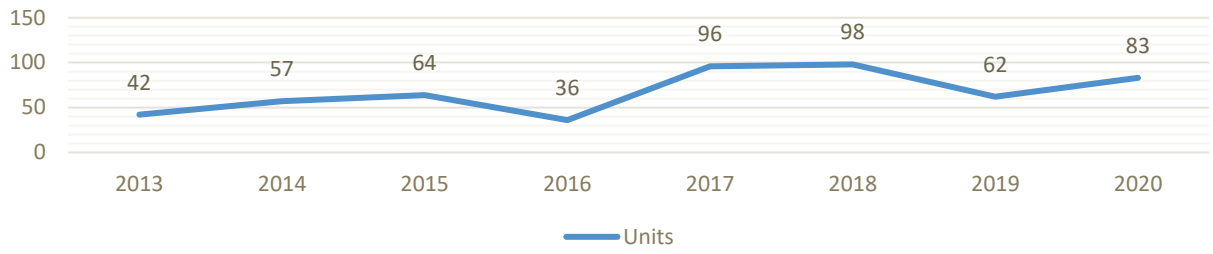
No non-residential development has been observed in the timeframe.

[1]Includes multifamily and plat data to represent the overall observed density by zone. Does not include single-family permits in order to accurately represent permitted densities; therefore, does not represent the total number of units developed in the timeframe.
Sources: City Permit Data, Pierce County Assessor-Treasurer Tax Parcels, Puget Sound Regional Council Housing Unit Permit Database.

While the non-residential development trends are informative to show the percent of land consumed for non-residential purposes (as shown in Figure 14-A), the employment densities used in the capacity assumptions are derived through employment density surveys, as documented in Appendix C: Employment Density Survey. Figure 14-A summarizes the split between residential and non-residential development between 2013-2020 by zone and the jurisdiction average. The percent split is based on the gross acres developed between 2013-2020 using the plat activity and multifamily permits for residential and non-residential permits for non-residential. The information is used to inform the percent split for mixed-use zones, as well as the percent of non-residential uses in residential-only zones.

Figure 14-A: City of Orting Residential vs. Non-residential Development Split



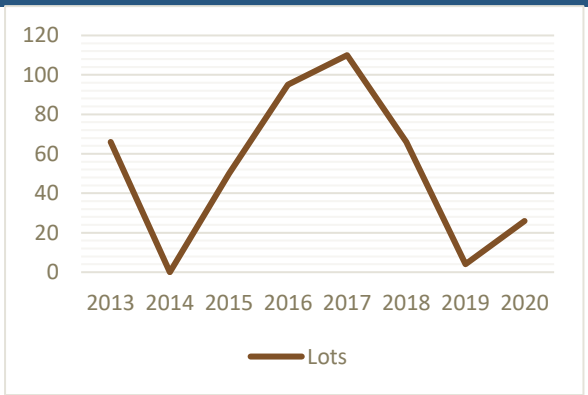
Zone	Use Type Split (Percent)[1]	
	Residential	Non-residential
MUTC	100%	0%
RU	100%	0%
Average	**100%**	**0%**

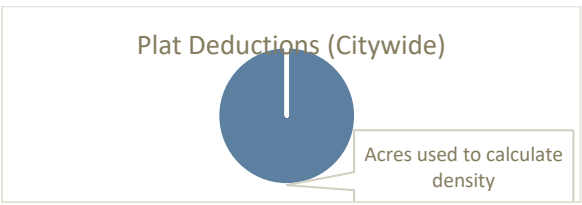
[1]Does not include single-family permits in order to avoid double-counting acreage.
Sources: City Permit Data, Pierce County Assessor-Treasurer Tax Parcels, Puget Sound Regional Council Housing Unit Permit Database.

Housing Production Rate

The residential data collected for the Buildable Lands Program tracks the density and other assumptions related to the capacity analysis. The Buildable Lands requirements that were amended in 2017 now require the tracking of housing production to compare to the necessary growth rates to achieve the housing targets. Due to the limitations of the permit data and lack of demolition permit data, Pierce County relies upon the Washington State Office of Financial Management estimates to track the number of housing units built per year in each jurisdiction for the purposes of this Report. The comparison of housing production and housing needs is shown in Table 1-2 and Table 1-3 (Countywide).

Figure 14-B: City of Orting Housing Production Rates (OFM)





Source: Washington State Office of Financial Management Housing Unit Data (2020).

Platting Activity

Platting activity is used to determine the achieved density for single-family residential zones and to identify the amount of land used for other purposes (whether netted out for density or applied by a regulation and affecting the achieved density). Plat data is used in conjunction with multifamily permits to determine the overall achieved density (as shown in Table 14-2).

Figure 14-C: City of Orting Platting Trends

Plat Activity by Year

Year	Lots	Acres	Density
2013	66	15.37	4.29
2014	-	-	-
2015	50	11.30	4.42
2016	95	19.56	4.86
2017	110	30.52	3.60
2018	66	16.40	4.02
2019	4	1.20	3.33
2020	26	11.75	2.21
Total	**417**	**106.10**	**3.93**

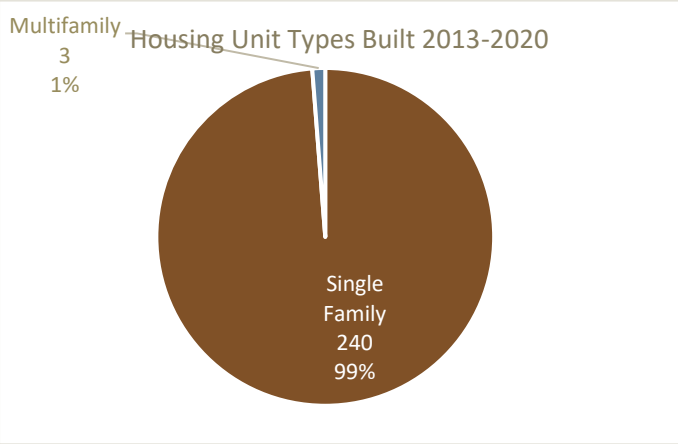
Zone	Roads	Critical Areas	Parks/Open Space	Storm -water
MUTC	0.0%	0.0%	0.0%	0.0%
RU	0.0%	0.0%	0.0%	0.0%
Average	**0.0%**	**0.0%**	**0.0%**	**0.0%**



Sources: City Permit Data, Pierce County Auditor Recorded Plats.

Residential Building Trends

Both multifamily and single-family building permits are collected and summarized; however, single-family permit reporting is optional per the Pierce County Countywide Planning Policies and limited in use for tracking factors affecting development. The single-family permit data is useful for identifying the total number of units built and the average lot size per zone and is provided as supplemental information. The multifamily permit data is used to identify the observed density and amount of land used for residential purposes. Please note that this data differs from the data provided in Figure 14-B due to collection limitations and should not be used to represent housing production in the jurisdiction.

Figure 14-D: City of Orting Residential Building Permit Trends

Multifamily Permits by Year

Year	Units	Net Acres	Net Density
2013	-	-	-
2014	-	-	-
2015	-	-	-
2016	-	-	-
2017	-	-	-
2018	-	-	-
2019	3	0.47	6.38
Total	**3**	**0.47**	**6.38**

Single-Family Permits by Year (Optional)

Year	Lots	Acres	Avg. Lot Size
2013	-	-	-
2014	-	-	-
2015	-	-	-
2016	-	-	-
2017	140	23.58	0.17
2018	84	20.22	0.24
2019	16	3.77	0.23
Total/Avg.	**240**	**47.58**	**0.20**

Sources: City Permit Data, Pierce County Assessor-Treasurer Tax Parcels, Puget Sound Regional Council Housing Unit Permit Database.

Non-residential Building Trends

Non-residential building permits typically include commercial and industrial development; however, public use is often collected and summarized as well when the use type produces jobs. While the project acreage, building square footage, and floor-to-area ratio information is collected and summarized for the report in order to track non-residential development, the employment density is analyzed in a separate report using data other than building permits. The most recent employment density study to support the assumptions in this Report is provided in Appendix C: Employment Density Survey.

Figure 14-E: City of Orting Non-residential Permit Trends

No non-residential development has been observed in the timeframe.

ASSUMPTIONS

Assumptions vary by jurisdiction and zone. Table 14-4 and Table 14-5 provide a snapshot of the densities, mixed-use split, and deductions used in the inventory development and capacity calculation tables. The assumptions for each zone are shown in the assumptions column of the capacity calculation tables shown in Appendix A: Full Data, Calculation Tables, and Maps

Table 14-4: City of Orting Assumptions Summary

Zone	Residential		Employment		Residential Market Factor		Non-Residential Market Factor		Land for Capital Facilities
	Percent	Density	Percent	Density	Vacant	Underutilized	Vacant	Underutilized	
LM	0%	0	100%	9	0%	0%	4%	50%	0%
MUTC	50%	8	50%	20	1%	50%	4%	50%	0%
MUTCN	50%	10	50%	20	1%	50%	4%	50%	0%
PF	0%	0	100%	20	0%	0%	4%	50%	0%
RC	100%	0.5	0%	20	1%	50%	0%	0%	0%
RMF	100%	6	0%	20	1%	50%	0%	0%	0%
RU	100%	4	0%	20	1%	50%	0%	0%	0%

The Vacant Single Unit size threshold listed below represents the parcel size used to determine if a vacant property is subdividable or only able to accommodate one unit. Parcels smaller than the size listed are considered Vacant Single Units unless otherwise determined by the jurisdiction during the parcel-specific review.

Table 14-5: City of Orting Plat Deductions for Single-Family Residential Zones

Zone	Roads	Critical Areas	Parks/Open Space	Stormwater	Non-residential	Vacant Single Unit
RC	10%	7.50%	6.20%	0%	0%	<4.50 acres
RMF	10%	7.50%	6.20%	0%	0%	<0.31 acres
RU	10%	7.50%	6.20%	0%	0%	<0.42 acres

HOUSING AND EMPLOYMENT CAPACITY

Inventory and Capacity Calculation Characteristics

A portion of the inventory is deducted from the gross acreage based on the assumptions identified in the previous section. Table 14-6 shows the characteristics of the initial inventory and Table 14-7 shows the amount of land that was reduced from that initial inventory to be included in the capacity analysis, as documented in the tables and maps in Appendix A: Full Data, Calculation Tables, and Maps.

Table 14-6: City of Orting Summary of Vacant and Underutilized Land Characteristics				
Characteristics/Category	**Vacant**	**Underutilized**	**Vacant Single Unit**	**Pipeline**
Total Acreage (Gross	156.55	70.99	9.75	20.92
Average Lot Size (Gross)	10.44	1.13	0.30	4.18
Total Acreage (Net)	106.77	31.70	2.48	4.96
Average Lot Size (Net)	7.12	0.50	0.08	0.99
Percent Critical Areas	32%	55%	75%	76%

The parcel inventory is used to categorize land and the capacity calculations are intended to represent the land available for development; thus, the inventory maps alone do not represent the "buildable land" per the Buildable Lands requirements. Table 14-7 shows the overall percentage of land assumed available as capacity in the 20-year planning period and the deductions made to account for constraints to the inventory and overall market conditions.

Table 14-7: City of Orting Summary of Deductions		
Deductions/Category	**Vacant**	**Underutilized**
Critical Areas	49.79	39.29
Plat Deductions	2.74	3.79
Capital Facilities	33.46	0.00
Market Factor	4.46	13.99
Total Percent Reduction in Inventory Land	39%	80%
Percent of Vacant or Underutilized Land Available for Capacity	61%	20%

Capacity Results

The housing and employment capacity totals in Table 14-8 and Table 14-9 are derived from the calculations shown in Appendix A: Full Data, Calculation Tables, and Maps. A summary of the countywide capacity results compared to need is shown in **Error! Reference source not found.** (2030 Housing Target), **Error! Reference source not found.** (2030 Employment Target), and Table 1-12 (DRAFT 2044 Targets).

15 CITY OF PACIFIC (PIERCE COUNTY PART)

A portion of the City of Pacific is in King County; this section represents only the portion within Pierce County. The City does not have any residential-zoned land in Pierce County.

Table 15-1: City of Pacific Zone Classifications

Zone Classification		Zone Type[1]	Total Acres[2]
C	Commercial	Commercial	73.5
LI	Light Industrial	Industrial	191.0
OP	Office Park	Commercial	24.0
PL	Public Land	Public Use	1.6

[1]For purposes of the Buildable Lands inventory and analysis; not a representation of the City zoning code.
[2]Represents parcel acreage, not zoning coverage.
Sources: City Zoning Code.

DEVELOPMENT TRENDS

This section summarizes building and plat data obtained through the Pierce County Assessor-Treasurer and Auditor Departments observed between **January 1, 2013 and December 31, 2020** that is used to monitor observed densities and update the assumptions for future development. The summaries in this

section are designed to show the average statistics used to inform the report. Only data pertinent to the Buildable Lands requirements is collected, and incomplete or not-applicable data is omitted; therefore, this Report does not provide a full summary of all development within the jurisdiction. For more detailed summaries by zone/year, see Appendix A: Full Data, Calculation Tables, and Maps.

Table 15-2 shows the average residential density per zone and jurisdiction-wide and is not intended to show the total units/lots created or overall acres consumed. The results reflect the density calculation used by the jurisdiction, and only include a summary of plats and multifamily (3+ attached units) projects. Table 15-3 shows the average floor-to-area ratio (FAR) by zone and the amount of non-residential building square footage developed. The non-residential projects summarized only include new development and omit additions to existing businesses and non-building type improvements.

Table 15-2: City of Pacific 2013-2020 Residential Trends by Zone[1]

The portion of City of Pacific within Pierce County does not contain residential land, and no residential development has been observed in the timeframe.

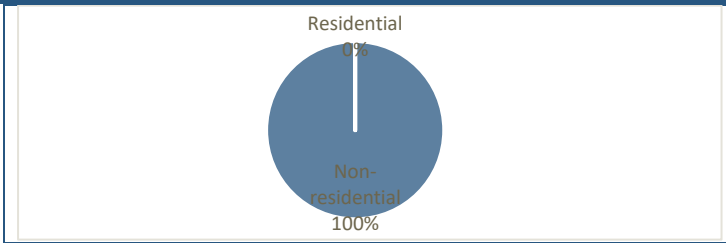

Table 15-3: City of Pacific 2013-2020 Non-residential Trends by Zone

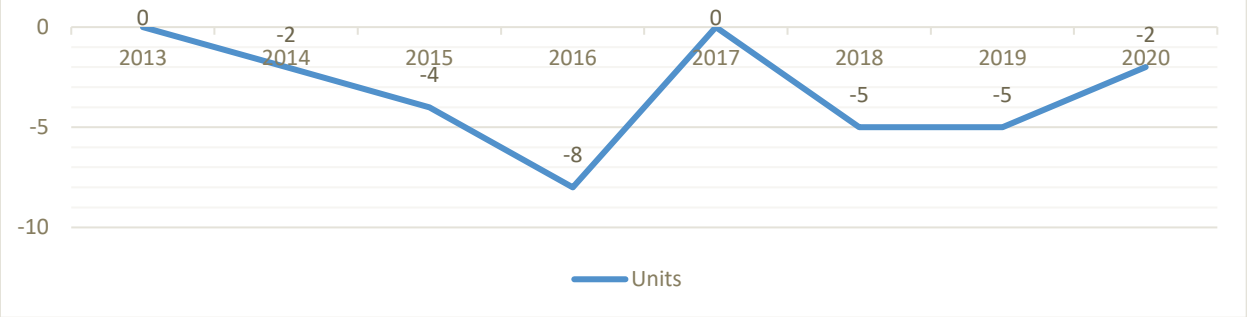
Zone	Acres	Sq. Ft.	FAR
C	4.24	21,313	0.12
LI	16.11	293,492	0.42
OP	1.68	7,500	0.10
Total/Avg.	**22.03**	**322,305**	**0.34**

[1]Includes multifamily and plat data to represent the overall observed density by zone. Does not include single-family permits in order to accurately represent permitted densities; therefore, does not represent the total number of units developed in the timeframe.
Sources: City Permit Data, Pierce County Assessor-Treasurer Tax Parcels, Puget Sound Regional Council Housing Unit Permit Database.

While the non-residential development trends are informative to show the percent of land consumed for non-residential purposes (as shown in Figure 15-A), the employment densities used in the capacity assumptions are derived through employment density surveys, as documented in Appendix C: Employment Density Survey. Figure 15-A summarizes the split between residential and non-residential development between 2013-2020 by zone and the jurisdiction average. The percent split is based on the gross acres developed between 2013-2020 using the plat activity and multifamily permits for residential and non-residential permits for non-residential. The information is used to inform the percent split for mixed-use zones, as well as the percent of non-residential uses in residential-only zones.

Figure 15-A: City of Pacific Residential vs. Non-residential Development Split

Zone	Use Type Split (Percent)[1]	
	Residential	Non-residential
OP	0%	100%
LI	0%	100%
C	0%	100%
Average	**0%**	**100%**



[1]Does not include single-family permits in order to avoid double-counting acreage.
Sources: City Permit Data, Pierce County Assessor-Treasurer Tax Parcels, Puget Sound Regional Council Housing Unit Permit Database.

Housing Production Rate

The residential data collected for the Buildable Lands Program tracks the density and other assumptions related to the capacity analysis. The Buildable Lands requirements that were amended in 2017 now require the tracking of housing production to compare to the necessary growth rates to achieve the

housing targets. Due to the limitations of the permit data and lack of demolition permit data, Pierce County relies upon the Washington State Office of Financial Management estimates to track the number of housing units built per year in each jurisdiction for the purposes of this Report. The comparison of housing production and housing needs is shown in Table 1-2 and Table 1-3 (Countywide).

Figure 15-B: City of Pacific Housing Production Rates (OFM)

Source: Washington State Office of Financial Management Housing Unit Data (2020).

Platting Activity

Platting activity is used to determine the achieved density for single-family residential zones and to identify the amount of land used for other purposes (whether netted out for density or applied by a regulation and affecting the achieved density). Plat data is used in conjunction with multifamily permits to determine the overall achieved density (as shown in Table 15-2).

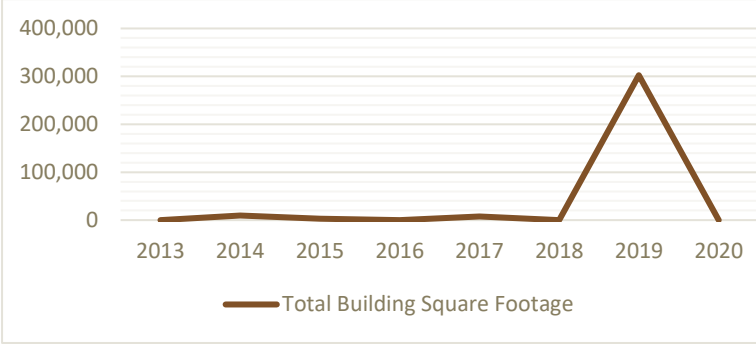
Figure 15-C: City of Pacific County Platting Trends

The portion of City of Pacific within Pierce County does not contain residential land, and no residential platting activity has been observed in the timeframe.

Residential Building Trends

Both multifamily and single-family building permits are collected and summarized; however, single-family permit reporting is optional per the Pierce County Countywide Planning Policies and limited in use for tracking factors affecting development. The single-family permit data is useful for identifying the total number of units built and the average lot size per zone and is provided as supplemental information. The multifamily permit data is used to identify the observed density and amount of land used for residential purposes. Please note that this data differs from the data provided in Figure 15-B due to collection limitations and should not be used to represent housing production in the jurisdiction.

Figure 15-D: City of Pacific Residential Building Permit Trends



The portion of City of Pacific within Pierce County does not contain residential land, and no residential development has been observed in the timeframe.

Non-residential Building Trends

Non-residential building permits typically include commercial and industrial development; however, public use is often collected and summarized as well when the use type produces jobs. While the project acreage, building square footage, and floor-to-area ratio information is collected and

summarized for the report in order to track non-residential development, the employment density is analyzed in a separate report using data other than building permits. The most recent employment density study to support the assumptions in this Report is provided in Appendix C: Employment Density Survey.

Figure 15-E: City of Pacific Non-residential Permit Trends

Year	Acres	Bldg. SF	FAR
2013	-	-	-
2014	2.45	9,540	0.09
2015	2.58	2,880	0.03

ASSUMPTIONS

Assumptions vary by jurisdiction and zone. Table 15-4 and Table 15-5 provide a snapshot of the densities, mixed-use split, and deductions used in the inventory development and capacity calculation tables. The assumptions for each zone are shown in the assumptions column of the capacity calculation tables shown in Appendix A: Full Data, Calculation Tables, and Maps.

Table 15-4: City of Pacific Assumptions Summary

Zone	Residential		Employment		Residential Market Factor		Non-Residential Market Factor		Land for Capital Facilities
	Percent	Density	Percent	Density	Vacant	Underutilized	Vacant	Underutilized	
C	0%	0	100%	20	0%	0%	0%	25%	0%
LI	0%	0	100%	16	0%	0%	0%	25%	0%
OP	0%	0	100%	20	0%	0%	0%	25%	0%
PL	0%	0	100%	20	0%	0%	0%	25%	0%

The Vacant Single Unit size threshold listed below represents the parcel size used to determine if a vacant property is subdividable or only able to accommodate one unit. Parcels smaller than the size listed are considered Vacant Single Units unless otherwise determined by the jurisdiction during the parcel-specific review.

Table 15-5: City of Pacific Plat Deductions for Single-Family Residential Zones

The portion of City of Pacific within Pierce County does not contain any residential-zoned land.

HOUSING AND EMPLOYMENT CAPACITY

Inventory and Capacity Calculation Characteristics

A portion of the inventory is deducted from the gross acreage based on the assumptions identified in the previous section. Table 15-6 shows the characteristics of the initial inventory and Table 15-7 shows the amount of land that was reduced from that initial inventory to be included in the capacity analysis, as documented in the tables and maps in Appendix A: Full Data, Calculation Tables, and Maps.

Table 15-6: City of Pacific Summary of Vacant and Underutilized Land Characteristics

Characteristics/Category	Vacant	Underutilized	Vacant Single Unit	Pipeline
Total Acreage (Gross	6.96	173.17	0.00	3.46
Average Lot Size (Gross)	0.70	1.59	0.00	1.73
Total Acreage (Net)	6.96	162.50	0.00	3.46
Average Lot Size (Net)	0.70	1.49	0.00	1.73
Percent Critical Areas	0%	6%	0%	0%

The parcel inventory is used to categorize land and the capacity calculations are intended to represent the land available for development; thus, the inventory maps alone do not represent the "buildable land" per the Buildable Lands requirements. Table 15-7 shows the overall percentage of land assumed available as capacity in the 20-year planning period and the deductions made to account for constraints to the inventory and overall market conditions.

Table 15-7: City of Pacific Summary of Deductions

Deductions/Category	Vacant	Underutilized
Critical Areas	0.00	10.68
Plat Deductions	0.00	0.00
Capital Facilities	0.00	0.00
Market Factor	0.00	43.30
Total Percent Reduction in Inventory Land	0%	25%
Percent of Vacant or Underutilized Land Available for Capacity	100%	75%

Capacity Results

The housing and employment capacity totals in Table 15-8 and Table 15-9 are derived from the calculations shown in Appendix A: Full Data, Calculation Tables, and Maps. A summary of the countywide capacity results compared to need is shown in **Error! Reference source not found.** (2030 Housing Target), **Error! Reference source not found.** (2030 Employment Target), and Table 1-12 (DRAFT 2044 Targets).

Table 15-8: City of Pacific 2020-2044 Housing Capacity (Dwelling Units)

PL	0	0	0	0
Total	123	1,968	42	2,133

CONSISTENCY EVALUATION

Development Trends

The development trends evaluation compares development that has occurred and the planned and regulated characteristics of the applicable zone, as well as with the assumptions used in the report. Since the development trend evaluation window is a short period of time and the application of zoning may change periodically, it is often found that there is not enough information to make a statistically valid conclusion. Due to this, the information is provided but no conclusions have been made.

The development trends evaluation compares development that has occurred and the planned and regulated characteristics of the applicable zone, as well as with the assumptions used in the report. Since the development trend evaluation window is a short period of time and the application of zoning may change periodically, it is often found that there is not enough information to make a statistically valid conclusion. Due to this, the information is provided but no conclusions have been made.

Error! Not a valid bookmark self-reference. is provided to show the number of permits, units, and acres developed to identify which zones have experienced development in the timeframe.

Table 3-10 is provided to show the number of permits, units, and acres developed to identify which zones have experienced development in the timeframe.

Table 15-10: City of Pacific Permits Summary					
Zone	Residential Permits	Non-Residential Permits	Dwelling Units	Acres Developed	% Zoned Acreage
C	0	3	0	4.24	5.6%
LI	0	4	0	16.69	8.6%
OP	0	1	0	1.68	6.9%
PL	0	0	0	0.00	0.0%

Table 3-11 shows the observed residential density trends in comparison to the permitted density and assumed density for each zone with sufficient data. Both the plat and multifamily project average densities are shown in order to understand the source of the overall density.

Table 15-11: City of Pacific Density Evaluation

Zone	Observed Density (Overall)	Observed Plat Density (Single-Family)	Observed Multifamily Density	Assumed Density
C	0	0	0	0
LI	0	0	0	0
OP	0	0	0	0
PL	0	0	0	0

Table 3-12 shows the observed percent of developed acreage between residential and non-residential uses. Mixed-use project acreage is duplicated in each category, resulting in a 50/50 percent split. In these cases, further analysis would be needed to determine if vertical mixed-use is part of the trend, resulting in a 100/100 percent split. The observed trend is compared to the assumptions used in the report for both the mixed-use split and the assumption for non-residential in and single-family zone. The trend is also compared to the permitted uses to determine if the zone is developing as planned.

Table 15-12: City of Pacific Mixed Use Split and Non-residential in Single Family Zones Evaluation

Zone	Observed Residential Percent	Assumed Residential Percent	Observed Non-residential Percent	Assumed Non-residential Percent	Zone Type (Residential, Non-residential, Mixed-use)	Assumed Non-residential in Single-Family zones Percent

DEVELOPMENT TRENDS

This section summarizes permit data observed between **January 1, 2013 and December 31, 2020** that is used to monitor observed densities and update the assumptions for future development. The summaries in this section are designed to show the average statistics used to inform the report. Only data pertinent to the Buildable Lands requirements is collected, and incomplete or not-applicable data is omitted; therefore, this Report does not provide a full summary of all development within the jurisdiction. For more detailed summaries by zone/year, see Appendix A: Full Data, Calculation Tables, and Maps.

Table 16-2 shows the average residential density per zone and jurisdiction-wide and is not intended to show the total units/lots created or overall acres consumed. The results reflect the density calculation used by the jurisdiction, and only include a summary of plats and multifamily (3+ attached units) projects. Table 16-3 shows the average floor-to-area ratio (FAR) by zone and the amount of non-residential building square footage developed. The non-residential projects summarized only include new development and omit additions to existing businesses and non-building type improvements.

Table 16-2: City of Puyallup 2013-2020 Residential Trends by Zone[1]

Zone	Net Acres[2]	Lots/Units	Density

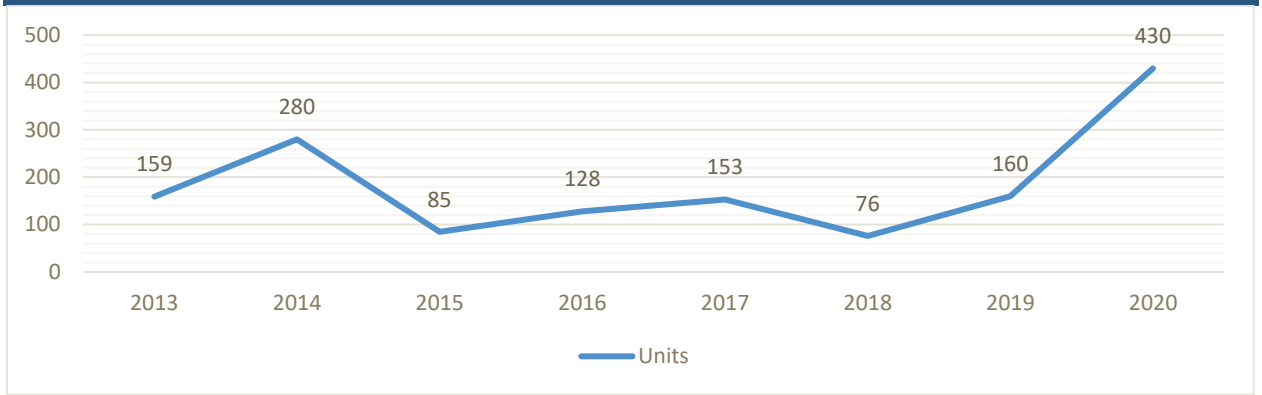
[1]Includes multifamily and plat data to represent the overall observed density by zone. Does not include single-family permits in order to accurately represent permitted densities; therefore, does not represent the total number of units developed in the timeframe.
Sources: City Permit Data, Pierce County Assessor-Treasurer Tax Parcels, Puget Sound Regional Council Housing Unit Permit Database.
*Non-residential data includes development that occurred prior to the establishment of the zone, since the allowed uses that were developed are permitted within the new zone.

While the non-residential development trends are informative to show the percent of land consumed for non-residential purposes (as shown in Figure 16-A), the employment densities used in the capacity assumptions are derived through employment density surveys, as documented in Appendix C: Employment Density Survey. Figure 16-A summarizes the split between residential and non-residential development between 2013-2020 by zone and the jurisdiction average. The percent split is based on the gross acres developed between 2013-2020 using the plat activity and multifamily permits for residential and non-residential permits for non-residential. The information is used to inform the percent split for mixed-use zones, as well as the percent of non-residential uses in residential-only zones.

Figure 16-A: City of Puyallup Residential vs. Non-residential Development Split



Zone	Use Type Split (Percent)[1] Residential	Non-residential

Residential Building Trends

Both multifamily and single-family building permits are collected and summarized; however, single-family permit reporting is optional per the Pierce County Countywide Planning Policies and limited in use for tracking factors affecting development. The single-family permit data is useful for identifying the total number of units built and the average lot size per zone and is provided as supplemental information. The multifamily permit data is used to identify the observed density and amount of land used for residential purposes. Please note that this data differs from the data provided in Figure 16-B due to collection limitations and should not be used to represent housing production in the jurisdiction.

Figure 16-D: City of Puyallup Residential Building Permit Trends

Multifamily Permits by Year

ASSUMPTIONS

Assumptions vary by jurisdiction and zone. Table 16-4 and Table 16-5 provide a snapshot of the densities, mixed-use split, and deductions used in the inventory development and capacity calculation tables. The assumptions for each zone are shown in the assumptions column of the capacity calculation tables shown in Appendix A: Full Data, Calculation Tables, and Maps.

The CCX, LMX, and UCX zones were established in 2017 as part of adoption of the South Hill Neighborhood Plan. They primarily replaced existing commercial zones (usually CG or CL zoning) and resulted in increased building heights, reduced parking requirements, and allowances for mixed-use development. In the previous zones, residential was allowed on a very limited basis and the City generally assumed only 5% of future development would include residential. The new zones allow for horizontal or vertical mixed-use development. It is assumed that an increased percentage of each zone will result in residential development.

Table 16-4: City of Puyallup Assumptions Summary

The Vacant Single Unit size threshold listed below represents the parcel size used to determine if a vacant property is subdividable or only able to accommodate one unit. Parcels smaller than the size listed are considered Vacant Single Units unless otherwise determined by the jurisdiction during the parcel-specific review.

Table 16-5: City of Puyallup Plat Deductions for Single-Family Residential Zones

HOUSING AND EMPLOYMENT CAPACITY

Inventory and Capacity Calculation Characteristics

A portion of the inventory is deducted from the gross acreage based on the assumptions identified in the previous section. Table 16-6 shows the characteristics of the initial inventory and Table 16-7 shows the amount of land that was reduced from that initial inventory to be included in the capacity analysis, as documented in the tables and maps in Appendix A: Full Data, Calculation Tables, and Maps.

Table 16-6: City of Puyallup Summary of Vacant and Underutilized Land Characteristics

Characteristics/Category	Vacant	Underutilized	Vacant Single Unit	Pipeline
Total Acreage (Gross	400.09	1,681.19	140.65	18.90
Average Lot Size (Gross)	1.98	1.15	0.36	1.35
Total Acreage (Net)	283.02	1,270.63	85.60	15.28
Average Lot Size (Net)	1.40	0.87	0.22	1.09
Percent Critical Areas	29%	24%	39%	19%

The parcel inventory is used to categorize land and the capacity calculations are intended to represent the land available for development; thus, the inventory maps alone do not represent the "buildable land" per the Buildable Lands requirements. Table 16-7 shows the overall percentage of land assumed

available as capacity in the 20-year planning period and the deductions made to account for constraints to the inventory and overall market conditions.

Table 16-7: City of Puyallup Summary of Deductions

Deductions/Category	Vacant	Underutilized
Critical Areas	117.06	410.56
Infrastructure Gaps	21.75	114.32
Plat Deductions	9.68	52.79
Capital Facilities	0.00	0.00
Market Factor	40.08	626.84
Total Percent Reduction in Inventory Land	32%	52%
Percent of Vacant or Underutilized Land Available for Capacity	68%	48%

Capacity Results

The housing and employment capacity totals in Table 16-8 and Table 16-9 are derived from the calculations shown in Appendix A: Full Data, Calculation Tables, and Maps. A summary of the countywide capacity results compared to need is shown in **Error! Reference source not found.** (2030 Housing Target), **Error! Reference source not found.** (2030 Employment Target), and Table 1-12 (DRAFT 2044 Targets).

CONSISTENCY EVALUATION

Development Trends

The development trends evaluation compares development that has occurred and the planned and regulated characteristics of the applicable zone, as well as with the assumptions used in the report. Since the development trend evaluation window is a short period of time and the application of zoning may change periodically, it is often found that there is not enough information to make a statistically valid conclusion. Due to this, the information is provided but no conclusions have been made.

The development trends evaluation compares development that has occurred and the planned and regulated characteristics of the applicable zone, as well as with the assumptions used in the report. Since the development trend evaluation window is a short period of time and the application of zoning may change periodically, it is often found that there is not enough information to make a statistically valid conclusion. Due to this, the information is provided but no conclusions have been made.

Error! Not a valid bookmark self-reference. is provided to show the number of permits, units, and acres developed to identify which zones have experienced development in the timeframe.

Table 3-10 is provided to show the number of permits, units, and acres developed to identify which zones have experienced development in the timeframe.

Table 3-12 shows the observed percent of developed acreage between residential and non-residential uses. Mixed-use project acreage is duplicated in each category, resulting in a 50/50 percent split. In these cases, further analysis would be needed to determine if vertical mixed-use is part of the trend, resulting in a 100/100 percent split. The observed trend is compared to the assumptions used in the report for both the mixed-use split and the assumption for non-residential in and single-family zone. The trend is also compared to the permitted uses to determine if the zone is developing as planned.

Table 16-12: City of Puyallup Mixed Use Split and Non-residential in Single Family Zones Evaluation

DEVELOPMENT TRENDS

This section summarizes building and plat data obtained through the Pierce County Assessor-Treasurer and Auditor Departments observed between **January 1, 2013 and December 31, 2020** that is used to monitor observed densities and update the assumptions for future development. The summaries in this

section are designed to show the average statistics used to inform the report. Only data pertinent to the Buildable Lands requirements is collected, and incomplete or not-applicable data is omitted; therefore, this Report does not provide a full summary of all development within the jurisdiction. For more detailed summaries by zone/year, see Appendix A: Full Data, Calculation Tables, and Maps.

Table 17-2 shows the average residential density per zone and jurisdiction-wide and is not intended to show the total units/lots created or overall acres consumed. The results reflect the density calculation used by the jurisdiction, and only include a summary of plats and multifamily (3+ attached units) projects. Table 17-3 shows the average floor-to-area ratio (FAR) by zone and the amount of non-residential building square footage developed. The non-residential projects summarized only include new development and omit additions to existing businesses and non-building type improvements.

Table 17-2: City of Roy 2013-2020 Residential Trends by Zone[1]

Zone	Net Acres[2]	Lots/Units	Density
SFR	1.60	5	3.13

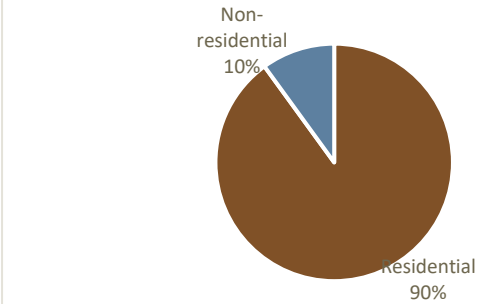

Table 17-3: City of Roy 2013-2020 Non-residential Trends by Zone

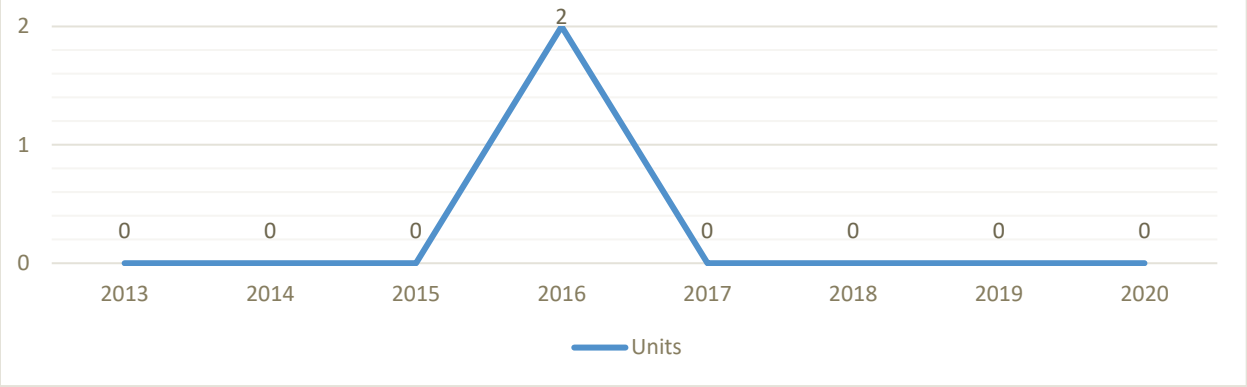
Zone	Acres	Sq. Ft.	FAR
C	0.19	168	0.02

[1]Includes multifamily and plat data to represent the overall observed density by zone. Does not include single-family permits in order to accurately represent permitted densities; therefore, does not represent the total number of units developed in the timeframe.
Sources: City Permit Data, Pierce County Assessor-Treasurer Tax Parcels, Puget Sound Regional Council Housing Unit Permit Database.

While the non-residential development trends are informative to show the percent of land consumed for non-residential purposes (as shown in Figure 17-A), the employment densities used in the capacity assumptions are derived through employment density surveys, as documented in Appendix C: Employment Density Survey. Figure 17-A summarizes the split between residential and non-residential development between 2013-2020 by zone and the jurisdiction average. The percent split is based on the gross acres developed between 2013-2020 using the plat activity and multifamily permits for residential and non-residential permits for non-residential. The information is used to inform the percent split for mixed-use zones, as well as the percent of non-residential uses in residential-only zones.

Figure 17-A: City of Roy Residential vs. Non-residential Development Split

Zone	Use Type Split (Percent)[1] Residential	Non-residential
C	0%	100%
SFR	100%	0%
Average	**90%**	**10%**



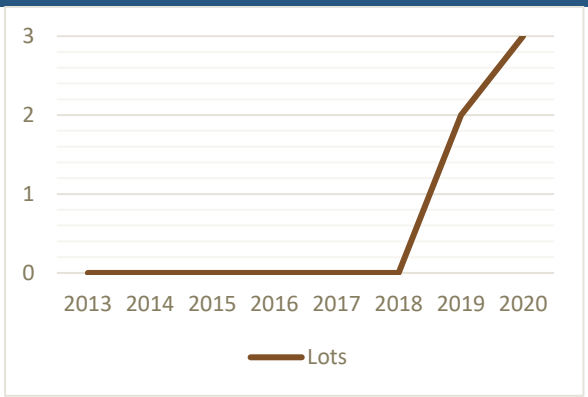
[1]Does not include single-family permits in order to avoid double-counting acreage.
Sources: City Permit Data, Pierce County Assessor-Treasurer Tax Parcels, Puget Sound Regional Council Housing Unit Permit Database.

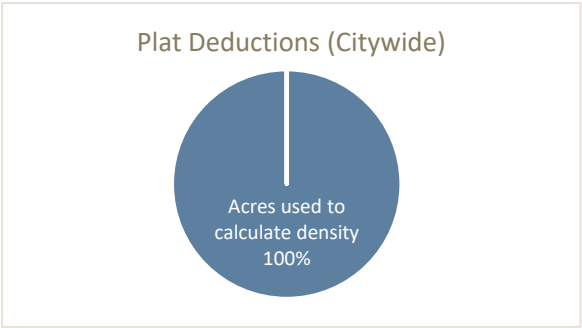
Housing Production Rate

The residential data collected for the Buildable Lands Program tracks the density and other assumptions related to the capacity analysis. The Buildable Lands requirements that were amended in 2017 now require the tracking of housing production to compare to the necessary growth rates to achieve the housing targets. Due to the limitations of the permit data and lack of demolition permit data, Pierce

County relies upon the Washington State Office of Financial Management estimates to track the number of housing units built per year in each jurisdiction for the purposes of this Report. The comparison of housing production and housing needs is shown in Table 1-2 and Table 1-3 (Countywide).

Figure 17-B: City of Roy Housing Production Rates (OFM)





Source: Washington State Office of Financial Management Housing Unit Data (2020).

Platting Activity

Platting activity is used to determine the achieved density for single-family residential zones and to identify the amount of land used for other purposes (whether netted out for density or applied by a regulation and affecting the achieved density). Plat data is used in conjunction with multifamily permits to determine the overall achieved density (as shown in Table 17-2).

Figure 17-C: City of Roy Platting Trends

Plat Activity by Year

Year	Lots	Acres	Density
2013	-	-	-
2014	-	-	-
2015	-	-	-
2016	-	-	-
2017	-	-	-
2018	-	-	-
2019	2	0.63	3.15
2020	3	0.96	3.12
Total	**5**	**1.60**	**3.13**

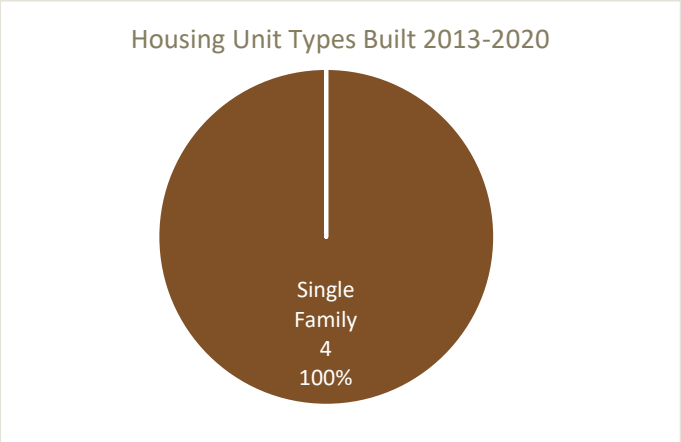
SFR	0.0%	0.0%	0.0%	0.0%



Sources: City Permit Data, Pierce County Auditor Recorded Plats.

Residential Building Trends

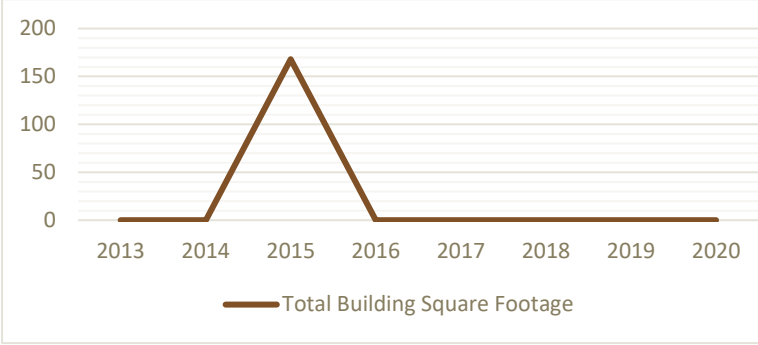
Both multifamily and single-family building permits are collected and summarized; however, single-family permit reporting is optional per the Pierce County Countywide Planning Policies and limited in use for tracking factors affecting development. The single-family permit data is useful for identifying the total number of units built and the average lot size per zone and is provided as supplemental information. The multifamily permit data is used to identify the observed density and amount of land used for residential purposes. Please note that this data differs from the data provided in Figure 17-B due to collection limitations and should not be used to represent housing production in the jurisdiction.

Figure 17-D: City of Roy Residential Building Permit Trends

Multifamily Permits by Year

No multifamily residential development has been observed in the timeframe.

Single-Family Permits by Year (Optional)



Year	Lots	Acres	Avg. Lot Size
2013	1	0.53	0.53
2014	-	-	-
2015	3	3.77	1.26
2016	-	-	-
2017	-	-	-
2018	-	-	-
2019	-	-	-
2020	-	-	-
Total	**4**	**4.30**	**1.08**

Sources: City Permit Data, Pierce County Assessor-Treasurer Tax Parcels, Puget Sound Regional Council Housing Unit Permit Database.

Non-residential Building Trends

Non-residential building permits typically include commercial and industrial development; however, public use is often collected and summarized as well when the use type produces jobs. While the project acreage, building square footage, and floor-to-area ratio information is collected and summarized for the report in order to track non-residential development, the employment density is analyzed in a separate report using data other than building permits. The most recent employment density study to support the assumptions in this Report is provided in Appendix C: Employment Density Survey.

Figure 17-E: City of Roy Non-residential Permit Trends

ASSUMPTIONS

Assumptions vary by jurisdiction and zone. Table 17-4 and Table 17-5 provide a snapshot of the densities, mixed-use split, and deductions used in the inventory development and capacity calculation tables. The assumptions for each zone are shown in the assumptions column of the capacity calculation tables shown in Appendix A: Full Data, Calculation Tables, and Maps.

Table 17-4: City of Roy Assumptions Summary

Zone	Residential		Employment		Residential Market Factor		Non-Residential Market Factor		Land for Capital Facilities
	Percent	Density	Percent	Density	Vacant	Underutilized	Vacant	Underutilized	
C	0%	0	100%	20	0%	0%	10%	50%	0%
LI	0%	0	100%	9	0%	0%	10%	50%	0%
MFR	100%	3.5	0%	0	10%	50%	0%	0%	0%
MU	75%	3.5	25%	20	10%	50%	10%	50%	0%
SFR	100%	3.5	0%	0	10%	50%	0%	0%	0%

The Vacant Single Unit size threshold listed below represents the parcel size used to determine if a vacant property is subdividable or only able to accommodate one unit. Parcels smaller than the size listed are considered Vacant Single Units unless otherwise determined by the jurisdiction during the parcel-specific review.

Table 17-5: City of Roy Plat Deductions for Single-Family Residential Zones

Zone	Roads	Critical Areas	Parks/Open Space	Stormwater	Non-residential	Vacant Single Unit
SFR	15%	GIS	5%	0%	0%	<0.25 acres

HOUSING AND EMPLOYMENT CAPACITY

Inventory and Capacity Calculation Characteristics

A portion of the inventory is deducted from the gross acreage based on the assumptions identified in the previous section. Table 17-6 shows the characteristics of the initial inventory and Table 17-7 shows the amount of land that was reduced from that initial inventory to be included in the capacity analysis, as documented in the tables and maps in Appendix A: Full Data, Calculation Tables, and Maps.

Table 17-6: City of Roy Summary of Vacant and Underutilized Land Characteristics				
Characteristics/Category	**Vacant**	**Underutilized**	**Vacant Single Unit**	**Pipeline**
Total Acreage (Gross	36.42	90.00	3.28	0.96
Average Lot Size (Gross)	4.05	3.10	0.25	0.96
Total Acreage (Net)	24.68	79.30	3.28	0.96
Average Lot Size (Net)	2.74	2.73	0.25	0.96
Percent Critical Areas	32%	12%	0%	0%

The parcel inventory is used to categorize land and the capacity calculations are intended to represent the land available for development; thus, the inventory maps alone do not represent the "buildable land" per the Buildable Lands requirements. Table 17-7 shows the overall percentage of land assumed available as capacity in the 20-year planning period and the deductions made to account for constraints to the inventory and overall market conditions.

Table 17-7: City of Roy Summary of Deductions		
Deductions/Category	**Vacant**	**Underutilized**
Critical Areas	11.74	10.70
Plat Deductions	1.31	11.64
Capital Facilities	0.00	0.00
Market Factor	2.63	33.93
Total Percent Reduction in Inventory Land	35%	62%
Percent of Vacant or Underutilized Land Available for Capacity	65%	38%

Capacity Results

The housing and employment capacity totals in Table 17-8 and Table 17-9 are derived from the calculations shown in Appendix A: Full Data, Calculation Tables, and Maps. A summary of the countywide capacity results compared to need is shown in **Error! Reference source not found.** (2030 Housing Target), **Error! Reference source not found.** (2030 Employment Target), and Table 1-12 (DRAFT 2044 Targets).

Table 17-8: City of Roy 2020-2044 Housing Capacity (Dwelling Units)

Total	136	31	0	167

CONSISTENCY EVALUATION

Development Trends

The development trends evaluation compares development that has occurred and the planned and regulated characteristics of the applicable zone, as well as with the assumptions used in the report. Since the development trend evaluation window is a short period of time and the application of zoning may change periodically, it is often found that there is not enough information to make a statistically valid conclusion. Due to this, the information is provided but no conclusions have been made.

The development trends evaluation compares development that has occurred and the planned and regulated characteristics of the applicable zone, as well as with the assumptions used in the report. Since the development trend evaluation window is a short period of time and the application of zoning may change periodically, it is often found that there is not enough information to make a statistically valid conclusion. Due to this, the information is provided but no conclusions have been made.

Error! Not a valid bookmark self-reference. is provided to show the number of permits, units, and acres developed to identify which zones have experienced development in the timeframe.

Table 3-10 is provided to show the number of permits, units, and acres developed to identify which zones have experienced development in the timeframe.

Table 17-10: City of Roy Permits Summary					
Zone	Residential Permits	Non-Residential Permits	Dwelling Units	Acres Developed	% Zoned Acreage
C	0	1	0	0.19	1.9%
LI	0	0	0	0.00	0.0%
MFR	0	0	0	0.00	0.0%
MU	0	0	0	0.00	0.0%
SFR	2	0	5	1.60	0.8%

Table 3-11 shows the observed residential density trends in comparison to the permitted density and assumed density for each zone with sufficient data. Both the plat and multifamily project average densities are shown in order to understand the source of the overall density.

Table 17-11: City of Roy Density Evaluation

Zone	Observed Density (Overall)	Observed Plat Density (Single-Family)	Observed Multifamily Density	Assumed Density
C	0	0	0	0
LI	0	0	0	0
MFR	0	0	0	4
MU	0	0	0	4
SFR	3	3	0	4

Table 3-12 shows the observed percent of developed acreage between residential and non-residential uses. Mixed-use project acreage is duplicated in each category, resulting in a 50/50 percent split. In these cases, further analysis would be needed to determine if vertical mixed-use is part of the trend, resulting in a 100/100 percent split. The observed trend is compared to the assumptions used in the report for both the mixed-use split and the assumption for non-residential in and single-family zone. The trend is also compared to the permitted uses to determine if the zone is developing as planned.

Table 17-12: City of Roy Mixed Use Split and Non-residential in Single Family Zones Evaluation

Zone	Observed Residential Percent	Assumed Residential Percent	Observed Non-residential Percent	Assumed Non-residential Percent	Zone Type (Residential, Non-residential, Mixed-use)	Assumed Non-residential in Single-Family zones Percent

[2]Represents parcel acreage, not zoning coverage.
Sources: City Zoning Code.

DEVELOPMENT TRENDS

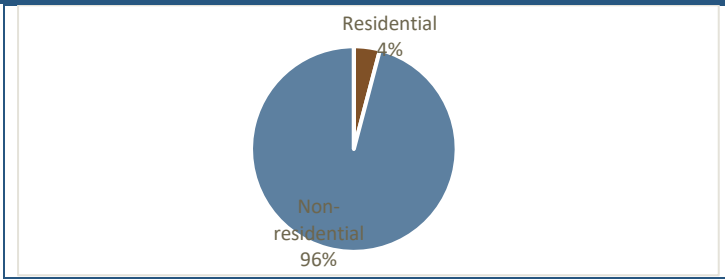
This section summarizes building and plat data obtained through the Pierce County Assessor-Treasurer and Auditor Departments observed between January 1, 2013 and December 31, 2020 that is used to monitor observed densities and update the assumptions for future development. The summaries in this

section are designed to show the average statistics used to inform the report. Only data pertinent to the Buildable Lands requirements is collected, and incomplete or not-applicable data is omitted; therefore, this Report does not provide a full summary of all development within the jurisdiction. For more detailed summaries by zone/year, see Appendix A: Full Data, Calculation Tables, and Maps.

Table 18-2 shows the average residential density per zone and jurisdiction-wide and is not intended to show the total units/lots created or overall acres consumed. The results reflect the density calculation used by the jurisdiction, and only include a summary of plats and multifamily (3+ attached units) projects. Table 18-3 shows the average floor-to-area ratio (FAR) by zone and the amount of non-residential building square footage developed. The non-residential projects summarized only include new development and omit additions to existing businesses and non-building type improvements.

Table 18-2: City of Ruston 2013-2020 Residential Trends by Zone[1]

Zone	Net Acres[2]	Lots/Units	Density
RES	0.49	4	8.24



[1]Includes multifamily and plat data to represent the overall observed density by zone. Does not include single-family permits in order to accurately represent permitted densities; therefore, does not represent the total number of units developed in the timeframe.
Sources: City Permit Data, Pierce County Assessor-Treasurer Tax Parcels, Puget Sound Regional Council Housing Unit Permit Database.

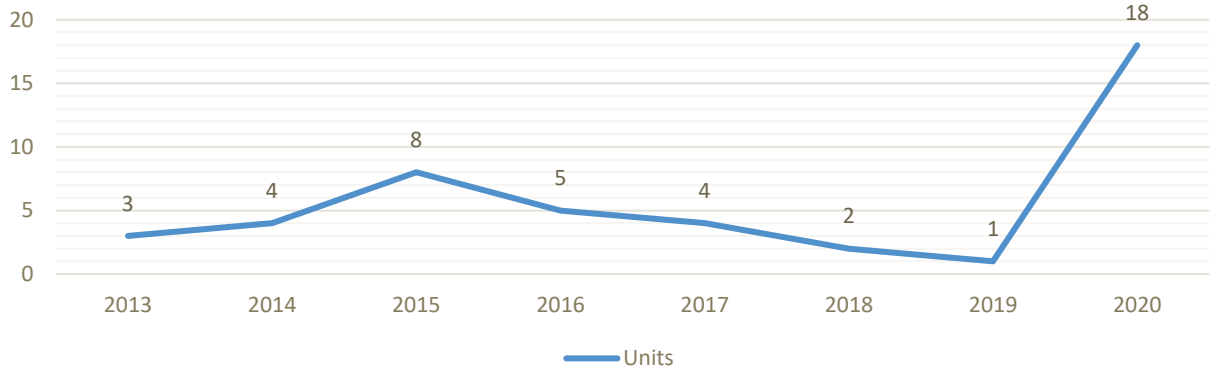
Table 18-3: City of Ruston 2013-2020 Non-residential Trends by Zone

Zone	Acres	Sq. Ft.	FAR
MPD-PR	11.37	215,096	0.43

While the non-residential development trends are informative to show the percent of land consumed for non-residential purposes (as shown in Figure 18-A), the employment densities used in the capacity assumptions are derived through employment density surveys, as documented in Appendix C: Employment Density Survey. Figure 18-A summarizes the split between residential and non-residential development between 2013-2020 by zone and the jurisdiction average. The percent split is based on the gross acres developed between 2013-2020 using the plat activity and multifamily permits for residential and non-residential permits for non-residential. The information is used to inform the percent split for mixed-use zones, as well as the percent of non-residential uses in residential-only zones.

Figure 18-A: City of Ruston Residential vs. Non-residential Development Split

Zone	Use Type Split (Percent)[1]	
	Residential	Non-residential
MPD-PR	0%	100%
RES	100%	0%
Average	**4%**	**96%**



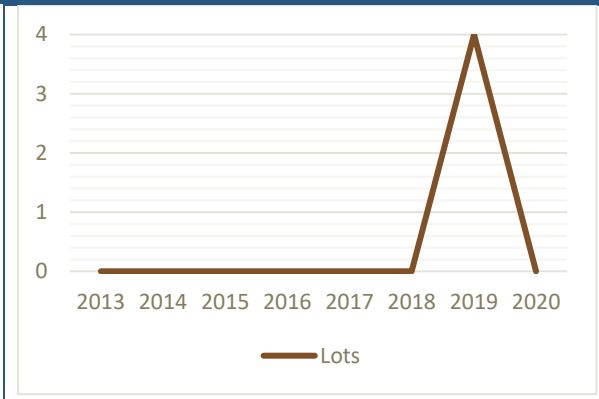
[1]Does not include single-family permits in order to avoid double-counting acreage.
Sources: City Permit Data, Pierce County Assessor-Treasurer Tax Parcels, Puget Sound Regional Council Housing Unit Permit Database.

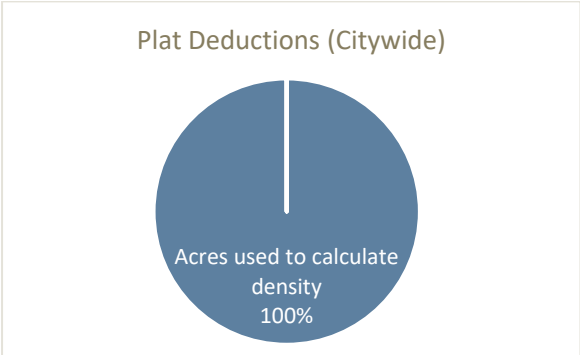
Housing Production Rate

The residential data collected for the Buildable Lands Program tracks the density and other assumptions related to the capacity analysis. The Buildable Lands requirements that were amended in 2017 now require the tracking of housing production to compare to the necessary growth rates to achieve the housing targets. Due to the limitations of the permit data and lack of demolition permit data, Pierce County relies upon the Washington State Office of Financial Management estimates to track the number

of housing units built per year in each jurisdiction for the purposes of this Report. The comparison of housing production and housing needs is shown in Table 1-2 and Table 1-3 (Countywide).

Figure 18-B: City of Ruston Housing Production Rates (OFM)





Source: Washington State Office of Financial Management Housing Unit Data (2020).

Platting Activity

Platting activity is used to determine the achieved density for single-family residential zones and to identify the amount of land used for other purposes (whether netted out for density or applied by a regulation and affecting the achieved density). Plat data is used in conjunction with multifamily permits to determine the overall achieved density (as shown in Table 18-2).

Figure 18-C: City of Ruston Platting Trends

Plat Activity by Year

Year	Lots	Acres	Density

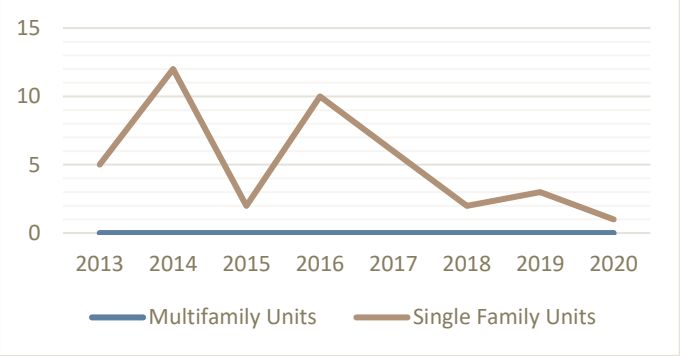
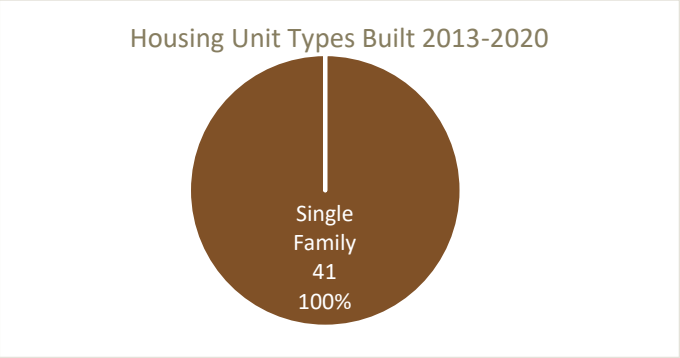
2020	-	-	-
Total	4	0.49	8.24



Plat Deductions by Zone (Percent)



Zone	Roads	Critical Areas	Parks/Open Space	Storm -water
RES	0.0%	0.0%	0.0%	0.0%

Residential Building Trends

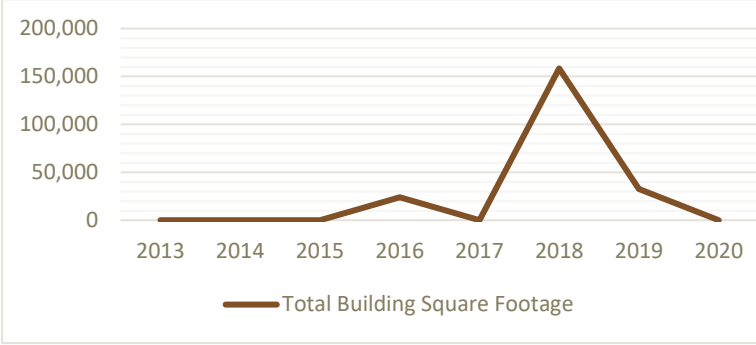
Both multifamily and single-family building permits are collected and summarized; however, single-family permit reporting is optional per the Pierce County Countywide Planning Policies and limited in use for tracking factors affecting development. The single-family permit data is useful for identifying the total number of units built and the average lot size per zone and is provided as supplemental information. The multifamily permit data is used to identify the observed density and amount of land used for residential purposes. Please note that this data differs from the data provided in Figure 18-B due to collection limitations and should not be used to represent housing production in the jurisdiction.

Figure 18-D: City of Ruston Residential Building Permit Trends

Multifamily Permits by Year

No multifamily residential development has been observed in the timeframe.

Single-Family Permits by Year (Optional)



Year	Lots	Acres	Avg. Lot Size
2013	5	1.32	0.26
2014	12	2.19	0.18
2015	2	0.34	0.17
2016	10	1.96	0.20
2017	6	1.06	0.18
2018	2	0.32	0.16
2019	3	1.25	0.42
2020	1	0.14	0.14
Total	**41**	**8.59**	**0.21**

Sources: City Permit Data, Pierce County Assessor-Treasurer Tax Parcels, Puget Sound Regional Council Housing Unit Permit Database.

Non-residential Building Trends

Non-residential building permits typically include commercial and industrial development; however, public use is often collected and summarized as well when the use type produces jobs. While the project acreage, building square footage, and floor-to-area ratio information is collected and summarized for the report in order to track non-residential development, the employment density is analyzed in a separate report using data other than building permits. The most recent employment density study to support the assumptions in this Report is provided in Appendix C: Employment Density Survey.

Figure 18-E: City of Ruston Non-residential Permit Trends

Year	Acres	Bldg. SF	FAR

ASSUMPTIONS

Assumptions vary by jurisdiction and zone. Table 18-4 and Table 18-5 provide a snapshot of the densities, mixed-use split, and deductions used in the inventory development and capacity calculation tables. The assumptions for each zone are shown in the assumptions column of the capacity calculation tables shown in Appendix A: Full Data, Calculation Tables, and Maps.

Table 18-4: City of Ruston Assumptions Summary

Zone	Residential		Employment		Residential Market Factor		Non-Residential Market Factor		Land for Capital Facilities
	Percent	Density	Percent	Density	Vacant	Underutilized	Vacant	Underutilized	
COM	0%	0	100%	20	0%	0%	10%	50%	0%
COM-P	0%	0	100%	20	0%	0%	10%	50%	0%
MPD	Single Parcel – Considered Built Out								
MPD-PR	Master Planned Development – Included as Pipeline								
MPD-RL	0%	0	0%	0	0%	0%	0%	0%	0%
MPD-SH	Master Planned Development – Included as Pipeline or Vacant Single Unit								
RES	100%	6	0%	0	0%	0%	10%	20%	0%

The Vacant Single Unit size threshold listed below represents the parcel size used to determine if a vacant property is subdividable or only able to accommodate one unit. Parcels smaller than the size listed are considered Vacant Single Units unless otherwise determined by the jurisdiction during the parcel-specific review.

Table 18-5: City of Ruston Plat Deductions for Single-Family Residential Zones

Zone	Roads	Critical Areas	Parks/Open Space	Stormwater	Non-residential	Vacant Single Unit
RES	0%	GIS	0%	0%	0%	<0.275 acres

HOUSING AND EMPLOYMENT CAPACITY

Inventory and Capacity Calculation Characteristics

A portion of the inventory is deducted from the gross acreage based on the assumptions identified in the previous section. Table 18-6 shows the characteristics of the initial inventory and Table 18-7 shows

the amount of land that was reduced from that initial inventory to be included in the capacity analysis, as documented in the tables and maps in Appendix A: Full Data, Calculation Tables, and Maps.

Table 18-6: City of Roy Summary of Vacant and Underutilized Land Characteristics

Characteristics/Category	Vacant	Underutilized	Vacant Single Unit	Pipeline
Total Acreage (Gross	3.75	4.88	3.10	22.12
Average Lot Size (Gross)	0.27	0.22	0.15	2.76
Total Acreage (Net)	1.48	4.62	2.64	19.54
Average Lot Size (Net)	0.11	0.21	0.13	2.44
Percent Critical Areas	61%	5%	15%	12%

The parcel inventory is used to categorize land and the capacity calculations are intended to represent the land available for development; thus, the inventory maps alone do not represent the "buildable land" per the Buildable Lands requirements. Table 18-7 shows the overall percentage of land assumed available as capacity in the 20-year planning period and the deductions made to account for constraints to the inventory and overall market conditions.

Table 18-7: City of Ruston Summary of Deductions

Deductions/Category	Vacant	Underutilized
Critical Areas	2.27	0.26
Plat Deductions	0.00	0.00
Capital Facilities	0.00	0.00
Market Factor	0.08	0.97
Total Percent Reduction in Inventory Land	55%	23%
Percent of Vacant or Underutilized Land Available for Capacity	45%	77%

Capacity Results

The housing and employment capacity totals in Table 18-8 and Table 18-9 are derived from the calculations shown in Appendix A: Full Data, Calculation Tables, and Maps. A summary of the countywide capacity results compared to need is shown in **Error! Reference source not found.** (2030 Housing Target), **Error! Reference source not found.** (2030 Employment Target), and Table 1-12 (DRAFT 2044 Targets).

CONSISTENCY EVALUATION

Development Trends

The development trends evaluation compares development that has occurred and the planned and regulated characteristics of the applicable zone, as well as with the assumptions used in the report. Since the development trend evaluation window is a short period of time and the application of zoning may change periodically, it is often found that there is not enough information to make a statistically valid conclusion. Due to this, the information is provided but no conclusions have been made.

The development trends evaluation compares development that has occurred and the planned and regulated characteristics of the applicable zone, as well as with the assumptions used in the report. Since the development trend evaluation window is a short period of time and the application of zoning may change periodically, it is often found that there is not enough information to make a statistically valid conclusion. Due to this, the information is provided but no conclusions have been made.

Error! Not a valid bookmark self-reference. is provided to show the number of permits, units, and acres developed to identify which zones have experienced development in the timeframe.

Table 3-10 is provided to show the number of permits, units, and acres developed to identify which zones have experienced development in the timeframe.

Table 18-10: City of Ruston Permits Summary					
Zone	Residential Permits	Non-Residential Permits	Dwelling Units	Acres Developed	% Zoned Acreage

19 TOWN OF SOUTH PRAIRIE

The Town of South Prairie's Comprehensive Plan and regulations implement densities based on net acreage.

Table 19-1: Town of South Prairie Zone Classifications

Zone Classification		Zone Type[1]	Total Acres[2]
AGB	Agricultural Business	Commercial	10.0
C	Commercial	Commercial	12.0
GOV	Government/Utilities	Public Use	7.1
IND	Industrial	Industrial	0.6
PTOS	Parks/Trails/Open Space	N/A	19.4
R	Residential	Residential	138.9
R/CUP	Residential CUP	Residential	34.2

[1]For purposes of the Buildable Lands inventory and analysis; not a representation of the Town zoning code.
[2]Represents parcel acreage, not zoning coverage.
Sources: Town Zoning Code.

DEVELOPMENT TRENDS

This section summarizes building and plat data obtained through the Pierce County Assessor-Treasurer and Auditor Departments observed between January 1, 2013 and December 31, 2020 that is used to monitor observed densities and update the assumptions for future development. The summaries in this section are designed to show the average statistics used to inform the report. Only data pertinent to the Buildable Lands requirements is collected, and incomplete or not-applicable data is omitted; therefore, this Report does not provide a full summary of all development within the jurisdiction. For more detailed summaries by zone/year, see Appendix A: Full Data, Calculation Tables, and Maps.

Table 19-2 shows the average residential density per zone and jurisdiction-wide and is not intended to show the total units/lots created or overall acres consumed. The results reflect the density calculation used by the jurisdiction, and only include a summary of plats and multifamily (3+ attached units) projects. Table 19-3 shows the average floor-to-area ratio (FAR) by zone and the amount of non-residential building square footage developed. The non-residential projects summarized only include new development and omit additions to existing businesses and non-building type improvements.

Table 19-2: Town of South Prairie 2013-2020 Residential Trends by Zone[1]

No multifamily residential development or plat activity has been observed in the timeframe.

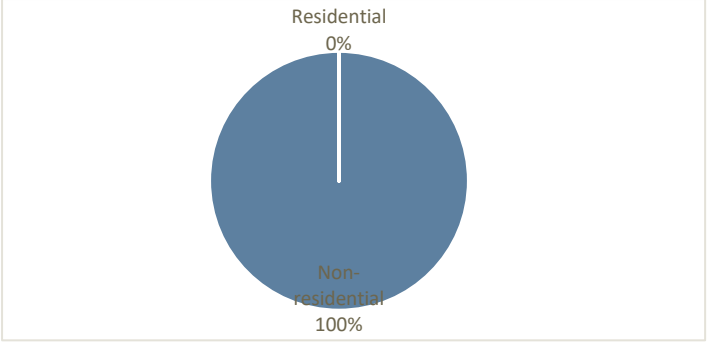

Table 19-3: Town of South Prairie 2013-2020 Non-residential Trends by Zone

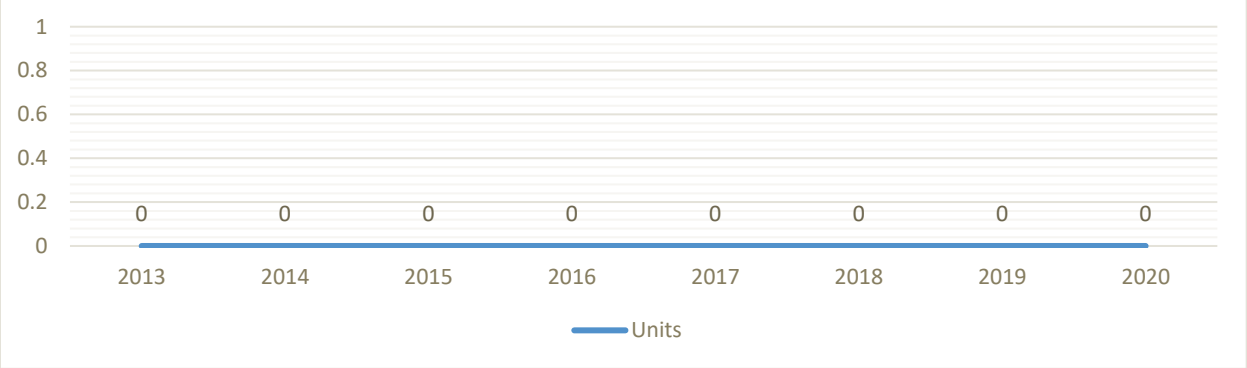
Zone	Acres	Sq. Ft.	FAR
C	1.67	5,640	0.08

[1]Includes multifamily and plat data to represent the overall observed density by zone. Does not include single-family permits in order to accurately represent permitted densities; therefore, does not represent the total number of units developed in the timeframe.
Sources: Town Permit Data, Pierce County Assessor-Treasurer Tax Parcels, Puget Sound Regional Council Housing Unit Permit Database.

While the non-residential development trends are informative to show the percent of land consumed for non-residential purposes (as shown in Figure 19-A), the employment densities used in the capacity assumptions are derived through employment density surveys, as documented in Appendix C: Employment Density Survey. Figure 19-A summarizes the split between residential and non-residential development between 2013-2020 by zone and the jurisdiction average. The percent split is based on the gross acres developed between 2013-2020 using the plat activity and multifamily permits for residential and non-residential permits for non-residential. The information is used to inform the percent split for mixed-use zones, as well as the percent of non-residential uses in residential-only zones.

Figure 19-A: Town of South Prairie Residential vs. Non-residential Development Split



Zone	Use Type Split (Percent)[1]	
	Residential	Non-residential
C	0%	100%

[1]Does not include single-family permits in order to avoid double-counting acreage.
Sources: Town Permit Data, Pierce County Assessor-Treasurer Tax Parcels, Puget Sound Regional Council Housing Unit Permit Database.

Housing Production Rate

The residential data collected for the Buildable Lands Program tracks the density and other assumptions related to the capacity analysis. The Buildable Lands requirements that were amended in 2017 now require the tracking of housing production to compare to the necessary growth rates to achieve the housing targets. Due to the limitations of the permit data and lack of demolition permit data, Pierce County relies upon the Washington State Office of Financial Management estimates to track the number of housing units built per year in each jurisdiction for the purposes of this Report. The comparison of housing production and housing needs is shown in Table 1-2 and Table 1-3 (Countywide).

Figure 19-B: Town of South Prairie Housing Production Rates (OFM)

Source: Washington State Office of Financial Management Housing Unit Data (2020).

Platting Activity

Platting activity is used to determine the achieved density for single-family residential zones and to identify the amount of land used for other purposes (whether netted out for density or applied by a regulation and affecting the achieved density). Plat data is used in conjunction with multifamily permits to determine the overall achieved density (as shown in Table 19-2).

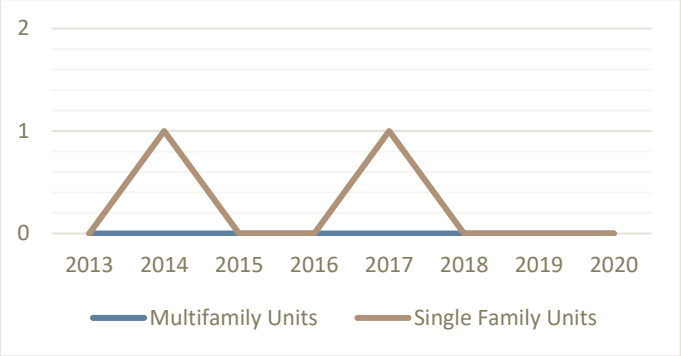


Figure 19-C: Town of South Prairie Platting Trends

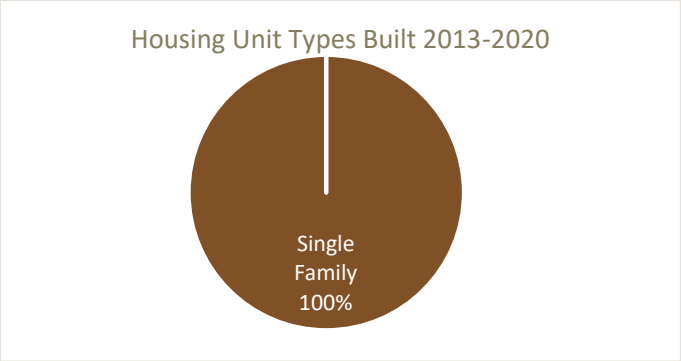


No plat activity has been observed in the timeframe.

Residential Building Trends

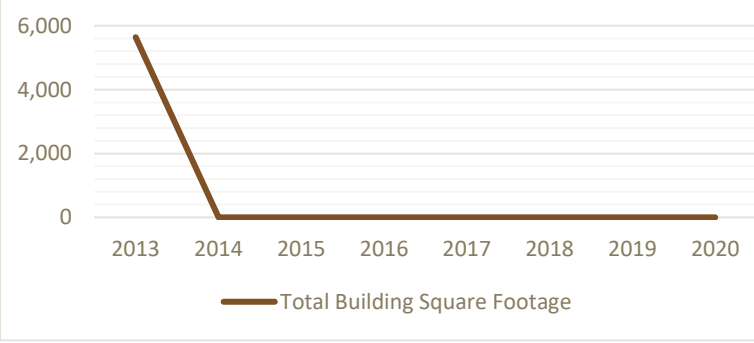
Both multifamily and single-family building permits are collected and summarized; however, single-family permit reporting is optional per the Pierce County Countywide Planning Policies and limited in use for tracking factors affecting development. The single-family permit data is useful for identifying the total number of units built and the average lot size per zone and is provided as supplemental information. The multifamily permit data is used to identify the observed density and amount of land used for residential purposes. Please note that this data differs from the data provided in Figure 19-B due to collection limitations and should not be used to represent housing production in the jurisdiction.

Figure 19-D: Town of South Prairie Residential Building Permit Trends

Multifamily Permits by Year

No multifamily residential development has been observed in the timeframe.

Single-Family Permits by Year (Optional)



Year	Lots	Acres	Avg. Lot Size
2013	-		-
2014	1	0.66	0.66
2015	1	0.11	0.11
2016	-	-	-
2017	1	0.18	0.18
2018	-	-	-
2019	-	-	-
2020	-	-	-
Total	**3**	**0.96**	**0.32**

Sources: Town Permit Data, Pierce County Assessor-Treasurer Tax Parcels, Puget Sound Regional Council Housing Unit Permit Database.

Non-residential Building Trends

Non-residential building permits typically include commercial and industrial development; however, public use is often collected and summarized as well when the use type produces jobs. While the project acreage, building square footage, and floor-to-area ratio information is collected and summarized for the report in order to track non-residential development, the employment density is analyzed in a separate report using data other than building permits. The most recent employment density study to support the assumptions in this Report is provided in Appendix C: Employment Density Survey.

Figure 19-E: Town of South Prairie Non-residential Permit Trends

Year	Acres	Bldg. SF	FAR
2013	1.67	5,640	0.08
2014	-	-	-
2015	-	-	-
2016	-	-	-
2017	-	-	-
2018	-	-	-
2019	-	-	-
2020	-	-	-
Total	**1.67**	**5,640**	**0.08**

ASSUMPTIONS

Assumptions vary by jurisdiction and zone. Table 19-4 and Table 19-5 provide a snapshot of the densities, mixed-use split, and deductions used in the inventory development and capacity calculation tables. The assumptions for each zone are shown in the assumptions column of the capacity calculation tables shown in Appendix A: Full Data, Calculation Tables, and Maps.

Table 19-4: Town of South Prairie Assumptions Summary

Zone	Residential		Employment		Residential Market Factor		Non-Residential Market Factor		Land for Capital Facilities
	Percent	Density	Percent	Density	Vacant	Underutilized	Vacant	Underutilized	
AGB	0%	0	100%	20	0%	0%	10%	50%	0%
C	0%	0	100%	20	0%	0%	10%	50%	0%
GOV	0%	0	100%	20	0%	0%	10%	50%	0%
IND	0%	0	100%	9	0%	0%	10%	50%	0%
R	100%	4	0%	20	25%	25%	0%	0%	0%
R/CUP	100%	4	0%	20	25%	25%	0%	0%	0%

The Vacant Single Unit size threshold listed below represents the parcel size used to determine if a vacant property is subdividable or only able to accommodate one unit. Parcels smaller than the size listed are considered Vacant Single Units unless otherwise determined by the jurisdiction during the parcel-specific review.

Table 19-5: Town of South Prairie Plat Deductions for Single-Family Residential Zones

Zone	Roads	Critical Areas	Parks/Open Space	Stormwater	Non-residential	Vacant Single Unit
R	30%	35%	10%	0%	3%	<1 acre
R/CUP	30%	35%	10%	0%	3%	<1 acre

HOUSING AND EMPLOYMENT CAPACITY

Inventory and Capacity Calculation Characteristics

A portion of the inventory is deducted from the gross acreage based on the assumptions identified in the previous section. Table 19-6 shows the characteristics of the initial inventory and Table 19-7 shows the amount of land that was reduced from that initial inventory to be included in the capacity analysis, as documented in the tables and maps in Appendix A: Full Data, Calculation Tables, and Maps.

Table 19-6: Town of South Prairie Summary of Vacant and Underutilized Land Characteristics

Characteristics/Category	Vacant	Underutilized	Vacant Single Unit	Pipeline
Total Acreage (Gross	35.78	111.19	4.67	0.00
Average Lot Size (Gross)	1.56	3.27	0.23	0.00
Total Acreage (Net)	26.58	70.87	3.65	0.00
Average Lot Size (Net)	1.16	2.08	0.18	0.00
Percent Critical Areas	26%	36%	22%	0%

The parcel inventory is used to categorize land and the capacity calculations are intended to represent the land available for development; thus, the inventory maps alone do not represent the "buildable land" per the Buildable Lands requirements. Table 19-7 shows the overall percentage of land assumed

available as capacity in the 20-year planning period and the deductions made to account for constraints to the inventory and overall market conditions.

Table 19-7: Town of South Prairie Summary of Deductions

Deductions/Category	Vacant	Underutilized
Critical Areas	9.20	40.32
Plat Deductions	18.02	43.35
Capital Facilities	0.00	0.00
Market Factor	1.76	12.02
Total Percent Reduction in Inventory Land	81%	83%
Percent of Vacant or Underutilized Land Available for Capacity	19%	17%

Capacity Results

The housing and employment capacity totals in Table 19-8 and Table 19-9 are derived from the calculations shown in Appendix A: Full Data, Calculation Tables, and Maps. A summary of the countywide capacity results compared to need is shown in **Error! Reference source not found.** (2030 Housing Target), **Error! Reference source not found.** (2030 Employment Target), and Table 1-12 (DRAFT 2044 Targets).

Table 19-8: Town of South Prairie 2020-2044 Housing Capacity (Dwelling Units)

Zone	Vacant	Underutilized	Vacant Single Unit	Pipeline	Total

Total	51	167	0	218

CONSISTENCY EVALUATION

Development Trends

The development trends evaluation compares development that has occurred and the planned and regulated characteristics of the applicable zone, as well as with the assumptions used in the report.

Since the development trend evaluation window is a short period of time and the application of zoning may change periodically, it is often found that there is not enough information to make a statistically valid conclusion. Due to this, the information is provided but no conclusions have been made.

The development trends evaluation compares development that has occurred and the planned and regulated characteristics of the applicable zone, as well as with the assumptions used in the report. Since the development trend evaluation window is a short period of time and the application of zoning may change periodically, it is often found that there is not enough information to make a statistically valid conclusion. Due to this, the information is provided but no conclusions have been made.

Error! Not a valid bookmark self-reference. is provided to show the number of permits, units, and acres developed to identify which zones have experienced development in the timeframe.

Table 3-10 is provided to show the number of permits, units, and acres developed to identify which zones have experienced development in the timeframe.

Table 19-10: Town of South Prairie Permits Summary

Zone	Residential Permits	Non-Residential Permits	Dwelling Units	Acres Developed	% Zoned Acreage
AGB	0	0	0	0.00	0.0%
C	0	2	0	1.67	14.0%
GOV	0	0	0	0.00	0.0%
IND	0	0	0	0.00	0.0%
PTOS	0	0	0	0.00	0.0%
R	0	0	0	0.00	0.0%
R/CUP	0	0	0	0.00	0.0%

Table 3-11 shows the observed residential density trends in comparison to the permitted density and assumed density for each zone with sufficient data. Both the plat and multifamily project average densities are shown in order to understand the source of the overall density.

Table 19-11: Town of South Prairie Density Evaluation

Zone	Observed Density (Overall)	Observed Plat Density (Single-Family)	Observed Multifamily Density	Assumed Density
AGB	0	0	0	0
C	0	0	0	0
GOV	0	0	0	0
IND	0	0	0	0
PTOS	0	0	0	0
R	0	0	0	4
R/CUP	0	0	0	4

Table 3-12 shows the observed percent of developed acreage between residential and non-residential uses. Mixed-use project acreage is duplicated in each category, resulting in a 50/50 percent split. In these cases, further analysis would be needed to determine if vertical mixed-use is part of the trend, resulting in a 100/100 percent split. The observed trend is compared to the assumptions used in the report for both the mixed-use split and the assumption for non-residential in and single-family zone. The trend is also compared to the permitted uses to determine if the zone is developing as planned.

Table 19-12: Town of South Prairie Mixed Use Split and Non-residential in Single Family Zones Evaluation

Zone	Observed Residential Percent	Assumed Residential Percent	Observed Non-residential Percent	Assumed Non-residential Percent	Zone Type (Residential, Non-residential, Mixed-use)	Assumed Non-residential in Single-Family zones Percent
AGB	0%	0%	0%	100%	Commercial	0%

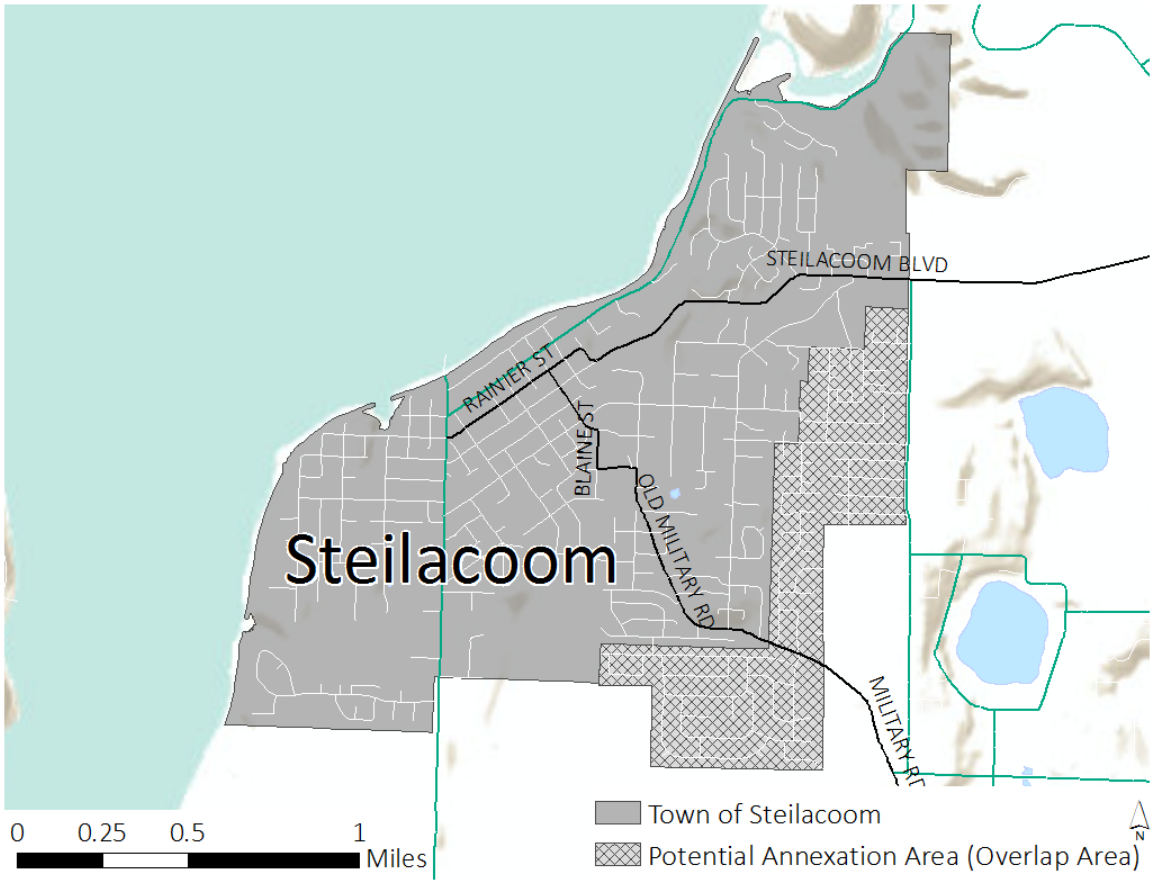
Housing Production / Growth Targets

Table 3-14 shows the observed housing production and average yearly housing production rate between 2010-2020 in comparison to the 2020-2044 housing growth target need and average yearly housing production rate needed to accommodate the growth target.

Table 19-14: Town of South Prairie Housing Production Trends Compared to Growth Target Needs

Housing Units			Total Housing Growth		Average Yearly Housing Growth (Growth / Years)		
2010 Census	2020 OFM Estimate	2044 Target	2010-2020 Observed	2020-2044 Growth Target	2010-2020 Observed	2020-2044 Growth Target	Yearly Increase Needed
174	149	162	-25	13	-3	1	**3**



Capacity / Growth Targets

Table 3-15 shows the 2020-2044 housing and employment capacity in comparison to the housing and employment 2020-2044 growth target need.

Table 19-15: Town of South Prairie Housing and Employment Capacity Compared to Growth Target Needs

Housing Capacity	2020-2044 DRAFT Housing Need	Difference	Employment Capacity	2020-2044 DRAFT Employment Need	Difference
73	13	60	218	10	208

20 TOWN OF STEILACOOM

The Town of Steilacoom's Comprehensive Plan and regulations implement densities using net acreage, subtracting out critical areas and their buffers, roads, and parks.

Table 20-1: Town of Steilacoom Zone Classifications

Zone Classification		Zone Type[1]	Total Acres[2]
CG	Commercial – General	Mixed Use	8.7
CS	Commercial – Shoreline	Mixed Use	22.3
IND	Industrial	Industrial	14.1
MF	Multi-Family	Residential	48.9
MPD	Master Planned Development	Planned Development	71.3
P/QP	Public/Quasi-Public	Public Use	72.1
POS	Parks & Open Space	N/A	100.5
R-7.2	Residential – 7.2	Residential	178.7
R-9.6	Residential – 9.6	Residential	512.0

[1]For purposes of the Buildable Lands inventory and analysis; not a representation of the Town zoning code.
[2]Represents parcel acreage, not zoning coverage.
Sources: Town Zoning Code.

DEVELOPMENT TRENDS

This section summarizes permit data observed between January 1, 2013 and December 31, 2020 that is used to monitor observed densities and update the assumptions for future development. The summaries in this section are designed to show the average statistics used to inform the report. Only data pertinent to the Buildable Lands requirements is collected, and incomplete or not-applicable data is omitted; therefore, this Report does not provide a full summary of all development within the jurisdiction. For more detailed summaries by zone/year, see Appendix A: Full Data, Calculation Tables, and Maps.

Table 20-2 shows the average residential density per zone and jurisdiction-wide and is not intended to show the total units/lots created or overall acres consumed. The results reflect the density calculation used by the jurisdiction, and only include a summary of plats and multifamily (3+ attached units) projects. Table 20-3 shows the average floor-to-area ratio (FAR) by zone and the amount of non-residential building square footage developed. The non-residential projects summarized only include new development and omit additions to existing businesses and non-building type improvements.

Table 20-2: Town of Steilacoom 2013-2020 Residential Trends by Zone[1]

Zone	Net Acres[2]	Lots/Units	Density
R-9.6	31.10	85	2.73

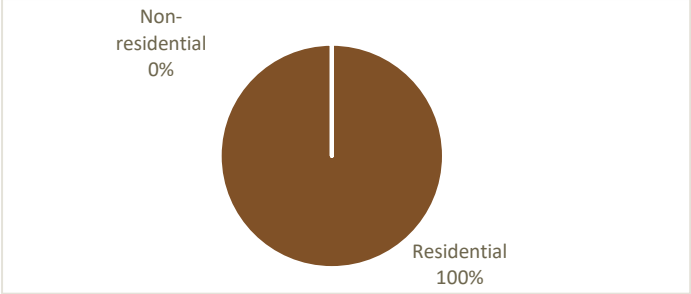


Table 20-3: Town of Steilacoom 2013-2020 Non-residential Trends by Zone

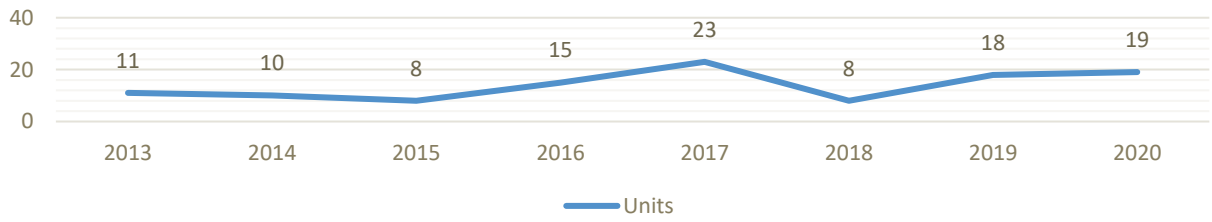
No non-residential development has been observed in the timeframe.

[1]Includes multifamily and plat data to represent the overall observed density by zone. Does not include single-family permits in order to accurately represent permitted densities; therefore, does not represent the total number of units developed in the timeframe.
Sources: Town Permit Data, Pierce County Assessor-Treasurer Tax Parcels, Puget Sound Regional Council Housing Unit Permit Database.

While the non-residential development trends are informative to show the percent of land consumed for non-residential purposes (as shown in Figure 20-A), the employment densities used in the capacity assumptions are derived through employment density surveys, as documented in Appendix C: Employment Density Survey. Figure 20-A summarizes the split between residential and non-residential development between 2013-2020 by zone and the jurisdiction average. The percent split is based on the gross acres developed between 2013-2020 using the plat activity and multifamily permits for residential and non-residential permits for non-residential. The information is used to inform the percent split for mixed-use zones, as well as the percent of non-residential uses in residential-only zones.

Figure 20-A: Town of Steilacoom Residential vs. Non-residential Development Split



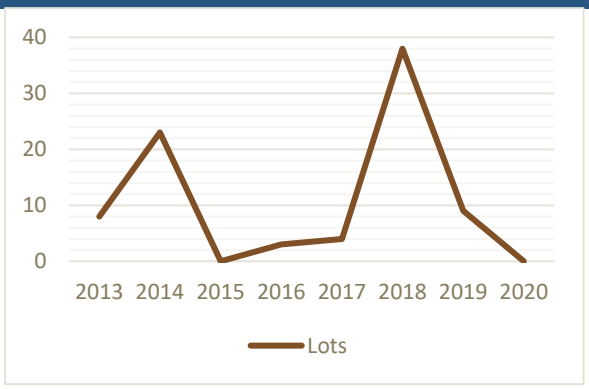
Zone	Use Type Split (Percent)[1]	
	Residential	Non-residential
R-9.6	100%	0%

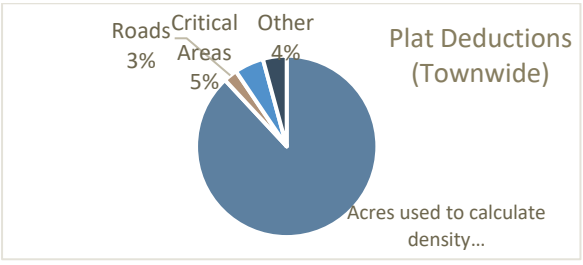
[1]Does not include single-family permits in order to avoid double-counting acreage.
Sources: Town Permit Data, Pierce County Assessor-Treasurer Tax Parcels, Puget Sound Regional Council Housing Unit Permit Database.

Housing Production Rate

The residential data collected for the Buildable Lands Program tracks the density and other assumptions related to the capacity analysis. The Buildable Lands requirements that were amended in 2017 now require the tracking of housing production to compare to the necessary growth rates to achieve the housing targets. Due to the limitations of the permit data and lack of demolition permit data, Pierce County relies upon the Washington State Office of Financial Management estimates to track the number of housing units built per year in each jurisdiction for the purposes of this Report. The comparison of housing production and housing needs is shown in Table 1-2 and Table 1-3 (Countywide).

Figure 20-B: Town of Steilacoom Housing Production Rates (OFM)





Source: Washington State Office of Financial Management Housing Unit Data (2020).

Platting Activity

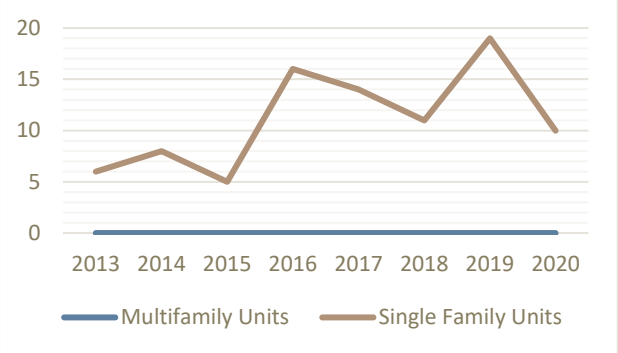
Platting activity is used to determine the achieved density for single-family residential zones and to identify the amount of land used for other purposes (whether netted out for density or applied by a regulation and affecting the achieved density). Plat data is used in conjunction with multifamily permits to determine the overall achieved density (as shown in Table 20-2).

Figure 20-C: Town of Steilacoom Platting Trends

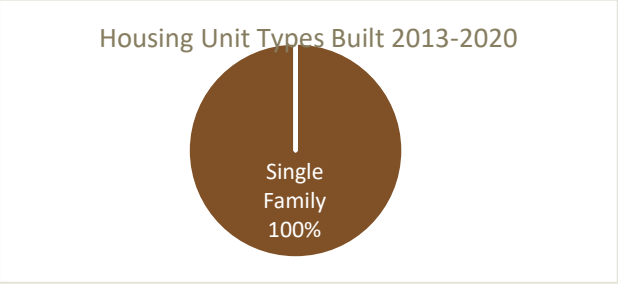
Plat Activity by Year

Year	Lots	Acres	Density
2013	8	2.14	3.74
2014	23	8.61	2.67
2015	-	-	-
2016	3	0.71	4.23
2017	4	1.30	3.08
2018	38	13.65	2.78
2019	9	4.69	1.92
2020	-	-	-
Total	**85**	**31.10**	**2.73**

Plat Deductions by Zone (Percent)



Zone	Roads	Critical Areas	Parks/Open Space	Storm -water
R-9.6	2.5%	5.2%	0.3%	3.9%



Sources: Town Permit Data, Pierce County Auditor Recorded Plats.

Residential Building Trends

Both multifamily and single-family building permits are collected and summarized; however, single-family permit reporting is optional per the Pierce County Countywide Planning Policies and limited in use for tracking factors affecting development. The single-family permit data is useful for identifying the total number of units built and the average lot size per zone and is provided as supplemental information. The multifamily permit data is used to identify the observed density and amount of land used for residential purposes. Please note that this data differs from the data provided in Figure 20-B due to collection limitations and should not be used to represent housing production in the jurisdiction.

Figure 20-D: Town of Steilacoom Residential Building Permit Trends

Multifamily Permits by Year

No multifamily residential development has been observed in the timeframe.

Single-Family Permits by Year (Optional)

Year	Lots	Acres	Avg. Lot Size
2013	6	1.57	0.26
2014	8	1.99	0.25
2015	5	1.06	0.21
2016	16	3.87	0.24
2017	14	3.40	0.24
2018	11	3.06	0.27
2019	19	6.48	0.34
2020	10	2.62	0.26
Total	**89**	**24.05**	**0.27**

Sources: Town Permit Data, Pierce County Assessor-Treasurer Tax Parcels, Puget Sound Regional Council Housing Unit Permit Database.

Non-residential Building Trends

Non-residential building permits typically include commercial and industrial development; however, public use is often collected and summarized as well when the use type produces jobs. While the project acreage, building square footage, and floor-to-area ratio information is collected and summarized for the report in order to track non-residential development, the employment density is analyzed in a separate report using data other than building permits. The most recent employment density study to support the assumptions in this Report is provided in Appendix C: Employment Density Survey.

Figure 20-E: Town of Steilacoom Non-residential Permit Trends

No non-residential development has been observed in the timeframe.

ASSUMPTIONS

Assumptions vary by jurisdiction and zone. Table 20-4 and Table 20-5 provide a snapshot of the densities, mixed-use split, and deductions used in the inventory development and capacity calculation tables. The assumptions for each zone are shown in the assumptions column of the capacity calculation tables shown in Appendix A: Full Data, Calculation Tables, and Maps.

Table 20-4: Town of Steilacoom Assumptions Summary

Zone	Residential		Employment		Residential Market Factor		Non-Residential Market Factor		Land for Capital Facilities
	Percent	Density	Percent	Density	Vacant	Underutilized	Vacant	Underutilized	
CG	15%	12	85%	20	0%	50%	10%	50%	0%
CS	15%	12	85%	20	0%	50%	10%	50%	0%
IND	0%	0	100%	9	0%	0%	10%	50%	0%
MF	100%	12	0%	20	0%	50%	0%	0%	0%
P/QP	0%	0	100%	20	0%	0%	10%	50%	0%
R-7.2	100%	6	0%	20	10%	20%	0%	0%	0%
R-9.6	100%	4	0%	20	10%	20%	0%	0%	0%
MPD	100%	6	0%	0	10%	20%	0%	0%	0%

The Vacant Single Unit size threshold listed below represents the parcel size used to determine if a vacant property is subdividable or only able to accommodate one unit. Parcels smaller than the size listed are considered Vacant Single Units unless otherwise determined by the jurisdiction during the parcel-specific review.

Table 20-5: Town of Steilacoom Plat Deductions for Single-Family Residential Zones

Zone	Roads	Critical Areas	Parks/Open Space	Stormwater	Non-residential	Vacant Single Unit
R-7.2	12%	10%	2%	3%	0%	<0.41 acres
R-9.6	12%	10%	2%	3%	0%	<0.55 acres

HOUSING AND EMPLOYMENT CAPACITY

Inventory and Capacity Calculation Characteristics

A portion of the inventory is deducted from the gross acreage based on the assumptions identified in the previous section. Table 20-6 shows the characteristics of the initial inventory and Table 20-7 shows the amount of land that was reduced from that initial inventory to be included in the capacity analysis, as documented in the tables and maps in Appendix A: Full Data, Calculation Tables, and Maps.

Table 20-6: Town of Steilacoom Summary of Vacant and Underutilized Land Characteristics

Characteristics/Category	Vacant	Underutilized	Vacant Single Unit	Pipeline
Total Acreage (Gross	62.91	120.48	41.00	8.55
Average Lot Size (Gross)	1.53	2.04	0.25	2.14
Total Acreage (Net)	43.70	75.71	33.37	6.89
Average Lot Size (Net)	1.07	1.28	0.20	1.72
Percent Critical Areas	31%	37%	19%	19%

The parcel inventory is used to categorize land and the capacity calculations are intended to represent the land available for development; thus, the inventory maps alone do not represent the "buildable

land" per the Buildable Lands requirements. Table 20-7 shows the overall percentage of land assumed available as capacity in the 20-year planning period and the deductions made to account for constraints to the inventory and overall market conditions.

Table 20-7: Town of Steilacoom Summary of Deductions

Deductions/Category	Vacant	Underutilized
Critical Areas	19.21	44.77
Plat Deductions	10.56	12.65
Capital Facilities	0.00	0.00
Market Factor	5.22	11.41
Total Percent Reduction in Inventory Land	25%	43%
Percent of Vacant or Underutilized Land Available for Capacity	75%	57%

Capacity Results

The housing and employment capacity totals in Table 20-8 and Table 20-9 are derived from the calculations shown in Appendix A: Full Data, Calculation Tables, and Maps. A summary of the countywide capacity results compared to need is shown in **Error! Reference source not found.** (2030 Housing Target), **Error! Reference source not found.** (2030 Employment Target), and Table 1-12 (DRAFT 2044 Targets).

CONSISTENCY EVALUATION

Development Trends

The development trends evaluation compares development that has occurred and the planned and regulated characteristics of the applicable zone, as well as with the assumptions used in the report. Since the development trend evaluation window is a short period of time and the application of zoning may change periodically, it is often found that there is not enough information to make a statistically valid conclusion. Due to this, the information is provided but no conclusions have been made.

The development trends evaluation compares development that has occurred and the planned and regulated characteristics of the applicable zone, as well as with the assumptions used in the report. Since the development trend evaluation window is a short period of time and the application of zoning may change periodically, it is often found that there is not enough information to make a statistically valid conclusion. Due to this, the information is provided but no conclusions have been made.

Error! Not a valid bookmark self-reference. is provided to show the number of permits, units, and acres developed to identify which zones have experienced development in the timeframe.

Table 3-10 is provided to show the number of permits, units, and acres developed to identify which zones have experienced development in the timeframe.

Table 20-10: Town of Steilacoom Permits Summary

Zone	Residential Permits	Non-Residential Permits	Dwelling Units	Acres Developed	% Zoned Acreage
CG	0	0	0	0.00	0.0%
CS	0	0	0	0.00	0.0%
IND	0	0	0	0.00	0.0%

R-9.6	15	0	85	31.10	5.9%

Table 3-11 shows the observed residential density trends in comparison to the permitted density and assumed density for each zone with sufficient data. Both the plat and multifamily project average densities are shown in order to understand the source of the overall density.

Table 20-11: Town of Steilacoom Density Evaluation

Zone	Observed Density (Overall)	Observed Plat Density (Single-Family)	Observed Multifamily Density	Assumed Density
CG	0	0	0	12
CS	0	0	0	12
IND	0	0	0	0
MF	0	0	0	12
MPD	0	0	0	6
P/QP	0	0	0	0
POS	0	0	0	0
R-7.2	0	0	0	6
R-9.6	3	3	0	4

Table 3-12 shows the observed percent of developed acreage between residential and non-residential uses. Mixed-use project acreage is duplicated in each category, resulting in a 50/50 percent split. In these cases, further analysis would be needed to determine if vertical mixed-use is part of the trend, resulting in a 100/100 percent split. The observed trend is compared to the assumptions used in the report for both the mixed-use split and the assumption for non-residential in and single-family zone. The trend is also compared to the permitted uses to determine if the zone is developing as planned.

Table 20-12: Town of Steilacoom Mixed Use Split and Non-residential in Single Family Zones Evaluation

Zone	Observed Residential Percent	Assumed Residential Percent	Observed Non-residential Percent	Assumed Non-residential Percent	Zone Type (Residential, Non-residential, Mixed-use)	Assumed Non-residential in Single-Family zones Percent

DEVELOPMENT TRENDS

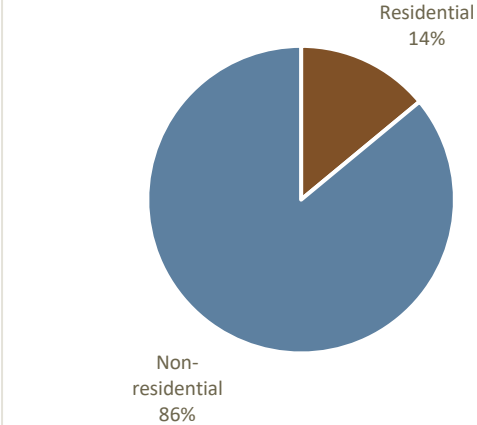
This section summarizes permit data observed between January 1, 2013 and December 31, 2020 that is used to monitor observed densities and update the assumptions for future development. The summaries in this section are designed to show the average statistics used to inform the report. Only data pertinent to the Buildable Lands requirements is collected, and incomplete or not-applicable data is omitted; therefore, this Report does not provide a full summary of all development within the jurisdiction. For more detailed summaries by zone/year, see Appendix A: Full Data, Calculation Tables, and Maps.

Table 21-2 shows the average residential density per zone and jurisdiction-wide and is not intended to show the total units/lots created or overall acres consumed. The results reflect the density calculation used by the jurisdiction, and only include a summary of plats and multifamily (3+ attached units) projects. Table 21-3 shows the average floor-to-area ratio (FAR) by zone and the amount of non-residential building square footage developed. The non-residential projects summarized only include new development and omit additions to existing businesses and non-building type improvements.

Table 21-2: City of Sumner 2013-2020 Residential Trends by Zone[1]

Zone	Net Acres[2]	Lots/Units	Net Density
GC	4.41	120	27.21
HDR	0.92	4	4.35
LDR-12	0.79	2	2.53
LDR-6	20.17	62	3.07
LDR-7.2	20.46	79	3.86
LDR-8.5	4.35	5	1.15
MDR	6.31	73	11.57
Total/Avg.	**57.41**	**345**	**6.01**

Table 21-3: City of Sumner 2013-2020 Non-residential Trends by Zone



Zone	Acres	Sq. Ft.	FAR

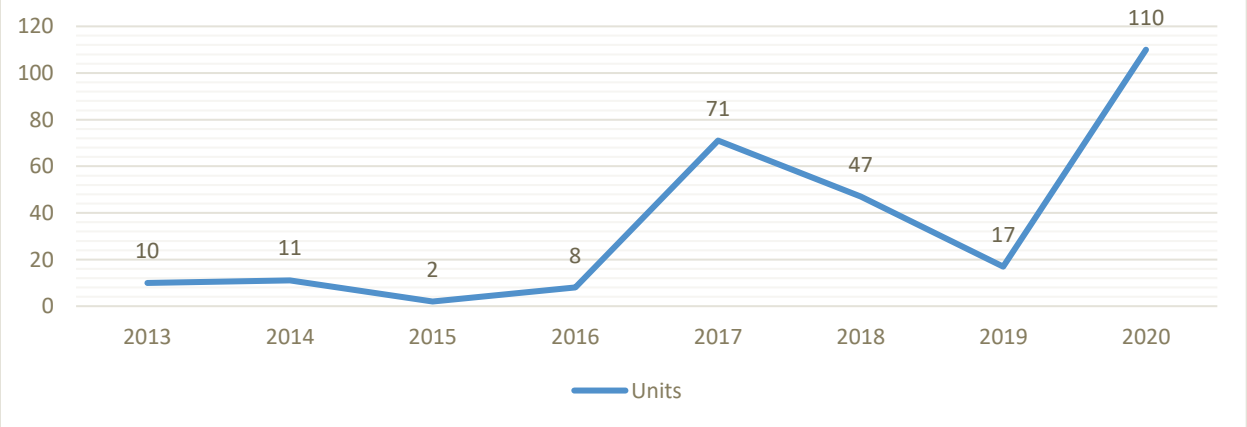
Total/Avg.	**355.6**	**5,068,779**	**0.33**

[1]Includes multifamily and plat data to represent the overall observed density by zone. Does not include single-family permits in order to accurately represent permitted densities; therefore, does not represent the total number of units developed in the timeframe.
Sources: City Permit Data, Pierce County Assessor-Treasurer Tax Parcels, Puget Sound Regional Council Housing Unit Permit Database.

While the non-residential development trends are informative to show the percent of land consumed for non-residential purposes (as shown in Figure 21-A), the employment densities used in the capacity assumptions are derived through employment density surveys, as documented in Appendix C: Employment Density Survey. Figure 21-A summarizes the split between residential and non-residential development between 2013-2020 by zone and the jurisdiction average. The percent split is based on

the gross acres developed between 2013-2020 using the plat activity and multifamily permits for residential and non-residential permits for non-residential. The information is used to inform the percent split for mixed-use zones, as well as the percent of non-residential uses in residential-only zones.

Figure 21-A: City of Sumner Residential vs. Non-residential Development Split



Zone	Use Type Split (Percent)[1] Residential	Non-residential
GC	22%	78%
HDR	43%	57%

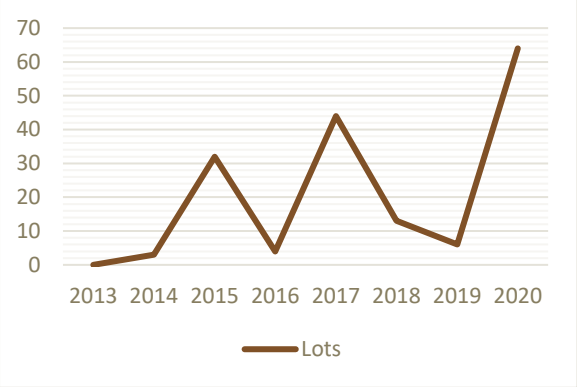
TCP	0%	100%
Average	**14%**	**86%**

[1]Does not include single-family permits in order to avoid double-counting acreage.
Sources: City Permit Data, Pierce County Assessor-Treasurer Tax Parcels, Puget Sound Regional Council Housing Unit Permit Database.

Housing Production Rate

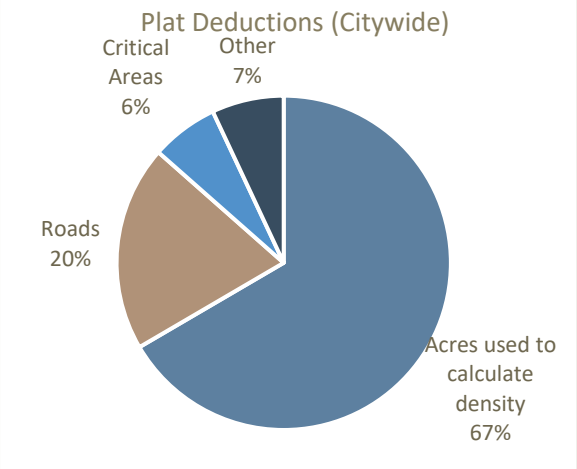
The residential data collected for the Buildable Lands Program tracks the density and other assumptions related to the capacity analysis. The Buildable Lands requirements that were amended in 2017 now require the tracking of housing production to compare to the necessary growth rates to achieve the housing targets. Due to the limitations of the permit data and lack of demolition permit data, Pierce County relies upon the Washington State Office of Financial Management estimates to track the number of housing units built per year in each jurisdiction for the purposes of this Report. The comparison of housing production and housing needs is shown in Table 1-2 and Table 1-3 (Countywide).

Figure 21-B: City of Sumner Housing Production Rates (OFM)



Source: Washington State Office of Financial Management Housing Unit Data (2020).

Platting Activity



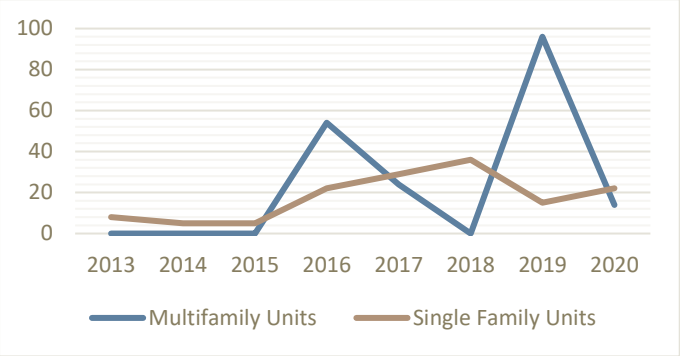
Platting activity is used to determine the achieved density for single-family residential zones and to identify the amount of land used for other purposes (whether netted out for density or applied by a regulation and affecting the achieved density). Plat data is used in conjunction with multifamily permits to determine the overall achieved density (as shown in Table 21-2).

Figure 21-C: City of Sumner Platting Trends

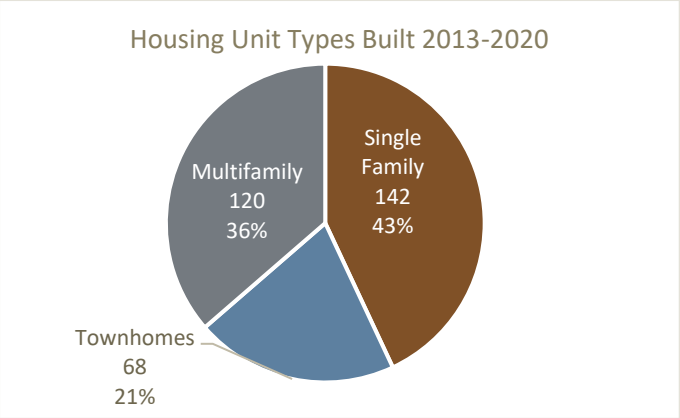
Plat Activity by Year

Year	Lots	Net Acres	Net Density
2013	-	-	-
2014	3	0.74	4.05
2015	32	5.71	5.60
2016	4	0.92	4.35
2017	44	7.80	5.64
2018	4	0.59	6.78
2019	6	1.17	5.13
2020	64	14.85	4.31
Total	**157**	**31.78**	**4.94**

Plat Deductions by Zone (Percent)



Zone	Roads	Critical Areas	Storm-water	Other
LDR-6	22.9%	5.3%	7.6%	7.6%
LDR-7.2	23.9%	0.0%	5.3%	3.2%
LDR-8.5	0.0%	46.9%	0.0%	0.0%
Average	**19.9%**	**6.5%**	**5.5%**	**1.5%**



Sources: City Permit Data, Pierce County Auditor Recorded Plats.

Residential Building Trends

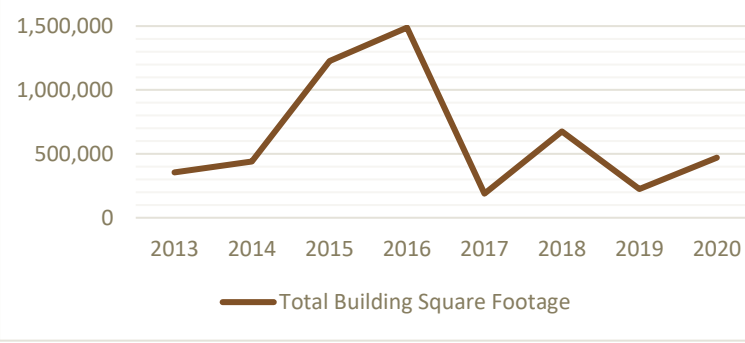
Both multifamily and single-family building permits are collected and summarized; however, single-family permit reporting is optional per the Pierce County Countywide Planning Policies and limited in use for tracking factors affecting development. The single-family permit data is useful for identifying the total number of units built and the average lot size per zone and is provided as supplemental information. The multifamily permit data is used to identify the observed density and amount of land used for residential purposes. Please note that this data differs from the data provided in Figure 21-B due to collection limitations and should not be used to represent housing production in the jurisdiction.

Figure 21-D: City of Sumner Residential Building Permit Trends

Multifamily Permits by Year

Year	Units	Acres	Density
2013	-	-	-
2014	-	-	-
2015	-	-	-
2016	54	4.26	12.68
2017	24	1.08	22.22
2018	-	-	-
2019	96	3.33	28.83
2020	14	1.00	14.00
Total	**188**	**9.67**	**19.44**

Single-Family Permits by Year (Optional)



Year	Units	Acres	Avg. Lot Size
2013	8	1.88	0.23
2014	5	1.27	0.25
2015	5	0.90	0.18
2016	22	8.02	0.36
2017	29	5.54	0.19
2018	36	6.70	0.19
2019	15	6.48	0.43
2020	22	4.55	0.21
Total	**142**	**35.35**	**0.25**

Sources: City Permit Data, Pierce County Assessor-Treasurer Tax Parcels, Puget Sound Regional Council Housing Unit Permit Database.

Non-residential Building Trends

Non-residential building permits typically include commercial and industrial development; however, public use is often collected and summarized as well when the use type produces jobs. While the project acreage, building square footage, and floor-to-area ratio information is collected and summarized for the report in order to track non-residential development, the employment density is analyzed in a separate report using data other than building permits. The most recent employment density study to support the assumptions in this Report is provided in Appendix C: Employment Density Survey.

Figure 21-E: City of Sumner Non-residential Permit Trends

Year	Acres	Bldg. SF	FAR
2013	17.88	354,838	0.46
2014	21.89	441,326	0.46
2015	57.48	1,225,785	0.49
2016	88.54	1,487,971	0.39
2017	18.47	188,741	0.23
2018	107.69	675,411	0.14
2019	16.30	223,741	0.32

ASSUMPTIONS

Assumptions vary by jurisdiction and zone. Table 21-4 and Table 21-5 provide a snapshot of the densities, mixed-use split, and deductions used in the inventory development and capacity calculation tables. The assumptions for each zone are shown in the assumptions column of the capacity calculation tables shown in Appendix A: Full Data, Calculation Tables, and Maps.

Table 21-4: City of Sumner Assumptions Summary

Zone	Residential		Employment		Residential Market Factor		Non-Residential Market Factor		Land for Capital Facilities

The Vacant Single Unit size threshold listed below represents the parcel size used to determine if a vacant property is subdividable or only able to accommodate one unit. Parcels smaller than the size listed are considered Vacant Single Units unless otherwise determined by the jurisdiction during the parcel-specific review.

Table 21-5: City of Sumner Plat Deductions for Single-Family Residential Zones

LDR-85	0%	GIS	0%	0%	2%	<0.49 acres
MDR	N/A	GIS	N/A	N/A	2%	N/A

HOUSING AND EMPLOYMENT CAPACITY

Inventory and Capacity Calculation Characteristics

A portion of the inventory is deducted from the gross acreage based on the assumptions identified in the previous section. Table 21-6 shows the characteristics of the initial inventory and Table 21-7 shows the amount of land that was reduced from that initial inventory to be included in the capacity analysis, as documented in the tables and maps in Appendix A: Full Data, Calculation Tables, and Maps.

Table 21-6: City of Sumner Summary of Vacant and Underutilized Land Characteristics

Characteristics/Category	Vacant	Underutilized	Vacant Single Unit	Pipeline
Total Acreage (Gross	296.21	610.72	53.37	66.72
Average Lot Size (Gross)	2.55	1.07	1.07	3.71
Total Acreage (Net)	142.95	433.76	7.41	36.89
Average Lot Size (Net)	1.23	0.76	0.15	2.05
Percent Critical Areas	52%	29%	86%	45%

The parcel inventory is used to categorize land and the capacity calculations are intended to represent the land available for development; thus, the inventory maps alone do not represent the "buildable land" per the Buildable Lands requirements. Table 21-7 shows the overall percentage of land assumed available as capacity in the 20-year planning period and the deductions made to account for constraints to the inventory and overall market conditions.

Table 21-7: City of Sumner Summary of Deductions

Deductions/Category	Vacant	Underutilized
Critical Areas	153.26	176.95
Plat Deductions	0.00	0.00
Capital Facilities	0.00	0.00
Market Factor	27.52	213.77
Total Percent Reduction in Inventory Land	21%	51%
Percent of Vacant or Underutilized Land Available for Capacity	79%	49%

Capacity Results

The housing and employment capacity totals in Table 21-8 and Table 21-9 are derived from the calculations shown in Appendix A: Full Data, Calculation Tables, and Maps. A summary of the countywide capacity results compared to need is shown in **Error! Reference source not found.** (2030 Housing Target), **Error! Reference source not found.** (2030 Employment Target), and Table 1-12 (DRAFT 2044 Targets).

CONSISTENCY EVALUATION

Development Trends

The development trends evaluation compares development that has occurred and the planned and regulated characteristics of the applicable zone, as well as with the assumptions used in the report. Since the development trend evaluation window is a short period of time and the application of zoning may change periodically, it is often found that there is not enough information to make a statistically valid conclusion. Due to this, the information is provided but no conclusions have been made.

The development trends evaluation compares development that has occurred and the planned and regulated characteristics of the applicable zone, as well as with the assumptions used in the report. Since the development trend evaluation window is a short period of time and the application of zoning may change periodically, it is often found that there is not enough information to make a statistically valid conclusion. Due to this, the information is provided but no conclusions have been made.

Error! Not a valid bookmark self-reference. is provided to show the number of permits, units, and acres developed to identify which zones have experienced development in the timeframe.

Table 3-10 is provided to show the number of permits, units, and acres developed to identify which zones have experienced development in the timeframe.

Table 21-10: City of Sumner Permits Summary

Zone	Residential Permits	Non-Residential Permits	Dwelling Units	Acres Developed	% Zoned Acreage

Table 3-12 shows the observed percent of developed acreage between residential and non-residential uses. Mixed-use project acreage is duplicated in each category, resulting in a 50/50 percent split. In these cases, further analysis would be needed to determine if vertical mixed-use is part of the trend, resulting in a 100/100 percent split. The observed trend is compared to the assumptions used in the report for both the mixed-use split and the assumption for non-residential in and single-family zone. The trend is also compared to the permitted uses to determine if the zone is developing as planned.

Table 21-12: City of Sumner Mixed Use Split and Non-residential in Single Family Zones Evaluation

[1]For purposes of the Buildable Lands inventory and analysis; not a representation of the City zoning code.
[2]Represents parcel acreage, not zoning coverage.
Sources: City Zoning Code.

DEVELOPMENT TRENDS

This section summarizes permit data observed between January 1, 2013 and December 31, 2020 that is used to monitor observed densities and update the assumptions for future development. The summaries in this section are designed to show the average statistics used to inform the report. Only data pertinent to the Buildable Lands requirements is collected, and incomplete or not-applicable data is omitted; therefore, this Report does not provide a full summary of all development within the jurisdiction. For more detailed summaries by zone/year, see Appendix A: Full Data, Calculation Tables, and Maps.

Table 22-2 shows the average residential density per zone and jurisdiction-wide and is not intended to show the total units/lots created or overall acres consumed. The results reflect the density calculation used by the jurisdiction, and only include a summary of plats and multifamily (3+ attached units) projects. Table 22-3 shows the average floor-to-area ratio (FAR) by zone and the amount of non-residential building square footage developed. The non-residential projects summarized only include new development and omit additions to existing businesses and non-building type improvements.

Table 22-2: City of Tacoma 2013-2020 Residential Trends by Zone[1]

Zone	Acres	Lots/Units	Density
C1	2.69	77	28.67

Total/Avg.	**177.02**	**1,374,509**	**0.18**

[1]Includes multifamily and plat data to represent the overall observed density by zone. Does not include single-family permits in order to accurately represent permitted densities; therefore, does not represent the total number of units developed in the timeframe.
Sources: City Permit Data, Pierce County Assessor-Treasurer Tax Parcels, Puget Sound Regional Council Housing Unit Permit Database.

While the non-residential development trends are informative to show the percent of land consumed for non-residential purposes (as shown in Figure 22-A), the employment densities used in the capacity assumptions are derived through employment density surveys, as documented in Appendix C: Employment Density Survey. Figure 22-A summarizes the split between residential and non-residential development between 2013-2020 by zone and the jurisdiction average. The percent split is based on the gross acres developed between 2013-2020 using the plat activity and multifamily permits for residential and non-residential permits for non-residential. The information is used to inform the percent split for mixed-use zones, as well as the percent of non-residential uses in residential-only zones.

Figure 22-A: City of Tacoma Residential vs. Non-residential Development Split

Zone	Use Type Split (Percent)[1]	
	Residential	Non-residential

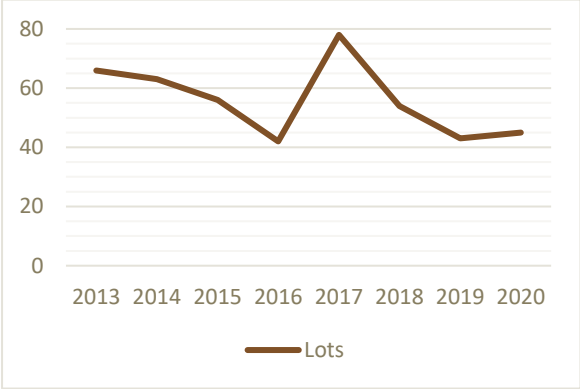
Housing Production Rate

The residential data collected for the Buildable Lands Program tracks the density and other assumptions related to the capacity analysis. The Buildable Lands requirements that were amended in 2017 now require the tracking of housing production to compare to the necessary growth rates to achieve the housing targets. Due to the limitations of the permit data and lack of demolition permit data, Pierce County relies upon the Washington State Office of Financial Management estimates to track the number of housing units built per year in each jurisdiction for the purposes of this Report. The comparison of housing production and housing needs is shown in Table 1-2 and Table 1-3 (Countywide).

Figure 22-B: City of Tacoma Housing Production Rates (OFM)



Source: Washington State Office of Financial Management Housing Unit Data (2020).

Platting Activity

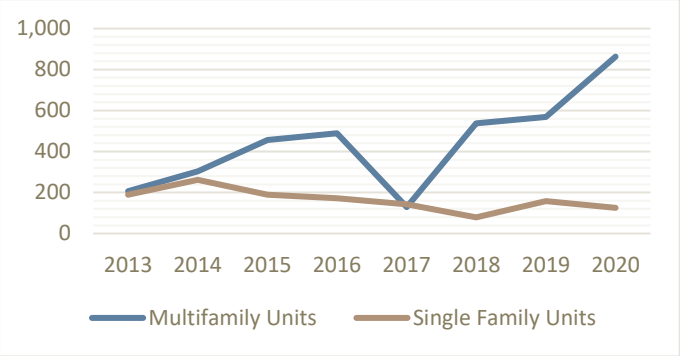
Platting activity is used to determine the achieved density for single-family residential zones, and to identify the amount of land used for other purposes (whether netted out for density or applied by a regulation and affecting the achieved density). Plat data is used in conjunction with multifamily permits for zones that permit both, to determine the overall achieved density (as shown in Table 22-2).

Figure 22-C: City of Tacoma Platting Trends

Plat Activity by Year

Year	Lots	Acres	Density
2013	66	12.07	5.47
2014	63	11.59	5.43
2015	56	8.49	6.60
2016	42	6.89	6.09
2017	78	27.87	2.80
2018	54	16.99	3.18
2019	43	6.59	6.53
2020	45	6.52	6.91
Total	**447**	**97.01**	**4.61**

Plat Deductions by Zone (Percent)



Not provided – Tacoma uses a gross calculation.

Residential Building Trends

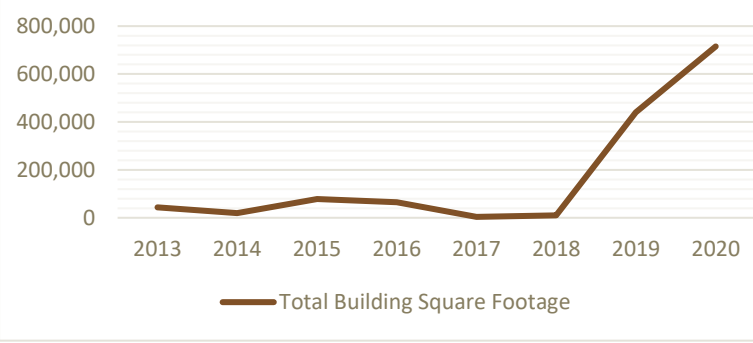
Both multifamily and single-family building permits are collected and summarized; however, single-family permit reporting is optional per the Pierce County Countywide Planning Policies and limited in use for tracking factors affecting development. The single-family permit data is useful for identifying the total number of units built and the average lot size per zone and is provided as supplemental information. The multifamily permit data is used to identify the observed density and amount of land used for residential purposes. Please note that this data differs from the data provided in Figure 22-B due to collection limitations and should not be used to represent housing production in the jurisdiction.

Figure 22-D: City of Tacoma Residential Building Permit Trends

Multifamily Permits by Year

Year	Units	Acres	Net Density
2013	207	4.32	47.88
2014	303	5.42	55.89
2015	456	13.07	34.89
2016	489	6.78	72.15
2017	129	4.11	31.37
2018	538	5.74	93.79
2019	568	9.04	62.87
2020	863	14.77	58.44
Total	**3,553**	**63.25**	**56.18**

Single-Family Permits by Year (Optional)



Year	Lots	Acres	Avg. Lot Size
2013	190	24.70	0.13
2014	262	29.62	0.11
2015	190	25.04	0.13
2016	172	23.42	0.14
2017	143	22.57	0.16
2018	79	12.17	0.15
2019	158	21.49	0.14
2020	125	16.45	0.14
Total	**1,319**	**175.47**	**0.13**

Sources: City Permit Data, Pierce County Assessor-Treasurer Tax Parcels, Puget Sound Regional Council Housing Unit Permit Database.

Non-residential Building Trends

Non-residential building permits typically include commercial and industrial development; however, public use is often collected and summarized as well when the use type produces jobs. While the project acreage, building square footage, and floor-to-area ratio information is collected and summarized for the report in order to track non-residential development, the employment density is analyzed in a separate report using data other than building permits. The most recent employment density study to support the assumptions in this Report is provided in Appendix C: Employment Density Survey.

Figure 22-E: City of Tacoma Non-residential Permit Trends

Year	Acres	Bldg. SF	FAR
2013	53.21	42,911	0.02
2014	2.05	19,402	0.22
2015	7.60	78,454	0.24
2016	2.69	65,007	0.55
2017	1.90	3,834	0.05
2018	1.41	9,601	0.16
2019	28.81	440,128	0.35
2020	79.25	715,172	0.21
Total	**177.02**	**1,374,509**	**0.18**

ASSUMPTIONS

Assumptions vary by jurisdiction and zone. Table 22-4 and Table 22-5 provide a snapshot of the densities, mixed-use split, and deductions used in the inventory development and capacity calculation tables. The assumptions for each zone are shown in the assumptions column of the capacity calculation tables shown in Appendix A: Full Data, Calculation Tables, and Maps.

Table 22-4: City of Tacoma Assumptions Summary

The Vacant Single Unit size threshold listed below represents the parcel size used to determine if a vacant property is subdividable or only able to accommodate one unit. Parcels smaller than the size

listed are considered Vacant Single Units unless otherwise determined by the jurisdiction during the parcel-specific review.

Table 22-5: City of Tacoma Plat Deductions for Single-Family Residential Zones

Zone	Roads	Critical Areas	Parks/Open Space	Stormwater	Non-residential	Vacant Single Unit

HOUSING AND EMPLOYMENT CAPACITY

Inventory and Capacity Calculation Characteristics

A portion of the inventory is deducted from the gross acreage based on the assumptions identified in the previous section. Table 22-6 shows the characteristics of the initial inventory and Table 22-7 shows the amount of land that was reduced from that initial inventory to be included in the capacity analysis, as documented in the tables and maps in Appendix A: Full Data, Calculation Tables, and Maps.

Table 22-6: City of Tacoma Summary of Vacant and Underutilized Land Characteristics

Characteristics/Category	Vacant	Underutilized	Vacant Single Unit	Pipeline
Total Acreage (Gross	1,053.29	2,836.84	187.48	183.75
Average Lot Size (Gross)	0.89	0.42	0.15	2.70
Total Acreage (Net)	548.36	2,541.46	143.37	162.85
Average Lot Size (Net)	0.46	0.38	0.12	2.39
Percent Critical Areas	48%	10%	24%	11%

The parcel inventory is used to categorize land and the capacity calculations are intended to represent the land available for development; thus, the inventory maps alone do not represent the "buildable land" per the Buildable Lands requirements. Table 22-7 shows the overall percentage of land assumed available as capacity in the 20-year planning period and the deductions made to account for constraints to the inventory and overall market conditions.

Table 22-7: City of Tacoma Summary of Deductions

Deductions/Category	Vacant	Underutilized
Critical Areas	504.92	295.38
Infrastructure Gaps	4.65	14.97
Plat Deductions	106.09	59.69
Capital Facilities	0.00	0.00
Market Factor	48.17	638.33
Total Percent Reduction in Inventory Land	14%	24%
Percent of Vacant or Underutilized Land Available for Capacity	86%	76%

Capacity Results

The housing and employment capacity totals in Table 22-8 and Table 22-9 are derived from the calculations shown in Appendix A: Full Data, Calculation Tables, and Maps. A summary of the countywide capacity results compared to need is shown in **Error! Reference source not found.** (2030 Housing Target), **Error! Reference source not found.** (2030 Employment Target), and Table 1-12 (DRAFT 2044 Targets).

CONSISTENCY EVALUATION

Development Trends

The development trends evaluation compares development that has occurred and the planned and regulated characteristics of the applicable zone, as well as with the assumptions used in the report. Since the development trend evaluation window is a short period of time and the application of zoning may change periodically, it is often found that there is not enough information to make a statistically valid conclusion. Due to this, the information is provided but no conclusions have been made.

The development trends evaluation compares development that has occurred and the planned and regulated characteristics of the applicable zone, as well as with the assumptions used in the report. Since the development trend evaluation window is a short period of time and the application of zoning may change periodically, it is often found that there is not enough information to make a statistically valid conclusion. Due to this, the information is provided but no conclusions have been made.

Error! Not a valid bookmark self-reference. is provided to show the number of permits, units, and acres developed to identify which zones have experienced development in the timeframe.

Table 3-10 is provided to show the number of permits, units, and acres developed to identify which zones have experienced development in the timeframe.

Table 3-12 shows the observed percent of developed acreage between residential and non-residential uses. Mixed-use project acreage is duplicated in each category, resulting in a 50/50 percent split. In these cases, further analysis would be needed to determine if vertical mixed-use is part of the trend,

resulting in a 100/100 percent split. The observed trend is compared to the assumptions used in the report for both the mixed-use split and the assumption for non-residential in and single-family zone. The trend is also compared to the permitted uses to determine if the zone is developing as planned.

Table 22-12: City of Tacoma Mixed Use Split and Non-residential in Single Family Zones Evaluation

Zone	Observed Residential Percent	Assumed Residential Percent	Observed Non-residential Percent	Assumed Non-residential Percent	Zone Type (Residential, Non-residential, Mixed-use)	Assumed Non-residential in Single-Family zones Percent

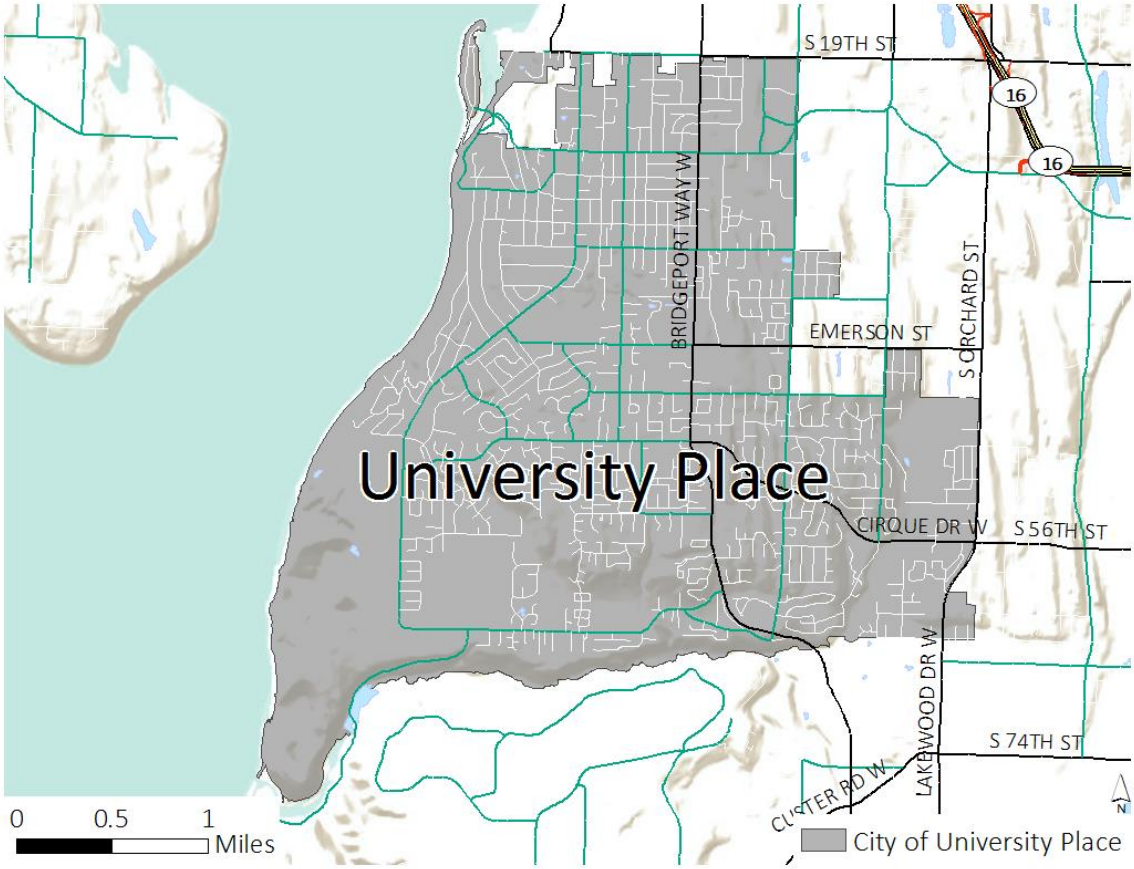
Housing Production / Growth Targets

Table 3-14 shows the observed housing production and average yearly housing production rate between 2010-2020 in comparison to the 2020-2044 housing growth target need and average yearly housing production rate needed to accommodate the growth target.

Table 22-14: City of Tacoma Housing Production Trends Compared to Growth Target Needs

Housing Units			Total Housing Growth		Average Yearly Housing Growth (Growth / Years)		
2010 Census	2020 OFM Estimate	2044 Target	2010-2020 Observed	2020-2044 Growth Target	2010-2020 Observed	2020-2044 Growth Target	Yearly Increase Needed
85,786	92,309	134,699	6,523	42,390	652	1,766	**1,114**



Capacity / Growth Targets

Table 3-15 shows the 2020-2044 housing and employment capacity in comparison to the housing and employment 2020-2044 growth target need.

Table 22-15: City of Tacoma Housing and Employment Capacity Compared to Growth Target Needs

Housing Capacity	2020-2044 DRAFT Housing Need	Difference	Employment Capacity	2020-2044 DRAFT Employment Need	Difference
68,049	42,390	25,659	84,436	70,800	13,636

23 CITY OF UNIVERSITY PLACE

The City's Comprehensive Plan and regulations implement densities using net acreage, subtracting roads and critical areas and buffers.

Table 23-1: City of University Place Zone Classifications

Zone Classification		Zone Type[1]	Total Acres[2]
MF-L	Multifamily Low	Residential	97.43
MF-H	Multifamily High	Residential	54.94
MU	Mixed Use	Mixed Use	8.29
MU-C	Mixed Use Center	Mixed Use	37.57
MU-M	Mixed Use Maritime	Mixed Use	122.99
MU-N45	Mixed Use Neighborhood	Mixed Use	205.12
MU-O	Mixed Use Office	Mixed Use	2.50
MU-U/I	Mixed Use Urban/Industrial	Mixed Use	205.12
MU-U75	Mixed Use Urban	Mixed Use	122.99
NC	Neighborhood Commercial	Commercial	17.72
POS	Parks and Open Space	N/A	127.51
R1	Residential 1	Residential	3,649.14
R2	Residential 2	Residential	374.00

[1]For purposes of the Buildable Lands inventory and analysis; not a representation of the City zoning code.

[2]Represents parcel acreage, not zoning coverage.

Sources: City Zoning Code.

DEVELOPMENT TRENDS

This section summarizes permit data observed between January 1, 2013 and December 31, 2019 and plat activity through December 31, 2020 that is used to monitor observed densities and update the assumptions for future development. The summaries in this section are designed to show the average statistics used to inform the report. Only data pertinent to the Buildable Lands requirements is collected, and incomplete or not-applicable data is omitted; therefore, this Report does not provide a full summary of all development within the jurisdiction. For more detailed summaries by zone/year, see Appendix A: Full Data, Calculation Tables, and Maps.

Table 23-2 shows the average residential density per zone and jurisdiction-wide and is not intended to show the total units/lots created or overall acres consumed. The results reflect the density calculation used by the jurisdiction, and only include a summary of plats and multifamily (3+ attached units) projects. Table 23-3 shows the average floor-to-area ratio (FAR) by zone and the amount of non-residential building square footage developed. The non-residential projects summarized only include new development and omit additions to existing businesses and non-building type improvements.

Table 23-2: City of University Place 2013-2020 Residential Trends by Zone[1]

Zone	Net Acres[1]	Lots/Units	Net Density
MF-L	2.25	9	4.00
R1	36.79	102	2.77
R2	37.74	188	4.98
TC	1.39	270	193.83
Total/Avg.	**61.02**	**569**	**9.32**

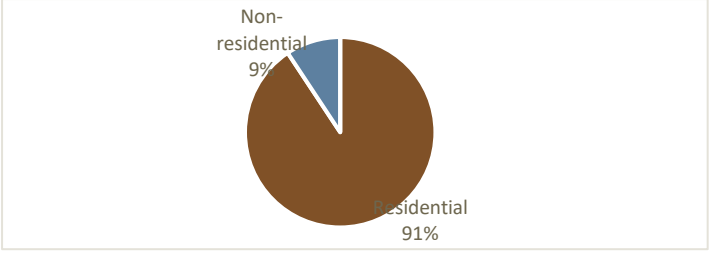


Table 23-3: City of University Place 2013-2020 Non-residential Trends by Zone

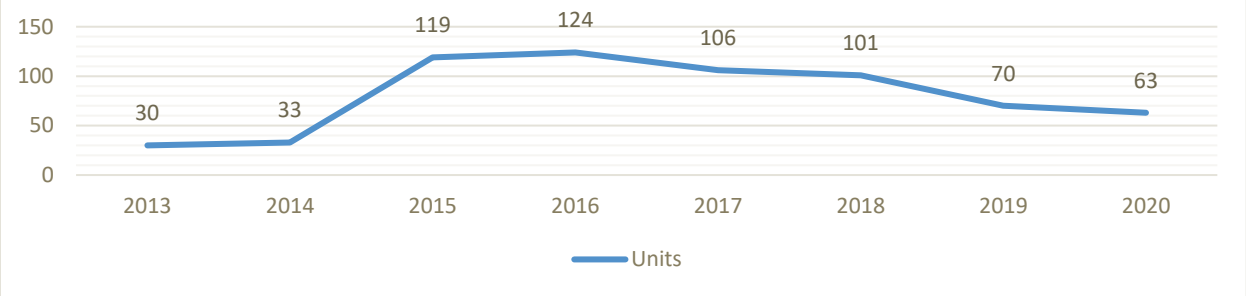
Zone	Acres	Sq. Ft.	FAR
MU	0.92	596	0.01
R2	1.50	18,222	0.28
TC	5.55	302,415	1.25
Total/Avg.	**7.97**	**321,233**	**0.93**

[1]Includes multifamily and plat data to represent the overall observed density by zone. Does not include single-family permits in order to accurately represent permitted densities; therefore, does not represent the total number of units developed in the timeframe.
Sources: City Permit Data, Pierce County Assessor-Treasurer Tax Parcels, Puget Sound Regional Council Housing Unit Permit Database.

While the non-residential development trends are informative to show the percent of land consumed for non-residential purposes (as shown in Figure 23-A), the employment densities used in the capacity assumptions are derived through employment density surveys, as documented in Appendix C: Employment Density Survey. Figure 23-A summarizes the split between residential and non-residential development between 2013-2020 by zone and the jurisdiction average. The percent split is based on the gross acres developed between 2013-2020 using the plat activity and multifamily permits for residential compared to non-residential permits. The information is used to inform the percent split for mixed-use zones, as well as the percent of non-residential uses in residential-only zones.

Figure 23-A: City of University Place Residential vs. Non-residential Development Split



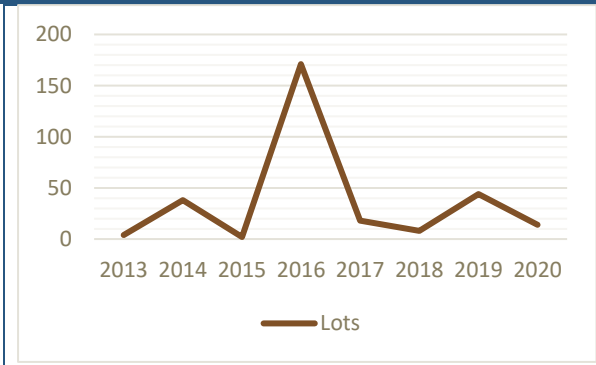
Zone	Use Type Split (Percent)[1]	
	Residential	Non-residential
MF-L	100%	0%
MU	0%	100%
R1	100%	0%
R2	96%	4%
TC	20%	80%
Average	**91%**	**9%**

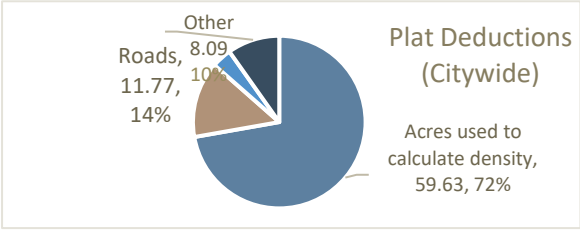
[1]Does not include single-family permits in order to avoid double-counting acreage.
Sources: City Permit Data, Pierce County Assessor-Treasurer Tax Parcels, Puget Sound Regional Council Housing Unit Permit Database.

Housing Production Rate

The residential data collected for the Buildable Lands Program tracks the density and other assumptions related to the capacity analysis. The Buildable Lands requirements that were amended in 2017 now require the tracking of housing production to compare to the necessary growth rates to achieve the housing targets. Due to the limitations of the permit data and lack of demolition permit data, Pierce County relies upon the Washington State Office of Financial Management estimates to track the number of housing units built per year in each jurisdiction for the purposes of this Report. The comparison of housing production and housing needs is shown in Table 1-2 and Table 1-3 (Countywide).

Figure 23-B: City of University Place Housing Production Rates (OFM)





Source: Washington State Office of Financial Management Housing Unit Data (2020).

Platting Activity

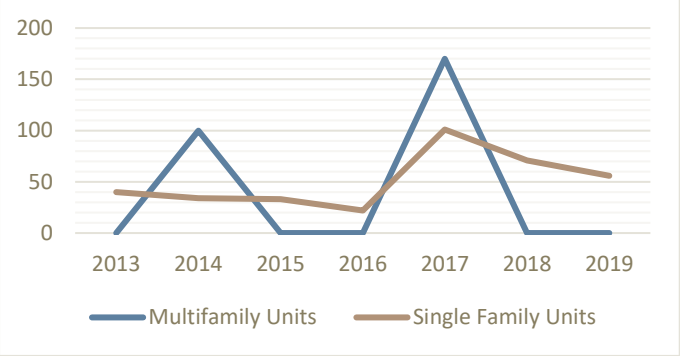
Platting activity is used to determine the achieved density for single-family residential zones and to identify the amount of land used for other purposes (whether netted out for density or applied by a regulation and affecting the achieved density). Plat data is used in conjunction with multifamily permits to determine the overall achieved density (as shown in Table 23-2).

Figure 23-C: City of University Place Platting Trends

Plat Activity by Year

Year	Lots	Acres	Density (Net)
2013	4	0.98	4.09
2014	38	8.88	4.28
2015	2	0.70	2.86
2016	171	27.03	6.33
2017	18	8.06	2.23
2018	8	3.07	2.60
2019	44	6.15	7.15
2020	14	4.75	2.95
Total	**299**	**59.63**	**5.01**

Plat Deductions by Zone (Percent)



Zone	Roads	Critical Areas	Parks/Open Space	Storm -water
MF-L	20.9%	0.0%	6.1%	17.0%
R1	9.6%	8.3%	3.5%	1.8%
R2	20.6%	0.0%	13.1%	1.7%
Average	**15.3%**	**4.0%**	**8.3%**	**2.2%**

Residential Building Trends

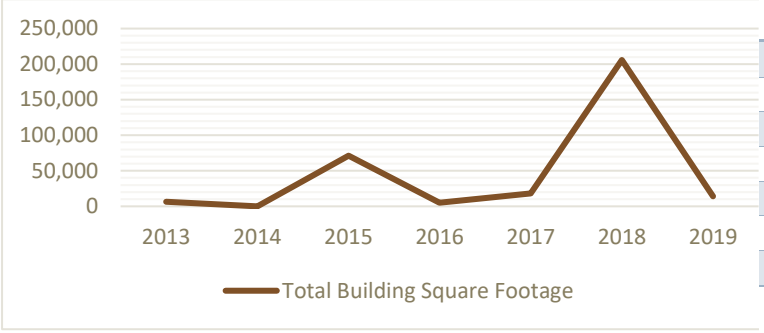
Both multifamily and single-family building permits are collected and summarized; however, single-family permit reporting is optional per the Pierce County Countywide Planning Policies and limited in use for tracking factors affecting development. The single-family permit data is useful for identifying the total number of units built and the average lot size per zone and is provided as supplemental information. The multifamily permit data is used to identify the observed density and amount of land used for residential purposes. Please note that this data differs from the data provided in Figure 23-B due to collection limitations and should not be used to represent housing production in the jurisdiction.

Figure 23-D: City of University Place Residential Building Permit Trends

Multifamily Permits by Year

Year	Units	Acres	Density
2013	-	-	-
2014	100	0.36	274.88
2015	-	-	-
2016	-	-	-
2017	170	1.03	165.18
2018	-	-	-
2019	-	-	-
Total	**270**	**1.39**	**193.83**

Single-Family Permits by Year (Optional)



Year	Lots	Acres	Avg Lot Size
2013	40	9.42	0.24
2014	34	7.29	0.22
2015	33	7.99	0.24
2016	22	3.48	0.17
2017	101	13.40	0.13
2018	71	10.84	0.15
2019	56	10.57	0.19
Total	**357**	**63.00**	**0.18**

Sources: City Permit Data, Pierce County Assessor-Treasurer Tax Parcels, Puget Sound Regional Council Housing Unit Permit Database.

Non-residential Building Trends

Non-residential building permits typically include commercial and industrial development; however, public use is often collected and summarized as well when the use type produces jobs. While the project acreage, building square footage, and floor-to-area ratio information is collected and summarized for the report in order to track non-residential development, the employment density is analyzed in a separate report using data other than building permits. The most recent employment density study to support the assumptions in this Report is provided in Appendix C: Employment Density Survey.

Figure 23-E: City of University Place Non-residential Permit Trends

Year	Acres	Bldg. SF	FAR
2013	0.65	6,599	0.23
2014	-	-	-
2015	3.36	71,049	0.49
2016	0.34	5,301	0.35
2017	1.50	18,222	0.28
2018	1.62	205,734	2.92
2019	0.50	14,328	0.66
Total	**7.97**	**321,233**	**0.93**

ASSUMPTIONS

Assumptions vary by jurisdiction and zone. Table 23-4 and Table 23-5 provide a snapshot of the densities, mixed-use split, and deductions used in the inventory development and capacity calculation tables. The assumptions for each zone are shown in the assumptions column of the capacity calculation tables shown in Appendix A: Full Data, Calculation Tables, and Maps.

Table 23-4: City of University Place Assumptions Summary

[1]S=Streetfront Overlay. The Storefront Overlay for these zones has separate assumptions due to requirements for ground-floor retail compatibility and the expectation that a portion of future development will incorporate a commercial use.

The Vacant Single Unit size threshold listed below represents the parcel size used to determine if a vacant property is subdividable or only able to accommodate one unit. Parcels smaller than the size listed are considered Vacant Single Units unless otherwise determined by the jurisdiction during the parcel-specific review.

Table 23-5: City of University Place Plat Deductions for Single-Family Residential Zones

Zone	Roads	Critical Areas	Parks/Open Space	Stormwater	Non-residential	Vacant Single Unit
MF-H	N/A	N/A	N/A	N/A	2%	N/A
MF-L	N/A	N/A	N/A	N/A	2%	N/A
R1	15%	GIS	7%	2%	2%	<0.41 acres
R2	15%	GIS	7%	2%	2%	<0.28 acres

HOUSING AND EMPLOYMENT CAPACITY

Inventory and Capacity Calculation Characteristics

A portion of the inventory is deducted from the gross acreage based on the assumptions identified in the previous section. Table 23-6 shows the characteristics of the initial inventory and Table 23-7 shows the amount of land that was reduced from that initial inventory to be included in the capacity analysis, as documented in the tables and maps in Appendix A: Full Data, Calculation Tables, and Maps.

Table 23-6: City of University Place Summary of Vacant and Underutilized Land Characteristics

Characteristics/Category	Vacant	Underutilized	Vacant Single Unit	Pipeline
Total Acreage (Gross	90.88	340.61	45.94	17.85
Average Lot Size (Gross)	1.32	0.72	0.23	1.28
Total Acreage (Net)	64.46	289.57	32.25	16.87
Average Lot Size (Net)	0.93	0.62	0.16	1.20
Percent Critical Areas	29%	15%	30%	6%

The parcel inventory is used to categorize land and the capacity calculations are intended to represent the land available for development; thus, the inventory maps alone do not represent the "buildable land" per the Buildable Lands requirements. Table 23-7 shows the overall percentage of land assumed available as capacity in the 20-year planning period and the deductions made to account for constraints to the inventory and overall market conditions.

Table 23-7: City of University Place Summary of Deductions

Deductions/Category	Vacant	Underutilized
Critical Areas	26.42	51.04
Plat Deductions	7.99	29.20
Capital Facilities	0.00	0.00
Market Factor	6.76	59.61
Total Percent Reduction in Inventory Land	38%	23%
Percent of Vacant or Underutilized Land Available for Capacity	62%	77%

Capacity Results

The housing and employment capacity totals in Table 23-8 and Table 23-9 are derived from the calculations shown in Appendix A: Full Data, Calculation Tables, and Maps. A summary of the countywide capacity results compared to need is shown in **Error! Reference source not found.** (2030 Housing Target), **Error! Reference source not found.** (2030 Employment Target), and Table 1-12 (DRAFT 2044 Targets).

CONSISTENCY EVALUATION

Development Trends

The development trends evaluation compares development that has occurred and the planned and regulated characteristics of the applicable zone, as well as with the assumptions used in the report. Since the development trend evaluation window is a short period of time and the application of zoning

may change periodically, it is often found that there is not enough information to make a statistically valid conclusion. Due to this, the information is provided but no conclusions have been made.

The development trends evaluation compares development that has occurred and the planned and regulated characteristics of the applicable zone, as well as with the assumptions used in the report. Since the development trend evaluation window is a short period of time and the application of zoning may change periodically, it is often found that there is not enough information to make a statistically valid conclusion. Due to this, the information is provided but no conclusions have been made.

Error! Not a valid bookmark self-reference. is provided to show the number of permits, units, and acres developed to identify which zones have experienced development in the timeframe.

Table 3-10 is provided to show the number of permits, units, and acres developed to identify which zones have experienced development in the timeframe.

Table 23-10: City of University Permits Summary

Zone	Residential Permits	Non-Residential Permits	Dwelling Units	Acres Developed	% Zoned Acreage
MF-H	0	0	0	0.00	0.0%
MF-L	1	0	9	2.25	1.9%

NC	0	0	0	0
POS	0	0	0	0
R1	3	3	0	4
R2	6	6	0	6

Table 3-12 shows the observed percent of developed acreage between residential and non-residential uses. Mixed-use project acreage is duplicated in each category, resulting in a 50/50 percent split. In these cases, further analysis would be needed to determine if vertical mixed-use is part of the trend, resulting in a 100/100 percent split. The observed trend is compared to the assumptions used in the report for both the mixed-use split and the assumption for non-residential in and single-family zone. The trend is also compared to the permitted uses to determine if the zone is developing as planned.

Table 23-12: City of University Mixed Use Split and Non-residential in Single Family Zones Evaluation

Zone	Observed Residential Percent	Assumed Residential Percent	Observed Non-residential Percent	Assumed Non-residential Percent	Zone Type (Residential, Non-residential, Mixed-use)	Assumed Non-residential in Single-Family zones Percent
MF-H	0%	100%	0%	0%	Residential	2%

DEVELOPMENT TRENDS

This section summarizes building and plat data obtained through the Pierce County Assessor-Treasurer and Auditor Departments observed between January 1, 2013 and December 31, 2020 that is used to monitor observed densities and update the assumptions for future development. The summaries in this section are designed to show the average statistics used to inform the report. Only data pertinent to the Buildable Lands requirements is collected, and incomplete or not-applicable data are omitted; therefore, this Report does not provide a full summary of all development within the jurisdiction. For more detailed summaries by zone/year, see Appendix A: Full Data, Calculation Tables, and Maps.

Table 24-2 shows the average residential density per zone and jurisdiction-wide and is not intended to show the total units/lots created or overall acres consumed. The results reflect the density calculation used by the jurisdiction, and only include a summary of plats and multifamily (3+ attached units) projects. Table 24-3 shows the average floor-to-area ratio (FAR) by zone and the amount of non-residential building square footage developed. The non-residential projects summarized only include new development and omit additions to existing businesses and non-building type improvements.

Table 24-2: Town of Wilkeson 2013-2020 Residential Trends by Zone[1]

No multifamily residential development or platting activity has been observed in the timeframe.

Table 24-3: City of 2013-2020 Non-residential Trends by Zone

No non-residential development has been observed in the timeframe.

[1]Includes multifamily and plat data to represent the overall observed density by zone. Does not include single-family permits in order to accurately represent permitted densities; therefore, does not represent the total number of units developed in the timeframe.
Sources: Town Permit Data, Pierce County Assessor-Treasurer Tax Parcels, Puget Sound Regional Council Housing Unit Permit Database.

While the non-residential development trends are informative to show the percent of land consumed for non-residential purposes (as shown in Figure 24-A), the employment densities used in the capacity assumptions are derived through employment density surveys, as documented in Appendix C: Employment Density Survey. Figure 24-A summarizes the split between residential and non-residential development between 2013-2020 by zone and the jurisdiction average. The percent split is based on the gross acres developed between 2013-2020 using the plat activity and multifamily permits for residential and non-residential permits for non-residential. The information is used to inform the percent split for mixed-use zones, as well as the percent of non-residential uses in residential-only zones.

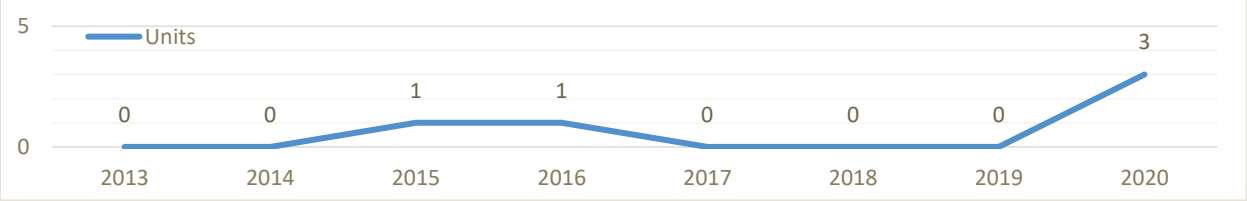

Figure 24-A: Town of Wilkeson Residential vs. Non-residential Development Split

No multifamily residential development, platting activity, or non-residential development has been observed in the timeframe.

Housing Production Rate

The residential data collected for the Buildable Lands Program tracks the density and other assumptions related to the capacity analysis. The Buildable Lands requirements that were amended in 2017 now require the tracking of housing production to compare to the necessary growth rates to achieve the housing targets. Due to the limitations of the permit data and lack of demolition permit data, Pierce County relies upon the Washington State Office of Financial Management estimates to track the number of housing units built per year in each jurisdiction for the purposes of this Report. The comparison of housing production and housing needs is shown in Table 1-2 and Table 1-3 (Countywide).

Figure 24-B: Town of Wilkeson Housing Production Rates (OFM)

Source: Washington State Office of Financial Management Housing Unit Data (2020).

Platting Activity

Platting activity is used to determine the achieved density for single-family residential zones and to identify the amount of land used for other purposes (whether netted out for density or applied by a regulation and affecting the achieved density). Plat data is used in conjunction with multifamily permits to determine the overall achieved density (as shown in Table 24-2).

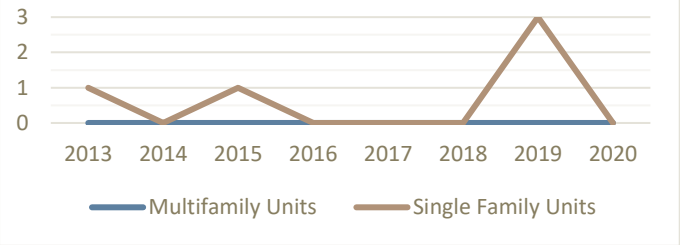

Figure 24-C: Town of Wilkeson Platting Trends

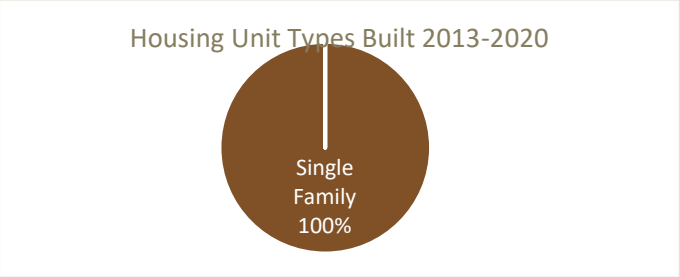

No platting activity has been observed in the timeframe.

Residential Building Trends

Both multifamily and single-family building permits are collected and summarized; however, single-family permit reporting is optional per the Pierce County Countywide Planning Policies and limited in use for tracking factors affecting development. The single-family permit data is useful for identifying the total number of units built and the average lot size per zone and is provided as supplemental information. The multifamily permit data is used to identify the observed density and amount of land used for residential purposes. Please note that this data differs from the data provided in Figure 24-B due to collection limitations and should not be used to represent housing production in the jurisdiction.

Figure 24-D: Town of Wilkeson Residential Building Permit Trends

Multifamily Permits by Year

No multifamily residential development or has been observed in the timeframe.

Single-Family Permits by Year (Optional)

Year	Lots	Acres	Avg. Lot Size
2013	1	0.27	0.27
2014	-	-	-
2015	1	0.17	0.17
2016	-	-	-
2017	-	-	-
2018	-	-	-
2019	3	0.90	0.30
2020	-	-	-
Total	**5**	**1.34**	**0.27**

Sources: Town Permit Data, Pierce County Assessor-Treasurer Tax Parcels, Puget Sound Regional Council Housing Unit Permit Database.

Non-residential Building Trends

Non-residential building permits typically include commercial and industrial development; however, public use is often collected and summarized as well when the use type produces jobs. While the project acreage, building square footage, and floor-to-area ratio information is collected and summarized for the report in order to track non-residential development, the employment density is analyzed in a separate report using data other than building permits. The most recent employment density study to support the assumptions in this Report is provided in Appendix C: Employment Density Survey.

Figure 24-E: Town of Wilkeson Non-residential Permit Trends

No non-residential development has been observed in the timeframe.

ASSUMPTIONS

Assumptions vary by jurisdiction and zone. Table 24-4 and Table 24-5 provide a snapshot of the densities, mixed-use split, and deductions used in the inventory development and capacity calculation tables. The assumptions for each zone are shown in the assumptions column of the capacity calculation tables shown in Appendix A: Full Data, Calculation Tables, and Maps.

Table 24-4: Town of Wilkeson Assumptions Summary

Zone	Residential		Employment		Residential Market Factor		Non-Residential Market Factor		Land for Capital Facilities
	Percent	Density	Percent	Density	Vacant	Underutilized	Vacant	Underutilized	
C	0%	0	100%	20	0%	0%	10%	50%	0%
P	0%	0	100%	20	10%	0%	10%	50%	0%
R-1	100%	5	0%	20	25%	25%	0%	0%	0%
R-2	100%	6	0%	20	25%	25%	0%	0%	0%
R-3	100%	6	0%	20	25%	25%	0%	0%	0%

The Vacant Single Unit size threshold listed below represents the parcel size used to determine if a vacant property is subdividable or only able to accommodate one unit. Parcels smaller than the size listed are considered Vacant Single Units unless otherwise determined by the jurisdiction during the parcel-specific review.

Table 24-5: Town of Wilkeson Plat Deductions for Single-Family Residential Zones

Zone	Roads	Critical Areas	Parks/Open Space	Stormwater	Non-residential	Vacant Single Unit
R-1	20%	35%	20%	0%	3%	<1 acre
R-2	20%	35%	20%	0%	3%	<1 acre
R-3	20%	35%	20%	0%	3%	<1 acre

HOUSING AND EMPLOYMENT CAPACITY

Inventory and Capacity Calculation Characteristics

A portion of the inventory is deducted from the gross acreage based on the assumptions identified in the previous section. Table 24-6 shows the characteristics of the initial inventory and Table 24-7 shows the amount of land that was reduced from that initial inventory to be included in the capacity analysis, as documented in the tables and maps in Appendix A: Full Data, Calculation Tables, and Maps.

Table 24-6: Town of Wilkeson Summary of Vacant and Underutilized Land Characteristics

Characteristics/Category	Vacant	Underutilized	Vacant Single Unit	Pipeline
Total Acreage (Gross	19.86	37.97	1.85	0.00
Average Lot Size (Gross)	1.10	0.95	0.12	0.00
Total Acreage (Net)	7.74	28.58	1.72	0.00
Average Lot Size (Net)	0.43	0.71	0.11	0.00
Percent Critical Areas	61%	25%	7%	0%

The parcel inventory is used to categorize land and the capacity calculations are intended to represent the land available for development; thus, the inventory maps alone do not represent the "buildable land" per the Buildable Lands requirements. Table 24-7 shows the overall percentage of land assumed available as capacity in the 20-year planning period and the deductions made to account for constraints to the inventory and overall market conditions.

Table 24-7: Town of Wilkeson Place Summary of Deductions

Deductions/Category	Vacant	Underutilized
Critical Areas	12.12	9.39
Plat Deductions	5.64	19.50
Capital Facilities	0.00	0.00
Market Factor	0.50	3.02
Total Percent Reduction in Inventory Land	92%	84%
Percent of Vacant or Underutilized Land Available for Capacity	8%	16%

Capacity Results

The housing and employment capacity totals in Table 24-8 and Table 24-9 are derived from the calculations shown in Appendix A: Full Data, Calculation Tables, and Maps. A summary of the countywide capacity results compared to need is shown in **Error! Reference source not found.** (2030 Housing Target), **Error! Reference source not found.** (2030 Employment Target), and Table 1-12 (DRAFT 2044 Targets).

Table 24-8: Town of Wilkeson 2020-2044 Housing Capacity (Dwelling Units)

Zone	Vacant	Underutilized	Vacant Single Unit	Pipeline	Total

CONSISTENCY EVALUATION

Development Trends

The development trends evaluation compares development that has occurred and the planned and regulated characteristics of the applicable zone, as well as with the assumptions used in the report. Since the development trend evaluation window is a short period of time and the application of zoning may change periodically, it is often found that there is not enough information to make a statistically valid conclusion. Due to this, the information is provided but no conclusions have been made.

The development trends evaluation compares development that has occurred and the planned and regulated characteristics of the applicable zone, as well as with the assumptions used in the report. Since the development trend evaluation window is a short period of time and the application of zoning may change periodically, it is often found that there is not enough information to make a statistically valid conclusion. Due to this, the information is provided but no conclusions have been made.

Error! Not a valid bookmark self-reference. is provided to show the number of permits, units, and acres developed to identify which zones have experienced development in the timeframe.

Table 3-10 is provided to show the number of permits, units, and acres developed to identify which zones have experienced development in the timeframe.

Table 24-10: Town of Wilkeson Permits Summary

Zone	Residential Permits	Non-Residential Permits	Dwelling Units	Acres Developed	% Zoned Acreage
C	0	0	0	0.00	0.0%
P	0	0	0	0.00	0.0%

R-2	0	0	0	0.00	0.0%
R-3	0	0	0	0.00	0.0%

Table 3-11 shows the observed residential density trends in comparison to the permitted density and assumed density for each zone with sufficient data. Both the plat and multifamily project average densities are shown in order to understand the source of the overall density.

Table 24-11: Town of Wilkeson Density Evaluation

Zone	Observed Density (Overall)	Observed Plat Density (Single-Family)	Observed Multifamily Density	Assumed Density
C	0	0	0	0
P	0	0	0	0
R-1	0	0	0	5
R-2	0	0	0	6
R-3	0	0	0	6

Table 3-12 shows the observed percent of developed acreage between residential and non-residential uses. Mixed-use project acreage is duplicated in each category, resulting in a 50/50 percent split. In these cases, further analysis would be needed to determine if vertical mixed-use is part of the trend, resulting in a 100/100 percent split. The observed trend is compared to the assumptions used in the

report for both the mixed-use split and the assumption for non-residential in and single-family zone. The trend is also compared to the permitted uses to determine if the zone is developing as planned.

Table 24-12: Town of Wilkeson Mixed Use Split and Non-residential in Single Family Zones Evaluation

Zone	Observed Residential Percent	Assumed Residential Percent	Observed Non-residential Percent	Assumed Non-residential Percent	Zone Type (Residential, Non-residential, Mixed-use)	Assumed Non-residential in Single-Family zones Percent
C	0%	0%	0%	100%	Commercial	0%

LAMIRD=Limited Areas of More Intensive Rural Development per RCW 36.70A.070(5)(d).

URBAN DEVELOPMENT TRENDS

This section summarizes permit data observed between January 1, 2013 and December 31, 2020 that is used to monitor observed densities and update the assumptions for future development. The summaries in this section are designed to show the average statistics used to inform the report. Only data pertinent to the Buildable Lands requirements is collected, and incomplete or not-applicable data

are omitted; therefore, this Report does not provide a full summary of all development within the jurisdiction. For more detailed summaries by zone/year, see Appendix A: Full Data, Calculation Tables, and Maps.

Table 25-2 shows the average residential density per zone and jurisdiction-wide and is not intended to show the total units/lots created or overall acres consumed. The results reflect the density calculation used by the jurisdiction, and only include a summary of plats and multifamily (3+ attached units) projects. Table 25-3 shows the average floor-to-area ratio (FAR) by zone and the amount of non-residential building square footage developed. The non-residential projects summarized only include new development and omit additions to existing businesses and non-building type improvements.

Table 25-2: Unincorporated Urban Pierce County 2013-2020 Residential Trends by Zone[1]

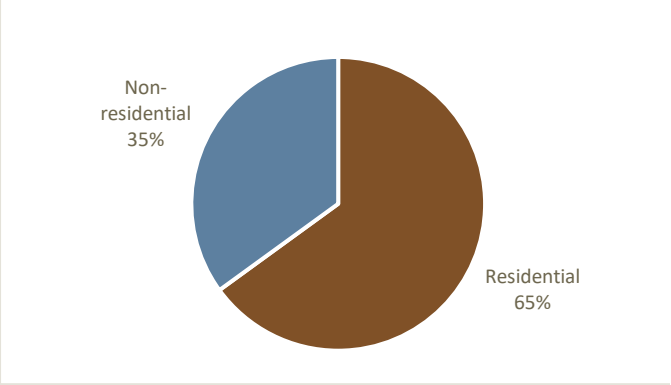
[1]Includes multifamily and plat data to represent the overall observed density by zone. Does not include single-family permits in order to accurately represent permitted densities; therefore, does not represent the total number of units developed in the timeframe.
Sources: County Permit Data, Pierce County Assessor-Treasurer Tax Parcels, Puget Sound Regional Council Housing Unit Permit Database.



While the non-residential development trends are informative to show the percent of land consumed for non-residential purposes (as shown in Figure 25-A), the employment densities used in the capacity assumptions are derived through employment density surveys, as documented in Appendix C: Employment Density Survey. Figure 25-A summarizes the split between residential and non-residential development between 2013-2020 by zone and the jurisdiction average. The percent split is based on the gross acres developed between 2013-2020 using the plat activity and multifamily permits for residential and non-residential permits for non-residential. The information is used to inform the percent split for mixed-use zones, as well as the percent of non-residential uses in residential-only zones.

Figure 25-A: Unincorporated Urban Pierce County Residential vs. Non-residential Development Split

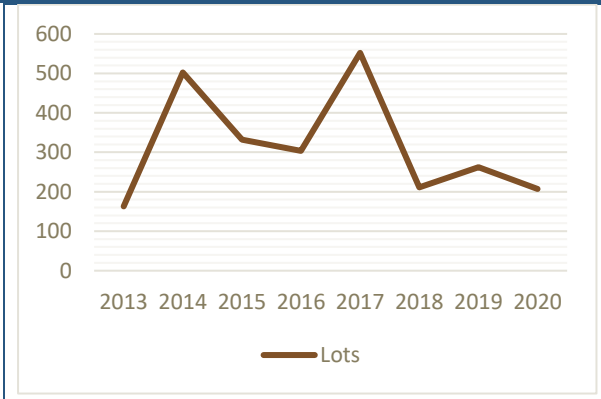
Housing Production Rate

The residential data collected for the Buildable Lands Program tracks the density and other assumptions related to the capacity analysis. The Buildable Lands requirements that were amended in 2017 now require the tracking of housing production to compare to the necessary growth rates to achieve the housing targets. Due to the limitations of the permit data and lack of demolition permit data, Pierce County relies upon the Washington State Office of Financial Management estimates to track the number of housing units built per year in each jurisdiction for the purposes of this Report. The comparison of housing production and housing needs is shown in Table 1-2 and Table 1-3 (Countywide).

Figure 25-B: Unincorporated Urban Pierce County Housing Production Rates (OFM)



Source: Washington State Office of Financial Management Housing Unit Data (2020).

Platting Activity

Platting activity is used to determine the achieved density for single-family residential zones and to identify the amount of land used for other purposes (whether netted out for density or applied by a regulation and affecting the achieved density). Plat data is used in conjunction with multifamily permits to determine the overall achieved density (as shown in Table 25-2).

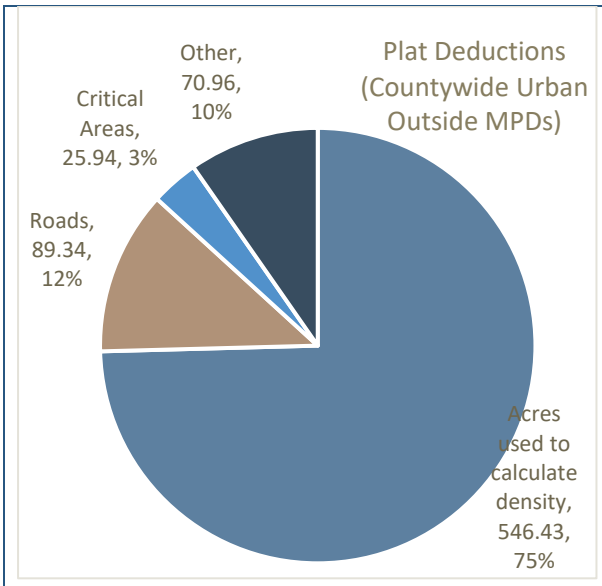


Figure 25-C: Unincorporated Urban Pierce County Platting Trends

Plat Activity by Year

Year	Lots	Acres	Density
2013	277	76.82	3.61
2014	1,001	235.59	4.25

[1]Does not include master planned developments that have development agreements that may differ from traditional zoning.
Sources: County Permit Data, Pierce County Auditor Recorded Plats.

Residential Building Trends

Both multifamily and single-family building permits are collected and summarized; however, single-family permit reporting is optional per the Pierce County Countywide Planning Policies and limited in use for tracking factors affecting development. The single-family permit data is provided as supplemental information but is not used for establishing assumptions. The multifamily permit data is used to identify the observed density and amount of land used for residential purposes. Please note that this data differs from the data provided in Figure 25-B due to collection limitations and should not be used to represent housing production in the jurisdiction.

Figure 25-D: Unincorporated Urban Pierce County Residential Building Permit Trends

Multifamily Permits by Year

Year	Units	Net Acres	Net Density
2013	233	18.32	12.72
2014	256	11.51	22.23
2015	24	2.25	10.69
2016	10	1.07	9.37
2017	920	51.86	17.74
2018	518	33.20	15.60
2019	595	36.85	16.14
2020	298	18.20	16.38
Total	**2,854**	**173.26**	**16.47**

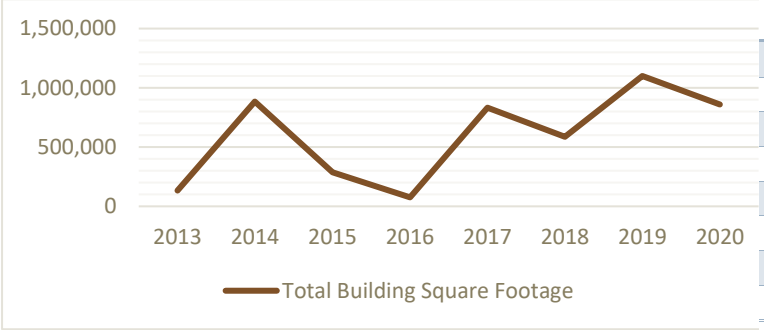
2017	1,051	258.26	0.30
2018	2,177	564.79	0.31
2019	1,521	781.60	0.66
Total	**8,786**	**2,538.36**	**0.34**



Note: Data includes Master Planned Developments; no single-family data for 2020 available.

Sources: County Permit Data, Pierce County Assessor-Treasurer Tax Parcels, Puget Sound Regional Council Housing Unit Permit Database.

Non-residential Building Trends

Non-residential building permits typically include commercial and industrial development; however, public use is often collected and summarized as well when the use type produces jobs. While the project acreage, building square footage, and floor-to-area ratio information is collected and summarized for the report in order to track non-residential development, the employment density is analyzed in a separate report using data other than building permits. The most recent employment density study to support the assumptions in this Report is provided in Appendix C: Employment Density Survey.

Figure 25-E: Unincorporated Urban Pierce County Non-residential Permit Trends

Year	Acres	Bldg. SF	FAR
2013	37.53	132,333	0.08
2014	86.92	882,836	0.23
2015	45.49	287,108	0.14
2016	32.83	75,957	0.05
2017	80.94	833,370	0.24

ASSUMPTIONS

Assumptions vary by jurisdiction and zone. Table 25-4 and Table 25-5 provide a snapshot of the densities, mixed-use split, and deductions used in the inventory development and capacity calculation tables. The assumptions for each zone are shown in the assumptions column of the capacity calculation tables shown in Appendix A: Full Data, Calculation Tables, and Maps.

Table 25-4: Unincorporated Urban Pierce County Assumptions Summary

The Vacant Single Unit size threshold listed below represents the parcel size used to determine if a vacant property is subdividable or only able to accommodate one unit. Parcels smaller than the size listed are considered Vacant Single Units unless otherwise determined by the jurisdiction during the parcel-specific review.

Table 25-5: Unincorporated Urban Pierce County Plat Deductions for Single-Family Residential Zones

Zone	Roads	Critical Areas	Parks/Open Space	Stormwater	Non-residential	Vacant Single Unit

URBAN HOUSING AND EMPLOYMENT CAPACITY

Unincorporated Pierce County Total

Inventory and Capacity Calculation Characteristics

A portion of the inventory is deducted from the gross acreage based on the assumptions identified in the previous section. Table 25-6 shows the characteristics of the initial inventory and Table 25-7 shows the amount of land that was reduced from that initial inventory to be included in the capacity analysis, as documented in the tables and maps in Appendix A: Full Data, Calculation Tables, and Maps.

Table 25-6: Unincorporated Pierce County Summary of Vacant and Underutilized Land Characteristics

Characteristics/Category	Vacant	Underutilized	Vacant Single Unit	Pipeline
Total Acreage (Gross	4,340.41	9,496.91	618.68	5,634.39
Average Lot Size (Gross)	3.80	1.90	0.27	13.16
Total Acreage (Net)	3,404.36	8,193.05	417.62	4,458.22
Average Lot Size (Net)	2.98	1.64	0.18	10.42
Percent Critical Areas	22%	14%	32%	21%

The parcel inventory is used to categorize land, and the capacity calculations are intended to represent the land available for development; thus, the inventory maps alone do not represent the "buildable land" per the Buildable Lands requirements. Table 25-7 shows the overall percentage of land assumed available as capacity in the 20-year planning period and deductions made to account for constraints to the inventory and overall market conditions.

Table 25-7: Unincorporated Pierce County Summary of Deductions

Deductions/Category	Vacant	Underutilized
Critical Areas	936.05	1,303.86
Infrastructure Gaps	986.14	3,471.13
Plat Deductions	163.63	828.48
Capital Facilities	0.00	0.00
Market Factor	275.79	1,741.66
Total Percent Reduction in Inventory Land	42%	49%
Percent of Vacant or Underutilized Land Available for Capacity	58%	51%

Capacity Results

The housing and employment capacity totals in Table 25-8 and Table 25-9 are derived from the calculations shown in Appendix A: Full Data, Calculation Tables, and Maps. A summary of the countywide capacity results compared to need is shown in **Error! Reference source not found.** (2030 Housing Target), **Error! Reference source not found.** (2030 Employment Target), and Table 1-12 (DRAFT 2044 Targets).

Note: The capacity is subject to the zoning at the time the report is published, not pending zoning changes. A large zoning update becomes effective after the publish date of this report, and the capacity for the updated zoning will be provided in an addendum to this report prior to the 2024 Comprehensive Plan periodic update.

CONSISTENCY EVALUATION

Development Trends

The development trends evaluation compares development that has occurred and the planned and regulated characteristics of the applicable zone, as well as with the assumptions used in the report. Since the development trend evaluation window is a short period of time and the application of zoning may change periodically, it is often found that there is not enough information to make a statistically valid conclusion. Due to this, the information is provided but no conclusions have been made.

The development trends evaluation compares development that has occurred and the planned and regulated characteristics of the applicable zone, as well as with the assumptions used in the report. Since the development trend evaluation window is a short period of time and the application of zoning may change periodically, it is often found that there is not enough information to make a statistically valid conclusion. Due to this, the information is provided but no conclusions have been made.

Error! Not a valid bookmark self-reference. is provided to show the number of permits, units, and acres developed to identify which zones have experienced development in the timeframe.

Table 3-10 is provided to show the number of permits, units, and acres developed to identify which zones have experienced development in the timeframe.

Table 3-12 shows the observed percent of developed acreage between residential and non-residential uses. Mixed-use project acreage is duplicated in each category, resulting in a 50/50 percent split. In these cases, further analysis would be needed to determine if vertical mixed-use is part of the trend, resulting in a 100/100 percent split. The observed trend is compared to the assumptions used in the report for both the mixed-use split and the assumption for non-residential in and single-family zone. The trend is also compared to the permitted uses to determine if the zone is developing as planned.

Table 25-20: Pierce County Mixed Use Split and Non-residential in Single Family Zones Evaluation

SECTION IV: APPENDICES

Appendix A: Full Data, Calculation Tables, and Maps

Appendix B: Buildable Lands Inventory Process

Appendix C: Employment Density Survey

Appendix A: Full Data, Calculation Tables, and Maps

The following sections document the permit data, base inventory for the capacity calculations, and the calculation tables used to determine the capacity of land suitable for development. The calculations are performed within an excel spreadsheet using the formula base shown in Appendix Figure 1 on the following page. Each zone's assumptions are documented in the "Assumption" columns on the table. The resulting acreage or unit/job deductions/additions based on the assumptions are documented in the "Calculation" columns on the table.

PERMIT DATA AND SUMMARIES (EXCEL)

The permit data and detailed zone/assumption summaries can be found online at https://www.piercecountywa.gov/DocumentCenter/View/115083.

CALCULATION TABLES

It is important to note that this calculation process differs from previous reports that added the displaced units and jobs back into the housing and employment needs, and instead reduces those units and jobs from the capacity itself. The calculation tables were also provided separately in previous reports and have been combined in this report to consolidate the information. The excel spreadsheets are also available at https://www.piercecountywa.gov/DocumentCenter/View/115083.

Appendix B: Buildable Lands Inventory Process

DATA INVENTORY

The process of buildable lands begins with assigning designations to parcels based on land use description. Parcels will be coded as vacant, potentially underutilized, unbuildable, or a special code for specific circumstance based on land use description. Certain land use codes that could be vacant will be marked for review by digital orthophoto to determine if they are vacant or not. This process is known as Stage 1A.

While vacant, vacant – single unit, and unbuildable are easily recognizable, underutilized lands require some definition and context. The underutilized category encompasses all parcels that could be further developed given market conditions. Thus, underutilized will capture parcels that have low densities for housing units or jobs that are assumed to have more capacity to accommodate population or employment growth. The following sections outline this process; text bodies contain the contextual information while the technical sequencing is displayed in bullets.

Appendix Figure 26: Buildable Lands Inventory Script Process

ESTIMATED NET UNITS AND JOBS

Net units and jobs are derived from the difference between the future estimated number of units and jobs respectively and the current baseline figures. These estimations are based on observed densities.

- For residential classifications future units equal the housing unit per acre assumption multiplied by the net acreage.
- For commercial and industrial classifications future jobs equal net acreage multiplied by the employees per acre density assumption.
- Residential net units equal the future residential units minus the 2020 inventoried units on the parcel.
- Commercial and industrial present jobs are calculated by parcel square feet divided by 500 for commercial and 900 for industrial.
- The net is then calculated by the present value subtracted from the future value.

INCLUSIONS AND EXCLUSIONS

Utilizing the classifications created in the first stage of this process, it was possible to manually search through selected fields and insert user overrides and special cases that need to be handled by the model separately. All of these classifications will be marked for inclusion or exclusion based on whether or not one could build upon them; hence those included are underutilized or vacant. Some parcels are locked at this stage so that the model ignores their land use type when calculating units and jobs. The model instead relies solely on the inventoried value supplied with the parcel itself. As an example, this occurs with pipeline projects which have a set number of future units.

- Query locks all pipeline parcels.
- Exclude all lots less than 3,000 net square feet, unless otherwise indicated by the jurisdiction.
- Exclude right of ways, narrow polygons, playgrounds, condos, some forms of government-owned lands, and marine areas.
- School sites are identified [this includes universities and colleges] and excluded.
- Vacant government parcels are included.
- Single-family residences on commercial, industrial, or mixed-use lands are included as underutilized.
- Exclude Joint Base Lewis-McChord parcels.
- Include/exclude manually corrected parcels.

REDEVELOPABLE EXCLUSIONS

Redevelopable exclusions provide another parameter which would exclude otherwise included parcels.

- If a single-family residence has an improvement value that is greater than or equal to $500,000 it is excluded.
- If a mobile home park, multifamily development, or commercial development has a value greater than or equal to $1,500,000 it is excluded.
- If a residential use has a future unit to base unit ratio less than 2.5 it is excluded.
- If a commercial use has a future job to existing estimated jobs ratio less than 5 it is excluded.

UNIT AND JOB REVISIONS

This section determines the final net units and jobs based on certain market assumptions, presumably that for underutilized units and jobs there must be sufficient additional units or jobs respectively, in order for development to likely occur.

- Housing units are first tested to determine if their acreage meets the minimum size for single-family zones. Those that do not meet this minimum are given a final unit of 1.
- School sites are marked at zero units and jobs while school parcels outside of the school boundary are treated as the parcel provided units and jobs indicate.
- Pipeline projects are marked with recorded units and jobs.
- Pipeline single-family residences are marked as vacant single units.
- Test redevelopable parcels for jobs and units and if they are below the minimum size. The ratio between future and base must be at least 2.5 for units and 5.0 for jobs.

CATEGORIZING POTENTIALLY VACANT, UNDERUTILIZED, AND UNBUILDABLE LAND

Appendix Table 1 shows the Assessor-Treasurer's (ATR) land use descriptions used to categorize land within the Buildable Lands Model.

Appendix C: Employment Density Survey

Pierce County contracted with AHBL and ECONorthwest to analyze available employment data and determine if an update to the employment assumptions used in the Buildable Lands analysis is necessary. ECONorthwest provided the following memorandum with findings on the employment density assumptions.

ECONorthwest
ECONOMICS • FINANCE • PLANNING

DATE: July 1, 2019
TO: Dan Cardwell and Jessica Gwilt, Pierce County
CC: Wayne Carlson and Brittany Port, AHBL
FROM: Bob Parker, Denise Chin, Sadie DiNatale, Ryan Ulsberger
SUBJECT: PIERCE COUNTY EMPLOYMENT DENSITY SURVEY TECHNICAL MEMORANDUM

1 Summary

An initial step in updating the methodology for Pierce County's buildable lands program is to review the methodology used to complete the 2014 Buildable Lands Report (BLR) and identify methodological changes based on amended state legislation, data availability, and best practices. Task 1.2 of the Buildable Lands Program Support work program includes an evaluation of the past employment density survey methodology, proposed refinements the approach, and conducting a new employment density survey for Pierce County. This memorandum summarizes ECONorthwest's initial research and analysis related to this task.

Several refinements to the 2014 methodology could improve the capacity and land need estimates. Given the amount of variability that exists in broad employment categories, and PSRCs regional plans, we recommend that any methodology employ the principles of simplicity and transparency. More complicated methods do not necessarily improve the results. We recommend the County consider adjustments for employment in residential areas and using the PSRC center framework.

Pierce County's challenge is developing an acceptable methodology that can be applied across many jurisdictions that range from urban centers to suburbs, to rural communities, to rural areas. After a thorough investigation of the methodological options, we make the offer the following recommendations:

- **Continue to use an EPA based method**. Given the countywide scope and the diversity of cities, EPAs are the most accurate and practical method for estimating employment capacity of vacant and under-utilitized land as well as land demand.
- **Consider refinements to the methods used in the 2014 BLR.** The County could make refinements to both the capacity and land demand estimates.
    - **Consider allocating some employment to non-employment lands**. Our review of the 2014 BLR suggests that all of the employment growth increment is allocated to employment lands. We suggest considering allocating some employment to non-employment lands.
    - **Consider disaggregating employment forecasts to three or more categories.** A review of the 2014 BLR only identified single value employment figures. The PSRC data ECO used for the employment density analysis in section 3 is available by city disaggregated by sectors or 2-digit NAICS codes. At the

simplest, the models could differentiate between retail, office, and warehouse employment densities.

- **Consider developing a land use typology based on PSRC's Regional Centers Strategy. Typology by PSRC regional centers.**[1] PSRC's VISION 2040 calls for the creation of central places with a mix of uses and activities connected by efficient transportation. PSRC designated 29 regional growth centers which are locations of the region's most significant business, governmental, and cultural facilities and are planning for growth. PSRC also identified nine regional manufacturing/industrial centers, which are locations for more intensive industrial activity. According to PSRC, both regional growth centers and regional manufacturing/industrial centers are focal points for planned growth, economic development and transportation infrastructure investments.

  Moreover, the framework identifies three primary geographies: Metropolitan Cities (16 centers), Core Cities (17), and Unincorporated Urban Areas (3). Five regional growth centers and two industrial/manufacturing centers are located in Pierce County.

  PSRC's 2013 Monitoring Report presents employment densities for each of the areas based on 2010 data. Exhibit X shows employment densities for Pierce County Centers. The observed densities are lower than the commercial assumptions in all instances, and considerably lower than the 2014 industrial assumptions for the industrial/manufacturing centers.

  Given that much of the county's employment is located outside these centers, any method will require assumptions for capacity of those lands. The County could use the 2014 assumptions, or use an approach based on city type.

2 Background

An initial step in updating the methodology for Pierce County's buildable lands program is to review the methodology used to complete the 2014 Buildable Lands Report (BLR) and identify methodological changes based on amended state legislation, data availability, and best practices. Task 1.2 of the Buildable Lands Program Support work program includes an evaluation of the past employment density survey methodology, proposed refinements the approach, and conducting a new employment density survey for Pierce County. This memorandum summarizes ECONorthwest's initial research and analysis related to this task.

Pierce County last completed an employment density in 2007. The County is interested in whether the methods and assumptions used in the 2010 Survey are still reasonable, and if there are ways to improve them. AHBL subcontracted to ECONorthwest to provide this analysis. This document details the process of confirming employment density assumptions in Pierce County. The key questions considered in this task are:

- How accurate were the previous methods used?
- How does employment density vary by and within employment sectors?
- How does employment density vary by geography (e.g., cities)?

The 2010 analysis used Employment Security data that allowed matching of specific employers to tax lots. ESD no longer releases parcel-specific employment data. Thus, the updated employment density survey will require a different method to update the employment density assumptions. In addition, the County desires to understand how employment densities may have changed over time based on changing work configuration and technologies. ECONorthwest conducted the analysis presented in this memorandum using the following approaches:

(1) Spatial analysis in GIS using PSRC employment data by city and census tract

(2) A review of studies surrounding buildable land inventories, employment surveys, and other relevant research to observe new employment density methods or consider changing assumptions

(3) Informational interviews with real estate professionals to gain insight on recent trends in commercial and industrial employment in Pierce County

The 2014 BLR used a relatively simple method that applied standardized average employee per acre assumptions for commercial and industrial uses. The memo concludes with a discussion of the merits of the method used in the 2014 BLR as well as alternative methodological options for estimating demand for employment land.

The following sections provide legal context to buildable land inventories in Pierce County under Washington state's Growth Management Act; and a discussion of past methods and assumptions used in Pierce County's Employment Density Surveys.

2.1 Legal Context

The employment density survey provides data that support assumptions used to determine land needed for employment uses. The statutory guidance from the program is codified in RCW 3670A.215. Specifically, the following two subsections address density of employment:

- Based on the actual density of development, review commercial, industrial, and housing needs by type and density range to determine the amount of land needed for these uses for the remaining portion of the current 20-year planning period (RCW 36.70A.215(3)(e));
- Determine if there is sufficient employment capacity for the remainder of the planning period based upon planned and achieved densities (RCW 36.70A.215(3)(e));

Section 3 provides further guidance on how the data are used:

(a) Determine whether there is sufficient suitable land to accommodate the countywide population projection established for the county pursuant to RCW 43.62.035 and the subsequent population allocations within the county and between the county and its cities and the requirements of RCW 36.70A.110;

(b) Determine the actual density of housing that has been constructed and the actual amount of land developed for commercial and industrial uses within the urban growth area since the adoption of a comprehensive plan under this chapter or since the last periodic evaluation as required by subsection (1) of this section; and

(c) Based on the actual density of development as determined under (b) of this subsection, review commercial, industrial, and housing needs by type and density range to determine the amount of land needed for commercial, industrial, and housing for the remaining portion of the twenty-year planning period used in the most recently adopted comprehensive plan.

The 2018 *Buildable Lands Guidelines* document provide concise direction on the process and distill the requirements into two questions: How much land was actually developed for commercial and industrial uses within the UGA since the last comprehensive plan was adopted or the last evaluation completed? Based on this and other relevant information, how much land would be needed for commercial and industrial development during the remainder of the 20-year comprehensive planning period?

Thus, while the guidelines provide direction on how to address commercial and industrial development, they are not proscriptive and provide considerable local discretion with respect to methods. Because the focus of this research is on employment density, we do not address other aspects of the methods related to commercial and industrial land.

2.2 Methods and Assumptions Used in Previous Studies

In this section, we discuss past methods and assumptions from Pierce County's 2007 Employment Density Survey and 2014 Buildable Lands Report. As a general observation, the methods used for employment density surveys have not changed much throughout the years.

Definitions: Floor Area Ratios, Employees Per Square Foot, and Employees Per Acre

The Buildable Lands Guidelines and BLR reports use the terms Floor Area Ratio (FAR), Employees Per Square Foot (Emp/sf), and Employees Per Acre (EPA). We start by establishing definitions and the relationship between each of these metrics.

By definition, employment density is the ratio of labor to land. Several measures of employment density exist: FARs, EPAs, and sq. ft. per employee. To understand the relationship between Floor Area Ratios, square feet per employee, and employee per acre ratios, we start with definitions.

- Floor Area Ratio (FAR). The Floor Area Ratio is the total building square footage (building area) divided by the site size square footage (site area)
- Square Feet Per Employee (SFE). The total square feet required for employees. This includes shared spaces such as lobbies, hallways, elevators and stairwells, restrooms, and other built space.
- Employee per acre ratio (EPA). The total number of employees divided by the size of the site. Implicitly, this is a net density figure; it does not include land needed for streets and other public uses.

Given these definitions, there is a simple mathematical relationship between the three measures as expressed below.

FAR can be derived from EPA and SFE as follows:
(EPA*43560)/SF per Emp

SFE can be derived from EPA and FAR:
(FAR*43560)/EPA

EPA can be derived from SFE and FAR:
(FAR*43560)/SFE

A key issue in estimating EPA ratios is what values are used in the numerator and denominator. The numerator is typically straightforward—reported employment figures. Most analysis we have reviewed do not make distinctions about shifts, or whether employees are full or part time. This is consistent with the way employment data are typically presented.

The issue of the denominator is considerably trickier. The nature of commercial and industrial development is such that it often spans several tax lots. In these instances, calculating density on a tax lot basis can be misleading. Shopping centers, industrial parks, or any employment use

that includes multiple tax lots should be analyzed as combined sites. Parking can also be an issue—is parking part of an employment use or not? If it is in the same ownership and directly related to the use, it should be.

Mixing of employment further complicates matters. In a detailed analysis in Bend, Oregon, we found considerable mixing of employment that would be considered commercial or industrial. The data showed considerable employment in industrial zones that would typically be considered commercial, and the opposite. Zoning codes typically are not proscriptive by NAICS categories.

A final issue is employment that is on lands not zoned for employment. In Oregon cities, we have observed that between 10% and 25% of employment in a city can be on lands that are not zoned for employment. These include typical uses that sometimes locate in residential zones such as schools and churches, as well as home occupations, construction firms, and certain types of retail or service firms that are permitted by zoning.

One of the issues that complicates estimating land capacity is variability. As pointed out in previous Pierce County employment density surveys, employment density in commercial zones can range from more than 100 per acre for restaurants to a few per acre for certain retail uses. Employee per acre ratios implicitly assume…

Pierce County 2007 Employment Density Survey

Pierce County conducted employment density surveys in 2004 and 2007. In those surveys, the method was based on location-specific employment data from the Washington State Employment Security Department (ESD)[2] and parcel data from the Pierce County Assessor-Treasurer. Businesses included in the survey were randomly selected and categorized based on the sector.

The 2007 Employment Density Survey utilized building permit data, ESD covered employment data, and Pierce County Assessor-Treasurer (ATR) parcel records. Data for Downtown Tacoma was segregated and reported separately due to its unique development intensity—downtown Tacoma reported much higher employment density than elsewhere in the County.

To arrive at the average employee per acre numbers, the sum of the total number of employees and parcel acreage under each category was divided by the total employees by total acreage.

The 2007 Survey identified several data limitations such as unavailable ESD employment data for the entire five-year trending period at the initiation of the project; a large number of commercial/industrial permits in 1999 and 2000 could not be associated with ESD employment data points.

[2] The ESD data includes firms that report covered employment. The data includes average employment, NAICS codes, and is geolocated. This makes calculating employment densities at the industry or zoning district level relatively straightforward: select a sample of employers, sum the average employment, and then divide it by the number of acres reported in the Assessor-Treasurer tax lot database.

Pierce County 2014 Buildable Lands Report

The 2014 BLR adopted the same methodology as the 2002 and 2007 analyses. The one exception in the 2014 BLR methodology is the consolidation of "underdeveloped" and "redevelopable" categories into one "underutilized" category, as well as the criteria used to identify parcels within this category. The authors note that this step was in effort to achieve inter-departmental consistency between the County's land use and transportation models.

Exhibit 1 provides a summary of resultant employment densities from past employment surveys and buildable lands reports in Pierce County. The report consistency applies the 8.25 EPA for commercial and the 19.37 EPA for industrial in all geographies but Tacoma.

Exhibit 1. Pierce County Employment Density Comparisons (employees per acre)

Employment sector	1999 Survey	2004 Survey Average	2004 Survey Median	2007 Survey	2014 BLR
Industrial	11.15	13.8	21.32	11.15	8.25
Commercial	34.3	21.92	19.37	19.37	19.37
Government	22.7	7.74	n/a	n/a	n/a
Downtown Tacoma	318	356.77	235.59	235.59	**

Source: ECONorthwest, with data from Pierce County 2007 Employment Density Survey and Pierce County 2014 Buildable Lands Report

** Table 11a of the 2014 Buildable Lands Report (page 225) shows that higher assumptions were used for Tacoma in many zones. The report does not provide an explanation of the source of the assumptions.

2018 Buildable Lands Guidebook

Chapter 3 of the 2018 *Buildable Lands Guidebook* provides guidance on approach and methodologies related to commercial and industrial land capacity. The guidebook indicates that data from the Institute of Transportation Engineers (ITE) presents employees per square footage of buildable area data their trip generation manuals to determine potential trip generation for development and redevelopment sites. Obtaining a copy of the ITE manual was cost prohibitive for this project.

The guidebook suggests that an alternative method that may be used is an employment density calculation based on a ratio of employees per net acre, if employee estimates are available. It suggests that Washington State Employment Sector data can supply jobs per acre estimates. ECO was unable to locate any analysis of employment density based on sector data. The next section presents an analysis of Census tract level. sector data compiled by PSRC.

The Guidebook also suggests that employment densities can be calculated using FAR for buildings constructed during the evaluation period. This approach can be refined by building type or type of employment if data are available. FAR data can then be combined with SF/Emp data from ITE or other sources to arrive at an estimate of employees and employment density in

EPA. This approach would allow for an estimate of achieved employment densities per land use category.

3 Pierce County 2019 Employment Density Analysis

The following sections detail analyses carried out by ECONorthwest to document achieved employment densities and inform methodological options.

3.1 Spatial Analysis of Employment Patterns and Densities

ECO explored alternative methods for estimating employment densities. This analysis intended to assess a methodology for estimating the density of employment throughout Pierce County, Washington using PSRC data at the census tract level combined with parcel data.

Our assessment of this approaches is that available data is not consistent enough to accurately predict employment densities with granularity to enable decision making. However, with directed effort, data maintained by Pierce County and other regional planning agencies could potentially be used for employment density analysis. We are unable to estimate the amount of effort it would take to make the data reasonably reliable for BLR purposes. Two factors are particularly problematic: (1) variability in employment densities within generalized categories; and (2) the quality of the underlying land use/parcel data.

Methodology

Assessors data is some of the most routinely maintained data by counties and represents the smallest geography available from tracking land use. Different properties have different appraisal types; for example, commercial properties are assessed differently than residential properties. Recognizing this advantage, the parcel database was used to identify the different types of land use occurring on properties throughout Pierce County.

As mentioned before, different types of appraisals occur for different types of land uses. Possible appraisal types are summarized in Exhibit 2.

Exhibit 2. Pierce County Appraisal Types

Land Use Categorization	Appraised Property Types
Residential Landuses	
	Residential
	Residential Leasehold
	Condominium
	Reference
Economic and Other Landuses	
	Commercial
	Commercial Condo
	Commercial Leasehold
	Commercial Multi Unit
	Industrial
	Trended Investment

Source: Pierce County Assessor

Appraisal types do not always correspond to the actual use of a parcel. Housing land uses can incorporate some economic uses which were not captured in this analysis. There is not an accurate way to predict where self-employed or work-from-home employees are based geographically from any available datasets. Furthermore, commercial and industrial appraisal types can also have residential land uses or community and cultural land uses which do not provide any employment. As a result, the Pierce County Assessor also identifies land use descriptions which attempts to clarify what the parcel's current use is. For non-housing appraisal types in Pierce County, there were 179 distinct land use descriptions. This analysis attempted to match land use descriptions to major sectors as designated by the North American Industry Classification System (NAICS). The land use NACIS describes the major sectors of employment as the following:

- Construction and Resources
- Finance, Insurance and Real Estate (FIRE)
- Manufacturing
- Retail
- Services
- Wholesale Trade, Transportation, and Utilities (WTU)
- Government
- Education

The minimum geographical unit available with employment coverage covering all of Pierce County is by census tract. Thus, each parcel was associated with the corresponding census tract.

Employment data was acquired from the Puget Sound Regional Council (PSRC) who has worked with the Washington State Employment Security Department (ESD) to conduct the

Quarterly Census of Employment and Wages (QCEW) and complied into the Covered Employment Estimate Dataset. This data collects the employment information for all employees covered by the Washington Unemployment Insurance Act and aggregates this data across census tracts. However, out of privacy concerns for employers, any employer who has more than 80% of the employment share for a given census tract has the value withheld.

Finally, the total land area for a given NACIS Major Sector was calculated by parcel area for each census tract. The PSRC employment data was joined to the parcel data using the census tract id, which revealed a total employee count per NACIS Major Sector land area where available. In areas where employment data was obscured, these parcels were removed from the analysis as

The result is an employment density covering the entirety of Pierce County.

Results

The results of the analysis, summarized in Exhibit 3, ranges of employment density range from 49 employees per acre for Finance, Insurance, and Real Estate uses to 2 employees per acre for both Construction and Resource, and Wholesale, Transportation, and Utility land uses in Pierce County. Unsurprisingly, land uses which are concentrated in office environments, or retail and service uses centered in Urban Centers have much higher employment densities that land uses which typically require larger footprints such as warehousing and industrial and manufacturing uses.

Exhibit 3.: Summary of Employment Density for NAICS Major Sectors

Economic Use Category	Total Census Tracts	Total Parcels	Total Acres	Total Employment	Employment Land Use Ratio (Employment/Acre)
CONSTRUCTION/RESOURCE	47	271	4,974	10,097	2
CONSTRUCTION/RESOURCE - EMPLOYMENT DATA REMOVED	3	32	569		
EDUCATION	132	746	5,206	20,494	4
FINANCE/INSURANCE/REAL ESTATE	76	350	241	11,716	49
FINANCE/INSURANCE/REALESTATE - EMPLOYMENT DATA REMOVED	11	14	12		
GOVERNMENT	96	369	2,318	19,013	8

WHOLESALE/TRANSPORTATION/UTILITIES - EMPLOYMENT DATA REMOVED	58	285	1,355		
UNCLASSIFIED	151	4,653	12,620		

Source: Pierce County, PSRC, Census, ECONorthwest

However, estimates of employment are likely to be lower than the actual employment because of the withheld employment estimates for those employers which had more than 80% of employment within a census tract. For example, employment in the Frederickson Manufacturing and Industrial Center is anchored by the Boeing Manufacturing Facility. The employment this facility was withheld because Boeing met the 80% threshold to obtain

anonymity in the PSRC employment dataset. Boeing is the 4th largest employer within Pierce County with an estimate employment of 1,550 employees as of 2018[3] and would represent an employment ratio of 2.7 employees per acre if all employees were working on the Fredrickson property.[4]

Review and Assessment

After reviewing the results from the employment density analysis for Pierce County, the results were not as conclusive as desired. In short, we do not conclude that this is a viable method that could be incorporated into the BLR.

In particular, two obstacles appeared while using the data available from the Pierce County Assessors Data and the PSRC Employment Dataset.

1. Assessors land use and appraisal types are not consistent across different land uses. Furthermore, land uses descriptions can describe a variety of potential uses that do not relate to economic activities cleanly; if they are classified at all.
2. Employment data is sensitive information and is often obscured to maintain the anonymity of an employer.

If these obstacles were mitigated, the feasibility of using the Pierce County Assessors Data and the PSRC Covered Employment Estimates could become a viable method. In particular, verifying the appraisal types and the land use descriptions of given parcels in Pierce County Assessors database would increase the resolution of the analysis. Furthermore, a partnership with the Washington State Employment Security Department to retrieve the employment data over the 80% employment threshold for a given census tract would allow for more refined results that could better estimate employment density in the county.

3.2 Literature review

EOC conducted an extensive literature review that included academic articles, planning reports conducted in cities and counties within and outside of Washington state, relevant findings from a similar ECONorthwest review conducted in 2015 that was focused on industrial employment densities. We also explored employment density themes throughout the region and the US. One observation we made is that there is little academic research on employment density—a fact we found surprising. Exhibit 4 displays a summary of studies reviewed from Washington state. A more detailed matrix can be found in Appendix 1.

3 Economic Development Board, https://www.edbtacomapierce.org/area-profile/2018-major-employers/, Accessed May, 2019

4 Manufacturing and industrial land uses exists on an estimated 571 acres for Census tract 731.08.

Exhibit 4. Summary of Methods, Assumptions, and Findings from Washington State Studies

Location	Methodology	Employment Density Assumptions (Emp./acre or SFE)		Findings
		Commercial	Industrial	
Counties				
Clark	• Building permits primary source of data from 2006-2016.	9.3	10.9	County has sufficient capacity to accommodate projected employment growth.
Island	• Suppressed data substituted with older available data. • For jobs missing in QCEW data, methodology from PSRC used to estimate total employment from covered employment. • City of Freeland excluded from calculation of employment density average due to lack of amenities (sewer). • Due to County's low industrial employment, rounded average from neighboring counties (Skagit, Clark, Pierce) used for industrial assumptions.	17.0	8.0	Sufficient capacity to accommodate anticipated employment growth.
King (BLR)	• Half of jurisdictions brought forward 2007 BLR density and capacity calculations; remainder cities required new capacity analysis • Location-specific densities reported in final analysis.	250 - 850 SFE*	250 - 851 SFE*	Sufficient capacity to accommodate residential, employment growth.
King (Emp. Capacity Analysis)	• Employment density assumptions from 2007 BLR. • Does not consider future fiscal impacts of redevelopment within Duwamish Industrial Manufacturing Center.	550 SFE	800 SFE	• Total assessed land value for the South Park LID area is $2,458,285,700. • Total assessed value for the MIC site is $193,751,000.
Kitsap	• Methods for Land Capacity Analysis adjusted following Remand Order: 1) Using trend-based density factors for each residential zone 2) Increase public facility deduction to 20% 3) Remove discount for environmental purposes in Urban Restricted Zone 4) Platted lots adjustment	969 SFE	500 SFE	Sufficient capacity to meet industrial and commercial development to 2025, 2016-2036.

Location	Methodology	Employment Density Assumptions (Emp./acre or SFE)		Findings
		Commercial	Industrial	
Snohomish	• Existing structures (as of April 2011) counted as population or employment base; proposed, built, or occupied structures after April 2011 counted as future capacity.	200 - 700 SFE	300 - 20,000 SFE	Adequate land capacity reported in the County for the 2025 adopted UGA population and employment growth targets.
Thurston		3.3	1.5	Sufficient land supply to support projected growth to 2035.
Whatcom	• Based on 2009 Land Capacity Analysis methodology	626 - 900 SFE	775 - 3,500 SFE	Surplus capacity to meet future employment needs
Region				
Puget Sound Regional Council	• Relevant mixed-use zones and land classification included into analysis if related to industrial land. E.g. "Business Park"; "Employment Center" • Parcels considered industrial land if significant industrial development present or permitted to occur. • Four categories of industrial lands: Core industrial; Industrial commercial; Military industrial; Aviation operations areas • Special consideration given to tribal land; natural resource lands; limited areas of more intense rural development; planned developments		0.25 - 14.7*	Employable land capacity variable to area: • Strong demand / limited capacity: Interbay-Ship Canal, Duwamish-North Tukwila, Kent-Renton, and SeaTac-Des Moines subareas • Strong demand/adequate capacity: Frederickson- Lakewood, Southwest Everett and Tacoma-Puyallup subareas • Adequate capacity: I-405 Corridor, Arlington-Marysville, and North-Central Everett subareas • Surplus capacity: DuPont-Gray Field, Puget Sound Industrial Center (PSIC)-Bremerton-Sinclair Inlet, and Auburn-Sumner subareas
City				
Lakewood	• Developed a consolidated employment capacity model • Error in Pierce Co. BLR--one residential zone moved to commercial	12 - 25	15 - 25	Sufficient capacity to meet 2030, 2035 employment targets

Notes: *Location specific numbers reported; ranges provided here. SFE = Square foot per employee.

3.3 Interview findings

ECONorthwest conducted phone interviews with real estate professionals familiar with recent commercial and industrial development in Pierce County (Task 1.2, subtask 4 - Real Estate Professional Interviews). The purpose of the interviews was to better understand local development conditions and emerging employment trends in Pierce County. To the extent possible, ECONorthwest vetted reasonableness of employment density assumptions from the 2014 Buildable Lands study.

ECONorthwest interviewed the following real estate professionals:

1. Rob Allen, Senior Economic Development Specialist with Pierce County, Economic Development Department
2. Kevin Clegg, Special Assistant to the Executive for Business Services with Pierce County, Economic Development Department
3. Patrick Gemma, SVP Investment Officer with Prologis

3.3.1 Interview Key Themes

The interviews consisted of a series of questions (see Appendix B). The following sections describe the key themes from the interviews.

Revisit the 2014 Employment Density Assumptions

Pierce County's 2014 Buildable Lands study used the following employment density assumptions: 19.37 employees per acre for commercial and services (1 employee per 500 sq. ft.) and 8.25 employees per acre for industrial warehousing and manufacturing (1 employee per 900 sq. ft).

Interviewees suggested that while the commercial employment density assumption seemed reasonable, they are more practical in areas with generally higher densities, such as downtown Tacoma (we note that the BLR indicates much higher EPA assumptions were used in downtown Tacoma). The assumption seemed less practical (too high) for the more suburban areas of the county.

Interviews indicated they thought the industrial employment density assumption seemed inflated (too high). Four to five employees per acre seemed more reasonable, if not a little high. Further, employment capacity needs in industrial / manufacturing facilities will fluctuate depending on the amount of office space that exists in the facility (e.g., a large office component in an industrial / manufacturing facility will accommodate more employees per acre). When taking that factor into consideration, the industrial employment density assumption seemed more reasonable. The following assumption was provided to illustrate typical employment capacity needs: four employees per 1,000 sq. ft. for the office component with one employee per 1,000 sq. ft. for the industrial / manufacturing component.

Vary Average Employment Density Assumptions

Interviewees suggested that varying average employment density assumptions by geographic area and industry sector seemed reasonable.

By geographic area: It is reasonable to assume that downtown or high-density areas will have a higher average employment density assumption. However, lower average employment density assumptions should be assumed in more suburban cities and towns. Accordingly, average density could vary for each incorporated area or between incorporated area versus unincorporated area. An appropriate threshold to help inform varied density assumptions by geographic location was unknown.

By industry sector: Breaking out employment assumptions by sector also seemed reasonable. Large differences in employment densities exist between sector types, such as warehousing versus manufacturing. While an average density works in a general sense, a fair number of anomalies result in observable differences between sites of different sector types. Managing these anomalies may make the study more precise. For example, the manufacturing sector will accommodate more jobs per acre than wholesale trade and transportation; wholesale trade and transportation will accommodate more jobs per acre than warehousing (and big-box warehousing will accommodate fewer jobs per acre than other warehousing types).

Different industrial /manufacturing facilities (with office components) will typically demand different employment capacity needs as well. For example, a distribution center will typically have an office component accounting for 3% - 5% of total building sq. ft. A manufacturing facility will typically have an office component accounting for 10% of total building sq. ft.[5]

Technology and Automation Will Affect Employment Capacity Needs

Looking forward, interviewees suggested that technology and automation will have the biggest impact on employment capacity needs. Other commercial / industrial trends are not expected to drastically affect change. For example, automation of the manufacturing process is a much more significant portion of economic activity than any movement *toward* creative offices or makerspaces or *away* from shopping malls and big box stores. An interviewee compared other trends to an "artsy" community in a downtown area – the trend may be cool (innovation-wise) but does not scale very well and affects only a specific area.

A range of opinions exist about how technology and automation are currently changing employment capacity needs:

[5] By using the previous example, four employees per 1,000 sq. ft. for an office component in an industrial / manufacturing facility: If both the distribution center and manufacturing facility were 100,000 sq. ft., the manufacturing facility would have about 40 office employees using 10% of the building while the distribution center would have about 12-20 office employees using 3-5% of the building.

- E-Commerce distribution centers (like Amazon) demand more employees per acre than traditional distribution centers because more people are needed to move goods in and around the center (and goods stay in the center for longer).
- Some distribution centers (like IKEA), are experiencing an interesting trend. Technology and automation reduce employment capacity needs, only for employment to increase soon after (although not to the same level). The hypothesis is that companies are "bouncing back" and can hire new employees to serve different roles than before.

Other Considerations

One interviewee provided a suggestion that may help inform employment density assumptions:

- Review the Institute of Transportation Engineers (ITE 10th addition) manual. ITE takes a deep dive into different land uses to determine traffic generation. It is possible that they determine traffic generation by using employment density assumptions. If this is true, the manual could offer a factual basis for Pierce County's assumptions. A caveat that small sample sizes may present limitations.

  We note that this approach is discussed in the 2018 *Buildable Lands Guidebook*.

4 Conclusions and Methodological Options

In general, most employment assumptions have remained the same since each county's previous employment density and/or buildable land study. This is likely because the relevant underlying data has not evolved much. Notable exceptions include Clark County, where lower employment densities were reported compared to its 2007 study. The City of Lakewood's study reported higher densities than what was found in Pierce County's 2014 study—the authors revised a zoning error that adjusted employment densities and showed that Lakewood has substantially more employment capacity than reported. An annotated literature review can be found in Appendix 2.

The following are methodological takeaways to note:

- **Employees per acre (EPA) vs. square feet per employee (SFE)**—some studies used employees per acre as a unit of measurement for employment densities, while others used square feet per employee. Because ESF requires an additional step to get to land estimates, we recommend using EPA as the measurement unit for employment density in Pierce County.
- **Densities seem to cluster around central figures**—while the results vary, employment densities (whether EPA or ESF) seem to cluster around some central figures (5-10 EPA for industrial uses; 15-25 EPA for commercial uses). These figures are not much different than those used in Pierce County's 2014 Buildable Lands Inventory and 2007 Employment Density Survey.

- **Location specific figures**—several studies developed location-specific employment densities (Chamberlain 2015; King County 2014; Gehrke and Srivastava 2012; Watson & Associates Economists Ltd. 2008). This could be an appropriate methodological approach for Pierce County to consider, which will be based on a taxonomy of development or place types. Considering the Cervero/Ewing method of defining place types could also be a useful methodological approach in determining location-specific figures.
- **Most studies relied on methods from their previous years**, with updates to employment data where possible. Lakewood, however, utilized a **hybrid method in calculating employment densities**, which combined a floor-to-area ratio method with acreage-based calculations using updated employment density factors identified by City staff. This method is worth consideration, given the time and resources available at Pierce County.

Notable Employment Trends in Washington State

- The Great Recession affected employment in the Puget Sound Region. Most studies noted, however, that the economy is bouncing back and recovering in their respective counties. Job growth in Washington is expected to rise over the next decade—several studies (e.g. Kitsap, Thurston) reported a projected increase in jobs, a majority of which will be in the commercial sector.
- There is an increasing number of remote workers/home businesses in the region. In Thurston County, for example, 20 percent of future jobs is projected to be in residential zones, which could be taken to mean remote, mobile employment and home-based businesses. The City of Lakewood reduced its total employment allocation by 12 percent to account for remote employees in its Employment Density Survey, consistent with a similar assumption in Pierce County's 2014 Buildable Lands Report.

Observations from Studies Outside of Washington State

- Accommodating future employment growth scenarios—the City of Reno, Nevada, made note of an impending Tesla factory that would increase employment in the city. The expansion of the University of Nevada in Reno was also a factor in future growth. The City utilized two growth scenarios, Baseline and Recent Trends to project future economic opportunities, where the latter doubled growth rate for manufacturing, wholesale trade, and transportation and warehousing to match Tesla's projected employment.
- Several studies (i.e. Reno, Minnesota, Placer County) used methods and assumptions informed by studies from other cities, such as Minneapolis, Washington state, Portland, Southern California, and Rhode Island.

4.1 Methodological Options

The primary objective of this research was to inform BLR methodologies around estimating land needed for employment. Several approaches exist for translating population/employment forecasts into land need. Exhibit 5 summarizes the approaches.

The first method is the easiest: jurisdictions should have current year population estimates as well as population forecasts. Estimates of the amount of developed commercial and industrial land should be developed during the supply analysis. The second method is similar to the first, but uses local employment estimates and forecasts.

The third method requires employee per acre assumptions. Employee-per-acre assumptions allow conversion of employment into acres. Employment density, however, varies considerably by industry—and even within industries. Thus, a small jurisdiction might use an assumption of 8 employees per acre, while a larger one might assume 15-20. Of importance here are whether the assumption is for *net* acres (i.e., land that is available for sale in parcels or lots after roads (right-of-way) has already been deducted, or gross acres (total land before those deductions): one should assume more employees on a net acre than on a gross acre, other things being equal.

Exhibit 5. Basic methods for estimating employment land demand

Method	Description
Population/developed land ratio	Uses the number of developed commercial and industrial acres per 1000 persons and extrapolates it to the planning horizon using the local population forecast.
Employment/developed land ratio	Uses the number of developed commercial and industrial acres per 1000 employees and extrapolates it to the planning horizon using the local population forecast. Requires both a current employment estimate and an employment forecast.
Employee per acre (EPA) ratio	Assumes a specific employment density, expressed in employees per acre. At the simplest level, the method uses an aggregate EPA ratio for all new employment. Requires both a current employment estimate and an employment forecast.
Floor area ratio (FAR) / Employees per sq. ft. (ESF)	Uses zoning to determine floor area ratios and allowable lot coverage. Lot coverage * FAR provides an estimate of built space in square feet. Built space * ESF provides an estimate of land capacity for employment.
Expert consultation	Relies on the expertise of local developers, business leaders and others to estimate land needs.

A variation of the third method is to build up to estimates of employees by using assumptions about floor-to-area ratios (FAR) and about square feet of built space per employee. For example, assumptions of 500 square feet of total (not usable or leasable) office space per employee and of a FAR of 0.3 (built space equals 30% of the buildable area) would yield about 26 employees per net acre, and about 21 employees per gross acre. This method tends to yield greater densities

than those typically assumed for employees per acre, perhaps because the FAR assumes for a single lot are hard to sustain over a larger area.

Each of these methods has limitations.

- **Population and Developed Land Ratio.** This method has two key limitations: (1) use of population forecasts to derive estimates of employment land; and (2) the quality of parcel data. The method is simple: divide developed acres by population to get a ratio of persons per acre (usually expressed as acres per 1,000 persons). A key issue is population is not a good proxy for employment and does not recognize variability of the amount of employment lands in a region. For example, a city that is an industrial center might have half its land in industrial uses; another may be a bedroom community with no industrial land. A second limitation is that assessor's parcel data typically requires considerable effort to identify lands in employment uses that are developed. As a result, this method provides very coarse estimates. We do not recommend considering this approach for the BLR.
- **Employment and Developed Land Ratio**. This is the same as the previous method, with the difference that it uses employment instead of population. ECO used the employment per developed land methodology to estimate EPAs (the analysis is summarized in Section 3 of this memo). The limitations of this method are the same for assessment data. A second limitation is the issue of how to address residential and other lands that might have employment but are not zoned for employment. Due to these limitations we do not recommend using this method for the BLR.
- **Employee Per Acre (EPA) Methods**. The advantage of EPA methods is that they distill the estimate into a very simple formula: net acres * EPA = capacity. EPA assumptions can be developed for broad employment types—the 2014 BLR used commercial (19.37 EPA) and industrial (8.25 EPA). These assumptions are in line with what we see in other studies (for example, Oregon advocates EPAs of 7-12 for heavy industrial uses; 10-15 for light industrial uses; and 12-20 for commercial uses). The limitations of this method are generally related to the source of the EPA assumptions as well as how the assumptions are applied. The EPAs used in the 2014 BLR were derived from a survey of properties using Employment Security data. In our view, this is the best method for developing assumptions using the best data sources.

  The biggest limitation of this approach is related to variability in employment densities. As we have discussed, considerable variation exists within zoning districts and within individual industries.
- **FAR/SFE Methods**. Like other methods, this method is limited by the quality of data. One of the biggest problems with this method is that it is difficult to generalize FARs across broad employment types. By definition, FARs are zoning specific. Moreover, variability exists in the amount of built space required by different industries. The amount of effort required to develop accurate estimates for the entire county is

significant given the countywide scope of the BLR. We do not recommend using this approach for future BLRs.

4.2 Recommendations

Pierce County's challenge is developing an acceptable methodology that can be applied across many jurisdictions that range from urban centers to suburbs, to rural communities, to rural areas. After a thorough investigation of the methodological options, we make the offer the following recommendations:

- **Continue to use an EPA based method**. Given the countywide scope and the diversity of cities, EPAs are the most accurate and practical method for estimating employment capacity of vacant and under-utilized land as well as land demand.
- **Consider refinements to the methods used in the 2014 BLR.** The County could make refinements to both the capacity and land demand estimates.
    - **Consider allocating some employment to non-employment lands**. Our review of the 2014 BLR suggests that all of the employment growth increment is allocated to employment lands. Analysis of employment patterns in every Oregon city ECO has worked in shows significant employment exists outside employment zones. Ideally, the amount of employment allocated to non-employment lands would be based on empirical analysis. We suggest exploring if an economist at the Washington Employment Security Department could conduct such an analysis based on zoning data provided by Pierce County.

      As an alternative, deductions could be made using ACS commute data. The 2013-17 ACS shows that 4.5% of worked at home. The assumption could be based on a countywide average, or on data for Census places. This refinement is a land demand refinement.
    - **Consider disaggregating employment forecasts to three or more categories.** A review of the 2014 BLR only identified single value employment figures. The PSRC data ECO used for the employment density analysis in section 3 is available by city disaggregated by sectors or 2-digit NAICS codes. At the simplest, the models could differentiate between retail, office, and warehouse employment densities. Typically, these would be grouped by NAICS codes. This method is only possible if the employment forecasts/allocations are disaggregated.
    - **Consider developing a land use typology based on geography and zoning.** One critique we heard of the 2014 method was that it does not adequately recognize geographic differences. Both ECO's previous work, as well as the literature we reviewed, suggest that geographic variations in employment density exist. In our view, the variations are both due to geography (e.g., one would expect higher

densities in urban cores than in rural areas—a fact that Tacoma's analysis for the 2014 BLR documents) and zoning. In short, a methodology that recognizes regional differences in land uses could be more robust. The question then is, what options are available?

Following are a few variations for consideration:

- **Typology by city size.** This would be a simple methodology that would develop a typology of city sizes and then associated those with EPA assumptions. The general idea would be that smaller cities and rural areas would be assigned lower EPA assumptions.
- **Typology by PSRC regional centers.**[6] PSRC's VISION 2040 calls for the creation of central places with a mix of uses and activities connected by efficient transportation. PSRC designated 29 regional growth centers which are locations of the region's most significant business, governmental, and cultural facilities and are planning for growth. PSRC also identified nine regional manufacturing/industrial centers, which are locations for more intensive industrial activity. According to PSRC, both regional growth centers and regional manufacturing/industrial centers are focal points for planned growth, economic development and transportation infrastructure investments.

  Moreover, the framework identifies three primary geographies: Metropolitan Cities (16 centers), Core Cities (17), and Unincorporated Urban Areas (3). Five regional growth centers and two industrial/manufacturing centers are located in Pierce County.

  PSRC's 2013 Monitoring Report presents employment densities for each of the areas based on 2010 data. Exhibit X shows employment densities for Pierce County Centers. The observed densities are lower than the commercial assumptions in all instances, and considerably lower than the 2014 industrial assumptions for the industrial/manufacturing centers.

  Given that much of the county's employment is located outside these centers, any method will require assumptions for capacity of those lands. The County could use the 2014 assumptions, or use an approach based on city type as described above.

[6] https://www.psrc.org/sites/default/files/centers_monitoring.pdf

Exhibit 6. Employment Densities in Pierce County Centers, 2010

Type/Center Name	Core Geography	EPA
Regional Growth Centers		
Lakewood	Core City	11.2
Puyallup Downtown	Core City	10.3
Puyallup South Hill	Core City	6.8
Tacoma Downtown	Metropolitan City	22.1
Tacoma Mall	Metropolitan City	14.8
Regional Manufacturing/Industrial Centers		
Fredrickson	Unincorporated UGA	1.2
Port of Tacoma MIC	Metropolitan City	1.8

Source: https://www.psrc.org/sites/default/files/centers_monitoring.pdf, pg 87-88

- **Typology by Zoning.** This is a variation on the previous approach and would be based on local zoning. Effectively, it would require developing a crosswalk between zoning districts and EPAs. This approach has some problems: (1) the number of zoning districts in the county, and (2) data limitations would make it difficult to assign EPAs to zoning districts with any certainty.

In summary, several refinements to the 2014 methodology could improve the capacity and land need estimates. Given the amount of variability that exists in broad employment categories, and PSRCs regional plans, we recommend that any methodology employ the principles of simplicity and transparency. More complicated methods do not necessarily improve the results. We recommend the County consider adjustments for employment in residential areas and using the PSRC center framework.

Appendix 1: Literature Review Matrix

Studies from Washington State

Location	Document Reviewed	Methodology	Employment Density Assumptions (Emp./acre)		Notable Trends	Findings
			Commercial	Industrial		
Counties						
Clark	BLI, 2015	• Building permits primary source of data from 2006-2014 • GIS to link parcels to building permits	9.3	10.9	County has experienced employment gains, however, observed net densities lower than 2007 planning assumptions--could be due to businesses adding employees without requiring new buildings.	County has sufficient capacity to accommodate projected employment growth.
Island	Comp. Plan, 2016	• Suppressed data substituted with older available data • For jobs missing in QCEW data, methodology from PSRC used to estimate total employment from covered employment • City of Freeland excluded from calculation of employment density average due to lack of amenities (sewer) • Due to County's low industrial employment--rounded average from neighboring counties (Skagit, Clark, Pierce) used for industrlal assumptions.	17	8	• UGAs resized to accommodate growth in 20 years. • Reduction in size of Freeland and Langley to result in more concentrated growth.	Sufficient capacity to accommodate anticipated employment growth

Location	Document Reviewed	Methodology	Employment Density Assumptions (Emp./acre)		Notable Trends	Findings
			Commercial	Industrial		
King	BLI, 2014	• Half of jurisdictions brought forward 2007 BLR density and capacity calculations; remainder cities required new capacity analysis • Location-specific densities reported in final analysis	250 - 850 SFE*	250 - 851 SFE*	Majority of capacity in Metro and Core cities	Sufficient capacity to accommodate residential, employment growth
King	Emp. Capacity Analysis, 2010	• Employment density assumptions from 2007 BLR • Does not consider future fiscal impacts of redevelopment within Duwamish Industrial Manufacturing Center	550 SFE	800 SFE	South Park has significant portion of employment land capacity	• Total assessed land value for the South Park LID area is $2,458,285,700. • Total assessed value for the MIC site is $193,751,000
Kitsap	BLI, 2014	• Methods for Land Capacity Analysis adjusted following Remand Order: 1) Using trend-based density factors for each residential zone 2) Increase public facility deduction to 20% 3) Remove discount for environmental purposes in Urban Restricted Zone 4) Platted lots adjustment	969 SFE	500 SFE	Majority commercial jobs expected to increase (over 70%) Industrial jobs expected to increase by 6%	Sufficient capacity to meet industrial and commercial development to 2025, 2016-2036
Snohomish	BLI, 2012	• Existing structures (as of April 2011) counted as population or employment base; proposed, built, or occupied structures after April 2011 counted as future capacity.	200 - 700 SFE	300 - 20,000 SFE		Adequate land capacity reported in the County for the 2025 adopted UGA population and employment growth targets.

Location	Document Reviewed	Methodology	Employment Density Assumptions (Emp./acre)		Notable Trends	Findings
			Commercial	Industrial		
Thurston	BLI, 2014		3.3	1.5	• Majority employment expected in commercial zones (over 70%) • Industrial jobs expected to increase by 8% • Employment in residential zones (remote jobs / home-based businesses) expected to increase by 20% • Federal endangered species listings anticipated to affect commercial, industrial land supply	Sufficient land supply to support projected growth to 2035.
Whatcom	BLI, 2016	Based on 2009 Land Capacity Analysis methodology	626 - 900 SFE	775 - 3,500 SFE	County-wide surplus employment capacity of almost 13%	Surplus capacity to meet future employment needs
Region						

Location	Document Reviewed	Methodology	Employment Density Assumptions (Emp./acre)		Notable Trends	Findings
			Commercial	Industrial		
PSRC	Industrial Land Analysis, 2015	• Relevant mixed-use zones and land classification included into analysis if related to industrial land. E.g. "Business Park", "Employment Center" • Parcels considered industrial land if significant industrial development present, permitted to occur. • Four categories of industrial lands: 1. Core industrial 2. Industrial commercial 3. Military industrial 4. Aviation operations areas • Special consideration given to: 1. Tribal lands 2. Natural resource lands 3. Limited Areas of more intense Rural Development 4. Planned Developments		0.25 - 14.7*	• Revival of manufacturing industry, comparable to the Gulf region, South Carolina, Colorado. • Industrial jobs occuring in non-industrial zoned land. • Non-industrial jobs on industrial lands projected to grow to 45% by 2040.	• Employable land capacity variable to area: Strong demand / limited capacity: Interbay-Ship Canal, Duwamish-North Tukwila, Kent-Renton, and SeaTac-Des Moines subareas. • Strong demand/adequate capacity: Frederickson- Lakewood, Southwest Everett and Tacoma-Puyallup subareas. • Adequate capacity: I-405 Corridor, Arlington-Marysville, and North-Central Everett subareas • Surplus capacity: DuPont-Gray Field, Puget Sound Industrial Center (PSIC)-Bremerton-Sinclair Inlet, and Auburn-Sumner subareas.
City						
Lakewood	Emp. Density Survey, 2017	• Developed a consolidated employment capacity model. • Error in Pierce Co. BLR--one residential zone moved to commercial	12 - 25	15 - 25	City has substantially greater employment capacity than reported in Pierce Co. BLR.	Sufficient capacity to meet 2030, 2035 employment targets

Notes: *Location specific numbers reported; ranges provided here. SFE = Square foot per employee.

Location	Document Reviewed	Methodology	Employment Density Assumptions (Emp./acre)		Notable Trends	Findings
			Commercial	Industrial		
Counties						
Placer, CA	Dev. Estimates, 1994	Two development scenarios used to project growth--2010 and 2040. Assumes County caotures over 18% regional employment growth for both scenarios.	333 - 550 SFE	700 SFE	• Strong long-term growth rates expected in Sacramento region. • Placer Co. expected to be one of the fastest growing counties due to population and employment increasing from 1990-2010.	Sufficient capacity to meet employment growth needs.
Maricopa, AZ	Emp. Analysis, 2012	• Identified 32 significant regional employment clusters in relation to transit • Employment clusters are assigned sector mix values		5.6 - 14.2	Lowest employment densities in regions characterized by production, distribution, repair	Employment clusters within quarter mile of transit in central and south region have highest densities and employment concentrations--mostly not industrial
Scott, MN	Commercial / Industrial Analysis, 2012	Informed by previous employment density research in other cities		344 - 753 SFE	Buildings with more on-site amenities have higher densities	• Commercial and industrial land expected to expand, but at slower pace than 2006 study. • Sufficient capacity to meet demand but may require land designation changes to meet this change.
Cities						

Location	Document Reviewed	Methodology	Employment Density Assumptions (Emp./acre)		Notable Trends	Findings
			Commercial	Industrial		
Anchorage, AK	BLI, 2009	• Employment density assumptions based on previous studies and trends from other cities. • Employment projections do not account for major construction projects, i.e. Natural Gas Pipeline, the Knik Arm Bridge, the Pebble Mine, Kensington Mine. • Employment density assumptions based on current trend of low density and FARs.		500 - 2000 SFE**	• Major construction projections anticipated to affect industrial sector. • Natural gas pipeline expected to require infrastructure improvements. • Changes in federal spending, expansions in mining or tourism, major infrastructure projects, oil price fluctuations known to have significant impact on local and regional economy. • City is on the lower end of spectrum in regard to industrial employment density.	Sufficient capacity to meet employment growth needs.
Eugene, OR	Emp. Density Analysis, 2006	Employment densities broken down by plan designation and study area	36.3 - 53.9*	8.3 - 20.7*		Provides employment densities by land use designation and study area.
Eugene, OR	Emp. Land Assumptions, 2011	• Government employment growth excluded because typically occurs on public, semi-public lands. • Used "safe harbor" methodology--utilized growth rate for Lane County as calculated by the State.	20 - 90.3	5 - 20	• New employment on non-employment lands: Covered employment occuring in residential and other non-employment land designations. • Increasing number of employment in existing space, making it difficult to predict vacancy rate. Number used in study reflects recession.	Community Advisory Committee agreed that densities would be similar to past.

Location	Document Reviewed	Methodology	Employment Density Assumptions (Emp./acre)		Notable Trends	Findings
			Commercial	Industrial		
Guelph, Canada	Emp. Land Assumptions, 2008	Location-specific densities reported	5 - 106*	2 - 48*	• Competitive industrial land prices. • Employment in Industrial sector expected to increase, followed by commercial and institutional development. • Land-extensive employment trends in warehousing sector.	• Limited supply of employment land, especially for larger sites. • City has adequate land for employment needs to 2031.
Minneapolis, MN	Emp. Pol. Plan, 2006	Introduces Industrial Scorecard to indicate each industry's projected growth, employment demand, and land demand.	7 - 64	14 - 42	Industrial sector significant economic contributor to City.	• Industrial land supply depleting. • City should adopt Employment Districts. • Rezoning for residential use should be reconsidered. • Rezonings should consider job impacts, tax base impacts, viability, transition costs, and adjacency to viable industrial areas.
Reno, NV	Emp. Capacity Analysis, 2016	• Two growth scenarios, Baseline and Recent trends to forecast anticipated employment • Industrial / Commercial buildings categorized by high density and medium/low density	0.15 - 1.25	0.15 - 0.5	Forecasting upcoming employment centers, i.e. Tesla Gigafactory, U of Nevada-Reno	City has capacity to meet employment demands. Growth rate for manufacturing doubled in forecast model to accommodate anticipated employment
San Diego, CA	Industrial Element, n.d.			15.7	Limited industrial land to meet anticipated employment needs.	Rezonings recommended to encourage industrial development.
Region						

Location	Document Reviewed	Methodology	Employment Density Assumptions (Emp./acre)		Notable Trends	Findings
			Commercial	Industrial		
SCAG	Emp. Density Survey, 2001	Over 100 categories consolidated into 10 categories. Employment densities calculated using two methods, median, and weighted averages for employment per acre and FARs.	11.04 - 22.9**	10.63 - 17.05**	Density in Government Offices land use category unusually high--possibly due to small sample size.	Employment density factors derived to be used at region- and county-level.
State						
Oregon	Emp. Density Survey, n.d.	• Employment outside of Central Business District but within city limits referred as Peripheral Employment. • Effects of Great Recession and rise in e-commerce could be reflected in data but difficult to prove at this stage.			• Decreasing jobs in Wholesale, Retail, Transportation, and IT jobs. • Retail trade survived Great Recession.	• Employment densities of downtown central commercial areas have decreased. • Employment densities in city peripheries are more varied.

Notes: *Location specific numbers reported; ranges provided here. **Report also provides weighted averages and/or averages by industry for employee per square foot. SFE = Square foot per employee.

Appendix 2: Annotated Literature Review

Studies from Washington state

Carter, Stephen, and Susan Davis. 2010. South Park Bridge Tiger Grant II Employment Capacity Analysis. ECONorthwest.

This memo includes the technical analysis to be used as background to contribute to the economic competitiveness analysis portion of the Tiger II grant application.

Location: King County, Washington

Relevant Information (2):

- ECONorthwest identified 2007 employment densities from the King County Buildable Lands Report:
    - Commercial: 550 square feet/employee
    - Industrial/warehouse: 800 square feet/employee

Chamberlain, Elizabeth. 2015. Industrial Lands Analysis for the Central Puget Sound Region. Puget Sound Regional Council.

This report assesses economic activity on industrial land in the central Puget Sound region. It is intended to "serve a broad range of land use and economic development planning needs and interests" (E-1).

Location: Puget Sound Region, Washington

Relevant Information (3-8):

- Employment densities for individual Manufacturing/Industrial Centers:
    - Ballard-Interbay (core industrial and industrial commercial): 14.66 EPA
    - Duwamish (core industrial and industrial commercial): 11.61 EPA
    - Frederickson (core industrial and industrial commercial): 1.17 EPA
    - Kent MIC (core industrial): 7.64 EPA
    - North Tukwila (core industrial): 14.05 EPA
    - Paine field/Boeing Everett (core industrial): 10.00 EPA
    - Port of Tacoma (core industrial): 1.79 EPA
    - Puget Sound Industrial Center-Bremerton: 0.25 EPA

Clark County. 2015. Clark County Buildable Lands Plan Monitoring Report.

This report provides updates to the County's enactment of the Growth Management Act, specifically sprawl reduction and urban growth concentration.

Location: Clark County, WA

Relevant information (4, 20)

- 2007 planning assumptions:
    - Commercial: 20 employees/acre
    - Industrial: 9 employees/acre
- Observed densities are lower than the 2007 planning assumptions:
    - Commercial: 9.3 employees/acre
    - Industrial: 10.9 employees/acre
- "Clark County has seen employment gains from 2006 to 2014. It is likely that some businesses have added employees, which would not require new building permits and may account for the low employment density reported." (20)

Gifford, Kevin. 2017. City of Lakewood Employment Capacity Analysis. BERK Consulting.

This report found that employment densities in Lakewood diverge from Pierce County's 2014 Buildable Lands Report. BERK's analysis concludes that the City of Lakewood has substantially greater employment capacity available than is represented in the 2014 Pierce County Buildable Lands Report.

Location: City of Lakewood, Washington

Relevant information:

- BERK developed a consolidated employment capacity model
    - "This blended approach combines the FAR-based method described for the Central Business District with acreage-based calculations using updated employment density factors, as identified by City staff."
    - "Model assumes a reduction in the market factor for underutilized properties from 50% (assumed by the Pierce County BLR) to 35%, comparable to other commercial hubs in northern Pierce County."
    - Model provides sufficient employment capacity to meet Lakewood's 2030 and 2035 employment targets.
- "Per 2014 Pierce County BLR report, total employment allocation is reduced by 12.1% to account for mobile workers and employees working from home."
- Found error in Pierce Co. BLR
    - ARC zone in residential moved to commercial. This study accounted for ARC zone in employment density
- Lakewood adjusted densities
    - Commercial density: 12-25 employees/acre
    - Industrial density: 15-25 employees/acre

Island County. 2016. "Appendix B: Population Growth Analysis & Accommodations." Island County 2036: 2016 GMA Periodic Review.

This document provides detailed account of Island County's population projections, including buildable lands analysis and employment projections. This document is an appendix to Island County's periodic review of the Growth Management Act.

Location: Island County, WA

Relevant information

- "Suppressed data was substituted for three sectors (Mining, Utilities and Management of Companies and enterprises) using older available data." (16)
- "To compensate for these missing jobs in the QCEW data, a methodology developed by PSRC was used to estimate total employment from covered employment."
- Commercial: 17 employees/acre
- Industrial: 8 employees/acre
- County comparisons
    - Skagit County
        - Commercial: 20 employees/site acre
        - Industrial: 6.5 employees/site acre
    - Clark County (see Clark Co. review—same as 2007 assumptions)
    - Pierce Co. (Unincorporated Pierce County 2014 buildable lands report)
        - Manufacturing/Warehousing: 8.2 employees per acre
        - Commercial/Services: 19.37 employees per site acre

King County. 2014. King County Buildable Lands Report.

This report is an update to the 2007 BLR, in fulfillment of the GMA. The report spans the time period from January 2006 to January 2012, encompassing all 39 cities in King County. The BLR concludes that King County has sufficient capacity to accommodate residential and employment growth.

Location: King County, Washington

Relevant information:

- Employment growth still in transition out of Great Recession (2)
- Minor shortfall in job capacity in unincorporated areas, but majority of King County's capacity to accommodate growth is located in Metro and Core cities. (3)
- Used similar assumptions to 2007 BLR, updated housing and jobs data to 2012
    - "Achieved densities and – for some cities – land capacity data are brought forward from the 2007 BLR into this 2014 BLR. Half of King County's

jurisdictions reported sufficient housing and job capacity in 2007 to absorb even the higher numbers in the new 2006-31 targets. Those cities, including most of the Small Cities, carried forward their 2007 BLR density and capacity calculations into this 2014 BLR… The remaining cities required new analysis of land capacity to overcome a shortfall of capacity with respect to the new targets as part of their process of developing new comprehensive plans." (2)

- Employment capacity in Table 5.5, 2007 BLR pg V-9

Kitsap County Department of Community Development. 2014. Kitsap County 2014 Buildable Lands Report.

This document provides information on Kitsap County's update to its growth projections and land capacity for housing and employment. The report found that the County had sufficient land supply to meet the demand for commercial and industrial development to 2025, and the 2016-2036 planning period.

Location: Kitsap County

Relevant information:

- "Kitsap County adopts employment targets to be consistent with the Puget Sound Regional Council's (PSRC) Regional Growth Strategy." (53)
- Over 45,000 additional jobs anticipated, majority commercial
  - Industrial jobs expected to increase by 6.4%
- From Appendix:
  - Commercial: 969 sq ft/employee
  - Industrial: 500 sq ft/employee

Snohomish County Council. 2012. Snohomish County Buildable Lands Report.

This report is in accordance with the Growth Management Act. The report evaluates land needs and capacity for residential, commercial, and industrial use anticipated in 20-year planning period, spanning to 2025.

Location: Snohomish County, Washington

Relevant information (3,23):

- Adequate land capacity reported in the County for the 2025 adopted UGA population and employment growth targets.
- No capacity shortfall anticipated in UGAs or cities within the UGAs
- Food Services = 200 sq ft/employee
- Other Services = 400 sq ft/employee
- Finance, Insurance and Real Estate (FIRE) - mini-storage warehouses only = 20,000 sq ft/employee

- Finance, Insurance and Real Estate (FIRE) - other = 350 sq ft/employee
- Retail = 700 sq ft/employee
- Manufacturing = 500 sq ft/employee
- Wholesale, Transportation and Utilities (WTU) = 1,000 sq ft/employee
- Government/Education = 300 sq ft/employee

Thurston Regional Planning Council. 2014. Buildable Lands Inventory for Thurston County.

Thurston County's BLR reports sufficient land supply to support projected growth to 2035. Varying by jurisdiction, Thurston County can sufficiently meet the demand for employment land needs.

Location: Thurston County, Washington

Relevant information:

- Majority of new employment expected to be in commercial zones (72%)
- 8% new jobs expected in industrial zones
- 20% jobs expected in residential zones, i.e. remote workers, home-based businesses
- Employment densities:
    - Commercial: 3.3 employees/1,000 sq ft.
    - Industrial: 1.5 employees/1,000 sq ft.
- "Questions remain as to how much of the commercial and industrial land supply will be available for development due to the pending federal endangered species listings." (65)

Whatcom County Planning and Development Services. 2016. Land Capacity Analysis Report.

This report provides a summary of the land capacity analysis for Whatcom County and its Urban Growth Areas as part of the County's Comprehensive Plan.

Location: Whatcom County, Washington

Relevant information:

- Employment density (found in Appendix C)
    - Commercial: 626-900 sq ft./employee
    - Industrial: 775-3500 sq ft./employee
- "Each UGA has a population growth capacity surplus or deficit within 6% of the allocation, with the exception of the Blaine UGA, which has considerable surplus capacity within its city limits. Figure 2 shows a countywide employment capacity surplus of 12.6%." (1)

Studies outside of Washington state

City of Minneapolis. 2006. Industrial Land Use Study and Employment Policy Plan.

The purpose of this study was to provide information and policy direction for industrial land use and employment in Minneapolis.

Location: Minneapolis, Minnesota

Relevant Information (52-53):

- Minneapolis Assessor/InfoUSA employment per acre:
    - Utilities: 42 EPA
    - Construction: 30 EPA
    - Manufacturing: 27 EPA
    - Wholesale Trade: 20 EPA
    - Transportation & Warehousing: 14 EPA
    - Information: 64 EPA
    - Real Estate, Rental, Leasing: 7 EPA
    - Professional and Technology Services: 64 EPA
    - Other Services: 50 EPA
    - All Industries: 34 EPA

Economic and Planning Systems, Inc. 2009. Anchorage Industrial Land Assessment Final Report. Prepared for the Anchorage Economic Development Corporation.

Chapter 4 of this report, "Industrial Land Demand," estimates the demand for future industrial land in Anchorage by analyzing the relationship between employment and industrial space.

Location: Municipality of Anchorage, Alaska

Relevant Information (29-38):

- Assumptions for employment density in Anchorage by land use category, based on "EPS experience and professional judgment and have been supplemented by significant research of employment density trends specific to the MOA" (31).
    - Industrial Services, Assembly, and Manufacturing: 1000 sq. ft./employee
    - Miscellaneous Industrial (Open storage, processing, heavy manufacturing, utilities, trades, and transportation): 1,800 sq. ft./employee
    - Warehouse/Distribution: 2,800 sq. ft./employee
    - Industrial Flex Space: 500 sq. ft./employee
- EPS conducted a national review of employment density studies with the following results:
    - Pierce County, WA (2006): 13.8 EPA for manufacturing/warehousing
    - Hillsboro, OR (n.d.): 9.0 EPA for industrial

- Silverton, OR (2006): 8.9 EPA for industrial
- Caledon, Ontario, Canada (2007): 17.0 EPA for manufacturing, 9.0 EPA for warehouse/distribution
- Peel Region, Ontario, Canada (2007): 15.8 EPA for industrial
- Grand Traverse County, MI (n.d.): 30.0 EPA for intensive industry, 14.0 EPA for intermediate intensive, 8.0 EPA for extensive
- Portland-Vancouver MSA (2001): 10.0 EPA for warehouse/distribution, 24.5 EPA for general industrial, 24.3 EPA for tech/flex
- Wilsonville, OR (2008): 16.3 EPA for efficient land need, 14.2 EPA for medium land need, 12.3 EPA for high land need
- Minneapolis, MN (2006): 27.0 EPA for manufacturing, 14.0 EPA for transportation and warehousing

Economic & Planning Systems, Inc. 2016. City of Reno: Employment Demand Forecast and Needs Analysis.

This report is a technical analysis to inform the policies and strategies of the City of Reno's Master Plan. It contains a summary of technical analysis, stakeholder feedback, and policy recommendations for the economic components of the Master Plan.

Location: Reno, NV

Relevant information (6-10)

- Used different building types to estimate employment density and land demand. Sub-categories within building types to reflect development density levels and square feet of building space.
- Assumptions based on existing conditions within the Region and national industry standards.
- Building types:
  - Office
    - Type A (Suburban or Campus Office): 300 sq ft./employee, 0.25 FAR
    - Type B (Mid-Rise / High-Rise Office): 250 sq ft./employee, 1.0 FAR
  - Industrial
    - Type A (Large Scale or Heavy Industrial): 1,500 sq ft./employee, 0.15 FAR
    - Type B (Small Scale or Light Industrial): 500 sq ft./employee, 0.50 FAR
  - Retail
    - Type A (Large Format Retail): 400 sq ft./employee, 0.15 FAR
    - Type B (Small Format Retail): 400 sq ft./employee, 0.60 FAR
  - Accommodation and Food Service
    - Type A (Accommodation): 750 sq ft./employee, 1.25 FAR

        - Type B (Food Service): 500 sq ft./employee, 0.30 FAR
    - Education
        - Type A (General Education): 1,000 sq ft./employee, 0.50 FAR
- Upcoming presence of Tesla's Gigafactory is noted to potentially have impact on employment trends.
- University of Nevada-Reno and its expansion is noted as another economic driver with impact on increased employment.
- Two growth scenarios used to project future economic opportunities, Baseline and Recent Trends. In Recent Trends scenario, growth rate is doubled for manufacturing, wholesale trade, and transportation and warehousing to match trends and include upcoming employment from Tesla.

ECONorthwest. 2006. "Eugene Employment Density Analysis."

This document provides a table of employment density by plan designation and study area in Eugene, Oregon.

Location: Eugene, Oregon.

Relevant information:

- Employment densities were broken down to be more location specific to study area
- Industrial:
    - Campus Industrial: 20.7 EPA
    - Heavy Industrial: 8.3
    - Light Medium Industrial: 15.8
    - Special Heavy Industrial: Not disclosable
- Commercial: 36.3 EPA
    - Commercial Mixed-use: 39.7
    - Major Retail Center: 53.9

Envision Eugene Technical Resource Group. 2011. City of Eugene Employment Land Assumptions Summary.

This document summarizes several assumptions that relate to Eugene's employment land needs. Employment density estimates were based on a 2006 employment density study of 22 areas of Eugene. The Community Advisory Committee agreed that densities would be similar to what they were in the past.

Location: Eugene, Oregon

Relevant Information (4-5)

- Industrial employment density: Ranged from 5 EPA (heavy industrial) to 20 EPA (light or campus industrial); Average industrial EPA: 13
- Commercial employment density: Ranged from 30 EPA (mixed retail and office) to 93 EPA (downtown); Average commercial EPA: 68
- Retail employment density: Ranged from 20 EPA to 37 EPA; Average retail EPA: 23

"Evaluating Employment Density and Land Needs: Floor Area Ratios, Employees Per Square Foot, and Employees Per Acre." N.d.

This document provides context to the units used when calculating employment densities.

Relevant information:

- Floor-to-Area ratio (FAR), Employees per acre (EPA), square feet per employee (SFA) are three different ways to express employment density
- The document provides the mathematical relationship between FAR, EPA, and SFA
    - "FAR can be derived from EPA and SF/Emp as follows:
      (EPA*43560)/SF per Emp
    - SF/Emp can be derived from EPA and FAR:
      (FAR*43560)/EPA
    - EPA can be derived from SF and FAR:
      (FAR*43560)/SF per Emp"
- The document also shows the relationship when other variables are held constant:
    - "FAR increasing: When sq. ft. per employee is held constant and FAR increases, EPA also increases (e.g., there is a linear relationship between EPA and FAR)
    - FAR constant/ sf per emp decreasing: When sq. ft. per employee decreases and FAR is held constant, EPA increases at an increasing rate (e.g., a compounding relationship)
    - FAR + SF/Emp Increasing. Under this scenario EPA remains constant.
    - FAR Increasing and SF/Emp decreasing. When both FAR and sf/emp are increased, EPA increases at an increasing rate (e.g., a compounding relationship)"
    - This information is provided in graph form as well

Gehrke, Amanda and Sujata Srivastava. 2012. Final Employment Analysis Memorandum for Maricopa Association of Governments Sustainable Land Use and Transportation Strategy. Strategic Economics.

This updated memo provides information and insight into the relationship between transit (both planned and existing) and employment patterns in Maricopa County. Strategic Economics identified 32 significant regional employment clusters. The Maricopa Association of Governments serves the Phoenix metro area.

Location: Maricopa County, Arizona

Relevant Information (7-15):

- Employment clusters within one-quarter mile of transit in the central and south MAG region have the highest densities and employment concentrations, mainly not industrial
- Regions characterized by PDR (Production, Distribution, and Repair) have lowest employment densities in the region
- Employment clusters are assigned sector mix values. Listed below are employment clusters with over 40% PDR classification, and each cluster's corresponding employment density (jobs per acre)
    - Falcon Field, 58% PDR, 5.6 EPA
    - I-10 West Corridor, 63% PDR, 2.8 EPA
    - West Chandler, 45% PDR, 10.3 EPA
    - West Temple Industrial, 40% PDR, 14.2 EPA

Karr, Peter. N.d. Employment and Density in Oregon 2004–2012. University of Oregon.

This study reports employment trends and density changes in Oregon's current downtown and city peripheries from 2004 to 2012. The author focuses on Wholesale and Retail Trade, Transportation, and Information Service Sectors (NAICS Codes 42, 44-45, 48-49, and 51-56), and how much employment from these sectors are in Residential and Mixed-use zones outside of downtown. The study reports findings from Albany, Bend, Corvallis, Eugene, Grants Pass, McMinnville, Medford, Salem, and Springfield.

Location: Oregon (Albany, Bend, Corvallis, Eugene, Grants Pass, McMinnville, Medford, Salem, and Springfield)

Relevant information (10, 23):

- Metrics for evaluation of density included:
    - Count of Businesses per 2-digit NAICS Designation
    - Average Minimum Number of Employees
    - Average Maximum Number of Employees
    - Average Total Number of Employees
    - Standard Deviation
    - Sum of Total Employees working in that Industry
    - Sum of Acreage Totals for Tax Lots Containing Businesses
- Employment in Wholesale and Retail Trade, Transportation, and Information Services has decreased.
- Retail Trade (NAICS Codes 44 and 45) showed increases.
- Employment densities of downtown central commercial areas have decreased, except Salem and Bend showing greater than 5% increase
- Employment densities in city peripheries are more varied

Mullins, Matt, and Amanda Janzen. 2012. "Commercial/Industrial Market Analysis for Scott County, Minnesota." Maxfield Research Inc. Prepared for the Scott County Community Development Agency.

This study analyzed commercial and industrial land supply for Scott County. It is estimated that commercial and industrial land would expand in the county from 2012-2020. To estimate employment density, Maxfield Research, Inc. used previous employment density research in Minneapolis, Washington (state), Portland, Southern California, and Rhode Island.

Location: Scott County, Minnesota

Relevant Information (97-99):

- Estimated EPA using previous studies: Utilities (40), Construction (30), Manufacturing (30), Wholesale Trade (20), Transportation and Warehousing (15), Information (60), Real Estate, Rental, Leasing (20), Professional and Technical Services (60), Other Services (50).
- Square feet per employee has increased in industrial sectors from 2001 to 2010:
  - Light Industrial: 365 sq ft/employee in 2001 to 387 sq ft/employee in 2010
  - General Industrial: 344 sq ft/employee in 2001 to 505 sq ft/employee in 2010
  - General Warehouse: 538 sq feet/employee in 2001 to 753 sq ft/employee in 2010
  - Large Scale/High Bay: 861 sq ft/employee in 2001 and 2010
- Industrial, warehouse, and distribution have experienced increases in EPA since 2001
- Buildings that have more on-site amenities have higher EPAs

Placer County. 1994. Assumptions and Development Estimates. Placer County Countywide General Plan Final EIR.

This chapter is a discussion of assumptions and development estimates in Placer County's Countywide General Plan Final EIR. The document reports estimates for the development scenarios for years 2010 and 2040, which provide the basis for the rest of the impact assessment.

Location: Placer County, CA

Relevant information (2-8)

- Employment density assumptions:
  - Commercial: 550 sq ft/worker
  - Office: 333 sq ft/worker
  - Industrial: 700 sq ft/worker
  - Assumptions based on 1991 County Assessor's database and projections of use over time

San Diego Industrial Element. N.d.

This portion of the general plan examines industrial parcels in Southeastern San Diego.

Location: San Diego County, California

Relevant Information (97):

- SANDAG identified 180 acres of industrial zoned land in Southeastern San Diego, with an employment density of 15.7 jobs per acre.

The Natelson Company. 2001. Employment Density Study Summary Report. Southern California Association of Governments.

This document produces employment density figures based on land use categories from six counties. The consultants consolidated over 100 categories into 10 categories and calculated employment densities using two methods, median and weighted averages for employment per acre and floor-to-area ratios.

Location: Six-county SCAG region (Imperial County, Los Angeles County, Orange County, Riverside County, San Bernardino County, and Ventura County)

Relevant information:

- Land use categories from six counties were aggregated to 10 primary land use categories:
    - Regional Retail
    - Other Retail/Svc.
    - Low-Rise Office
    - High-Rise Office
    - Hotel/Motel
    - R & D/Flex Space
    - Light Manufacturing
    - Heavy Manufacturing
    - Warehouse
    - Government Offices
- Employment density reported in two formats
    - Median employees per acre density and median FAR. Employees per acre:
        - Regional Retail: 14.99
        - Other Retail/Svc.: 13.49
        - Low-Rise Office: 22.91
        - High-Rise Office: 116.32
        - Hotel/Motel: 11.04
        - R & D/Flex Space: 18.13

        - Light Manufacturing: 11.63
        - Heavy Manufacturing: 17.05
        - Warehouse: 10.63
        - Government Offices: 16.23
    - Weighted average of employees per acre density and weighted average FAR. Employees per acre:
        - Regional Retail: 19.71
        - Other Retail/Svc.: 21.98
        - Low-Rise Office: 43.95
        - High-Rise Office: 175.49
        - Hotel/Motel: 33.07
        - R & D/Flex Space: 20.53
        - Light Manufacturing: 17.83
        - Heavy Manufacturing: 31.14
        - Warehouse: 11.40
        - Government Offices: 51.67

Watson & Associates Economists Ltd. 2008. City of Guelph Employment Lands Strategy Phase 1.

This Employment Lands Strategy created a vision and plan for future employment lands in the City of Guelph, while maintaining competitiveness in business retention and attraction. The first of two phases, Phase 1: Needs and Opportunities Analysis, identified future employment lands by forecasting demand and evaluating existing vacant and developable land supply.

Location: Guelph, Ontario, Canada

Relevant Information (4-14 – 4-18):

- 2006 Employees per net acre in Hanlon Business Park (287 net acres)
    - Manufacturing: 16 EPA
    - Warehousing & Distribution (including transportation, storage, and wholesale trade): 11 EPA
    - Utilities & Construction: 2 EPA
    - Office: 6 EPA
    - Retail: 5 EPA
    - Other: 24 EPA
- 2006 Employees per net acre in the York-Watson Industrial Area (110 net acres)
    - Manufacturing: 29 EPA
    - Warehousing & Distribution (including transportation, storage, and wholesale trade): 11 EPA

    - Utilities & Construction: 30 EPA
    - Office: 14 EPA
    - Retail: 24 EPA
    - Other: 1 EPA
- James Snow Parkway Area, Milton, Industrial EPA: 18
- Harry Walker Parkway Industrial Park, Newmarket, Light Industrial EPA: 23
- Beaver Creek/Commerce Valley Dr. Area, Richmond Hill, Business Commercial/Office EPA: 86; Prestige Industrial EPA: 48
- Brantford, General Industrial EPA: 8
- Mississuga, Limited Outside Storage Industrial EPA: 20, Outside Storage Industrial EPA: 9, Restricted Commercial EPA: 106

Summary

The City of Auburn's Parks, Recreation, and Open Space (PROS) Plan is an ambitious and visionary blueprint designed to elevate the city's parks and recreation facilities to meet the evolving needs of its vibrant community. This comprehensive plan, which spans from 2024 to 2030, is the result of extensive public engagement, reflecting the community's collective aspirations for a higher quality of life through enhanced recreational services and access to diverse outdoor opportunities.

The PROS Plan outlines a strategic Capital Improvement Program (CIP) that prioritizes both immediate enhancements and long-term projects, ensuring that Auburn's parks and open spaces continue to be cherished assets for generations to come. It reaffirms the city's commitment to fostering a healthy, walkable community, promoting environmental stewardship, and creating spaces that inspire connection, well-being, and a sense of place.

To bring this vision to life, the plan is designed with flexibility, allowing for adjustments as community needs evolve, new opportunities arise, and funding sources become available. The city is committed to leveraging a mix of municipal budgets, grants, and the passionate efforts of community volunteers to realize these improvements. Through ongoing review and adaptive management, Auburn aims to create a parks and recreation system that not only meets the current needs of its residents but also anticipates and shapes the future, ensuring that the city remains a dynamic, engaging, and inclusive place to live, work, and play.

August 23, 2024

Auburn is proud of its public parks, arts and recreation programs and facilities which include over 50 parks, community, teen and senior centers, the 18-hole Auburn Golf Course, Postmark Center for the Arts, White River Valley Museum and Mary Olson Farm, as well as two beautiful cemeteries. Our parks include something for everyone, from picnic areas to sports fields. The whole family can enjoy our extensive recreation trail system, enjoy community events such as Petpaloozza, Kids Day, Veterans Day Parade, Farmers Market as well as participate in youth and adult recreation programs as well as our beautiful open spaces and trails.

This PROS Plan is used to develop strategies to deliver the "right parks and programs in the right places" and bring those places to life through events and public programming. Active use of our Parks, Arts and Recreation system improves your health as well as the health of our community.

We continue to grow and change for the betterment of our community and the enjoyment of our citizens, visitors, and patrons. I invite you to visit our parks and facilities and enjoy the quality of life they offer – the benefits are endless.

Sincerely,
Daryl Faber
Director of Auburn
Parks, Arts and Recreation

Introduction

Welcome to the City of Auburn's Parks, Recreation, and Open Space Plan Update (PROS Plan). This document fulfills the requirements of the Growth Management Act (GMA), ensuring the City's eligibility for funding from the Washington State Recreation and Conservation Office (RCO) and other sources over the next six to ten years. It provides a comprehensive overview of Auburn's parks, recreation areas, open spaces, and non-motorized trails.

The PROS Plan incorporates public input gathered through surveys, outreach, and online tools to assess recreational needs and preferences. It evaluates the current conditions of the city's parks and open spaces, establishing a vision and goals based on community demand.

A critical component of this document is the Capital Improvement Plan (CIP). Upon approval, the CIP will finalize the PROS Plan by recommending enhancements aimed at improving services for Auburn residents over the next six years and beyond. These recommendations are strategically linked to potential grant funding sources, guiding the City in prioritizing projects that align with the community's desired quality of life.

Purpose

In Washington State, communities like Auburn rely on Parks, Recreation, and Open Space (PROS) Plans to shape the future of their outdoor spaces, serving as vital roadmaps for growth, development, and preservation. These plans are not just state mandates; they are essential tools for balancing growth with environmental protection and enhancing residents' quality of life.

For Auburn, the PROS Plan is crucial for complying with the Growth Management Act (GMA), which ensures thoughtful planning to accommodate growth while protecting the environment and enhancing residents' quality of life.

However, the PROS Plan goes beyond mere compliance. It embodies a vision and a commitment to community engagement, providing a platform for residents to express their needs and desires for parks, trails, and recreational areas. Through surveys, outreach, and online tools, the city gathers valuable input to ensure the plan reflects the diverse interests and aspirations of its people.

At its core, the PROS Plan is about dreaming big while remaining practical. It sets ambitious goals for improving access to recreational amenities, enhancing existing facilities, and expanding green spaces. These goals are not just lofty ideals; they are actionable steps toward creating a community where residents can live, work, and play.

Within the PROS Plan is the Capital Improvement Plan (CIP), a strategic blueprint for turning vision into action. The CIP outlines specific projects and improvements designed to enhance services for Auburn's residents over the next six years and beyond. These projects are carefully aligned with the community's goals and values, ensuring that every dollar spent brings tangible benefits.

In essence, the PROS Plan is Auburn's promise to its residents: a commitment to vibrant parks, thriving green spaces, and abundant opportunities for outdoor adventure. It is a testament to the city's dedication to building a sustainable future where nature and community flourish together.

Regulatory Requirements

Growth Management Act Requirements

RCW 36.70A.140, known as the Growth Management Act (GMA), is crucial to all Comprehensive Parks, Recreation, and Open Space (PROS) Plans in Washington State. This law mandates that local governments, such as cities and counties, plan for growth through comprehensive plans that consider natural resources, economic development, and residents' quality of life.

Specifically, the GMA requires local governments to adopt comprehensive plans that address various aspects, including parks and recreation. Additionally, it outlines the requirements for a Capital Facilities Plan (CIP) that includes:

- An inventory of existing public facilities, including green spaces.
- Forecasts for future needs of these facilities.
- Plans for expanding or building new facilities.
- A six-year funding plan with identified public funding sources.
- A requirement to reassess plans if funding falls short, ensuring all elements are coordinated. Parks and recreation facilities are integral to the CIP.

The Parks and Recreation element of the GMA further specifies that the plan should include:

- Estimates of park and recreation demand for at least ten years.
- An evaluation of existing facilities and service needs.
- Exploration of opportunities for regional collaboration on park and recreation services.

In the context of a PROS Plan, RCW 36.70A.140 provides the legal framework for integrating parks, recreation, and open space considerations into overall planning. The PROS Plan becomes a specific component of the broader comprehensive plan, focusing on developing, maintaining, and enhancing these aspects within the community.

By adhering to RCW 36.70A.140, cities like Auburn ensure their PROS Plans align with state goals for sustainable growth and development. Compliance with the GMA is essential for Auburn to access state funding and effectively manage its parks, recreation, and open spaces.

Washington Recreation and Conservation Office (RCO) Requirements

The Recreation and Conservation Office (RCO) promotes outdoor recreation and conservation in Washington State through grants and technical assistance, ensuring that all residents have access to well-maintained parks and protected natural spaces. However, their role extends beyond funding.

1. The RCO recognizes the importance of well-planned park systems, which not only serve local communities but also contribute to a statewide network of parks and open spaces. A well-implemented Parks, Recreation, and Open Space (PROS) Plan acts as a roadmap for a city's park system, communicating the current state of parks, recreation facilities, budgeting, and programs to the RCO. It identifies gaps in current and future service levels and develops an actionable vision for the community's future. This roadmap assures the RCO that grant money will be used effectively to meet community needs aligned with statewide goals.

The RCO requires a PROS Plan, updated every six years, to comply with the Growth Management Act (GMA). These plans should cover the following key elements:

2. Existing Conditions & Baseline Analysis: Establishes the groundwork by reviewing past plans, demographics, and park system trends.
3. Community & Systems Needs Assessment: Identifies gaps and needs in park infrastructure, assesses facility conditions, and sets service level benchmarks.
4. Priorities, Strategies, and Implementation Plan: Compiles the analyses and proposes recommendations. It prioritizes goals, outlines implementation strategies, and establishes a potential capital improvement plan for park development.

By following RCO's guidelines and creating a strong PROS Plan, Auburn can secure grant funding, improve its park system, and enhance the quality of life for its residents. To ensure compliance with RCO's framework

and alignment with the GMA, communities must submit the PROS Plan along with the RCO's Self-Certification Form (see Approvals Section). By adhering to this framework, Washington communities can develop a robust vision for their parks and recreation systems and strengthen their grant applications by demonstrating clear vision and strategic priorities.

More information can be found in RCO's Manual 2: Planning Guidelines (January 2024), available at:

https://rco.wa.gov/recreation-and-conservation-office-grants/grant-manuals/.

Process

While RCO has no specific requirements for the number of pages, number of chapters, or format for comprehensive parks plans, it is expected that the plan will capture the needs of the organization and, more importantly, the quality of life desired by the community.

The process used to develop the City of Auburn's Park's PROS Plan Update is modeled after six minimum elements noted in RCO Manual 2: Planning Policies & Guidelines. Whether this plan supports a grant application for a capital project (facility development and land acquisition) or a non-capital project (architectural, engineering, planning, etc.,) the organization of this plan and the process followed is purposefully designed to capture the elements expected by RCO.

Aside from this, the first section, the project overview, this plan is structured around six primary sections or elements needed for an effective comprehensive parks plan:

Existing Conditions (Systems Inventory)

A description of the planning or service area, including the physical setting, the community profile, other mutually supportive planning efforts, and a summary of conditions of the complete inventory of each existing outdoor recreation asset or program.

Public Involvement

A description of how the planning process gave the public ample opportunity to be involved in plan development and adoption.

Demand & Needs Analysis

An analysis that takes your inventory work and public involvement into consideration, balancing public demand with your organization's current capacity and future expectations.

Goals and Objectives

The plan must support the applicant's park and recreation mission, including the current project, with broad statements of intent, or goals that capture a community's desired outdoor recreation resources.

Capital Improvement Program

A list of the desired capital improvements or capital facility programs of at least 6 years that lists and prioritizes desired land acquisition, development, renovation, and restoration projects.

Approvals

A resolution, ordinance, or other adoption instrument showing formal approval of the plan and planning process by the governing entity.

The process diagram below identifies the priority sections needed to develop a GMA-compliant and RCO-certified PROST plan, however, many steps ran concurrently.

Inventory & Assessment

INVENTORY & ASSESSMENT

This section aims to provide a comprehensive understanding of the current conditions of Auburn's parks, recreation programs, open space, and trail system. It examines the condition of the City's parks system, the population served by these parks, and the regional context and planning efforts that shape the system.

The City of Auburn manages a diverse range of parks and recreation assets, including 10 neighborhood parks, 14 community parks, 6 parcels of dedicated open space, 13 pocket parks and tot lots, and 16 special use facilities, including a golf course and trail systems. Given Auburn's current population of 90,096 in 2024, this equates to approximately 11.8 acres of parkland per 1,000 residents. This ratio aligns Auburn with other communities across the country, which have a median of 11.2 acres of parkland per 1,000 residents. A more detailed analysis of the composition of Auburn's parks and recreation system is provided in the Demand & Needs section of this report.

The inventory and assessment section, and the information that follows, is divided into four distinct contexts that capture the structure upon which the parks system is a part of.

- **Physical Context**
- **Demographic Context**
- **Planning Context**
- **Site Evaluations**

Pocket Parks

21st Street Playground • North Tapps Estates
Riversands Park • Terminal Park
Village Square Park • Ballard Park
Dorothy Bothell Park • Dykstra Park
Edgeview Park • Forest Villa Tot Lot
Gaines Park • Indian Tom Park • Jordana Park

Neighborhood Parks

Auburndale 2 Park • Shaughnessy Park
Auburndale Park • Cameron Park
Cedar Lanes Park • Evergreen Park
Lakeland Hills Park • Riverpoint Park
Scootie Brown Park • Trail Run

Community Parks

104th Ave SE • Brannan Park • Fulmer Park
Game Farm Park • Game Farm Wilderness

Centennial Viewpoint Park • City Hall Plaza
Clark Plaza • Community Garden A
Community Garden B • Environmental Park
Fenster Nature Park • Fly-in Lion
Mary Olson Farm • Mountain View Cemetery
Pioneer Cemetery • Plaza Park
Slaughter Memorial

Planning Context

Auburn: A History of Transformation

The Auburn area has a rich history of human settlement, with indigenous populations being the first inhabitants. Tribal groups such as the Skopamish, Smalhkamish, and Stkamish thrived at the confluence of local rivers, establishing trade routes over the Cascade Mountains, interacting with eastern tribes, and using the waterways for resource gathering and commerce with coastal groups.

In the mid-1800s, the first European pioneers arrived in the White River Valley. The following decades, particularly the 1880s, saw the arrival of railroads, which attracted settlers from various regions, including the eastern and Midwestern United States, Europe, and Asia. Early European and Japanese farmers began cultivating the fertile land, leading to bountiful harvests and establishing the White River Valley as a prominent agricultural center.

Auburn's central location between Seattle and Tacoma played a significant role in its development. The construction of a hydroelectric power plant on the upper White River in 1911 provided electricity for Auburn, Seattle, and Tacoma, and powered the Interurban Railway. Additionally, the selection of Auburn by the Northern Pacific Railroad in 1910 as the site for its western freight terminal spurred a population boom, driven by the influx of permanent rail workers in need of housing.

World War II had a profound impact on Auburn's trajectory. The federal government's wartime relocation of Japanese American citizens to internment camps resulted in the loss of numerous businesses, homes, and farms. Unfortunately, most of these families never returned.

Although Auburn remained an agricultural hub for some time, the city began transitioning towards increased industrialization in the post-war period. In the 1960s, the establishment of a Boeing aircraft plant in the city marked a pivotal shift. Efforts to address historical flooding issues, including the construction of Mud Mountain and Howard Hanson Dams by the U.S. Army Corps of Engineers, further supported Auburn's transformation from a frontier settlement to a developed industrial center.

Auburn's strategic position within south King County made it a desirable location during the 1990s, a period coinciding with a population surge across the Puget Sound region. The city's population, estimated to be around 30,000 in 1990, grew significantly over the next few decades, reaching approximately 76,347 by 2014—a 154.5% increase. However, from around 2014 onward, growth slowed to approximately 11%, marking a significant deceleration from the previous pace.

This slowdown during the 2000s can be attributed to a combination of economic and demographic factors. The region faced the aftermath of the dot-com bust and the early 2000s economic recession, which impacted job creation and investment. Additionally, the housing market crisis that culminated in the 2008 financial crash significantly affected real estate development and home purchases, leading to a decrease in population influx. Infrastructure limitations and congestion also played a role, as the city's capacity to accommodate rapid growth was stretched thin, particularly considering its physical context. Moreover, competition from nearby cities offering more attractive amenities or better economic opportunities may have diverted potential residents and businesses away from Auburn. These factors collectively contributed to a period of slower growth for the city during that decade.

Today, Auburn remains an attractive community known for its family-oriented, small-town atmosphere. With more affordable housing compared to most of King County, convenient highway access, and a charming small-town feel, Auburn is poised for continued, stable, and sustainable growth. This growth will increase the demand for quality of life elements that the community expects, including the demand for and access to recreational facilities.

Physical Context

Auburn's location in the Puget Sound region has profoundly influenced its historical development and future growth. The city's geography has been central to its evolution, with its proximity to rivers making it an essential transportation hub for both Native Americans and early settlers. The fertile valley attracted cultivation, and railways were later built to transport crops and timber from Auburn to larger cities like Tacoma and Seattle.

Today, Auburn is traversed by two major rivers, the White River and the Green River, along with two critical transportation corridors, SR-167 and SR-18. These natural and man-made features divide the city, with a flat valley floor surrounded by steep ascents leading to the West Hill and East Hill. The valley is further segmented by Highway 167 and distinct zoning designations, creating identifiable areas such as Downtown and the Industrial Valley.

The Green River is fed by numerous creeks that carve through the East Hill, forming ravines and preserving natural spaces, which in turn limit mobility within this region. East Hill is primarily a residential area with pockets of retail, and it is crossed by major roads like Highway 515 and E James Street. In contrast, West

Hill is somewhat isolated from the rest of the city, bounded by the Green River and Highway 516, and further divided by I-5.

Topography

Nestled within the Puget Sound Lowland region of the Pacific Northwest, Auburn is a city shaped by the enduring legacy of ancient glacial epochs and the ongoing influence of geological forces. Positioned between the eastern foothills of the Cascade Range and the shores of Puget Sound, Auburn features a diverse range of terrain types.

To the east, the Cascade foothills rise gradually, giving the landscape a gentle undulation that ascends toward the towering peaks of the Cascade Range. These foothills provide a rich tapestry of topographical variety, offering panoramic vistas and numerous recreational opportunities.

The city's landscape is marked by a broad, flat valley bordered by the Green River and Lea Hill to the east, and West Hill to the west. These green slopes define Auburn's contours, creating natural boundaries within the urban expanse while offering breathtaking views of the Cascade Range and the iconic silhouette of Mount Rainier.

To the west, Auburn's proximity to Puget Sound imparts a maritime character to its climate and geography. Located near the southern edge of the sound, the city benefits from easy access to waterfront areas and the thriving marine ecosystems they support. This maritime influence moderates the climate, resulting in milder winters and cooler summers compared to the more extreme conditions experienced further inland.

Hydrology

Auburn's intricate network of rivers and creeks holds deep significance for the community, serving a variety of crucial functions and enriching the local landscape. These waterways act as natural drainage systems, contribute to flood mitigation, provide vital habitats for diverse fish and wildlife, offer scenic beauty, hold historical importance, and create opportunities for recreation.

The history of Auburn's watercourses, particularly the White River, highlights the complex interaction between natural forces and human intervention. Before 1906, the White River flowed through King County, merging with the Green River before emptying into Elliot Bay. However, a significant debris blockage in 1906 altered the river's course, diverting floodwaters away from King County and redirecting them down the Stuck River into the Puyallup River. To manage this change, a permanent diversion wall was built at Game Farm Park in Auburn, directing the White River to its current path.

Today, the White River in southern Auburn serves as a natural boundary, separating the more developed urban core from the rural areas beyond. Historically, the city developed within the river valley, where many of its parks are located. However, with the valley reaching its developmental capacity, urban growth has expanded into newly annexed areas to the west, east, and south. Various water bodies, including the Green River, Mill Creek, Bowman Creek, Olson Creek, Mill Pond, and White Lake, have significantly influenced Auburn's spatial development. The wetlands along much of Mill Creek have limited extensive urbanization in that area, though some industrial properties have been established.

Among Auburn's water features, White Lake and West Auburn Lake are the only naturally occurring lakes or ponds. West Auburn Lake, acquired by the city within the past decade, offers recreational opportunities within a highly urbanized setting. In contrast, White Lake, located south of Highway 18, remains privately owned and inaccessible to the public, preserving its natural state.

Climate

Nestled within a temperate maritime climate, Auburn experiences a nuanced interplay of meteorological forces, shaping its seasonal identity with distinct variability.

Summer (June to August) brings warmth to the region, with temperatures typically ranging from 75°F to 85°F (24°C to 29°C). While the season is mostly dry, occasional light rainfall may punctuate the otherwise arid conditions.

Autumn (September to November) ushers in cooler temperatures, settling between 60°F and 70°F (15°C to 24°C). During this period, Auburn transitions to a wetter climate, with more frequent showers that cast the familiar Pacific Northwest veil of precipitation over the landscape.

Winter (December to February) sees temperatures dip to an average of 45°F to 50°F (7°C to 10°C). While cold air intrusions can briefly push temperatures below freezing, such occurrences are typically short-lived. Precipitation increases during the winter months, and although snowfall is rare, it occasionally blankets the city. When snow is accompanied by freezing rain, it can significantly impact local traffic.

Spring (March to May) signals a gradual warming, with temperatures rising to a moderate 55°F to 65°F (13°C to 18°C). Intermittent showers persist, remnants of the previous seasons' precipitation, as the landscape undergoes its annual rejuvenation.

Auburn receives approximately 37 inches (940 mm) of annual precipitation, evenly distributed across the seasons, reflecting its maritime influence. The city's proximity to the Pacific Ocean helps moderate extreme temperatures, tempering both the summer heat and winter chill.

Auburn's diverse topography, with its varying elevations and water bodies like the Green River, fosters the development of microclimates within the city. These microclimates create subtle weather patterns and temperature differences, adding richness and complexity to Auburn's overall climate.

DEMOGRAPHIC CONTEXT

Auburn, Washington, is a vibrant city with a diverse demographic profile. Based on the latest U.S. Census data, here is a detailed breakdown of key demographic aspects:

Population Size & Growth

Auburn is a mid-sized city in King County, Washington, with a population of approximately 90,096 as of July 2023. The city has experienced steady growth, reflecting broader trends in the Seattle metropolitan area. Since 2000, Auburn's population has increased by 54.4%. With a population density of about 3,046 people per square mile, the city continues to see urban development and residential expansion.

In recent years, Auburn's growth rate has moderated. Between 2020 and 2023, the population grew at an annual rate of about 0.99%. Looking ahead, the growth rate is projected to decelerate to approximately 0.31% annually from 2023 to 2028.

Employment

Auburn's economy is diverse, with key industries including retail, manufacturing, healthcare, education, and various service sectors. Major employers in the city reflect this diversity. Among them are Boeing, which operates a significant aerospace manufacturing facility in Auburn, employing thousands of workers and playing a central role in the city's industrial base. Multicare Health System and CHI Franciscan Health are also significant employers, providing a wide range of healthcare services to the region.

In addition to these, The Muckleshoot Indian Tribe is a major contributor to the local economy, not only through its government operations but also through its enterprises, such as the Muckleshoot Casino and Muckleshoot Bingo. Auburn School District is another key employer, reflecting the city's strong focus on education.

Many residents of Auburn work within the city, benefiting from the presence of these major employers. However, a significant portion of the population commutes to nearby employment hubs such as Seattle, Tacoma, and Bellevue, which are easily accessible due to Auburn's strategic location and robust transportation infrastructure, including major highways and rail services.

Auburn's accessibility and central location make it a vital center for both residential living and employment opportunities within the Puget Sound region. The combination of local employment and the city's position within a broader regional economy enhances Auburn's role as both a residential community and a significant economic hub.

Race and Ethnicity

Auburn stands out for its notable ethnic and racial diversity, which is somewhat unique compared to other cities in Washington State. According to recent data, the racial composition of Auburn's population is approximately 59.7% White, 11.6% Asian, 7.3% Black or African American, 2.1% American Indian or Alaska Native, and 2.8% Native Hawaiian or other Pacific Islander. Additionally, 16.5% of the population identifies as Hispanic or Latino. The city's diversity is further highlighted by the fact that 21.4% of Auburn's residents are foreign-born, a figure that exceeds the state average.

Auburn's significant Asian and Hispanic or Latino populations are particularly noteworthy. While many cities in Washington have diverse communities, Auburn's proportion of Asian residents stands out, reflecting broader trends in the Seattle-Tacoma-Bellevue metropolitan area, yet distinguishing itself from smaller or less urban areas in the state.

Moreover, Auburn is home to a significant population of Marshall Islanders, who have migrated to the United States primarily under the Compact of Free Association (COFA). This treaty allows citizens of the Marshall Islands, along with those from Micronesia and Palau, to live and work in the U.S. without visas. Auburn has become a notable center for Marshallese migrants, following Arkansas, which hosts the largest population on the mainland.

The migration of Marshallese to the U.S. has been driven

by various factors, including economic opportunities and better access to healthcare. Additionally, many Marshallese migrate due to environmental degradation and health issues linked to the legacy of nuclear testing conducted by the United States in the Marshall Islands during the mid-20th century. This has resulted in health concerns such as cancer and other chronic diseases, prompting many to seek better healthcare in the U.S.

In Auburn, the Marshallese community has maintained strong cultural ties, frequently gathering in local churches and community events to support one another and preserve their traditions. This tight-knit community aspect is crucial as they navigate the challenges of migration, including language barriers and economic adjustments.

Auburn's demographic diversity is rooted in its historical development as a key agricultural and industrial hub, which has attracted various immigrant communities over the years. This has created a rich cultural fabric that continues to shape the city's identity today.

Languages

While English is the primary language spoken in Auburn, with 69.36% of residents speaking it exclusively, the city's cultural diversity means that a variety of languages can be heard in everyday life. Spanish is the most common non-English language, spoken by 13.28% of the population. Additionally, other languages, including various Slavic languages, contribute to the city's linguistic landscape.

The Auburn School District reflects this diversity, with over 80 languages spoken in the homes of its students. More than 40% of students use multiple languages in their daily lives. The district's Multilingual Learner Program is designed to help students develop English language skills while also promoting the preservation of their home languages. Although the exact number of students speaking each language at home is not disclosed due to privacy concerns, the fact that the district's Multilingual Learners department serves students from over 80 different language backgrounds illustrates the rich tapestry of languages spoken in Auburn.

Moreover, the district offers translation services for a variety of languages, including Afrikaans, Burmese, Hmong, Marshallese, Russian, Spanish, and Ukrainian. While this is not an exhaustive list, it highlights some of the prominent languages spoken in the community alongside English.

These languages likely represent just a portion of Auburn's diverse linguistic landscape. However, by examining the languages supported by the school district, we can gain insight into the multilingual character of the city.

Age

Auburn has a diverse age distribution among its population of approximately 90,096 people. The largest age group consists of residents aged 35 to 54, comprising about 27% of the population. This is followed by children and teenagers (ages 5 to 17), who make up roughly 18%. Young adults aged 25 to 34 represent around 15%, while those in the 55 to 64 age bracket account for approximately 12%. The senior population (over 65 years) comprises about 13% of the population, and those aged 18 to 24 constitute around 9%. The youngest segment, children under 5 years old, represents about 7% of Auburn's population.

Recent trends in Auburn's age distribution have shown relative stability across the different age groups. However, there has been a slight increase in the senior population, mirroring broader national trends of an aging demographic. This shift suggests a growing need for services and amenities that cater to older residents, while also maintaining support for families and younger adults.

Gender

Auburn's gender distribution is close to an even split between males and females, with a slightly higher percentage of males. According to the latest U.S. Census Bureau data, Auburn has approximately 46,922 males (52.1%) and 43,174 females (47.9%), indicating a clear majority of males over females in the city. This trend is somewhat uncommon in many parts of the United States, where women typically outnumber men.

Income

Auburn's residents represent a wide range of income levels, reflecting the diverse economic profiles of its neighborhoods and communities. While some areas of Auburn are affluent, others have a higher percentage of lower-income households. The city's economic structure includes a mix of blue-collar and white-collar workers, contributing to this diversity. As of the most recent data, the median household income in Auburn is approximately $83,881, with a per capita income around $41,440. The city's poverty rate is 10.7%, and 14.9% of children live below the poverty line. Housing is a significant aspect of the local economy, with the median home value around $561,000 (per 2024 Zillow Home Value Index). This reflects a community with varied economic experiences, encompassing both substantial earning potential and areas in need of economic support.

Education

Auburn is served by a variety of educational institutions, including both public and private schools. The Auburn School District is a key provider, operating numerous elementary, middle, and high schools, such as Auburn High School, Auburn Riverside High School, and Auburn Mountainview High School, along with various elementary and middle schools spread throughout the city. The district serves a substantial student population, with an enrollment of over 17,000 students.

Private education options in Auburn include Valley Christian School, which offers a Christian-centered education from preschool through 12th grade, and Auburn Adventist Academy, a Seventh-day Adventist high school. Additionally, the Muckleshoot Tribal School, managed by the Muckleshoot Indian Tribe, provides education from kindergarten through high school, addressing the specific needs of its tribal community.

Green River College is a notable public institution in the area, offering a range of associate degrees, certificates, and transfer programs. Collectively, these educational institutions contribute to the diverse and comprehensive learning environment in Auburn.

Housing

Auburn's housing market is diverse, featuring a mix of single-family homes, apartments, and affordable housing options. As of mid-2024, the median home price in Auburn is approximately $621,000 (per 2024 Zillow Home Value Index), reflecting a 5.5% increase over the past year. The market remains highly competitive, with homes typically selling within a week of listing. Rental prices are also significant, with median rents around $1,919 per month. The city supports a range of affordable housing programs through the King County Housing Authority, including Section 8 vouchers and subsidized housing designed for low-income families, seniors, and individuals with disabilities.

This varied housing landscape influences Auburn's parks and recreation system by increasing the demand for accessible and inclusive recreational spaces. The presence of affordable housing communities, such as Burndale Homes and Firwood Circle, which offer on-site services and are located near parks, highlights the importance of maintaining and expanding public recreational facilities. These parks provide essential amenities and green spaces for residents of all income levels, promoting community well-being and environmental sustainability.

Commuters

Auburn is often considered a commuter city due to its strategic location in the Puget Sound region and its proximity to major employment centers such as Seattle, Tacoma, and Bellevue. The city's population fluctuates during the day as residents commute to jobs in these areas. The average one-way commute time for Auburn residents is approximately 31.6 minutes, covering an average distance of around 10.75 miles.

Here's an overview of key cities to which Auburn residents commonly commute for work and the respective employment opportunities:

1. Tacoma is a major city in the Puget Sound region offering a wide range of employment opportunities across various industries.
2. As a neighboring city, Puyallup provides job options in retail, healthcare, education, and other sectors.
3. Although farther from Auburn, some residents commute to Seattle for jobs in tech, finance, healthcare, and various other industries.
4. Located to the north, Kent offers job opportunities in logistics, manufacturing, and retail.
5. Also north of Auburn, Renton is home to companies in aerospace, technology, healthcare, and other industries.
6. To the west, Federal Way has a diverse job market, including opportunities in retail, healthcare, and education.

System Inventory

Auburn takes great pride in its expansive parks system, designed to cater to a variety of recreational interests while preserving the natural beauty of the area. Among the many parks throughout the city, Les Gove Park stands out as a tranquil oasis in downtown Auburn, offering verdant green spaces, meandering pathways, and designated picnic areas, providing a peaceful retreat amid the urban bustle. Game Farm Park, a premier destination for sports enthusiasts and families alike, spans 80 acres and features sports fields for soccer, baseball, and softball, along with tennis courts, a skate park, and playgrounds. Isaac Evans Park, located along the scenic Green River, delights visitors with riverside trails, scenic viewpoints, and inviting picnic spots, allowing nature lovers to immerse themselves in a serene environment. Brannan Park, near the Green River, is a picturesque spot for outdoor recreation, offering walking trails, picnic shelters, and a boat launch for water enthusiasts. For those seeking a more botanical experience, Soos Creek Botanical

Garden (privately owned) showcases a stunning array of native and exotic flora, inviting visitors to explore its themed gardens, winding paths, and tranquil ponds.

Auburn's park system extends beyond recreation to include educational and environmental initiatives. Auburn Environmental Park combines recreational amenities with interactive exhibits and interpretive trails, serving as a platform for environmental education and awareness. These programs enrich the community's understanding of local ecosystems and foster a deeper appreciation for the natural world. In essence, Auburn's parks system is more than just a collection of green spaces; it's a vibrant tapestry of recreational opportunities, natural wonders, and educational endeavors that enrich the lives of residents and visitors alike.

Auburn prioritizes the development of park spaces that align with the community's values. To determine what improvements are needed or desired, the first step is to catalog and assess the current conditions of all the city's existing parks, open spaces, and trail resources. This process involves identifying the assets that Auburn currently owns, manages, and maintains, and evaluating them to ensure they meet or exceed park development standards, safety criteria, liability and risk concerns, recreational trends, aesthetic appeal (placemaking), and landscape and climate change resiliency objectives.

To effectively plan for budgeting and resource allocation based on each park's level of service or area of influence, parks are also assessed to determine the individual contributions they provide to the community.

Physical & Mental Health: Assessing a park by expected or projected use helps visitors know what to expect and allows park managers to establish rules and guidelines that ensure visitors' safety and preserve the park's resources.

Ecological Diversity: Parks often vary in terms of their ecosystems and biodiversity. Assessing parks based on their ecological features can aid in understanding and protecting these unique natural environments.

Cultural and Historical Significance: Some parks are often assessed based on their cultural or historical importance. These designations help preserve and showcase sites of cultural heritage, such as historical landmarks, archaeological sites, and areas with indigenous significance.

Tourism & Branding Benefits: Classifying parks can aid in promoting tourism and attracting visitors. Visitors often have varying interests, so categorizing parks allows tourism agencies to target specific audiences with appropriate marketing strategies.

Educational and Interpretive Benefits: Classification helps in developing educational programs and interpretive materials tailored to the park's unique characteristics. This enhances visitor experiences by providing relevant information about the park's natural, cultural, and historical attributes.

Research and Conservation Planning: Scientists and conservationists can use classification systems to prioritize research efforts and develop conservation plans. By understanding the different types of parks and their specific features, they can focus on areas that are most in need of study and protection.

Categorized Recreation Programs

The City of Auburn offers a wide range of recreation programs designed to meet the diverse interests and needs of its community members. These programs, categorized by age group and activity type, provide opportunities for fitness, personal growth, social engagement, and community involvement.:

Fitness Programs:

- Fitness memberships
- Fitness classes
- Open gym sessions
- Equipment and weight room access at the Auburn Community & Event Center

Preschool Programs (Ages 1-5):

- Indoor playground
- Classes and programs
- Birthday party packages
- Youth Programs (Ages 6-12):
- Rec n Roll (mobile recreation unit)
- Summer camps
- Classes and programs
- Family programs
- Birthday party packages

Teen Programs (Ages 13-18):

- The REC Teen Center
- Classes and programs
- Camps
- MakerSpace

Adult Programs (Ages 18+):

- Art classes
- MakerSpace
- Fitness classes
- Open gym

Senior Programs (Ages 50+):

- Senior Activity Center
- Fitness classes
- Social activities
- Educational workshops

Family Programs:

- Various family-oriented activities and events

Specialized Recreation:

- Programs for individuals with disabilities
- Sports & Athletics:
- Youth leagues
- Youth sports classes

Community Events and Special Programs:

- Auburn Farmers Market
  (June-September at Les Gove Park)
- National Recreation and Park Month events
  Various special events throughout the year

Cultural Arts Programs:

- Performing arts
- Public art installations

Outdoor Recreation:

- MTB Trailblazers biking program
- Hiking and trail activities

Volunteer Opportunities:

- Community service and volunteer programs

Facility Rentals:

- Athletic fields
- Campground
- Meeting and banquet rooms
- Picnic shelters

Overall, the City of Auburn's diverse array of programs and services supports a healthy, active, and engaged community and highlights Auburn's commitment to providing diverse and inclusive recreational opportunities for its residents, promoting community well-being and engagement

Existing Parks & Recreation Facilities

The City of Auburn offers a wide array of recreational opportunities and park spaces for both residents and visitors, with a strong emphasis on developing park spaces that align with the community's values. Auburn's park system currently encompasses approximately 980 acres of mostly developed or partially developed parklands, along with non-contiguous trail segments along the White River that aim to connect to the downtown core.

To identify necessary or desired improvements, the City first catalogs and assesses the current conditions of all its existing parks, open spaces, and trail resources. This assessment process involves identifying and evaluating the assets that the City of Auburn owns, manages, and maintains, ensuring they meet or exceed park development standards, safety criteria, and liability and risk concerns. Additionally, this evaluation addresses recreational trends, enhances aesthetic appeal through placemaking, and supports landscape resiliency.

Assessment Methodology

Modeled after RCO's suggested Level-of-Service (LOS) grading system and NRPA's "system level" approach, a custom assessment methodology was used in this study to inventory and assess the current range of recreation and open space opportunities within any particular area. The methodology used in this report is ranked on a scale of 5 to 0, from high to low, across a number of different criteria, including:

- Location
- Park Classification
- Facility Age
- History
- Funding Encumbrances or Regulatory Framework
- Condition of Individual Components & Amenities
- Maintenance / Known Issues

Table 2-1: Assessment Rankings

Ranking (High to Low)	Description
0	n/a - Not Present
1	Major liability and structural failures present and imminent. Needs to be closed.
2	Condition is poor with major structural, cosmetic, maintenance, and liability issues observed.
3	Condition is moderate with some major cosmetic or maintenance issues that create minor liability concerns.
4	Condition is very nice with only minor cosmetic or maintenance issues observed.
5	Perfect condition with a long life cycle and no risk or liability issues.

Please note that park areas developed by private entities e.g., a HOA, or and public or private schools were not included on the overall City Park map, therefore they were not part of the assessment procedure.

Process

The following steps were executed to capture the institutional knowledge of City staff, while allowing the consultant team to assess each park and trail component.

1. Inventory and build maps of the existing parks.
2. Develop a detailed inventory of each park from the previous planning process and geospatial sources, including encumbrances research and park / funding histories.
3. Distribute inventory information to City for review.

Park Classifications

Classification systems provide a standardized method to develop, organize, operate, and manage parks based on certain criteria, which can include factors such as their size, ecological importance, recreational opportunities provided, historical or cultural significance, placemaking potential, economic development, and ability to support conservation & climate resiliency goals.

Table 2-2: Park Classifications

Key*	Classification
C	Community
N	Neighborhood
O	Natural Areas & Greenspaces (Open Space)
S	Special Use Facilities
P	Pocket Parks / Mini-Parks / Tot Lots
T	Trails, Bikeways & Pathways

* to be used when referring to the parks system key map, Figure 2-1.

Washington State Parks & RCO use different classification definitions but are built on the same premise - consistent methodology is critical to best manage our public spaces and to ensure the public are active and able to enjoy a quality mix of structured and natural environments and all the benefits that they provide.

There are six basic park and greenspace facility types typically classified and utilized by municipalities the size of Auburn of which are currently exhibited:

Pocket Parks / Mini-Parks / Tot Lots

Pocket parks are very small and serve a limited radius (up to ¼-mile) from the site; they provide passive and play-oriented recreational opportunities. Examples of pocket parks can include a tot lot with play equipment such as a climber, slide or swings; a viewpoint; or waterfront access areas such as at street ends.

A small urban plaza or civic recognition project may also be considered a pocket park. Parking is not often provided at pocket parks, although lighting may be used for security and safety.

Neighborhood (Local) Park

Generally considered the basic unit of traditional park systems, neighborhood or local parks are small park areas designed for unstructured play and limited active and passive recreation. They are generally up to around 5 acres in size, but can be larger depending on a variety of factors including neighborhood need, physical location and opportunity, and should meet a minimum size of 2 acre in size when possible.

Community Park

Larger multi-acre sites developed for organized play, contain a wider array of facilities and, as a result, appeal to a more diverse group of users. Community parks are generally 20 to 50 acres in size, meet a minimum size of 20 acres when possible and serve residents within a 1-mile radius of the site.

Natural Areas (Open Space)

Natural areas are those which are preserved to maintain the natural character of the site and are managed to protect valuable ecological systems, such as riparian corridors and wetlands, and to preserve native habitat and biodiversity. In managing for their ecological value, these natural areas may contain a diversity of native vegetation that provides fish and wildlife habitat and embodies the beauty and character of the local landscape. Low-impact activities, such as walking, nature observation, and fishing are allowed, where appropriate, and horseback riding is also permitted on certain sites.

Trails, Bikeways & Pathways

Trails are non-motorized transportation networks separated from roads. Trails can be developed to accommodate multiple uses or shared uses, such as pedestrians, in line skaters, bicyclists, and equestrians. Bikeways are different than trails in that their principal focus is on safe and efficient non-motorized transportation. Bikeways & pathways serve distinctly different user groups than trail users. For shared-use trails, it is important that the alignment and cross sections be designed with flexibility to accommodate higher speeds, passing zones and greater widths. Surfaces will vary with intended use and environmental considerations.

More information on the other classification types not used can be found in Appendix B.

Current Inventory

Over its 133-year history, Auburn, WA, has developed a robust park system under the guidance of its past and present Mayors and City Councils. The City has expanded its parkland through various means, including donations, dedications, and purchases. Each park undergoes regular evaluations and renovations to ensure they align with evolving recreational trends, aesthetic standards, safety protocols, and government regulations. To meet the needs of both current and future residents, Auburn must continue to acquire new parkland while also maintaining and enhancing its existing parks and facilities.

This section provides an overview of each park and open space, detailing the neighborhood it is located in, its year of establishment, classification, and acreage. As a prelude, the following table identifies the quantity and total acreage of the entire system, based on its classification.

Parks, Open Space & Special Use Facilities

The core of Auburn, WA's parks system is characterized by its diverse parklands, expansive open spaces, and specialized use facilities, all of which contribute to the community's recreational and aesthetic needs.

Auburn's parklands consist of a variety of mini-parks, neighborhood parks, community parks, open spaces, and special use facilities that provide residents with access to green spaces for leisure, sports, and recreational activities. These parks are equipped with amenities such as playgrounds, sports fields, picnic areas, and walking trails, ensuring they cater to the needs of individuals and families alike. Open spaces offer residents opportunities for passive recreation, such as hiking, bird-watching, and enjoying the scenic beauty of nature. The city's commitment to maintaining these open spaces ensures that natural resources are protected and accessible to the community.

Table 2-3: Existing Parks & Open Spaces

Key	Classification	Count	Acres
C	Community	14	283.30
N	Neighborhood	10	51.23
O	Open Space	6	321.42
S	Special Use Facilities	14	307.69
P	Tot-Lots	13	16.71
	Totals:	**57**	**980.35***

* does not include other non-park related properties, or other landbanked right-of-ways and easements.

21st Street Playground

405 21st Street SE
0.17 acres – Dedicated in 2006
Classification: Pocket Park
Status: Developed

This small pocket park is situated adjacent to a City stormwater detention pond. Park amenities include a playground, picnic table, and benches. The park is on a short list of parks that need to go through the naming process.

Auburndale Park

31700 108th ST SE
9.74 acres –Transferred in 2003
Classification: Neighborhood Park
Status: Developed

Auburndale Park falls into the neighborhood park category, and like many in this classification, is underused. The City recently constructed an entrance on the east side of the park in order to provide better access to the surrounding neighborhoods in an effort to increase use in the park. The main feature of the park is a natural wooded area with a loop trail. There is a play area, picnic tables and barbecue grill.

Auburndale Park II

29725 118th ST SE
9.34 acres – Transferred in 2003
Classification: Neighborhood Park
Status: Undeveloped

Auburndale II is an undeveloped park with a mix of native over-story, and an under-story that is dominated by Himalayan blackberry and scotch b room. A future trail connecting Lea Hill to the valley floor is being considered, which would likely run east to west along the northern boundary of the park.

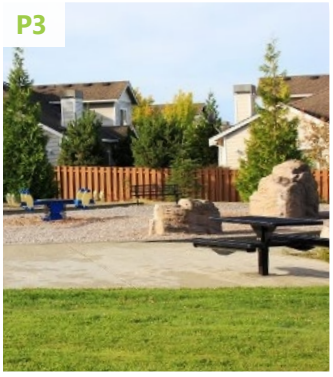
Ballard Park

1612 37th Way SE
0.68 acres - Dedicated in 1966
Classification: Pocket Park
Status: Developed

Ballard Park is a neighborhood park with a distinctive stone picnic shelter. In 2003, a new playground and irrigation system was installed, as well as pathways and an entrance gate. Two new tables and benches were installed and a new concrete fence constructed at that same time. Ballard Park is situated high above the White River and benefits from an appealing view of the river. There is not direct river access.

Cameron Park

3727 Lemon Tree Lane
3.85 acres – Dedicated in 1989
Classification: Neighborhood Park
Status: Developed



Cameron Park is a nestled between two rows of houses, east of the Muckleshoot Indian Reservation. The park has two entrances, one near the intersection of Lemon Tree Lane SE and Academy Drive SE, and the other off of Lemon Tree Lane SE. Visitors can take an asphalt path into the heart of the park that winds through a large grassy open field, planted with occasional trees. A colorful play structure is located in the northeast corner of the park. Picnic tables next to the playground provide seating for picnics or for caretakers of young children. The layout of the path provides a good opportunity to integrate the play area into the rest of the park using landscaping to create a more lush and cohesive setting. A limiting factor in achieving this is the utility easement of Northwest Pipeline, which reduces the ability to landscape and improve some parts of the park.

Cedar Lanes Park

1002 25th Street SE
8.36 acres – Dedicated in 1969
Classification: Neighborhood Park
Status: Developed

Cedar Lanes Park is a unique combination of native woodland, well-kept lawn, and a formal playground. The forested area contains a mix of western red cedar, big leaf maple, and cottonwood trees. The park includes a bike skills park with drop zones, a flow track and other features that was constructed in 2023. In 2024 an asphalt pump track, new restroom, and storage/shelter were constructed.

Dorothy Bothell Park

1087 Evergreen Way SE
4.35 acres – Dedicated in 2009
Classification: Pocket Park
Status: Developed

Located adjacent to the Lakeland Hill Community Center, Dorothy Bothell Park is a an attractive neighborhood park in Lakeland Hills. Park amenities include a playground, climbing boulders, and a trail that connects with other trails beyond the park. Dinosaur bones have been buried in the play area for the kids to uncover.

P4

Dykstra Park

1487 22nd Street NE

1.67 acres – Dedicated in 1979

Classification: Neighborhood Park

Status: Developed

Dykstra Park is a small, attractive park along the Green River. Its linkage to the larger Isaac Evans Park via a suspension bridge increases its value to the community. The bridge was substantially repaired in 2002, with major structural repair completed on the north end of the structure.

Dykstra is primarily a playground neighborhood park, and its proximity to the river also makes it popular with walkers and wildlife lovers. A new playground was installed in April 2015 made possible by a Dr. Pepper/ Kaboom! Playground grant. The playground was constructed using volunteer labor during the City's annual Clean Sweep volunteer event. In addition to the three new playground pieces, approximately 150 cubic yards of playground fiber wood chips were placed within the play area.

P6

Forest Villa Park

1647 Fir St. SE

0.23 acres – Dedicated in 1971

Classification: Pocket Park

Status: Developed

The Forest Villa Park is located on a single lot in a single family residential neighborhood. The play structure is the primary focus of the park.

P7

Gaines Park

1008 Pike Street NW

1.33 acres – Dedicated in 1999

Classification: Neighborhood Park

Status: Developed

Gaines Park is located in the Vistaria/Sunning Hills residential area. This park is a joint project between the City's Storm Water Division and Parks and Recreation. There is a short section of boardwalk through a wetland area on the east edge of the park. The park has a picnic area, play area, ½ basketball court, and a walking trail through the park.

P8

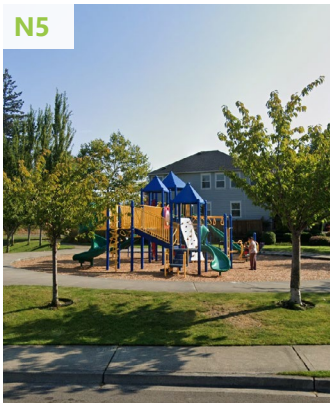
Indian Tom Park

1316 6th Street NE

0.42 acres – Deeded to the City in 1979 from King County

Classification: Pocket Park

Status: Developed



This small park is located on a single lot in the middle of a residential block. A playground was installed in April 2014 made possible by a Dr. Pepper/ Kaboom! Playground grant. The playground was constructed using volunteer labor at the City's annual Clean Sweep volunteer event.

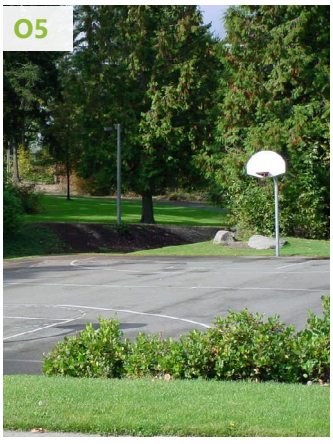
Jornada Park

1433 U Court. NW
1.89 acres – Dedicated in 2004
Classification: Pocket Park
Status: Developed

This small park is located on a single lot in the middle of a residential block. It contains a play structure, climbing wall, picnic tables and a short loop trail.

Evergreen Park

5480 Charlotte Ave. SE
2.73 acres – Dedicated in 2014
Classification:Neighborhood Park
Status: Developed



This park was constructed to meet level of service needs for a neighborhood park within in newly developed Kersey III neighborhood. A paved walking trail with picnic tables and benches connects the ball field, to the playground and the basketball court.

Edge View Park

1433 U Court. NW
0.79 acres – Dedicated in 2014
Classification: Pocket Park
Status: Developed

This park has similar features and amenities as nearby Evergreen Park, but on a smaller scale.

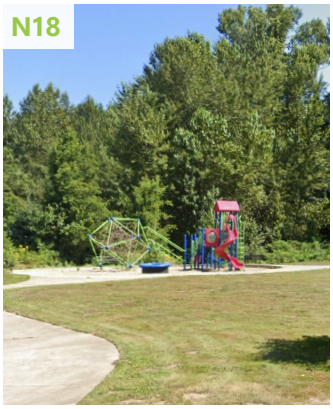
Lakeland Hills Park

1401 Evergreen Way SE
5.06 acres – Dedicated in 1993
Classification: Neighborhood Park
Status: Developed

Lakeland Hills Park serves the Lakeland development in south Auburn. This five-acre park is nestled into a wooded hillside, where many native trees were saved and integrated into the design of the park. The park provides active recreation facilities at a neighborhood scale, and also a paved trail around the circumference of the park. Restroom facilities were built in this park and share a common structure with some water utility equipment.

Lea Hill Tennis Courts

32121 105th Pl. SE.
1.18 acres
Classification: Special Use Facility
Status: Developed



The Lea Hill Tennis Court has a unique location on top of a City of Auburn water reservoir. Originally, two courts were constructed, but one of these is now being used as a basketball court. The court is on Lea Hill, surrounded by an adjacent apartment complex. Standing water is evident in several low areas.

Riverpoint Park

1450 32nd St. NE
3.8 acres – Dedicated in 2005
Classification: Neighborhood Park
Status: Developed

Built in 2005, the park is adjacent to the Green River and provides an access point to the Green River Trail.

Trail Run

5014 Pike Street NE
1.76 acres – Dedicated in 2015
Classification: Neighborhood Park
Status: Developed

This pocket neighborhood park located is along the Green River near the northern City Limits. Visitors can gain direct access from the park to a bridge across the river that connects to the City of Kent's S. 277th Street Trail (1.1 miles). The future Green River Trail will run along the eastern boundary of the park if the trail is ever extended through Auburn.

Rotary Park

2635 Alpine Street SE
3.89 acres – Dedicated in 1966
Classification: Neighborhood Park
Status: Developed

Rotary Park was developed in 1966 by the Auburn Rotary Club. At first glance the playground is the only apparent facility here. The rolling topography, unusual shape of the site and the location of conifers obscure the presence of the other major recreation facilities, including the basketball court and informal softball field. An additional acre, and a half-court basketball was added to Rotary Park in connection with the development of the Riverwalk neighborhood.

Scootie Brown Park

1403 Henry Road NE
1.68 acres – Dedicated in 1973
Classification: Neighborhood Park
Status: Developed

The park is located at a junction between commercial and residential zones. Bounded on the north by 8th Street N.E., the park has a busy, open feel, with minimal landscaping. The City's youth baseball programs use this park for practice.

Shaughnessy Park

3302 21st Street SE
3.46 acres – Dedicated in 1973
Classification: Neighborhood Park
Status: Developed

Shaughnessy Park is located in an attractive setting of mature Douglas Firs on a quiet residential street. Several recreational courts are located in close proximity to the street. An open play field with a backstop is in a corner of the park and is not readily apparent from other parts of the park and street. The adjacent residential neighbors have erected fences between their backyards and the playing field. Recent park improvements were made possible by a Neighborhood Block Grant in the amount of $50,000.

Terminal Park

1292 C Street SE
1.22 acres – Dedicated in 1913
Classification: Neighborhood Park
Status: Developed

Terminal Park is a small park along a quiet residential street. The newly renovated playground at the center of the park is the focal point here. The remainder of the park contains a slightly rolling lawn, with mature trees scattered throughout. Improved irrigation has also been added. In 2013 broken patio pavers were replaced with colored concrete in the patio adjacent to the playground.

Village Square

12111 SE 310th Street
1.10 acres – Transferred in 2007
Classification: Pocket Park
Status: Developed

This is a small pocket park is located in the middle of an apartment complex. The park has a short loop trail with a small grassy area in the middle. Access to the park can either be gained from the adjacent apartment complex or from SE 310th Street.

C1

104th Ave SE

31495 104th Ave. SE

14.73 acres – Transferred in 2006

Classification: Community Park

Status: Undeveloped

This undeveloped riverside property is comprised of two parcels along the Green River. A nice sandy beach along the Green River is popular for swimmers in the summer, and fishermen in the fall and winter months. Nearly two-thirds of the park is located within the 100-year floodplain so given the location of the park along the river and regulatory constraints, the park will likely be designed as a passive use nature park.

C2

Brannan Park

1019 28th St. NE

21.68 acres – Dedicated in 1973

Classification: Community Park

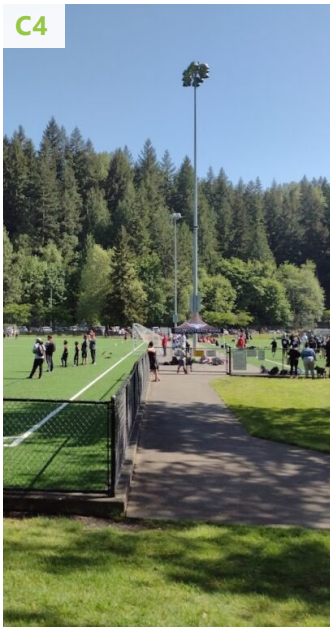
Status: Developed

Brannan Park contains one of Auburn's most heavily used sports complexes. The City sponsors many sports events at Brannan Park; Cascade Middle School users and a variety of organizations – youth soccer leagues, and Little League - also use the playing fields extensively. Brannan Park is on a flat, open site, with the Green River forming the park's eastern boundary. The remaining sides are bounded by residential housing to the north and west, and Cascade Middle School to the south.

C3

Fulmer Park

1005 5th Street NE



5.04 acres – Dedicated in 1979

Classification: Community Park

Status: Developed

Fulmer Park is primarily an active sports facility. In 2015 an undeveloped area on the north side of the park was bladed, all of the blackberry bushes were removed, and a new perimeter fence was installed. New irrigation, perimeter landscaping, and grass seed was added in 2014. New backstops, fencing, dugouts and drinking fountains, as well as scorekeeper tables, were added to the park in 1998. A new playground was installed in 2023.

C4

Game Farm Park

3030 R ST SE

57.20 acres – Dedicated in 1988

Classification: Community Park

Status: Developed

Game Farm Park continues to be one of the largest and most frequented parks in Auburn. The park contains a wide variety of facilities for organized sports activities as well as a distinctive natural setting. The hillside backdrop and the White River along its southern edge create an intimate setting for park for users to enjoy. The park with its many courts, fields and picnic facilities is heavily used. Game Farm Park was dedicated in 1988 and exhibits many successful design features. Designing and building the park in one phase resulted in functional architectural features and site layout. Passive uses such as trails or open grassy slopes are located where the park abuts residences. Good pedestrian access is available to the surrounding neighborhood at several points along the park's perimeter. A trail head off of Forest Ridge Drive SE provides access to a relatively unimproved gravel trail along the river in the eastern portion of the park. A pedestrian bridge was constructed in 2024 connecting the two Game Farm parks across the White River.

C5

Game Farm Wilderness Park

2407 Stuck River Dr. SE 48.50acres –

Dedicated in 1989

Classification: Community Park

Status: Developed

Game Farm Wilderness Park emphasizes a connection between park users and the natural environment. It has limited development and has preserved most of the native woodland along the White River. The White River Trail continues along the river on the north side of the park from Kersey Way beyond the east end of the park. The park is designed for both overnight and daytime visitors. The camping area is designed to accommodate recreation vehicles, providing each unit with water and power hook-ups. An 18-hole disc golf course is located in the wooded area between the campground and White River.

C6

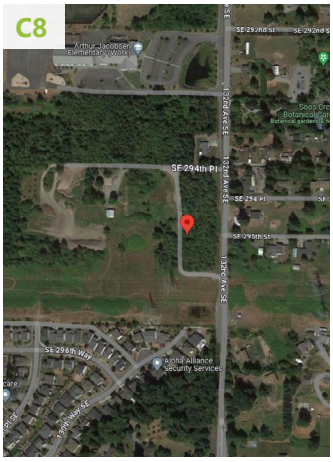
GSA Park

413 15th St. SW

5.31 acres – Dedicated in 1966

Classification: Community Park

Status: Developed



The land for GSA Park was donated to the City by the U.S. General Services Administration. Its location in a heavily trafficked industrial zone has resulted in an atypical park setting. Currently the park has two youth softball/baseball fields, a parks maintenance building, and dugouts. New dugout covers were recently added, made possible by donations from Auburn Little League. A greenhouse is located on the property near the maintenance that is used by the City's horticulturist to propagate new plants. The two ball fields were completed in 2003, including drinking fountains and an asphalt trail to the ball fields.

Isaac Evans Park

29827 Green River Road SE
19.87 acres – Dedicated in 1989
Classification: Community Park
Status: Developed

Isaac Evans Park is a riverfront park providing valuable passive recreation opportunities for the citizens of Auburn. The park's connection to Dykstra Park via the suspension bridge increases its accessibility to local residents and is an appealing feature for visitors. The pedestrian bridge may also accommodate future trail connections between the eastern and western sides of the river. A internal paved trail runs around the circumference of the park. The forested riparian area along the Green River remains in a natural condition with recent restoration plantings added to accommodate the Reddington Levee Setback project located across the river from the park. Scattered throughout the grassy space on the inside of the trail are clusters of picnic tables, a picnic shelter, restroom facilities, and playground equipment.

Jacobsen Tree Farm Park

29387 132nd Ave. SE
29.30 acres – Transferred in 2003
Classification: Community Park
Status: Undeveloped

The Jacobsen Tree Farm property is an undeveloped park located in the Lea Hill area of Auburn. The City went through a master planning process for the future park, which was completed in 2010. Future elements of the park include soccer fields, baseball fields, play grounds, and passive recreational opportunities. The park is adjacent to Arthur Jacobsen Elementary and Auburn Mountainview High School, and has magnificent views of Mount Rainier. A bond or levy will be needed in order to develop this large community park property.

Lea Hill Park

31693 124th Ave. SE
5.26 acres –Dedicated in 2013
Classification: Community Park
Status: Developed

Lea Hill Park is a community park that serves the Lea Hill neighborhood and is located adjacent to the Green River Community College Campus. Park amenities include a skate park, pervious walking pathways, a rentable picnic shelter, an amphitheater, baseball field, free game synthetic sport area, half basketball court, and a play area featuring a tractor and climbing toys. An ADA accessible restroom facility with two unisex bathrooms and drinking fountains was completed in the spring 2015.

Les Gove Park/Les Gove Community Campus

910 9th St. SE
26.07 acres –Dedicated in 1966
Classification: Community Park
Status: Developed

Les Gove Park is a recreational and educational facility serving the entire community. The Library, Parks and Recreation Administration Building, Community Center, Teen Center, Senior Center, the White River Valley Museum, and a variety of recreational features make Les Gove a very popular destination.

Mill Pond Park

4582 Mill Pond Dr. SE
4.20 acres – Dedicated in 1997
Classification: Community Park
Status: Developed

Mill Pond is unique in several ways. The park is a joint project between the Parks and Public Works Departments, the Auburn School District, and the developer of Lakeland Hills. All of these groups came together to create a park with a dual purpose: to provide a recreational experience in a natural setting, and to provide stormwater detention and filtering for a 400 acre area. The site includes a permanent pond, a grass-lined bio-swale that becomes a temporary pond during storms, a 1/4 mile paved trail around the circumference of the ponds, and a fishing dock. Fishing in the pond is limited to children under 15.

Roegner Park

601 Oravetz Road SE
19.22 acres – Dedicated in 1994
Classification: Community Park
Status: Developed

This community park is located along the banks of the White River, adjacent to Auburn Riverside High School. A trail system includes both hard and soft-surfaced sections that meet the needs of many different users, including equestrians from the near- by Hidden Valley neighborhood. Trail construction began in 1997 from the east side of Roegner Park to Kersey Way, and continuing east along the river to Game Farm Wilderness Park. An approximate ½- acre off-leash fenced dog park is located near the trail, and can be easily accessed from the parking area off of Oravitz Road. Commissioned artwork for the park includes a uniquely designed bench with a salmon motif, placed to allow views of the river.

Sunset Park

1420 69th St. SE
15.15 acres – Dedicated in 2003
Classification: Community Park
Status: Developed

Sunset Park was developed by the developer in Lakeland Hills. It is unique in several ways. The community park serves the Lakeland Hills neighborhood but also the community. The site includes a picnic shelter, two youth baseball/softball fields, trails, basketball court and skate park.

Veterans Memorial Park

405 E St. NE
7.67 acres – Dedicated in 1926
Classification: Community Park
Status: Developed

Veteran's Memorial Park, formerly City Park, is a popular community park located close to downtown Auburn and adjacent to Auburn High School's Memorial Stadium. The park is distinctive for its Veterans Memorial structure, shady woods and underlying expanse of green lawn. The Veterans Memorial structure was funded with donations and fund-raising events by local veterans groups. Its design and construction were accomplished with use of volunteer labor.

Special use facilities include unique recreational and cultural amenities that serve specific community interests. This includes the Auburn Golf Course, the White River Valley Museum, and various sports complexes and community centers, all enhancing the quality of life for Auburn residents.

Trails, Bikeways & Pathways

Auburn's parks system is designed to offer a balanced mix of recreational opportunities, natural preservation, and specialized facilities, which fosters a vibrant and active community. The city's mild climate, combined with a strong culture of outdoor activities, significantly contributes to the high usage and support of its extensive trail network.

The city categorizes its trails into three primary types:

1. Recreational loop trails
2. Linear trails
3. Recreation/transportation trails.

Recreational loop trails are typically short paths that form loops within a single park or site. These trails are designed for activities such as walking, bicycling, hiking, or skating, and they often connect various activity areas within a park or provide access to natural preserves or nearby neighborhoods. These trails can be constructed with either hard surface materials and are usable in all weather conditions, while soft surface trails offer a more rustic and natural experience.

Linear trails in Auburn are designed to connect different areas of the city or activity centers, leading to key destinations. These trails are generally hard-surfaced, making them suitable for activities like walking, bicycling, and skating, even in varying weather conditions. Notable examples of linear trails include the Green River (Reddington) Trail, Lakeland Hills Linear Trail, Lake Tapps Parkway Trail, and the White River Trail. The White River Trail, for example, stretches from Game Farm Wilderness Park through Roegner Park and ends at A Street SE, featuring both paved sections and soft surface areas that accommodate a variety of users, including mountain bikers, horseback riders, and hikers.

Recreation/transportation trails serve a dual purpose by connecting various parts of the city or activity centers for both recreational and transportation uses. Refer to Table 2-6 for the primary or major examples of these trails. These trails are typically linear, hard-surfaced, and designed to accommodate a variety of transportation modes, such as walking, bicycling, and skating. Sometimes referred to as "multi-modal trails," they are built to stricter standards and are generally designed for two-way traffic.

Table 2-5: Existing Trails					
Park/Trail	Description	Linear Trails Total (miles)	Recreational Loop Trails Total (miles)	Recreation / Transportation Trails Total (miles)	Total Length
Auburndale Park	Paved loop path around park		0.41		0.14
Auburn Environmental Park	Board Walk Trail		0.23		0.23
Brannan Park	Paved loop path around Park to Reddington levee. A paved surface linear trail extends along the levee.	1.7	0.72		2.42
C' Street SE Trail	Ellington Rd. SW to 15th Street SW			1.6	1.6
Cameron Park	Paved loop path through park and loops through Lemon Tree Lane		0.33		0.33
Cedar Lanes Park	Informal path through wooded area		0.25		0.25
Dorothy Bothell	Loop trail		0.25		0.25
Game Farm Park	Paved loop path around meadow, play structure, ball fields. Extensive sidewalk throughout park		3.3		3.3
Game Farm Wilderness Park	Paved trail along the White River and around the group camp area.	See White R. Trail			
Interurban Trail	Paved 12' wide trail runs alongside the Union Pacific railroad, from the city's northern to southern limits			4.5	4.5
Isaac Evans Park	Paved loop through wood and along the Green River		1.07		1.07
Jornada Park	Paved loop through wood and around park		0.1		0.1
Lakeland Hills Linear	Extensive sidewalk path on Lake- land Hills Way from Evergreen Way to Lake Tapps Parkway	0.73			0.73
Lakeland Hills Park Trail	Paved loop path around recreational fields		0.39		0.39
Lake Tapps Pkwy Trail	Paved sidewalk and asphalt trail	1.62			1.62
Les Gove Park Trail	Paved loop path around open space		0.58		0.58
Mill Pond Park Trail	Paved loop path around pond. Connects to Lakeland Hills Trail.		0.29		0.29
PSE (Lakeland)		0.4			0.4
Roegner Park	Both hard and soft surface trails are present in the park. A paved loop path is marked.	See White River Trail Below			
Sunset Park	Paved loop path around park.		1.19		1.19
West Auburn Lake			0.25		0.25
White River Trail	Paved and soft surface trail	3.5			2.3
Total		**7.95**	**9.11**	**6.1**	**23.16**

The Interurban Trail is managed by King County Parks for the sections outside specific municipal boundaries. However, within Auburn's city limits, the Auburn Parks Department is responsible for maintaining the segment of the trail that runs through the city. This collaborative effort ensures the trail remains well-maintained and accessible throughout its route. On the other hand, the White River Trail is primarily maintained by the City of Auburn Parks Department, which ensures its upkeep and accessibility as it connects several key parks within the city. The Interurban Trail is a prominent example of this type, serving as a major non-motorized route that runs north to south through several cities, including Tukwila, Kent, Auburn, Algona, and Pacific. This 12-foot-wide path follows the Puget Power right-of-way and parallels the Union Pacific Railroad for much of its length, making it a key transportation and recreational asset. The trail also provides access to several of Auburn's major employers, including Boeing, GSA, the Outlet Collection, and Auburn Environmental Park. Located less than half a mile from downtown Auburn, the Interurban Trail is a vital link for the community.

Table 2-6: Auburn Maintained Trails (Dedicated)

Type	Length
Interurban Trail (South)	4.5 mi
White River Trail	3.5 mi
Green River Trail*	TBD
	8.0 mi

* Future proposed extension

Both the Interurban Trail and the White River Trail are also designed to accommodate equestrians, making them versatile for a range of users. Additionally, informal trails in the open space areas of southeast Auburn and the shoulders of some rural roads are also used by equestrians, although these are not specifically designed or managed for this purpose. Auburn's commitment to providing diverse and accessible recreational options ensures that the city's parks and trails continue to meet the needs of its growing population.

Schools & Other Outdoor Recreation Amenities

In Auburn, recreational opportunities extend beyond city parks, encompassing other public lands and private facilities, which play a crucial role in assessing the adequacy of the City's park system. Among these, schools are one of the largest contributors to recreational space outside of city-managed parks.

Schools naturally serve as neighborhood gathering places and are often within walking distance of most homes in the city. School grounds typically feature sports fields, open grassy areas for play, playground equipment, and basketball courts. However, the accessibility and availability of these school facilities can vary. During the school year, these spaces are primarily used by the schools throughout the day and often during after-school hours, limiting their availability for individual use or non-school sports leagues. Additionally, some sports fields may be too small or not maintained to the standards required for organized league play. Therefore, while school facilities are valuable components of the community's overall recreational resources, they cannot substitute for a robust public park system.

Table 2-7 in the following pages summarizes the recreational facilities available at Auburn School District properties. It's important to note that the Auburn School District's boundaries extend beyond the Auburn city limits, resulting in a service area that does not fully align with that of the City of Auburn. As a result, the availability and utilization of these school facilities for Auburn residents may vary based on geographic and jurisdictional differences.

In addition to school properties, several other lands used informally for recreation are owned by other public entities. The Auburn Water Utility manages several watershed areas with restricted access to maintain water quality. The Coal Creek Spring Watershed in south Auburn is the city's primary water source, while the West Hill Watershed serves as a secondary source. Despite the proximity of these areas to neighborhoods, public access is generally discouraged to protect water quality.

King County Parks also owns several developed and undeveloped properties near Auburn. While Auburn's parks are more convenient for residents, many recreational users also utilize nearby King County parks, regardless of civic boundaries. A significant regional project, the Green River Trail, managed by King County, spans over 19 miles from Cecil Moses Park near Seattle's southern boundary to North Green River Park near Auburn. Extending the Green River Trail south from Kent has indeed faced challenges due to private property issues. However, plans are still in development to continue this extension through Auburn and eventually to Flaming Geyser State Park at the Green River Gorge. The project remains in the design and planning stages, with ongoing efforts to resolve these challenges and facilitate the trail's expansion further south.

Additionally, the State of Washington owns an easement along certain sections of the west side of the Green River within the city. This easement, which runs directly behind several residences, permits access for fishing only, limiting broader public use.

Table 2-7: Auburn School District Facilities	
School	Available Facilities
Elementary Schools	
Alpac	2 youth baseball/softball fields
Chinook	4 youth baseball/softball fields
Evergreen Heights	2 youth baseball/softball fields

Existing Major Public Art Projects

The City of Auburn Parks Department plays a vital role in maintaining the city's vibrant public art installations. These installations not only enhance the beauty of public spaces but also reflect the cultural and artistic spirit of the community. Below is a list of the major public art installations that the Auburn Parks Department is responsible for maintaining, ensuring they remain in excellent condition for all residents and visitors to enjoy.

Table 2-8: Existing Public Art Inventory

Year	Artist	Piece	Location
1989	Meg Pettibone	Steelhead	Isaac Evans Park
1991	Richard Beyer	Children Playing Train at the Switch	City Hall
1993	Michele Van Slyke	Every Year the Salmon Return	Roegner Park
1994	Nancy Hammer	Burlington Northern Railroad Bridge	Auburn Way S & Hwy 18
1995	Garth Edwards	B Street Plaza	E Main & B St. SE
1996	Timothy Siciliano	Bus Shelter Murla	15th St SW
1996	Gerald Tsutukawa	Sun Circle	Game Farm Park
1997	Timothy Siciliano	The Equine Amusement	15th St. NE @ Metro P&R
1998	Deborah Merksy	Pioneer Cemetery Entryway	Auburn Way N & 8th St. NE
1999	Kulzer & Spitzer	Xtreme AtmosFearic Oscillator	Auburn Skate Park
2000	Evans & Mee	Mnemosyne's Opus	King County Library
2001	Phillip Levine	Threshold	Les Gove Park
2001	Ries Niemi	5 Moments Senior Center	Les Gove Park
2003	Paul Sorey	Running Figures	Sound Transit Plaza
2004	Brandon Zebold	Sighting	LL Hills Way & Evergreen Way
2004	Sidney Genette	Blue Neutron	Auburn Justice Center
2005	Ingrid Lahti	Les Gove Community Campus Sign	Auburn Way S & F Street
2006	Darel Grothaus	Evergreen-Washelli Cemetery: Seattle, WA	Cemetery Admin Building

2019	Peter Reiquam	Crow with Fries	Les Gove Park
2019	Nicholas Goettling	Pillow Fight Mural	F Street Bridge Underpass
2021	MacRae Wylde	Truth	Postmark Center for the Arts

Public Involvement

The successful development and implementation of a community's parks system ultimately relies on listening to the needs, demands, and ideas the community has to improve or suggest new additions to the system. Knowing that "the people who show up get to make the decisions", it was imperative that a successful public involvement process be implemented that allowed Auburn's citizens, and its visitors, multiple opportunities to inform the process and results. These opportunities hosted during this planning process included:

- Community Needs Assessment Survey
- Community Visioning Survey

With grant programs and other decision makers focusing on understanding a community's desired quality of life, public involvement is the most crucial and time-consuming element of the PROS planning process, allowing a correct assessment of a community's desired quality of life. This is where the public and users can share their ideas, goals, and objectives for their parks system and communicate these needs and desires to the City.

The intention behind the public involvement approach was to maximize an equitable distribution of needs, wishes, and ideas from the public. To ensure that the PROS Plan is reflective of the Auburn community and their interests, needs, and priorities, a series of engagement goals and methodologies were discussed and developed.

Engagement Goals

As this process began and continued through the COVID-19 pandemic, many public events were canceled or postponed due to safety concerns and government restrictions, leading to a substantial decline or, in many cases, the elimination of in-person participation. To adapt, more focus was placed on virtual engagement techniques, which provided a safer alternative for community engagement, though they could not fully replace in-person experiences. There was also a notable increase in the use of parks and outdoor spaces as people sought safe ways to engage in recreational activities while maintaining social distancing, with activities like hiking, biking, and outdoor fitness classes gaining popularity. The pandemic prompted a reevaluation of public health and safety practices, resulting in changes to engagement planning and execution. As restrictions eased, participation rates began to recover gradually, although some individuals still remained cautious about returning to large in-person events. Additionally, there was an increased focus on health

and wellness, driving interest in related programs offered by parks and recreation departments and encouraging the development of more diverse and inclusive programming to meet community needs. Overall, COVID-19 brought about significant changes in public participation, with a lasting impact on how events are conducted and attended. To overcome this potential lack of participation, a series of goals for the engagement plan was developed.

1. Continue to Build On or Validate Public Sentiment From Previous Surveys

The goal is to recognize that in communities like Auburn, public communication often relies heavily on informal channels such as word-of-mouth and conversations among neighbors. This approach is effective for disseminating information and fostering discussions about local events. Auburn also has other planning processes, such as the Comprehensive Plan and Downtown Master Plan, ongoing during this time. The current planning effort aims to incorporate a review of these past surveys to identify relevant data that can inform the understanding of the community's desired quality of life.

2. Ensure equitable distribution of new survey results throughout the city.

To gain a holistic understanding of a city's diverse communities and their needs, conducting surveys at the neighborhood level is crucial. This approach ensures that the concept of "quality of life" is not skewed towards a specific demographic. Ideally, the surveys are designed to capture respondents' residential locations within the city. This allows for the identification of localized needs and the development of tailored strategies for equitable resource allocation, targeted interventions, and effective community engagement. Using a GIS-based tool to identify the locations of comments will ensure we can achieve a desired level of response equity across all neighborhoods of Auburn.

3. Deploy multiple engagement opportunities

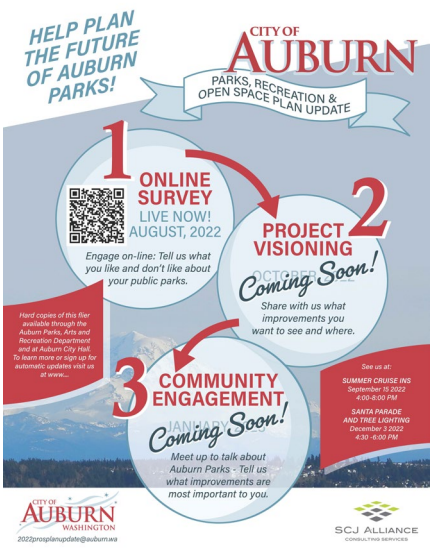
The inclusion of multiple participation methods effectively broadens the reach of the survey and addresses potential accessibility challenges. In addition to online and virtual surveys, the public is invited to participate in multiple engagement events online and complete paper surveys distributed at designated locations like City Hall, the Senior Center, and the Museum. This multi-modal approach ensures inclusivity by catering to residents with varying technological access and preferences.

4. Provide a broad range of constituents the ability to supply both broad and specific action-oriented feedback.

The goal is to transcend the collection of broad public needs and desires by implementing an online map-based engagement tool that uniquely incorporates opportunities for residents to actively participate in the "design" of their parks, generating site-specific suggestions. This approach will align with the principles of an inclusive planning framework, emphasizing citizen engagement in shaping service delivery. The aim is to create avenues for the public to contribute "real" ideas and concepts, fostering a sense of ownership and impact. Additionally, measures will be taken to ensure participant demographics accurately reflect the Auburn community profile.

Public Engagement Plan Overview

The engagement plan was organized around a series of both virtual and in-person events, noting the specific time dates. With the primary goal of the City always being to engage with the public about its park and recreation needs, the City developed a public engagement plan centered around two different kinds of virtual engagement techniques: 1) an online Needs & Assessment Survey, and 2) an online map-based project.



A successful engagement process harnesses the community's energy and inspires community ownership of the process, while also adapting to new insights and feedback. Stakeholders and community members supply the local knowledge, context, and information necessary to make informed project decisions.

As part of this engagement process, public comment was collected via an online community needs assessment survey, conducted in the Fall of 2022 and linked through the City's website. The project team will use the collected input, summarized in this report, to inform and drive the PROS Plan update.

Kickoff Meeting

SCJ met with City of Auburn Staff to conduct a kickoff meeting. At this meeting, the following was reviewed and discussed:

1. Determine the current parks, recreation, and open space issues
2. Brainstorm and finalize stakeholder interview list
3. Share and finalize the Public Engagement Plan

Engagement Marketing

With a primary goal of the City to always be engaging with the public about its park & recreation needs, the City developed a public engagement plan centered around two different kinds of virtual engagement techniques, 1) A online Needs & Assessment Survey, and 2) a on-line map-based project

A successful engagement process harnesses the community's energy and inspires community ownership of the process, while also adapting to new insights and feedback. Stakeholders and community members supply the local knowledge, context, and information necessary to make informed project decisions.

As part of this engagement process, public comment was collected via an online community needs assessment survey, conducted in the Fall of 2022 and linked through the City's website. The project team will use the collected input, summarized in this report, to inform and drive the PROS Plan update.

Note that all the engagement marketing, flyers, and surveys were all translated and offer in multiple languages, including Chinese, Russian, and Spanish. A Marshaleese translator was found but was not able to process the survey information in time.

Parks Needs & Assessment Survey

To assess how people were using Auburn's park and trail system, an online survey was conducted in the fall of 2022. This initiative aimed to gather valuable insights from both residents and visitors. The survey specifically focused on understanding current usage patterns of existing parks and trails, identifying any barriers that hinder their use, and gauging resident interest in adding or removing specific park and recreation features. The online survey consisted of both multiple-choice and open-ended questions focusing on community needs and issues with regards to Auburn's park facilities and recreation programs.

Additionally, the survey sought to identify the most popular parks and amenities among residents and visitors. To ensure broad participation, the survey was offered in both English, Spanish, Chinese, and Russian.

The list of questions asked, minus typical demographic inquiries, included:

How frequently do you use the City's park and recreation facilities?

How long is your average visit to these facilities?

What are the existing barriers to your use of parks in Auburn?

The survey was live for several months in the Fall of 2022, and a total of 619 completed surveys were received in that time. A summary of the responses to each question is provided on the following pages.

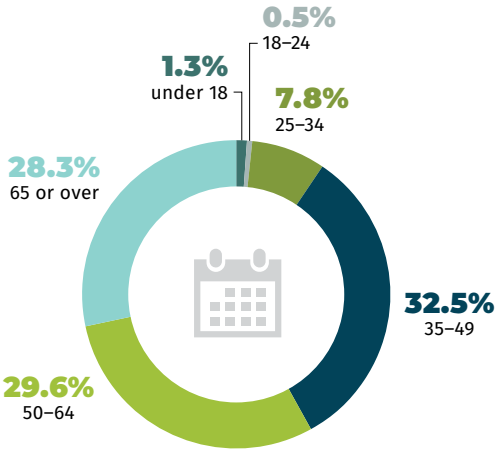
How much do you or would you use specific recreational elements?

What does Auburn need more or less of?

What is your connection to Auburn?

Other typical demographic questions were asked as well, in order to better understand the survey audience, identify any trends and ensure that a balanced representation was captured.

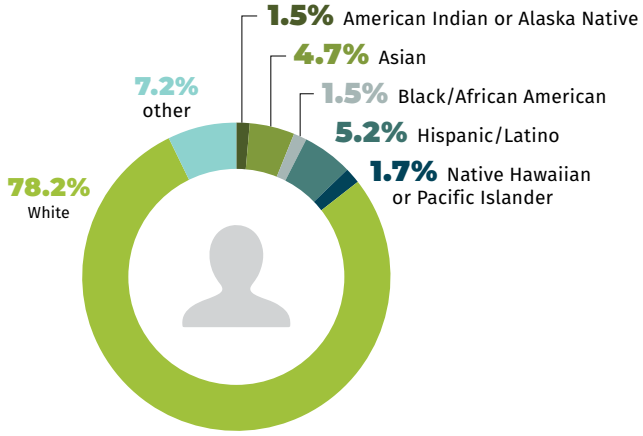
Full survey results are found in Appendix C, with key takeaways and highlights summarized here.



Demographics

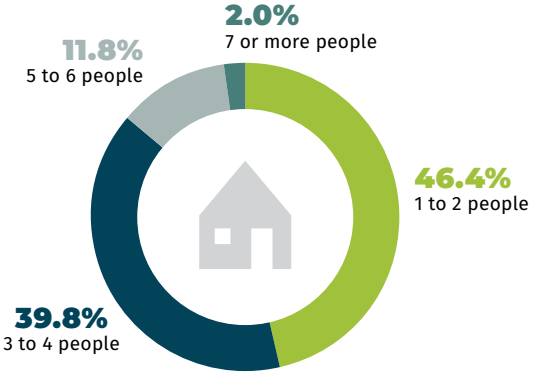
Demographic information was collected to help ensure survey responses are representative of the community and amenities are tailored to patrons and residents. All responses were voluntary and were collected anonymously.

Age Range



When asked the question, "What age range are you in?" the largest percentage (33%) were in the 35–49 age range. Another 30% were in the 50–64 range, and 28% were 65 or over. Only 10% of respondents were under the age of 35.

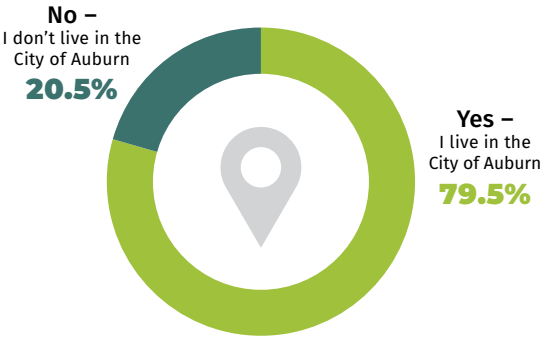
Ethnicity



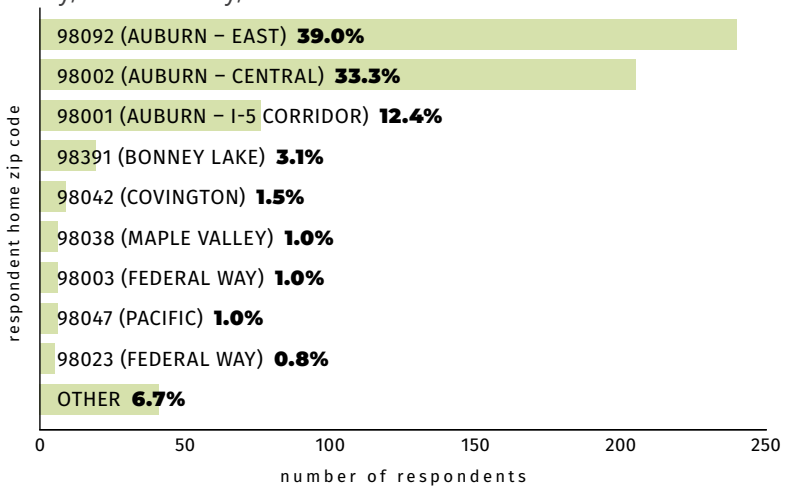
When asked "What is your ethnicity?" the largest percentage (78%) identified as "White", with another 5% identifying as "Hispanic/Latino" and 5% identifying as "Asian."

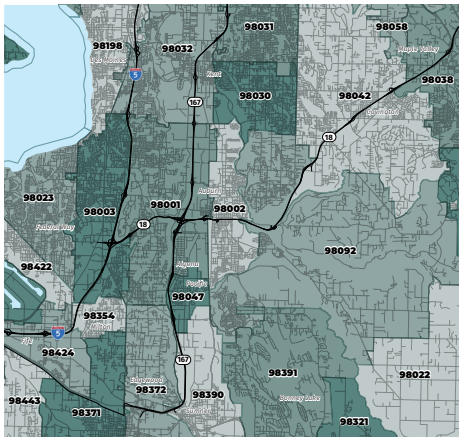
"American Indian or Alaska Native," "Black/ African American," and "Native Hawaiian or Pacific Islander" each accounted for less than 2% of the respondent population, and about 7% of respondents identified as "Other."

Household Size



Nearly half of respondents (46%) indicated their household consists of only 1 to 2 people, and another 40% indicated their household consists of 3 to 4 people.

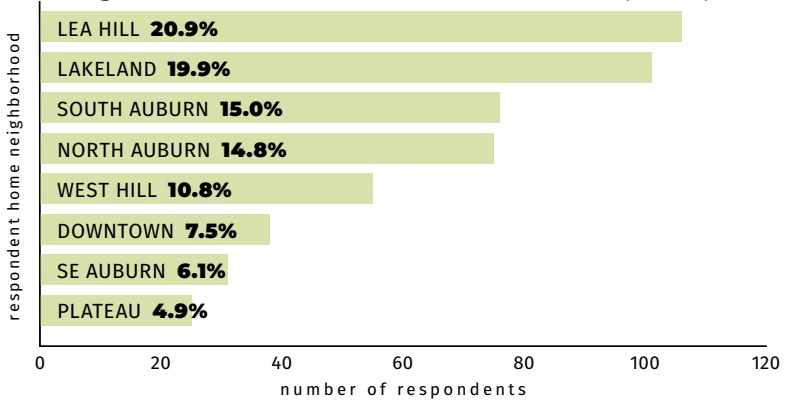


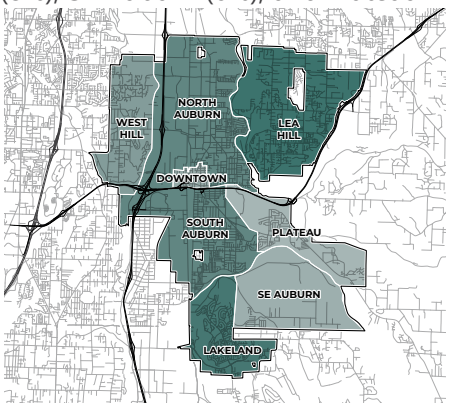


Demographics

Home Location

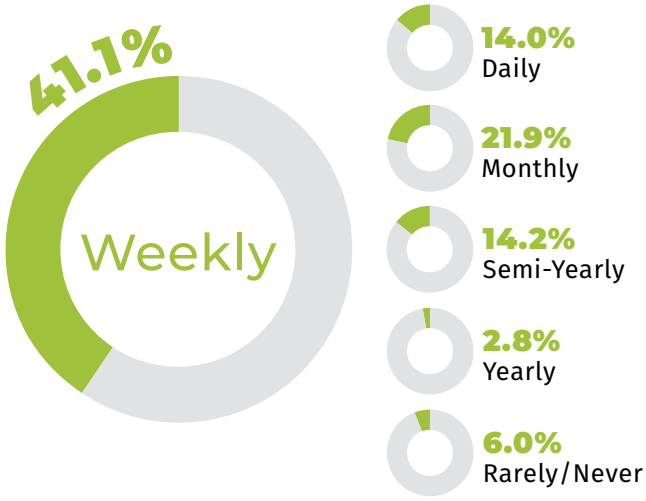
A majority of survey participants (79.5%) indicated they live in the City of Auburn. In order to better understand where Auburn's park users live, survey participants were also asked what zip code they live in. Nearly 40% of participants responded that they live in zip code 98092 (Auburn – east), with another third of participants in 98002 (Auburn – central) and 12% in 98001 (Auburn – I-5 corridor). The survey also saw a significant number of participants who lived in Bonney Lake, Covington, Maple Valley, Federal Way, and Pacific.



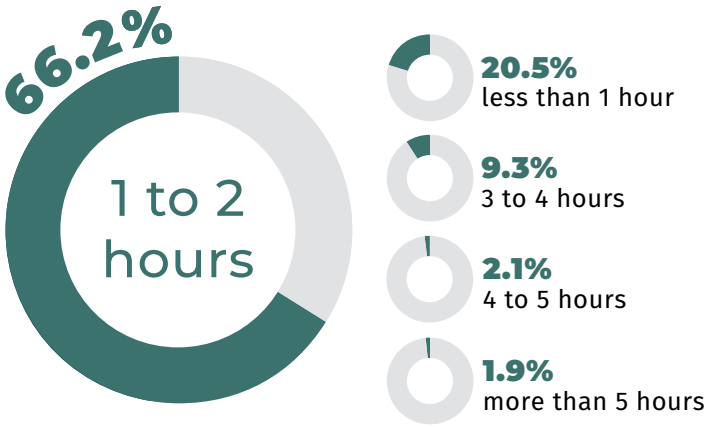


Neighborhood of Residence

Of the 507 survey participants who indicated they live in the City of Auburn, the highest percentages live in the Lea Hill (21%) and Lakeland (20%) neighborhoods. The Downtown (8%), SE Auburn (6%), and Plateau (5%) neighborhoods had the smallest numbers of participants.

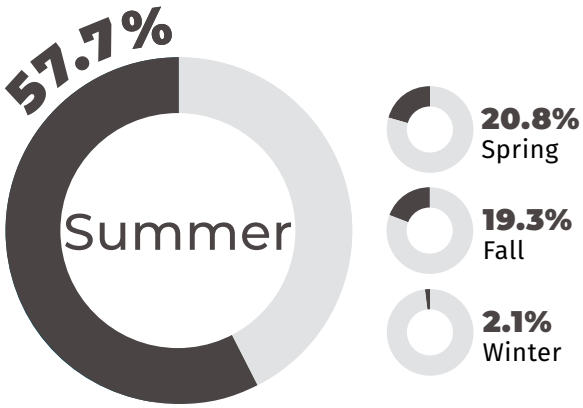


Use of Auburn's Existing Facilities



Frequency

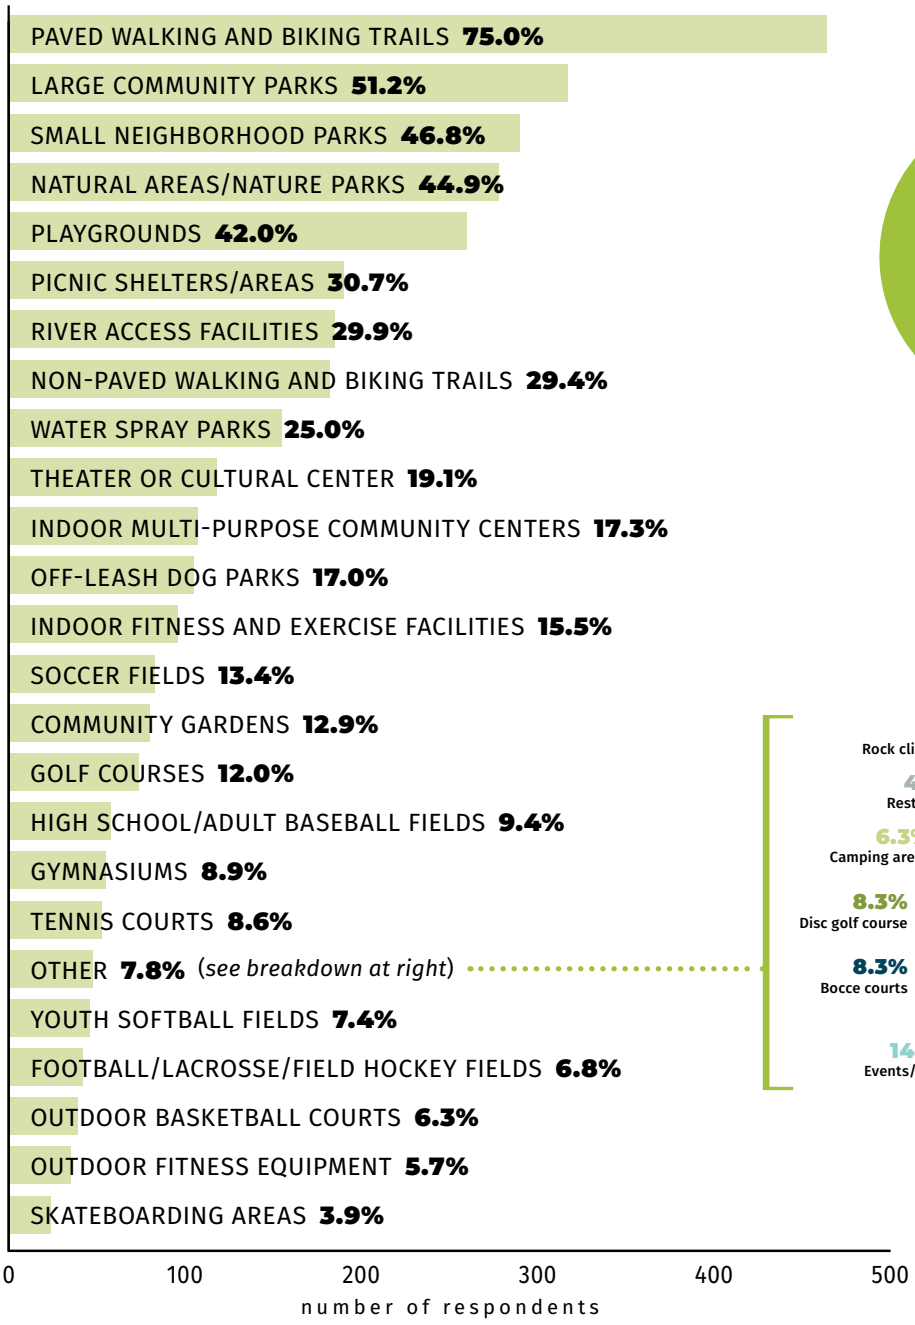
Survey participants were asked, "How frequently do you visit the parks or recreational facilities within the City of Auburn?" Over 40% indicated they visit Auburn's parks weekly, with another 22% visiting monthly.



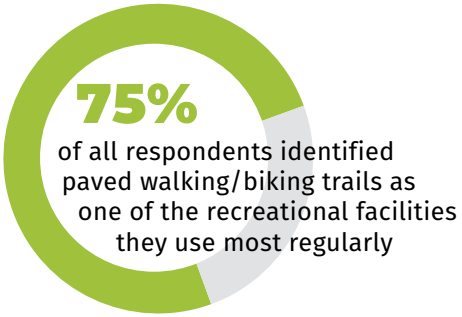
Length of Visit

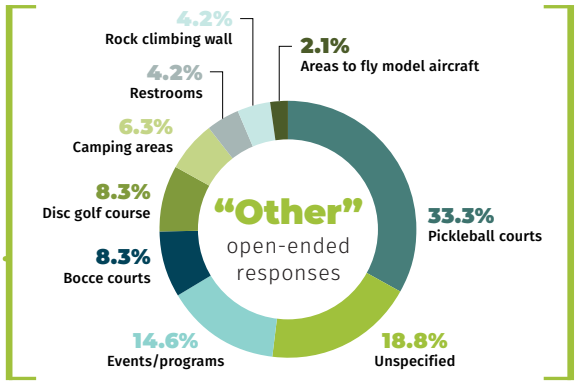
When asked, "How long is your average visit to a park or recreational facility within the City of Auburn?" nearly two-thirds of participants responded with 1 to 2 hours, with another 21% indicating their average visits last less than 1 hour. Only 13% of respondents indicated their average visits were longer than 2 hours.

Season



Participants were asked, "What is your favorite season to visit parks and recreational facilities in the City of Auburn?" Summer was the favorite time to visit for 58% of respondents, with Spring and Fall each garnering about 20% of the vote. Only 2% of respondents indicated winter was their favorite season for a parks visit.

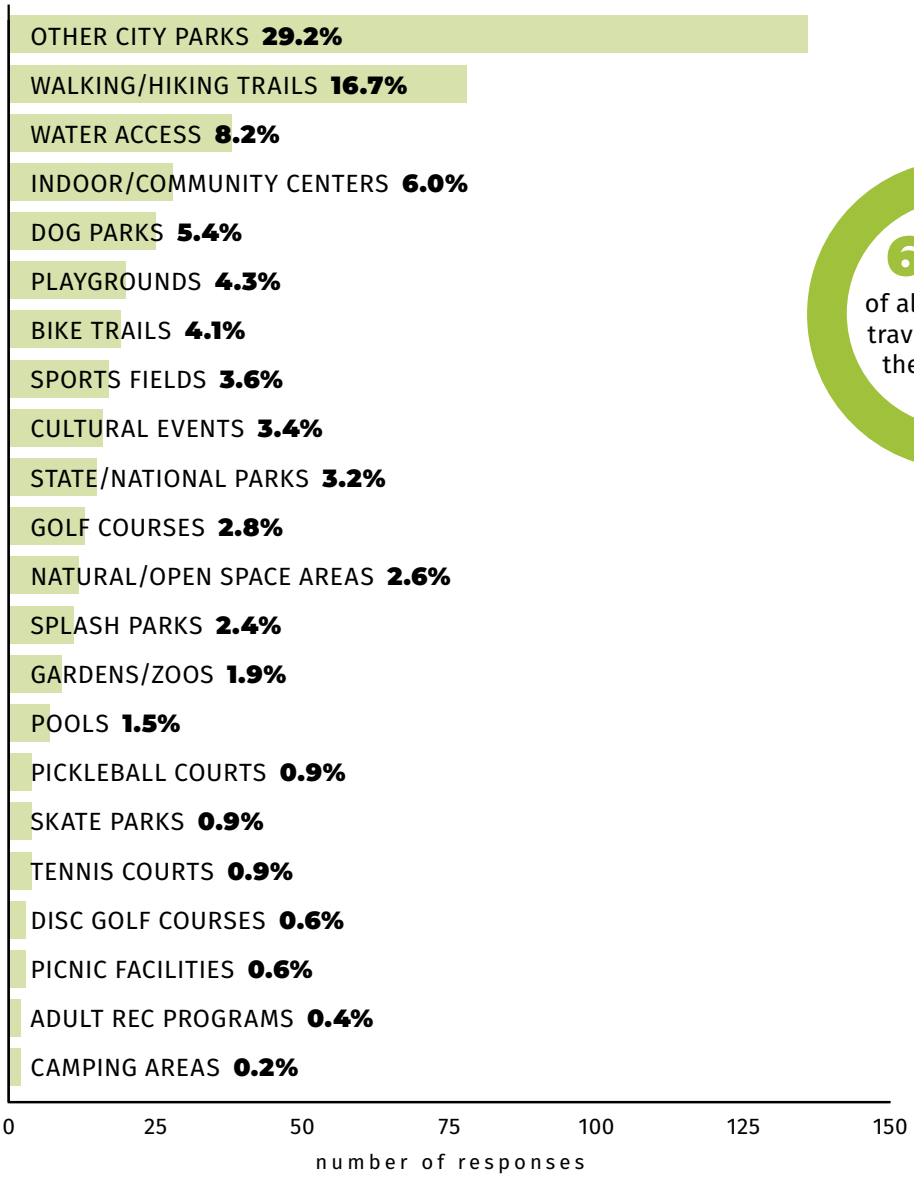


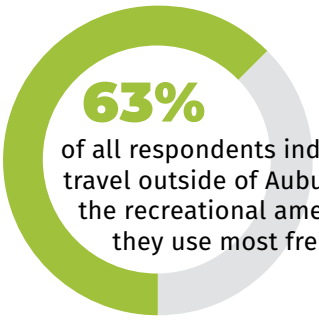


Recreational Facility Use

Types of Facilities Used

Respondents were asked to select from a multiple-choice list to answer the question, "What are the types of recreational amenities/facilities that you most regularly use?" Respondents could select as many choices as applicable for them/their household, regardless of whether the facilities were located in Auburn or not.

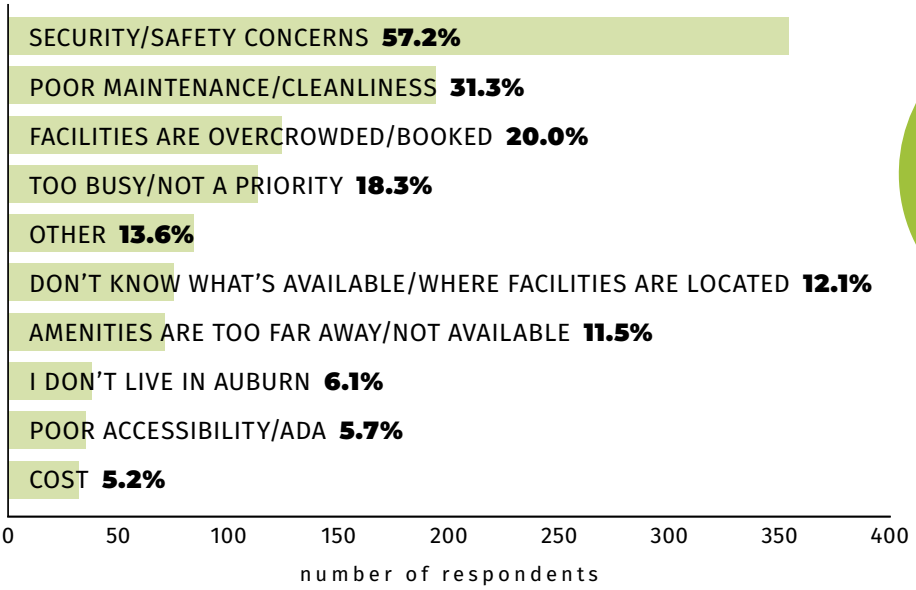


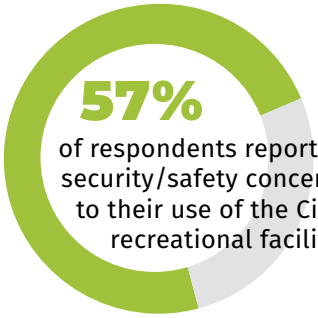


Recreational Facility Use

Recreational Facilities Outside Auburn

As a follow-up question to what types of recreational amenities/facilities they use most regularly, survey participants were asked, "Do you currently travel outside the City of Auburn for any of these amenities?" They were then asked to list the facilities they currently travel outside the City of Auburn to use. The open-ended answers provided by participants can be broadly broken into the categories below.



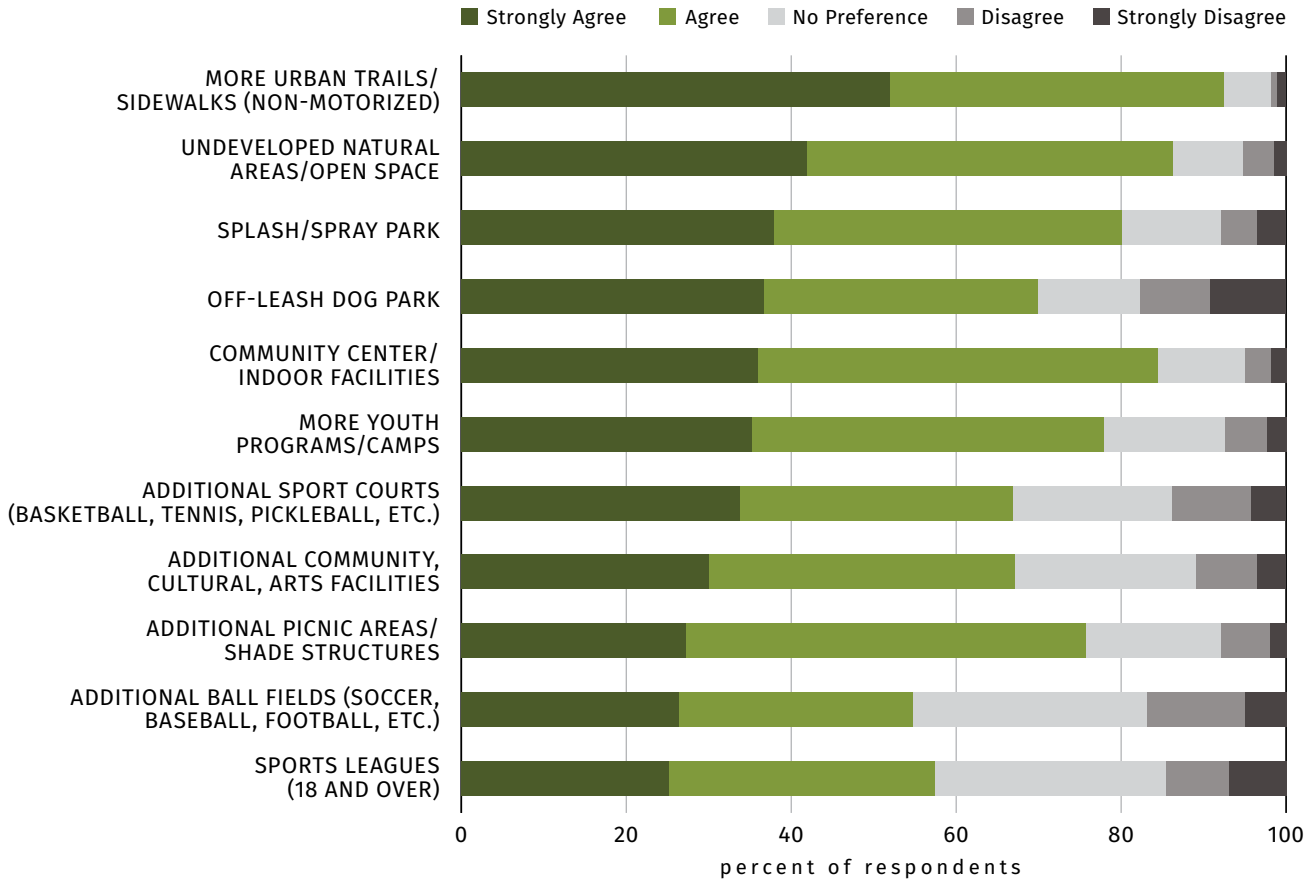


of all respondents indicated they travel outside of Auburn to access the recreational amenities/facilities they use most frequently

Recreational Facility Use

Barriers to Use

Survey participants were asked to select from a multiple-choice list to answer the question, "What are some of the existing barriers or reasons why you may not use available recreational facilities or participate in parks and recreational programs within the City of Auburn?" Participants were invited to select as many choices as applied for them/their household. Security/safety concerns (57%) were the top barrier to participants' use of existing facilities, followed by maintenance/cleanliness (31%) and overcrowded/booked facilities (20%).



of respondents reported that security/safety concerns are a barrier to their use of the City's available recreational facilities or programs

Parks and Recreation Needs

The City Needs...

Survey participants were provided with a list of recreational facilities and amenities, each framed as a statement ("The City needs [facility/amenity]"). Participants were asked to select how strongly they agreed or disagreed with each statement on a sliding scale of one to five (5 = strongly agree, 4 = agree, 3 = no preference, 2 = disagree, 1 = strongly disagree). Responses are summarized in the above chart.

At the top of the list, over 90% of participants either agreed or strongly agreed that the City needs more urban trails/sidewalks (non-motorized). Strong support was also given for undeveloped natural areas/ open space, splash/spray parks, off-leash dog parks, community center/indoor facilities, and more youth programs/camps.

Key Takeaways

The project team will use the input collected through the community survey to inform and drive the PROS Plan update. Key takeaways from the survey data include:

- Survey respondents' **most-used** recreational facilities include **paved walking/biking trails** (used by 75% of respondents), **large community parks** (51%), **small community parks** (47%), small neighborhood parks (47%), **natural areas/nature parks** (45%), and **playgrounds** (42%).
- Survey respondents' **least-used** recreational facilities include **skateboarding areas** (used by 4% of respondents), **outdoor fitness equipment** (6%), **football/lacrosse/hockey fields** (7%), and **youth softball fields** (7%).
- 63% of survey participants indicated they **travel outside of Auburn** to access the recreational amenities/facilities they use most frequently. These facilities include other (nearby) **city parks** (29%), **walking/hiking trails** (17%), **water access** (8%), and **indoor community centers** (6%). These responses suggest there could be a need for more of these facility types in the City of Auburn, or a need to improve those that already exist within the city.
- **Barriers to use** indicate existing issues that need to be addressed by the City in order to improve Auburn parks users' experience. The largest barriers to use of the City's available recreation facilities or programs, as reported by survey respondents, are **security/safety concerns** (57% of respondents), **poor maintenance/cleanliness** (31%), and **overcrowded/booked facilities** (20%).
- According to survey respondents, the City of Auburn's biggest parks and recreation needs include:
  - More non-motorized urban trails/sidewalks (92.5% of respondents)
  - Undeveloped natural areas/open space (86.4%)
  - Community centers/indoor facilities (84.5%)
  - Splash/spray parks (80.2%)
  - More youth programs/camps (77.9%)
  - Off-leash dog parks (69.9%)

Demand & Needs

The purpose of the demand and needs analysis is to evaluate, quantify, and understand the current and future demand for recreational facilities and parkland. This analysis also identifies the existing and anticipated needs for providing parkland, facilities, and open spaces, both now and in the future. "Needs" in this context includes both the preservation of existing services and resources, as well as the projected future requirements based on population forecasts and economic outlooks.

This update reflects the community's needs, desires, and recommended priorities, establishing a foundation for the next 6 to 10 years. It also outlines longer-term aspirations for the next 15 to 20 years.

Quantifications vs Qualifications

Traditionally, quantitative standards have been used to assess the need for and identify potential actions to acquire or develop additional parks and recreation elements. Based on the National Recreation and Park Association's (NRPA) guidelines and its online database "Park Metrics," simple comparisons of adequate land, derived from normalized averages across the country, were used to determine the minimum amount of parkland required to effectively provide parks and recreation services.

While this plan is primarily focused on the needs identified by the public, it also evaluates the recreational demands of the City of Auburn using traditional level-of-service (LOS) standards, recreation trends, and a gap analysis of access within the current park system.

However, while quantifiable metrics allow for straightforward comparisons, they fall short when it comes to understanding the "quality" of life that a community expects or demands. Developing strong strategies and identifying potential improvements requires engaging with community members through surveys, public meetings, and other forms of public consultation. The previous section of this report outlines this process in detail.

This section concludes with a comparison of the quantitative and qualitative findings to refine a methodology for testing and ultimately selecting improvements that will enhance Auburn's quality of life, aligned with its demonstrated values and preferences.

Park Equity & Access

To better understand where the demand and need for park lands should occur, a service area map was created on the following pages that identifies the current service area of each existing park and the new service areas created by proposed improvements.

To develop the service maps, Open Street Map data was used to identify and verify known sidewalk data and the City's transportation grid that the City of Auburn provided. Sidewalks are considered to be safe walking routes. All the existing access points to each existing park and/or trail space were digitized and a network analysis of the safe walking routes to each access point was developed. The analysis would initially stop even if the end of a sidewalk was encountered before the 10-min range (approximately 1/2 mile) was reached.

A second analysis ignored the known sidewalks and trails but followed the City's existing transportation grid, essentially identifying known gaps in the walkshed that could be addressed by extending existing sidewalks.

Additional maps on pages 60 and 61 highlight specific areas of the City where residents identified gaps in the current park system, with a particular emphasis on the need for more sports fields, courts, and other recreational amenities, as indicated through public involvement responses.

The "10-Min Walk" Metric

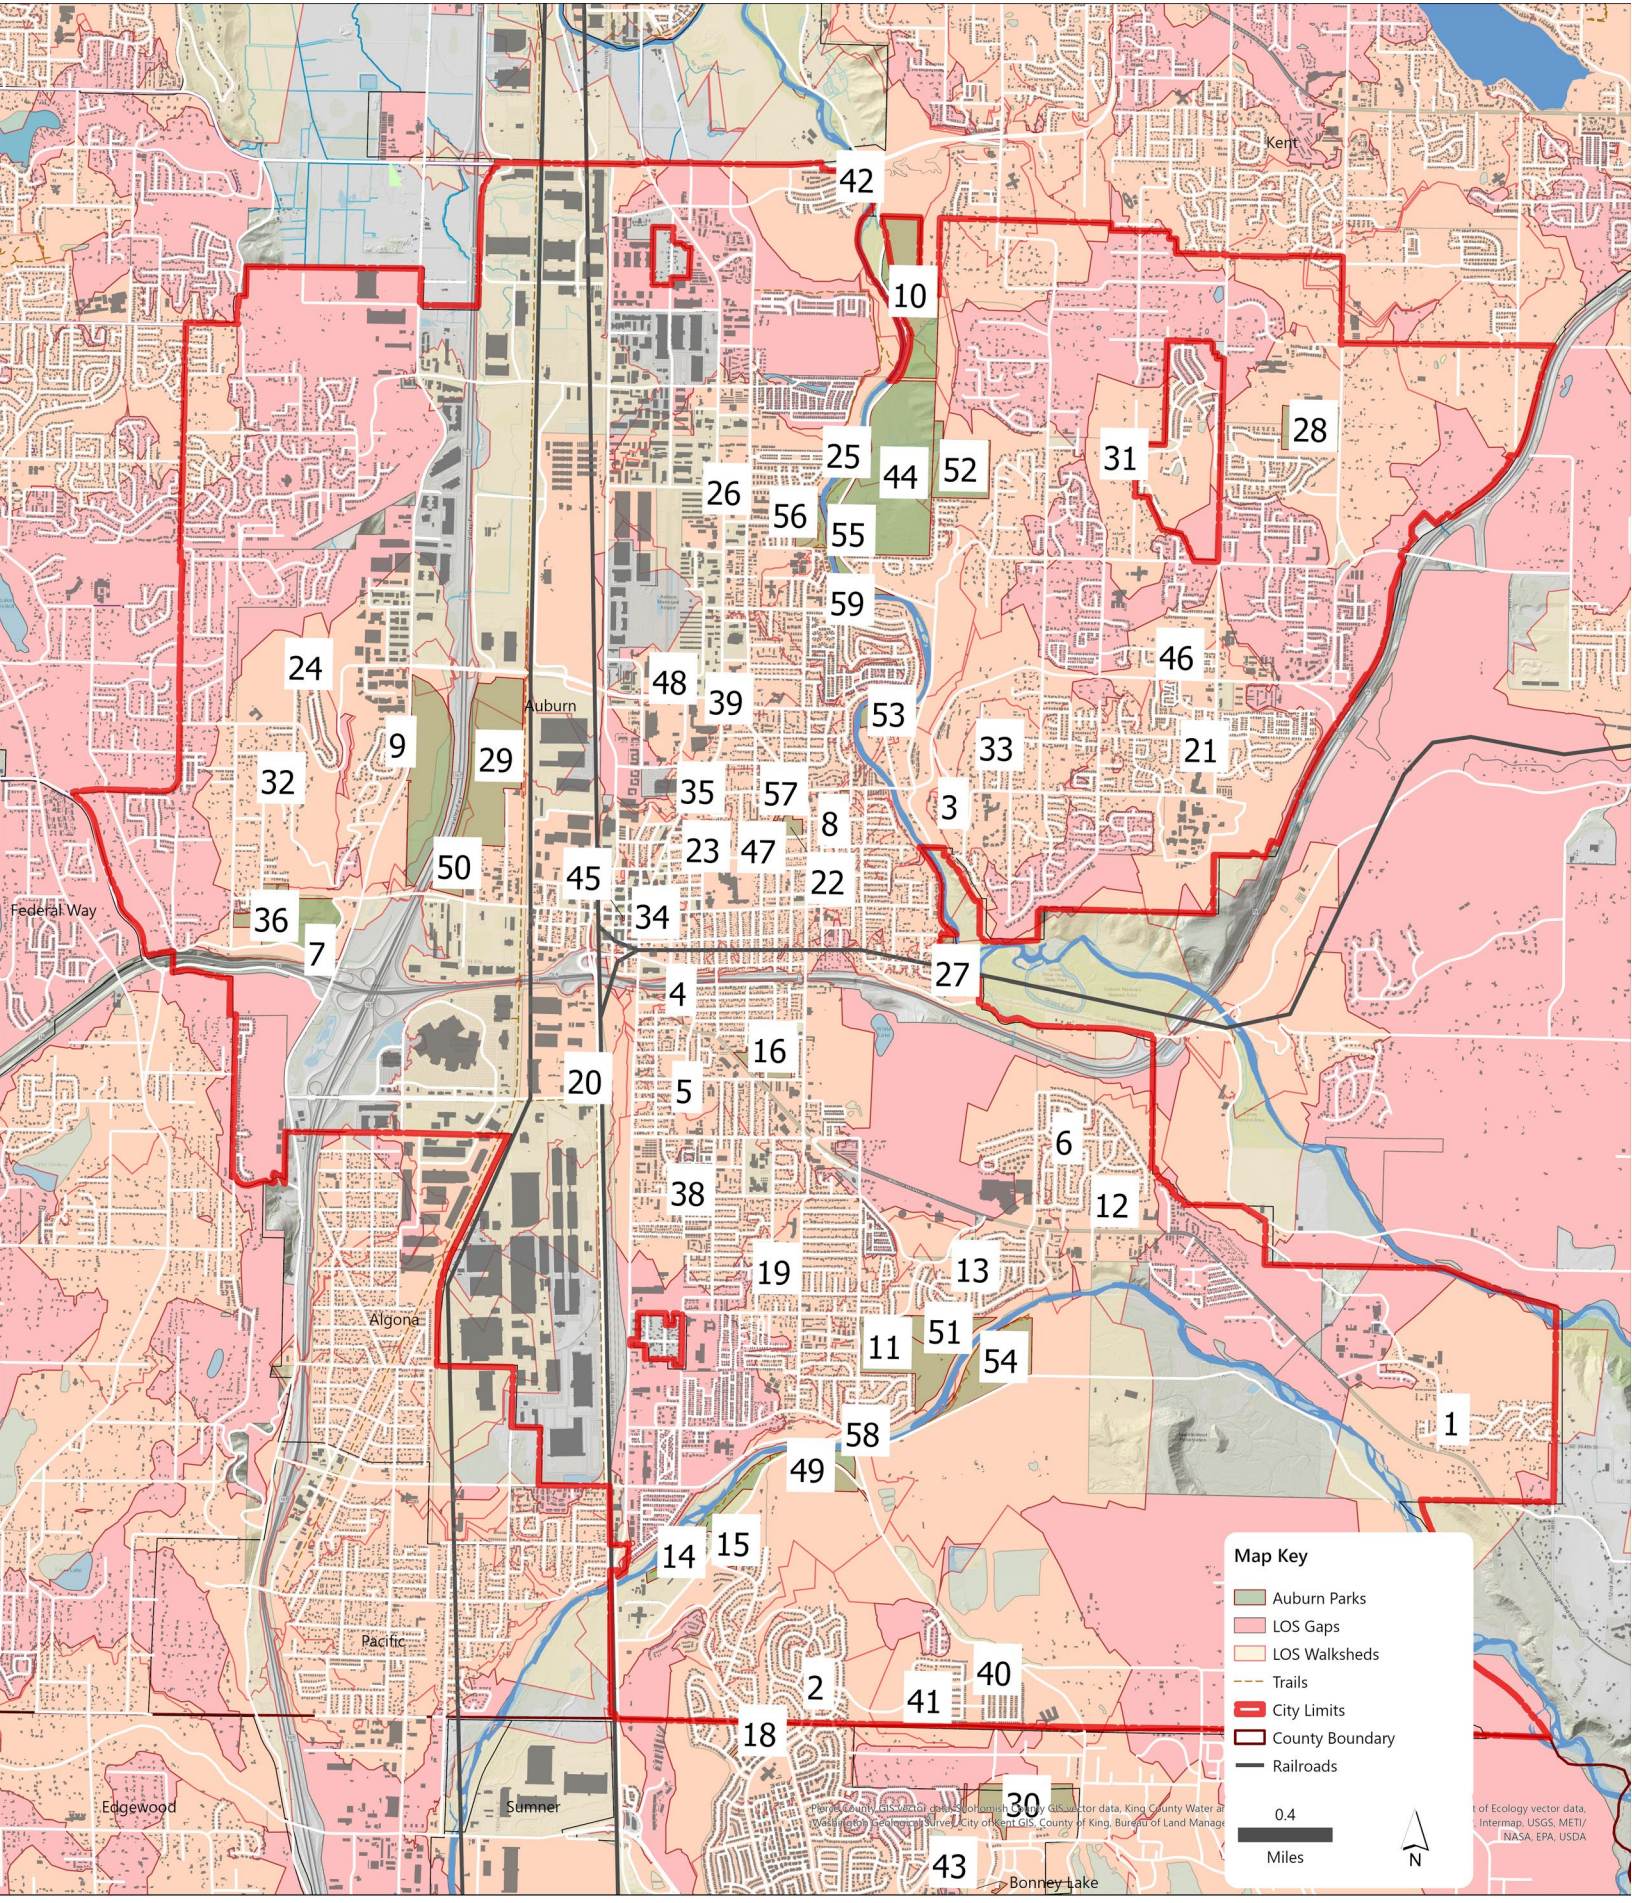
A 10-minute walk is considered an important park access metric for several reasons. A 10-minute walk (approximately 1/2 mile on level ground) as a park access metric is important because it promotes physical activity, equity, sustainability, social interaction, and overall community well-being (see 'Benefits of the 10-min Walk' on the next page.) It aligns with various health, environmental, and social goals the City has and should encourage staff and policymakers to prioritize accessible green spaces as a fundamental part of Auburn's development and the community's desired quality of life.

The figure on the following page identifies the service areas, AKA the 10-minute "walksheds", for each existing park as well as showing the current gaps on the page after that.

Gap Analysis

As outlined in the Goals & Objectives and related policies, ensuring that residents have fair and easy access to parks located within a half-mile of their homes is crucial for the overall health and well-being of the community. This previous figure offer insights into population density and conducts a network analysis of park accessibility. This analysis examines each property's ability to reach a nearby park within a half-mile, either via a street or a trail. The service area maps are designed to demonstrate how accessible parks with various amenities are to the community and how accessibility could be enhanced through improvements to parks that currently offer limited amenities. It's worth noting that these accessibility gaps can be reduced by ensuring safe access to parks can be increased with new sidewalks and transportation improvements.

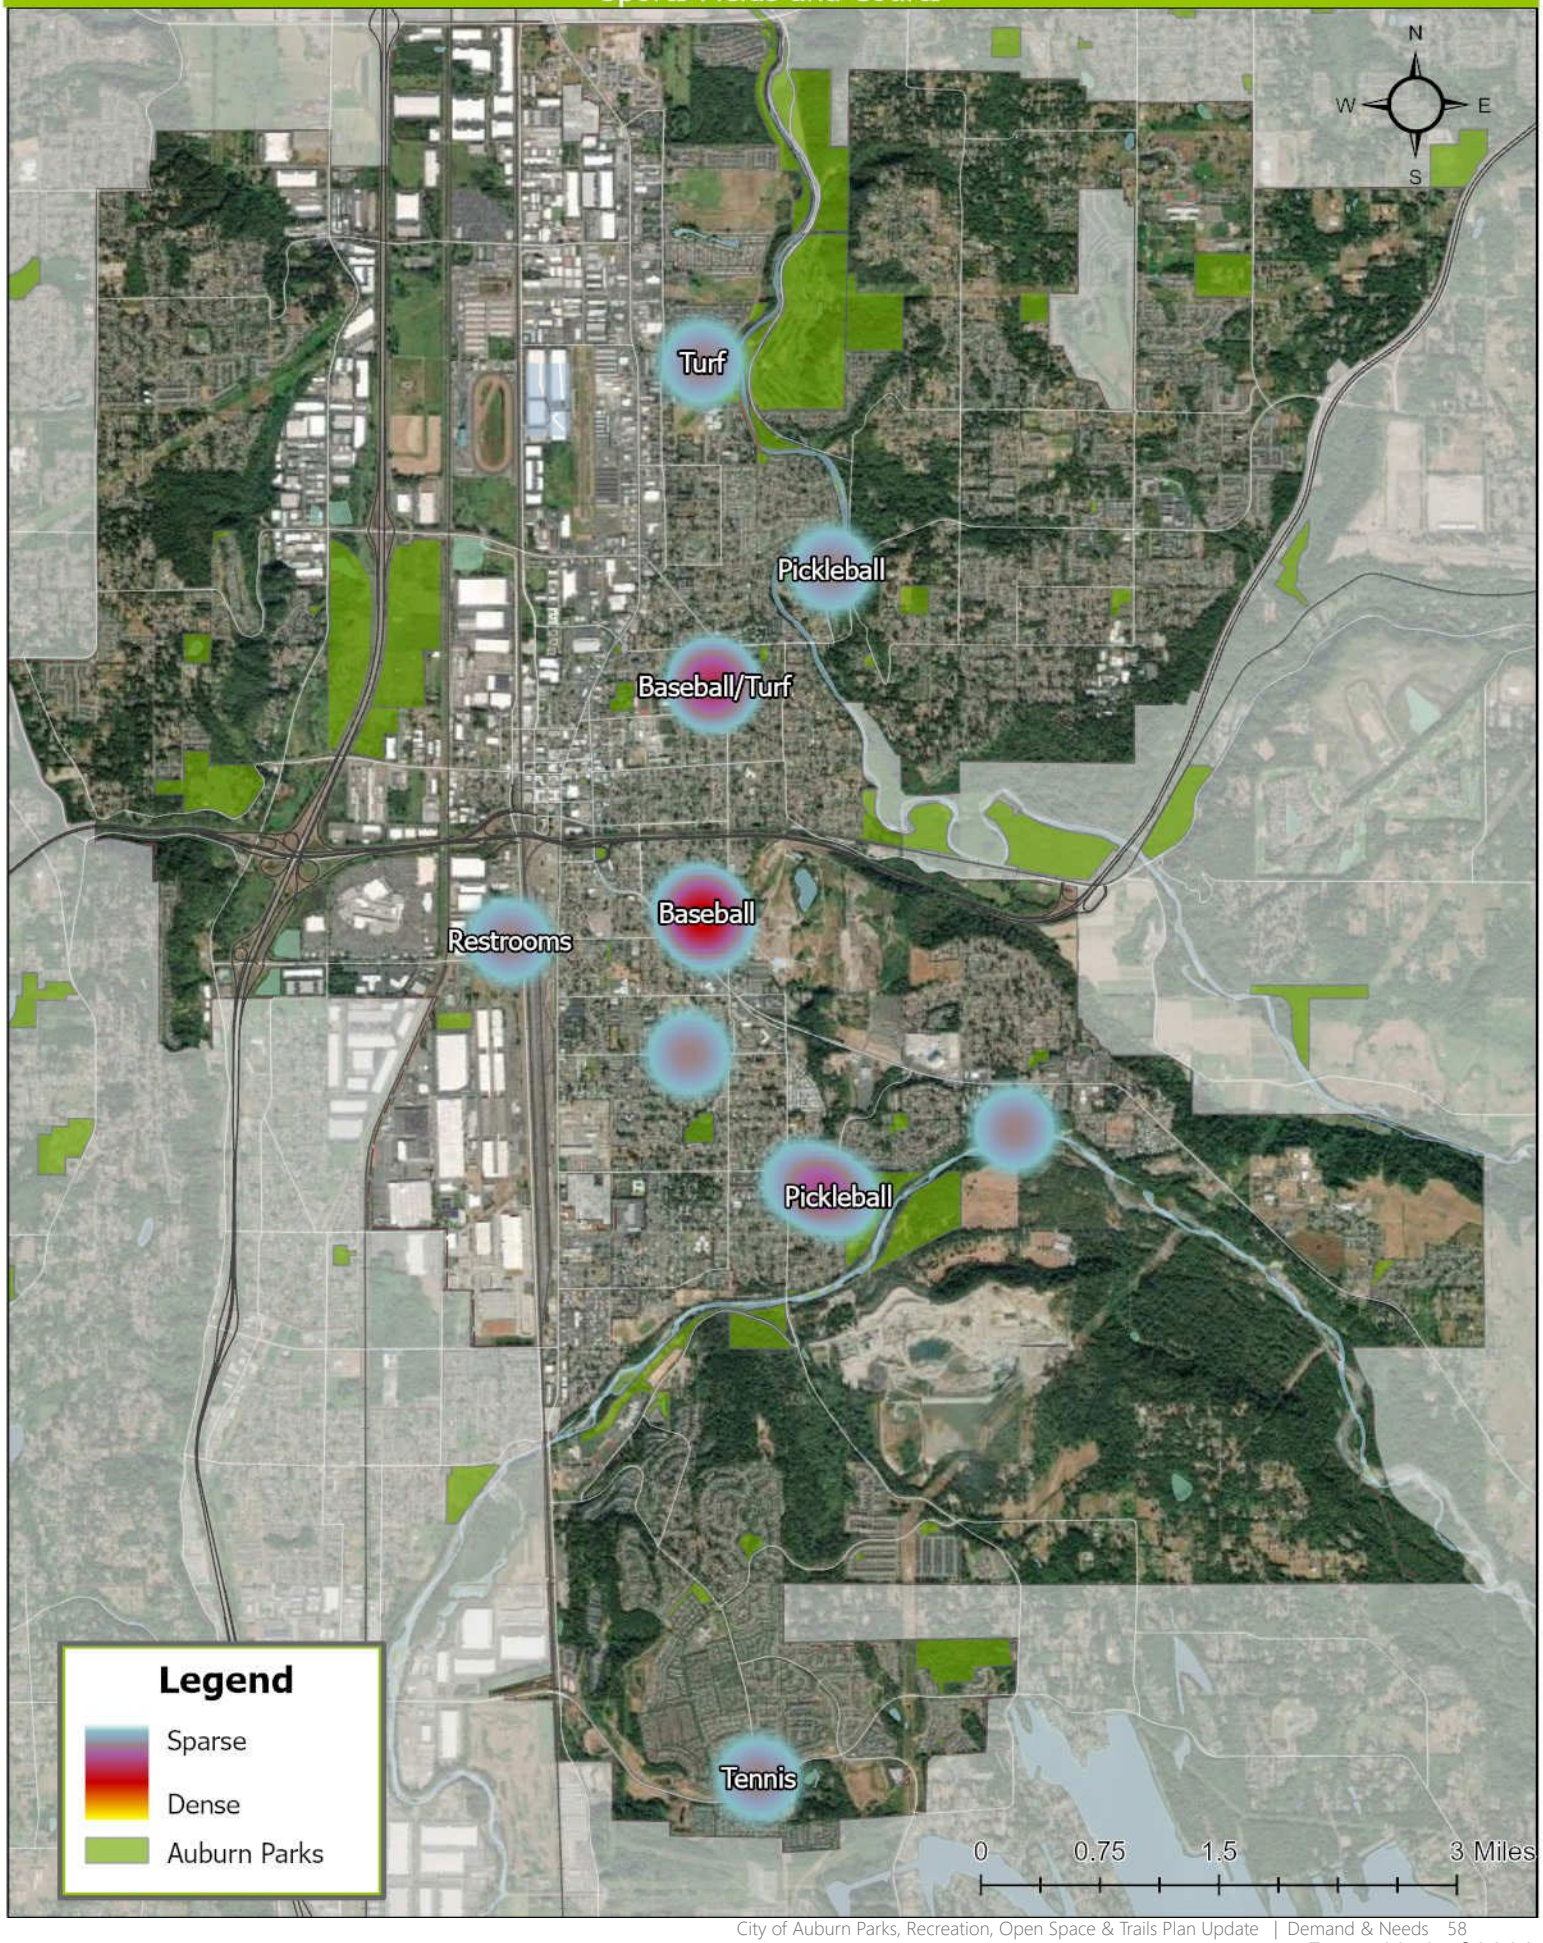
City of Auburn Projections



The City of Auburn, out of 635 named cities and populated areas, is currently ranked #14 in the list of cities in the State of Washington based on population size, and is located in the county with the highest desnity of people living per sq mile.

The Office of Financial Management (OFM) predicts population projections under the Growth Management Act (GMA) to accommodate growth over the next 20 years. While the most recent census data available is from 2020, it shows the population has grown to over 88,000. The rapid growth experienced during the '90's and '00's may have slowed, but Auburn remains an attractive community known for its family-oriented, small-town atmosphere. With affordable housing compared to most of King County, convenient highway access, and a charming small-town feel, Auburn is poised for continued, stable growth that will support the demand for recreational facilities.

Recreation Trends



Outdoor recreation is on the rise nationwide, and Washington State and all its communities is no exception. Since 2019, and especially throughout the Covid pandemic, outdoor recreation equipment sales saw a significant increase across all major product categories. In Washington, there has been a notable surge in the participation rates of 20 outdoor activities since 2017. Among these activities, non-motorized trails, nature and wildlife viewing, camping, paddling, winter recreation, and leisure activities in nearby parks are consistently in high demand among Washington residents. With an expected statewide population increase of 2 million residents in the next 25 years, it's more critical for cities such as Auburn to plan for the future demand on outdoor recreation facilities.

Outdoor recreation not only supports local economies

Support Amenities

but also connects people with the natural world, promoting physical and mental well-being. With the rise of work-from-home arrangements post-pandemic and housing shifts from larger cities to smaller communities, residents are increasingly seeking convenient access to a variety of outdoor experiences, both developed and primitive, that allow them to integrate nature-based recreation into their busy schedules while avoiding crowds and traffic.

However, striking a balance between providing access to outdoor recreation and safeguarding natural and cultural resources remains a significant concern statewide. The heavy concentration of outdoor recreation at popular sites has led to resource degradation and reduced user satisfaction. Many communities face disparities in access to meaningful outdoor recreation opportunities, and residents often struggle with the time, cost, and information needed to support their outdoor pursuits. As the state aims to promote equitable access to the social, health, and economic benefits of outdoor recreation, a careful approach to outdoor recreation management is essential to ensure the protection of natural and cultural resources.

2030 Statewide Comprehensive Outdoor Recreation Plan

The 2023 Recreation and Conservation Plan, or commonly referred to as the Statewide Comprehensive Outdoor Recreation Plan (SCORP), is a comprehensive document outlining the state's vision for outdoor recreation and public land conservation. Developed by the Recreation and Conservation Office (RCO), the plan guides investments for the next 5-10 years. It considers challenges and benefits of outdoor recreation, assesses current demand, and inventories existing opportunities. By establishing statewide priorities and goals, the plan serves a crucial role in securing funding, guiding investments strategically, and fostering collaboration between land managers. Public input through surveys and outreach ensures the plan reflects the needs of Washington residents. Ultimately, the WA State RCO SCORP Plan serves as a blueprint for a sustainable future where outdoor recreation and public lands are preserved and accessible for all.

RCO's 2022 Assessment of Resident Demand

In the 2022 Assessment of Resident Demand report, participation rates for 45 activities were compared to 2017. All but two of those activities (Technology-based games and Collecting or Gathering Things in Nature) showed an increase in participation. Activities that had the greatest increase in participation include the following:

- Wildlife or nature viewing increased by 28%
- Paddle sports increased by 28%
- Visiting outdoor cultural or historical facility increased by 27%
- Tent camping (undeveloped area) increased by 26%
- Backpacking increased by 25%
- Playing yard games (in a park) increased by 25%
- Snowshoeing increased by 23%
- Tent camping (developed area) increased by 19%
- Hanging out (in a park) increased by 19%
- Mountain biking increased by 18%

The SCORP document classifies Auburn within the 'Seattle King" region, encompassing King CVounty soley. Note that a portion of Auburn stretches into Pierce County. Regardless, the SCORP survey reveals a significant trend – "walking in a park or trail setting" that boasts the highest participation rate in the region (92% compared to the statewide average of 82%). This preference for walking holds true across diverse demographics, including age, gender, race, and income groups.

An interesting observation is the increasing popularity of walking as a recreational activity since the previous RCO survey in 2012. Additionally, participation in boating and swimming has also risen, with swimming now ranking among the top 10 recreational activities in the Seattle King region. Other favored activities include nature-based pursuits like visiting rivers, streams, and beaches, wildlife viewing, attending outdoor events like farmer's markets and fairs, and day hiking. These findings from the SCORP planning outreach program align with the trends identified in state-level surveys, underscoring the importance of walking/hiking opportunities and nature-based recreation in King County.

Trails

Trails, both within parks and connecting parks, schools, shops, and destinations are generally the top demand seen across the country. Providing trail connections between these popular destinations enhances a community's walkability and encourages active lifestyles. Trail usage has seen a significant uptick in recent years, with data suggesting a surge starting in 2020. Recent studies by both American Trails report increases ranging from 79% to 171% and can

attributed to several factors, especially as a response to the COVID-19 pandemic. With access to traditional forms of exercise and leisure activities significantly impacted due to closures and safety concerns, many people turned to outdoor recreation, including hiking and other trail-based activities as safe and accessible options. This trend has continued post-pandemic, with increased trail use likely due, in part, to the population continuing to seek alternative ways to exercise and maintain mental well-being.

While some pandemic restrictions have eased, evidence from the National Parks Service and the Washington State SCORP suggests a continued rise, or at least a steady hold, in trail use. This trend underscores the growing importance of well-maintained trail networks. This applies not just within parks themselves, but also in connecting parks and open spaces together. As demand for these outdoor spaces rises, so too does the need for additional supporting infrastructure to ensure their continued enjoyment by all.

Canines

The trend of dog ownership in the United States is experiencing a significant upswing, with estimates suggesting a population exceeding 89 and 94 million canine companions nationwide. This surge translates to a parallel rise in demand for designated dog parks across the country. These parks, particularly larger facilities, have become popular destinations, attracting dog owners and potentially boosting agency revenue through user fees and contributing to tourism.

In Washington State, the growing human-canine bond is likely influencing public land use plans. With dogs increasingly viewed as cherished family members, especially in urban environments, families are actively seeking opportunities to include their furry companions in outdoor activities. Cities are likely taking note of this trend, potentially leading to the inclusion of designated dog walking areas or off-leash spaces within their planning strategies.

Pickleball & Padel

The participation in pickleball has witnessed a remarkable surge, growing by 159% in just three years, reaching 8.9 million participants in 2022, as reported by the Sports & Fitness Industry Association.

This swift expansion has presented challenges for public parks and recreation departments, which must strike a balance between the competing interests of diverse recreational activities while working within constraints of limited space and budgets. Parks agencies are becoming more confronted with the task of accommodating pickleball enthusiasts, who favor this tennis-like sport with a smaller court, without causing discomfort or inconvenience to others. The noise and disruption generated by pickleball is becoming more a source of frustration for some neighbors, tennis enthusiasts, parents with young children, and other community members.

In various towns and cities, homeowners' associations and local residents have begun to impose restrictions on pickleball activities and thwart the construction of new courts. They have initiated petitions, pursued legal actions, and voiced their concerns at council and town hall meetings, all in an effort to temper the widespread enthusiasm for pickleball and its unique auditory characteristics.

Similar to pickleball, Padel is a racket sport of Mexican origin gaining popularity across the United States. This game is a cross between tennis, racquetball, and squash. It's currently estimated that Padel has over 100,000 players in the United States, and the number of courts has more than doubled in the last two years, expecting to grow to 30,000 courts by 2030. It is expected that the sport will grow substantially in communities with growing Hispanic populations, including Auburn.

Youth Sports

Participation in youth sports leagues has undergone a complex transformation in recent years. While traditional team sports remain popular, data suggests a decline in children (ages 6-12) consistently playing on teams. The Aspen Project reports a drop from 45% in 2008 to 38% in 2018, and the Sports & Fitness Industry Association (SFIA) confirms this trend with a 6% decline in core participation (ages 6-17) between 2019 and 2022. This translates to roughly 1.2 million fewer participants. Several factors may contribute to this decline, including the financial burden of participation fees, equipment, and travel expenses, concerns about over-specialization leading to burnout, and time constraints due to competing academic and extracurricular demands.

This changing landscape has potential implications for the need for large regional sports facilities. While the decline in regular participation suggests a decreased demand for facilities solely focused on traditional team sports, total team sports participation (including those playing at least once a year) remained stable between 2019 and 2022, suggesting a potential shift towards less structured forms of sports involvement. Basketball continues to be the most popular sport, with nearly a

quarter of youth (ages 6-17) participating at least once in 2022.

Multi-sport facilities catering to a wider range of activities and hosting tournaments or events attracting teams from a broader area are expected to see continued use. Well-designed facilities could also become community hubs, offering recreational activities for all ages and potentially incorporating amenities like fitness centers or indoor walking tracks that would noit be affected by inclement weather.

The future of youth sports will require adaptation in programs. Focusing on fun and inclusivity, offering flexible scheduling and shorter seasons, implementing strategies to reduce financial barriers, e.g. developing parks districts to help cover long-term operating & maintenance costs, and promoting foundational athletic skills applicable to various sports are all crucial considerations. By adapting to these trends, youth sports programs can ensure they continue to play a vital role in promoting physical activity, social development, and positive health outcomes for children.

Playground Trends

Modern playground design reflects a growing emphasis on inclusivity, fostering connections with nature, and catering to a wider range of users. A key trend to note is the creation of inclusive playgrounds, ensuring accessibility for children with various abilities through features like ramps, sensory panels, and equipment that accommodates different physical and cognitive needs.

Playgrounds are also increasingly designed to mimic natural environments, incorporating elements like logs, boulders, and water features. This reconnection with nature encourages open-ended and imaginative play.

The concept of multigenerational playgrounds is also gaining traction, offering adult fitness equipment and interactive features that promote intergenerational play within families and communities. Grant programs such as AARP's FitLot program is a great example.

Sensory play experiences are being actively integrated through musical instruments, textured panels, and fragrant plants. These elements stimulate different senses, enriching the play experience and catering to children with special needs.

While still emerging, some playgrounds are exploring seamless technology integration through augmented reality or interactive elements, adding a new layer to physical play.

Recognizing the limitations of shrinking green spaces in downtown cores or within communities, there's a growing focus on "playgrounds within reach." This involves maximizing the play value of smaller spaces through multifunctional equipment, innovative design, and better integration with surrounding areas.

Overall, these trends highlight a shift towards playgrounds that are not just fun, but also inclusive, educational, and promote holistic development in children.

Electrification

As electric technology develops, maintenance equipment, vehicles, mowers, and other equipment used in parks and recreation are transitioning from gas powered resources to electric assets. This transition provides long-term cost savings, environmental benefits, and decreased noise. Additionally, parks and trailheads should consider the addition of EV charging stations in parking lots, as the number of EV cars on the road continues to grow. Washington State has led this transition to electric vehicles, with over 18% of new cars sold in the first half of 2023 being fully electric or plug-in hybrids according to the Seattle Times. Vehicle chargers located at park facilities enable drivers to engage with park facilities while waiting for a full charge.

Climate Resiliency

The concept of electrification pertains to growing needs for climate resilience and the ways in which future park implementations can accommodate the increase of hotter days and nights, as well as the increase of storm and wildfire impacts. Parks create a great opportunity to address these goals through smart design and engineering. Parks and open space can mitigate urban heat islands, absorb flood and stormwater, and create fire breaks through green space and linear trail corridors. Climate change, stormwater/flooding implementations, and tree canopy coverage should be considered in future park renovations to increase resiliency.

Funding Threats & Availability

Funding for parks and municipal recreation services has been forced into a creative shift as municipalities have been forced to seek additional ways to fund operation and improvements. Long-standing grant and funding assistance programs have repeatedly come under threat at both the federal and state level. Congress let the Land and Water Conservation

Fund (LWCF) expire in 2015 for the first time in 50 years. In response to public outcry, several members in Congress fought for a short-term solution: an emergency authorization of three years. In 2016, Congress had another opportunity to permanently reauthorize LWCF, thanks to legislation championed by Washington's own Senator Maria Cantwell in the Energy Bill. While LWCF initially failed under the past administration, in September 2021, LWCF was permanently authorized with full funding through the Dingell Act. This act directed a significant portion of offshore oil and gas royalties to the LWCF for the preservation of public lands, waters, and recreational opportunities.

Since then, specific funding levels and appropriations for the LWCF have varied from year to year as part of the federal budgeting process. Funding for the LWCF depends on annual appropriations by Congress, hence the program's budget and funding levels can be subject to changes and priorities set by the federal government.

Investments in Parks Will Rise

Across other municipal agencies statewide, investment in state and local infrastructure, which had been depressed since the Great Recession of 2008, and especially since the COVID-related stimulus packages, e.g., ARPA, increased federal funding has helping that fund public works and park and recreation infrastructure improvements, such as buildings, restrooms, and roads.

State and local spending is up nearly 10 percent from last year, according to data from the Commerce Department, and spending on capital outlays continues to grow. The Commerce Department data also show that spending on amusement and recreation facilities is up 31 percent from a year ago. It appears that economic conditions will remain favorable for new investments in park and recreation infrastructure if local and state tax collections continue to rise and interest rates remain relatively low. Building on the momentum of the past few years, local and state governments will make even more park and recreation infrastructure investments in buildings, playground equipment, roads and bridges, and capital repairs to aging infrastructure, topping the highest level of infrastructure spending since the recession of 2008.

Level-of-Service (LOS)

To evaluate how different types of parks align with a community's desires, the National Recreation & Park Association (NRPA) developed and maintains simple demand standards as a guideline for identifying the number of park facilities potentially needed per community. While there are various methods to assess the service standards of a park system, the NRPA's standards focus primarily on comparing population size to the number and types of parks or recreational amenities offered.

Traditionally, the ratio of land acres per thousand people has been a widely adopted measure. However, this metric provides only a limited evaluation of a park system. A more comprehensive approach to determining service standards should consider the distribution of land and facilities throughout the community, the per capita value of the system, the availability of programs for all demographics, the characteristics of the park user base, the quality and upkeep of facilities, and, most importantly, public perception of the park system as an indicator of quality of life.

Recognizing that the vision, values, and needs of each community are unique, planners have acknowledged that simply applying local level-of-service (LOS) standards to a national benchmark is not an effective means of evaluating a community's specific needs and vision. Consequently, NRPA's LOS standards have evolved in recent decades, now recommending that each community develop its own standards based on local goals, priorities, and conditions.

NRPA Recommendations

The National Recreation and Park Association (NRPA) provides guidelines for Level of Service (LOS) standards, which help communities determine appropriate targets for parks and recreational facilities based on population. However, it's important to note that NRPA has moved away from prescribing specific numeric LOS standards (traditional benchmarks) for all communities, recognizing that each community has unique needs and contexts. Instead, they emphasize using data-driven approaches, including benchmarking against similar communities, community input, and local conditions to determine the appropriate LOS.

For communities with populations of 85,000 to 100,000 residents, the NRPA suggests the following general recommendations:

Total Parkland per 1,000 Residents

Traditional Benchmark: Historically, a common benchmark was to provide around 10 acres of parkland per 1,000 residents. However, this is no longer a one-size-fits-all recommendation. Communities are encouraged to set their own targets based on factors such as geographic constraints, population density, and specific recreational needs.

Contemporary Approach: Communities might set goals ranging from 5 to 20 acres per 1,000 residents, depending on their unique circumstances and priorities.

Park Access and Distribution

Accessibility: NRPA recommends that all residents should have access to a park or green space within a 10-minute walk (approximately 0.5 miles) from their home. This focus on accessibility ensures that park benefits are equitably distributed across the community.

Distribution: For larger communities, ensure that parks are evenly distributed across different neighborhoods and are easily accessible by diverse modes of transportation, especially safe walkable routes.

Programming and Services

Diversity: Communities should offer a wide range of recreational programs that meet the diverse needs of their population, including youth, adults, seniors, and special populations. This may include sports leagues, fitness classes, arts and culture programs, and environmental education.

Staffing Levels

Staffing is crucial for maintaining facilities and delivering quality programming. NRPA provides guidance on staffing ratios, often suggesting a mix of full-time, part-time, and seasonal staff based on the size and scope of the park system.

Staffing by Park Acreage Benchmark: NRPA recommends approximately 1 full-time equivalent (FTE) maintenance staff member per 10 to 20 acres of developed parkland. This number can vary depending on the complexity of the park, the intensity of maintenance required, and the specific facilities within the park (e.g., sports fields, playgrounds, trails).

Programming and Operations Staff: For every 50 to 100 acres of parkland, NRPA suggests having 1 FTE dedicated to programming and operations. This staff is responsible for organizing events, managing facilities, and overseeing day-to-day operations.

Staffing by Number of Parks: NRPA recommends approximately 1 FTE staff member (including maintenance, administrative, and programming roles) per park, assuming the park is of average size and complexity. Smaller parks might not require a full-time staff member and could be maintained by part-time

Budget and Funding

NRPA annually surveys parks organizations across the country to provide quantitative data on several budget and funding metrics:

Per Capita Spending: NRPA Park Metrics reports suggest that the average spending per capita by park and recreation agencies across the U.S. is around $85-$90 per resident. However, this can vary significantly depending on the size of the city, regional cost of living, and specific needs of the community.

Operating Budget Per Acre: NRPA's Park Metrics also indicate that the median operating expenditure is around $6,000 to $8,000 per park acre. This includes costs for maintenance, staffing, utilities, and other operational needs.

Capital Expenditures: A common benchmark is that capital expenses (new developments, major renovations, etc.) should be a significant portion of the overall budget. A rough guideline is allocating 20-30% of the total budget to capital projects, though this can fluctuate based on current needs and existing infrastructure.

Auburn's Quantitative LOS

With NRPA's recommendations in mind, a straightforward quantitative analysis of the City's Level of Service (LOS) can be conducted. The following section evaluates Auburn's current park system against expected NRPA benchmarks to identify current performance and future needs. Ultimately, these quantitative findings will be integrated with the public involvement findings to develop a customized set of LOS standards. This approach, grounded in extensive community engagement, ensures that Auburn's parks and recreation system reflects the community's priorities, whether that means more green spaces, enhanced sports facilities, expanded trails, or additional cultural amenities.

LOS Standards & Overview

Table 4.1 presents the current Level of Service (LOS) based on Auburn's park classifications and recreational amenities inventory. The LOS analysis utilizes assumed low to median values for each category, considering

Table 4-1: Existing Facility Type & LOS Targets					
Facility Type	Current	Recommended Standard*	Current Ratio	Current Difference	Projected Difference****
Park Classification					
Mini-Parks (Pocket Parks)	16.71 acres	0.25 to 0.5 acres	0.19	-0.06	-0.1
Neighborhood Parks	51.23 acres	1 to 2 acres	0.57	-0.43	-0.55
Community Parks	283.31 acres	5 to 8 acres	3.14	-1.86	-3.14
Open Space	321.42 acres	5 to 10 acres	3.57	-1.43	-2.19
Special Use Areas	307.69 acres	Variable			
Total Parkland	980.35 acres	10 acres	10.88	+0.88	-1.44
Total # of Parks	57	1 park per 2000	46	+11	-
Trails	21.96**	.25 to .5 miles	0.24	-	-6.67
Recreation Amenity					
Baseball/Softball Fields	7	1 per 5,000	18.02	-9	-13
Soccer Fields	4	1 per 10,000	9.01	-5	-11
Football Fields	2	1 per 20,000 to 25,000	3.6	-2	-4
Multi-use Fields	6	1 per 10,000	9.01	-3	-5
Basketball Courts	18	1 per 5,000	18.02	-	-5
Tennis Courts	8	1 per 4,000	22.52	-13	-20
Playgrounds	33	1 per 1,000 children under 12***	18	+15	+3
Pickleball Courts	16	1 per 4,000	22.52	-6	-12
Volleyball Courts	2	1 per 10,000	9.01	-7	-9
Recreation Centers	1	1 per 25,000	3.6	-2.6	+3.5
Splash Pads	2	1 per 25,000	3.6	-1.6	-2.5
Dog Parks	2	1 per 50,000	1.8	-	-
Skate Parks	4	1 per 25,000	3.6	-	-.5

Community Gardens (Plots)	16	1 per 10,000	9.01	+7	+5
Amphitheaters	1	1 per 50,000	1.8	-0.8	-1

* measured as acres per 1000 population

** Includes other trails maintained by others

*** Projected 2044 Population = 114,540

**** Assumed # of childen under 12 approximately 20% of overall population

Auburn's current population of 90,096 (as of 2024) and a projected population of 114,540 by 2044. Below is an overview and guideline for LOS quantifications, structured around common park classifications and key recreational elements.

Total Parkland LOS Analysis

Overview: Currently, the City of Auburn boasts a diverse portfolio of parks and recreation assets, totaling 57 sites and covering over 980 acres. This exceeds the lower end of the expected range for parkland based on NRPA guidelines. The NRPA typically recommends between 10 to 20 acres of parkland per 1,000 residents as a general standard. With Auburn's current population of 90,096 (as of 2024), the expected median total acreage of parkland would range from approximately 900 to 1,800 acres. Auburn's park system is therefore well-aligned with these recommendations, supporting the recreational needs of its residents today.

- Total Number: 57 parks
- NRPA Target Number of Parks Based on Population: 57 Parks
- Total Acreage: 980.35 acres
- Average Size: 21.97 acres
- NRPA Target Acreage Based on Population: 10-20 acres per 1000
- Current LOS: 10.88 acres per 1,000 residents
- Projected LOS: 8.56 acres per 1,000 residents
- Auburn Target LOS: 10 acres per 1,000 residents or additional 164 acres of total parkland by 2024

Conclusion/Recommendations: Auburn's current total acreage of parkland is generally within the expected range for a community of its size and physical context. However, when analyzing the distribution and average size of its park types, especially neighborhood and community parks, there are notable discrepancies compared to national standards.

According to the National Recreation and Park Association (NRPA), the recommended level of service (LOS) for community parks is between 5 to 8 acres per 1,000 residents. Auburn currently averages only 3.14 acres per 1,000 residents, which is below this recommended standard. For neighborhood parks, the NRPA suggests an LOS of 1 to 2 acres per 1,000 residents, but Auburn's current average is just 0.57 acres per 1,000 residents. This indicates a significant shortfall in the provision of both neighborhood and community parks relative to the city's population.

Furthermore, the NRPA recommends 5 to 10 acres of open space per 1,000 residents, yet Auburn currently provides only 3.57 acres per 1,000 residents. When factoring in land managed by other organizations, such as King County's Department of Natural Resources, this figure improves and aligns more closely with the recommended range.

Auburn exceeds expectations in total acreage due to the significant footprint of its Special-Use Facilities. This surplus is largely attributed to the inclusion of extensive environmental areas and the golf course, both of which are managed differently from traditional parks and offer limited access to the general public. While reclassifying the golf course as open space might enhance Auburn's Level of Service (LOS) for open space, the specific use, management practices, and limited public access associated with the golf course support its continued classification as a special-use area.

In summary, while the overall size of Auburn's park system aligns with general recommendations, there is a clear shortfall in the distribution of neighborhood and community parks. Additionally, while the city maintains over 30 beautification areas that enhance its aesthetic appeal, these spaces do not replace the need for more neighborhood and community parks to meet national standards and adequately serve the recreational needs of Auburn's residents.

Parklets / Mini Parks / Tot-Lots LOS Analysis

Overview: These parks serve small areas, often a single neighborhood or part of one. They typically feature amenities like playgrounds, benches, and small open spaces with no restrooms. incorporating more parklets and mini-parks can be an effective strategy for addressing Level of Service (LOS) deficiencies, especially in urban areas where space is limited. These smaller parks can provide critical, but disconnected, green space, recreational opportunities, and social gathering spots within densely populated neighborhoods. They are often easier and quicker to implement than larger parks, making them a practical solution to improve accessibility and equity in park distribution. However, they generally require the same level of maintenance and operational purview as larger local or neighborhood parks and, factoring in the increased travel time, can potentially become a lrger burden on park staff.

- Number: 13 parks
- Acreage: 16.71 acres
- Average Size: 1.28 acres
- Target Size: Typically less than 1 acre
- NRPA Target LOS: 0.25 to 0.5 acres per 1,000 residents
- Current LOS (2024): 0.19 acres per 1,000 residents
- Projected LOS (2044): 0.15 acres per 1,000 residents
- Draft NEW LOS: 0.25 acres per 1,000 residents
- Projected Deficit (Acres): 11.29 acres
- Service Radius: 1/4 mile or less

Conclusion/Recommendations: To address the projected decline in the Level of Service (LOS) for mini-parks, parklets, and tot-lots, it is recommended that the City prioritize the strategic addition of these smaller park facilities only as opportunities arise. Currently, the LOS stands at approximately 0.19 acres per 1,000 residents, which close to NRPA's minimum of .25, but without intervention, this will decrease to 0.15 acres per 1,000 residents by 2044. To maintain an adequate LOS, the City should aim to add approximately 11 acres of new park areas in this classification by 2044, ensuring continued access to these essential recreational spaces for the growing population.

Neighborhood Parks LOS Analysis

Overview: Local or neighborhood parks serve as the recreational and social hubs of a neighborhood. These parks are designed to be accessible by foot or bicycle and typically feature amenities such as playgrounds, athletic fields, picnic areas, sports courts, and open play areas. Some parks may also include restrooms and other supportive facilities. Currently, there is a shortage of local or neighborhood parks based on current park classifications, but the total parkland acreage across the city exceeds the cumulative standard.

- Number: 10 parks
- Acreage: 51.23 acres
- Average Size: 5.12 acres
- Target Size: Generally 5 to 10 acres
- NRPA Target LOS: 1 to 2 acres per 1,000 residents
- Current LOS (2024): 0.57 acres per 1,000 residents
- Projected LOS (2044): 0.45 acres per 1,000 residents
- NEW LOS: 1 acres per 1,000 residents
- Projected Deficit (Acres): 63.31 acres
- Service Radius: 1/4 to 1/2 mile

Conclusion/Recommendations: The current Level of Service (LOS) for neighborhood parks in Auburn is 0.57 acres per 1,000 residents, which is projected to decline to 0.45 acres per 1,000 residents by 2044. This projected LOS falls significantly below the recommended minimum standard of 1 acre per 1,000 residents. To meet this new standard by 2044, Auburn will need to add approximately 63 acres of new neighborhood parks. This strategic addition is critical to ensuring that the growing population has sufficient access to neighborhood park facilities, maintaining a high quality of life and community well-being.

Community Park Inventory and Needs Analysis

A community park is planned primarily to provide active and structured recreation op- portunities for young people and adults. They often exceed 10 acres in size and may have sports fields, water bodies, gardens, nature trails or similar features as the central focus of the park. Community parks can also provide indoor facilities to meet a wide range of recre- ation interests. They require more support facilities such as parking and restrooms than neighborhood parks. Community parks serve a much larger area than neighborhood parks and offer more facilities. Where there are no neighborhood parks, the community park can also serve the neighborhood park function. The community park service area covers a one to two mile radius.

Community Parks LOS Analysis

Overview: Community parks serve broader community needs, often featuring larger facilities or arrays of facilities types, e.g., tournament baseball field complexes, and a wider range of amenities, such as swimming pools, and community centers that are intended to support the entire community. The number of community parks a city like Auburn, WA, should have depends on several factors, including NRPA guidelines, local demand, and geographic considerations. The target acreage for community parks typically ranges from 20 to 50 acres per park or 5-8 acres per 1000 residents, according to NRPA guidelines. Using those metrics, Auburn, WA, should have about 2 to 4 community parks based on its population, with an ideal total acreage between 40 - 200 acres. This ensures that the parks are large enough to accommodate a variety of amenities, such as sports fields, playgrounds, walking trails, and open spaces, while serving a significant portion of the population effectively.

- Number: 14 parks
- Acreage: 283.31 acres
- Average Size: 20.2 acres
- Target Size: Generally 20 to 50 acres
- NRPA Target LOS: 5 to 8 acres per 1,000 residents
- Current LOS (2024): 3.14 acres per 1,000 residents
- Projected LOS (2044): 2.47 acres per 1,000 residents
- NEW LOS: 3.5 acres per 1,000 residents
- Projected Deficit (Acres): 116.69 acres
- Service Radius: 1 to 2 miles

Conclusion/Recommendations: The current Level of Service (LOS) for community parks in Auburn is 3.14 acres per 1,000 residents, but it is projected to decline to 2.47 acres per 1,000 residents by 2044. This anticipated reduction highlights a significant shortfall, with a projected deficit of over 116 acres in this park classification. To meet the needs of Auburn's growing population and maintain the recommended LOS, the City will need to prioritize the addition of these 116 acres of new community parks by 2044.

Future community park sites should be strategically selected in areas like West Hill and Lea Hill, where development is ongoing, and large gaps exist between existing parks. Additionally, other residential areas, particularly in the northeast and southeast corners of the City, are on the edges of existing service areas and will require new community park acquisitions and development as population growth continues.

Two key sites, Jacobsen Tree Farm and the 104th Ave SE property along the Green River, offer significant potential for development into community parks. These sites account for 44 acres of undeveloped land that will be crucial in addressing the City's parkland needs. The development of these areas into community parks will help close the gap in service coverage and ensure that Auburn's residents continue to have access to ample recreational spaces, supporting the overall quality of life in the community.

Special Use Parks LOS Analysis

Overview: Unlike other recreational classifications, special use facilities serve very unique, often singular functions and include unique features that add depth and variety to the city's recreational and open space amenities. By integrating these specialized spaces, Auburn creates a vibrant public landscape that reflects the city's identity and enhances recreational opportunities for the community. Examples of these facilities include pocket landscape areas, community gardens, streetscapes, unique sections of the Environmental Park, viewpoints, historic sites, public art installations, and traffic islands.

- Number: 14
- Acreage: 307.69 acres
- Auburn Average Size: 21.9 acres
- Target Quanitity & Size: Varies depending on the facility type and use
- Target LOS: Depends on community needs; not typically defined by a strict LOS but considered based on demand.
- Service Radius: Typically serves the entire community or region.

Conclusion/Recommendations: Past and more recent survey comments indicate that residents have a strong desire to enhance the City's aesthetics by increasing the planting of street trees, flowers, and other greenery. Integrating these beautification efforts, along with the development of additional special-use areas as opportunities arise, presents a valuable chance to improve the overall appearance of the community.

However, there are currently no specific targets or goals for purposefully developing more special-use areas. Introducing a significant number of small, specialized facilities could result in higher-than-expected maintenance and operational costs for the department. As development continues and additional land is acquired—including smaller, less usable areas within the public right-of-way—it is essential to remain vigilant in assessing these opportunities. Evaluating them for their unique, heritage, natural, and activity-centric qualities that could provide community value is recommended.

The Parks Department should continue collaborating with relevant departments to ensure that landscaping standards support the inclusion of street trees and other plantings, further integrating existing green spaces and improving their connectivity. This will not only enhance the city's aesthetics but also contribute to public safety. Additionally, encouraging the development of boulevard-style streets in key locations can further improve the visual appeal and functionality of the urban environment.

Natural Resource Areas and Greenways (Open Space)

Overview: Open space areas are vital for protecting and preserving natural landscapes, wildlife habitats, and green corridors. The purpose of these amenities is to maintain natural landscapes, safeguard wildlife habitats, and protect critical natural infrastructure, while also providing residents with opportunities for passive recreation and environmental education, such as hiking and birdwatching.

NRPA provides general guidelines for the amount and size of open space and natural areas within a community. Typically, these guidelines recommend that a city should maintain between 7 to 10 acres of open space and natural areas per 1,000 residents. For a city the size of Auburn, with a population of 90,096 (as of 2024), this would equate to approximately 630 to 900 acres of open space and natural areas. Currently, Auburn has 321 acres of dedicated open space areas. However, when considering other greenways and open spaces within the city that are not maintained by the City of Auburn, the total approaches the minimum target of 630 acres.

Given Auburn's current inventory of open space areas available to residents, the city is close to meeting the lower range of the NRPA's recommendations for open space and natural areas. Auburn's commitment to preserving these areas aligns well with NRPA guidelines, and the city's existing acreage of natural areas and open spaces is well-positioned to support the ecological and recreational needs of its residents. This ensures that Auburn continues to provide valuable natural amenities as the community grows.

- Number: 6 Open Space and Natural Areas
- Total Acreage: 321.42
- Average Size: 53.57 acres
- Target Acreage: 630-900 acres
- NRPA Target LOS: 5 to 10 acres per 1,000 residents
- Current LOS (2024): 3.57 acres per 1,000 residents
- Projected LOS (2044): 2.81 acres per 1,000 residents

- NEW LOS: 4 acres per 1,000 residents
- Projected Deficit (Acres): 136.58 acres
- Service Radius: Typically regional, with users traveling farther to access these areas

Conclusion/Recommendations: Auburn's current Level of Service (LOS) for open space areas is 3.57 acres per 1,000 residents as of 2024. However, with the city's projected population growth, this LOS is expected to decline to 2.81 acres per 1,000 residents by 2044. This decrease places Auburn below both the National Recreation and Park Association's (NRPA) target LOS of 5 to 10 acres per 1,000 residents and the City's draft new LOS standard of 4 acres per 1,000 residents.

The decision to increase the LOS for open space reflects a growing recognition of the critical role these areas play in promoting climate change resiliency, managing flood hazards, supporting wildlife habitats, and mitigating the effects of urban heat on aging populations. As climate change continues to impact weather patterns, open spaces can serve as vital buffers, absorbing excess rainfall and reducing the risk of flooding, particularly in vulnerable areas along rivers and low-lying regions.

Furthermore, open spaces provide essential habitats for wildlife, helping to preserve biodiversity within the city. These natural areas are increasingly important as urbanization encroaches on green spaces, putting pressure on local ecosystems. By expanding and protecting open space, Auburn can help ensure that wildlife populations continue to thrive, maintaining ecological balance and enhancing the natural beauty of the community.

In addition to their environmental benefits, open spaces are crucial for the health and well-being of Auburn's residents, especially as the population ages. Access to nature has been shown to reduce the effects of heat islands in urban areas, where concrete and asphalt trap heat, leading to higher temperatures. These elevated temperatures can be particularly harmful to older adults, who are more susceptible to heat-related illnesses. Expanding open space provides shaded areas and cooling effects that are vital for protecting vulnerable populations.

To meet the new LOS standard of 4 acres per 1,000 residents by 2044, Auburn will need to acquire and develop an additional 136.58 acres of open space. This strategic expansion is essential not only to meet recreational needs but also to ensure the city's resilience in the face of climate change and urbanization. By investing in open spaces, Auburn can enhance its ability to manage environmental challenges, protect its natural heritage, and promote the long-term health and well-being of all its residents.

Trails LOS Analysis

Auburn, WA, boasts an extensive network of trails that weave through the city's diverse landscapes, offering residents and visitors a range of recreational opportunities. These trails, often referred to as linear parks, typically follow natural and man-made features such as stream corridors, abandoned railroads, or power line easements. They serve multiple purposes, including providing pathways for walking, running, and biking, as well as creating interpretive areas, open spaces, and landscaped zones.

The city's trail system is designed with minimal development to preserve the natural environment, focusing on essentials such as trailheads, educational signage, benches, and picnic tables. However, in areas with more space, like wide power line easements, there is potential for more extensive development, allowing for a broader range of recreational uses while still maintaining the primary function of these linear parks.

Auburn currently has 21 different trail segments of varying purposes covering a total of 21.96 miles across the city, however 6.75 miles of those trails are within existing parks (see Table 2-5.)

- Total Miles of Trails (All): .25 to .5 miles per 1,000 residents
- Total Miles of Trails (All): .25 to .5 miles per 1,000 residents
- Expected NRPA Standard: .25 to .5 miles per 1,000 residents
- Existing Ratio: Total: 0.28 miles per 1,000 residents
- Existing Inventory: 21.96 miles
- Current Need: 0.0 miles
- Future Need (2044): 6.69 miles
- NEW LOS: 0.125 miles per 1,000 residents

Conclusion/Recommendations: Auburn's current ratio of 0.24 miles of developed trail parkland per 1,000 residents aligns closely with the minimum expected average. However, with the projected population increase, there is an anticipated need for an additional 6 miles of trails by 2044. Given the existing opportunities for new trail development and the high level of public interest in trails, it is recommended to slightly adjust the standard to 0.125 miles of developed trail parkland per 1,000 residents. Although Auburn's current inventory of trails already exceeds the adopted standards, further expansion and development are essential to ensure connectivity across different areas of the city and beyond. The demand for an interconnected trail system is expected to grow, particularly as residents, especially post-pandemic, continue to express a strong interest in trails for

recreation and as an alternative means of commuting, as identified in the Statewide Comprehensive Outdoor Recreation Plan (SCORP). This underscores the importance of enhancing Auburn's trail network to meet the evolving needs of its community.

Future Trails/Linear Park Development:

There are several opportunities to develop additional trails and linear parks in Auburn providing local and regional trail systems. Considering the interest in trail activities as demonstrated by public invovlement results and national recreation trends, these additional trails are worth pursuing. Identified locations for potential loop trails within parks, new linear parks, or extensions of existing linear parks include:

- BPA Power Line Easement (Lea Hill to Green River Road)
- Green River TRail (Planned)
- White River Trail (A Street to Interurban Trail)
- Mill Creek Corridor
- Rotary Park
- Shaughnessy Park
- Fulmer Park

Goals & Objectives

The Auburn Parks, Arts, and Recreation Department is dedicated to preserving the city's natural beauty through a vibrant and well-maintained system of parks, open spaces, and trails. Our mission is to enrich the lives of Auburn's residents by providing diverse recreational and cultural opportunities that foster a strong sense of community, promote health and well-being, and celebrate the unique natural landscapes that define our city.

The goals and objectives outlined in this chapter have been meticulously crafted to align with the requirements of the Growth Management Act (GMA) and are the result of an extensive and thoughtful planning process. This process drew upon a range of valuable resources, including insights from the 2015 Park, Arts, and Recreation Open Space Plan, findings from the 2023 Parks, Recreation, and Open Space Survey, and input from dedicated Parks and Recreation staff. Additionally, we carefully analyzed recreation trends, participation rates, and the current state of our parks to ensure that these goals are both forward-looking and responsive to the evolving needs of our community.

Through this comprehensive approach, we aim to create a park system that not only meets the present demands but also anticipates future growth and challenges. Our commitment is to maintain and enhance Auburn's parks and recreation offerings, ensuring that they continue to serve as vital community assets for generations to come.

Goal 1: Serve all residents and provide a broad range of programs and facilities in order to serve all residents regardless of age or ability.

The Auburn Parks, Arts, and Recreation Department is committed to providing accessible leisure and recreational programs for all residents, with a focus on accommodating special needs. To ensure awareness of these programs, the City has adapted its marketing strategies, blending innovative social media with traditional outreach to engage the community effectively.

Goal 1: Objectives

1A. Provide a variety of recreation facilities and programs that will improve the physical and mental well being of community members.

1B. Provide a system of neighborhood and community parks so that residents live within a half mile walking distance to a developed park.

1C. Develop multi-use facilities to increase flexibility to meet recreational trends as demonstrated by community input.

1D. Continue to identify under-served segments of the population and develop programs that will satisfy unmet needs.

1E. Develop marketing strategies allowing the widest possible distribution of information concerning park facilities and recreation programs.

1F. Provide programs and facilities designed for maximum affordability to local residents.

1G. Continue to improve upon and expand the Fee Waiver and Scholarship Programs, where possible, to allow more low income youth and seniors to participate at reduced rates.

1H. Continue to improve access for the disabled and seniors by providing wheelchair ramps and other appropriate facilities in parks where they do not currently exist.

1I. Continue to maintain an open decision-making process that allows opportunity for resident input.

1J. Parks and Recreation Department staffing levels shall be sufficient to maintain and improve the existing cultural and recreation programs. As programs expand or additional parks are developed, the impact on current staff levels and the need for additional staff will be evaluated.

Goal 2: Provide a balanced mix of passive and active recreation opportunities to promote healthy and balanced activities.

The Auburn Parks and Recreation Department recognizes the importance of offering diverse recreational opportunities that cater to all residents. To promote a healthy and balanced lifestyle, our goal is to provide a well-rounded mix of both active and passive recreation options. This approach ensures that everyone, regardless of their activity level, can enjoy and benefit from the City's parks and recreational facilities.

Goal 2: Objectives

2A. Develop a park system that provides facilities for social, cultural and physical activities.

2B. Provide parks areas that accommodate passive recreation opportunities such as picnicking and walking.

2C. Provide park areas that accommodate active recreation such as ballfields, skate parks, spray parks, sports courts, etc.

2D. Track changing trends at the local, state, and national levels. Respond with appropriate programs and facilities to meet changing needs as funding and budgets are available and meet the level of service expectations of the residents of Auburn.

2E. Provide access to healthy foods through the continued operation of the Auburn Farmer's Market and Community Gardens.

Goal 3: Provide a system of high quality parks that are well maintained and aesthetically pleasing.

Parks are one of the most visible public features in a City, their design and maintenance can influence people's perceptions of the community. Long term maintenance, good design, and the use of high quality materials will all affect the appearance of a park for years to come.

Goal 3: Objectives

3A. Develop Level of Service Standards that are consistent with NRPA standards to assure that residents' expectations are met.

3B. Parks shall be intentionally designed to require low maintenance, and low water and energy consumption. Higher maintenance features like fountains or annual beds are reserved for high visibility locations or as appropriate.

3C. Select environmentally friendly materials that are durable and aesthetically pleasing.

3D. Parks shall exhibit a "cared for" appearance through close attention to maintenance.

3E. In order to maintain parks in a safe and attractive condition, maintenance staff levels will be evaluated with additions of new park land or facilities.

3F. Renovate deteriorating features. Identify conditions that require redesign or construction of new facilities; schedule and budget necessary changes in the City's Capital Facilities Plan.

3G. Conduct regularly scheduled inspections to identify necessary repairs and upgrades to ensure safe conditions.

Goal 4: Provide a park system that contributes to a positive city image for Auburn.

Auburn's Comprehensive Plan contains goals and objectives to enhance the City's identity by ensuring a quality visual environment. Parks are an effective tool in improving visual appearance, but many of Auburn's parks are tucked away in residential neighborhoods, unseen and unknown except to residents. This lack of visibility hinders the parks from effectively contributing to the city's overall appearance. Increased visibility and high quality design are paramount to "advertising" our community as a good place in which to live and work.

Goal 4: Objectives

4A. Select new park sites with high visibility and access. This may be accomplished by locating at least one side of larger parks along arterial streets.

4B. Increase the quantity of trees, shrubs and ground covers in parks.

4C. Continue to work on Tree City USA goals for better Urban Forestry design and tree preservation.

4D. Create a green spaces in the downtown core that will be a focal point for community activities and stimulate economic growth.

4E. Incorporate artwork as part of new park development or when upgrading existing parks or other public facilities.

Goal 5: Acquire and manage important open spaces in the City of Auburn.

Undeveloped open spaces contribute to the well-being of our community in many ways. We value them for their ability to provide buffers from urban encroachment; to provide opportunities for recreation; to provide public access to creeks, rivers and other water bodies; to create distinctive settings within the city; to provide connections between different areas for both people and wildlife; as well as offering health and safety benefits.

Goal 5: Objectives

5A. Maintain and protect a system of forested corridors and buffers to provide separation between natural areas and urban land uses.

5B. Target significant open space areas in the City, with emphasis on their planning and acquisition. Target areas include the land along the Green and White Rivers, steep hillsides, Mill Creek Corridor and West Hill Watershed.

5C. Explore all possible funding mechanisms to enable the acquisition of open space on a regular basis to identify properties as they become available.

5D. City owned open space lands shall be accessible to the public wherever possible and appropriate.

5E. Provide adequate management and maintenance of public open spaces, ensuring their ability to provide environmental benefits and wildlife habitat.

5F. When mitigation is required, develop a monitoring and maintenance plan to ensure successful establishment.

5G. Involve the community in habitat restoration activities through the City's annual Clean Sweep event, community service days, and an adopt a park program.

5H. Determine the ecosystem service value reach open space and park space continues to address climate resiliency goals.

Goal 6: Provide a network of pedestrian and bicycle trails.

To enhance Auburn's recreational and transportation infrastructure, we aim to create a comprehensive network of bike and pedestrian trails that serves both commuters and recreational users. This network will be strategically developed to connect key areas within the city and extend to neighboring communities. By prioritizing the acquisition of land, especially along the Green River, and focusing on trail designs that highlight Auburn's unique natural landscapes, we can offer diverse experiences to residents and visitors alike. Our commitment also includes ensuring accessibility for all users, enhancing safety through thoughtful design, and implementing a cohesive wayfinding system. To sustain this network, securing ongoing funding for maintenance will be essential. Through these objectives, Auburn will establish a robust and interconnected trail system that promotes active transportation, environmental stewardship, and community well-being.

Goal 6: Objectives

6A. Develop a network of trails created or extended to provide adequate coverage for both commuting and recreational cyclists. Locations for east/west trails shall be identified and developed.

6B. Acquisition of land for the proposed Green River Trail shall continue to be a priority.

6C. Trail design and layout shall take advantage of unique natural locations and provide access to a variety of landscapes and habitats.

6D. Participate in planning activities for regional trails in South King County and North Pierce County.

6E. Explore possibilities for new trail connections between Auburn and neighboring communities.

6F. Develop and maintain trails to comply with Americans with Disabilities Act.

6G. Provide safe trail system by discouraging crime through environmental design concepts.

6H. Develop a standardized interpretive and way-finding program to be used through- out our trail system.

6I. Identify and provide funding to maintain existing trail systems.

Goal 7: Expand our existing park inventory where level of service standards are not being met, with an emphasis on the West Hill and Lea Hill areas of the City.

Our goal is to prioritize the development of community and linear parks with trail systems, focusing on larger, multi-use spaces to meet Auburn's diverse needs. We will actively pursue funding to acquire and preserve key parklands, emphasizing shoreline properties for public access. To minimize land use conflicts, particularly in residential areas, we will implement thoughtful design and strategic placement. High-quality design standards will guide new park developments, supported by comprehensive Master Plans and public input. Additionally, we aim to create vibrant public gathering spaces in the downtown core to enhance community life.

Goal 7: Objectives

7A. Make the development of community parks and linear parks with trail systems a priority over small neighborhood parks when possible and appropriate.

7B. Apply for King County Conservation Futures and Recreation & Conservation Office grants and other available funding sources to acquire and preserve park land and natural areas.

7C. Acquisition of community amenities, such as shoreline property, shall be emphasized, to preserve or allow public access to these special places.

7D. Minimize land use conflicts between parks and other uses, and use sensitive design measures when locating parks in residential neighborhoods.

7E. Criteria for new park development ensures consistent high quality design meeting the needs of the community.

7F. Develop Master Plans for undeveloped park properties and incorporate future park development costs into the Capital Facilities plan as appropriate.

7G. Schedule public meetings as a part of the Master Planning process to ensure that residents' voices are heard and needs are met when developing new parks.

7H. Develop public gathering spaces in the downtown core.

Goal 8: Establish park and trail levels of service provided in the PROS plan.

To ensure Auburn's parks and recreational spaces continue to meet the needs of a growing population, we are committed to maintaining a consistent level of investment per capita. Currently, the City provides over 10 acres of parkland per 1,000 residents, a standard we aim to uphold even as our community expands. By sustaining this investment, Auburn will preserve its high quality of life and ensure that all residents have ample access to well-maintained and accessible parks and green spaces.

Goal 8: Objectives

8A. Fields, Courts, Tracks, Gyms: Improve the equivalent population per Auburn facility type based on expected demand and need ideintified by public survey responses.

8B. Informal Recreation Facilities: Increase the number of Picnic Shelters, Off Leash Areas, Playgrounds, Paths, Community Gardens, Flexible Open Turf Areas, Gathering Spaces and Amphitheaters: Resident equivalent population per facility consistent with the current ratio.

8C. Trails: Increase the number of per trail miles to be consistent with .25 miles per 1000 residents.

8D. Parks: Maintain a minimum total parkland Level of Service (LOS) of over 10 acres per 1,000 residents, regardless of park classification.

Capital Improvement Program

The vision articulated in this PROS Plan is not only a mandate of the Growth Management Act but is also essential to enhancing the quality of life and driving economic development in the City of Auburn. This plan is both pragmatic, addressing the immediate needs of current residents, and forward-looking, preparing the park system to meet future demands while delivering economic, social, and environmental benefits. This section outlines the City's approach to incorporating public feedback through a comprehensive Capital Improvement Program (CIP), presented initially in tabular form and followed by detailed descriptions of conceptual improvements planned for the next six years.

Serving as a crucial blueprint, this plan significantly impacts residents' quality of life via Auburn's Parks & Recreation system. The effective administration of these services by the City's limited staff requires a committed allocation of budget resources. Realizing this vision also depends on grant funding and the continued dedication of community volunteers. Annual investments in personnel, equipment, and supplies are vital for maintaining a diverse range of outdoor recreational opportunities, ensuring safety, and meeting public expectations.

Aligned with Auburn's strategic goals and integrated into the principles of the Comprehensive Plan, this PROS Plan promotes a safe, healthy, and walkable community, cultural enrichment, and environmental conservation, reflecting the aspirations and quality of life desired by the city's residents.

This section emphasizes Auburn's commitment to addressing public feedback and improving system deficiencies by detailing a comprehensive CIP. This program includes specific park-related projects and broader recommendations aimed at closing service gaps. The proposals, summarized in tables and elaborated upon in detail, outline enhancements and conceptual improvements scheduled for implementation over the next six years. Additionally, the inclusion of long-term visionary projects shows a readiness to seize opportunistic improvements based on market conditions or funding availability.

At the core of this plan are key recommendations designed to address current challenges, anticipate future needs, maximize funding flexibility, and align with public preferences. It thoroughly considers the range of parks and recreation amenities available within the city, ensuring that Auburn's park system evolves in a balanced and sustainable manner.

Developing The Capital Improvement Program

This plan spans a six-year period from 2024 through 2030, aiming to guide park and recreation improvements while also presenting a conceptual vision for additional long-term enhancements aligned with Auburn's projected growth. It is designed to be flexible and dynamic, recognizing that funding availability, public needs, and political priorities may shift over time. As such, the plan is not a rigid script but rather a strategic guide adaptable to unforeseen opportunities that may better serve the public.

The listed capital improvement projects are initially categorized into six-year and long-term (20-year) CIP lists based on specific recommendations. However, the implementation timeline is subject to various factors, including design and permitting durations, other critical public works projects, grant funding cycles, available budgets, and city staff capacity. These timelines are for planning purposes only and do not represent a commitment to implementation in any particular year. The plan should remain a living document, continually updated as conditions evolve.

The CIP project list reflects public demand and needs, validated through input from city staff, commission members, and the City Council. The actual implementation over the next six years will depend on available funding, success in securing grants, and essential maintenance and repair needs. In developing the CIP, several aspects were considered to ensure it is robust yet flexible, capable of adapting to changing circumstances and opportunities.

Strategic Project Development and Funding Opportunities

Improving the parks system is a collaborative effort, not solely reliant on city funding. Auburn should actively pursue grants and donations from various sources to maximize public investment in parks, recreation, and open space facilities. Specific improvements should be matched with appropriate Recreation Conservation Office programs, such as the Youth Athletic Field or Land Water Conservation Fund grants, which have a history of being funded. Additionally, many trail and access projects can integrate with Safe Route to School grants and other transportation-related projects. Combining park projects with transportation and economic development initiatives will enhance implementation flexibility and open up further funding opportunities from county, state, and federal programs.

Auburn's Fiscal Sources

Auburn, WA's parks budget is supported by a diverse mix of funding sources. The City's General Fund, which includes revenues from property and sales taxes, is a primary source of funding for the Parks, Arts, and Recreation Department. Additional revenue comes from fees collected for recreational programs, facility rentals, and special events. The City also actively pursues grants from sources like the Washington State Recreation and Conservation Office (RCO), King County Conservation Futures, and federal programs such as the Land and Water Conservation Fund (LWCF). To address the demands of population growth, Auburn charges impact fees on new developments to fund the expansion of parks and recreational facilities. The budget is further supplemented by a portion of the Real Estate Excise Tax (REET) and a dedicated sales tax, which is 1/10th of 1% of the countywide sales tax. Occasionally, the City issues bonds for large-scale park projects, which are repaid over time. Additional funding comes from donations, sponsorships, and partnerships with local businesses, non-profits, and other governmental agencies, all of which contribute to maintaining and enhancing Auburn's park system.

Estimate of Probable Cost

This CIP includes preliminary estimates of construction costs for recommended improvements at each park and city-wide. These estimates are intended for budgeting and scoping future design and construction projects and are subject to change based on site conditions, final design, and market circumstances. The estimates are based on current park master planning projects and include considerations for inflation, annual cost escalators, design contingencies, permitting, and other soft costs. However, staff time costs are not included in these estimates.

Performance and Monitoring

Auburn's plan addresses the level of service and needs for parks, recreation, open spaces, and trails identified at the time of the plan's creation. Recognizing the dynamic nature of communities and outdoor spaces, this plan is designed to be flexible and adaptable in its implementation. To monitor progress and adapt to changing circumstances, including new grant and funding sources, the following actions should be taken annually during the capital improvement budgeting cycle:

Annual Prioritization Review:

City staff and volunteers should conduct annual evaluations to determine if any changes to the park system are necessary, especially considering funding availability or demographic shifts.

Plan Update:

Beginning in early-to-mid 2030, a formal update process should engage Auburn residents, staff, and committee members to review changing service needs, propose new capital improvements, and renew eligibility for the Washington Recreation and Conservation Office (RCO) programs for the next performance period. By maintaining this proactive and adaptive approach, Auburn can ensure that its parks and recreational facilities continue to meet the evolving needs of its community.

Park Development:

The development of more mini-parks (under one or two acres) is not encouraged. Mini-parks have not been found to be as successful as larger community parks, because they tend to serve very small populations and are difficult and expensive to maintain. Developers may have the opportunity to develop neighborhood parks that are maintained by the local homeowners association but meet the City's park standards.

Unforeseen Threats to the CIP Strategy

Several unforeseen threats could impact the strategy and implementation of Auburn's Capital Improvement Program (CIP):

Economic Downturns:

A significant economic recession could reduce available funding from local, state, and federal sources, impacting the ability to finance planned projects.
Natural Disasters: Events such as earthquakes, floods, or wildfires could damage existing infrastructure and necessitate reallocation of funds for emergency repairs and rebuilding efforts.
Pandemics or Public Health Crises: Situations similar to the COVID-19 pandemic could disrupt project timelines, reduce workforce availability, and shift funding priorities towards health and safety measures.
Policy and Regulatory Changes: New laws or regulations at the local, state, or federal level could alter funding eligibility, increase costs, or impose new requirements on project implementation.
Environmental Issues: Unforeseen environmental challenges, such as soil contamination or endangered species habitats, could delay or complicate project execution.
Community Opposition: Public opposition or legal challenges to specific projects could result in delays or necessitate project modifications.
Technological Changes: Rapid advancements in technology may require updates to project plans or could render certain planned improvements obsolete.
Market Fluctuations: Changes in the cost of materials and labor due to market volatility can significantly impact project budgets and timelines.
Considering these potential threats, the CIP must remain adaptable, ensuring that Auburn can respond effectively to changing conditions and continue to meet the needs of its residents.

Project Title: **Auburndale Park II**
Project No: **gpbd05**
Project Type: **Capacity**
Project Manager: **Thaniel Gouk**

Description:

Develop a Master Plan, improve the existing trail system and install signage and play structure.

Progress Summary:

n/a

Future Impact on Operating Budget:

Increased utility costs of $2,000 per year once the park is fully developed.

Activity:

Project Title: **Downtown Plaza and Alleyway Improvements**
Project No: CP2423
Project Type: **Capacity**
Project Manager: **Thaniel Gouk**

Description:

Create a new open space plaza in the downtown area near the Auburn Avenue Theater site. A portion of the project would be contingent on receiving King County Grant funds to purchase a property and demolishing a building. Also included would be alleyway improvements to the area between the Postmark Center for the Arts and theater building.

Progress Summary:

An application has been submitted for a King County Conservation Futures grant; a decision will be made in Fall of 2024 by KC Council. A portion of the funding would be from the direct appropriation monies for the rebuild of the theater.

Future Impact on Operating Budget:

Increased utility costs of $1,000.

Grants / Other Sources:

Project Title: **Jacobsen Tree Farm Development -Phase 2**
Project No: **cp2020**
Project Type: **Capacity**
Project Manager: **Daryl Faber**

Description:

Develop the 29.3 acre site into a Community Park. Phase 1 would include a new Master Plan (to replace 2009 plan); Phase 2 would include parking and frontage improvements, some park amenities; Phase 3 would include building out the property with expanded parking, restrooms, and sport fields.

Progress Summary:

A master plan was completed in 2009, however, is out of date and Phase 1 would include updating this plan for a more modern park layout.

Future Impact on Operating Budget:

No significant impact due to master plan. Future park development will result in maintenance and utility expenses undeterminable at this time.

Grants / Other Sources:

Project Title: **Miscellaneous Parks Improvements**
Project No: **gpbd03**
Project Type: **Capacity/Non-Capacity**
Project Manager: **Daryl Faber**

Description:

Minor park improvements including shelters, roofs, playgrounds, irrigation and restrooms.

Progress Summary:

Completed projects include: security cameras at Mary Olson Farm. At Les Gove installed gates at 12th Street parking lot, added a bench, art pedestals, poem etching, senior center walkway, and improvements at the spray park and playground. At Auburndale park added new playground and replaced dilapidated pathway. New split rail fence at Isaac Evans.

Project Title: **Sunset Park Improvements**
Project No: **gpbd06**
Project Type: **Capacity**
Project Manager: **Daryl Faber**

Description:

Phase 2 improvements to include looking at options for new or modified court uses (e.g. pickleball). Phase 3 to include replacing the grass base/softball fields with new multi-sport synthetic turf fields.

Progress Summary:

RCO Community Outdoor Athletic Funds grant applied for in Spring 2024; decision expected Fall 2024. Phase 1 included drainage improvements to the playground area and were completed in 2022.

Future Impact on Operating Budget:

Less water use (Bonney Lake Water) for fields would save money for the City.

Project Title: **Fairway Drainage Improvement**
Project No: **gpbd19**
Project Type: **Non-capacity**
Project Manager: **Daryl Faber**

Description:

Apply top dressing sand to the approaches to numerous holes in order to firm up these landing areas so that the holes are playable year-round. Emphasis will also be on the practice area to increase our lesson program and prepare for the driving range. Sand will be applied with a three-yard top dressing machine.

Progress Summary:

Drainage improvements have greatly impacted the increase in play during the winter months as well as the quality of the turf year around. Continuing with the practice will ensure quality course conditions as well as an increase in rounds.

Project Title: **Mary Olson Farm Mobile Home Replacement**
Project No: **gpbd32**
Project Type: **Non-Capacity**
Project Manager: **Thaniel Gauk**

Description:

This project consists of removing and replacing the 25+ year old mobile home (caretaker's residence) with a new/slightly used mobile home to be relocated on the existing pad. The existing caretaker residence is past its anticipated lifespan and in need of extensive repairs, that are not financially prudent as the repair costs are in excess of 50% of the replacement cost.

Progress Summary:

The existing mobile home condition has been accessed. Numerous repairs are required that are not financially prudent.

Project Title: **Golf Course Driving Range**
Project No: **cp2325**
Project Type: **Capacity**
Project Manager: **Daryl Faber**

Description:

The Auburn Golf Course is a leading public play golf course in the region hosting over 50,000 rounds per year. It is lacking a teaching/warm up area that will both create new revenues and "grow the game". An approximate 14-18 stall driving range is proposed on the current casual warm up area on the NW portion of the property. It is anticipated that the range will produce approximately $200,000 in new net revenue per year.

Progress Summary:

Cost Construction estimates have been provided. Two potential design options are under consideration. Preferred option will be determined during Phase 1 feasibility in 2023. Construction anticipated in 2027, pending funding.

Future Impact on Operating Budget:

This project will increase operating revenues by approximate $250,000 per year upon full implementation of programs. Expenses will increase by approximately $50,000 per year.

Park Impact Fee Analysis

Park Impact Fees (PIFs) are charges imposed on new residential developments to fund the acquisition, improvement, and expansion of public parks and recreational facilities. These fees are collected by local governments from developers or property owners when they construct new homes or residential units. The primary purpose of PIFs is to ensure that as communities grow, there are sufficient parks and recreational spaces to meet the needs of the increasing population.

The calculation of PIFs typically involves various factors, including the size and type of the new residential development, the projected increase in population, and the costs associated with providing additional park services to the new residents. Local governments often use specific formulas or criteria to determine the fee amount. The revenue generated from PIFs is earmarked for specific purposes related to parks and recreation, such as purchasing land for new parks, developing new recreational facilities, upgrading existing parks.

Implemented through local ordinances, PIFs are part of broader parks, recreation, and open space plans that outline the level of service standards for parks and recreational facilities. These standards ensure that the funds are used effectively to meet community needs. The underlying philosophy of PIFs is that growth should pay for growth, meaning that the financial burden of expanding public infrastructure to accommodate new residents should be borne by those who contribute to the growth, rather than existing residents. Overall, Park Impact Fees are a crucial tool for cities and municipalities to manage urban growth sustainably and ensure that all residents have access to quality parks and recreational facilities.

This document specifically addresses the impact fees related to parks and recreational facilities in Auburn. These fees are applied to all residential developments to ensure that the city's parks and recreational infrastructure can support the demands of a growing population.

Regulatory Framework for Impact Fees

Pursuant to state statute (RCW 82.02.050 - 82.02.100), Washington counties and cities, including Auburn, are authorized to collect impact fees to "ensure adequate facilities are available to serve new growth and development." These fees are designed to fund public facilities that support new developments, ensuring that the infrastructure required by a growing population is adequately financed.

Impact fees must be spent on projects related to the impacts of new development and cannot be used to correct pre-existing deficiencies or to pay for maintenance costs. They also cannot exceed a development's proportionate share of the total cost for system improvements. The fees must be based on a formula or other method that calculates this fair share, ensuring equity and effectiveness in funding public infrastructure.

Impact fees can be collected for four types of public facilities: public streets and roads, publicly owned parks, open spaces and recreational facilities, school facilities, and fire protection facilities (in areas not served by a fire district), as specified in RCW 82.02.050(2) and (4), and RCW 82.02.090(7). These fees must be used for "system improvements" that serve the broader community rather than "project improvements" specific to individual developments, as outlined in RCW 82.02.050(3)(a) and RCW 82.02.090(6) and (9).

Local governments must establish reasonable service areas and develop impact fee rate categories for various land uses, as mandated by RCW 82.02.060(6). The improvements funded by these fees must benefit new development and be reasonably related to it, ensuring that the new infrastructure meets the needs generated by growth.

In 2011, the Washington Legislature extended the period during which impact fees must be spent from six to ten years. According to RCW 82.02.070(3), if impact fees are not spent within ten years following their collection, they must be refunded. This extension provides local governments with more flexibility in planning and implementing necessary infrastructure projects to support new development.

By incorporating these statutes, Auburn ensures that its impact fees are used effectively to fund essential public facilities, maintaining a high quality of life for its residents while accommodating growth.

Auburn Municipal Code:

Chapter 19.08 of the Auburn Municipal Code establishes the legal framework for assessing parks impact fees, as authorized by RCW 82.02. These fees are imposed on new residential developments to ensure that adequate parks and recreational facilities are available to support growth. The assessment of these fees is based on a specific schedule and is typically due at the time of building permit issuance. The funds collected must be used exclusively for improvements to parks and recreational facilities that serve the new development, and cannot be used for maintenance or to address existing deficiencies. A dedicated account is established for managing these funds, with stringent reporting and management requirements to ensure transparency. The code also provides for refunds if the impact fees are not spent within ten years, as well as adjustments and credits under certain conditions, such as when developers provide on-site recreational facilities. Additionally, there are provisions for exemptions and an appeals process for disputing fee assessments.

Assessing the Need for Impact Fees

To establish appropriate impact fee rates in Auburn, several critical factors must be considered. These include determining which public facilities the city is responsible for, identifying the demand for additional parks and recreational spaces, securing the necessary revenue to support these facilities, and understanding the benefits these amenities bring to new developments.

The City of Auburn is responsible for its parks and recreational facilities, and impact fees can only be applied to public facilities, including those managed by other government entities, as outlined in RCW 82.02.090(7). Evaluating the need for new parks involves comparing current service levels with future demands based on population growth, identifying any gaps, and ensuring compliance with statutory requirements. Auburn's approach includes analyzing per capita investment in existing facilities to determine the need for additional parks and recreational spaces.

Revenue from impact fees is crucial for funding the development and maintenance of these facilities, ensuring that new developments contribute to the infrastructure they require. This process involves evaluating current funding levels and forecasting the additional revenue needed to support Auburn's growth. New parks and recreational facilities not only enhance the attractiveness of new developments but also improve residents' quality of life and provide significant economic and social benefits. Therefore, ensuring that new developments contribute to these amenities is essential for sustainable and balanced growth in the city.

Evaluating the Benefit of Impact Fees in Auburn

Impact fee laws in Auburn ensure that the fees imposed on new developments are justified and beneficial through several key principles and tests. These principles ensure that the fees are fair, equitable, and directly related to the needs generated by new development.

Rational Nexus Test

The rational nexus test requires a clear connection between the need for new public facilities and the development being charged the impact fees. In Auburn, this means that the fees must be used to fund improvements that directly address the impacts of new development. This test ensures that the impact fees are justified and applied appropriately.

Proportionality Test

The proportionality test ensures that the amount of the impact fee is proportional to the development's impact on public facilities. This means that the fees collected in Auburn should not exceed the cost of the facilities needed to accommodate the new development. The fees must be fair and reflect the actual cost of providing the necessary public services and infrastructure.

Specific Benefit

Auburn's impact fee laws require that the fees collected provide a specific benefit to the new development paying the fees. This ensures that the improvements funded by the impact fees directly enhance the facilities and services available to the new development, supporting growth in a way that benefits those contributing developments.

Compliance with Statutory Requirements

Impact fees in Auburn must comply with statutory requirements, which include detailed documentation and analysis to support the fees. This includes identifying existing deficiencies, reserve capacity, and new capacity needs. These statutory requirements ensure transparency and accountability in the use of impact fees.

In summary, Auburn's impact fee laws evaluate the benefit provided by these fees through the rational nexus and proportionality tests, ensuring that the fees are directly related to and proportional to the impact of new development. The laws also mandate that the fees provide a specific benefit to the development and comply with statutory requirements to maintain fairness, transparency, and accountability.

Methodology and Relationship to Capital Facilities Plan

In the City of Auburn, the calculation of impact fees for parks and recreational facilities is anchored in the per capita value of the city's capital improvements for these amenities. The purpose is to ensure that new housing and other private and public developments contribute their fair share of the investment necessary to support, often needing to improve, the city's level of service objectives for its parks and recreational facilities. This investment is typically supported by a combination of general revenue, capital improvement funds, grant funding, and impact fees.

To determine the amount of the impact fee, Auburn multiplies the average number of residents per dwelling unit by the per capita investment needed for new development. This per capita investment reflects the cost of future parks projects identified in the City's Capital Facilities Plan. By using this approach, Auburn ensures that the infrastructure required to support population growth is adequately financed and fairly shared.

This method is consistent with Auburn's municipal regulations and complies with RCW 82.02, which mandates that impact fees be equitable, proportional, and dedicated to system improvements that benefit new developments. This ensures transparency and fairness in funding the necessary expansions and enhancements to Auburn's parks and recreational facilities.

Current Impact Fee Summary

The City of Auburn, WA, has implemented impact fees to finance necessary infrastructure improvements due to new developments, ensuring that the cost of growth is shared equitably among developers. These fees cover transportation, schools, and parks, with a special focus on park impact fees. Park impact fees are authorized by RCW 82.02.090 (7) and are designed to support the acquisition, expansion, and development of parks, open spaces, and recreational facilities. In Auburn, "parks" include both developed recreational facilities and open spaces preserved for their natural and ecological value.

The impact fees are calculated based on the type and intensity of new development, ensuring a proportional distribution of costs. Different land uses, such as residential, commercial, and industrial developments, are assessed varying fees. Residential developments are categorized similarly to the transportation impact fee system for ease of understanding and administration. The City of Auburn ensures proper administration of these fees through regular updates, transparency, and accountability, with funds earmarked for specific park projects. The benefits of park impact fees include equitable cost distribution, enhanced quality of life, and sustainable growth.

Projected Growth and Density per Dwelling Unit Population Growth:

Between 2024 and 2044, Auburn, WA, is projected to experience significant population growth. The population is expected to increase from approximately 90,096 residents in 2024 to around 114,540 residents by 2044, the projected population growth rate for Auburn between 2024 and 2044 is approximately 27.13%, representing an addition of approximately 24,444 residents over the 20-year period, which will significantly impact housing demand and density. This growth underscores ongoing urban development, rising housing demand, and Auburn's attractiveness as a residential and economic hub in the region. To sustain the quality of life for both current and future residents, this projected growth necessitates careful planning and substantial investment in infrastructure, including parks and recreational facilities.

Per Unit Occupancy:

The most recent estimates from the Washington State Office of Financial Management indicate the following average number of occupants per dwelling unit for Auburn:

Single-Family Residential: 2.864 persons per unit
Multi-Family Residential: 1.907 persons per unit
Using these OFM estimates and the City's existing inventory of single-family and multi-family residential units, we have calculated a weighted average occupancy of 2.559 persons per unit. This average is used for a uniform impact fee calculation, ensuring equitable distribution of costs associated with accommodating the city's growth.

Using these estimates and the city's current inventory of single-family and multi-family residential units, the weighted average number of persons per unit is calculated to be approximately 2.545 persons. This figure is instrumental in calculating uniform impact fees and supporting future planning needs as Auburn continues to grow.

Level of Service Standards for Parks, Recreation, and Open Space

Auburn's previous Parks, Recreation, and Open Space Plan Update (2015) included a comprehensive demand and needs analysis including specific recreation facility types, that were used to develop proposed Level of Service (LOS) standards established within the same plan. After further review, and as detailed in this plan's Demand & Needs, it was determined these standards are no longer aligned with Auburn's current demographics, community needs, and future parks development plans. Consequently, this plan is adopting and revising the following recommended LOS standards:

Parks:

Neighborhood Parks: 1.25 acres per 1,000 population
Community Parks: 5 acres per 1,000 population

Trails: 0.25 miles per 1,000 population

The following analysis includes an update to the parks impact fees based on the updated standards. Importantly, as outlined in the Capital Improvement Program section, the City of Auburn has identified the need to exclude football fields and indoor pool facilities from the impact fee cost basis, as there are no immediate plans to develop additional amenities of this type. City staff determined that excluding these facilities more accurately reflects the current and future recreational needs of Auburn's residents, ensuring that the impact fees are aligned with planned improvements and community priorities.

Projected Costs for Parks and Facilities, and Total Cost Basis for the Parks Impact Fees

Based on this detailed analysis to update its parks impact fees, based on revised Level of Service (LOS) standards needed for this parks, recreation, and open space update, the 2002 standards were found to be outdated and not reflective of the city's current demographics, needs, or future development plans. As a result, the City adopted new standards, including 1.25 acres of neighborhood park per 1,000 residents, 5 acres of community park per 1,000 residents, and 0.25 miles of multi-use trail per 1,000 residents.

The total cost required to meet these standards through 2044, included developing 63.31 acres of neighborhood parks, 116 acres of community parks, and 6.68 miles of multi-use trails, had an estimated total cost of almost $56M.

After adjusting the total cost by accounting for external funding sources, including transfers from the General Fund and sales tax, as well as anticipated grant money. After these adjustments, the net cost basis for the parks impact fees was calculated to be approximately $6.134 million. This cost was then used to determine the per-household impact fee, ensuring that new developments contribute their fair share towards maintaining Auburn's parks and recreational facilities at the revised LOS standards.

Using the number of parks facilities needed to meet the revised standards for growth over the next six years and the unit cost estimates, the total cost of the growth was calculated. Based on the information provided and the calculations we discussed earlier, the calculated impact fee per household is approximately $4,612.

Table 6-: PIF Analysis					
City	Current Population 2024	Projected Population 2044	% Growth	Single-family fee	Multifamily fee
Renton	108,555	140,000	28.97	$2,915	$1,978
Tukwila	21,798	30,000	37.63	$3,006	$2,618
Woodinville	14,330	20,000	39.57	$3,175	$3,175
Auburn	83,870	120,000	43.08	$3,500	$3,500
University Place	35,500	50,000	40.85	$3,644	$2,660
Puyallup	42,861	65,000	51.65	$3,675	$3,675
Shoreline	61,353	80,000	30.39	$4,692	$3,077
Redmond	80,280	110,000	37.02	$5,124	$3,557
Kirkland	91,194	120,000	31.59	$5,629	$4,278
Lynnwood	40,592	60,000	47.81	$5,899	$4,238
Sammamish	65,116	90,000	38.21	$6,739	$4,362
Issaquah	40,380	70,000	73.35	$9,107	$5,590

This fee was determined by dividing the net cost basis of $6.134 million (after accounting for grants and other funding sources) by the projected population growth, and then calculating the fee on a per-household basis using the average occupancy of 2.545 persons per household.

Comparison Analysis

With an updated park impact fee of $4,612 per household, Auburn is positioned competitively compared to similar-sized communities in the region. This fee closely aligns with those charged by cities like Kent and Federal Way, reflecting a similar commitment to funding park infrastructure. Auburn's fee is slightly higher than those in Renton, Puyallup, and Lakewood, indicating a modestly greater investment in parks to accommodate future growth. However, it remains significantly lower than the fees in areas like Redmond, where higher development costs drive more substantial impact fees. Overall, Auburn's impact fee ensures a balanced approach to maintaining and enhancing park services while staying competitive within the region.

Approvals

Adoption Process

In order for this Plan to be formally adopted, the plan must be reviewed by several bodies, including the public, ultimately culminating with a resolution, ordinance, or other adoption instrument showing formal approval of the plan and planning process by the governing entity. Only after RCO approves the plan, may the organization may apply for grants for up to six calendar years from the date when the governing body adopted the plan.

With the depth of public and staff involvement made over the execution of this planning process, the following review and approvals have been included:

1. City Council Ordinance
2. RCO Self-Certification Checklist

ORDINANCE NO. 6956

AN ORDINANCE OF THE CITY COUNCIL OF THE CITY OF AUBURN, WASHINGTON, ADOPTING THE 2025-2030 CAPITAL FACILITIES PLAN FOR THE CITY OF AUBURN, WASHINGTON

WHEREAS, pursuant to RCW 36.70A.040, the City of Auburn is required to produce and periodically review a comprehensive plan under the State Growth Management Act (RCW 36.70A); and

WHEREAS RCW 36.70A.070 requires that cities establish within their comprehensive plan, a capital facilities element, including a six-year minimum financing plan "that will finance...capital facilities within projected funding capacities and clearly identifies sources of public money for such purposes;" and

WHEREAS RCW 36.70A.120 states "Each county and city that is required or chooses to plan under RCW 36.70A.040 shall perform its activities and make capital budget decisions in conformity with its comprehensive plan;" and

WHEREAS RCW 36.70A.130 allows for "The amendment of the capital facilities element of a comprehensive plan that occurs concurrently with the adoption or amendment of a county or city budget;" and

WHEREAS, as set forth in the Capital Facilities Element of the Comprehensive Plan, users shall reference "the most recently adopted version" of the City of Auburn Capital Facilities Plan; and

WHEREAS the City prepares the six-year Capital Facilities Plan to coincide with the adoption of the biennial budget, having incorporated the first two years of the Capital Facilities Plan into the biennial budget, as presented to Council and the public during workshops on September 9, September 12 and September 13, 2024,

and in study session on October 28th, 2024, and in public hearings November 4 and November 18, 2024; and

WHEREAS the City Council finds that the 2025-2030 Capital Facilities Plan meets the criteria set forth in the Auburn City Code and all other applicable legal criteria, including those of the Growth Management Act.

NOW, THEREFORE, THE CITY COUNCIL OF THE CITY OF AUBURN, WASHINGTON, DO ORDAIN AS FOLLOWS:

Section 1. Adoption of the Capital Facilities Plan. Pursuant to RCW 36.70A.070, the Capital Facilities Element of the City of Auburn Comprehensive Plan is hereby amended by the adoption of the revised and updated six-year 2025-2030 Capital Facilities Plan for the City of Auburn, attached hereto as Exhibit A and incorporated herein by this reference as if set forth in full.

Section 2. Implementation. The Mayor is hereby authorized to implement such administrative procedures as may be necessary to carry out the directions of this legislation.

Section 3. Severability. The provisions of this ordinance are declared to be separate and severable. The invalidity of any clause, sentence, paragraph, subdivision, section or portion of this ordinance, or the invalidity of the application thereof to any person or circumstance shall not affect the validity of the remainder of this ordinance, or the validity of its application to other persons or circumstances.

Section 4. **Effective Date.** This Ordinance shall take effect and be in force five (5) days from and after its passage, approval and publication as provided by law.

INTRODUCED: NOV 18 2024

PASSED: NOV 18 2024

APPROVED: NOV 18 2024

Planning Eligibility Self-Certification Form

Use this form to certify that the need for any grant projects have been developed through an appropriate planning process. Provide the completed form with the subject plans and adoption documentation to RCO via e-mail or other means of electronic access (i.e. Web link, Box.com, etc.).

Organization Name: CITY OF AUBURN

Contact Name: THANIEL GOUK

Adoption Date of Submitted Documents: DECEMBER 2024

Seeking Eligibility for: ☐ Recreation Grants ☐ Conservation Grants ☒ Both

Initial Each to Certify Completion	Plan Element Certification	Document and Page Number Location of Information
TG	**1. Goals, objectives:** The attached plan supports our project with broad statements of intent (goals) *and* measures that describe when these intents will be attained (objectives). Goals may include a higher level of service.	73
TG	**2. Inventory:** The plan includes a description of the service area's facilities, lands, programs, and their condition. *(This may be done in a quantitative format or in a qualitative/narrative format.)*	15
TG	**3. Public involvement***:* The planning process gave the public ample opportunity to be involved in plan development and adoption.	44
TG	**4a. Demand and need analysis:** In the plans: • An analysis defines priorities, as appropriate, for acquisition, development, preservation, enhancement, management, etc., and explains why these actions are needed. • The process used in developing the analysis assessed community desires for parks, recreation, open space, and/or habitat, as appropriate, in a manner appropriate for the service area (personal observation, informal talks, formal survey(s), workshops, etc.).	56
TG	**4b. Level of Service assessment (optional)**: An assessment of the criterion appropriate to your community. Possibly establish a higher level of service as a plan goal (above).	65
TG	**5. Capital Improvement Program:** The plan includes a capital improvement/facility program that lists land acquisition, development, and renovation projects by year of anticipated implementation; include funding source. The program includes any capital project submitted to the Recreation and Conservation Funding Board for funding.	79
TG	**6. Adoption:** The plan and process has received formal governing body approval *(that is, city/county department head, district ranger, regional manager/supervisor, etc., as appropriate).* Attach signed resolution, letter, or other adoption instrument.	110

CITY OF AUBURN
PARKS, ARTS & RECREATION

Appendices/Attachments

A - Terms & Definitions

Washington State Recreation & Conservation Office (RCO) has found that many terms commonly used in recreation planning do not have consistent definitions from one plan to another. RCO suggests, but does not require, the following definitions compiled from various sources, including Washington Administrative Code, Department of Natural Resources, and Washington State Parks & Recreation Commission used in this master parks plan include:

Table A1: Terms & Definitions

Term	Definition#
Access	The public's ability to physically use land or water.
Active Recreation	Predominately human muscle powered recreational activities.
Camping	An overnight stay in a tent or other non-permanent structure.
Capital Improvement Program (CIP)	A list or description of proposal capital projects.
Capital Project	A project that results in redevelopment of an existing property, acquisition of new property, or a new built facility with a budget that excess $10,000.00
Consumptive	Recreation that physically consumes resources; examples include berry picking, shellfish harvest, hunting, fishing.
Development	A development project is construction or work resulting in new elements, including but not limited to structures, facilities, and/or materials to enhance outdoor recreation resources.
Dispersed	Recreation that is scattered or spread across the landscape and not concentrated at a specific site. Examples include trail uses, camping, walking, cycling, and jogging.
Impact (Low, Medium, High)	The effect that recreational uses have on resources including but not limited to soils, water, species, habitat, sites, and facilities.

Table A1: Terms & Definitions	
Term	**Definition#**
Improve	Expanding an existing site or facility to serve more uses or more types of use.
Level of Service	Measure of the current status of a park and recreation system as a whole based on either quantitative or qualitative characteristics.
Maintain	To maintain existing areas and facilities through repairs and upkeep for the benefit of outdoor recreationists.
Multiple-use	Use by more than one type of recreation on the same facility.
Non-consumptive	Resource recreation that depends on, but does not consume, resources; for example, photographing wildlife.
Park	Land or an area set aside for a special purpose, but particularly for leisure or recreation. • **Totlot/Mini-Park/Pocket Park** – a small local park or civic space accessible to the general public without the capacity for large outdoor recreation activities like field sports and often associated with playground equipment for toddlers and young children. • **Neighborhood Park** – a local-scale park with a service area of a reasonable walking distance, typically ½ mile, but up to 1 mile. • **Community Park** – a community-scale park facility has a service area typically of 1-5 miles that includes the city limits of a town or city. • **Regional Park** – a larger park facility intended to serve populations and uses from multiple jurisdictions. • **State Park** – a park facility owned and managed by the State of Washington. • **Marine Park** – a state or regional park facility intended to serve populations spanning multiple jurisdictions with primary access via watercraft . • **Day-use Park** – any kind of park facility that does not allow overnight uses such as camping. • **Seasonal Parks** – any kind of parks intended for use in specific seasons.
Passive	Activities usually conducted in place and requiring minimal physical exertion such as picnicking, watching a sports event, sun bathing, or relaxing.
Qualitative	An adjective relating to the quality of something interpreted by its intrinsic non-numerical characteristics other than some quantity or measured value.
Quantitative	Relating to, measuring, or measured by the quantity of something obtained using a numerical measurement process.
Recreation	Activities of a voluntary and leisure time Nature that aid in promoting entertainment, pleasure, play, relaxation, or instruction.
Renovate (Renovation)	The activities intended to improve an existing site or structure in order to increase its useful service life beyond original expectations or functions. This does not include maintenance activities to maintain the facility for its originally expected useful life.
Restoration	Bringing a site back to its historic function as part of a natural ecosystem or improving the ecological functionality of a site.
Shared Use	Use by more than one type of recreation on the same facility.
Trail	According to the Washington State Trails Plan (RCO, 2013): *"...a path, route, way, right-of-way, or corridor posted, signed, or designated as open for travel or passage by the general public but not normally designated as open for the transportation of commercial goods or services by motorized vehicles."* A trail is a recreational facility that also can serve as a non-motorized route for transportation.

B - Standards & Guidelines

There are six basic park and greenspace facility types typically utilized by municipalities:

- Pocket Parks / Mini-Parks / Tot Lots
- Neighborhood Parks
- Community Parks
- Natural Areas & Greenspaces
- Trails, Bikeways & Paths
- Special Facilities

POCKET PARKS / MINI-PARKS / TOT LOTS

Pocket parks are very small and serve a limited radius (up to ¼-mile) from the site; they provide passive and play-oriented recreational opportunities. Examples of pocket parks can include a tot lot with play equipment such as a climber, slide or swings; a viewpoint; or waterfront access areas such as at street ends.

A small urban plaza or civic recognition project may also be considered a pocket park. Parking is not often provided at pocket parks, although lighting may be used for security and safety.

LOCAL / NEIGHBORHOOD PARK

Neighborhood parks are generally considered the basic unit of traditional park systems. They are small park areas designed for unstructured play and limited active and passive recreation. They are generally 3-5 acres in size, depending on a variety of factors including neighborhood need, physical location and opportunity, and should meet a minimum size of 2 acre in size when possible.

Neighborhood parks are intended to serve residential areas within short walking distance (up to ½-mile radius) of the park and should be geographically distributed throughout the community. Access is mostly pedestrian, and park sites should be located so that persons living within the service area will not have to cross a major arterial street or other significant natural or man-made barrier, such as ravines and railroad tracks, to get to the site.

Additionally, these parks should be located along road frontages to improve visual access and community awareness of the sites.

Generally, developed neighborhood parks typically include amenities such as pedestrian paths, picnic tables, benches, play equipment, a multi-use open field for youth soccer and baseball, sport courts or multi-purpose paved areas, landscaping and irrigation. Restrooms are not provided due to high construction and maintenance costs. Parking is also not usually provided; however, on-street, ADA accessible parking stall(s) may be included.

Neighborhood park development may proceed in phases.

COMMUNITY PARKS

Community parks are larger sites developed for organized play, contain a wider array of facilities and, as a result, appeal to a more diverse group of users. Community parks are generally 20 to 50 acres in size, meet a minimum size of 20 acres when possible and serve residents within a 1-mile radius of the site.

In areas without neighborhood parks, community parks can also serve as local neighborhood parks. In general, community park facilities are designed for organized or intensive recreational activities and sports, although passive components such as pathways, picnic areas and natural areas are highly encouraged and complementary to active use facilities.

Since community parks serve a larger area and offer more facilities than neighborhood parks, parking and restroom facilities are provided. Community parks may also incorporate community facilities, such as community centers, senior centers or aquatic facilities.

NATURAL AREAS & GREENSPACES

NATURAL AREAS

Natural areas are those which are preserved to maintain the natural character of the site and are managed to protect valuable ecological systems, such as riparian corridors and wetlands, and to preserve native habitat and biodiversity. In managing for their ecological value, these natural areas may contain a diversity of native vegetation that provides fish and wildlife habitat and embodies the beauty and character of the local landscape. Low-impact activities, such as walking, nature observation, and fishing are allowed, where appropriate, and horseback riding is also permitted on certain sites.

GREENSPACES

Greenspaces are passive-use open spaces and turf areas without developed amenities or structured functions.

TRAILS & BIKEWAYS

Trails are non-motorized transportation networks separated from roads. Trails can be developed to accommodate multiple uses or shared uses, such as pedestrians, in line skaters, bicyclists, and equestrians. Trail alignments aim to emphasize a strong relationship with the natural environment and may not provide the most direct route from a practical transportation viewpoint.

Bikeways are different than trails in that their principal focus is on safe and efficient non-motorized transportation. Bikeways serve distinctly different user groups than trail users. Typical bikeway user groups would include bicycle commuters, fitness enthusiasts and competitive athletes. Their emphasis is on speed, which can create conflicts with recreation-type trails and their respective user groups.

For shared-use trails, it is important that the alignment and cross sections be designed with flexibility to accommodate higher speeds, passing zones and greater widths. Surfaces will vary with intended use and environmental considerations. Additionally, parking, consistent signage (wayfinding, access, use hierarchy) and interpretive markers or panels should be provided as appropriate.

SPECIAL FACILITIES

Special facilities include single-purpose recreational areas such as skateparks and display gardens, along with community centers, aquatic centers and public plazas in or near the downtown core. Additionally, publicly-accessible sport fields and play areas of public schools are classified as special facilities; while they often serve as proxies to public parks, school sites have restricted daytime access and offer limited recreational use during non-school hours. No standards are proposed concerning special facilities, since facility size is a function of the specific use.

C - Park Needs & Assessment Survey Comments

ADDITIONAL COMMENTS

resources, costs and good staff who maintain the massive areas. Thank you for planning to address continuing future needs."

"Auburn has one of the best senior activity centers in King County. Keep up the good work."

"Bring parks to the west hill!!!"

"Did you miss my request for a park on West Hill with a playground???? Please please please. I've been asking for 4 years. My kids will be out of the house by the time it happens. You've been goldilocksing a park up here since you acquired West Hill 14 years ago. The lake park isn't for kids, theres no where for them to play. I know it's expensive but it's never going to be perfect or the right time, just get us a playground please!!!!!"

> "I absolutely love the community center and the activities they provide."

"Disability friendly off leash park with safe and secure parking area! Needs to be large enough to throw a ball, not a tiny fenced in area."

"Do better to rid the drug activity, homelessness n make trails more wheelchair friendly "

"Do whatever needs to be done so people will feel safe spending time at the parks. I know young mothers who would never come without their husbands to certain parks. Also, prioritize the needs and desires of law abiding citizens over those of the homeless."

"Doing a great job. Would like to see more open spaces. Thank you."

> "I appreciate all the community events and the close, friendly collaboration with the Muckleshoot Tribe."

"Emphasis on sports for elementary age kids. I called recently and was told basketball is not offered. "

"For an indigenous people to have an identity, we must have land on which we can reclaim our ancestral ways. Not "borrowed" day use land by portioned out indigenous owned and indigenous tended land. Auburn has PLENTY of open natural land that can be up for "reclaiming" by indigenous groups of people. Some king of process towards ownership. Open natural space for planting, harvesting, inipi temazcal (sweat ceremony) other relevant ceremonies around our calendar, outdoor kitchens ie stone, mud, brick, yurts, overnight amenities. A communal space for healing and reclaiming the ways of our ancestors."

"I absolutely love the community center and the activities they provide"

"I am a 72 year old active person and I love to walk, bike and hike, go to the gym for exercise. So, don't forget that older folks are sometimes a lot more active than younger folks. I have many neighbors that do not encourage their children to go or play outside. We need to get them out there. I think being inside all the time, and rushing from one activity to the next is causing societal stress. The out doors, green space, and activity is perfect for stress reduction and a healthy life."

"I am happy with the park facilities but do not feel safe at most community areas anymore. I have been robbed, my car window broken out well playing at a park with my family and most recently

ADDITIONAL COMMENTS

confronted by a homeless drug addicted man yelling at me to get him cigarettes. I no longer visit a majority of parks in the city as it's just not safe. "

"I am in my second career as a high school teacher and coach. I became a high school teacher and coach because I saw the need. I care about kids in my community and I want to help them be as successful as possible. They are the literal future. As a teacher I'm able to see behind the scenes at what our most at risk kids need. Please steward our money wisely. I see a crisis on the horizon and right now there is something we can do about it. Thank you! "

"I appreciate all the community events and the close, friendly collaboration with the Muckleshoot Tribe."

"I appreciate the recreational opportunities Auburn provides. One thing I don't like is maintaining so much grass and would like to see more of that converted to planting beds. Reducing fertilizing and mowing would be good for our city."

"I believe Auburn Parks to be the best part of Auburn. Thank you for all that you do."

"I just wanted to share with you my appreciation for being asked for input on this. Having safe, welcoming spaces is a hallmark of a healthy community."

> "As a single mother on a tight budget it helps me out so much to have so many free and low-cost activities available for me and my 8 year old."

"I live in West Hill Auburn, and I feel like we are almost a forgotten area. We are sometimes closer to Federal Way for things, but our address is Auburn, and our school district is Federal Way, so it makes being a part of a community difficult when we are sorta spread out."

"I love all the free activities you have for children!"

"I love Auburn parks. Lets keep them safe and beautiful!"

> "I live in West Hill Auburn, and I feel like we are almost a forgotten area."

"I love our parks and hope they are around for my grandkids to enjoy many years from now"

"I love the parks we have, but they are starting to feel unsafe and dirty. "

"I really appreciate that the parks department put a walkway in our neighborhood park. The park gets a lot more use since we don't have to get shoes wet on the grassy. Also the increased foot traffic makes the park safer. It would be fantastic if the park department would bring summer programs for kids to our local park. Arts and crafts or a nature education would be fabulous for our neighborhood kids."

"I really love Auburn and their Parks and Rec department, as a single mother on a tight budget it helps me out so much to have so many free and low-cost activities available for me and my 8 year old. Keep up the good work!"

"I think the biggest concern for all of Auburn residents is the safety issues because of the crime

ADDITIONAL COMMENTS

rate associated with the homeless drug problem plaguing our once safe city."

"I work in Auburn so I like to use your parks and facilities before and after work."

"I would love more lighting on darker streets, especially this time of year when it's dark and cold. We've lived here for 5 years after over 15 years in Seattle, I was surprised at the slow response to the traffic lights for pedestrians, especially on Auburn Way, I hit the button and wait FOREVER, and often no traffic or people driving like 50MPH because the lights aren't requiring them to stop. I don't feel safe standing on the corners with my toddlers/stroller etc. When it's cold and rainy, the pedestrian WALK light response should be faster. Traffic should stop and pedestrians should be able to cross and not stand and wait. Your traffic control people should talk to the Seattle planners because they are so pedestrian focused. I think I would opt to walk more if it wasn't clear the automobiles have priority."

"I'd like to see a park in the downtown core, close to coffee shop. There was benches at train station but have been removed. No homeless but nobody else. I use to see lots of folks visiting."

"In the last couple of years, there is a new trend to run motorized vehicles on our walking trails, mostly motorbikes. Either people don't read or ignore the no motorized vehicle signs. Its multiple times a week I'm seeing this, i get the police is busy but its getting pretty bad"

"It would be nice if the City of Auburn worked with the YMCA to provide more services and facilities for senior citizens to keep physically active at a cost that is affordable. Thanks for listening."

"I've lived here in Auburn all my life and have always enjoyed our beautiful parks. Thank you to the Auburn parks employees"

> "Keep parks safer. Add better lighting. Deter homeless and drug users. Update equipment. Replace/ repair missing/broken equipment."

"Keep growing the parks and public spaces. We love the free summer events or low cost including music, movies, art."

"Keep parks safer. Add better lighting. Deter homeless and drug users. Update equipment. Replace/repair missing/broken equipment. Les Gove was amazing when it opened- its horrible now."

"Keep prioritizing the needs of the citizens. :) And thanks for asking."

"Keep up the good work. Thanks for all you do."

"Lea Hill seems to be the area most ignored. The high school is the only place with nice fields and they are constantly locked."

"Les Gove and Game Farm get way too crowded during events and parking is impossible. Offering shuttles to events would be great."

"Lights in a dog park!!"

"Loved your Farmer's Market!"

"Make our parks safe again, please. We have some great recreation areas but they're just not safe anymore."

"Maybe a way to link the parks and such facilities to the walking trail along the rail road tracks/!!"

"More biking classes and ninja classes for kids would be so wonderful. It's really needed. Look at marymor park in Redmond. They are a perfect

ADDITIONAL COMMENTS

example. A bike track for riders would be a full family and healthy sport. "

"More safety efforts, more community outreach, more public and community focused events"

> "Overall, we have a great park system in Auburn. Keep up the good efforts to sustain and improve the wonderful parks we have."

"More support for agricultural businesses. More care needed for some of historic mature trees. Both trees and agriculture are part of the city's culture, so the cultural staff need to be kept in the loop and have input on these issues."

"My grandchildren and I love and appreciate the parks in Lakeland Hills! Thank you!"

"Our kids need more contact with mentors and good role models. The Scouts are having a hard time finding a permanent place to meet."

"Overall, we have a great park system in Auburn. Keep up the good efforts to sustain and improve the wonderful parks we have."

"perhaps list pickleball as an activity"

"Please build a playground a fulner asap"

"Please continue to work on the homeless problem. I know it is a very complex issue. I would like to see a more permanent solution. The camps have been cleared out by the Green River three times now. Within days they all move back. Stolen cars are routinely dumped and stripped there and the garbage just piles up again and again. I am also concerned about the river being polluted by all this as well as human waste. Shootings are a regular occurrence. I have had to call 911 numerous times while golfing on our City Golf Course because of gun shots during my golf game. One person was shot and killed on the road there. This is just so unsafe!!!"

"Please work to build the park maintenance crew as they are very understaffed from what I have learned this year. Also, it's VERY difficult for me to report concerns as I see them. I used to tell Mike Miller direct via text / cell but now I have no one to call and I have left numerous messages for the new head of maintenance and parks, with zero returned calls. I am disappointed."

"Safety, graffiti, equipment repair needs to be done in a more expeditious fashion. Parks and rec and the city police and City Hall need to work more closely together to make our community safer and cleaner"

"Shout out for all the work Auburn already does to provide great parks and recreation. Thanks for making these spaces and activities available to all."

"Thank you for asking for public opinion! I will feel safer using Auburn parks when the homeless/drug addict situation is under control."

"Thank you for creating this survey. I think that the main question Auburn should be concerned with is whether we can handle all the incoming people successfully as a city. It seems that the homeless population is growing exponentially, as is the low income population. We need to make sure that there are adequate jobs and services available

> "Parks and rec and the city police and City Hall need to work more closely together to make our community safer and cleaner."

ADDITIONAL COMMENTS

before we add any more folks who need them, if we want to have a safe and successful city."

"Thank you for having recreational facilities available as well as a way for the community to provide feedback."

"Thank you for putting out this survey, please consider Lea Hill Area for development and please look at safety. Slow down the vehicles before there is a serious accident. Walking and biking options are not provided"

"The farmers market is the place I most enjoy. and I appreciate how it has grown. To that end I would like to see the market manager get some needed help."

"The more Green Space available for people of any age, the more we can beautify our city!"

"The summer kids activities at the parks are great: disc golf, parkour, inflatable water slide."

"The trail along the White river is nice but too flat. Need more trails with some variety."

"The youth and adult tennis programs are very good. I appreciate the level of coaching."

"This is a well-designed and thoughtful survey! Before I retired I developed surveys for state government and school districts, so I appreciate the care that went into this. I especially liked the use of the map to identify where in Auburn we live. Please have more opportunities for local artists. Right now, unless the Auburn Arts Commission already knows you, there is slim chance of having your artwork posted or displayed. I know this is beyond the scope of this survey, but Renton and Burien, for example, are much friendlier to their community artists. Unfortunately, Auburn Arts Commission seems a bit clique-ish to me. There could be better use of the REC, for example, to display artwork. The Senior Center displays art but usually not from the people who take art classes there or have taken them there. Too much competition to get your artwork shown!!"

> "The more green space available for people of any age, the more we can beautify our city!"

> "I love that there are a lot of community events and the parks are great."

"We appreciate all of the programming and fun activities that you provide year round - thank you!"

"We appreciate seeing how Auburn takes care of itself and wants to be a place for community."

"We love Auburn parks and nice maintenance all the time. Sometimes I see homeless people at parking lots or next to green river. We wish we could do something for them, we hope we can kind a share each other those parks or trails nicely."

"We love Auburn. I love that there are a lot of community events and activities and the parks are great. Would love to see even more additions and/or improvements to make them even better!"

"We need to find ways to acknowledge and welcome the full diversity of our neighbors. The unsheltered neighbor is still my neighbor! As I would not seek to remove my trailer house living neighbor, nor apartment living, nor too fancy

ADDITIONAL COMMENTS

home for my taste neighbor – nor do I seek to remove these neighbors. How to help us be better neighbors to one another is a real question! What would help them to be better neighbors to me? Restrooms, showers, places to stay warm, cook food, share healthy interactions, places for dumping garbage, transportation opportunities .... hmmmm... hope we are finding a way to positively seek all these neighbors input on these vital questions! Thank you"

> "Working parents need options that are available during non-work hours."

"Working parents need options that are available during non work hours. And toddlers need places to play especially with the COVID baby boom"

"Would like to see the farmers market back on main street"

"Would like to use the parks/facilities again without fearing for my safety or theft."

"Would love an indoor playground near the Lea Hill area"

KEY TAKEAWAYS

The project team will use the input collected through the community survey to inform and drive the PROS Plan update. Key takeaways from the survey data include:

- Survey respondents' **most-used** recreational facilities include **paved walking/biking trails** (used by 75% of respondents), **large community parks** (51%), **small community parks** (47%), small neighborhood parks (47%), **natural areas/nature parks** (45%), and **playgrounds** (42%).
- Survey respondents' **least-used** recreational facilities include **skateboarding areas** (used by 4% of respondents), **outdoor fitness equipment** (6%), **football/lacrosse/hockey fields** (7%), and **youth softball fields** (7%).
- 63% of survey participants indicated they **travel outside of Auburn** to access the recreational amenities/facilities they use most frequently. These facilities include other (nearby) **city parks** (29%), **walking/hiking trails** (17%), **water access** (8%), and **indoor community centers** (6%). These responses suggest there could be a need for more of these facility types in the City of Auburn, or a need to improve those that already exist within the city.
- **Barriers to use** indicate existing issues that need to be addressed by the City in order to improve Auburn parks users' experience. The largest barriers to use of the City's available recreation facilities or programs, as reported by survey respondents, are **security/safety concerns** (57% of respondents), **poor maintenance/cleanliness** (31%), and **overcrowded/booked facilities** (20%).
- According to survey respondents, the City of Auburn's biggest parks and recreation needs include:
  - More non-motorized urban trails/sidewalks (92.5% of respondents)
  - Undeveloped natural areas/open space (86.4%)
  - Community centers/indoor facilities (84.5%)
  - Splash/spray parks (80.2%)
  - More youth programs/camps (77.9%)
  - Off-leash dog parks (69.9%)

Plan Overview

CH.1

Introduction

Overall purpose, goals, policies, and actions of the Comprehensive Transportation Plan. Summary of other Plan elements, including public outreach efforts and agency coordination, regulatory compliance, and the relationship between land use and transportation.

CH.2

Multimodal Network

Multimodal level of service (LOS) standards. Streets system and functional classification of City streets. Existing and future LOS conditions. Transportation demand management strategies.

CH.3

Safety

Where to find additional safety information, with reference to the City's Comprehensive Safety Action Plan.

CH.4

Policies

Goals, policies, and actions to establish the framework for Auburn's transportation system vision.

CH.5

System Management, Maintenance, and Operations

Overview of existing and needed staffing and resources to manage, maintain, and operate Auburn's transportation system.

CH.6

Funding

Planning tools and funding mechanisms available to the City to finance the maintenance and improvement of Auburn's transportation system.

CH.7

Monitoring & Evaluation

Strategy to regularly re-evaluate and update the Comprehensive Transportation Plan to incorporate changes and ensure consistency with other plans.

CHAPTER 1

Introduction

IN THIS CHAPTER

- Plan Purpose, Goals, Policies, and Actions
- Public Involvement
- Regulatory Compliance
- Agency Coordination
- Land Use/Transportation Relationship

The transportation system is a vital component of Auburn's social, economic, and physical structure. The primary purposes of the transportation system is to support the movement of people and goods within the City and connect the City to the broader region. The transportation system influences patterns of growth, development, and economic activity by providing access to adjacent land uses. Planning for the development and maintenance of the transportation system is a critical activity promoting the efficient movement of people and goods, ensuring emergency access, and optimizing the role transportation plays in attaining other community objectives.

1.1. PURPOSE

Auburn's Comprehensive Transportation Plan ("the Plan or CTP") evaluates the transportation system by identifying key assets and improvement needs, which guides the future of the transportation system.

This Plan is multimodal, addressing multiple forms of transportation in Auburn including streets, active transportation, transit, and freight. Evaluating all modes enables the City to address its future transportation needs in a comprehensive and balanced manner.

The Plan provides policy and technical direction for development of the City's transportation system through the year 2044. Major updates are required every 10 years, with an implementation report required every five years.

1.2. GOALS, POLICIES, AND ACTIONS

Transportation goals, policies, and actions establish the framework for realizing the City's vision of its transportation system. Policies provide guidance for the City, other governmental entities, and private developers, enabling the City to achieve its goals in accordance with the Plan. Adopted goals, policies and actions to support them are included in Chapter 4. The policies presented in the Plan will be followed by the City in its evaluation of individual projects, programs, and other actions to address its transportation infrastructure needs. The goals, policies, and actions make reference to the City of Auburn Engineering Design Standards (EDS) that provide specific guidelines and standards for design of the City's transportation system.

The Plan reflects the current and future needs of the Auburn community and, in doing so, seeks to:

- Enhance the quality of life for all Auburn residents
- Encourage a healthy, sustainable, and equitable community through active transportation
- Promote a transportation system that supports local businesses and enhances economic development opportunities
- Create a transportation system that is efficient, uncomplicated, and welcoming to visitors
- Provide a balanced, multimodal transportation system that addresses both local and regional needs

1.3. PUBLIC INVOLVEMENT

Public outreach is a critical component of the comprehensive planning process. Throughout years 2023 and 2024, City staff attended several public events and provided a webpage with a survey for public participation. The information provided on the webpage was available is English, Spanish, Ukrainian, Russian, and Tagalog, which are prevalent languages in Auburn.

As part of the adoption process, the Plan is also reviewed by the Transportation Advisory Board and the Planning Commission. Detailed description of the public involvement and comments received is in Appendix D.

1.4. REGULATORY COMPLIANCE

1.4.1. GMA and PSRC Requirements

Washington State's 1990 Growth Management Act (GMA) requires that transportation planning be directly tied to the City's land use decisions and financial planning. This is traditionally accomplished through the adoption of the Transportation Element of the Comprehensive Plan.

The City of Auburn is a member of the Puget Sound Regional Council (PSRC), the regions Metropolitan Planning Organization (MPO). PSRC is responsible for developing a long-range regional transportation plan and near-term regional transportation improvement program. PSRC establishes policies, procedures, and programs for award of Federal Highway Administration (FHWA) and other federal funding. PSRC has established requirements for agency comprehensive transportation plans that must be met to maintain eligibility for PSRC managed grant funding.

Auburn fulfills this mandate by adopting the Comprehensive Transportation Plan as the Transportation Element of the City's Comprehensive Plan.

Appendix C includes a list of GMA and PSRC

requirements and provides page/policy references where the requirement is satisfied in the Plan, the goals, policies, and or actions.

1.4.2. ADA Compliance

The Americans With Disabilities Act (ADA) went into effect on January 26, 1992. ADA requires that all facilities constructed after this date are readily accessible and usable by persons with disabilities. The City is committed to providing public infrastructure without barriers to those with disabilities and achieving compliance with ADA.

In 2020, the City adopted its first ADA Transition Plan for facilities in the public right-of-way. This document guides the process to reach full compliance with the ADA requirements for facilities in the public right-of-way. It addresses pedestrian pathways such as sidewalks, trails, curb ramps, and cross walks and traffic control devices such as pedestrian pushbuttons and pedestrian signals.

The ADA Transition Plan includes the following elements:

·Overview and Background

·Self-Evaluation

·Policies and Procedures

The ADA transition plan will be updated regularly to reflect new data and the progress towards full ADA compliance. Public comments are accepted and will be considered during the updates.

The City will make all reasonable modifications to policies and programs to ensure that people with disabilities have an equal opportunity to enjoy all its programs, services, and activities.

The City's current ADA Transition Plan is available here and included as part of this Plan by reference.

1.4.3. Title VI Compliance

In accordance with Title VI of the Civil Rights Act of 1964 (Title VI), the City assures that no person shall, on the grounds of race, color, national origin, or sex be excluded from participation in, be denied the benefits of, or be otherwise subjected to discrimination under any program or activity funded directly or indirectly with federal funds. The City further assures every effort will be made to ensure non-discrimination in all its programs and activities, whether those programs and activities are federally funded or not.

The City works closely with the Washington State Department of Transportation (WSDOT) Office of Equal Opportunity to provide required Title VI assurances, plan, and annual reporting.

The City's Title VI information and reports are available here.

1.5. AGENCY COORDINATION

Auburn's transportation system is influenced by what happens outside its jurisdiction and/or boundaries: growth in neighboring communities, infrastructure maintenance by regional agencies, new capacity projects, and competing needs for transit service.

The Plan calls for effective inter-jurisdictional collaboration to address shared transportation issues. The Plan also recognizes that other jurisdictions, particularly state agencies and transit providers, are responsible for a major share of the transportation facilities serving Auburn.

1.5.1. Tribe

The **Muckleshoot Indian Tribe (MIT)** is situated in the southeastern portion of the City and in unincorporated King County, generally to the east of Auburn Way South (SR 164) and south of SR 18. MIT owns significant attractions in or near Auburn including the Emerald Downs Racetrack, Muckleshoot Bingo, the Muckleshoot Casino Hotel and Resort, and the White River Amphitheatre. These activity centers generate a relatively large number of vehicle trips. Residential, industrial, and commercial development on tribal lands is expected to increase in the future and must be evaluated during transportation planning efforts.

The City and MIT coordinate on a variety of transportation planning issues to accommodate the capacity needs derived from traffic generated by tribal land uses and to ensure the tribe has a functioning transportation system for its members. The City and the MIT have established a Memorandum of Understanding (MOU) to partner on pedestrian improvement projects along the Auburn Way South corridor. The partnership has provided for pedestrian access and safety improvements on, and along, the Auburn Way South corridor.

During July 2015, the State Legislature passed a

transportation package which included $15 million for the SR 164 East Auburn Access project along SR 164 between SR 18 and the Auburn plateau area, which was intended to create and develop an affordable, long-term improvement to congestion and safety issues, while also planning to accommodate future growth in the area. MIT is the lead agency on the project and the City has been involved in the alternatives development and evaluation process. The current status of the project is unknown and the City's traffic modeling does not include project improvements. The City's traffic modeling and planning approaches will be updated, as needed, to address progress on this project by MIT.

1.5.2. State

The **Washington State Department of Transportation (WSDOT)** has jurisdiction over three major routes connecting Auburn to the region: SR 167, SR 18, and SR 164 (Auburn Way South). SR 164 is considered a City of Auburn street and a state route and is subject to the City Streets as Part of State Highways Guidelines agreement. SR 164 is also designated by the State as a Highway of State Significance, which has implications regarding applicable level of service standards and concurrency. **Chapter 2** includes additional information regarding SR 164 and other State transportation facilities in Auburn. Auburn coordinates with WSDOT to study these corridors and implement roadway improvements. WSDOT also serves an important role as administrator of federal and state transportation funds.

1.5.3. Transit Agencies

Sound Transit provides a variety of regional transit services for King, Snohomish, and Pierce counties. In Auburn, Sound Transit provides commuter rail, parking, and express bus service. Auburn Station also serves as a hub and transfer station for local transit service provided by **King County Metro Transit** and **Pierce Transit.**

The transit chapter provides more detail on current Sound Transit services, remaining needs for regional transit service, and the role Auburn plays in coordinating with the agency.

King County Metro Transit (KC Metro) provides local bus, Metro Flex, vanpool, and paratransit services for the Auburn area. Planned service for the City of Auburn is described in the Metro Strategic Plan for Public Transportation 2021-2026, and in Metro Connects Long Range Public Transportation Plan, which was adopted by the King County Council in 2021. The City has developed an employee Commute Trip Reduction (CTR) program in cooperation with WSDOT. Details of the CTR program are summarized in the Active Transportation and Transit chapters of this plan.

Pierce Transit operates the 497 Lakeland Hills Express route which provides AM and PM direct service between Lakeland Hills and Auburn Station. This is a partnership route with the City, KC Metro, and Pierce Transit providing funding through an inter-local agreement.

1.5.4. Counties

King County Road Services Division is responsible for maintaining and regulating the roadway network in King County, including the Totem and Klump portions of King County, which are islands of unincorporated King County within the greater jurisdictional boundary of Auburn. King County Road Services has a number of programs and plans in place that regulate development and other activities affecting their roadway network.

Under the GMA, King and Pierce Counties have adopted Countywide Planning Policies to guide development in both incorporated and unincorporated areas of their jurisdictions. The policies support county and regional goals to provide a variety of mobility options and establish LOS standards that emphasize the efficient movement of people and not just vehicles. The Countywide Planning Policies are also important because they provide direction for planning and development of potential annexation areas.

1.5.5. Regional Government

The **Puget Sound Regional Council (PSRC)** sets policy for King, Pierce, Kitsap, and Snohomish Counties through its long-range planning document, Vision 2050, and its regional transportation plan, Transportation 2040. Auburn's transportation plan is required to be consistent with PSRC's regional planning documents and policies. PSRC encourages future growth to be concentrated in regional growth centers. Regional growth centers are locations with significant business, governmental, and cultural facilities, and serve as focal points

for planned growth, economic development, and transportation infrastructure investments.[1] The PRSC Planning documents seek to provide a multimodal transportation system that serves all travel modes, creating opportunities for the use of alternatives to single occupant vehicles. Other important PRSC policy themes are a focus on maximizing the efficiency of the transportation system through transportation demand management (TDM) and transportation system management (TSM) strategies, as well as completing critical links in the network.

1.5.6. Neighboring Cities

The **City of Kent** shares Auburn's northern border and several regional transportation corridors including S 277th Street, SR 167, Auburn Way North/Central, and West Valley Highway. Most recently, Auburn has completed coordination with Kent on the annexation of S 277th Street from Auburn Way North to the Green River into the City of Auburn to allow the widening of S 277th Street between Auburn Way N and L Street NE.

The **City of Federal Way** is located west of Auburn. Several roadways, most notably SR 18, connect Auburn and Federal Way. Auburn and Federal Way regularly coordinate on both vehicular and active transportation improvements affecting both jurisdictions.

The City partners with its southern neighbors in many respects, including street system planning, transit planning, and regional trail planning. Auburn is also working with **Sumner**, **Pacific**, and **Algona** on roadway improvement projects, including the financial support of the Sumner and Pacific projects to widen Stewart Road. The City coordinates primarily with **Bonney Lake** for provision of water service in the Pierce County portion of the City. However, efforts to coordinate transportation systems and services will likely occur in the future. Partnerships with neighboring cities will continue to be an important factor in successful transportation planning.

1.6. LAND USE/TRANSPORTATION RELATIONSHIP

Land use and the transportation system are intertwined, each influencing the needs and development of the other. Therefore, it is necessary to evaluate how existing transportation systems can be improved to best support both existing and proposed land uses.

It is equally important to consider potential transportation system needs when developing future land use plans. This 2024 Comprehensive Transportation Plan was developed concurrently with the City's Comprehensive Plan that included reviewing, evaluating, and revising projected land use throughout the City.

1.6.1. Land Use Characteristics and Transportation Systems

A broad overview of Auburn's existing land use designations shows industrial (light and heavy) designations in the west side of the valley floor portion of the City, extensive commercial development (light and heavy) located along Auburn Way N, Auburn Way S, and A Street SE, and sizable heavy commercial designated areas near the SR 18 and 15th Street SW interchange and between 15th Street NW and 37th Street NW (Emerald Downs). Residential development generally exists along the east side of the valley floor and the surrounding hillsides of West Hill, Lea Hill, and Lakeland Hills. A major land use activity in Lea Hill to the east includes the Green River College located on SE 320th Street.

The existing land use element identifies Industrial as the City's second most predominant zoning designation (Residential being first). Consequently, the City's land use plan establishes a development pattern that has traffic generated by these industrial uses directed towards the State Highway System.

Another key feature in the land use element is a Heavy Commercial designation at 15th Street SW, adjacent to SR 167 and SR 18. This commercial designation is the site of The Outlet Collection. The Outlet Collection generates high volumes of local and regional traffic that utilize State highways and City streets. Auburn's "Auto Row", along Auburn Way N, to the north of downtown also generates large volumes of local and regional traffic.

1 PSRC, https://www.psrc.org/our-work/centers

Downtown Auburn is near the geographic center of the City, located generally east of the Interurban Trail, north of SR 18, west of F Street SE/NE, and south of 3rd Street NW/NE and 4th Street NE. Downtown Auburn is designated as a Regional Growth Center by the PSRC as part of Vision 2050. Designated regional growth centers are identified for housing and employment growth, as well as being eligible for regional transportation funding. Downtown Auburn contains a mix of land uses including residential, commercial, and industrial uses. Commercial uses in Downtown are focused along Main Street, Auburn Way, and A Street SE. Historically, this commercial development has served predominantly local needs. However, the presence of Auburn Station, MultiCare, City Hall, and new development projects, combined with regulations and policies that encourage transit-oriented developments (TODs), downtown commercial development will serve a broader range of needs in the future. Downtown Auburn also has the City's most robust active transportation infrastructure, including both extensive pedestrian and bicycle facilities. This provides the opportunity for both residents and employees to rely on proximate transit services at Auburn Station, combined with a robust active transportation system for a portion of their transportation needs.

The City's Comprehensive Plan land use map focuses residential development in the eastern portion of the valley and in the West Hill, Lea Hill, and the Lakeland Hills area. Access to the State Highway System in Lea Hill is limited to SR 18 at SE 304th Street. Future impacts on the State Highway System in the Lea Hill area will primarily be commuter traffic due to the predominance of residential comprehensive plan designations in that area, and continued growth of Green River College. The development of Lakeland Hills will also principally result in increased commuter traffic.

1.6.2. **Future Land Use**

The Washington Office of Financial Management (OFM) produces population and employment forecasts for each county which are then allocated to cities through the Countywide Planning Policies. Cities must plan to accommodate the required levels of housing and employment growth allocated through this process. King and Pierce Counties have allocated Auburn a combined target of 12,096 new housing units (12,000 in King County and 96 in Pierce County) and 19,520 new jobs (all in King County) between the baseline of 2019 and 2044.

Based on the available land capacity as zoned in 2023, Auburn showed a deficit of capacity for both the 2044 housing unit and jobs targets. The future land use map developed with the 2024 Comprehensive Plan was developed to accommodate the 2044 housing and jobs targets through new zoning and land uses in various corridors and nodes throughout Auburn, and in the Downtown area in particular. Development of the future land use map involved evaluating alternative land use scenarios and testing them against various factors. Further information regarding this process is included in the Comprehensive Plan.

This Comprehensive Transportation Plan is based on the Preferred Land Use Alternative documented in the Comprehensive Plan. This land use alternative was a combination of two alternatives that each focused on centralizing housing and employment growth with either corridors or centers approach. Both alternatives included intense housing and employment growth focused in the Downtown area by expanding and increasing development density and intensity. The combined alternative targets employment and housing along the Auburn Way North and I Street NE corridors where frequent transit is planned to start operating in 2026. Focused growth in employment and housing was also identified at locations of known future development plans. These areas include the Outlet Collection Mall area along 15th Street SW, the Icon Materials mining operations and adjacent lands along the east side of Kersey Way (known as the Segale development area), and at vacant or underdeveloped land areas on Lea Hill and West Hill.

CHAPTER 2

Multimodal Network

IN THIS CHAPTER

- Multimodal Level of Service Standards
- Streets System
- Active Transportation
- Transit
- Freight
- Airport

The transportation network includes facilities for several modes of transportation, which must integrate well together, and support or complement each other, to provide the best possible mobility options throughout the city. While it is important to limit vehicle congestion and traffic delays, it is equally important to provide alternative transportation options, which can encourage active transportation and reduce the need to increase vehicle capacity on the roadways.

The availability of transit service, bike facilities, and sidewalks will become more important to achieve a comprehensive multimodal transportation network, which is composed of the vehicular traffic network (roads) which serves cars, trucks, and buses, and the active transportation network, which includes bike and pedestrian facilities. Some roads are more heavily used by trucks, and are identified in the freight network. Transit routes are also identified. Based on the primary function of the roads, special considerations are made to carefully prioritize specific modes, and protect other modes where there are overlaps, such as freight corridors along bikes routes.

2.1. MULTIMODAL LEVEL OF SERVICE STANDARDS

Transportation level of service (LOS) standards are metrics that indicate how well transportation facilities are moving people and goods.

Prior to this Plan, as with comprehensive transportation plans for most other agencies in Washington, the City of Auburn's Comprehensive Transportation Plan only included LOS standards for motorized vehicles (vehicle LOS). Without adopted multimodal LOS standards (MMLOS), there were no metrics by which the effectiveness of the active transportation and transit systems could be measured and evaluated. With MMLOS, the City of Auburn can ensure that transportation system improvements are planned, funded, and implemented to develop a comprehensive, connected, and versatile transportation system. One of the main goals of MMLOS is to realize a transportation system that doesn't rely on adding more vehicular capacity alone to address growing needs to move people and goods. The MMLOS approach supports providing other transportation modes including walking, bicycling, and transit to address these needs. The City of Auburn's MMLOS have been developed with the strategic and focused intent of maximizing potential mode shifts from driving cars to walking, biking, and riding transit. The standards work towards this by setting higher level of service standards for walking and biking in areas where doing so will best support existing and planned transit service.

These principles, many of which can be promoted by thoughtful transportation systems planning, encourage healthier communities by increasing physical activity and decreasing air pollution caused

In 2023, Washington enacted House Bill (HB) 1181 which required agencies to develop MMLOS. MMLOS expand the transportation system metrics to include other travel modes such as transit, walking, and biking.

Auburn's multimodal transportation network primarily includes the **modes of travel highlighted below**, which are explained and assessed in more detail throughout the Plan.

Separate sections have been included in the Plan that address the following elements for each mode:

- General description and overview
- Existing facilities and/or services
- LOS standards
- Existing LOS evaluation and existing deficiencies
- Future LOS evaluation and future deficiencies
- Strategies, projects, and programs to address existing and future deficiencies

The City of Auburn envisions a transportation system that will help promote healthy community principles by coordinating land use, the active transportation system, and transit in a manner that encourages walking and bicycling. PSRC has identified several elements that contribute to the desirability of walking, bicycling, and transit use in their Vision 2050 "Update Paper on Health":

- **Concentrating complementary uses** such as restaurants, retail, and grocery stores proximate to residences and employment.
- **Linking neighborhoods** by connecting streets, sidewalks, and trails.
- **Designing for safe and welcoming pedestrian and bicycle facilities.**
- **Enhancing transit opportunities and active transportation connections** to transit facilities.
- **Reducing and mitigating the effects of parking.**

Motorized vehicles moving people on streets

Pedestrians and bicyclists

Buses and trains moving people

Trucks and trains moving goods

by vehicle emissions. Auburn has historically planned for a transportation system that incorporates many healthy community principles, such as transit facility planning and regional trail planning. In addition, the Downtown Plan calls for a mixed-use, high density, pedestrian-oriented downtown. Improving the active transportation system also helps address the findings of the citywide Health Impact Assessment process, which recommended that the City improve sidewalk connectivity; improve the pedestrian environment; eliminate natural and man-made mobility barriers for pedestrians and bicyclists; improve access to transit; and improve vehicle safety, and pedestrian safety.

In the future, Auburn shall continue to promote these principles through long-range planning efforts, capital facility improvements, development review, and community activities involving active lifestyle elements.

MMLOS is vital to providing an equitable, effective, sustainable, and environmentally balanced transportation system. MMLOS allows a more strategic approach towards moving people and goods as compared to the historic approach of only using vehicle LOS standards. Products of the historic approach are visible all around us where we see wide multi-lane roadways with narrow or missing sidewalks, neighborhoods and commercial areas with little to no transit services, and an incomplete, often sporadic bicycle network. These deficiencies in the transportation system are understandable given that LOS standards are used to identify where the transportation system is not adequately functioning and, subsequently, used to plan and prioritize improvements to address those issues. If vehicle LOS is the only standard in place, the resulting transportation investments are focused on moving goods and people with motorized vehicles while other modes receive little funding relative to vehicle capacity.

2.2. STREETS SYSTEM

The City has 249 centerline miles of public roadways. The City's planned arterial street network is mostly established with existing roadways with only a few new arterials that have yet to be constructed. Many of the City's arterial and other streets were not built to current City design standards as the network itself is a product of almost a century of evolving standards and design approaches. Many older roads, including those inherited through several annexations, do not include robust pavement sections and do not accommodate active transportation users. The annexed county road networks present a challenge as they were originally set to provide access to rural areas and not to accommodate existing and future planned higher density housing and commercial areas. The network challenges are most prevalent on the City's West Hill and Lea Hill areas where connectivity is mostly provided by two-lane county roadways that don't form a fully connected network. Constructing new roadways or re-aligning existing roads to improve the network connectivity is heavily constrained by topography, environmentally sensitive areas, existing development, and jurisdictional boundaries.

Almost 400,000 vehicle trips use Auburn's streets everyday. Most of the City's arterial and collector roadways have adequate vehicle capacity on sections of roadways without intersections. Where capacity issues do occur, they are mostly at controlled intersections of arterial and/or collector streets.

An inventory of the City's street system is maintained using the City's asset management software and geographic information systems (GIS). The inventory includes spatially referenced roadway segments generally delineated between roadway centerline intersections. Each roadway segment includes a set of data associated with it such as roadway width, number of lanes, classification, posted speed, pavement condition index, and initial construction, maintenance/repair, and replacement history. This data is used to generate the maps included in Appendix A.

2.2.1. Functional Classification of City Streets

The street system functions as a network. Functional classification is the hierarchy by which streets and highways are defined according to the service they provide. There are three main classes of streets in Auburn: **arterials**, **collectors**, and **local streets**.

Map 7. 2024 Roadway Classifications in Appendix A provides the currently adopted classification of Auburn's existing and planned streets. Streets are classified using the Federal Functional Classification system guidelines, as shown in Map 9. 2024 Federal Functional Classifications in Appendix A.

The Auburn EDS establishes typical roadway cross sections for each City street classification. Some City streets have specific cross sections and other design elements that have been established through specific studies and/or design efforts. The following City studies or standards are included in this Plan by reference and establish roadway cross sections and other design elements for the studied roadways:

- R Street SE Corridor Study
- Lea Hill Road Corridor Study
- BNSF Railway and A Street SE Crossing Study
- Downtown Division Street Promenade Project
- Downtown Urban Standards as Presented in the EDS
- Other studies that have, or will be prepared and approved, by the City Engineer with consultation and input provided by the Transportation Advisory Board (TAB) and the City Council

Designation of functional classifications allows for the preservation of the right-of-way for future transportation corridors, whether the corridor provides access to car, transit, bike, or pedestrian use. Functional classification helps establish corridors that will provide for the future movement of people and goods, as well as emergency vehicle access. Proper designation is crucial to the planning effort; as development occurs, accommodation for the appropriate transportation corridors should be incorporated into development plans.

The following describes the different classifications used by the City, in order from highest classification to lowest:

Principal Arterials are designed to move traffic between locations within the region and connect with the freeway system. Design emphasis is placed on providing movement for both inter- and intra-City traffic. As such, these facilities typically carry the highest traffic volumes and are designed to accommodate longer-distance trips, provide the highest level of mobility, and have the highest speed limits of all City streets. Principal arterials will generally carry moderate to high level of large truck traffic. Direct access to adjacent land uses is permitted, although these streets are most likely to have limited or managed access in an effort to enhance safety and preserve capacity. Active modes also use these streets, but rely on sidewalks and other dedicated facilities to safely navigate vehicle traffic.

Principal arterials are the framework street system for the City and usually extend beyond the City limits, connecting with neighboring jurisdictions. Principal arterials are heavily utilized as bus routes, carrying both local and regional service.

Minor Arterials connect collector and local industrial streets to principal arterials and freeways. They serve moderate length trips, provide slightly less mobility than principal arterials, and distribute traffic to smaller geographic areas. Minor arterials may serve secondary traffic generators such as business centers, neighborhood shopping centers, major parks, multifamily residential areas, medical centers, larger religious institutions, and community activity centers.

Minor arterials will generally carry moderate to low levels of large truck traffic. Direct access to adjacent land use is permitted but may sometimes require limited or managed access in an effort to enhance safety and corridor capacity. Active modes also use these streets, and often rely on sidewalks and other dedicated facilities to safely navigate vehicle traffic.

Collectors and Rustic Collectors carry traffic originating from local streets, neighborhoods, and recreational areas to minor and principal arterials. Collectors typically serve only local truck trips and are not typically intended for use by large trucks. Collectors are intended to have a residential neighborhood feel and encourage active transportation. Collectors may accommodate some local transit routes.

Rustic collectors are located in areas with less intensive land uses associated with the Residential Conservancy land-use designation and along environmentally sensitive corridors such as Green River Road. Rustic collectors are intended to have a less urban feel and generally don't have separate bike or pedestrian facilities. Rustic collectors do not typically carry fixed route transit services.

Local, Local Industrial, and Local Rustic primarily provide direct access to adjacent land uses and connect with other local streets to eventually connect to collectors and arterials. Local streets are not intended to connect traffic between collector and arterial streets, also known as cut-through traffic. Local street networks generally consist of shorter roadway segments between intersections with collectors and arterials and often have cul-de-sacs and looping configurations. Local streets generally do not serve fixed route transit. Local streets are the most common streets in the City and are intended to have a residential neighborhood feel with relaxed and comfortable driving, biking, and walking experiences. Local streets are not intended to serve large truck traffic.

Rustic residential streets are a type of local street that serve areas associated with the Residential Conservancy zoning designation. Rustic residential streets are intended to have a less urban feel and typically do not have separate walking and biking facilities.

Local industrial streets serve primarily industrial and manufacturing land uses. They are intended to accommodate large trucks and provide a more urban or industrial setting.

Alleys are the lowest classification of City street and provide vehicular access to abutting properties generally from the rear or side. Alleys also provide access for garbage collection and emergency vehicles and serve as corridors for city and non-city utilities. Alleys can also serve additional purposes including access management and the alleviation of traffic operations issues on streets with higher classifications (not related to level of service issues). Alleys generally connect to local streets and are short in length without separate walking or biking facilities.

2.2.2. City Street Classification Changes

In preparing the Plan, the roadway classifications and street network were reviewed to evaluate if revisions were needed to reflect current and future needs. Previously, the City classified its local and collector streets as being either residential, non-residential, or rustic. There was some ambiguity and inconsistency in the non-residential designation as the name implied that the classification was intended for all commercial, industrial, and non-rustic streets. However, the typical roadway cross sections in the EDS for non-residential streets included wide vehicle travel lanes to accommodate large trucks. The EDS also specified a pavement section for non-residential roads that was very robust, again, intended to serve large trucks. Throughout the City, roads previously classified as non-residential included roads serving

multi-family housing, commercial areas, multi-use areas, and industrial areas. Except some heavy commercial and industrial areas, the wide lanes and robust pavement section specified in the EDS were generally not desirable for these roadways. To address this issue, the decision was made to discontinue the use of the non-residential collector classification. Streets previously classified as non-residential collectors were updated to be reflect the new classification approach. The local street classifications were updated to be either local, local industrial, or local rustic. Streets previously classified as local non-residential streets that serve industrial areas and large volumes of truck traffic were updated to be local industrial streets. Streets that were not local rustic or local industrial were classified as local streets. In addition to the change in roadway classification categories, the assigned classification to various City streets were updated to reflect current and future land-use, traffic volumes, and other factors. A summary of these changes is provided in Appendix E.

2.2.3. State Highways

State highways include **SR 18**, **SR 167**, and **SR 164**. A description of each highway is provided in **Table 1**.

2.2.4. Private Streets and Shared Driveways

Private Streets can be appropriate for local access in very limited usage. They provide direct access to City streets and are not intended to connect between two or more public streets immediately adjacent properties.

Shared Driveways, sometimes referred to as access tracts provide public right-of-way access for one or more properties. A driveway serving only one property but utilizing an access easement or tract across another property for access to the public right-of-way is also considered a shared driveway. They are most common in panhandle lots or rear lots that do not have street or alley access. Shared driveways have become very common in subdivision projects that are trying to meet density requirements while also working around critical areas and other constraints. Access tracts are privately owned and maintained.

2.2.5. City Streets LOS

Streets are based on the amount of delay experienced by drivers at intersections and how the queue of vehicles waiting at those intersections may block other intersections, driveways, and travel lanes. Previously, the City also included corridor delay as a vehicle LOS standard. Corridor LOS is no longer considered because intersections generally control how well the roadway network functions. If a roadway corridor is congested, most often it is the result of delays and queuing at the intersections along the corridor. The City's established policies and actions related to providing an efficient and effective multimodal network include provisions to support efficient, effective, and resilient roadway corridors. Previously the City vehicle LOS standards

Table 1. State Highways

ROUTE	
18	• Connects I-5 to I-90 through Auburn • Within the City limits, has interchanges with SR 167, West Valley Highway, C Street SW, SR 164/Auburn Way S, Auburn Black Diamond Road, and SE 304th Street providing access to downtown Auburn and Lea Hill • Classified as both a Highway of Statewide Significance (HSS) and a National Highway System (NHS) route for the entire corridor segment • A full control limited access highway, allowing access only at interchanges within the City limits
167	• Also known as the Valley Freeway • Serves as an alternative to I-5, connecting south King and north Pierce Counties to the I-405 corridor to the north • Designated as both HSS and NHS • Within the City limits, SR 167 has interchanges with SR 18, S 277th Street, 15th Street NW, and 15th Street SW • A full control limited access highway, allowing access only at interchanges within the City limits
164	• Also known as Auburn Way South • A 15-mile roadway corridor beginning at the SR 18 interchange with Auburn Way S • The corridor is aligned southeast through the City, connecting through the Muckleshoot Indian Tribe lands and unincorporated King County before terminating in the City of Enumclaw at its junction with SR 410 • A City street which is part of a state highway • Functionally classified as an urban other arterial by WSDOT, and also a Highway of State Significance (HSS) • Subject to WSDOT Complete Streets requirements

also included reference to other factors like pavement degradation, safety impacts, and general roadway geometry. Since those factors don't have a metric or rating that can be used to determine how well a facility is functioning, they are no longer included as a vehicle LOS standard. Instead, those are addressed with other goals and policies throughout the Plan and provided for with standards established in the EDS.

The vehicle LOS methodology used in the City of Auburn for intersection delay is based on the current edition of the Highway Capacity Manual (HCM) which assigns intersections with a letter designation from 'A' through 'F' based on control delay. Control delay is the total elapsed time from a vehicle joining the intersection queue until its departure from the stopped position at the head of the queue. This includes the time required to decelerate into the queue and accelerate back to free-flow. **Table 2** shows the LOS ratings for intersections based on the type of intersection control and maximum expected delay times. The Plan policies establish LOS "D" as

Figure 1. Vehicle LOS - Illustration of Roadway Delay

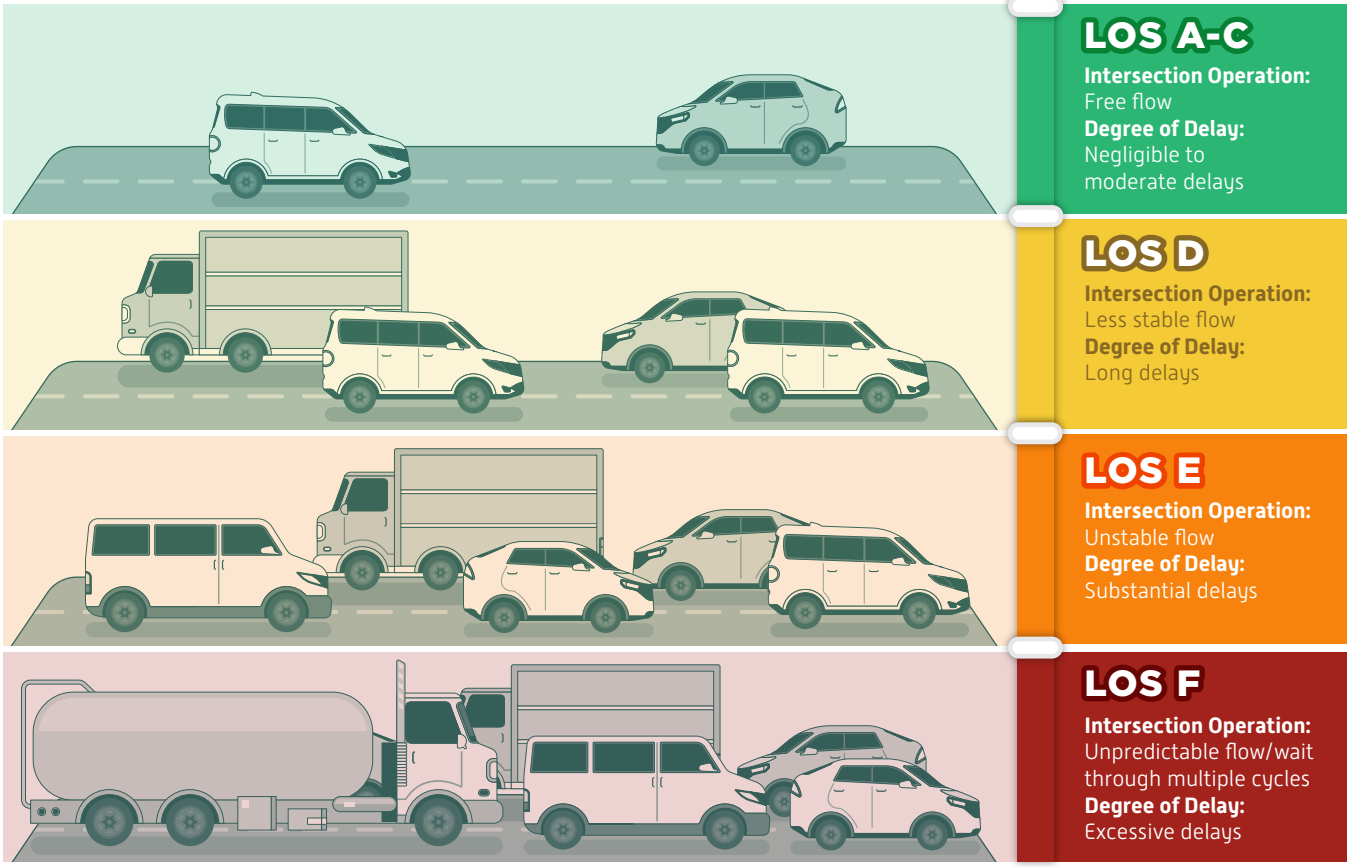

Table 2. Vehicle Intersection Delay LOS Table

INTERSECTION TYPE	LEVEL OF SERVICE					
	A	B	C	D	E	F
	AVERAGE CONTROL DELAY (SECONDS PER VEHICLE)					
Stop Control*	0 – 10	>10 – 15	>15 – 25	>25 – 35	>35 – 50	> 50
Traffic Signal or Roundabout Control**	0 – 10	>10 – 20	>20 – 35	>35 – 55	>55 – 80	>80

* LOS for stop-controlled intersections with one or more uncontrolled approaches is evaluated based on the movement with the highest delay.
** Intersections with roundabouts are also evaluated using V/C ratio.
Source: Highway Capacity Manual, 6th Edition

the minimum standard for most intersections with the exception being signalized intersections of two or more principal arterial roadways which have a LOS "E" minimum standard. Intersections with roundabout control are evaluated using both the letter designation "A" through "F" grade for control delay and the volume/capacity ratio (V/C ratio). The City has adopted WSDOT's Measures of Effectiveness (MOE) approach for roundabouts and established 0.90 as the maximum allowed V/C for each lane group.

Another metric used for Vehicle LOS standards in Auburn is based on the length of the queue of vehicles backed up at an intersection. This is a pass/fail metric based on whether or not all intersection approaches fit within the available queue storage under projected 95th percentile queue lengths. If any approach does not fit within the available storage, the intersection queuing LOS standard is "failed." If all approaches fit within available storage, the intersection queuing LOS standard is "pass." As outlined in the Plan policies, the queuing standard is that the 95th percentile queue shall not extend across an adjacent driveway, alley, or street intersection, except if the driveway, alley, or street intersection is within the functional intersection boundary of the queue in which case the queue may extend to the limit of the functional intersection boundary. Additionally, queuing for a designated turn lane shall not exceed the turn-lane storage area and cause a blockage of adjacent lane(s).

2.2.6. Vehicle LOS Standards - State Highways

Amendments to the GMA in 1998 added new requirements for local jurisdictions to address state-owned transportation facilities, as well as local transportation system needs in their comprehensive plans (RCW 47.06.140). House Bill 1487, adopted by the Washington State Legislature in 1998, requires that the transportation element of local comprehensive plans include the LOS standards for HSS. HB 1487 clarified that the concurrency requirement of the GMA does not apply to HSS or other transportation facilities and services of statewide significance. HB 1487 also requires local jurisdictions to estimate traffic impacts to state-owned facilities resulting from land use assumptions in the Comprehensive Plan.

WSDOT has identified a LOS D standard for all urban HSS, according to the State Highway System Plan (HSP). All state highways within the City of Auburn, including SR 18, SR 167, and SR 164, are classified as urban HSS, and therefore have a LOS D standard.

2.2.7. Transportation Demand Management (TDM)

In 1991, the State of Washington adopted its Commute Trip Reduction (CTR) law. The law's intent is to reduce traffic congestion and air pollution by shifting drive-alone commutes to other modes. Today, more than 1,000 worksites take part in the CTR program statewide and the program is well known nationally as an example of impactful TDM.

The law requires local jurisdictions to adopt ordinances detailing requirements for employers to implement employee commute trip reduction programs that encourage the reduction of the number of trips and miles people drive alone to work. In 2010, City of Auburn adopted Ordinance 6218, codified by Auburn City Code Chapter 10.02, which provides these requirements for employers within the City limits.

Reducing congestion includes strategies to reduce demands on the transportation system. The State of Washington emphasized the importance of TDM by adopting a CTR law. That law requires all major employers, with over 100 employees at a single site and arriving between the hours of 6:00 and 9:00 AM, to develop programs and strategies to reduce the number of commuter automobile trips made by their employees. Transportation demand management reduces demand on the street system. While TDM and TSM employ different strategies, they share many of the same benefits. Both reduce the peak vehicle demand, increase the efficiency of the transportation system, reduce the need for costly capacity expansions, help improve LOS, and contribute to an enhanced quality of life for those who use and benefit from the transportation system.

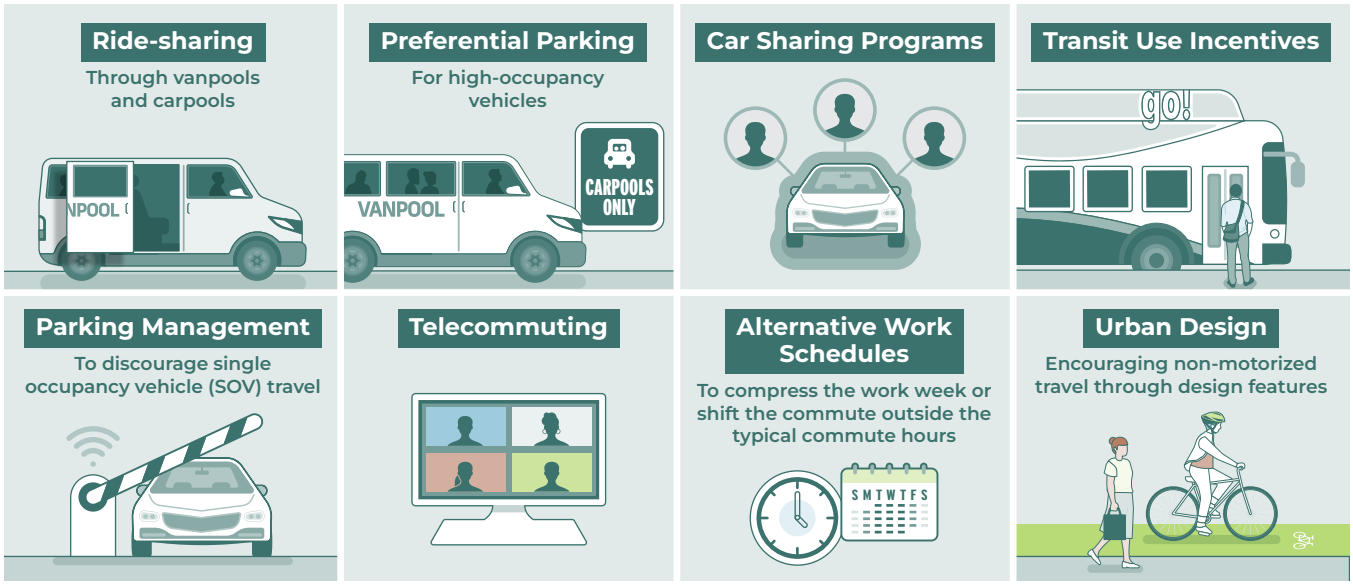
TDM strategies include those shown in **Figure 2** on the next page.

The City of Auburn will continue to encourage drivers of single occupancy vehicles to consider alternate modes of travel such as carpools, vanpools, transit, active transportation travel, and alternative work schedules, and has identified mode split goals for the Regional Growth Center. The goals were developed in consideration of the current mode splits for the Auburn Regional Growth Center, the current mode splits for all designated Regional Growth Centers, and the 2040 mode split targets identified by PSRC for all designated Regional Growth Centers. The existing and 2035 mode split goals for the Auburn Regional Growth Center are summarized in **Figure 3** on the next page.

The mode split goals for the Regional Growth Center reflect the desire to significantly reduce automobile travel as a share of work trips, with the most significant increase in transit trips. The reduction in the vehicle mode split will be the result of the right

mix of land use changes, transportation investments, and roadway pricing tools. Additionally, factors such as shifting demographic trends, preferences, and technology may contribute to mode shifts above and beyond the identified goals.

Figure 2. TDM Strategies



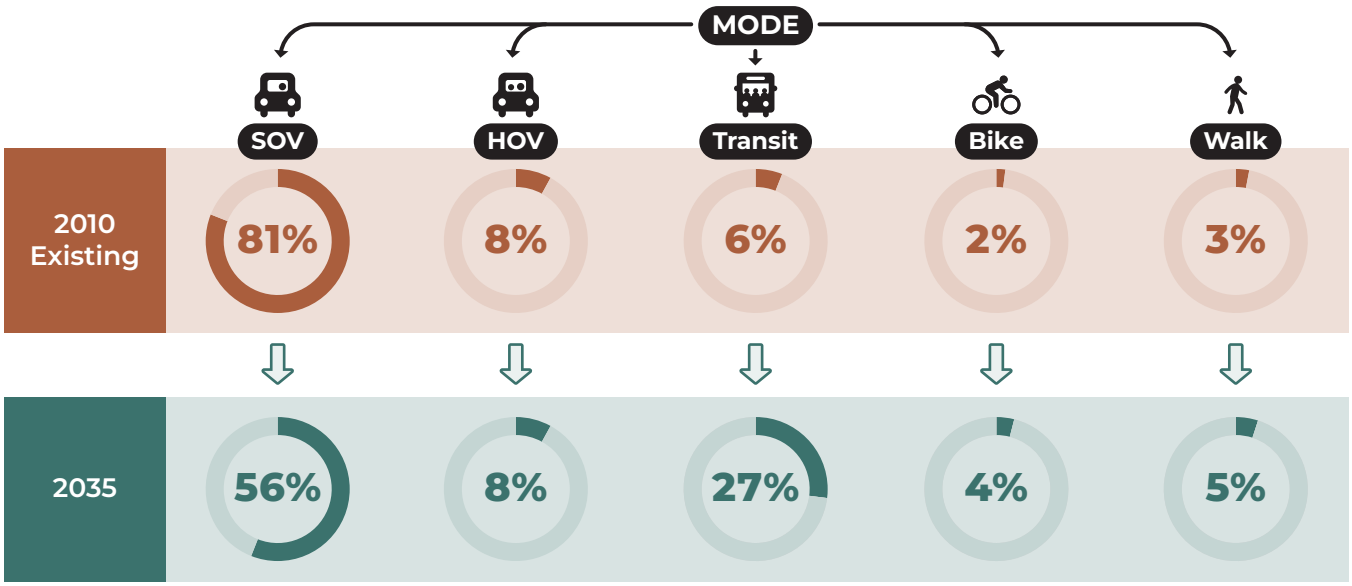


Figure 3. Regional Center Mode Split Goals

2.2.8. Existing and Future Vehicle LOS Conditions

Existing Conditions

In 2022, the City collected average daily traffic counts from arterial and collector streets and peak hour turning movement counts at 157 intersections in Auburn. These observations formed the basis for the existing conditions analysis of traffic operations in Auburn. Existing turning movement counts were analyzed using Synchro traffic operations software to calculate the LOS at each study intersection for the busiest hour during the weekday AM (7:00 - 9:00 am) and PM (4:00 - 6:00 pm) peak periods. Wherever possible, HCM 6th edition analysis was used. In some cases, due to incompatible intersection channelization and/or phasing settings, HCM 2000 was applied. Of the 157 intersections evaluated, the 11 (or 8%) shown in **Table 3** are currently operating below the City's adopted LOS standard. **Figure 4** displays the existing LOS standard of evaluated intersections and numbered intersections currently operating below the LOS standard.

The majority of intersections operating below adopted level of service standards or failing intersections have two-way stop-control; of the 13 failed intersections, three are signalized, one has all-way stop-control, and eight have two-way stop-control. The PM peak hour period is also when the network is under most strain: seven intersections are failing only during the PM peak hour, while only four intersections are failing only during the AM peak hour, and two intersections are failing during both AM and PM peak hours. In addition to current failures, five intersections are operating near the threshold of failure in the AM and three are approaching the City's standard in the PM, indicating that future growth could cause the level of service to drop below standards.

Many of the intersections with existing level of service issues are on Lea Hill or West Hill. Multiple intersections along Auburn Way South (SR 164), M Street SE, and A Street SE carry heavy volumes of both local and regional traffic and are close to or failing City and/or state LOS standards.

Future Conditions (2044 Preferred)

To forecast what travel patterns might be in 2044, the City's VISUM-based travel demand model was applied. Developing these forecasts required validation of the model to confirm it could replicate existing traffic volumes (with model inputs reflecting 2022 roadway and land use conditions throughout Auburn). Then, the model was updated to reflect land use and transportation conditions expected under the 2044 preferred land use scenario from the City's Comprehensive Plan Land Use Element. **Table 4** lists the projects included in the Initial 2044 Preferred Land Use Future model. The table also indicates what the current project status is and what are the next steps planned for the project. The next steps indicate whether or not the project will be retained or removed from the Plan project list included in Appendix B.

The initial 2044 Preferred Land Use Future Model was used to generate future travel demand volumes and turning movement counts at 162 study intersections[2] throughout the city during the busiest hour of the weekday AM (7:00 - 9:00 am) and PM (4:00 - 6:00 pm) peak periods.

Figure 5 shows the forecast 32% increase in households and 44% increase in jobs in the City of Auburn between 2022 and 2044. AM peak hour trips are forecast to increase by 28% (from 22,900 trips today to 29,300 trips in 2044). PM peak hour trips are forecast to increase by 37% (from 30,700 trips today to 42,200 trips in 2044).

Forecast volumes from the preferred land use alternative model were then applied to study intersections using Synchro software to test future LOS.

In the preferred land use alternative, 162 intersections were analyzed. Of these, 22 intersections are forecast to operate below City or state LOS standards in 2044. These intersections are listed in **Table 5**. Of the intersections forecast to fail, 10 currently do not meet the adopted LOS standards. These 10 intersections are highlighted in pink in **Table 5**. **Figure 6** shows a map of intersection LOS across the City.

Approaching Standard	33
At Standard	19
Failed	22

2 Note that the future scenario includes five intersections that do not exist today.

Figure 6. Intersection Level of Service in the 2044 Future Preferred Land Use Alternative

Of the intersections forecast to operate below LOS standards by 2044, the vast majority have two-way stop-control; only three failing intersections are signalized, four have all-way stop-control, and 14 have two-way stop-control. More of the intersections are impacted during the PM peak hour than in the morning, similar to existing conditions. In addition to the 21 intersections that are expected to fail city or state standards by 2044, 14 intersections are forecast to operate at the City's LOS standard, two in both the AM and PM, three in the AM and nine in the PM peak hour, signaling that increased growth could test the capacity on more of the road network in Auburn.

With some exceptions, Vehicle LOS issues associated with the preferred land use alternative are concentrated along five corridors, where multiple intersections will fail to meet City or state LOS standards:

- **East:** SE 304th Street corridor on Lea Hill
- **North:** I St corridor and Auburn Way N
- **West:**51st Ave S / S 321st Street Corridor on West Hill
- **South:** A Street SE corridor

2.2.9. Addressing Vehicle LOS Deficiencies

Projects to Address Existing and Forecast LOS Issues

Where the future analysis indicated that an intersection would not meet adopted LOS standards in 2044, measures to address the deficiency were identified, evaluated, and costed. City transportation policies, goals, site characteristics, and and adjacent planned or underway projects were considered to identify effective and desirable improvements. The types of improvements considered included roundabouts, re-channelization of intersections, access management, turning restrictions, and signalization. Where a signalized intersection was deemed a desirable solution, MUTCD 11th Edition signal warrants were applied to determine if forecast volumes would warrant signalization of the intersection. In instances where a failing intersection would not meet MUTCD signal warrants, non-signalized mitigation measures, such as channelization and access management, were considered. All improvements were analyzed using Synchro traffic operations software to ensure the recommended measure would facilitate the intersection meeting the adopted level of service standards in the 2044 preferred land use alternative. Projects to implement these improvements are included in the project list in Appendix B.

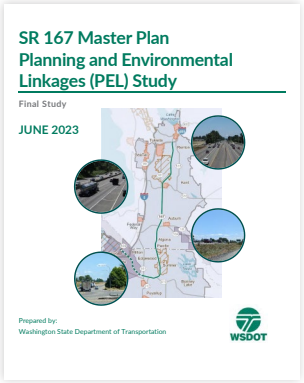
Trip Reductions

The Preferred scenario includes reductions to vehicle trip generation rates to reflect shifts to other travel models due to increased density and mixed-use development projects, focused land use growth and increased access to additional active transportation facilities, transit service, increased vehicular travel costs, and demographic changes. The reduction percentages were determined based on results from PSRC's regional travel demand for travel behavior changes in the City of Auburn. Reductions were applied across the City based on the Transit LOS rating. This metric is based on walking proximity to transit. Reductions were only applied in areas with level of transit service 1 and 2, the highest quality transit options in the City: within the walkshed of Auburn Station and frequent transit routes (BRT and routes with less than 30 minute headways). The reductions in vehicle trip rates ranged from 1.5 to 8.0 percent based on trip type (commute vs. non-commute) and transit area type.

Regional Capacity Projects

In addition to projects that provide additional vehicle capacity to meet City vehicle LOS standards, a set of projects have been identified that would provide regional system-wide capacity benefit. These projects are included in the Regional Transportation Plan (RTP), by the Puget Sound Regional Council (PSRC) and are listed below:

- **Auburn Way South - Hemlock to Poplar** (currently in construction)
- **Auburn Way South: 32nd St to City Limit** (candidate project)
- **Auburn Way South - Poplar to 32nd St** (candidate project)
- **E Valley Highway Widening** (currently in design w/planned construction start in 2028)
- **M Street NE Widening, E Main St to 4th St NE**, (currently in design w/planned construction start in 2025/2026)
- **M Street SE Corridor Improvements** (8th St SE to Auburn Way S)



See Project Comp-20 in Appendix B. For more information regarding these projects, please refer to the **PSRC Regional Transportation Plan** available at https://www.psrc.org/planning-2050/regional-transportation-plan.

SR 167 Master Plan

The SR 167 Master Plan update includes recommendations to address the significant congestion and impact on local roadways from regional traffic flowing through the SR 167 corridor.

The plan calls for an additional express toll lane in each direction and interchange improvements on SR 167 at 15th Street NW, SR 18, and 15th Street SW to reduce bottlenecking and queuing issues. These changes are complemented by a suite of transit improvements and active mode access improvements in the surrounding area. Additionally, the master plan also includes support for reconstructing the BNSF freight railway over Ellingson Road to reduce bottleneck and impacts to traffic.

For further review of the SR 167 master plan, visit the WSDOT project website.

SR 167 PEL Study

2.3. ACTIVE TRANSPORTATION

Active transportation is an integral component of Auburn's transportation system. Active transportation includes walking, bicycling, and rolling. The City seeks to enhance the active transportation travel environment both for recreational travel and trips that might otherwise be taken via a car to improve mobility and environmental health.

The City recognizes that the past development of the transportation system has prioritized the automobile as the primary travel mode. A side effect of this has been conditions less conducive to active transportation travel. The City seeks to redress the balance by enhancing conditions in which active transportation modes are a realistic and attractive travel option.

Over the last 15 years, there have been significant improvements to active transportation facilities in Auburn's Regional Growth Center (Downtown Auburn). Sidewalk, ADA, and lighting improvements have been made to Main Street, S Division Street Promenade, City Hall Plaza and Plaza Park, and behind the shops on East Main Street. Growth in the downtown core has resulted in the development of multi-story residential and office buildings and senior housing, helping renew the pedestrian infrastructure and creating a need for continued effort to maintain and improve the sidewalk system. In addition, the Sounder Auburn Station and transit hub at West Main Street and C Street SW provide pedestrians more options for connecting to regional destinations.

These improvements contribute to a more hospitable environment for pedestrians. Despite the progress that has been made over the past several years, there are still many areas of need and gaps in active transportation systems in Downtown Auburn and in other areas throughout the city.

Commercial development outside the downtown exists primarily along arterials and is dominated by strip development and auto-oriented businesses. Although sidewalks are provided on most arterials, pedestrians may feel exposed to the traffic. Surface parking lots border the sidewalks, and driveways interrupt the continuity of the sidewalk system. The high volumes of vehicular traffic and wide streets along arterials, such as Auburn Way, pose a barrier for pedestrians crossing the roadway.

Residential areas, such as southwest Lea Hill, were built under King County's jurisdiction and sidewalk construction was not required. Breaks in the sidewalk network require pedestrians to maneuver around parked cars, into private yards, or into the street. In newer neighborhoods such as Lakeland Hills,

sidewalks built to the city standards applicable at the time of their construction are provided on both sides of the street.

The Lea Hill and West Hill neighborhoods have a sporadic and often disconnected sidewalk system. Most newer residential developments have sidewalks, but many of the older residential areas and arterial streets are missing large segments of sidewalk, resulting in an inconsistent pedestrian environment.

The Auburn Valley is flat and conducive to cycling for a range of skill levels and has a good network of existing or planned north-south biking routes and trails. Areas along the Green and White Rivers provide opportunities for multi-use trails that accommodate bicyclists and pedestrians. The Interurban Trail is part of a major north-south regional trail system. The Green River trail is also an extension of a north-south regional trail. Conversely, there are few existing east-west connections between the West Hill and Lea Hill areas of Auburn which are more challenging due to steep topography. Many bicycle lanes existing throughout the City but often have gaps before forming a fully connected network or connection to transit and trails.

Planning and developing a strong active transportation network supports several state and national acts including Washington's GMA, CTR Act, the federal Clean Air Act, the ADA, and the Move Ahead for Progress in the 21st Century Act (MAP-21) and its successors. Supporting the active transportation system helps ensure compliance with these initiatives and the healthy community principles espoused by PSRC through Vision 2050. It also increases funding opportunities for City projects. Improving the active transportation system also helps address the findings of the citywide Health Impact Assessment, which recommended that the City improve sidewalk connectivity; improve the pedestrian environment; eliminate natural and man-made mobility barriers for pedestrian and bicyclists; improve transit access; and improve traffic safety, and pedestrian safety.

As a regional growth center, the City encourages transportation planning that emerges from a clear land use plan based on a community vision and the values expressed in Imagine Auburn. In this vision, Auburn supports higher density housing in the downtown; neighborhood commercial districts; and landscaped, pedestrian-oriented street and sidewalk design. This pattern of development reinforces a positive walking and biking environment.

Auburn's developing trail network provides local and regional connections for both recreational use and commuting. The regional trails that have been developed include the Interurban Trail and portions of the Green River and White River Trails. The Lakeland Hills Trail network provides connections to neighborhood parks, community center, and to the Sumner Link Trail via a tunnel under the BNSF railway. Map 2. 2024 Bike Route Network in Appendix A illustrates the existing and proposed trail network within the City.

Figure 7. Existing Bike Facility Statistics as of January 2024

TOTAL: 46.67 mi

In 2024, the City's existing bike facilities were mapped using aerial photography and field verification. All roads in the City of Auburn are considered Class III Bikeways. However, only bike facilities of Class III Bikeways with Pavement Markings level and higher were included in the inventory. The inventory is depicted in Map 3. 2024 Existing Bike Facilities in Appendix A and yielded the statistics shown in **Figure 7**.

A citywide sidewalk inventory was completed in 2022. This initial inventory collected the following information for city sidewalks:

- Location
- Surface type (concrete, asphalt, brick)
- Width
- Length
- Surface area

The inventory was collected prior to the development of the Pedestrian Level of Traffic Stress (LTS) standards and for many sidewalks, doesn't include all information needed to determine the Pedestrian LTS. An ongoing effort is underway to collect this additional information that will then be used to evaluate and document where existing sidewalks meet or don't meet pedestrian LOS standards.

The total length of City sidewalks inventoried in 2022 was **298 Miles**.

2.3.1. Active Transportation Level of Service Standards

The Plan policies establish active transportation LOS standards based on the LTS, shown in **Figure 8**. This approach is consistent with Washington State, Pierce County, and King County policies and standards. LTS describes how comfortable a pedestrian or bicycle route feels to its users based on a variety of variables including posted speed limit, traffic volumes, whether or not the roadway is a truck route, and the type of active transportation facility provided. Active transportation facilities in, or along, roadways with higher vehicle speeds and volumes generally have higher LTS scores because the vehicle traffic makes it less comfortable for bicyclists and pedestrians to use those facilities. Facilities that provide more separation between active transportation modes and adjacent roadway vehicular traffic and/or on lower speed roadways are more comfortable for bikes and pedestrians and therefore have a lower LTS. The City rates the LTS of its bicycle and pedestrian facilities on a scale of "1" to "4" with "1" being the most comfortable facilities and are the most likely to be used by people with a wide range of ages and abilities and "4" is the least comfortable and are likely to be used by only a select group of people and may present a barrier to the general walking and biking community.

2.3.2. Walking LOS Standards

The City's pedestrian network consists mostly of sidewalks and roadway shoulders. Trails and alleys also provide pedestrian connectivity in some areas. The City utilizes the Pedestrian Facility LTS Table shown in **Table 6** to identify the LTS scores for pedestrian facilities. The Plan policies establish an LTS of "2" as the minimum standard for new and upgraded pedestrian facilities. The Plan policies also establish that new and upgraded pedestrian facilities will meet current ADA requirements. The Plan policies support actions to identify, prioritize, and plan improvements to existing pedestrian facilities to meet current LTS standards and ADA requirements.

Figure 8. Level of Traffic Stress (LTS)

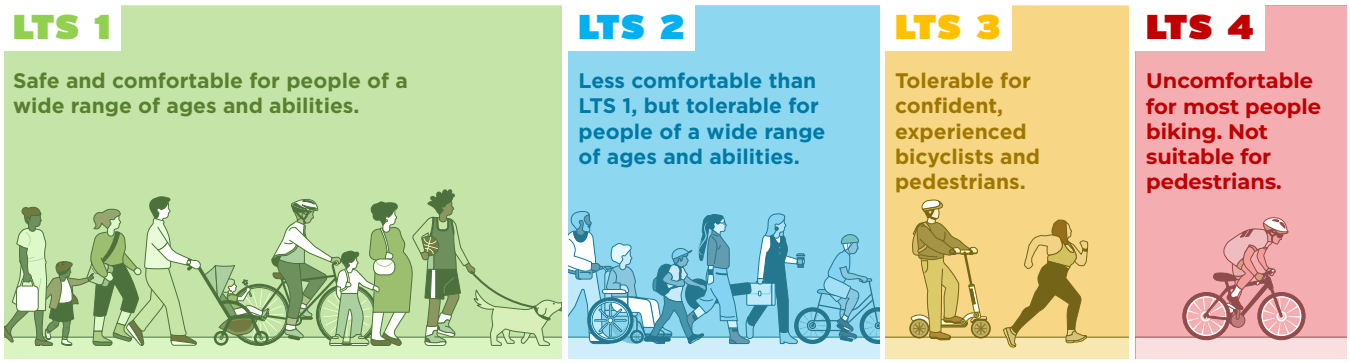


Table 6. Pedestrian Facility LTS Table

ROADWAY CLASS	NO SEPARATE PEDESTRIAN FACILITY	5' SHOULDER	5' SHOULDER WITH PHYSICAL BARRIER	5' SIDEWALK	5' SIDEWALK WITH 5' SEPARATION	10' SIDEWALK
Alley	2	1	1	1	1	1
Local Rustic	2	1	1	1	1	1
Rustic Collector	3	2	1	1	1	1
Local	3	3	2	2	1	1
Collector	4	3	2	2	1	1
Local Industrial	4	4	3	3	2	1
Minor Arterial	4	4	4	3	2	1
Principal Arterial	4	4	4	3	2	1

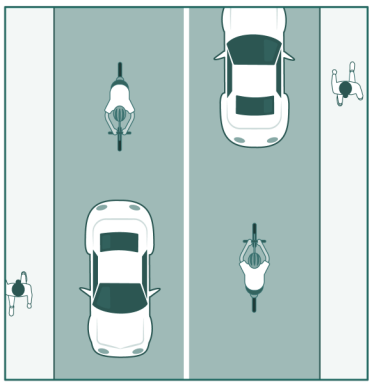
2.3.3. Biking LOS Standards

The planned and existing routes making up the City's bicycle transportation network have been classified as either Regional, Priority, or Auxiliary Routes and are shown on Map 2. 2024 Bike Route Network in Appendix A. These classified bicycle routes, both existing and planned, support general movement of cyclists throughout the City and have been identified to provide connectivity between neighborhoods and commercial areas to transit stops, regional trail connections, and the downtown urban center. Streets and trails not identified as Regional, Priority, or Auxiliary routes provide important connections between local destinations, recreational use, and access to the bicycle transportation network.

- **Regional routes** provide connectivity through the City to areas outside the City
- **Priority routes** provide connectivity from Auxiliary Routes to Regional Routes, frequent transit stops, and Auburn Station
- **Auxiliary routes** provide connectivity to Priority Routes from neighborhoods, commercial areas, schools, services, and non-frequent transit stops

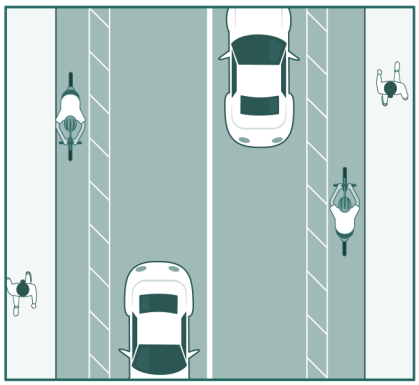
The Plan policies establish standards that require Regional Routes to have the lowest LTS of "1", Priority Routes to have a slightly higher LTS of "2" or less, and Auxiliary Routes to have an LTS of no more than "3". Bicycle facilities not identified as being Regional, Priority, or Auxiliary do not have assigned LTS standards d are designed in accordance with the standard roadway cross sections by street classification in the EDS.

The City utilizes the Bicycle Facility LTS Table shown in **Table 7** to identify the LTS scores for bicycle facilities. The table represents a simplified approach towards evaluating bicycle level of traffic stress. In some cases, factors not shown in the table may need to be considered and could necessitate the use of a more robust bike facility than is shown on the table to achieve the level of traffic stress standard. Standards for Class I, II, and III Bikeways are included in the EDS, shown in **Figure 9**.



The EDS will be periodically updated to reflect current and emerging approaches towards achieving LTS standards with differing treatments and approaches.

Although a bike network route is not identified on SR 164, this state route is subject to WSDOT complete streets requirements. Per these standards, SR 164 would require a minimum of a separated trail (Class I Bike Facility) to meet WSDOT level of traffic stress requirements. The City will look for opportunities to improve SR 164 to include these facilities where feasible with capital and development project improvements and in partnership with the Muckleshoot Indian Tribe.



2.3.4. Sidewalk Facility Gap Analysis

The inventory of existing sidewalks was used to identify gaps in the City's sidewalk network. Improvements to address gaps and to address safety, accessibility, and level of traffic stress deficiencies have been, or will be, identified and included projects in this plan or addressed with future projects and programs.

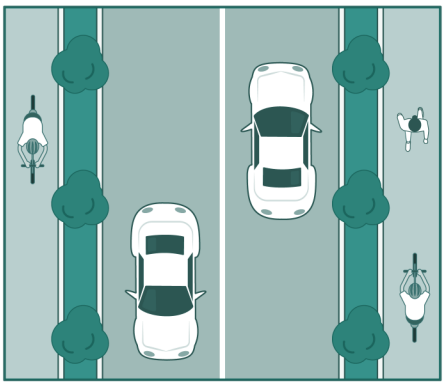


Figure 9. Bikeway Standards

Class III bikeways typically has the bicyclists and vehicles sharing travel lanes.

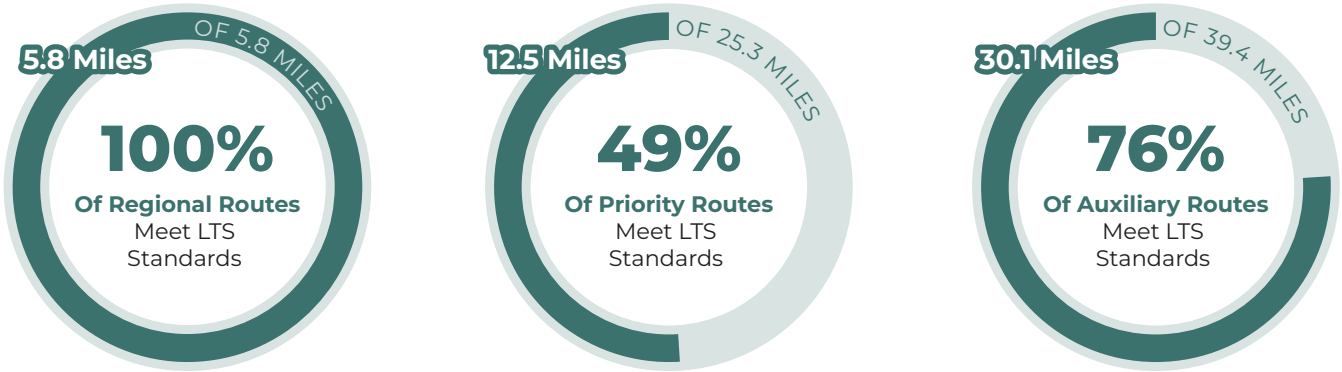
Class II bikeways are generally bicycle lanes in the roadway but separated from vehicular traffic.

Class I bikeways are bicycle facilities that are outside the roadway and are usually separated from roadway traffic by curbing, landscaping, buffer hardscaping, or physical barriers.

Table 7. Bicycle Facility LTS Table

POSTED SPEED LIMIT (MPH)	ARTERIAL TRAFFIC VOLUME/ FREIGHT CLASS	CLASS III BIKEWAY	CLASS III BIKEWAY W/ PAVEMENT MARKINGS	CLASS II BIKEWAY	CLASS II BIKEWAY W/BUFFER	CLASS I BIKEWAY
25/Not Posted	<3k	1	1	1	1	1
	3-7k	3	2	2	2	1
	≥7k	3	3	2	2	1
30	<15k	4	3	2	2	1
	≥15k	4	4	3	2	1
35	<25k	4	4	3	3	1
	≥25k	4	4	4	3	1
40+	Any Volume	4	4	4	4	1
Any	T-2* or Greater	4	4	4	4	1

2.3.5. Bike Facility Gap Analysis



The inventory of existing bike facilities was evaluated using the LTS Table to determine the LTS for existing facilities.

The existing bike facilities LTS data was compared to the Map 2. 2024 Bike Route Network in Appendix A of regional, priority, and auxiliary routes to identify gaps in the planned bike network and existing bike facilities that do not currently meet the LTS standards. The comparison yielded the following statistics shown in **Figure 10**.

Bike facilities not located on the City's bike network do not have an LTS standard and were therefore not assessed for a gap between the provided LTS and the LTS standard.

Completing gaps in the bike network and upgrading bike facilities to meet or exceed LTS standards in areas closer to transit services and where those transit services are more frequent and convenient (level of transit service "1" or "2", see Section 2.4.2. Transit LOS Standards) is more likely to encourage a mode shift from cars to bikes and transit. These projects would help relieve vehicle congestion and reduce needs for increased vehicle capacity and are therefore eligible to be funded with a per person trip transportation impact fee program. These projects are listed in Appendix B.

Figure 10. Bikeway Network Assessment Statistics as of January 2024

2.4. TRANSIT

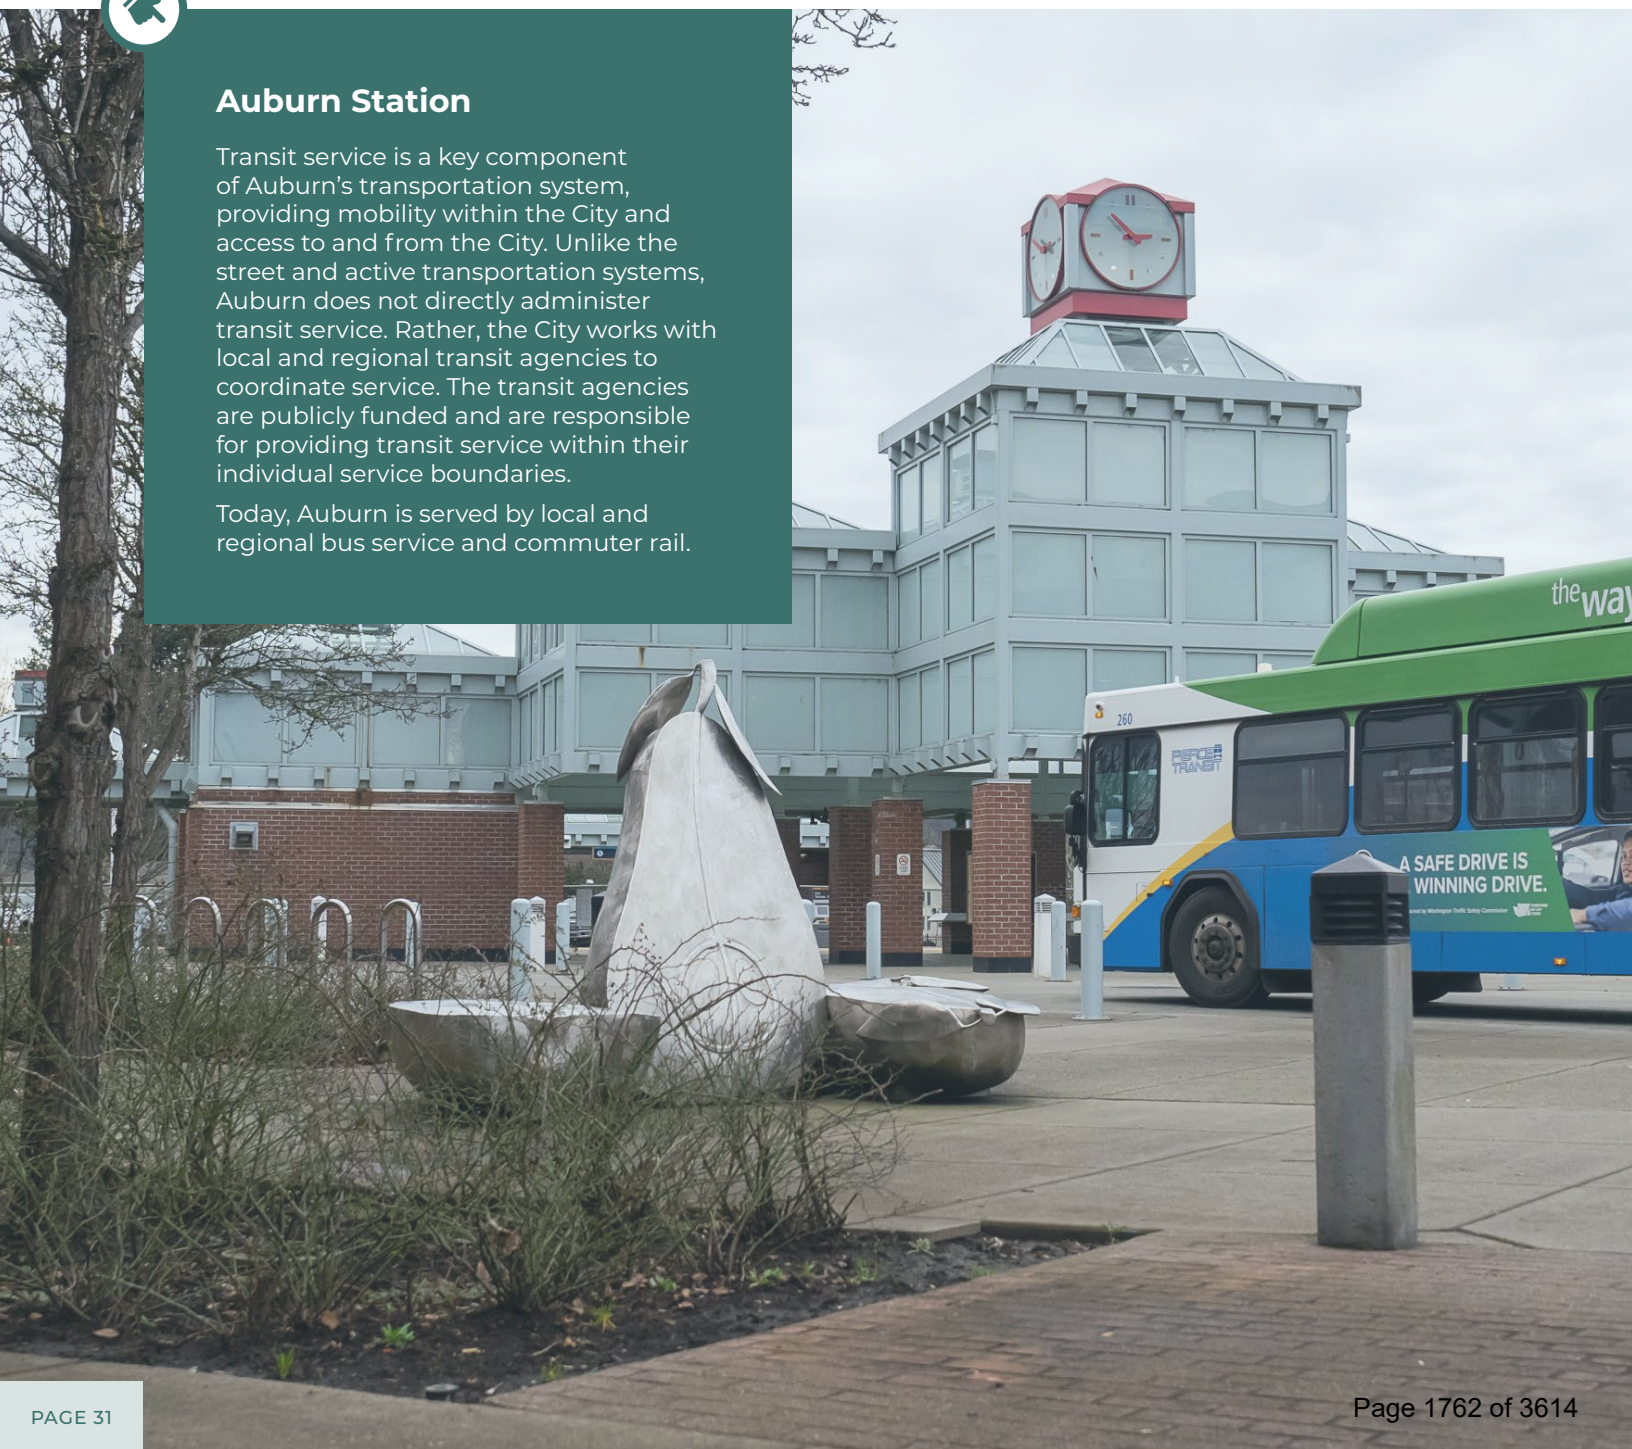
2.4.1. Existing Transit Services

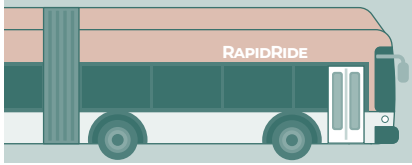
Figure 11 provides a brief summary of the public transportation services offered in Auburn. Existing transit service for the Auburn area is identified in Map 5. 2024 Transit Bus Routes/Stops in Appendix A. The service levels outlined in this section are for normal operations as of January 2024.

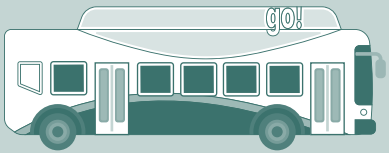
Auburn Station

Transit service is a key component of Auburn's transportation system, providing mobility within the City and access to and from the City. Unlike the street and active transportation systems, Auburn does not directly administer transit service. Rather, the City works with local and regional transit agencies to coordinate service. The transit agencies are publicly funded and are responsible for providing transit service within their individual service boundaries.

Today, Auburn is served by local and regional bus service and commuter rail.







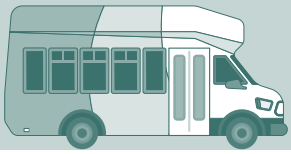


Figure 11. Types of Transit Services in Auburn

AUBURN STATION (MANY TRANSIT OPTIONS AVAILABLE)

- Sound Transit Sounder commuter rail service
- Sound Transit express bus service
- KC Metro frequent route service
- KC Metro and Muckleshoot Tribal Transit local route service
- KC Metro DART service
- Pierce Transit express route service

	Level of Service	Service/ Frequency	Distance Between Stops
Frequent Routes BRT – Bus Rapid Transit (RapidRide) 	**HIGHEST** service frequency/ hours	**< 15 MINS OR LESS** headways during service hours Minimum 4 buses/hour during peak times (currently route 160)	**STOPS EVERY 1/2 MILE**
Local Routes 	**MEDIUM** service frequency/ hours	**≤ 30 MINS** headways during peak hours **≤ 60 MINS** during service hours outside of peak hours (currently routes 181, 184, Muckleshoot Tribal Transit)	**STOPS EVERY 1/4 MILE**
DART & Express Routes 	**LIMITED** service frequency/ hours	**Service with few stops between destinations, intended to take riders quickly to the key destinations.** • Express routes are currently routes 497, 566, and 578 • Dial-A-Ride Transit Service (DART) routes are currently routes 915 and 917	**STOPS EVERY 1/4 MILE**

King County Metro Transit (KC Metro)

KC Metro offers a network of bus service in Auburn, connecting the city to the region. KC Metro adopted and implemented changes to its network in September 2020, via the Renton-Kent-Auburn Area Mobility Plan (RKAAMP), and some routes were affected. These changes were in part to accommodate the planned RapidRide I Line, which would replace a portion of Route 160, and provide frequent, reliable, and extended (early mornings to late night) service from Auburn Station, along the Auburn Way N corridor, connecting Auburn, Kent, and Renton transit stations.

Route 160 provides connection between Auburn Station, Kent Station, and the Renton Transit Center with very limited stops in between. It provides a maximum of 15-minute service during peak hours and 30-minute service during off-peak, and operates from 4 am to 3 am on weekdays and from 5 am to 3 am on weekends. This route will become the RapidRide I Line in 2026 and will provide service every 10 to 15 minutes.

Route 165 provides regional service between Kent, Auburn, and Green River College. It connects with Route 181 at Green River College. This route provides 20-minute service during peak hours and 30- to 60-minute service during off-peak, operating from 5 am to 12 am on weekdays and 6 am to 12am on weekends.

KC Metro provides frequent, local, and DART bus services linking destinations within the community and providing regional connections to the Auburn Station.

Route 181 provides daily service between the Twin Lakes Park-and-Ride, Federal Way Commons Mall, Federal Way Transit Center, the Outlet Collection, Auburn Station, and Green River College. It provides 15- to 30-minute service during peak hours and 30- to 60-minute service during off-peak, operating from 5 am to 11:30 pm on weekdays and 6:45 am to 11:30 pm on weekends.

Route 184 provides daily service from Auburn Station to south Auburn. It provides 20- to 30-minute service during the day, and 30- to 60-minute service during nights and weekends, and operates from 4:30 am to 1:30 am on weekdays and 5:30 am to 2 am on weekends.

Route 915 provides weekday and Saturday service between Auburn Station and Enumclaw via Auburn Way South. The route also includes a small portion of DART service with limited, variable routing in response to rider requests in downtown Enumclaw and the northern part of the Auburn Downtown Urban Center around the MultiCare Auburn Medical Center. This route provides 40- to 60-minute service, operating from 4:30 am to 7:45 pm, during weekdays, and 90-minute service, operating from 10 am to 6:30pm, on weekends.

Route 917 provides weekday and Saturday service between A St SE, 41st St SE, Algona, the Outlet Collection, and Auburn Station. The route offers DART service (limited variable route) in portions of Pacific. This route provides 25- to 40-minute service on weekdays, and 60-minute service on weekends. It operates from 5 am to 7 pm on weekdays and from 8:30 am to 5:45 pm on weekends.

Metro Flex

Metro Flex is an on-demand neighborhood ride share service, allowing transit users to ride anywhere within its service area at the same cost as a KC Metro bus trip. Metro Flex provides service in places that are not near frequent bus or rail service, helping to fill transit gaps in the areas that it serves. While Auburn is not currently within a Metro Flex service area, it is on the short list for expansion of the program.

ACCESS

ACCESS Transportation is a KC Metro paratransit service, providing door-to-door, shared-ride van transportation within most of King County. The ADA requires door-to-door paratransit service for persons whose disabilities prevent use of accessible fixed-route bus service.

Vanpool Services

KC Metro sponsors vanpool services that serve residents and employees in Auburn. Vanpool is a shared-ride service that provides group transport for commuters with proximate origins and destinations. Vanpool is a popular and flexible service that provides commuters with an alternative to driving alone and fixed-route transit service. Vanpool will continue to be an important strategy for mitigating peak period congestion throughout Auburn and the region.

Metro Transit Facilities

KC Metro owns and operates the Auburn 15th Street NW Park-and-Ride with approximately 150 surface parking stalls. KC Metro also operates into Auburn Station, which is managed by Sound Transit.

Pierce Transit

Route 497 is operated by Pierce Transit in partnership with the City of Auburn and KC Metro. It operates peak hour weekday service between Lakeland Hills and Auburn Station. As a morning and evening service meeting Sounder commuter rail schedule, Route 497 is a commuter-oriented route, but is open to all riders. Route 497 primarily serves Sounder passengers and significantly reduces the demand for commuter parking at the Auburn Station parking garage managed by Sound Transit.

Vanpool Services are provided by Pierce Transit similar to those offered by KC Metro.

Sound Transit

Sound Transit is the regional transit provider for the many parts of the Puget Sound region. It provides limited-stop transit services linking Auburn to major regional destinations in King and Pierce Counties. The agency offers Sounder commuter rail and regional express bus services in Auburn.

Sounder Commuter Rail

Sound Transit operates the Sounder commuter rail service on the Lakewood to Tacoma to Seattle route (S Line) via the BNSF Railway. The S Line provides weekday peak hour trips northbound to Seattle in the morning and southbound from Seattle to Tacoma to Lakewood in the afternoon. Limited reverse direction trips are also provided in each peak hour, as well as limited midday service. Some connections are available between S Line Sounder trains, which terminate in Seattle, and N Line Sounder trains from Everett to Seattle. Additional special event service to and from Seattle for Mariners, Seahawks, and Sounders games on some weekends.

Currently, nine trains operate northbound to Seattle in the morning peak, and ten trains return southbound during the evening peak. Three trains operate southbound to Tacoma/Lakewood in the morning and northbound to Seattle in the evening. There is currently one midday train running northbound to Seattle.

Due to shifts in ridership since the COVID-19 pandemic and changes in many commuters' work schedules, particularly the increase in telework, Sound Transit is re-examining the priorities from the 2020 Sounder South Strategic Plan. Prior to the pandemic, near capacity ridership growth was expected during peak periods, resulting in the plan prioritizing longer trains (from seven cars to ten cars) during the peak periods. However, since the pandemic, peak ridership has lowered, leading Sound Transit to consider prioritizing new trips, including more trips during off-peak hours, over longer trains.

Any new trips, however, will require approval from BNSF Railway, which owns most of the tracks the Sounder runs on.

As part of its re-examination of its priorities, Sound Transit conducted public engagement around the question of longer trains during peak hours versus more trips. The survey results showed that approximately 90% of respondents preferred adding new trips over longer trains. Sound Transit will use the feedback from its public engagement, along with other research, to inform Sound Transit Board discussions regarding its Sounder S-Line priorities.

Regional Express Bus Service

Route 566/567 offers daily weekday, limited-stop service between Auburn Station, Kent Station, Renton Transit Center, Bellevue Transit Center, and Overlake Transit Center. It provides 20- to 30-minute service northbound during the morning peak from 5:30 am to 11 am, and 20- to 30-minute service southbound during the evening peak from 1:40 pm to 8 pm.

Route 577/578 offers daily limited-stop service between Puyallup, Sumner, Auburn, Federal Way, and Seattle. Route 577 provides service between the Federal Way Transit Center and Seattle during the peak periods when the Sounder train is in operation. The 578 provides service between Puyallup and Seattle during the off-peak hours when train service is not currently provided. Route 578 provides 30- to 60-minute service on weekdays. On weekends, Route 578 provides hourly service.

Auburn Station

Sound Transit owns and operates Auburn Station located in downtown Auburn. This full-service multimodal facility provides parking for a total of 633 vehicles in a six-story parking garage and a surface parking lot. A new parking garage is expected to be available for transit users in 2027, offering an additional 525 parking stalls. A number of parking stalls are reserved for carpool/vanpool, and a number of stalls are reserved for paying single-occupant vehicles.

The facility currently handles approximately 470 daily bus trips. Approximately 3,000 passengers ride bus service to/from the station on a daily basis. Boardings at Auburn on the Sounder commuter rail are approximately 1,300 per day.

Muckleshoot Tribal Transit

MIT currently operates the Muckleshoot Tribal Transit (MTT) services that offers two publicly available transit routes. The Reservation Hot Lap provides local service between SE 384th Street and SE 416th Street with 30- to 60-minute service from 7 am to 8 pm on weekdays. The Reservation Route serves the SR 164 corridor generally between SE 416th Street, Downtown Auburn, and the Outlet Collection with 30-minute service from 5:30 am to 8:30 pm on weekdays, and 30-minute service from 10 am to 4:30 pm on Saturdays and holidays. MTT shares many stop locations with KC Metro and is a valuable resource to the community as the service is free to all passengers.

2.4.2. Transit LOS Standards

Different agencies take different approaches towards transit LOS standards. Unlike facilities and services for other transportation modes, the City of Auburn does not own or operate transit facilities and does not directly provide transit services. It follows that the City evaluates and utilizes transit LOS standards differently than transit service providers (KC Metro, Pierce Transit, Muckleshoot Indian Tribe, and Sound Transit). Agencies that provide transit service typically utilize transit LOS standards to identify deficiencies in transit services and plan for expanded or improved transit services and facilities.

The City of Auburn's approach utilizes transit LOS standards to identify and prioritize investments in other transportation modes that would best encourage people to use transit services instead of driving.

This approach utilizes transit LOS as a gauge to evaluate the likelihood that people would choose transit over driving. The variables used to evaluate transit LOS by the City are proximity to transit services and the type of transit services available to the area. People in areas that are within closer walking and biking distances to transit services are more likely to use those services and therefore those areas have a higher transit LOS than areas further from transit services. Similarly, people are more likely to use transit services that offer more frequent and connected services and therefore areas served by more frequent and connected services have a higher transit LOS than areas with less frequent, less connected services.

Using the transit LOS in **Table 8**, a transit LOS rating ranging from "1" to "4" can be assigned for any location in the City using a combination of the walking distance from the location to transit service and the type of transit service available. A transit LOS rating of "1" is the highest rating which indicates an area is within a comfortable walking or biking distance to the most frequent and convenient transit services (frequent transit and/or transit hubs like Auburn Station). A transit LOS rating of "4" is the lowest rating and indicates an area is not within a short walking or biking distance to even the most basic transit services.

Map 6. 2024 Level of Transit Service in Appendix A shows level of transit service ratings throughout the City. Transit LOS is estimated using the walkshed distance to current and near-term planned transit stops based on the existing street network and does not account for whether or not those streets have active transportation facilities that meet current LOS pedestrian and bike standards. The City utilizes transit LOS to help prioritize investments in active transportation facilities intended to reduce the transportation system's need for vehicular capacity. Placing a new sidewalk, bike lane, or trail in a location with a transit LOS of "1" is more likely to encourage mode shift from vehicle to transit than placing the new facility in a location with a transit LOS of "4". Additionally, mitigation of potential vehicular LOS impacts caused by development is more likely realized with active transportation improvements in areas with higher transit LOS ratings. Map 6. 2024 Level of Transit Service in Appendix A is also used by the City in its coordination efforts with transit agencies to help identify service needs and gaps. It is the City's intention to improve overall transit LOS in the City by coordinating with transit agencies to encourage and support improved services, planning growth in the City near areas served by transit, and prioritizing investments in active transportation facilities that provide connectivity to transit services.

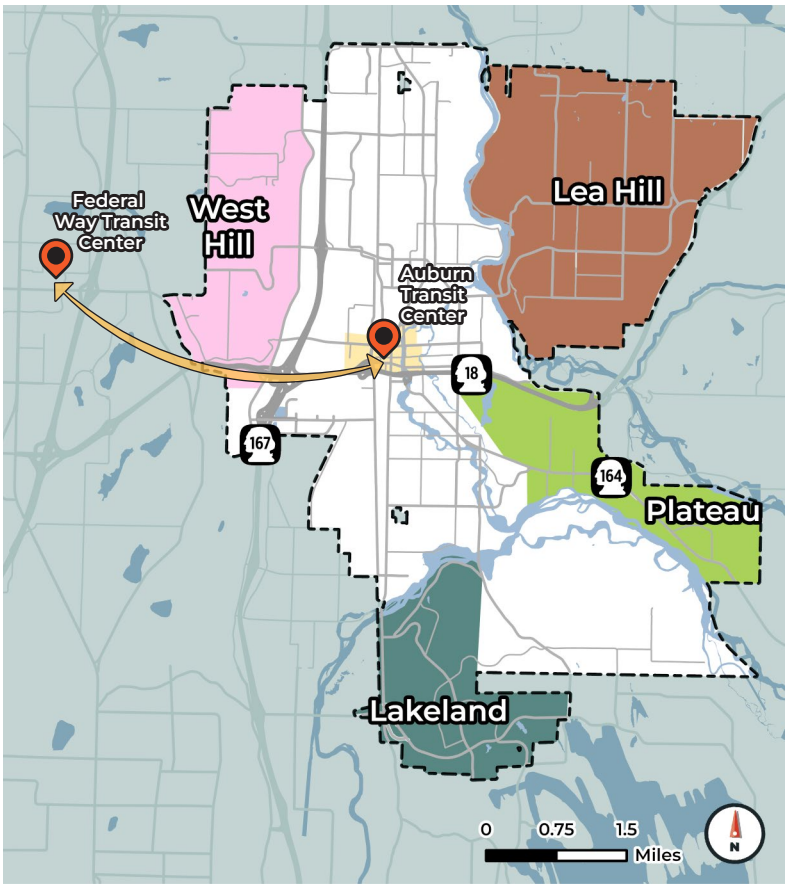

Table 8. Transit LOS Table

TYPE OF TRANSIT SERVICE	>1 MILE WALKSHED	1 MILE WALKSHED	¾ MILE WALKSHED	½ MILE WALKSHED	¼ MILE WALKSHED
Auburn Station	4	3	2	1	1
Frequent	4	3	2	1	1
Local	4	4	3	2	2
Express and Dart	4	4	4	3	2

2.4.3. Transit Needs and Gaps

The City serves as a community voice and advocate to transit providers to maintain and expand transit services to meet community needs. However, the City is not in full control of these services, therefore, the City's approach towards addressing transit level of service issues in order to improve that level of service where the City has control is to focus on providing access to existing and planned transit services. Those efforts are centered on improving sidewalk and bicycle facilities to provide connections to transit services and are described in the active transportation sections of this plan. This section summarizes the gaps and needs in the existing transit services in Auburn and provides recommendations on how those gaps and needs may be filled. The City will continue to communicate and coordinate with transit agencies to advocate for these needs.

Figure 12. Auburn Neighborhoods with Transit Needs and Gaps

West Hill

The West Hill of Auburn is generally the area bound on the west by 56th Ave S, Peasley Canyon Rd, 51st Ave S and 46th Place S (City limits), on the east by West Valley Highway, on the south by the S 348th St alignment (City limits), and on the north by the S 284th St alignment (the City limits approximately ½ mile south of S 277th St). Auburn's West Hill is not directly served by any transit services making its 7,500 residents the least transit served people in Auburn. Auburn's West Hill is also unique in that it sits between the Auburn Station and the Federal Way Transit Center. This presents an opportunity to provide transit connections from West Hill to the Federal Way Transit Center, Auburn Station, or both. These connections could come in the form of new routes or by modifying existing routes. KC Metro Route 183 could be modified to expand into portions of the West Hill to provide connection to the Federal Way Transit Center. KC Metro Route 181 could be modified to pass through a portion of West Hill to provide access to both the Federal Way Transit Center and Auburn Station. Another recommended solution would be to provide Metro Flex services to the West Hill and other parts of Auburn that lack transit services.

Connection Between Auburn Station and Federal Way Transit Center

With the Link Light Rail expanding south to Federal Way with an expected opening in 2026, there is an opportunity and need to improve Auburn's overall access to regional transit systems by providing frequent and efficient transit services between the Federal Way Link Station and Auburn Station. When the Link Light Rail is complete to the Federal Way Transit Center, the demand for this route is likely to increase significantly. The City of Auburn strongly supports and advocates for the expansion to frequent services and/or conversion of the existing Route 181 to a RapidRide line to enhance the connection between Auburn Station and the Federal Way Transit Center.

Lea Hill

The Lea Hill area of Auburn is bound on the west and south by the Green River, on the east by SR 18, and on the north by the City limits along S 282nd St and S 288th St. Lea Hill, a predominantly residential community, has two transit routes that predominantly serve Green River College, leaving a large portion of the residents unable to walk or bike to a transit route. In 2014, a license plate survey of the Auburn Station garage indicated that a substantial

number of Lea Hill residents utilize transit service at Auburn Station. This suggests that a commuter-oriented shuttle serving Lea Hill, similar to the Route 497 shuttle implemented in Lakeland Hills, could be successful. Another recommended solution would be to provide Metro Flex services to the Lea Hill and other parts of Auburn that lack transit services.

Plateau

The area along Auburn Way South (SR 164) between Riverwalk Drive, east to the City limits is referred to as the Plateau and is currently served by KC Metro Route 915 and Muckleshoot Tribal Transit. With both of these routes running, headway time ranges from 30 to 60 minutes. The City will continue to encourage partnership between KC Metro and Muckleshoot Tribal Transit to improve transit services to/from the

Other Transit Needs and Suggested Improvements

Residential areas of east Auburn, east of M St NE and south of 8th St NE, and parts of northeast Auburn, east of I St NE, are located more than 1/4 mile from fixed-route bus service. It is difficult for these areas to access transit, both for local and regional trips.

The design of KC Metro's local bus routes in Auburn should be reviewed in relation to future changes in Sound Transit's Sounder commuter rail and regional express bus services to identify opportunities and priorities for productive improvements to transit coverage, frequency, and hours of operation.

To maximize the investment in public transit service in Auburn, it is recommended that both Sound Transit and KC Metro conduct an evaluation of their schedules with a focus on improving service to major employers in the Auburn area.

Sounder Commuter Rail operates bi-directionally in the peak periods. Most of the trips are operated in the peak direction: northbound during the weekday AM peak and southbound during the weekday PM peak. No midday, evening, or weekend regular service is currently provided, except for the special events times. These services are needed, as is additional capacity on some of the currently most popular runs. The City encourages Sound Transit to institute midday Sounder service to and from Tacoma/Lakewood and Seattle, and plan for evening and weekend service in the near future.

The City will continue to work with Sound Transit as it designs and builds the second parking garage for the Auburn Station.

The City will utilize the CTR commuter surveys and employer program reports and continue to develop partnerships with CTR businesses to better understand the transit needs and gaps with the major employers in Auburn.

The City will continue to work with transit providers to ensure that transit stops are clean, secure, and meet safety requirements.

Auburn encourages Amtrak to consider implementing more intercity rail stations in the high density and traffic congested areas of Puget Sound, such as at Auburn Station. A new Auburn stop would have great ridership benefits since it is at a station with available overnight parking and is in close proximity to hundreds of thousands of potential new customers.

plateau to shorten headways along Auburn Way South. Another recommended solution would be to provide Metro Flex services to the Plateau and other parts of Auburn that lack transit services.

Lakeland Hills

Lakeland Hills, a planned residential community with approximately 3,800 homes, has peak-hour service to downtown Auburn, but lacks all-day service. The City of will continue to work with Pierce Transit, KC Metro, and Sound Transit to preserve Route 497 and add service to the route to meet all existing and future Sounder trains. In its Destination 2040 Long Range Plan, Pierce Transit lists an unfunded project that would expand Route 497 to become Route 498 that would run between Auburn and Fife. The City will continue to coordinate with Pierce Transit when, or if, this route expansion project starts to move forward. Another recommended solution would be to provide Metro Flex services and/or Pierce Transit Runner services to Lakeland Hills.

Additionally, during the public outreach efforts for development of this Plan, the City heard a suggestion from multiple people to expand KC Metro Route 184 into Lakeland to replace or augment Route 497. The City will discuss and potentially advocate for this, or similar concepts, with KC Metro and Pierce Transit.

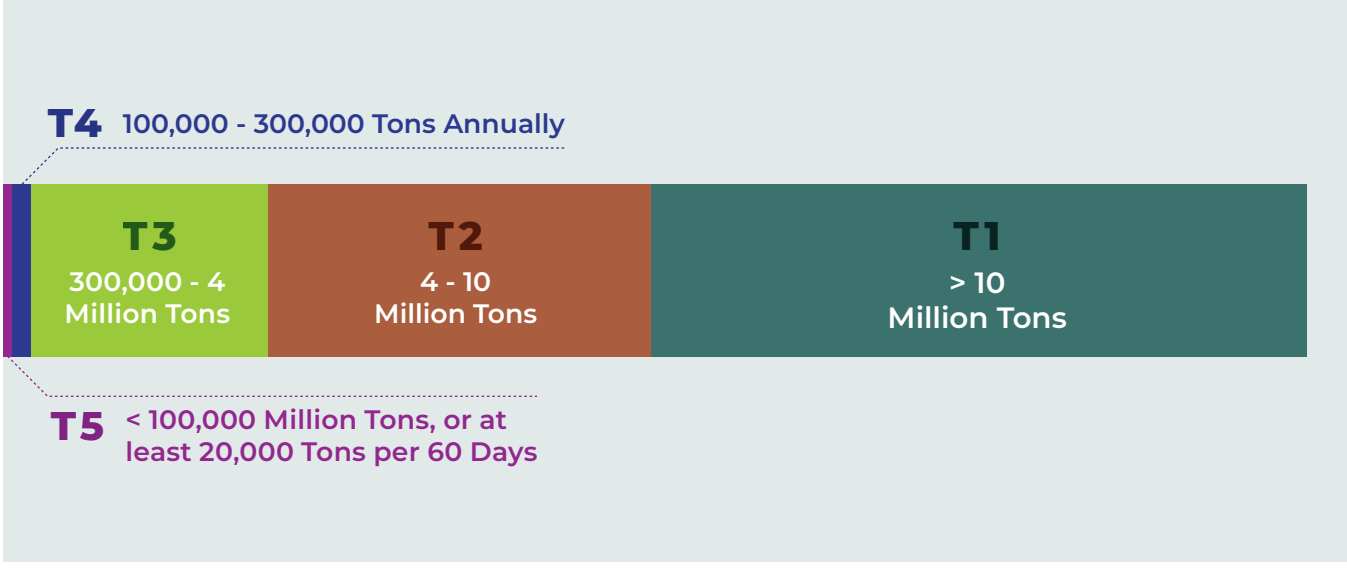
2.5. FREIGHT

The efficient movement of freight, through and within the City, is critical to local and regional economic stability. Both rail and truck freight, originating largely in the Ports of Tacoma and Seattle, pass through Auburn regularly.

Within Auburn, freight, or the movement of goods, occurs mostly with trucks on state routes and City streets or on railroad facilities. These facilities benefit the City as they provide regional connectivity and access. The state routes present challenges as they create barriers to other roadways and active transportation facilities. Multiple railroad corridors pass through Auburn and provide regional benefit as they provide freight movement and, in the case of the BNSF Railway north-south corridor, also local benefit as it provides commuter rail line service. However, like the state routes, in many areas throughout the valley area of the City, the railroads obstruct neighborhood access and transportation network connectivity. A strength of the railroad network is that 11 of the 21 mainline rail crossings of City trails and roadways are grade separated. All non-grade separated mainline rail crossings have gates and warning lights. An opportunity to greatly improve neighborhood access and overall transportation network connectivity exists in working to create more grade separated crossings for active transportation modes. A significant amount of freight also moves throughout the City on City streets. Based on actual truck usage data, there are currently 49 centerline miles of T-1, T-2, and T-3 truck routes in Auburn.

2.5.1. **Truck**

The City has designated truck routes for through freight movement in an effort to maximize the efficiency of and protect the roadway infrastructure. Current City of Auburn truck routes are shown in Map 10. 2024 Freight Network in Appendix A. Truck routes, established by City ordinance, are designated for roadways that incorporate special design considerations such as street grades, continuity, turning radii, street and lane widths, pavement strength, and overhead obstruction heights.



In addition, the Washington State Freight and Goods Transportation System (FGTS) is used to classify roadways, freight railroads, and waterways according to the annual freight tonnage they carry as directed by RCW 47.05.021. Map 10. 2024 Freight Network in Appendix A shows the 2023 classifications of City streets. The FGTS is primarily used to establish funding eligibility for Freight Mobility Strategic Investment Board (FMSIB) grants, fulfill federal reporting requirements, support transportation planning process, and plan for pavement needs and upgrades. The FGTS classifies roadways using the categories shown in **Figure 13**.

Truck freight tonnage values are derived from actual or estimated truck traffic counts and converted into average weights by truck type.

The City expects that the majority of regional truck trips will take place on state highways. However, recognizing that trips through the City are sometimes necessary, Auburn has designated a network of north-south and east-west corridors as truck routes, which are built to truck standards. In addition, the City has designated future truck routes, which will be designed and constructed to accommodate truck traffic, as opportunities arise. FMSIB has expressed an interest in these first and last mile connectors which provide access between these classified freight facilities and port, rail yard, distribution centers, and truck terminals.

Auburn has significant industrial and commercial development throughout the City. The City encourages local delivery trucks to use the designated truck network as much as possible, but recognizes that trips on non-truck routes are necessary. The City is committed to supporting local industry and recognizes that the ability to ship and receive freight is essential to the success of many businesses. To implement this policy, the City will collaborate with local businesses to improve freight access, while maintaining the roadway infrastructure whenever possible. This may include adopting City Code and updating the Auburn Engineering Design and Construction Standards in a manner that favors these priorities. However, in a limited number of key locations, trucks may be prohibited due to existing design elements which do not support trucks, protecting sensitive areas such as downtown and residential neighborhoods, and to extend pavement life.

Figure 13. FGTS Truck Route Classification

2.5.2. **Rail**

The Union Pacific Railroad (UP) and Burlington Northern Santa Fe Railway (BNSF) have rail lines running through Auburn. The UP line runs north-south, to the east of the Interurban Trail. BNSF has a triple-track, federally designated, high-speed railroad line running north-south. The BNSF Stampede Pass line runs east-west through downtown Auburn, entering Auburn at the east end of town near Auburn-Black Diamond Road, and merges with the north-south line just south of Auburn Station.

In addition, BNSF operates a rail yard between A Street SE and C Street SW, south of SR 18. In the future, this area may develop as a multimodal rail yard, prompting the need to mitigate increased truck traffic through capacity improvements. BNSF also has plans to increase traffic on the Stampede Pass line, the east-west rail line running through Auburn. To accommodate this increase, the City completed the grade separation of M Street SE. Both the BNSF north-south line and the Stampede Pass line are handling an increase in rail freight traffic. BNSF handles a number of unit (solid) coal trains traveling to terminals in northwest Washington state, as well as unit oil trains carrying crude oil to northwest Washington state refineries. While loaded coal and oil trains are usually handled on the north-south line, some of these empty trains return east to Wyoming or North Dakota via the Stampede Pass line.

At-grade railroad crossings create conflict points between vehicles and active transportation road users and rail traffic. Auburn has several at-grade railroad crossings: the Union Pacific tracks cross 44th St NW, 37th Street NW, 29th Street NW, West Main Street, and 15th Street SW. The BNSF tracks cross 37th Street NW, 29th Street NW, 3rd Street NW, W Main Street, and Auburn-Black Diamond Road. There are also at-grade crossings of spur tracks at various locations throughout the City.

With as many as 75 trains passing through the City each day, the City has many at-grade crossings, each with unique safety implications. The City coordinates with railroad operators and the State to upgrade the crossings whenever possible. For instance, the project to grade separate M Street SE at the BNSF Stampede Pass tracks by lowering M Street SE under the railroad overpass was completed during 2013.

Upgrades include the construction of a pre-signal where 37th Street NW crosses the BNSF tracks, to stop westbound vehicles on 37th Street NW to the west of the grade crossing in advance of the traffic signal at B Street NE. The pre-signal will prevent vehicles from stopping on the crossing.

BNSF recently constructed a third rail mainline between Seattle and Auburn to improve service and reliability for passenger rail. The new mainline is located on the west-side of the existing tracks. The third mainline reduces vehicle storage for westbound vehicles on W Main Street and 3rd Street NW

between the tracks and traffic signals with C Street NW.

Vehicle delays and queuing at the remaining at-grade crossings are anticipated to worsen in the future due to increased vehicle demands at the crossings, combined with increased rail and longer trains, resulting in more frequent, and longer duration, closures.

2.5.3. Freight LOS Standards

Within Auburn, freight, or the movement of goods, occurs mostly with trucks on state routes and City streets or on railroad facilities. The City of Auburn's freight LOS standards focus on elements of the freight network that the City owns, operates, or has regulatory authority to control such as City streets and intersections. The standards are intended to provide a network of roadways to carry freight traffic to/from freight oriented land use within the City to/from state highways and other regional truck routes. The standards are also intended to facilitate local deliveries using truck routes in the City. Unlike other LOS standards, freight LOS standards do not apply to all City streets. Instead, the standards are applied to truck routes in the City as designated in the Plan policies and shown on Map 10. 2024 Freight Network in Appendix A. Generally, truck routes include T-1, T-2, or T-3 routes, except as designated otherwise by the City Code or as posted by the City Engineer. In addition, the City recognizes local industrial roads, which are other key connections between truck routes and industrial properties. The freight LOS standards are established in the Plan policies and are summarized in **Table 9**.

Table 9. Freight LOS Standards

	LOS STANDARD
1	Freight LOS standards for intersection delay and queuing on truck routes match vehicle LOS standards.
2	Intersections of truck routes shall be designed to accommodate turning trucks such that the trucks do not interfere or obstruct with other travel modes or cause damage to adjacent property and facilities.
3	Roadway pavement on truck routes shall be designed with a minimum 20-year service life with truck loading.
4	Driveways serving trucks and lane widths on the adjacent truck routes shall be designed such that trucks accessing the driveways do not enter into opposing roadway or driveway lanes. Driveways with excessive width may be required to provide mitigation treatments for bicyclists and pedestrians crossing the driveway.
5	Truck oriented land-uses shall provide on-site parking area for truck loading and unloading and shall accommodate truck access and on-site turn-around. Development anticipating regular truck deliveries or services shall provide a delivery plan that identifies the trucks size, frequency, and delivery or service duration and demonstrates how, when, and where the trucks will make deliveries or services without causing impacts to vehicles, bicycles, and pedestrians in the roadway corridor.

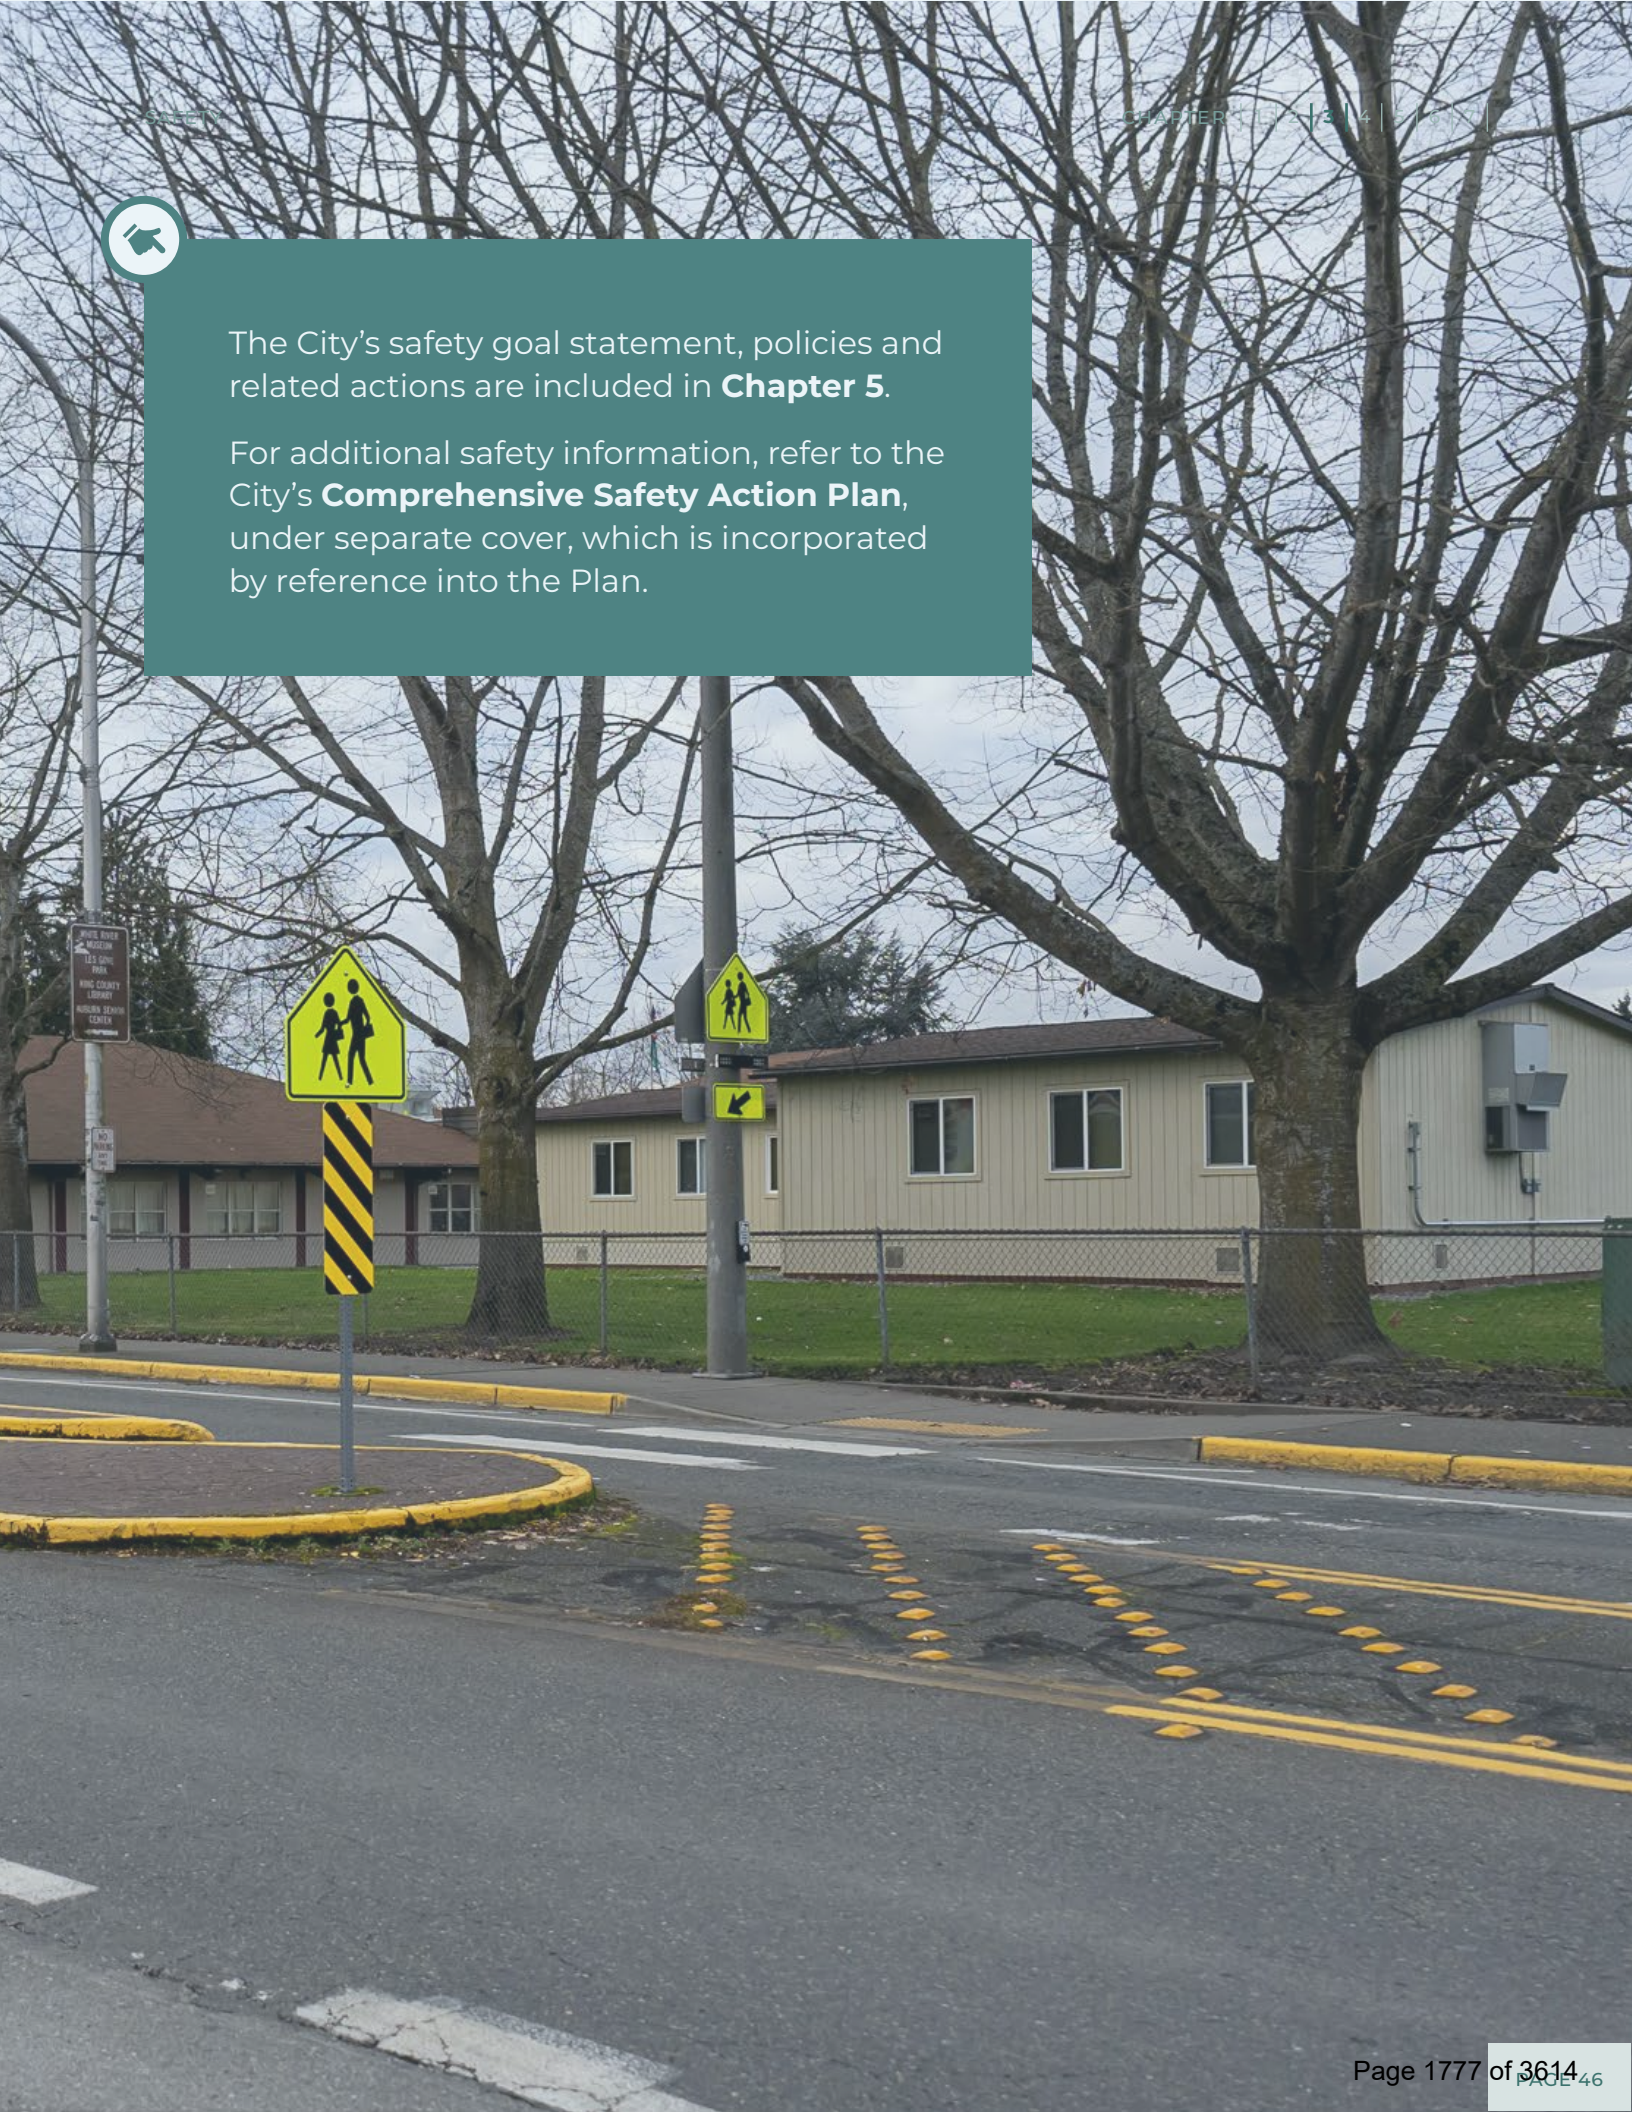
2.6. AIRPORT

The Auburn Municipal Airport was founded in 1969. It is a division within the Public Works Department, is operated by three full-time City staff and is supported by other City of Auburn departments. The Airport is guided by seven volunteers on the Airport Advisory Board who advise the City Council regarding operations, master planning, facilities improvements, leasing, rental fees, and other aviation concerns. The airport is comprised of 113 acres. This includes 1,330,436 total square feet of pavement which is maintained by staff. The Airport has 254 hangar units (145 are City-owned), and 140 tie downs. In 2021, the City undertook an update to the City's Zoning regulations to address the need to discourage incompatible uses near the airport. The revised Auburn City Code Chapter 18.39, LF Airport Landing Field District, Overlay, and FAR Part 77 Surfaces, provides zone regulations specific to development near the airport that include restrictions, performance standards and requirements of development within the overlay areas Airport planning is specifically addressed in a separate document, Auburn Municipal Airport – Airport Master Plan.

Auburn Municipal Airport – Airport Master Plan

CHAPTER 3

Safety



IN THIS CHAPTER

Where to Find Additional Safety Information

The City's safety goal statement, policies and related actions are included in **Chapter 5**.

For additional safety information, refer to the City's **Comprehensive Safety Action Plan**, under separate cover, which is incorporated by reference into the Plan.

CHAPTER 4

Policies

IN THIS CHAPTER

Goals, Policies and Actions

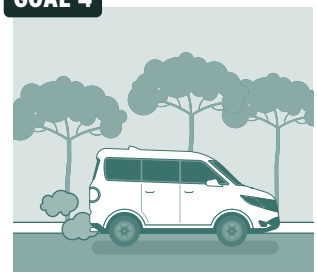
Transportation goals, policies, and actions establish the framework for realizing the City's vision of its transportation system. Policies provide guidance for the City, other governmental entities, and private developers, enabling the City to achieve its goals in accordance with the Plan. The policy framework presented in this chapter is a guideline, which the City will use to evaluate individual projects, programs, actions, and other actions to address its infrastructure needs. The goals, policies, and actions make reference to the City of Auburn Engineering Design Standards (EDS) that provide specific guidelines and standards for design of the City's transportation system.

4.1. GOALS

GOAL 1

Planning: Plan, expand, and improve the transportation system.

GOAL 2



Equity: Plan and implement the City's transportation system to support system wide equity.

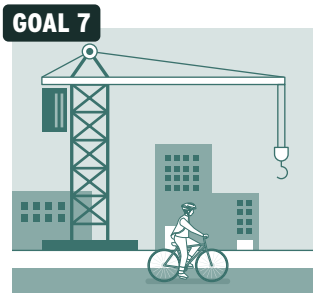
GOAL 3

Safety: Significantly reduce or eliminate traffic fatalities and serious injuries through a safe systems approach.

GOAL 4

Environmental: Comply with environmental laws and regulations.

GOAL 5

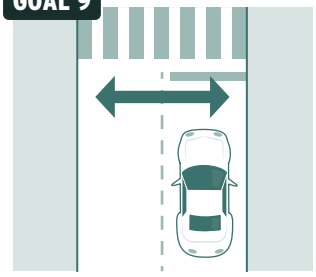


Multimodal Accessible Network: Ensure Auburn's transportation system is designed to be comprehensive, integrated, accessible for all.

GOAL 6

Multimodal Level of Service: Establish multimodal level of service (MMLOS) for all City streets, active transportation facilities, and access to transit.

GOAL 7

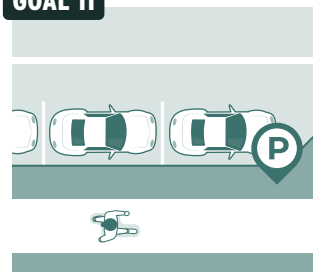


Multimodal Concurrency: Ensure transportation systems and facilities are adequate to serve development.

GOAL 8

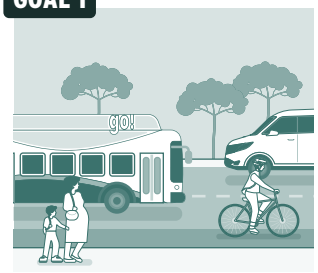
Demand & System Management: Transportation Demand Management (TDM) and Transportation System Management (TSM) strategies.

GOAL 9



Right-of-Way: Retain and preserve existing Right-of-Way (ROW) and identify and acquire new ROW as needed.

GOAL 10



Asset Management: Design, construct, preserve, and maintain the City's transportation system in the most cost-effective manner.

GOAL 11

Parking: Ensure a balance between on-street and off-street parking.

GOAL 1

Planning

Plan, expand, and improve the transportation system in cooperation and coordination with adjacent and regional jurisdictions to ensure concurrency compliance with the Growth Management Act, and to improve the safety and efficiency of the multimodal system to meet the community needs, facilitate the land use plan, and reduce vehicle miles traveled and greenhouse gas emissions.

Planning Policies

The City's long range planning tool for its transportation systems shall be the Comprehensive Transportation Plan that will comply with State Law (RCW 36.70A.070).

TR1-1. The City's short range (6-year) planning tool for transportation system capital projects and programs, shall be the Transportation Improvement Program (TIP) that will comply with State Law (RCW 35.770.010).

TR1-2. The TIP shall be financially constrained to align planned project and programs expenditures with anticipated available funding.

TR1-3. The City shall identify transportation facilities or services that are below established multimodal level of service standards and develop projects and programs and engage in coordination activities that support improving those facilities or services to meet level of service standards.

TR1-4. City transportation planning will focus system improvements to connect centers and support existing and planned development as allocated by the Regional Growth Strategy.

SUPPORTING ACTIONS

- Evaluate and amend the Comprehensive Transportation Plan regularly to ensure it is technically accurate, consistent with state, regional, and other local plans, and in keeping with the City's vision of the future transportation system.
- Prepare a 5-year Comprehensive Transportation Plan intermediate progress report in 2029.
- Prepare a periodic update to the Comprehensive Transportation Plan to be adopted by Council in 2034 or date required by the State, whichever is earlier.
- Coordinate transportation planning and improvements with other transportation authorities and governmental entities (cities, counties, tribes, state, federal) to address transportation issues and to ensure that Auburn and its adjacent jurisdictions do not unreasonably preclude each other from implementing their planned improvements.
- Prepare, amend, and update a 6-year Transportation Improvement Program that is reviewed and adopted by the City Council in accordance with RCW 35.77.010. The TIP will include the following elements:
  - *Proposed road and bridge construction work and other transportation facilities and programs deemed appropriate.*
  - *Any new or enhanced bicycle or pedestrian facilities identified pursuant other applicable changes that promote nonmotorized transit.*
  - *Identify projects of regional significance for inclusion in the regional TIP.*
  - *Revise the TIP before July 1st of each year to encompass the ensuing six calendar years to update the included projects, programs, and associated funding to reflect transportation system priorities and available funding.*
- Coordinate transportation improvements with City utilities to provide efficiency and cost-effective solutions for both planned transportation improvements and planned utility improvements.
- Identify and fund capital projects and programs that address existing and emerging system needs to meet MMLOS standards and to support safety goals.

GOAL 2

Equity

Plan and implement the City's transportation system to support system wide equity.

Equity Policies

TR2-1. Transportation system improvements shall be planned such that they minimize and mitigate potential impacts, as well as past impacts, to historically under-represented and under-served communities.

TR2-2. The transportation system will be planned, built, and operated to provide equitable levels of access to transportation systems based on the needs of the populations being served, particularly populations that are traditionally underserved.

TR2-3. Encourage the involvement of residents, business and property owners in the planning process, including the participation of vulnerable populations and overburdened communities, and ensure coordination with other agencies to reconcile conflicts.

TR2-4. In the development of projects, the city shall identify opportunities to remove barriers created by past transportation programs or improvements.

SUPPORTING ACTIONS

- Develop and implement a process during project/program planning to review demographic information and identify potential impacts to historically under-represented and under-served communities and identify potential mitigation measures.
- Develop and implement equity tools to assist in transportation system planning, construction, and operations.
- For the communities adjacent to the project locations, or served by the projects and programs, research how to best engage with them, and develop outreach and information tools.

GOAL 3

Safety

Significantly reduce or eliminate traffic fatalities and serious injuries through a safe systems approach.

Safety Policies (General)

TR3-1-1. The City shall apply the Safe System Approach for pursuing its transportation safety goal through the different elements associated with the safety of the City's transportation system which the City has the ability to influence including: roadways, roadway users, speeds, vehicles, and post crash care.

TR3-1-2. The City shall study, plan, and implement safety improvements prioritized by the occurrence of fatal and serious injury crashes and/or the presence of systemic characteristics indicative of serious or fatal crash risk.

TR3-1-3. The City will seek internal and external funding to both implement safety strategies and on-going maintenance of improvements.

SUPPORTING ACTIONS (GENERAL)

- Implement, maintain, and regularly update the Local Road Safety Plan (LRSP) and Comprehensive Safety Action Plan (CSAP).
- The LRSP/CSAP will include documentation of the progress towards actions and performance metrics identified in the plans.
- Establish a transportation program in the Transportation Improvement Plan and funding that provides for safety data collection, study, planning, and implementation.
- Identify, evaluate, and pursue grant funding and other outside funding sources for safety programs and improvements.

What is the Safe Systems Approach?

Founded on the belief that death and serious injuries on city streets are preventable, the Safe System Approach considers how the transportation system as a whole can be improved to avoid serious and fatal crashes. It is organized into five categories: Safe Roads, Safe Speeds, Safe Vehicles, Safe Road Users, and Post Crash Care.

To learn more, please visit
highways.dot.gov/safety/zero-deaths

Source: Federal Highway Administration (https://highways.dot.gov/safety/zero-deaths)

Safety Policies (Roadways)

TR3-2-1. The City will integrate the Safe System Approach into roadway design standards and related policies, and project development processes and be consistent with industry best practice.

TR3-2-2. Roadway design shall consider safety and multi-modal level of service standards to meet both transportation level of service goals and safety goals to the greatest extent feasible. However, safety of active transportation users shall be prioritized over vehicle level of service standards.

TR3-2-3. In making changes to existing roadways, including horizontal or vertical re-alignment, re-channelization, additional lanes, new or modified intersections, and new or modified driveways, design speeds for safety related design elements shall not be less than the 85th percentile speeds of existing vehicle traffic except where roadway changes include traffic calming measures that will reduce vehicle speeds.

TR3-2-4. The City shall fund and implement the neighborhood traffic safety program that will take a pro-active, area wide approach towards traffic calming through studying streets in residential areas to identify safety concerns. The program will identify and implement physical measures per the EDS and as funding allows address identified concerns.

TR3-2-5. Safety countermeasures will be incorporated into roadways as recommended by the Federal Highway Administration and as appropriate to City roadways as funding allows to potentially reduce roadway fatalities and serious injuries.

SUPPORTING ACTIONS (ROADWAYS)

- Periodically review and update City EDS to integrate current and emerging Safe System Approaches and safety countermeasures.
- In identifying projects for inclusion in the Plan and TIP, develop and implement approaches to consider all travel modes and to specifically address risk factors identified in the CSAP in the project scope.
- At locations with a high number of risk factors identified in the CSAP, identify potential safety countermeasures to reduce the potential for fatality and serious injury crashes. Seek funding to implement countermeasures and implement as funding is available.
- Establish standards for physical improvements implemented with the neighborhood traffic calming program, including, but not limited to, speed cushions, traffic circles, raised crosswalks, and tabletop intersections.

Safety Policies (Road Users)

TR3-3-1. Seek and utilize opportunities to provide the community with information to educate and encourage safe driving, biking, and walking practices.

TR3-3-2. Implement and operate, as appropriate and funding allows, systems to provide information to roadway users that could help improve safety.

SUPPORTING ACTIONS (ROAD USERS)

- Establish and implement approaches towards education, outreach, and other measures as appropriate to encourage safe behaviors.
- Regularly communicate rules of the road and other safer travel strategies to the general public via various mediums such as signage, social media, public service announcements, flyers, articles, and mailers.

(Continued on next page)

Safety Policies (Road Users)

TR3-3-3. City employees are responsible for operating City vehicles responsibly and safely, according to all state and local laws and City administrative policies.

TR3-3-4. Support equitable, unbiased enforcement to enhance overall public safety.

SUPPORTING ACTIONS (ROAD USERS)

- Coordinate with appropriate partners such as local, county, and state law enforcement, local and regional hospitals, school districts, and large employers to create and distribute safety messages and materials.
- Regularly coordinate with law enforcement regarding the road user behaviors and/or street locations being targeted for enforcement to encourage equitable, unbiased enforcement that uses practices to enhance overall public safety, including use of automated enforcement technologies.
- Explore, identify, evaluate, and as appropriate and funding allows, implement systems such as dynamic message signs that provide roadway conditions and other information to drivers.

Safety Policies (Speeds)

TR3-4-1. Posted and design speeds of new roadways shall consider context, including adjacent land use, presence and proximity of active transportation, traffic volumes, and geometric design constraints.

TR3-4-2. The 85th percentile speed of vehicular traffic shall be used to evaluate speed compliance and to determine appropriate traffic calming measures as established by thresholds and considerations in the EDS. Traffic calming measures will be prioritized and implemented as funding is available.

TR3-4-3. The City will implement automated speed enforcement that encourages speed compliance as allowed by state law.

SUPPORTING ACTIONS (SPEEDS)

- Establish criteria in the EDS for when physical traffic calming measures may be appropriate to encourage safer speeds.
- Implement automated school speed zone enforcement. Modify and/or expand program as needed to address compliance issues and other concerns. Provide annual reporting as required by law.
- Identify, evaluate, and implement automated speed enforcement in non-school zone areas as allowed by law and as determined to be appropriate to address speed compliance concerns.
- As issues and concerns arise, as part of specific speed studies, and/or as part of public improvement project designs, the City will review roadways to identify existing and desired posted speeds based on classification, land use context, types of road users, and degree of separation or conflict management between vehicles and active transportation users. The review will identify changes needed to posted speeds, if any, and any new or modified roadway features needed to align desired speeds and posted speeds.

Safety Policies (Vehicles)

TR3-5-1. The City shall advocate for vehicle and device safety enhancements that make traveling in Auburn safer.

TR3-5-2. Seek opportunities to provide the community with information to educate and encourage vehicle safety practices.

TR3-5-3. City shall continue to implement vehicle safety practices on its fleet.

TR3-5-4. New or modified vehicle types and emerging vehicle technology shall be evaluated and measures may be taken to promote, prohibit, or restrict their use in the City transportation network as appropriate to support adopted goals and policies.

SUPPORTING ACTIONS (VEHICLES)

- Coordinate with other local, regional and state agencies to advocate for vehicle safety enhancements for commercial motor vehicles as well as technologies used in private automobile industry, and vehicle inspections.
- Review, update, and maintain local ordinances regarding the appropriate use of new or modified vehicle types and emerging vehicle technology.
- Ensure City vehicles are regularly inspected and maintained, and include regulatory required appropriate safety enhancing technologies, and are equipped with appropriate emergency equipment and tools.

Safety Policies (Post Crash Care)

TR3-6-1. Maintain the transportation system to support entities providing emergency response services to crashes.

TR3-6-2. Prioritize emergency vehicle routes and access to hospitals and trauma care centers.

TR3-6-3. Actions will be taken, as applicable, after crashes involving serious injury or fatality, to reduce or eliminate the possibility of repeat crashes at the location due to malfunctioning or failing traffic control devices.

SUPPORTING ACTIONS (POST CRASH CARE)

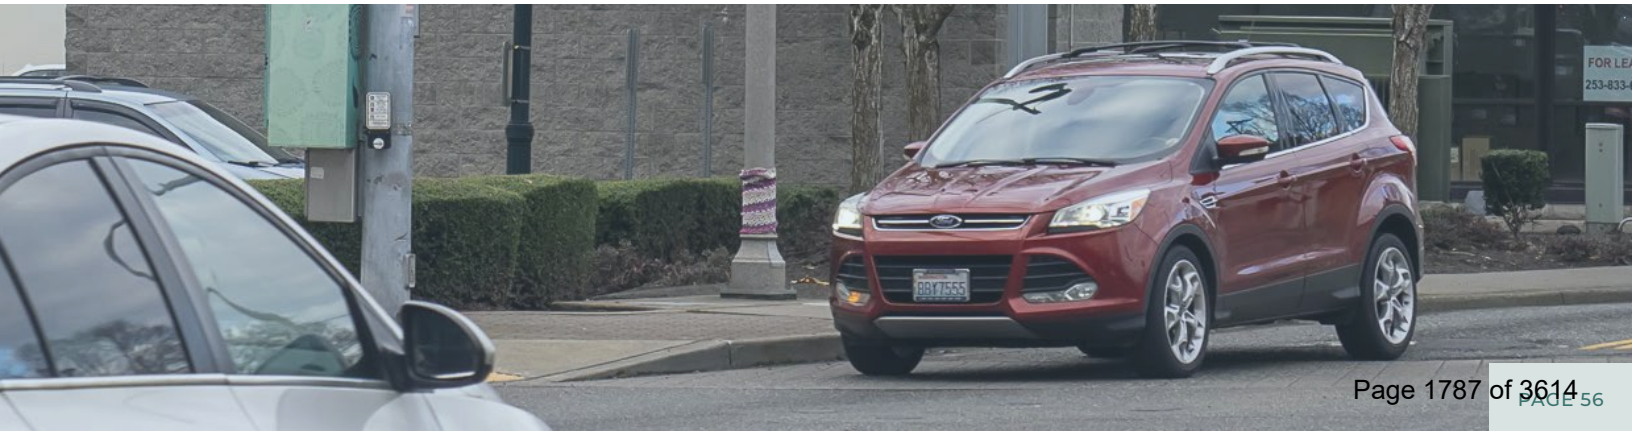
- Coordinate with entities providing emergency response services to crashes with the purpose of maintaining appropriately managed routes, access and facilitate wayfinding to hospitals and trauma care facilities.
- Continue to maintain emergency vehicle pre-emption technology at traffic signals throughout the City prioritizing emergency vehicle routes and access to hospitals and trauma care centers, and emergency response to crashes.
- When notified by Police, City Public Works staff perform post crash investigations where a serious injury or fatality crash occurs at a traffic signal or stop controlled intersection, in a marked and/or enhanced cross walk, involves a pedestrian during non-daylight hours where street lighting is present, or other situations that warrant verification that transportation systems are functioning as intended.

GOAL 4

Environmental

Comply with environmental laws and regulations.

Environmental Policies



TR4-1. The impacts of transportation projects shall be evaluated, and the appropriate mitigation measures identified in accordance with the applicable environmental laws and regulations.

TR4-2. The multimodal transportation systems shall be designed efficiently and support reductions in greenhouse gas emissions and per capita miles traveled, protect and enhance environmental, economic, and human health and safety, and advance environmental justice, and are based on regional priorities and coordinated with other comprehensive plans.

TR4-3. In planning transportation facilities and programs, the City will seek to reduce stormwater pollution from transportation facilities and improve fish passage.

SUPPORTING ACTIONS

- Incorporate environmental factors into transportation decision-making, including attention to human health and safety.
- Review and implement guidance from the Department of Commerce pertaining to measures that cities may implement to reduce greenhouse gas emissions. These guidelines will prioritize measures that benefit overburdened communities that have experienced disproportionate harm due to air pollution and be consistent with environmental justice assessment pursuant to RCW 70A.02.060.

GOAL 5

Multimodal Accessible Network

Ensure Auburn's transportation system is designed to be comprehensive, integrated, accessible for users of all abilities, and facilitates different types of traffic flows, including pedestrians, bicyclists, motorists, transit riders and operators, truck operators and aviation users.

Multimodal Accessible Network Policies (General)

TR5-1-1. The network of sidewalks, bicycle facilities and roadways shall be interconnected to encourage active transportation between neighborhoods, activity centers, community resources, and transit.

TR5-1-2. Ensure that the city's standards and development requirements align with the complete streets policies.

TR5-1-3. Context and flexibility in balancing user needs for all travel modes shall be considered in the planning and design of all projects and, if necessary, a deviation from the EDS may be considered to ensure the Complete Streets Goal and supporting policies are achieved.

TR5-1-4. The development of the multimodal transportation system shall balance safety and convenience to accommodate all users of the transportation system to safely, reliably, and efficiently provide access and mobility to people and goods.

SUPPORTING ACTIONS (GENERAL)

- Plan for and develop a balanced transportation system, which provides safer access and connectivity to transportation facilities for users of all ages and abilities, including pedestrians, bicyclists, motorists, transit users and operators, and truck operators.
- Plan for, design, and construct all transportation projects, whether City led or development driven, to provide appropriate accommodation for bicyclists, pedestrians, and transit users in a manner consistent with the Comprehensive Plan, except in situations where the establishment of such facilities would be contrary to public health and safety or the cost would be excessively disproportionate to the need
- Ensure the transportation system meets the requirements outlined in the ADA and the ADA Transition Plan for Facilities in the Public Right-of-Way and its policies.
- Ensure the EDS requirements support the policies and guidance for complete streets, bicycle LTS, and pedestrian facilities.

Multimodal Accessible Network Policies (Streets)

TR5-2-1. City streets shall be classified as arterial, collector, local, or alley to support the goals and policies of the Plan. The EDS may establish more detailed classifications as needed to serve the needs of the transportation system.

TR5-2-2. The City Functional Roadway Classifications Map shall serve as the adopted standard for identifying classified streets in the City of Auburn.

TR5-2-3. The City shall pursue federal classification of all eligible streets and prioritize federal classification as funding needs and regulatory requirements are identified.

TR5-2-4. Street standards in the EDS shall reflect the street classification system and function.

TR5-2-5. The design and management of the street network shall seek to improve the appearance of existing street corridors. The EDS shall include provisions for streetscaping to enhance the appearance of City street corridors, where appropriate.

TR5-2-6. The classification standards adopted in the EDS are considered the City's minimum standards for new streets. The standards do not limit or prevent developers or the City from providing facilities that exceed the City's standards.

TR5-2-7. The standards for residential streets may be modified in cross section to provide better relationships between the different components of the street including, but not limited to, on-street parking, the landscape strip, and the sidewalk. Among other objectives, this may be done to balance the need to provide adequate parking and buffer pedestrians from traffic.

TR5-2-8. The city shall designate new arterials and collectors to serve developing areas concurrent with approval of such development. These new roadways shall be spaced in compliance with transportation network planning principles and support the importance of overall system circulation.

SUPPORTING ACTIONS (STREETS)

- The EDS will include cross section standards for the various city roadway classifications and established more detailed sub-classifications as appropriate.

- To achieve access control to meet city policy, the City:
  - *Adopts and supports the State's controlled access policy on all state highway facilities;*
  - *May acquire access rights along some arterials and collectors;*
  - *Adopts design standards that identify access standards for each type of functional street classification;*
  - *Encourages consolidation of access in developing commercial and high-density residential areas through shared use of driveways and local access streets; and*
  - *Will establish standards for access management, develop a planning process to work with the community, and implement access management solutions on arterial corridors.*

(Continued on next page)

Multimodal Accessible Network Policies (Streets)

TR5-2-9. The City will seek consolidation of access points to state highways, arterials, and collectors as appropriate to benefit the highway and city street system, reduce interference with traffic flows on arterials, and discourage through traffic on local streets.

TR5-2-10. ROW access shall be provided in a manner that minimizes operational impacts to the City street system, reduces or eliminates safety impacts to the ROW, and provides for access needs of the property. Shared driveways in access tracts or easements may be allowed as specified in the EDS to reduce access points to the ROW.

TR5-2-11. Intersections controlled with roundabouts are preferred over signalized intersections. Where necessary to meet level of service standards, roundabout control shall be implemented over signalization or all-way stop-control, unless determined to be infeasible.

TR5-2-12. Conversion of an intersection to all-way stop-control as mitigation for existing intersection level of service deficiencies shall only be allowed as a temporary measure where permanent measures such as a traffic signal or roundabout are planned.

TR5-2-13. New all-way stop-control intersections shall be discouraged. In evaluating improvements to existing intersections, roundabout or signalization are preferred over all-way stop-control.

TR5-2-14. The local street network shall be developed to maximize the efficiency of the transportation network in residential areas and minimize through traffic in neighborhoods.

TR5-2-15. The street network should be developed and maintained to increase resiliency and support security and emergency management.

TR5-2-16. Private streets are discouraged, but may be permitted on a discretionary basis, as regulated by City code and the EDS. Private streets are not intended to connect between two public streets and shall be built to public street standards. The properties benefiting from the private street are responsible for its maintenance.

SUPPORTING ACTIONS (STREETS)

- To maximize the efficiency of the transportation network in residential areas and minimize through traffic in neighborhoods, the EDS will incorporate requirements such that:
  - *The internal local residential street network for a neighborhood discourages regional through traffic and non-residential traffic from penetrating the neighborhood or adjacent neighborhoods.*
  - *Streets shall be planned, designed, and constructed to connect to future development as appropriate to support the goals and policies of the Plan.*
  - *Residential developments should be planned in a manner that minimizes the number of local street access points to arterials and collectors.*
  - *To promote efficient connectivity between areas of the community, existing stub end streets shall be linked to other streets in new development whenever the opportunity arises and the resulting traffic volumes are not likely to exceed acceptable volumes per the street classification as identified in the EDS.*
- Design criteria for roundabouts, including feasibility criteria, will be incorporated into the EDS.
- The City will coordinate with the WSDOT, counties, and adjacent cities to facilitate the movement of traffic through the City, to construct improvements needed to the state and county arterial and freeway systems, and to develop through routes that minimize the impact of through traffic on Auburn's residential neighborhoods.

Multimodal Accessible Network Policies (Active Transportation)

TR5-3-1. The City's active transportation facilities include bicycle and pedestrian networks and shall be planned and built in accordance with the active transportation level of service standards.

TR5-3-2. City investment in active transportation facilities will prioritize facilities that: 1) Encourage mode shifts from vehicle to active transportation and transit; 2) Provide access to key destinations, such as schools, parks, community services, transit stops, commercial areas, and the Downtown Urban Center; 3) Encourage and support bicycle and pedestrian safety; and 4) Serve disadvantaged and historically underserved communities.

TR5-3-3. City bicycle routes shall be classified as Regional, Priority, or Auxiliary to support the goals and policies of the Plan.

TR5-3-4. The City shall seek external funding and prioritize investments to develop the bicycle network identified in the bicycle priority map, and to build the associated projects listed in Comprehensive Transportation Plan.

TR5-3-5. Active transportation facilities shall be designed to reduce modal conflicts, with greater separation from vehicle traffic along roadways with higher classification, expecting higher vehicle volume and speed.

TR5-3-6. Bicycle and pedestrian crossings of vehicular travel ways shall be placed to align with desired crossing lines and in accordance with the EDS.

TR5-3-7. Pedestrian facilities shall be designed consistent with ADA guidelines and the existing infrastructure shall be updated per the city's ADA Transition Plan for facilities in the Public Right-of-way, to accommodate users of all ages and abilities.

TR5-3-8. Wayfinding elements may be constructed to guide travelers along major active transportation routes.

SUPPORTING ACTIONS (ACTIVE TRANSPORTATION)

- The City shall schedule, plan, and co-sponsor events that support recreational walking and bicycling. These events should emphasize their recreational and health values and introduce people to the transportation capabilities of bicycling and walking.
- Develop programs and publications, and work with local employers to encourage citywide bicycle commuting.
- Work with the Community Development Department to establish guidelines and building code requirements to require convenient and secure bicycle storage facilities in all large public and private developments.
- The City will develop, and periodically update, a Bicycle Route Map that defines the bicycle network in Auburn and classifies bicycle routes throughout the City as either Regional, Priority, or Auxiliary. The network of classified bicycle routes will focus on connectivity from non-classified routes in neighborhoods and commercial areas to auxiliary, priority, and regional routes.
- Develop and maintain an official Auburn Bicycling Guide Map.
- Evaluate transportation projects and identify opportunities to include sidewalk and bicycle facilities based on the identified priority locations.
- Seek ways to provide pedestrian amenities such as streetlights, trees (within the downtown and on local residential streets), signage, and public art along appropriate pedestrian travel routes.
- Encourage the formation of Local Improvement Districts to develop pedestrian pathways and other active transportation amenities throughout the City. Partner with the local school districts to improve Safe Walking Routes to School.
- Actively seek to acquire land along corridors for planned bike routes as identified in the Bicycle Route Map and for pedestrian facilities needing more property to meet LOS standards.

(Continued on next page)

Multimodal Accessible Network Policies (Active Transportation)

TR5-3-9. Active transportation routes shall be constructed to accommodate emergency vehicle access and be amenable to law enforcement.

TR5-3-10. When applicable, active transportation paths shall be provided at the end of dead end streets to shorten walking distances to an adjacent arterial or public facility including, but not limited to, schools and parks.

Multimodal Accessible Network Policies (Transit)

TR5-4-1. Active transportation improvements shall be prioritized based on transit level of service with higher priority placed on improvements in areas with higher transit level of service.

TR5-4-2. Improvements that optimize intersections and corridors to facilitate speed and reliability of transit service will be encouraged and supported as appropriate and will be balanced with the needs of the other travel modes.

TR5-4-3. The City shall cultivate partnerships with transit agencies and WSDOT to help with, or support the development of a robust transit network, to serve trip generators such as colleges, commercial areas, and community resources, to expand transit service within the underserved areas of Auburn, and to achieve a transit network that is convenient and provides a viable alternative to driving.

TR5-4-4. The City shall advocate for adequate off-street parking supply to accommodate demand associated with transit facilities in Auburn, where no alternative options are provided by transit agencies to access transit service that meet the needs of the transit riders.

TR5-4-5. The City shall encourage development projects to provide access improvements to transit stops located within priority transit walksheds.

TR5-4-6. The City shall establish parking restrictions in areas where transit parking impacts nearby residential areas to mitigate the impact of overflow transit parking.

TR5-4-7. The City shall seek partnership opportunities with transit agencies for grant applications and cost sharing to improve access to transit for active transportation facilities, supporting safety, equity, and sustainability.

SUPPORTING ACTIONS (TRANSIT)

- Evaluate intersections and identify opportunities to improve speed and reliability of transit service.
- Partner with transit agencies to support transit service in the City.
- Work proactively with Sound Transit, KC Metro, and Pierce Transit to ensure the adequate supply of transit parking capacity in Auburn.
- Expand the areas included in the Restricted Parking Zones and other parking restrictions as needed to mitigate impacts from transit parking.

Multimodal Accessible Network Policies (Freight)

TR5-5-1. City transportation planning efforts will seek to facilitate the movement of freight and goods through Auburn with minimal adverse traffic and environmental impacts.

TR5-5-2. The movement of freight and goods that serve largely national, state, or regional needs should take place in such a way so that the impacts on the local transportation system are minimized. These movements should take place primarily on state highways, interstates, or on rail corridors with grade separated roadway crossings to minimize the local impacts.

TR5-5-3. All through truck trips and the majority of local trips shall take place on designated truck routes. This policy shall not apply to developments and uses operating under existing ROW use permits, traffic mitigation agreements, or equivalent agreements directly related to the regulation of permitted haul routes.

TR5-5-4. Prioritize improvements that facilitate truck movements along and connecting to future and existing truck routes to accommodate truck traffic and minimize impacts to infrastructure.

TR5-5-5. Development shall be required to mitigate the impacts of development project generated truck traffic on the City's transportation system, based on the City's vehicle LOS standard.

TR5-5-6. Temporary haul routes for overweight or oversized vehicles shall be permitted under circumstances acceptable to the City and with appropriate mitigation. A temporary haul permit must be obtained prior to the hauling of oversized or overweight freight.

TR5-5-7. Truck traffic in residential neighborhoods shall be prohibited, except for local deliveries within said neighborhood, unless no other possible route is available, in which case mitigation may be required.

SUPPORTING ACTIONS (FREIGHT)

- Evaluate intersections and identify opportunities to reduce delays along freight corridors.
- Seek public and private partners to leverage funds for freight improvement projects and associated mitigation.
- Work with local and regional groups to ensure regional freight needs are met and local impacts are mitigated.
- The City will coordinate and communicate with railroad purveyors in Auburn (United Pacific Railroad and Burlington Northern Santa Fe Railway) regarding safety and operational concerns at railroad crossings, along railroad corridors, and near rail yards.

(Continued on next page)

Multimodal Accessible Network Policies (Freight)

TR5-5-8. As roadway reconstruction projects are identified, opportunities to reconstruct roadways adapted to heavy truck traffic shall be evaluated along T-1 and T-2 freight corridors, to prevent accelerated damage to these facilities.

TR5-5-9. Grade separation of roadway and active transportation facilities from railroad tracks and T-1 Truck Routes (such as SR 167 and SR 18) is preferred over at-grade crossings. The City shall plan its multimodal networks to utilize existing grade separated crossings and identify where future grade separation improvements are desired.

TR5-5-10. The City shall maintain its transportation systems to be compliant with Washington Utilities and Transportation Commission requirements regarding railroad crossings and shall work diligently to address any identified deficiencies.

Multimodal Accessible Network Policies (Air Transportation)

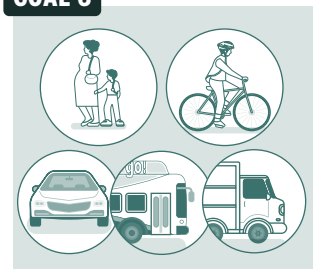
TR5-6-1. Continue to develop the Auburn Municipal Airport in accordance with the Airport Master Plan as adopted or amended.

TR5-6-2. The airport shall be managed as a general aviation facility. General aviation includes all civilian flying except scheduled passenger airline service.

TR5-6-3. When siting new or revised facilities or operations at the airport, the impacts on neighborhoods such as increased noise generated from the use of those facilities shall be considered.

TR5-6-4. Use of the airport by non-conventional aircraft, such as ultra lights, is discouraged.

TR5-6-5. Minimize or eliminate the potentially adverse effects of light, glare, and obstructions on the operation of the Auburn Airport.



TR5-6-6. Insure that uses surrounding the Airport are compatible with the operations of the Airport as development occurs.

SUPPORTING ACTIONS (AIR TRANSPORTATION)

- Review existing and planned uses near Auburn Municipal Airport through development actions and review ACC18.38 regulations periodically to continue to discourage incompatible uses neat the airport.
- Coordinate planning efforts to optimize the effectiveness of the aviation system while minimizing health, air quality, and noise impacts to surrounding communities, including historically marginalized communities.

GOAL 6

Multimodal Level of Service (MMLOS) Standards

Establish multimodal level of service standards for all City streets, active transportation facilities, and access to transit service to serve as a gauge to judge performance of the system and success in helping achieve the comprehensive plan goals consistent with environmental justice.

The MMLOS policies under Goal 6 for bicycle and pedestrian facilities, including access to transit, are intended to provide guidance to evaluate the multimodal facilities, identify deficiencies, and prioritize projects to eventually reach a complete multimodal network that can support and promote mode shift, reducing the vehicle capacity demand on the roadways.

MMLOS Standards Policies (Vehicles)

TR6-1-1. The City adopts the following vehicle LOS standards for the AM and PM peak periods per the Highway Capacity Manual:

- **Signalized:** The LOS standard for signalized intersections is "D", with the following exceptions: for signalized intersections of two principal arterial roads the LOS standard is "E."
- **Stop Controlled:** The LOS standard for stop controlled intersections is "D."
- **Roundabout:** The LOS standard for roundabout controlled intersections is "D" and a V/C ratio for each lane group of less than 0.90.
- **Queuing:** The LOS standard for intersection queuing is the 95th percentile queue shall not extend across an adjacent driveway, alley, or street intersection, except if the driveway, alley, or street intersection is within the functional intersection boundary of the queue in which case the queue may extend to the limit of the functional intersection boundary. Additionally, queuing for a designated turn lane shall not exceed the turn lane storage area and cause a blockage of through lane(s).

SUPPORTING ACTIONS

- Regularly conduct traffic counts, observations, and modeling to evaluate current and future Vehicle LOS and identify projects to address deficiencies.

MMLOS Standards Policies (Active Transportation)

TR6-2-1. The City adopts the following bicycle LOS standards:

- **Bicycle LOS shall be based on Bicycle Level of Traffic Stress (LTS) ranging from "1" to "4" as follows:** "1" – minimal traffic stress and high comfort facilities that accommodate bicyclists of all ages and skill levels; "2" – some traffic stress and moderate comfort facilities that accommodate average bicyclists; "3" – moderate to high traffic stress and moderate to low comfort facilities that accommodate mostly experienced bicyclists; "4" – high traffic stress and low comfort facilities that accommodate mostly bicycle enthusiasts with advanced experience and skill levels.
- The **Bicycle LTS standard** for Auxiliary bicycle routes is "3."
- The **Bicycle LTS standard** for Priority bicycle routes is "2."

SUPPORTING ACTIONS (ACTIVE TRANSPORTATION)

- The EDS will be updated to include standards for various types of bicycle facilities intended to meet level of service standards as defined in the Plan.
- Standards will be developed and incorporated within the EDS to establish typical cross sections by roadway classification to meet the pedestrian LTS standards.

(Continued on next page)

MMLOS Standards Policies (Active Transportation)

- The **Bicycle LTS standard** for Regional bicycle routes is "1."
- **Minimum Bicycle LTS standards** for City streets without Regional, Priority, or Auxiliary bicycle routes shall be per the standard roadway cross sections by street classification in the EDS.
- **Streets may be designed with Bicycle LTS higher than the minimum standard** to accommodate local needs such as parks, schools, and other uses.

TR6-2-2. The City adopts the following pedestrian LOS standards:

- **Pedestrian LOS** shall be based on Pedestrian Level of Traffic Stress (LTS) ranging from "1" to "4" as follows: "1" – minimal traffic stress and high comfort facilities; "2" – some traffic stress and moderate comfort facilities; "3" – moderate to high traffic stress and moderate to low comfort facilities; "4" – high traffic stress and low comfort facilities.
- The **pedestrian LTS standard for City streets** is "1" except streets classified as "rustic" or alleys have a Pedestrian LTS standard of "2."
- **Streets may be designed with pedestrian LTS higher than the minimum standard** to accommodate local needs such as parks, schools, and other uses.

SUPPORTING ACTIONS (ACTIVE TRANSPORTATION)

- The Street cross sections included in the EDS will be updated to include active transportation facilities that provide at least minimum level of service requirements.

MMLOS Standards Policies (Transit)

TR6-3-1. Transit LOS is defined as the accessibility, frequency, comfort, reliability, and connectivity of available transit services using active transportation modes. A Transit LOS score ranging from "1" to "4" can be estimated for any location in the City using a combination of the walking shed distance from the location to transit services and the type of available transit service as defined in the Plan.

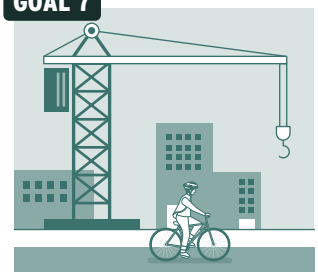
TR6-3-2. Active transportation improvements shall be prioritized based on transit level of service with higher priority placed on improvements in areas with higher transit level of service.

SUPPORTING ACTIONS (TRANSIT)

- Coordinate regularly with transit operators to understand service plans.
- Maintain a map that reports transit service levels citywide based on transit service plans and walksheds.
- Prioritize eliminating gaps in active transportation routes and improving sub standard active transportation facilities in areas of transit levels of service "1" and "2".
- Develop tools to assess current and future planned transit level of service throughout the City and identify active transportation gaps and substandard active transportation facilities.
- Advocate for, and support, transit speed and reliability improvements.

MMLOS Standards Policies (Freight)

TR6-4-1. The City adopts the following Freight LOS standards:



- **LOS for freight movement** follows the vehicle LOS standards.
- **Principal Arterial, Minor Arterial, Non-Residential, and other streets** identified as T-1, T-2, or T-3 routes are considered truck routes except as designated otherwise by the City Code or as posted by the City Engineer.
- **Intersections of truck routes** shall be designed to accommodate turning trucks such that the trucks do not interfere or obstruct with other travel modes or cause damage to adjacent property and facilities.
- **Roadway pavement on truck routes** shall be designed with a minimum 20-year service life with truck loading.
- **Driveways serving trucks and lane widths on the adjacent truck routes** shall be designed such that trucks accessing the driveways do not enter into opposing roadway or driveway lanes. Driveways with excessive width may be required to provide mitigation treatments for bicyclists and pedestrians crossing the driveway.
- **Truck dependent land-uses** shall provide on-site parking area for truck loading and unloading and shall accommodate truck access and on-site turn-around.
- **Development anticipating regular truck deliveries or services** shall provide a delivery plan that identifies the trucks size, frequency, and delivery or service duration and demonstrates how, when, and where the trucks will make deliveries or services without causing impacts to vehicles, bicycles, and pedestrians in the right-of-way.

SUPPORTING ACTIONS (FREIGHT)

- Maintain a map of Auburn streets that overlap with the WSDOT Freight and Goods Movement Transportation System and ensure that transportation projects that overlap with T-1, T-2, and T-3 routes include adequate space for large vehicle turns.
- Update the EDS to ensure they adequately consider the needs of freight vehicles in terms of intersection turning movements, mid-block turning movements into driveways, loading docks, and alleys, and entrance to, navigation of, and exit from traffic circles and roundabouts.
- Identify truck routes that do not meet current freight level LOS standards and prioritize investments to address deficiencies based on level of impact and available funding.

GOAL 7

Multimodal Concurrency

Ensure that those transportation system facilities and services necessary to support development shall be adequate to serve the development at the time the development is available for occupancy without decreasing current service levels below established minimum standards.

Concurrency Policies

TR7-1. The City will not approve development activity if the development causes the vehicle level of service on a transportation facility to decline below level of service standards or if the development negatively impacts a transportation facility currently operating below vehicle level of service standards (any increase in intersection delay where intersection delay standard is already exceeded or any increase to queue length of an existing queue length that does not meet standards). Strategies that may allow a development to proceed, include, but are not limited to, one or more of the following:

- Concurrent with the development, Developer constructs **street improvements** to address the vehicular level of service impacts of the development.
- Concurrent with the development, Developer provides **active transportation** facility improvements, increased or enhanced **public transportation** service, **ride-sharing** programs, **demand management**, and other transportation systems management strategies that demonstrate a mode shift from vehicle to active transportation and/or transit modes such that the development vehicular level of service impacts are mitigated.
- If the City's Transportation Improvement Program includes a **project that is not fully funded (for instance, the funding includes unsecured grants)** that will mitigate the impacts of the development and is scheduled to be complete concurrent to the development, the City may allow the developer to provide funds to fully fund the project so that it may proceed concurrent to the development.
- If the City's Transportation Improvement Program or Comprehensive Transportation Plan includes a project that would **mitigate the impacts** of the development, the City may allow the developer to fund (all or in-part) and build the project concurrent to the development.
- Development project scope is **reduced**.

SUPPORTING ACTIONS

- Include standards in the EDS that require development projects to conduct a traffic impact analysis (TIA) when certain thresholds are met. Thresholds will be intended to require a TIA when it is likely that a development could cause transportation facilities to operate below level of service standards or when then development is likely to have negative impact on transportation facilities already operating below level of service standards. The TIA scope will be scalable based on the development project and its potential impacts on the transportation system. The TIA will identify impacts and associated mitigation actions proposed to address the impacts.
- The City will review transportation impact analyses for developments outside the City through SEPA to identify if there may be potential impacts to City systems.
- The City will provide transportation impacts analyses for developments within the City that may impact other agencies so that those agencies may identify if there are potential impacts to their facilities.
- The City will update the per-person trip traffic impact rate for the following calendar year based on the traffic impact fee funding need identified in the TIP and revise the fee schedule based on this per-person trip rate for adoption as part of the City's overall fee schedule.

(Continued on next page)

- Development project is **phased or delayed**.
- Establish a **lower vehicle level of service standard** via the City Council adoption of an amended Comprehensive Transportation Plan. The denial of a development in order to maintain concurrency may be grounds for the City declaring an emergency for the purpose of amending the Comprehensive Transportation Plan outside of the annual amendment cycle.

For the purposes of this policy **"concurrent with the development"** means that improvements or strategies are in place at the time of development, or that a financial commitment is in place to complete the improvements or strategies within six years.

TR7-2. The City may afford a developer that funds and/or constructs improvements that provide mitigation beyond the impacts of the development activity a credit against the traffic impact fees due for the project.

TR7-3. Development activity generating people trips shall pay a transportation impact fee that is used by the City to make system wide capital improvements and programs that provide vehicular capacity and encourage a mode shift from vehicles to active transportation and/or transit.

TR7-4. Development activity shall make improvements along project right-of-way frontages to provide for vehicle, pedestrian, bicyclist, transit, and freight trips to/from the project. Improvements shall be in accordance with multimodal level of service standards and the EDS.

TR7-5. The City may enter into latecomer (payback) agreements where transportation investments are made by one party that legitimately should be reimbursed by others, agreements will be at the discretion of the City Council. Latecomer or payback agreements do not apply to situations in which a property owner is required to construct improvements per an existing city code provision, such as in the case of half-street and other required improvements.

TR7-6. The City may make transportation improvements that would be required for an undeveloped or underdeveloped private property to develop or redevelop with a City funded capital project and re-coup the costs of those improvements assessed through a payback requirement on the private property.

TR7-7. Conversion of an intersection to all-way stop-control as mitigation for intersection level of service deficiencies shall only be allowed as a temporary measure where permanent measures such as a traffic signal or roundabout will be constructed concurrent to the development activity triggering the mitigation requirement.

SUPPORTING ACTIONS

- On an annual basis, the City will develop a per person transportation impact fee based on the number of people trips anticipated over the next six-year period of the TIP and the impact fee funding needed to implement projects to accommodate those trips. Projects include those that increase vehicular capacity or provide mode shift from vehicle to active transportation and transit, thereby reducing the need for vehicle capacity.
- In planning expenditure of transportation impact fees, the City will seek to support development concurrency by prioritizing projects that address vehicular level of service issues related to recent and anticipated development activity.
- The EDS will define frontage improvements (half-street improvements) required to be provided by development activities.
- The City will seek grant, loan, and partnership funding for system capacity and mode shift projects that would help reduce traffic impact fee rates required to maintain concurrency.

GOAL 8

Demand and System Management

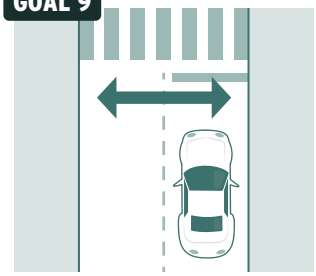
Use Transportation Demand Management (TDM) and Transportation System Management (TSM) strategies to reduce capacity demand on the transportation system.

Demand and System Management Policies

TR8-1. TSM strategies shall be utilized to efficiently operate the existing transportation system, thereby maximizing resources, and reducing the need for physical system capacity expansion.

TR8-2. TDM strategies, such as the Commute Trip Reduction (CTR) program or other strategies that reduce single occupant vehicle travel shall be utilized, when possible, to lessen the impact on transportation system capacity.

TR8-3. Reduce the need for new capital improvements through investments in operations, pricing programs, demand management strategies, and system management activities that improve the efficiency of the current system.



TR8-4. Emphasize transportation investments that provide alternatives to single occupancy vehicle travel, increase travel options, especially to and within centers, and support compact, pedestrian- and transit-oriented densities and development.

SUPPORTING ACTIONS

- Identify and map prioritized intelligent transportation system (ITS) improvements, based on available funding and existing infrastructure.
- Coordinate with transit agencies to enhance CTR programs for CTR employers in Auburn.
- Improve the CTR Program for City employees.

GOAL 9

Right-of-Way (ROW)

Retain and preserve existing right-of-way and identify and acquire new right-of-way as needed to provide for the existing and planned transportation system.

ROW Policies

TR9-1. Seek opportunities to obtain right-of-way along roadways and at intersections in accordance with adopted standards and comprehensive planning.

TR9-2. The City may acquire right-of-way, development rights, easements, and other property rights in accordance with the uniform act and other local, state, and federal law.

TR9-3. Private property shall not be taken for public use without just compensation having been made. The property rights of landowners shall be protected from arbitrary and discriminatory actions.

TR9-4. Right-of-way that has the potential for future transportation system needs shall be retained and right-of-way that has no potential future transportation system needs shall be considered for vacation.

TR9-5. When triggered by City code, require the dedication of right-of-way to accommodate the build-out of half street improvements based on the roadway classification and active transportation facilities identified in this Plan.

TR9-6. Permanent use or encroachment of right-of-way for non-City transportation system purposes shall be prohibited, restricted, or regulated to preserve the City's existing and planned use of the right-of-way for City transportation system purposes.

SUPPORTING ACTIONS

- Preserve and protect existing right-of-way through the issuance of permits such as Construction Permits, right-of-way Use Permits and franchise agreements.
- Monitor and address right-of-way encroachments.
- Acquire additional right-of-way as necessary to implement the Comprehensive Plan.
- As budgeted funds allow, purchase property when it is available on the market as a voluntary protective purchase rather than under threat of use of eminent domain.

GOAL 10

Asset Management

Design, construct, preserve, and maintain the City's transportation system in the most cost-effective manner.

Asset Management Policies

TR10-1. The target average Pavement Condition Index (PCI) for all streets is 70.

TR10-2. The minimum design service life for new and re-built roadways is 20 years.

TR10-3. The City shall take and require actions by others that minimize and mitigate impacts to the roadway surfaces by utility work and other construction activities.

TR10-4. Pursue and secure other funding sources, such as grants, partnerships, and revenue mechanisms to fund pavement preservation projects.

TR10-5. To the extent allowed by available preservation funding, the City shall prioritize the preservation of streets prior to the existing pavement degrading to the point where reconstruction of the roadway becomes the appropriate treatment.

TR10-6. Non-residential roadways requiring full pavement replacement shall be prioritized based on vehicle volumes and classifications with higher volumes of vehicles, heavy trucks, and transit routes being higher priorities than those with less.

TR10-7. Local Street Preservation program shall focus on preserving and re-building roadways classified as local residential, local industrial or rustic residential.

TR10-8. The Arterial Street Preservation program shall focus on preserving and re-building roadway systems classified as arterials or collectors.

SUPPORTING ACTIONS

- EDS prohibit trenching or cutting into newly constructed pavement surfaces (within five years) or require additional pavement replacement area where trenching or cutting in newly constructed pavement surfaces cannot be avoided.
- Notify and coordinate with private and public utilities when planning to complete pavement overlays or reconstruction.
- Identify City streets that are nearing a deterioration level that would require complete roadway re-build for inclusion in the pavement preservation program.
- Require roadways to be built per the requirements in the adopted EDS.
- Evaluate options to meet funding gaps that may include revenue mechanisms available through the Transportation Benefit District for consideration and potential implementation.
- Maintain a Computerized maintenance management system (CMMS) to record response to customer service calls.

(Continued on next page)

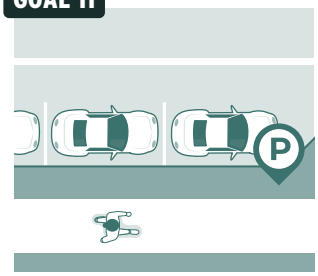
TR10-9. Prioritize the maintenance and replacement of pedestrian facilities to address deficiencies and to meet ADA requirements.

TR10-10. Prioritize maintenance of bicycle facilities to keep them visible with signage and markings, and clear of encroachments and debris.

TR10-11. Prioritize maintenance, repairs, and replacement of traffic control systems (signals, dynamic message signs, rapid rectangular flashing beacons) at a level consistent with optimizing system reliability, asset economic life, and system performance .

TR10-12. Ensure adequate resources to maintain, per USDOT, MUTCD, and other regulatory requirements and best practices, other elements of the street system such as signage, street lighting, and roadway markings.

TR10-13. Bridge inspection and maintenance shall follow State, Federal, and other applicable regulatory requirements.



TR10-14. Intelligent Transportation Systems (ITS) will be managed and maintained to be secure, reliable, and effective.

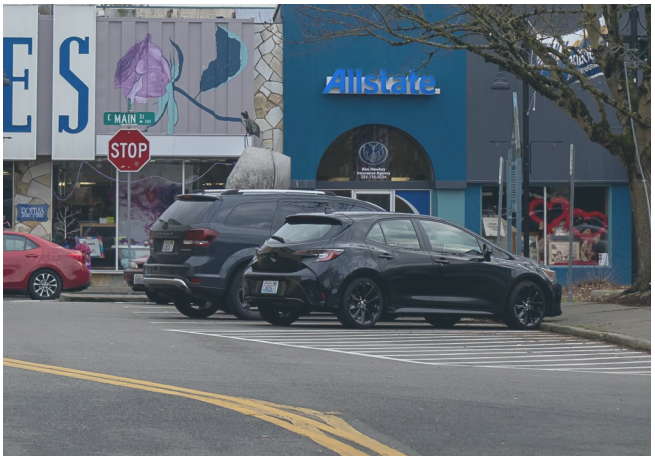
TR10-15. Prepare for changes in transportation technologies and mobility patterns.

SUPPORTING ACTIONS

- Assign industry standard design lives for control systems. Seek to repair or replace system assets before they exceed their economic life and minimize the number of high-criticality assets beyond their economic life.
- Take measures to ensure system security for traffic control systems.
- Incorporate repair and replacement of sidewalks and other street assets into pavement preservation projects as appropriate and as resources allow.

GOAL 11

Parking



Ensure a balance between on-street and off-street parking provided to meet the needs of existing land use, development, and other community needs and as allowed by law.

Parking Policies

TR11-1. On-street parking should be allowed only when consistent with the classification and intended function of the street.

TR11-2. New developments shall provide adequate off-street parking to meet the needs of their development unless otherwise precluded by law.

TR11-3. Within high density areas, such as Regional Growth Center, evaluate and address the need for passenger and/or commercial loading zones.

SUPPORTING ACTIONS

- Take an active approach to managing on- and off-street parking in commercial and high-density residential areas to minimize land dedicated to parking and ensure right-of-way balancing parking with other community needs.
- Explore the feasibility of parking management programs, shared parking strategies, and/or subsidized ORCA cards programming as new low-income housing units are being developed; addressing the transportation needs as development occurs.
- Encourage new development to incorporate appropriate design features such as: Preferential parking for carpools and vanpools; Special loading and unloading facilities for carpools and vanpools; Transit passenger facilities, including comfortable bus stops and waiting areas that may be integrated in the building design; and secure and covered bicycle parking, showers, lockers, and related facilities to support bicycle commuters. Where applicable, encourage convenient short-term bicycle parking for customers or other visitors.
- Develop guidance for the creation of parking facilities for bicycles, scooters, and other active transportation vehicles that help promote mode shift away from motorized vehicles.

IT'S A
GOOD
DAY

CHAPTER 5

System Management, Maintenance, and Operations

IN THIS CHAPTER

- Staffing
- Equipment/Fleet
- Facilities
- Asset Management

Efficient and effective management, maintenance, and operations of the City's transportation systems relies on strategic planning and implementation. These efforts require identification of current and future assets and the financial, equipment, facilities, and personnel resources required to maintain and operate them. This chapter summarizes current and anticipated future staffing, equipment, and facilities needs and describes management of key transportation systems and elements such as pavement, street signal, sidewalks, and signage.

5.1. STAFFING

The staffing for the City's transportation system is broken down into four areas: Transportation Engineering and Planning, Traffic Signal Operation and Maintenance, Street Maintenance and Vegetation Maintenance.

5.1.1. Transportation Engineering and Planning

This area is responsible for the development, management, and administration of the Plan, Transportation Improvement Plan, Traffic Impact Fee program, street payback agreements, development review and permitting related to transportation requirements on all types of developments, traffic studies, citywide traffic count program, citywide channelization and pavement marking program, franchises, right-of-way use permits, community banner program, adopt a street program, right-of-way vacations, Americans with disabilities transition plan for right-of-way, commute trip reduction program for all large employers within Auburn, pavement preservation, capital project grants, neighborhood traffic calming program, on-street parking management, photo enforcement program, and regional coordination on transportation issues. There are currently five full-time equivalent (FTE) employees to manage these responsibilities.

5.1.2. Traffic Signal Operations and Maintenance

This area is responsible for the operation and maintenance of the City's traffic signals including programing and signal timing, electronic traffic control and warning devices, dynamic message signs, traffic cameras, school zone flashing beacons, and the ITS including fiber optic cable. There are currently five FTE's to manage these responsibilities.

5.1.3. Street Maintenance

This area is responsible for the maintenance of the roadway system including signage, street lighting, guardrails, walls, pavement, sidewalks, curbing, and delineators. There are currently 10.5 FTE's to complete this work.

Litter management is contained within the Solid Waste program through contracted services.

5.1.4. Vegetation Maintenance

This area is responsible for maintenance of roadside and pond vegetation, hardscape medians located along the roadways of the city, and provides street sweeping services on all roadways. The Parks Department maintains the landscaped medians within the roadway corridors of the City. There are currently 11.5 FTE's to complete this work, however, 5.1 FTE's are funded by the Storm Drainage Utility and provide for the vegetation maintenance of the Storm properties and facilities and therefore only 6.4 FTE's are dedicated to the street vegetation maintenance functions.

The City's transportation system elements are shown in **Table 10**.

Table 10. Transportation System Elements

QTY	DESCRIPTION
248.69	Miles of Streets
17	Bridges
11,000	Street Signs
13,389	Feet of Guardrail
96	Traffic Signals
31	Rapid Rectangular Flashing Beacons
3.684	Street Lights - City Owned
2,261	Street Lights - PSE Owned
53	School Zone Flashing Beacons
19	Speed Radar Feedback Signs
89	Traffic Cameras
12	Speed Photo Enforcement Locations (School Zones)
4	Dynamic Message Signs
43.86	Miles of Fiber Optic Systems
2	Community Banner Locations

As the City's transportation systems grow and new regulatory requirements are enacted, the resources needed to complete necessary maintenance and operations must be evaluated and adjusted to ensure adequate resources to meet the growing needs of the system and continue to maintain the system in a state of good repair. Unfortunately, because not all agencies provide the same services and functions, there are no reliable national standards to look at to determine level of staffing needed for a transportation system with the exception of signal maintenance.

The Federal Highway Administration and Institute of Transportation Engineers recommends a ration of between 25-50 traffic signal/field devices per technician. The City of Auburn has three signal technicians and one supervisor which results in a ratio of 76:1 and is therefore under resourced for the current number of systems that they are responsible for. This plan has identified a need for potentially ten to 12 new traffic signals and several RRFB's associated with projects and programs to improve pedestrian access and safety. In addition, there is the potential for future expansion of the photo enforcement program which should also be considered when determining future staff resources needed.

5.2. EQUIPMENT/FLEET

The City currently has the equipment resources for use in the maintenance of transportation systems shown in **Table 11** and **Table 12**.

Similar to the staff resource discussion above, there are no national statistics on the amount of equipment needed for the size of a transportation system because there are too many differences between agency responsibilities and levels of service. The current resources allow for adequate maintenance of the City's systems and as staffing resources grow, equipment resources will be need to increase accordingly.

In addition, in 2024 the City will be implementing an all electric street sweeper which was made possible through a grant from the Department of Ecology. In order to reduce the cities greenhouse gas emissions, replacement of fleet equipment and purchase of new equipment will consider the ability for electric vehicles, hybrid vehicles, or alternative fuels to be used as these technologies develop and improve.

Table 11. Equipment Assigned to Street Division or Traffic Signal Division

QTY	EQUIPMENT DESIGNATION	TYPE
4	6402E, 6403F, 6404B, 6412E	1 Ton Truck
1	6415C	F 350 Light Truck
1	6418D	Sign Truck
2	6113D, 6114D	Signal Transit Van
1	6116D	Signal Bucket Truck
1	6116D	Engineering SUV
4	6413D, 6414C, 6114C, 6113D	Staff Vehicles
2	6450A, 6450B	Bucket Trucks
1	6426D	Patching Truck
3	6411C, 6425C, 6425D	International Dump Truck
6	A402A, A402B, A901A, A408A, A404A, A501D	Plow Attachments
3	A403A, A405A, A401A	Sander Attachments
2	A904A, A407A	Deicer Attachments
1	A411A	1650 Gallon Tank
1	6423D	NorAm Grader
1	6420C	Johne Deere Loader
1	6432D	CAT Roller
1	6436A	Wacker Roller
1	6934A	Trverus Sidewalk Cleaner
1	N/A	ACCUBRINE Brine Maker

Table 12. Additional Equipment Available for all M&O Teams

QTY	EQUIPMENT DESIGNATION	TYPE
1	6940C	Case Skid Steer
1	A428E	30'' Cold Grinder
1	N/A	84" Angle Broom attachment-seria
1	6523C	Backhoe/ Extendahoe
1	6900	Backhoe
2	6635A, 6930A	Yanmar Excavator
1	6601A	John Deere Excavator
3	6911B, 6910C, 6505B	International Dump Truck
4	A904A, A905A, A406A, (6910D)	Plow
4	A903A, A902A, A502A, (6910D)	Sander
1	6910D	Kenworth Dump Truck
1	6911A	Mack Dump Truck
1	6420C	Johne Deere Loader
1	6432D	CAT Roller
1	6436A	Wacker Roller
1	6934A	Trverus Sidewalk Cleaner
1	N/A	ACCUBRINE Brine Maker

5.3. FACILITIES

Management, maintenance, and operations of the City's transportation systems are provided from two locations:

- **1 East Main Street** – City Hall Annex, Transportation Engineering Services
- **1305 C Street SW** – Maintenance and Operations Shops, Street Division, Vegetation Division, Traffic Signals Division

Other facilities also used for the Transportation system include the following

- **Sand and salt storage** – five locations citywide
- **Vegetation sorting facility** – Jacobson Tree Farm
- **Storage** – City's GSA Property on C Street SW

In 2020, the City undertook a study, the Facility Master Plan, to determine the space needs for the Public Works, Parks and Police departments. The recommendation of that study as it relates to the transportation system was to continue to provide maintenance and operations services from the 1305 C Street SW location but to expand the facilities with the construction of approximately 13,100 SF crew building, expansion of the fleet shops, relocation of the employee parking, completion of a driveway connection to 15th Street SW, and construction of covered parking for high valued fleet. This plan and its recommendations were adopted by the City Council in 2021 with Resolution 5595.

In 2024 construction is anticipated in the first phase of the Facility Master Plan for Public Works which is the expansion of the fleet shop facilities. As part of this work in the first phase, the City is improving the electrical service to the property to accommodate future charging stations for the electric street sweeper and future electric and/or hybrid fleet vehicles. In 2024/2025 it is anticipated that planning work will be done in the second phase of the identified improvements which for Public Works includes improvements at the Maintenance and Operations Shops to address the need for more crew space and warehousing space.

In 2024/2025 the City will be increasing the ability for the City to handle inclement weather events in the future by adding an additional sand and salt storage location. Planning efforts are also underway to relocate the vegetation sorting facility, which allows debris from operations to be separated and dried before disposal thereby reducing the costs of disposal is completed, from the Jacobson Tree Farm Property. This is due to the future plans of the City to build a Community Park on the tree farm site.

In 2024, the City is also completing a remodel at the City Hall Annex facility to provide the necessary office space for the future growth of the Public Works, Community Development and Finance departments located on the second floor and will provide necessary space for the transportation staff located there.

5.4. ASSET MANAGEMENT

Asset management involves the balancing of costs, opportunities and risks against the desired performance of assets to achieve objectives of the transportation system. The City currently uses an asset management system for its transportation and utility infrastructure and integrates this information with its GIS. This system allows the City to track requests for services both internally and from the community, assign specific tasks both reactionary and preventative to the maintenance of our facilities, and track information on specific assets defined within the system. The City has been implementing this system since 2007 and continues to improve the asset data sets and mapping to provide resources for our planning of system improvements as well as the day to day work of maintaining the systems.

5.4.1. Street Pavement

The City's Streets Division completes temporary and permanent pavement patching as needed in response to requests and complaints on all roadway corridors up to 6' x 10' in size. Areas that require more extensive patching or full pavement replacement are incorporated into the pavement preservation programs and implemented as capital projects managed by the Public Works Engineering services.

As of December 2022, City streets have an overall average pavement condition index of "67" on a scale of "0" to "100" where "0" is a completely deteriorated roadway surface and "100" is a new roadway surface. The City's goal is to achieve and maintain an average 70 pavement condition index which reflects a "good" surface condition.

An annual report is published to document the pavement rating throughout the City.

In November 2004, Auburn residents approved Proposition 1, Save Our Street Program, which created a dedicated local street fund. This money was set aside for repair and maintenance of local roadways which can sometimes also include sidewalk repair and rebuild. In 2013, the City Council modified the funding source for this program to be from construction sales tax revenues and no longer from property taxes. In 2018, the City Council modified the funds for this program, to be temporarily provided by real estate excise tax (REET) Revenues until a permanent and sustainable source could be established. Beginning in 2023, the City Council reallocated the existing 1% tax on utilities previously used to fund the arterial street preservation program to the fund the local street preservation program (formerly known as the Save Our Streets Program).

Figure 14. Local Residential Street Before and After SOS Rebuild

This re-allocating established $2 million annually to the local streets preservation program, which is the funding level estimated (in 2022 dollars) needed to achieve and maintain the City's average pavement condition index (PCI) goal of 70.

In 2008, the City created a similar program to fund the repair and maintenance of arterials and collector streets. Through 2022, this program was funded with a 1% utility tax, which was supplemented by grant funds, which provided an average of approximately $3.3 million per year. Analysis shows that approximately $5 million per year (in 2022 dollars) is needed to improve our arterial and collector streets to the PCI average target of 70 within the next 10-15 years, and then maintain them at that level.

Besides preserving, repairing, and replacing pavement surfaces, the street preservation programs also address non-ADA compliant curb ramps on-streets being re-paved or re-built when required per the criteria established in the City's ADA Transition Plan. The programs also address damaged or lifted sidewalks that may present an ADA obstruction or concern on streets it is re-paving or re-building.

In 2022, the City Council took actions to work towards reaching and sustaining the needed funding for both programs. Starting in 2023 the 1% utility tax revenue was moved to the local streets preservation program and a 1.5% tax on City Utilities was enacted to provide funding for the arterial streets preservation program. Additionally, as the City's Transportation Benefit District, the City Council enacted a 0.1% sales tax to provide funding for the arterial street preservation program. These new revenue streams, combined with grants, and fund balance are projected to get the City closer to the $5 million needed per year for the arterial street preservation program. The analysis in 2022 also identified that the City may need to consider the implementation of a $20 car tab fee through the Transportation Benefit District depending on future grant revenues. Current grant programs provide funding opportunities based on eligibility and scoring that exclude many City streets and the number of streets that are eligible and score well for the grants that have not already been repaired and preserved is diminishing. Therefore, the future level of grant revenues for pavement preservation is uncertain.

5.4.2. Active Transportation Facilities

Sidewalk Repair and Accessibility Program

The City of Auburn has an Annual Citywide Sidewalk Repair and Accessibility Program to repair damaged sidewalks, install/replace curb ramps that do not meet ADA standards, and to complete missing links in the sidewalk network.

These funds are essential for promoting active transportation travel and can be used to leverage other funding sources, such as state and federal grants or other city capital projects.

Auburn has identified three principal areas in which sidewalk improvements should be prioritized: corridors that provide access to and within the downtown, school zones, and parks, with a focus on addressing areas of known concern and complaints. Additional criteria for priority access improvement could include, but are not limited to, areas with high concentrations of senior citizens or disabled citizens, areas with high volumes of pedestrian-transit interaction, areas where private improvements such as trees have damaged the public infrastructure,

and areas where property owners are willing to financially participate in the construction of sidewalk improvements through payment into the City's sidewalk repair program. This program may also include the completion of sidewalk improvements using Community Development Block Grant funding to address areas that are within a qualified census tract as defined by HUD.

5.4.3. Street Lights

In 2021, the City completed the conversion of all of its City-owned standard Cobrahead style street lights from sodium halide to LED lighting and implemented a control system that provides information on the use of the system and can provide notifications when lights are not working. Beginning in 2021, the City created a Street Lighting Improvement program to complete the conversion of PSE-owned lights within the City to LED and to provide funds to add street lights where lighting does not meet the City's current design standards. More significant lighting projects are included in the transportation improvement plan as funding allows.

5.4.4. Traffic Signal Systems

The City completes annual preventative maintenance on its traffic signal systems. Every eight to ten years, the City also completes the re-lamping of signal heads. Each capital project that may impact an existing traffic signal is also reviewed for improvements and/or equipment replacements that may be needed for signal operations. In addition, as a traffic signal system reaches the end of its useful service life, it is included in the transportation improvement plan for replacement as funding allows. Often, development or capital projects re-build all, or portions, of existing traffic signal systems. Generally, to keep up with the general useful service lifetime of the City's traffic signals, a complete signal system must be replaced every three to four years.

5.4.5. Street Landscaping/Vegetation

The City's street standards require landscape strips along some roads classified as local residential or collector. City code establishes that the landscape strips are the responsibility of the adjacent property owner to maintain. Medians that include landscape treatments are maintained by the City's Parks Department through a contract with a landscape maintenance company. Roadside vegetation is maintained by the City's Vegetation Division where formal landscape strips do not exist and where vegetation within the right-of-way may create potential hazards or sight distance concerns.

5.4.6. Transportation System Management (TSM) and ITS

TSM techniques, which make more efficient use of the existing transportation facilities, can reduce the need for costly system capacity expansion projects. These techniques can also be used to improve reduce congestion and delays at intersections and along corridors to help meet City LOS standards TSM techniques used by the City include:

- Re-channelization/restriping, adding turn lanes, adding
- Signal interconnect and optimization
- Turn movement restrictions
- Access Management
- ITS, including Dynamic Message Signs (DMS)
- Traffic monitoring with PTZ cameras
- Signal battery backups on all major intersections

The City will continue to use these TSM techniques to maximize the efficiency of the existing street network. Of the various TSM strategies available, the City continues to invest in and expand its ITS infrastructure as a cost-effective means of increasing system capacity. The ITS system enables the City to change traffic signals in phasing and timing real-time, thereby accommodating unexpected increases in traffic or traffic obstacles such as event related traffic and crashes. For example, ITS has proven to be a useful tool in helping to manage the impact of event traffic traveling south on Auburn Way South, often during the PM peak, to the White River Amphitheatre. The City will continue to roll out ITS capabilities on corridors around the City, as referenced in Map 8. 2024 Intelligent Transportation Systems (ITS) in Appendix A.

In addition to TSM strategies, the City strives to provide viable alternatives for travelers to encourage mode shifts away from single occupancy vehicles to transit, biking, and walking,

5.4.7. Signage and Channelization

The City maintains street signage per the Manual of Uniform Traffic Control Devices (MUTCD) as adopted by WSDOT. This includes the replacement of signage as necessary due to knock downs or when reflectivity is below standards. Reflectivity requirements are established in the MUTCD.

The City re-paints roadway and curb striping on an annual basis. A database of the locations of all thermoplastic roadway markings is currently being created to facilitate a programmatic approach to the refreshing of these markings on a one to five-year basis. In addition, this data set will include the locations of raised pavement markers (RPMs) as new regulatory requirements within the MUTCD call for these RPM's to be updated/replaced on streets without street lighting and meeting other criteria.

5.4.8. Bridges

The City completes bridge inspections as required by the FHWA on an annual or bi-annual basis as determined in the prior inspection report. Inspection reports identify if there are maintenance, repairs, rehabilitation or replacement that is needed for the bridges within the City. The City Bridge program provides for minor cost repairs that are identified in the annual inspections on an annual or bi-annual basis depending on the work identified within each bridge inspection report. When larger items of work are identified, the City includes specific projects within the Transportation Improvement Plan as funding allows. The City also typically applies for grants through WSDOT's Local Bridge Grant Program and has secured funding for bridge maintenance and repairs.

CHAPTER 6

Funding

IN THIS CHAPTER

- Financial Summary
- Financial Planning & Programming
- Funding Sources
- Revenue Shortfall Contingency
- Funding Strategies, Project Prioritization

The ability to finance the maintenance and enhancement of the transportation system is critical to the implementation of this plan and the success of the future transportation system. This chapter details the financial planning tools and funding mechanisms available to accomplish these goals.

6.1. FINANCIAL SUMMARY

The summary below provides an overview of the 20-year financial outlook for the City's transportation systems. Forecasts are based on current funding levels for City funds and based on past trends for grants and partnerships. All amounts shown are shown in current dollars (2024) without discount rate adjustments to current value.

Table 13. 2024 to 2044 Expense and Revenue Forecast

OPERATIONS		
Labor, Materials, Facilities Operations, Equipment Maintenance	$	(336.6 Million)
Facilities Expansion, Additional Equipment	$	(20 Million)
Motor Vehicle Excise Tax Revenue	$	18.9 Million
General Fund	$	337.7 Million
OPERATIONS FUNDING REMAINDER/(SHORTFALL)	$	0
CAPITAL		
Plan Projects/Programs Expense	$	(320 Million)
Traffic Impact Fees Revenue	$	25.86 Million
Transportation Benefit District Revenue		
0.1% Sales Tax	$	47.5 Million
$20 Car Tabs*	$	11.7 Million
Utility Taxes Dedicated to Transportation		
1.0% on Non-City Utilities	$	40.98 Million
2.5% on City Utilities	$	26.61 Million
Motor Vehicle Excise Tax Revenue	$	10.6 Million
Multimodal Transportation	$	2.5 Million
Interest Earning and Investment Income	$	2.73 Million
Utility Revenues for Local Street Impacts	$	3 Million
Other (Developer and/or Other Contributions/Payments)	$	12.6 Million
Grants, Loans, and Partnerships Revenue**	$	106 Million
Real Estate Excise Tax Revenue	$	29.7 Million
OVERALL FUNDING CONTINGENCY/(SHORTFALL)	$	0.22 Million

* Assumes 13 years of collection at $900k collected per year.
** Based on historic average of $4.25 million awarded per year + $20 million grant for BNSF/A Street Access Project.

6.2. FINANCIAL PLANNING & PROGRAMMING

The City uses the Transportation Improvement Program (TIP) and Capital Facilities Plan (CFP) to develop a financial plan for capital improvements in Auburn, thus enabling the City to fulfill the GMA requirement of having a multi-year financing plan based on the identified transportation needs.

6.2.1. Transportation Improvement Program

The TIP is a six-year fiscally constrained plan which lists programmed transportation improvements in the following categories: roadway improvement projects, intersection improvement projects, active transportation and transit projects, preliminary engineering and miscellaneous projects, and preservation projects. Transportation needs are identified by examining the latest information concerning safety and crash history, growth trends, the traffic model, traffic studies, and the projects identified in the Plan. The City adopts an updated TIP annually, including a revenue forecast and analysis of available funding. Projects are then prioritized according to a number of factors including safety, capacity needs, access needs, and the likelihood of securing funding. The first three years of the TIP must be financially constrained, however, the City utilizes financial constraint on the full TIP period so project programming is often limited due to anticipated funding limitations.

The TIP is an important tool for identifying funding and developing a financial plan for project implementation. This planning document is incorporated into the CFP and used to influence the City's adopted budget.

6.2.2. Capital Facilities Plan

The CFP is the Comprehensive Plan element which identifies the financial plan for implementing all capital improvements in Auburn. Transportation improvements are included in the CFP, which is amended with each Biennial Budget. The CFP enables the City to fulfill the GMA requirement of having a multi-year financing plan based on identified transportation needs. It also enables the City to make informed decisions about its investment of public dollars and make timely decisions about maintaining LOS's in accordance with the Comprehensive Plan standards. The 2024-2044 Plan capital projects and program costs are summarized in **Table 14** on the next page.

Table 14. Capital Project and Program Cost Summary and Revenue Forecast

DESCRIPTION	SUMMARY			2024 – 2044 TOTAL
Comprehensive Plan Projects (Comp-X) from Appendix B	See Appendix B		$	**123 Million**
Asset Preservation, Repair, Replacement Projects/Programs	Traffic Signals Maintenance	$200,000 / Year	$	**162 Million**
	Traffic Signal Replacements	$150,000 / Year		
	Sidewalk Repair and Replacement Program	$250,000 / Year		
	Arterial Street Preservation	$5 Million / Year		
	Local Street Preservation	$2 Million / Year		
	Bridge Repair & Maintenance	$100,000 / Year		
	Channelization and Pavement Markings	$400,000 / Year		
Active Transportation Projects/Programs	Active Transportation Mode Shift Projects	$1 Million / Year	$	**20 Million**
Safety Projects/ Programs	Street Lighting	$50,000 / Year	$	**11 Million**
	Traffic Safety Programs	$500,000 / Year		
Other	Transit Partnership Routes	$200,000 / Year	$	**4 Million**
		TOTAL	$	**320 Million**

6.3. FUNDING SOURCES

The City uses a combination of public and private funding sources to implement transportation improvements in Auburn, both for maintenance activities and capital improvements.

6.3.1. General Tax Revenues

The City receives tax revenues from a variety of state, regional, and local sources including the Real Estate Excise Tax, sales tax, property tax, and the motor vehicle fuel tax (MVFT).

In addition, the City has implemented a utility tax on all utilities within the City and allocated a portion of these revenues specifically to the City's transportation system for improvements. This includes a 1% tax on all non-City utilities such as gas, power, telecommunications, and cable and a 2.5% tax on City utilities including water, sanitary sewer, storm drainage, and solid waste.

In 2023, the City began operation of a school zone photo enforcement program that may provide revenues for future transportation related projects.

6.3.2. Transportation Benefit District

Chapter 36.73 of the Revised Code of Washington provides for the establishment of Transportation Benefit District (TBD) by cities and counties to levy

and impose various taxes and fees to generate revenues to support transportation improvements within the district. A TBD is a quasi-municipal corporation and independent taxing district created for the sole purpose of acquiring, constructing, improving, providing, and funding transportation improvements within the district. The State Legislature provided local governments with the tools of the TBD because inflation has eroded the local share of gas tax and a series of statewide ballot initiatives passed over the last 12 years have eliminated other traditional sources of funding for local transportation needs.

In 2011, the City of Auburn implemented a TBD to provide adequate levels of funding for transportation improvements that are consistent with existing state, regional, and local transportation plans, and are necessitated by existing or reasonably foreseeable congestion levels.

The geographic boundaries of the Auburn TBD is the municipal limits of the City of Auburn as they currently exist. The Auburn TBD geographic boundaries would expand with any future annexations.

In December 13, 2016, there was an approval to implement an annual vehicle license fee of $20.00 for qualifying vehicles in the district. However, in September 19, 2017, the action was rescinded and therefore, no vehicle license fees were put into effect and no fees have been collected.

In 2022, the City Council completed a review of the needs for the preservation of the City's streets and determined that $5 Million was needed annually to preserve the City's arterial and collector streets and $2 Million was needed annually for local streets. As a result of that the Council developed three recommendations to provide funding for preservation of the City's roads. Two of the recommendations utilize the authorities granted to the TBD by the State Legislature. The first one was approved by the City Council on October 3, 2022, with the adoption of Ordinance No. 6881 which added a new section to the Auburn City Code (Chapter 3.23) imposing a Transportation Benefit District 0.1% Sales and Use Tax as authorized by RCW 84.55 and RCW 36.73. This tax became effective on January 1, 2023 and may be used for transportation improvements with a focus on preservation of the City's arterial and collector roadways. The second TBD consideration is a future implementation of a $20 Car Tabs at such time as the City is unable to obtain the grant funding to supplement the revenues for arterial and collector street preservation to meet the annual budget need of $5 Million. Based on the projected need of this Plan, it is anticipated that the $20 Car Tab's may be required to be implemented between 2031 and 2032. In addition, the 0.1% Sales and Use tax is enacted for a 10 year period and the City will need to consider continuing that tax every 10 years to continue to receive the revenues forecast in this plan.

The TBD is provided the authority to:

- Establish and implement district policies, programs and procedures
- Borrow money and incur indebtedness
- Provide for investment of district funds
- Create advisory committees (limited to seven City residents)
- Other powers consistent with state law

6.3.3. Grants

The City has an active grant program and continually seeks grants, both private and public, to improve Auburn's transportation system. The following is a list of some of the grants the City has historically applied for and will likely apply for again in the future.

Federal Legislation

In 2021, the Federal Legislature approved the new Surface Transportation reauthorization bill called the Infrastructure Investment and Jobs Act (IIJA). This is the largest long-term investment in infrastructure and provides $550 billion over fiscal years 2022 through 2026 in new federal funding. This is also know as the Bipartisan Infrastructure Law (BIL).

State Legislation

In 2015 and 2022, the Washington State Legislature passed two separate transportation funding packages called Connecting Washington and Move Ahead Washington. These programs also increased potential funding available to existing grant programs within the State and each identified specific regional projects to be funded by the programs.

Freight Mobility Strategic Investment Board (FMSIB)

The mission of the FMSIB is to create a comprehensive and coordinated state program to facilitate freight movement between and among local, national, and international markets which enhances trade opportunities. FMSIB is also charged with finding solutions that lessen the impact of the movement of freight on local communities.

FMSIB obtains funding directly from legislative appropriations and has contributed funds to the 3rd Street SW Grade Separation, the S 277th Street Grade Separation, M Street NE Widening 8th to 4th, and the M Street Underpass projects.

Potential Grant Programs for Consideration

From these state and federal actions, there are a number of grant programs available to local agencies related to transportation infrastructure improvements, as shown in **Table 15**.

There are a multitude of other potential federal grant programs through the IIJA that are evaluated as calls for projects are issued. PSRC has published a summary of the numerous grant programs available at https://www.psrc.org/media/7292.

Table 15. Potential Grant Program for Consideration

PROGRAM	DESCRIPTION
Transportation Alternatives Program (TAP)	TAP funds projects designed to strengthen the cultural, aesthetic, and environmental aspects of the inter-modal transportation system. The program provides for the implementation of a variety of non-traditional projects, including the restoration of historic transportation facilities, the construction of bicycle and pedestrian facilities, landscaping and scenic beautification, and the mitigation of water pollution from highway runoff.
Surface Transportation Program (STP)	STP provides flexible funding that may be used by states and localities for projects on any federally classified public road, active transportation improvements, bridge, and transit capital project.
Safety Program	A federal program targeted at reducing crash rates at intersections and along corridors, particularly at those locations with higher than average fatality and injury rates. Funds come from the Highway Safety Improvement (HSIP) Program . HSIP requires that states program and spend safety funds according to their Local Road Safety Plan. Washington State's plan is called Target Zero.
Congestion Mitigation and Air Quality (CMAQ)	A federally funded program administered through PSRC. CMAQ funds projects and programs in air quality non-attainment and maintenance areas, which reduce transportation related emissions.
Safe Routes to Schools Program	A state and federally funded program that aims to protect children from traffic related deaths and injuries and promotes a healthy lifestyle by encouraging bicycling and walking to school.
Pedestrian and Bicycle Safety Grant	A state funded program that funds active transportation safety improvements.
Transportation Improvement Board (TIB)	TIB administers annual grant programs that fund roadway and active transportation projects that improve safety, mobility, capacity, and promote economic development. The TIB offers several programs, each of which emphasizes different funding criteria. In addition, they offer a Complete Streets program.

(Continued on next page)

PROGRAM	DESCRIPTION
Community Economic Revitalization Board (CERB)	A state funded program that provides low-cost financing for public facility improvements. Public entities are eligible to apply for and receive loans and grants for public facilities linked to economic development outcomes such as private business investment and job creation. CERB also finances site-specific studies and plans.
Regional Mobility Grant Program	A State managed program to improve connectivity between counties and regional population centers and reduce transportation delay. There are four project types: vehicle and equipment purchases, capital construction, operations, and transportation demand management.
Local Bridge Grant Program	A State managed program to preserve and improve the condition of bridges that are physically deteriorated or structurally deficient through replacement, rehabilitation and systematic preventative maintenance.
Rebuilding American Infrastructure with Sustainability and Equity (RAISE)	A discretionary program funding to complete critical freight and passenger transportation projects.
Safe Streets and Roads For All (SS4A)	A discretionary program funding regional, local, and Tribal initiatives to prevent roadway deaths and serious injuries.
Reconnecting Communities and Neighborhoods (RCN)	RCN provides funding to prioritizing disadvantaged communities, aiming to improve access to daily needs such as jobs, education, healthcare, food, and recreation, fosters equitable development and restoration, and reconnects communities by removing, retrofitting, or mitigating highways or other transportation facilities that create barriers to community connectivity, including to mobility, access, or economic development.

6.3.4. Loans

Low-interest loans are also available to municipalities. For example, the Washington State Department of Commerce Public Works Board offers low-interest loans (PWTF) for local governments to finance public infrastructure construction and rehabilitation. Eligible projects must improve public health and safety, respond to environmental issues, promote economic development, or upgrade system performance. Roads, streets, and bridges are eligible for these loans. The loans can be strategically employed to leverage grant funding by providing a local match, enabling the City to compete for funding for public infrastructure projects. In addition, the City has the option of issuing bonds for public infrastructure projects. The City may also pursue financing airport improvements through the Community Aviation Revitalization Board (CARB) loan program.

Table 16. 2024-2044 Forecast

CURRENT LOANS & INDEBTEDNESS			
Harvey Road/8th Street NE Intersection Improvements	Remaining Debt Payments 2024 – 2028	**$**	**407,933**
M Street SE Undercrossing Improvements	Remaining Debt Payments 2024-2041	**$**	**2,155,891**
Auburn Way South Widening (Hemlock St SE to Poplar St SE)	Anticipated Payback Period 2025-2045	**$**	**3,000,000 + Interest**

6.3.5. Transportation Impact Fees

The City has an established traffic impact fee system based on the Institute of Traffic Engineers (ITE) guidelines, as amended by the City Council. The fee system estimates the amount of traffic each development is anticipated to create, based on the land use type and size. Traffic impact fees compensate the City for the capacity improvements needed to accommodate the new trips generated by new development. In turn, the City uses the revenues to expand the street network through the capacity projects included in the TIP. The fees are based on the costs of the capacity project included in the TIP and forecast growth throughout the City. The fees are updated annually following the adoption of the TIP by City Council. Payment of the impact fee does not relieve developers of their codified obligation to construct half-street improvements, nor the need to mitigate project impacts identified through the SEPA process, which may include the construction of an identified TIP project (and a credit for the impact fee contribution towards that project).

The City also charges a truck impact fee for certain land-use types which are associated with significant truck traffic generation, such as commercial and industrial uses. These fees are used to address impacts on the City's truck routes and other truck-related infrastructure.

With the adoption of this plan, the City will be updating its transportation impact fee schedule to be based on a per person trip approach. The impact fees generated from this revised approach will be used for both vehicle capacity projects and active transportation projects that support mode shift away from vehicles (and therefore reduce need for vehicle capacity).

6.3.6. Funding Partnerships

The City has successfully formed several funding partnerships, which have enabled it to leverage its resources in implementing transportation improvements.

The Muckleshoot Indian Tribe (MIT) has graciously provided easements, funding, and other support to the City for several transportation projects and programs. In 2020, the City and MIT entered into a Memorandum of Understanding (MOU) where both parties agreed to work together to identify needs and provide solutions to gaps in active transportation facilities on, and along, SR 164/Auburn Way South. Subsequently, the MIT and City have entered into funding agreements for specific projects where MIT has provided funding for projects implemented by the City.

The City anticipates continuing to partner with WSDOT on funding projects involving the state routes through the City.

Local Improvement Districts (LIDs) enable City investment in a specified area by leveraging City funds, when available, with contributions from property owners in the district. LIDs are a means of using limited city resources to improve neighborhood quality through improvement of streets, sidewalks, and other features of the roadway. Historically, LIDs were often implemented to construct public improvements associated with new commercial and residential neighborhoods. It has been over 15 years since the City has last implemented an LID. This is presumably due to the high costs that LIDs would require the benefited property owners to pay. Additionally, most new residential and commercial developments trigger the requirement for public improvements such as streets, sidewalks, and street lighting to be built by the development at the time of the development rather than being built through LID. For these reasons, the City has not included any LID constructed improvements or funding in its future projections.

In 2022, the City implemented a new Sidewalk Repair Program to address situations where adjacent property owners are financially responsible for the correction of damaged sidewalks within the City. This program allows for a property owner to pay the City a pre-determined fee to complete the work on their behalf in the next regularly scheduled sidewalk improvement project.

Street Deferral agreements or Fee In Lieu payments are allowed per Auburn City Code 12.64A where property owners responsible for the construction of frontage improvements along their properties can pay the City for the completion of the work where a planned improvement project has been identified in the City's Transportation Improvement Plan and/or adopted budget.

6.4. REVENUE SHORTFALL CONTINGENCY

Revenue forecasts for City funds are considered to be relatively secured. Other revenue such as grants and partnership funding can be slightly more unpredictable. While all the revenue currently forecast is anticipated to fully fund the transportation plan, if shortfalls arise the City will have to take one or more of the following actions to maintain compliance with GMA concurrency requirements:

- Supplant the projected budget shortfall with other existing City funds.
- Enact new sources of revenue.
- Revise the Land Use Plan to reduce development capacity and resultant need for additional transportation improvements.
- Lower the LOS Standard sufficiently to reduce the need for additional transportation improvements.
- Impose restriction (moratorium) on further development with impacts to areas not meeting LOS standards until the current LOS standard is met.

6.5. FUNDING STRATEGIES, PROJECT PRIORITIZATION

The City uses a variety of criteria to prioritize transportation projects, including safety, mobility, and overall community benefit. In addition, the City also considers the availability of funding and the ability to leverage City dollars to raise addition funds. For example, grants are often available for specific types of capital investments, whereas they are more limited for maintenance/preservation. Hence, the City often needs to budget for maintenance/preservation through tax revenues. Capital improvements may be financially secured through a combination of public and private investment. Hence, project prioritization for capital improvements is often partially dependent on the ability to secure outside funding. Likewise, maintenance and preservation are highly dependent on the limited tax revenues available to the City. In the future, the City will need to continue lobbying for its share of federal, state, and county tax revenues, seek creative avenues for securing private investment dollars and grant funds, and potentially implement new funding strategies such as car tabs or additional tax implementation when allowed.

CHAPTER 7

Monitoring & Evaluation

IN THIS CHAPTER

Annual Updates

Multi-Year Updates

Accomplishments Since the Last Plan Update (2019)

The Comprehensive Transportation Plan, a long-range plan with the horizon year 2044, predicts the needs and conditions of the future transportation system, enabling the City to anticipate its future needs. Nonetheless, the transportation network is dynamic, constantly evolving due to circumstances beyond the scope and influence of this plan. Hence, regular updates are necessary to ensure the Plan remains current and relevant.

7.1. ANNUAL UPDATES

The Plan can be amended annually as part of the City's regular Comprehensive Plan amendment cycle, which ensures proposed changes go through a public review process before the amended plan is adopted by the City Council at the end of the calendar year. In preparation for the annual amendment cycle, the City will review the plan and propose updates as needed. These proposed updates may be due to changes to City priorities, the availability of new information, or the relevance of certain plan components.

7.1.1. Re-Evaluation

The annual re-evaluation process provides an opportunity for the City to identify progress made in implementing the Plan, as well as identify new needs that have arisen since the previous update. The update will consider the street, active transportation, and transit systems, and assess whether the Plan adequately addresses the implementation strategies necessary to ensure the transportation infrastructure continues to grow in line with the City's objectives.

As part of this process, the City will review its future projects list and update the TIP and the CPF as appropriate. It will also review and update the Policies and Funding chapters in order to remain consistent with the City's vision and current with potential funding strategies.

7.1.2. Technical Information

The Plan contains a range of technical data, much of which informs other elements of the Plan. As part of the annual amendment cycle, technical information, such as traffic volumes, existing LOS, roadway classifications, and transit route and ridership information, will be updated as appropriate. Updated information will inform much of the evaluation process, enabling the City to quantify system changes over time and make appropriate decisions in planning the future system.

7.1.3. Model Updates

The City's traffic model shall be updated on a regular basis, every few years, as new land use, employment, and housing data becomes available. Model updates are important as they ensure the City has an accurate understanding of how land use patterns, employment, and other factors impact future transportation conditions, enabling the City Council to make informed policy decisions. The model also provides an understanding of the impacts associated with different projects, allowing the City to devise a revised list of future projects to improve capacity and safety, as well as achieve other priorities.

7.1.4. Comprehensive Plan Consistency

The annual evaluation process is an opportunity to ensure the Plan is consistent with other elements of the City's Comprehensive Plan, including the land use and economic development elements; Auburn Parks, Recreation and Open Space Plan, Transportation Improvement Program; and CFP. Hence, as part of the annual amendment cycle, the City will ensure these plan components are consistent with and supportive of each other.

7.2. MULTI-YEAR UPDATES

The City has the opportunity to perform annual updates to the Plan on an as-needed basis to account for significant changes which have occurred during the previous year. A more exhaustive process is periodically necessary; hence, a thorough rewrite of the Plan shall be conducted every five to eight years. This endeavor will include a broad public outreach effort with input from neighboring jurisdictions, state and regional agencies, and Auburn residents and businesses. Much like the process for the 2024 update, it will present an opportunity to holistically examine the current transportation system and lay the framework for development of the future system.

7.3. ACCOMPLISHMENTS SINCE THE LAST PLAN UPDATE (2019)

Since 2019, the City has completed numerous transportation improvements, with an emphasis on providing new road capacity, improving pedestrian and bicycle safety, preservation of existing infrastructure, and providing better access to regional transit services including commuter rail.

In addition to the completed planned capacity projects, additional projects were completed, such as the I Street extension to South 277th Street, the Auburn Way South sidewalk additions from Dogwood to Hemlock, Riverwalk Drive Sidewalks Expansion, and numerous pavement preservation projects.

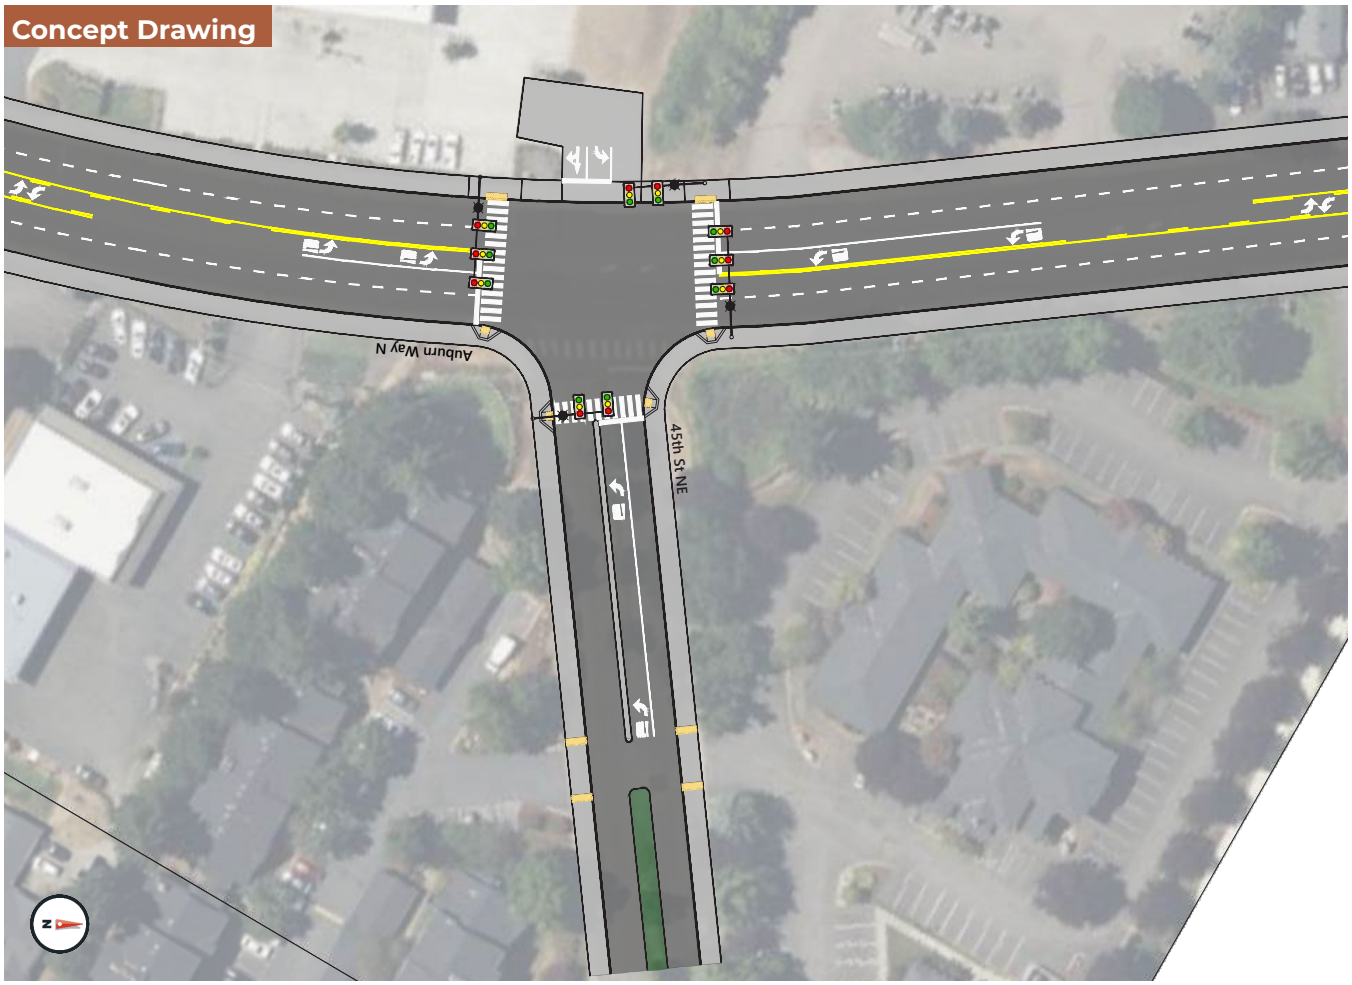
COMP-1

AUBURN WAY N & 45TH ST NE INTERSECTION IMPROVEMENTS

Project Origin: New 2024 CTP Project

Primary Need: Vehicle Capacity



Description:

Intersection delays will be reduced through the replacement of the stop control with construction of a new traffic signal.

VEHICLE LOS WITHOUT PROJECT	AM	PM
2024 Existing	Meets	Fails
2044 Future	Fails	Fails

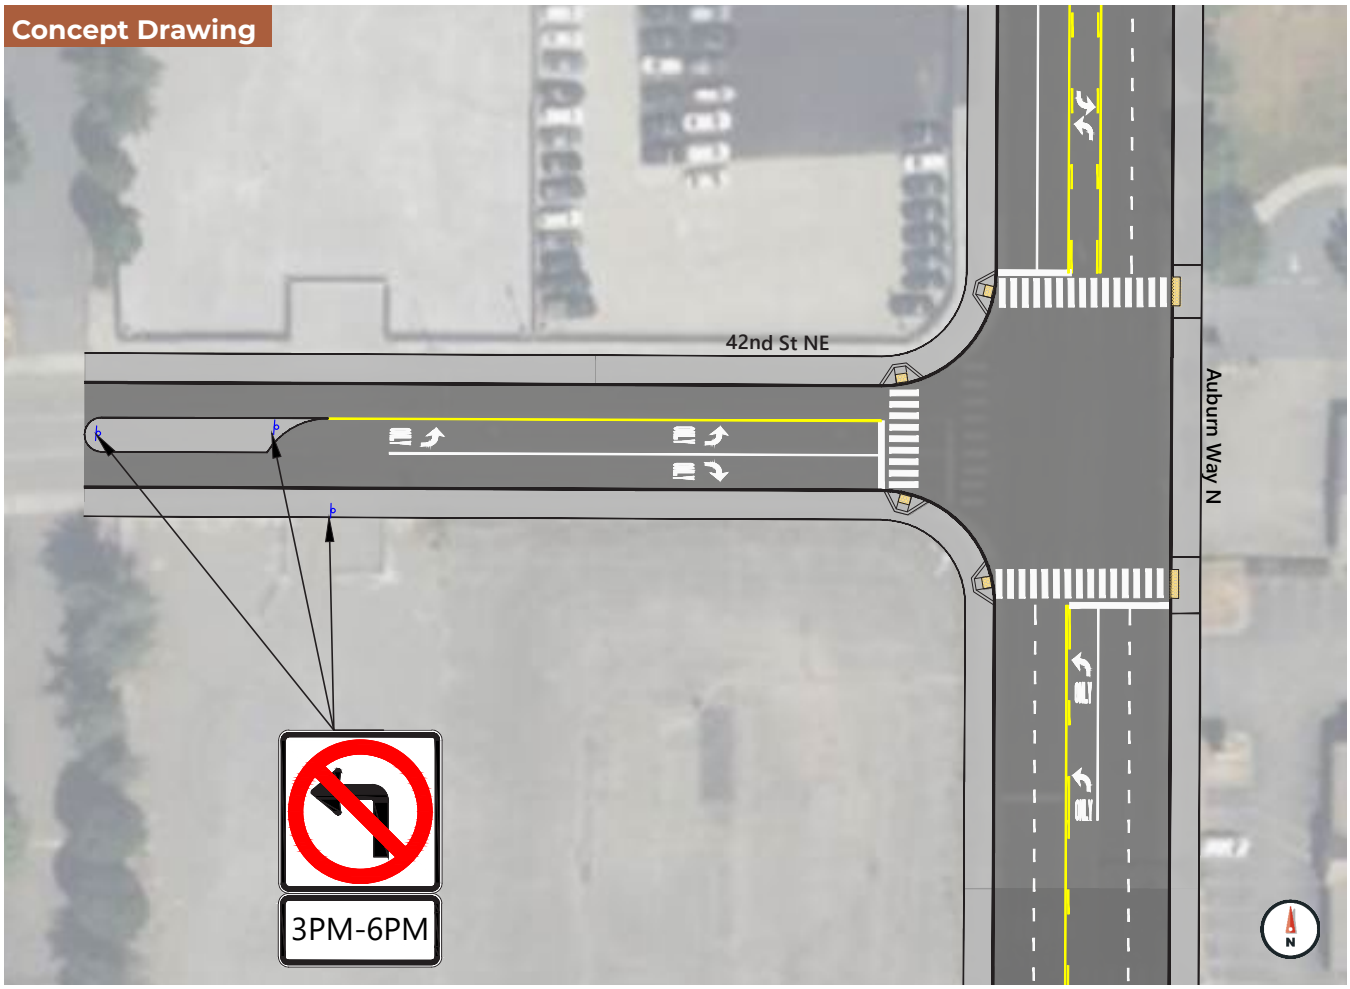
PROJECT PHASE	COST ESTIMATE
Planning & Engineering/ Design	$ 700,000
Right of Way	$ 0
Construction	$ 1,200,000
Total	$ 1,900,000

Concept Drawing

COMP-2
AUBURN WAY N & 42ND ST NE INTERSECTION IMPROVEMENTS

Project Origin: New 2024 CTP Project

Primary Need: Vehicle Capacity



Description:

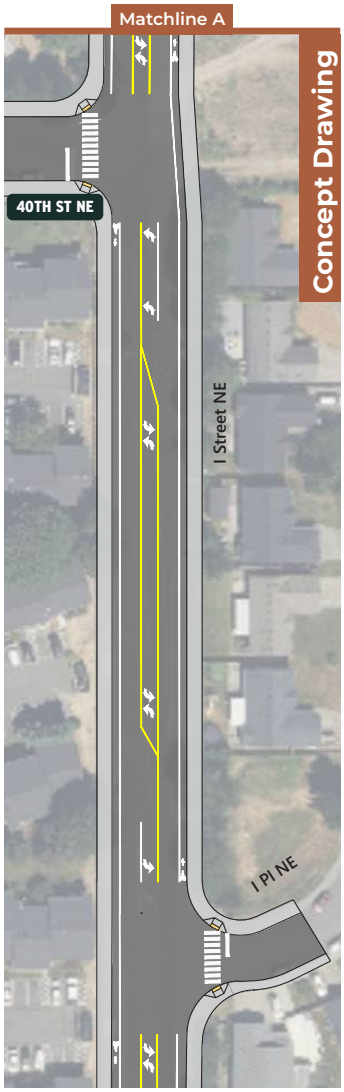
Intersection delays will be reduced through the restriction of left turns from 42nd St NE to Auburn Way N during PM peak hours with signage installed on a new raised median.

VEHICLE LOS WITHOUT PROJECT	AM	PM
2024 Existing	Meets	Meets
2044 Future	Meets	Fails

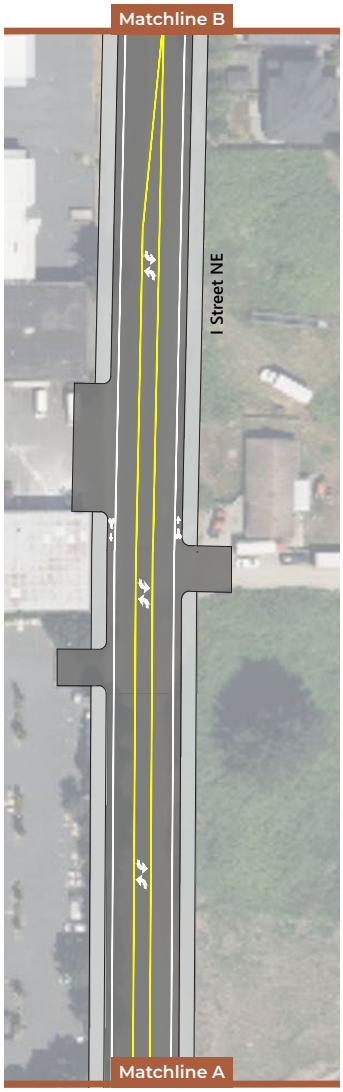
PROJECT PHASE	COST ESTIMATE
Planning & Engineering/ Design	$ 25,000
Right of Way	$ 0
Construction	$ 75,000
Total	$ 100,000

Concept Drawing

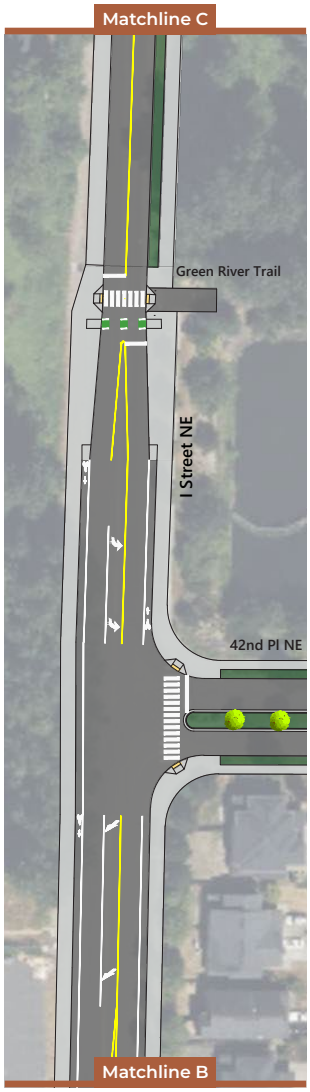
COMP-3
I ST NE IMPROVEMENTS
(37TH ST NE - 45TH ST NE)



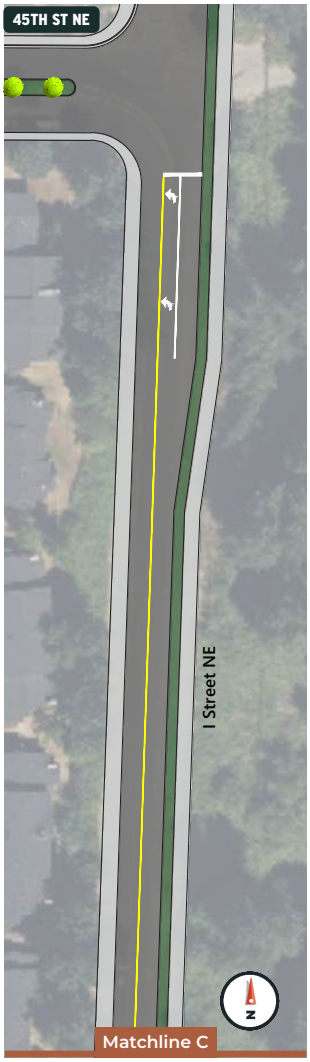
Project Origin: New 2024 CTP Project



Primary Need: Safety/Active Transportation/ Mode Shift

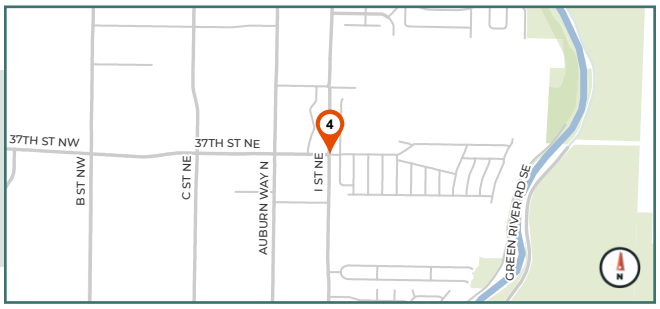


Description:



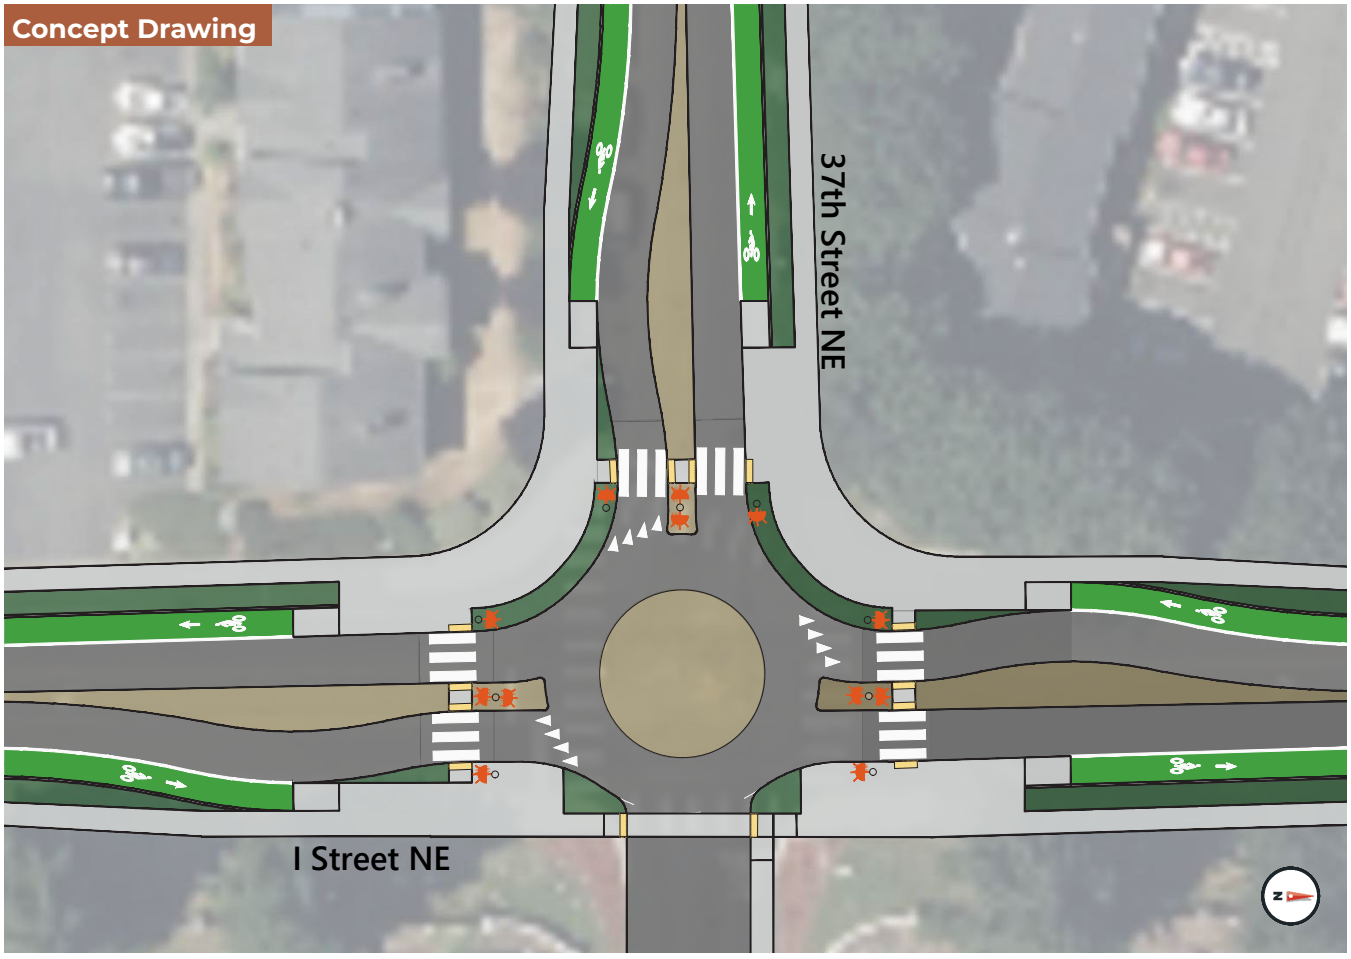
The I St NE Corridor provides access to several neighborhoods and commercial properties. To improve multi-model safety, and meet city roadway standards, bicycle and pedestrian improvements are proposed between 37th St NE and 45th St NE.

PROJECT PHASE	COST ESTIMATE
Planning & Engineering/ Design	$ 2,000,000
Right of Way	$ 1,000,000
Construction	$ 3,700,000
Total	$ 6,700,000



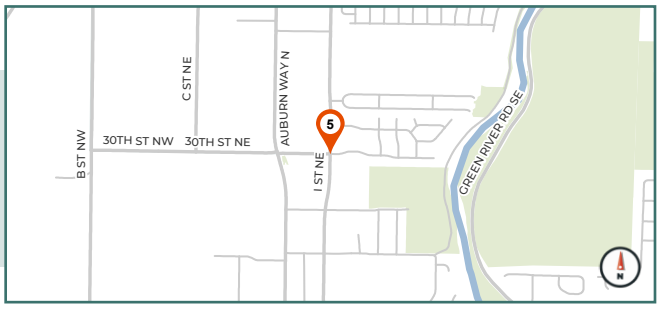
COMP-4
I ST NE & 37TH ST NE INTERSECTION IMPROVEMENTS

Project Origin: New 2024 CTP Project



Primary Need: Vehicle Capacity

Description:



Intersection delays will be reduced through the construction of a single-lane roundabout.

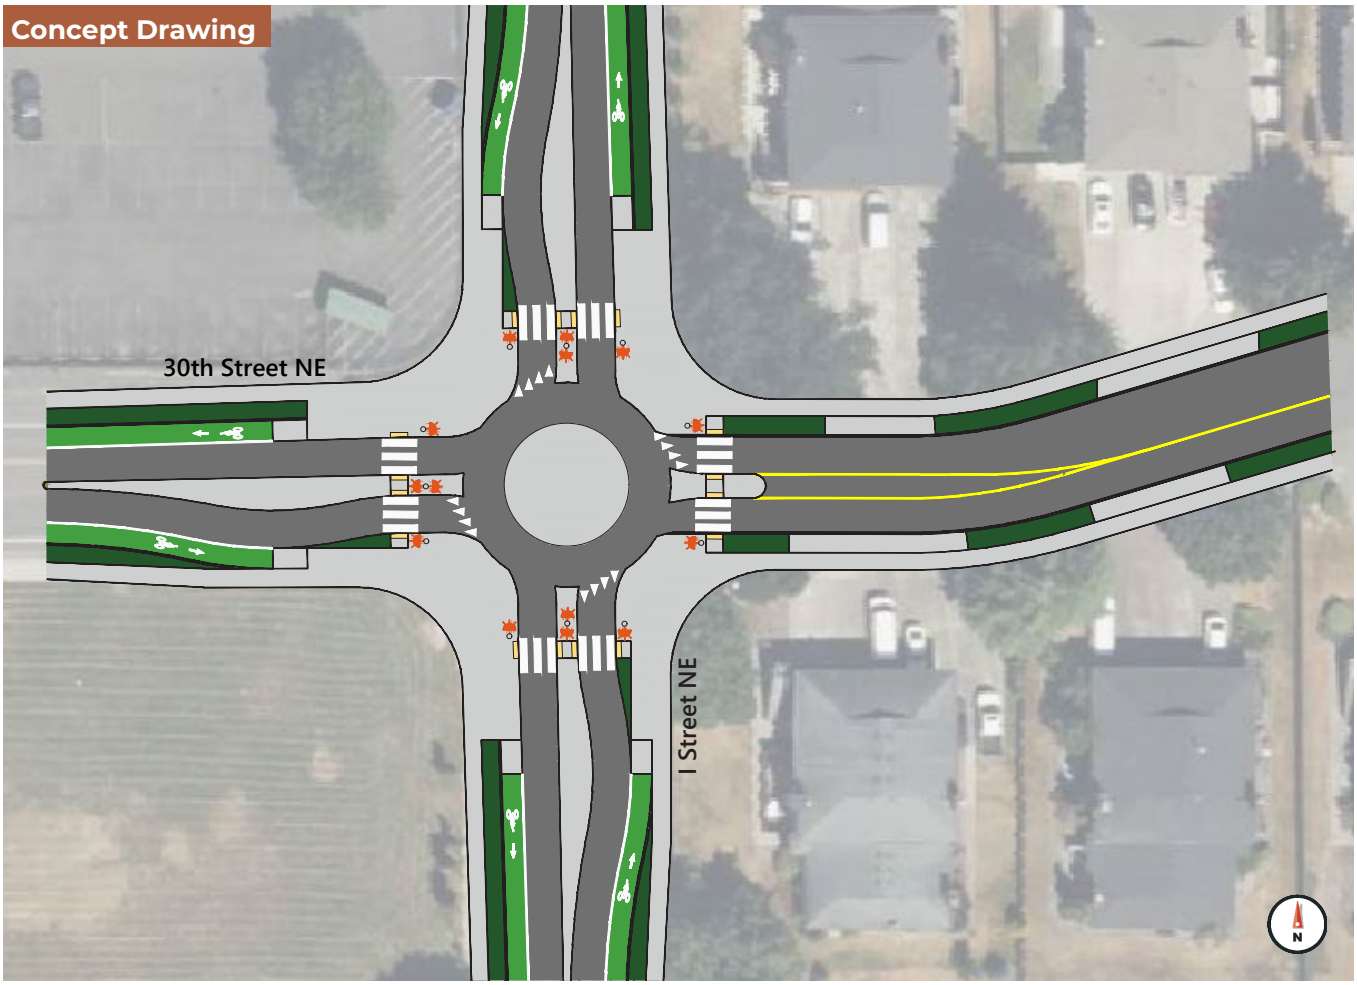
VEHICLE LOS WITHOUT PROJECT	AM	PM
2024 Existing	Meets	Meets
2044 Future	Meets	Fails

PROJECT PHASE	COST ESTIMATE
Planning & Engineering/ Design	$ 800,000
Right of Way	$ 100,000
Construction	$ 1,400,000
Total	$ 2,300,000

COMP-5
I ST NE & 30TH ST NE INTERSECTION IMPROVEMENTS

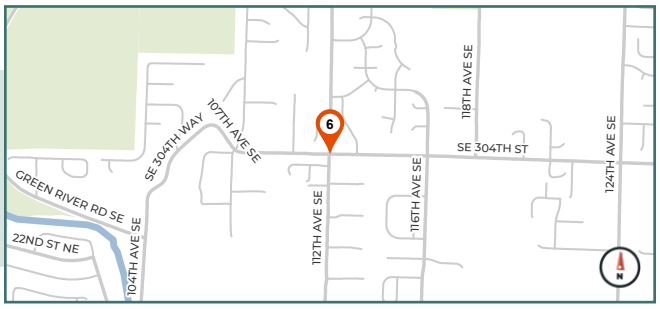
Project Origin: New 2024 CTP Project

Primary Need: Vehicle Capacity



Description:

Intersection delays will be reduced through the construction of a single-lane roundabout.



VEHICLE LOS WITHOUT PROJECT	AM	PM
2024 Existing	Meets	Meets
2044 Future	Meets	Fails

PROJECT PHASE	COST ESTIMATE
Planning & Engineering/ Design	$ 1,100,000
Right of Way	$ 50,000
Construction	$ 2,100,000
Total	$ 3,250,000

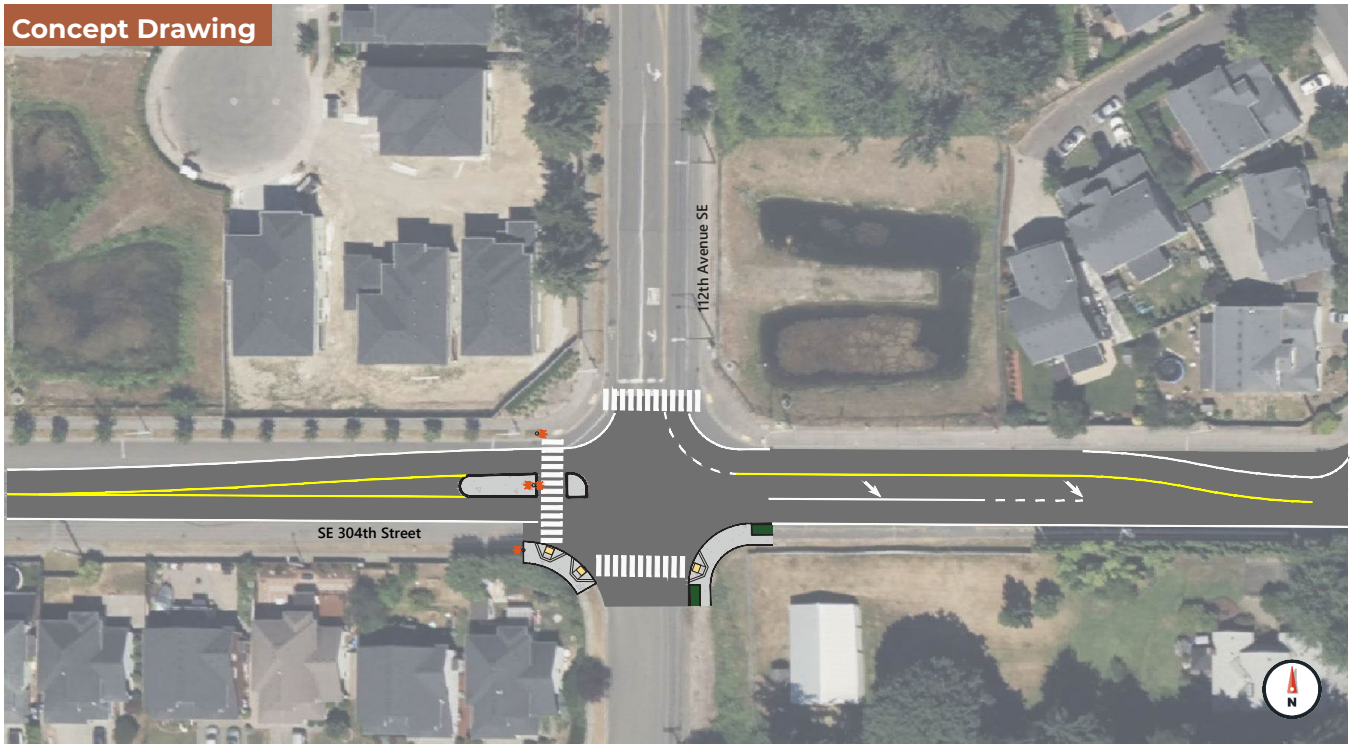
Concept Drawing

COMP-6
SE 304TH ST & 112TH AVE SE INTERSECTION IMPROVEMENTS

Project Origin: New 2024 CTP Project

Primary Need: Vehicle Capacity

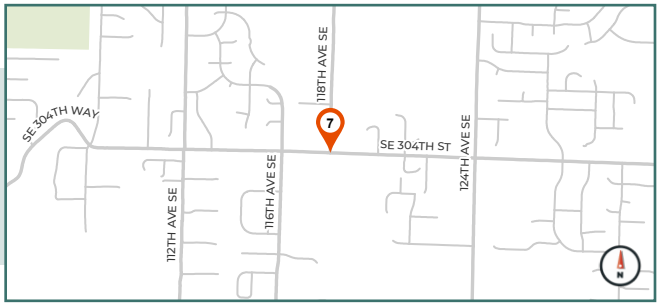
Description:



Intersection delays will be reduced through the construction of a new two-stage left turn lane on SE 304th St that will assist motorists turning from 112th Ave SE. A pedestrian refuge island and flashing beacons will be provided to enhance pedestrian crossing safety.

VEHICLE LOS WITHOUT PROJECT	AM	PM
2024 Existing	Meets	Meets
2044 Future	Meets	Fails

PROJECT PHASE	COST ESTIMATE*
Planning & Engineering/ Design	$ 300,000
Right of Way	$ 0
Construction	$ 500,000
Total	$ 800,000



** Includes RRFB system*

Concept Drawing

COMP-7

SE 304TH ST & 118TH AVE SE INTERSECTION IMPROVEMENTS

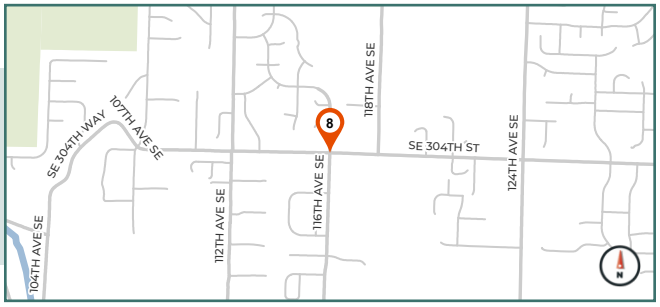
Project Origin: New 2024 CTP Project

Primary Need: Vehicle Capacity

Description:

Intersection delays will be reduced through the construction of a raised median on SE 304th St that will restrict left turns from 118th Ave SE.

VEHICLE LOS WITHOUT PROJECT	AM	PM
2024 Existing	Meets	Meets
2044 Future	Fails	Fails



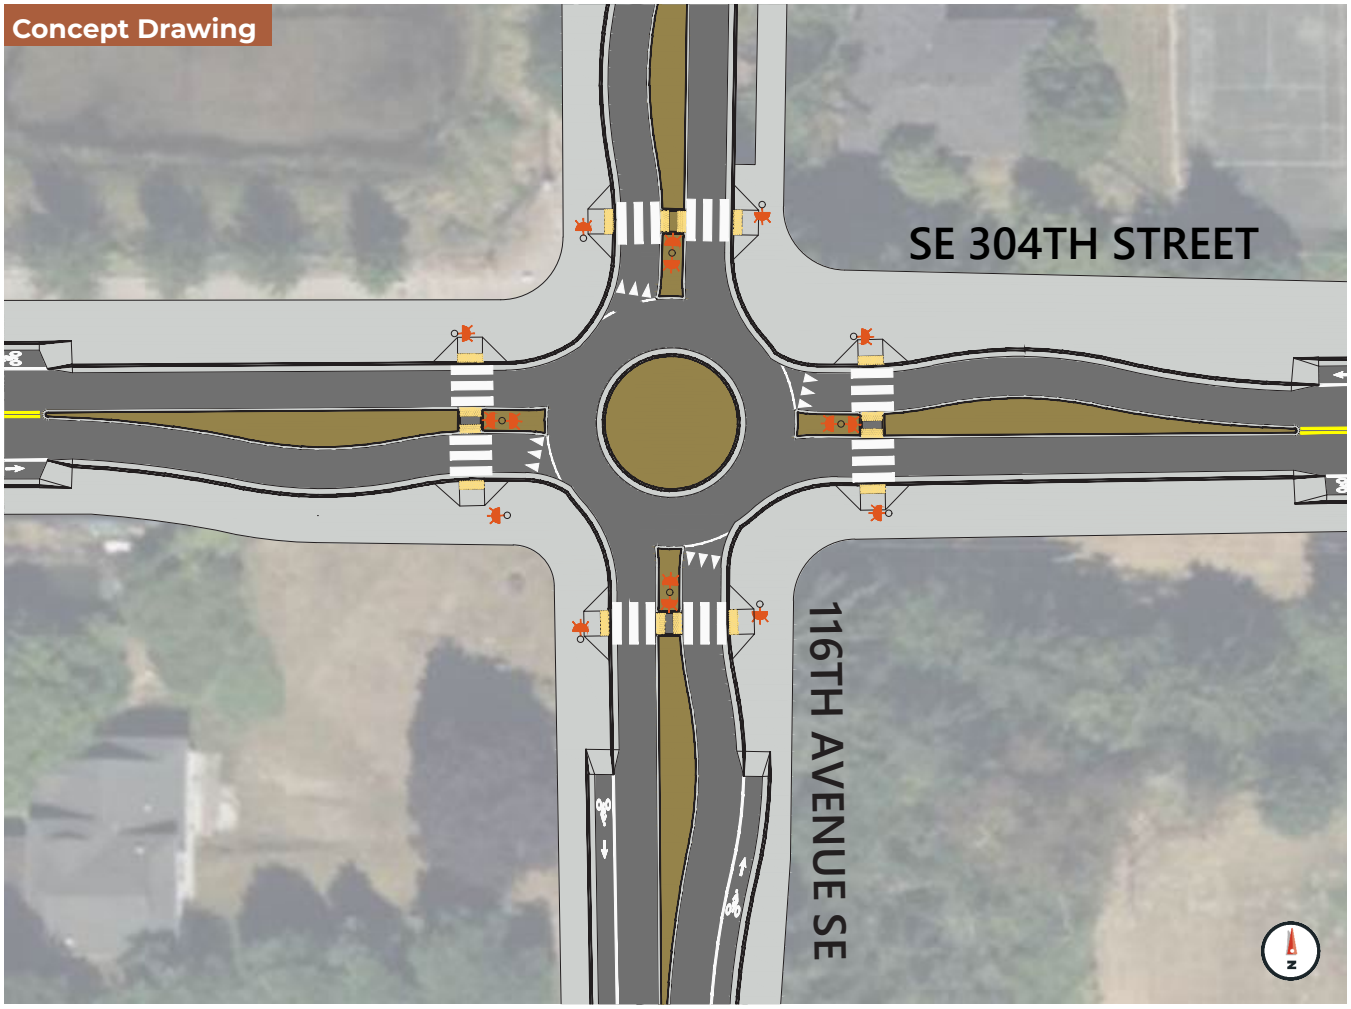
PROJECT PHASE	COST ESTIMATE
Planning & Engineering/ Design	$ 300,000
Right of Way	$ 50,000
Construction	$ 600,000
Total	$ 950,000

Concept Drawing

COMP-8

SE 304TH ST & 116TH AVE SE INTERSECTION IMPROVEMENTS

Project Origin: New 2024 CTP Project



Primary Need: Vehicle Capacity

Description:

Intersection delays will be reduced through the construction of a single-lane roundabout.

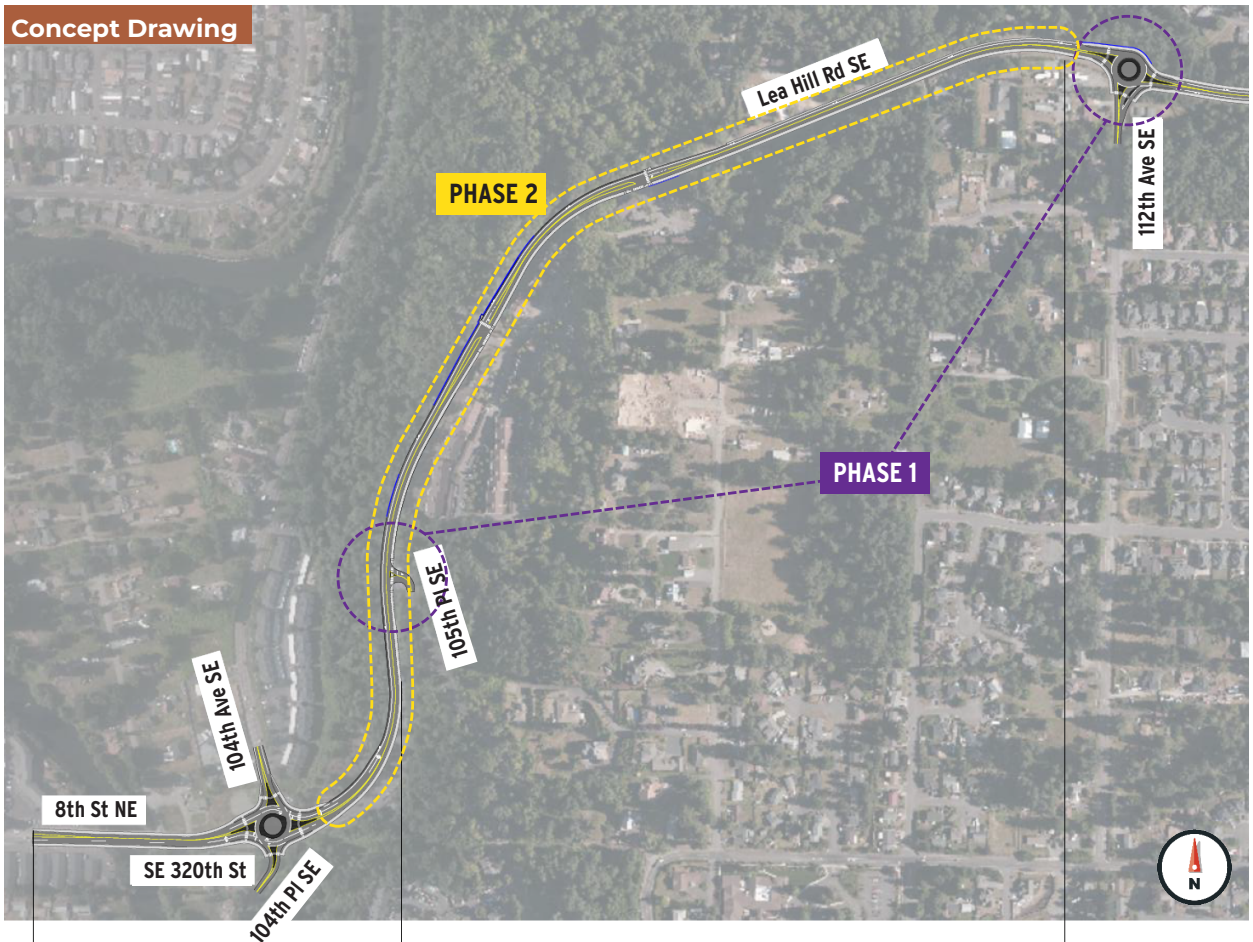
VEHICLE LOS WITHOUT PROJECT	AM	PM
2024 Existing	Fails	Meets
2044 Future	Fails	Meets

PROJECT PHASE	COST ESTIMATE
Planning & Engineering/ Design	$ 1,200,000
Right of Way	$ 325,000
Construction	$ 2,200,000
Total	$ 3,725,000

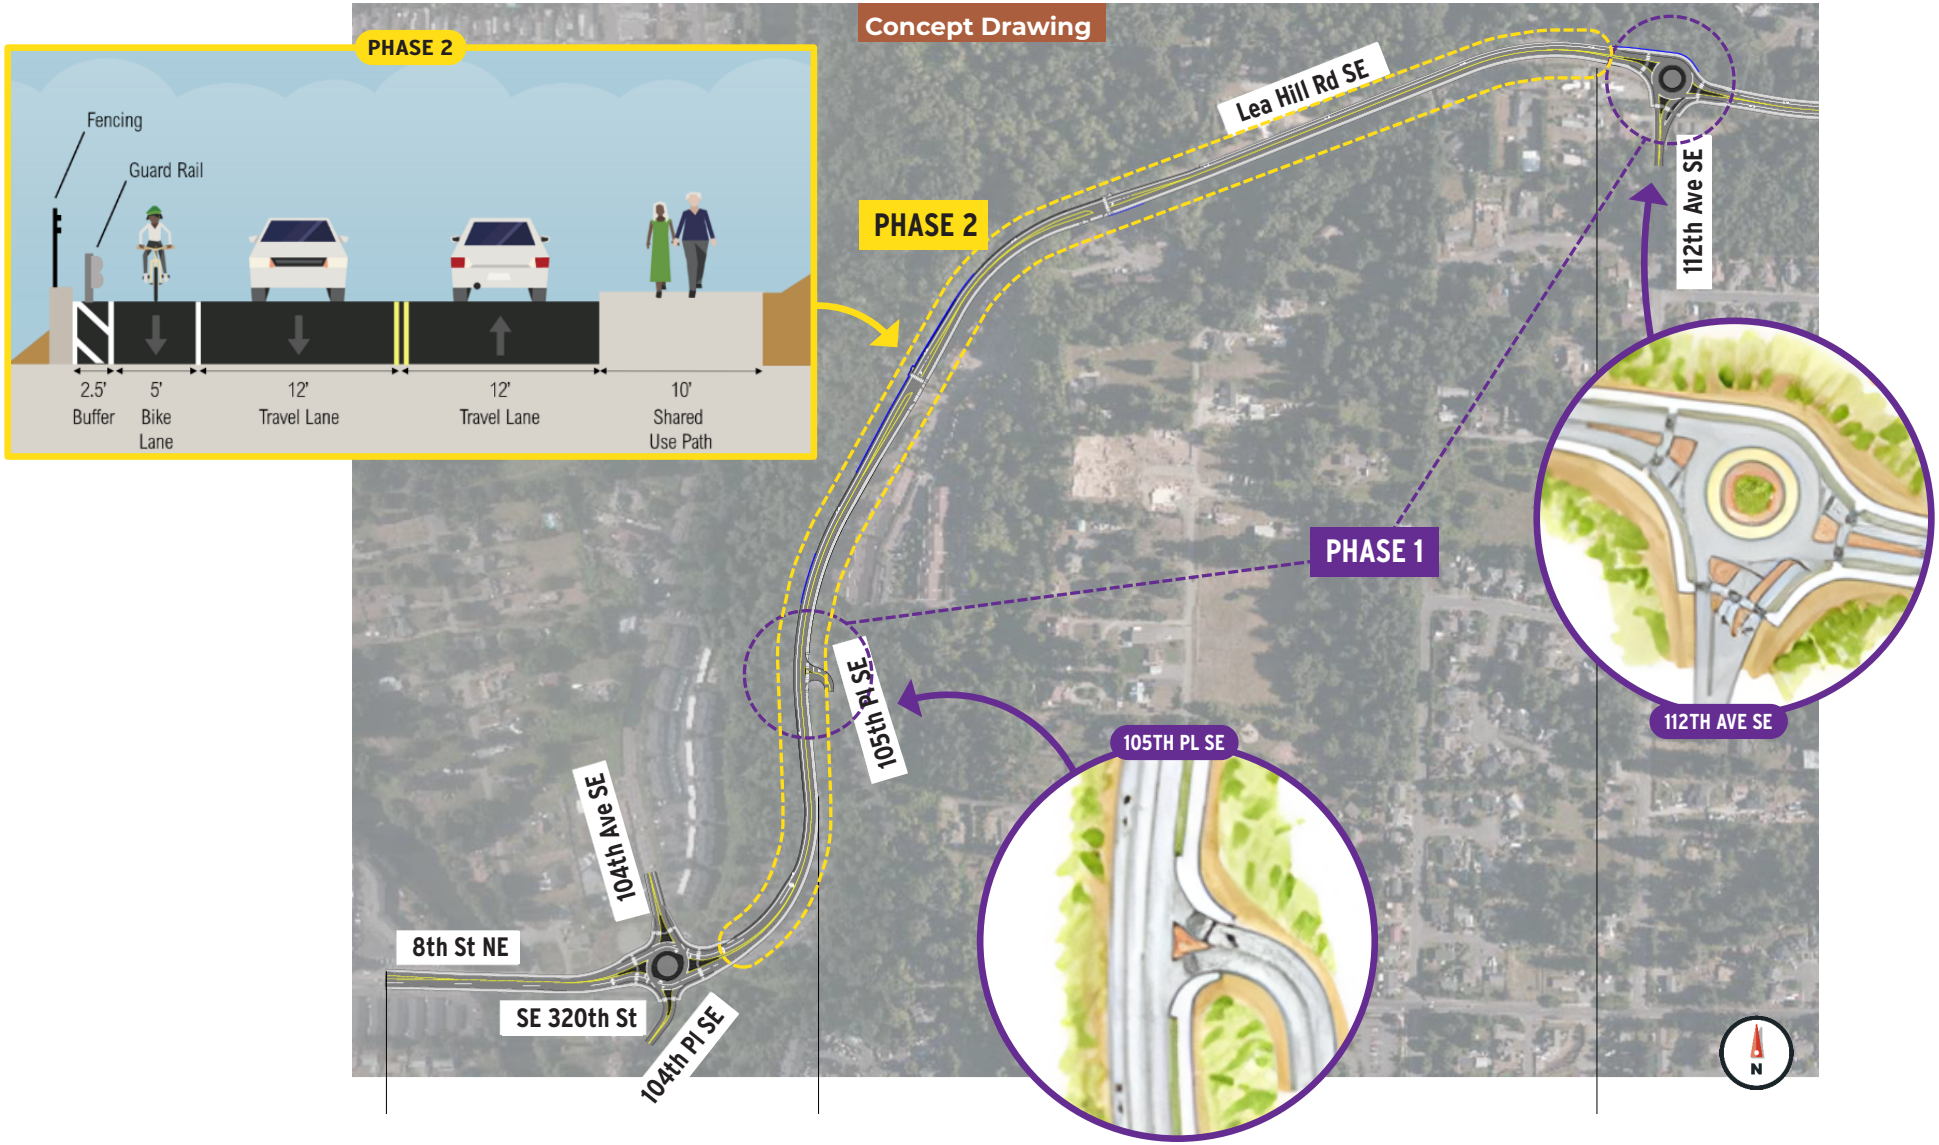
COMP-9
LEA HILL CORRIDOR IMPROVEMENTS

Project Origin: Lea Hill Corridor Study (2020)

Primary Needs: Vehicle Capacity, Mode Shift, Active Transportation, Safety



PROJECT PHASE	COST ESTIMATE
Phase 1: Lea Hill Corridor - 112th Ave SE & 105th Pl SE Intersections Improvements	$ 5,175,000
Phase 2: Lea Hill Rd Corridor - Non-Motorized Improvements from 104th Ave SE to SE 312th St	$ 9,500,000
Total	$14,675,000



Description:

This project will reduce intersection delays, improve vehicle and active transportation safety, and support mode shift through the construction of the following improvements that would likely be implemented as two separate phased projects:

- Phase 1 -
  New single lane roundabout at the intersection of Lea Hill Road and 112th Ave SE and removal of the existing traffic signal at the intersection of Lea Hill Road and 105th Ave SE. A raised media would restrict left turning movements at 105th Ave SE.
- Phase 2 -
  New multi-use shared path along east side (uphill) and bike lane along west side (downhill) of Lea Hill Road from the new roundabout at 104th Ave SE (previously constructed as a separate project), to the new roundabout at 112th Ave SE (constructed with Phase 1 of this project).

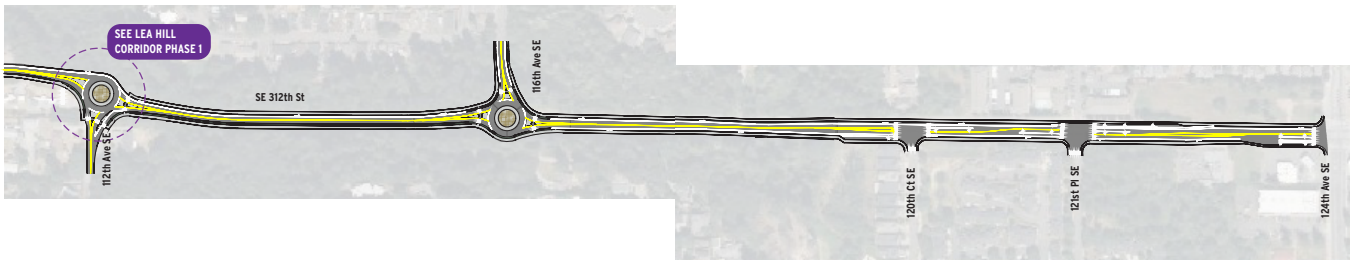
COMP-10

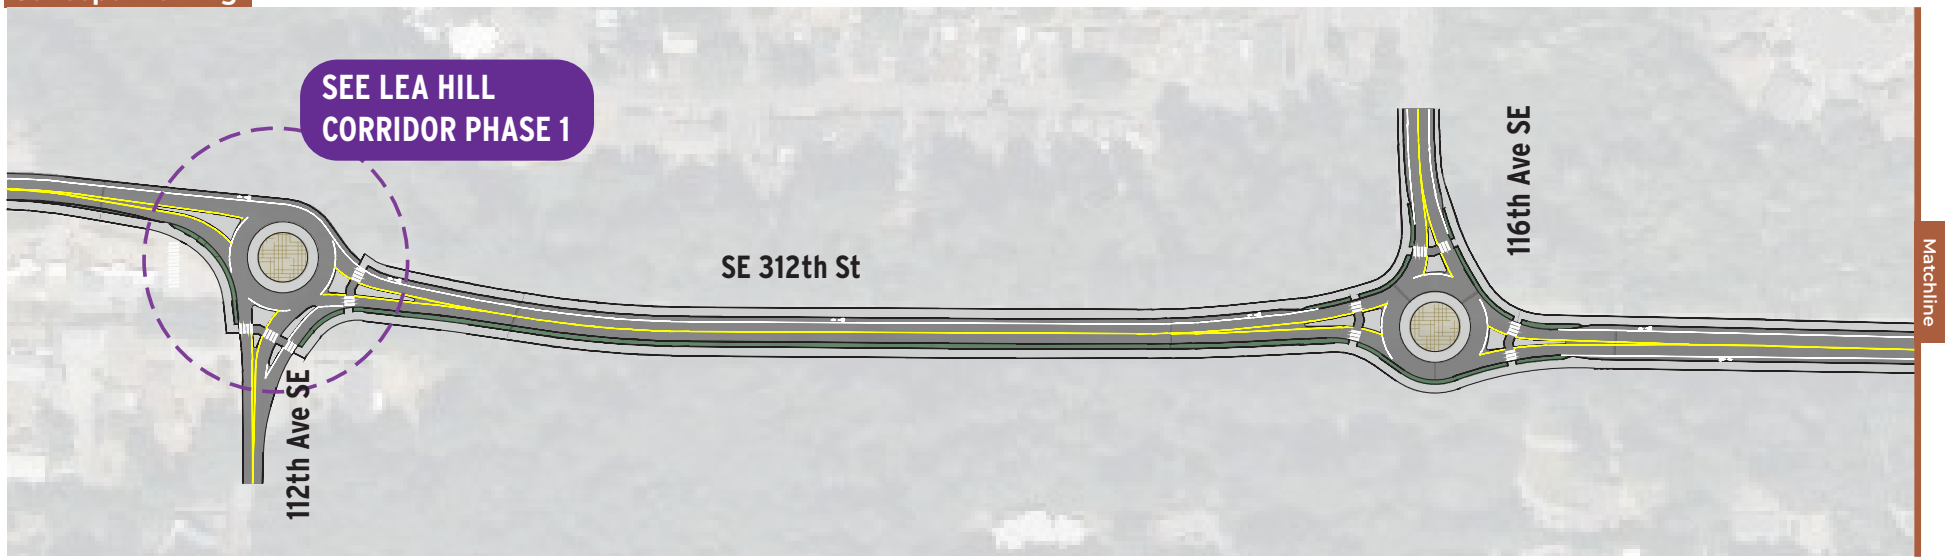
116TH AVE SE & SE 312TH ST IMPROVEMENTS

Project Origin: Lea Hill Corridor Study (2020)

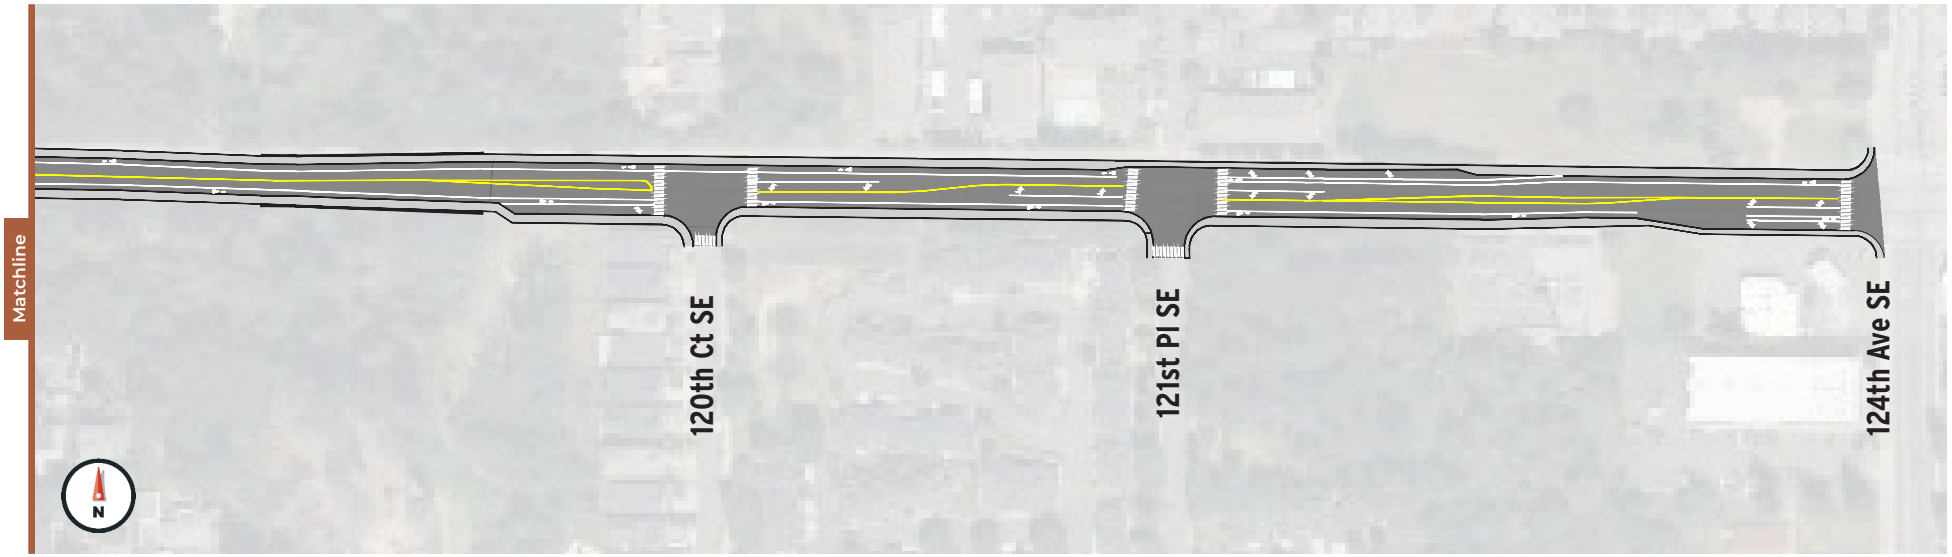


Primary Need: Vehicle Capacity

PROJECT PHASE	COST ESTIMATE
Planning & Engineering/ Design	$ 550,000
Right of Way	$ 50,000
Construction	$ 5,000,000
Total	$ 5,600,000



Description:



This project will reduce intersection delays, address bike and pedestrian LTS deficiencies, and provide overall safety improvements on Lea Hill Road/SE 312th Street from a new roundabout to be constructed with a separate project at the intersection of 112th Ave SE to the intersection of 124th Ave SE. Improvements include a new single lane roundabout at the intersection of 116th Ave SE, a bike lane along the north side of Lea Hill Road/SE 312th Street, a separated multi-use shared trail along the south side of Lea Hill Road/ SE 312th Street between 112th Ave SE and 116th Ave SE, and completing gaps in sidewalks and bike lanes on both sides of Lea Hill Road/SE 312th Street between 116th Ave SE and 124th Ave SE.

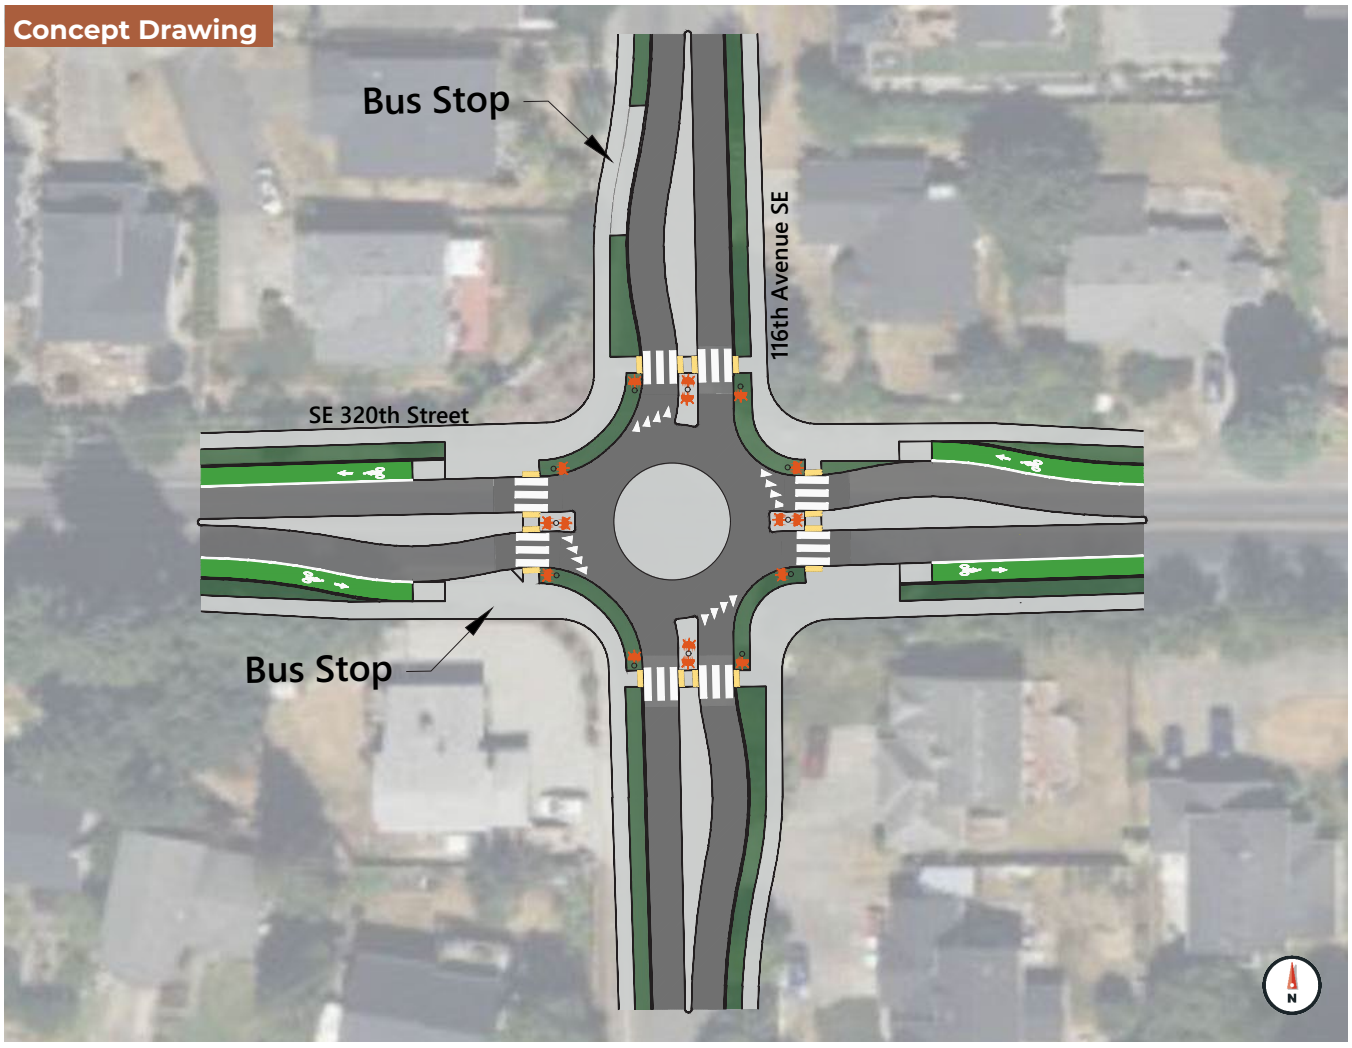
Concept Drawing

Concept Drawing

COMP-11

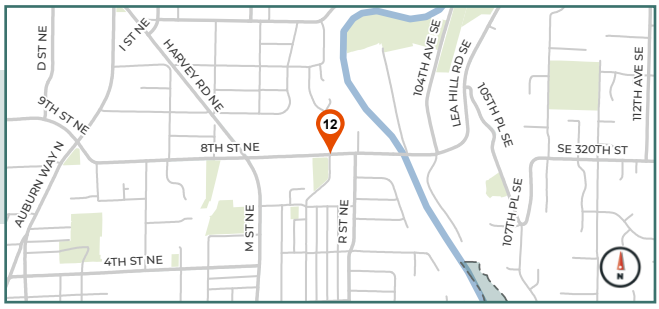
116TH AVE SE & SE 320TH ST INTERSECTION IMPROVEMENTS

Project Origin: 2019 Comprehensive Transportation Plan



Primary Needs: Safety, Active Transportation

Description:



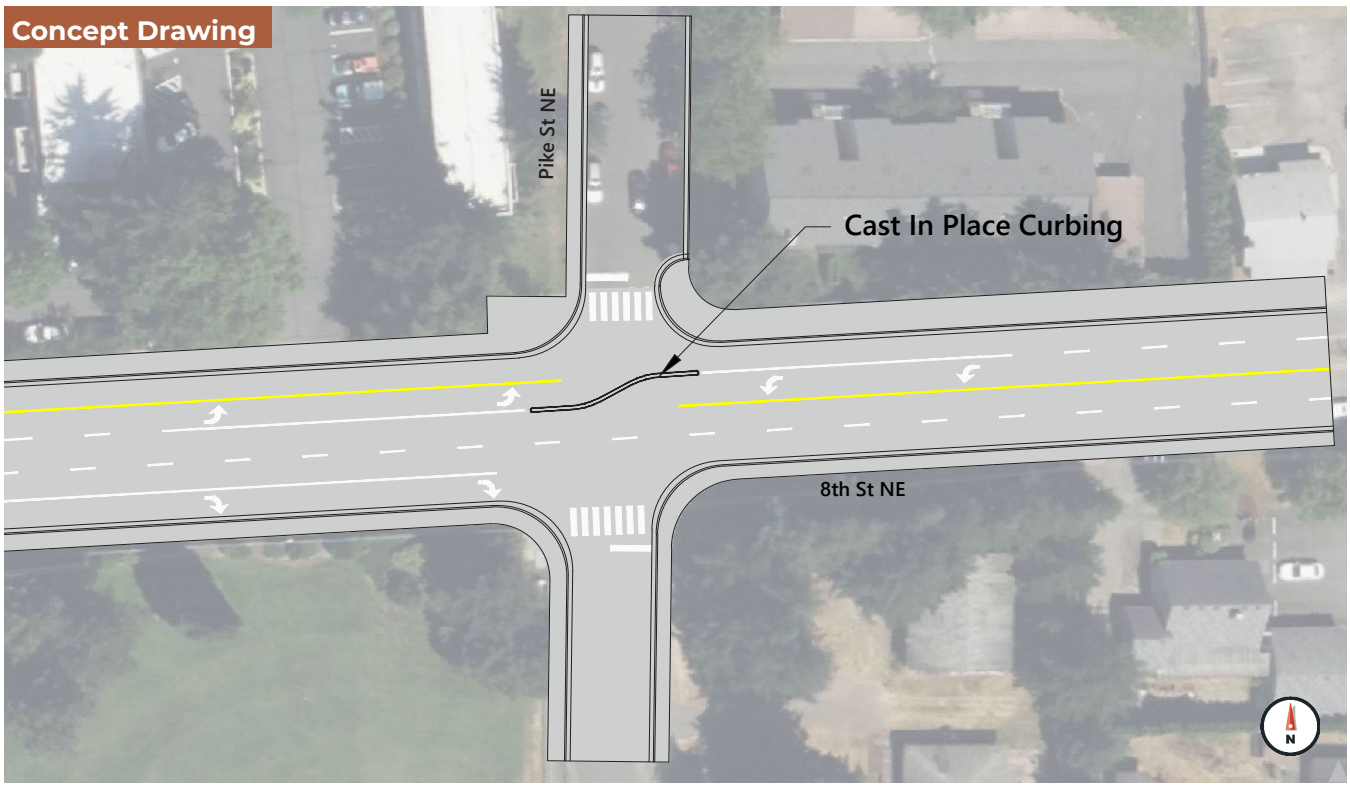
This project will improve vehicle and active transportation safety at the intersection with the construction of a single lane roundabout. This project may be expanded to complete gaps in sidewalks and bike lanes on SE 320th Street.

PROJECT PHASE	COST ESTIMATE
Planning & Engineering/ Design	$ 1,100,000
Right of Way	$ 50,000
Construction	$ 2,000,000
Total	$ 3,150,000

Concept Drawing

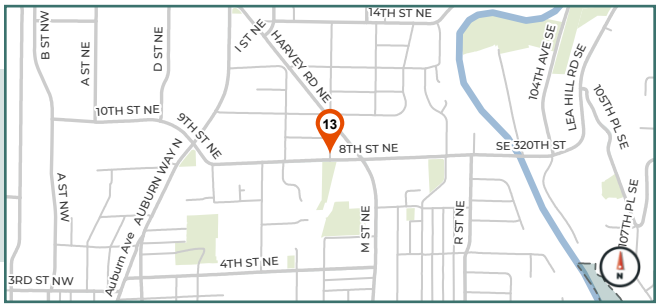
COMP-12
PIKE ST NE & 8TH ST NE ACCESS MANAGEMENT

Project Origin: New 2024 CTP Project



Primary Need: Vehicle Capacity

Description:



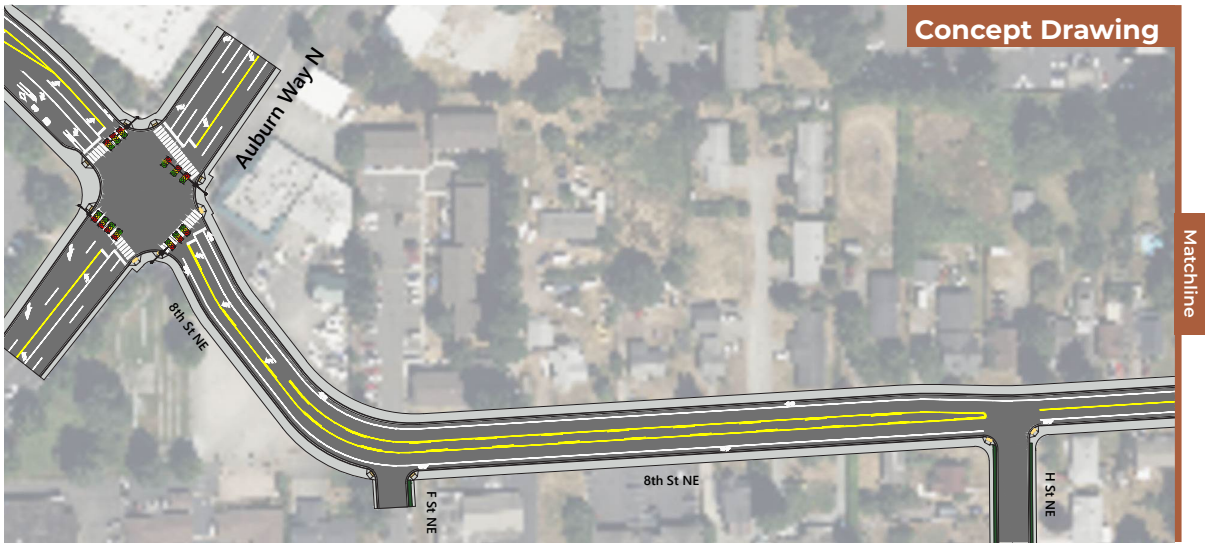
Intersection delays will be reduced by restricting left turns from both northbound and southbound Pike St NE on to 8th St NE.

VEHICLE LOS WITHOUT PROJECT	AM	PM
2024 Existing	Meets	Fails
2044 Future	Fails	Fails

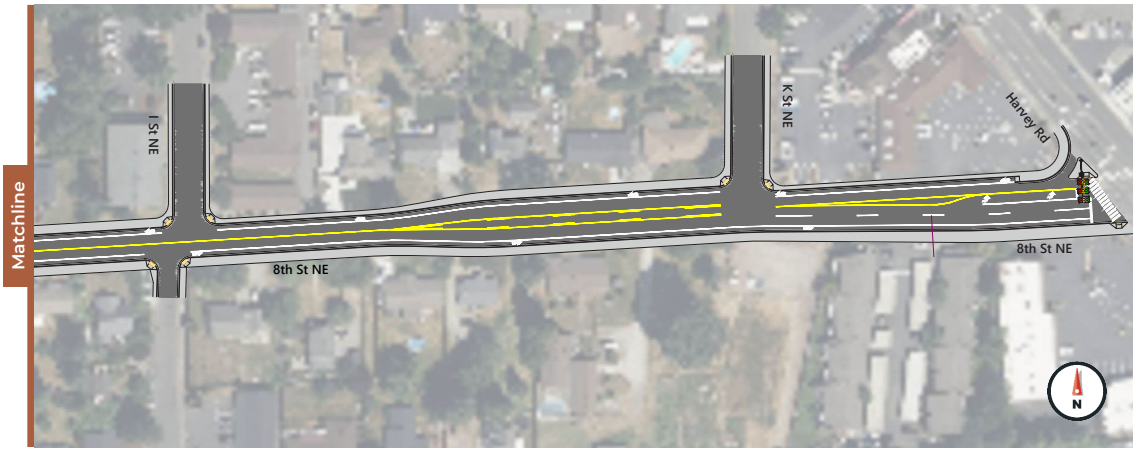
PROJECT PHASE	COST ESTIMATE
Planning & Engineering/ Design	$ 15,000
Right of Way	$ 0
Construction	$ 35,000
Total	$ 50,000

COMP-13
8TH ST NE IMPROVEMENTS PROJECT
(AUBURN WAY N - HARVEY RD/M ST NE)

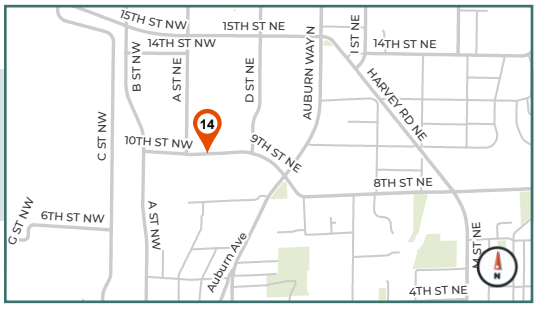
Project Origin: 2024 CTP New Project



Primary Needs: Mode Shift/Active Transportation/Safety



PROJECT PHASE	COST ESTIMATE
Planning & Engineering/ Design	$ 2,300,000
Right of Way	$ 1,800,000*
Construction	$ 4,100,000
Total	$ 8,200,000

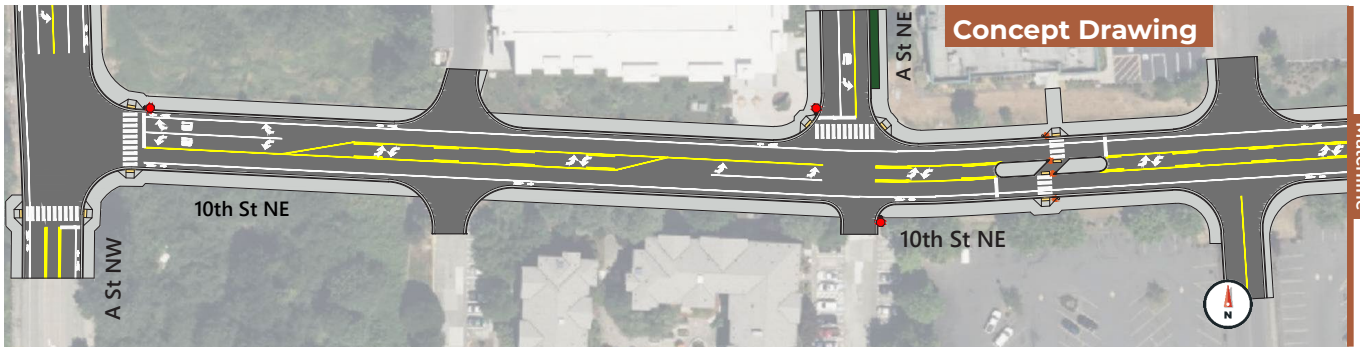


* ROW costs assume no relocation is required.

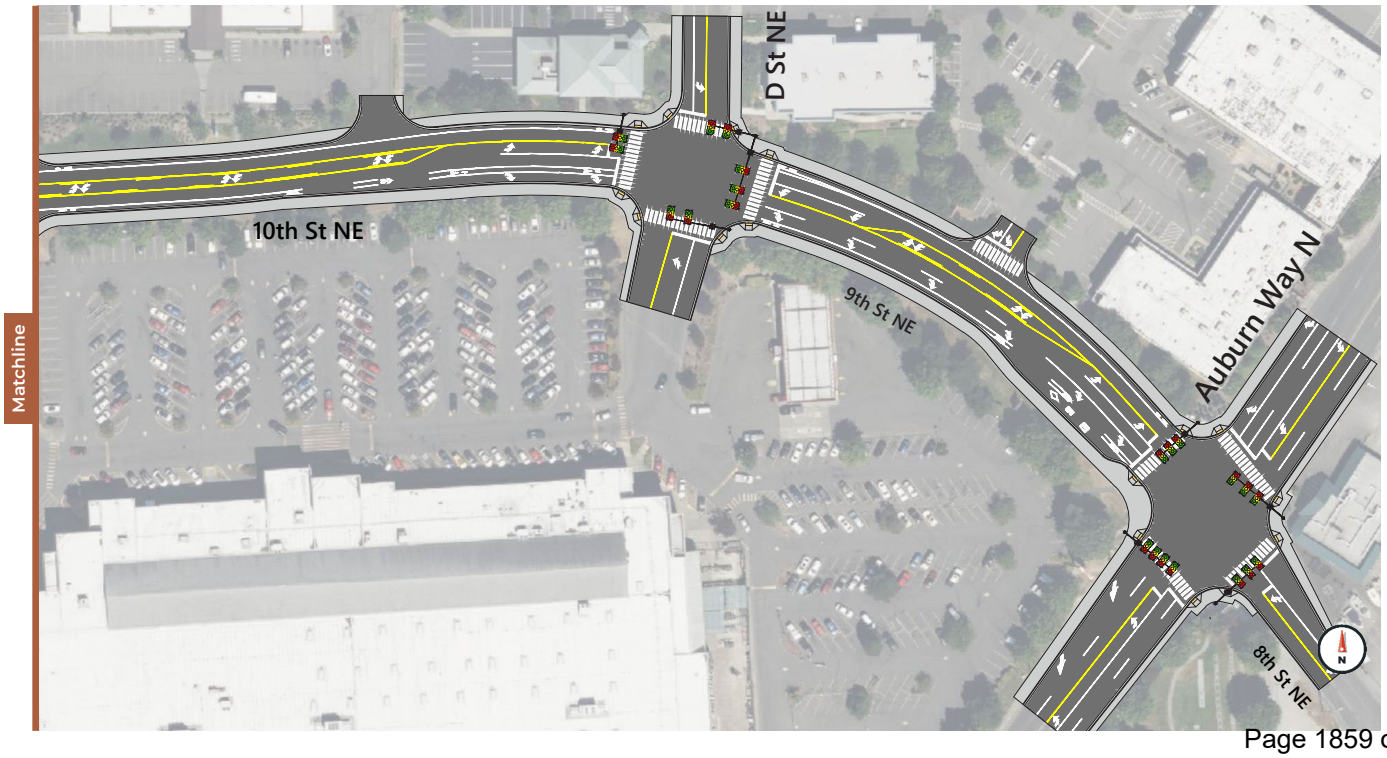
Description:

Residents from the neighborhoods along 8th Street NE currently must walk or ride along narrow shoulders to get to shopping, social services, recreation, and transit along Auburn Way North and M Street NE/Harvey Rd. This route is part of the City's designated bike route network (as shown in Map 2 - Bike Network) and is a critical connection to Downtown Auburn and regional transit and bike facilities. This project will improve the roadway to provide comfortable walking and biking facilities that meet or exceed the City's active transportation level of service standards. The project concept currently includes a center turn lane but whether or not the lane is included in the final project design will depend on detailed design considerations, including right of way needs.

COMP-14
10TH ST NE IMPROVEMENTS
(A ST NW - AUBURN WAY N)

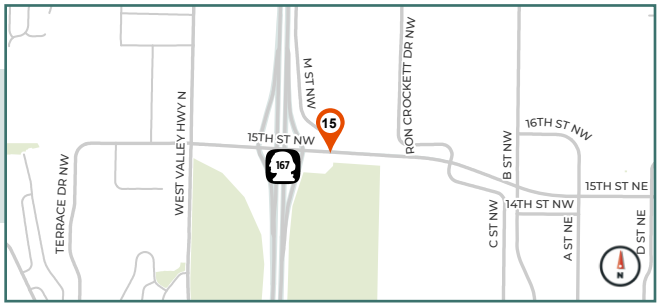


Project Origin: 2024 Comprehensive Transportation Plan



Primary Needs: Safety, Active Transportation, Mode Shift

PROJECT PHASE	COST ESTIMATE
Planning & Engineering/Design	$ 800,000
Right of Way	$ 0
Construction	$ 1,500,000
Total	$ 2,300,000



Description:

This project will provide bicycle facilities that meet or exceed City LTS Standards and improve vehicle and pedestrian safety measures on 10th Street NE between A Street NW and Auburn Way North. Improvements include addition of bike lanes, a road-diet to convert two lanes in each direction to one lane in each direction with a center turn lane, removal of stop-control at the intersection of A Street NE, and installation of an enhanced pedestrian crossing. The project provides active transportation facilities that connect housing and commercial areas to frequent transit on Auburn Way North.

COMP-15
15TH ST NW & M ST NW ACCESS MANAGEMENT

Project Origin: New 2024 CTP Project

Primary Need: Vehicle Capacity

Description:

Intersection delays will be reduced by restricting left turns from southbound M St NW to eastbound 15th St NW during peak travel demand periods.

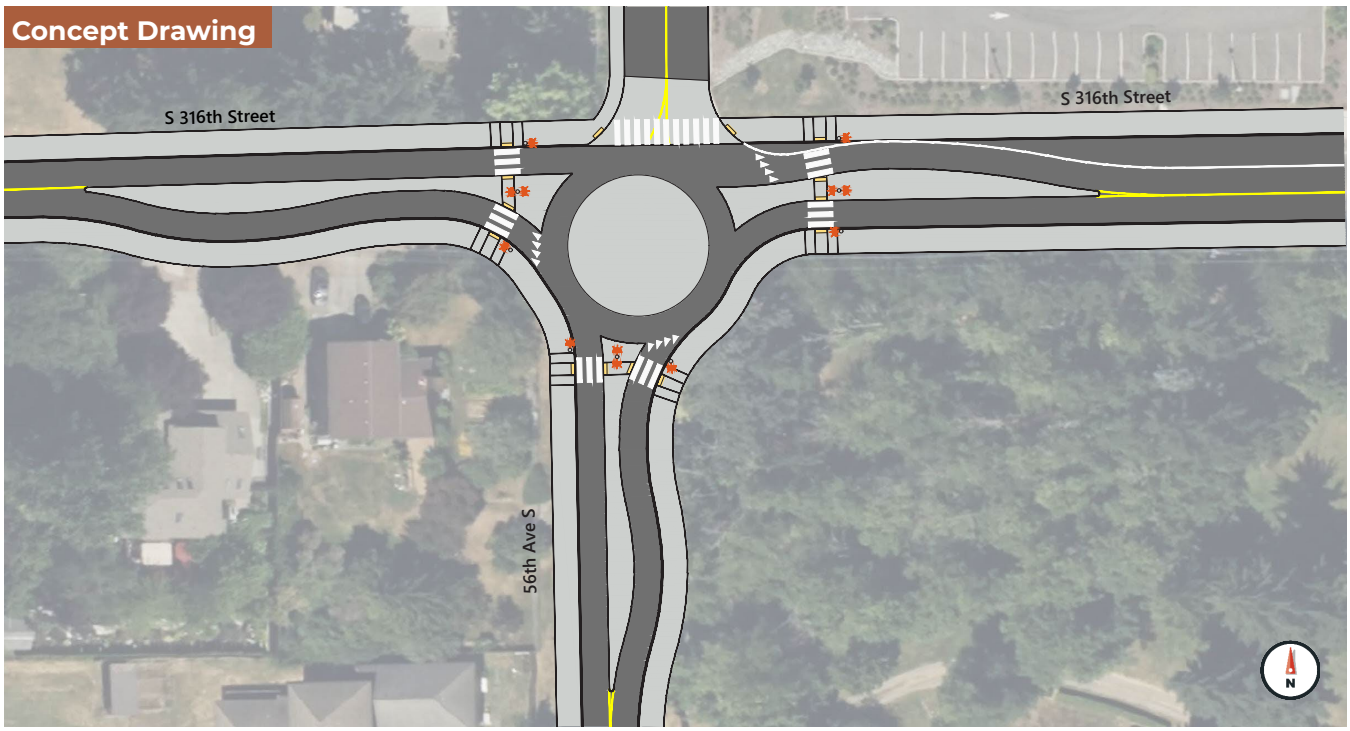
VEHICLE LOS WITHOUT PROJECT	AM	PM
2024 Existing	Meets	Meets
2044 Future	Fails	Fails

PROJECT PHASE	COST ESTIMATE
Planning & Engineering/ Design	$ 10,000
Right of Way	$ 0
Construction	$ 40,000
Total	$ 50,000

COMP-16

S 316TH ST & 56TH AVE S INTERSECTION IMPROVEMENTS

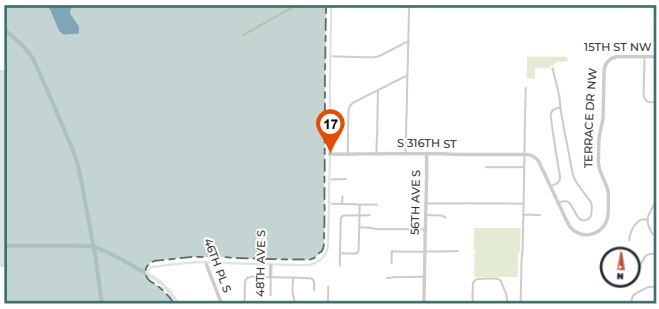
Project Origin: New 2024 CTP Project



Primary Need: Vehicle Capacity

Description:

Intersection delays will be reduced through the construction of a single-lane roundabout.



VEHICLE LOS WITHOUT PROJECT	AM	PM
2024 Existing	Meets	Meets
2044 Future	Meets	Fails

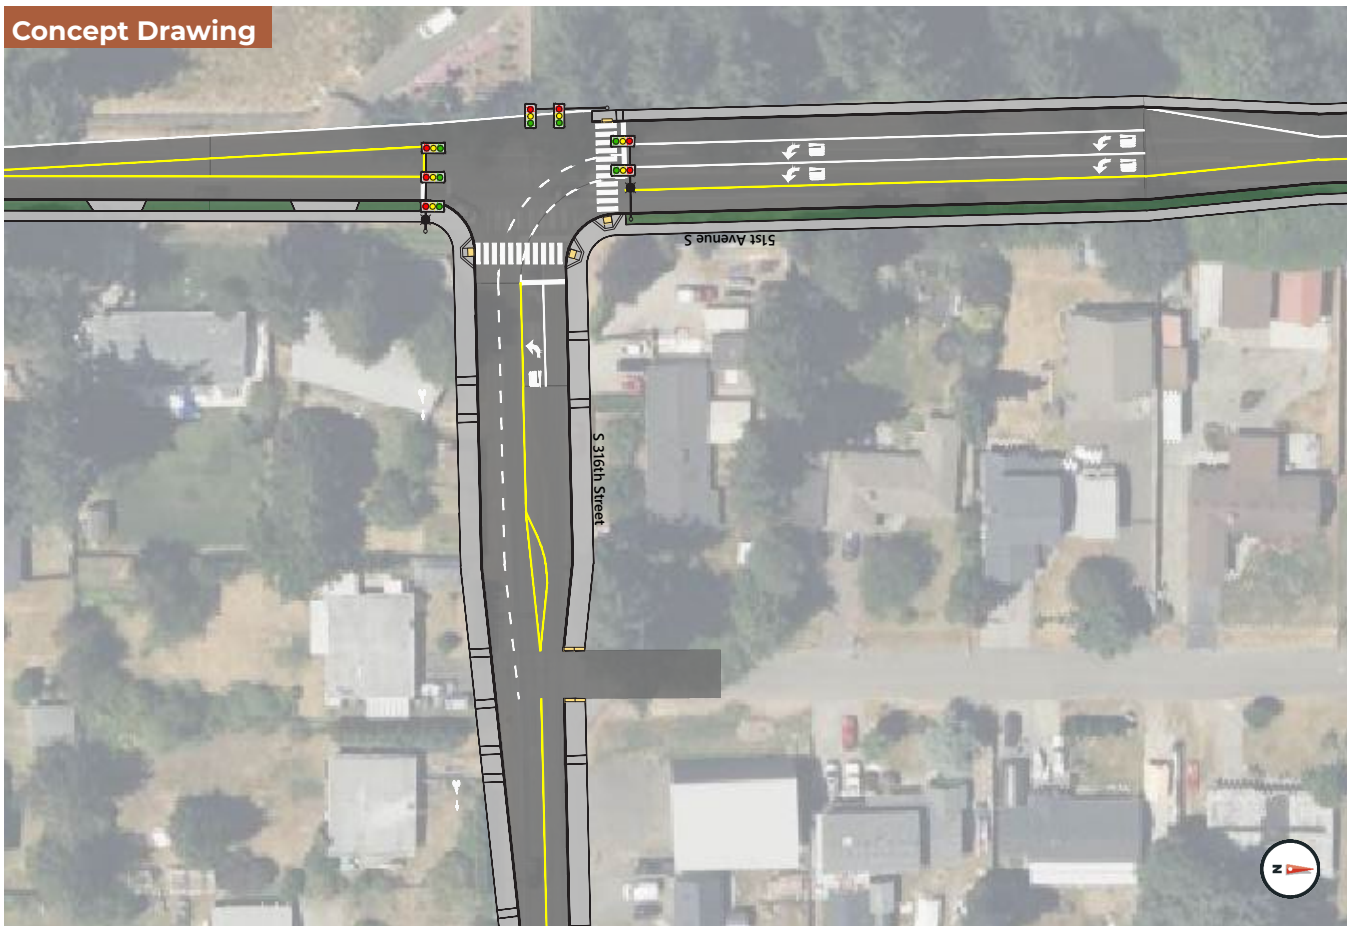
PROJECT PHASE	COST ESTIMATE
Planning & Engineering/ Design	$ 1,100,000
Right of Way	$ 125,000
Construction	$ 2,000,000
Total	$ 3,225,000

COMP-17

S 316TH ST & 51ST AVE S INTERSECTION IMPROVEMENTS

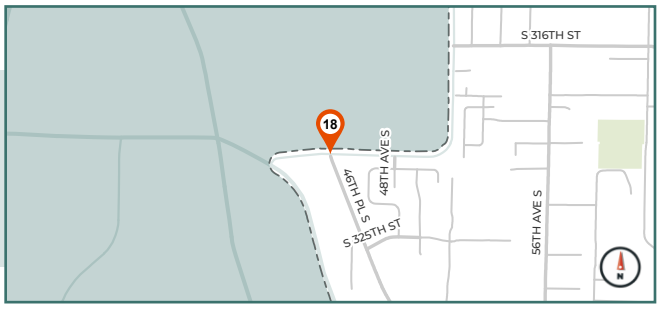
Project Origin: New 2024 CTP Project

Primary Need: Vehicle Capacity



Description:

Intersection delays will be reduced through the replacement of the stop controls with construction of a new traffic signal. This intersection is outside City limits in King County. Coordination with King County will be required to fund and implement this project.



VEHICLE LOS WITHOUT PROJECT	AM	PM
2024 Existing	Meets	Fails
2044 Future	Meets	Fails

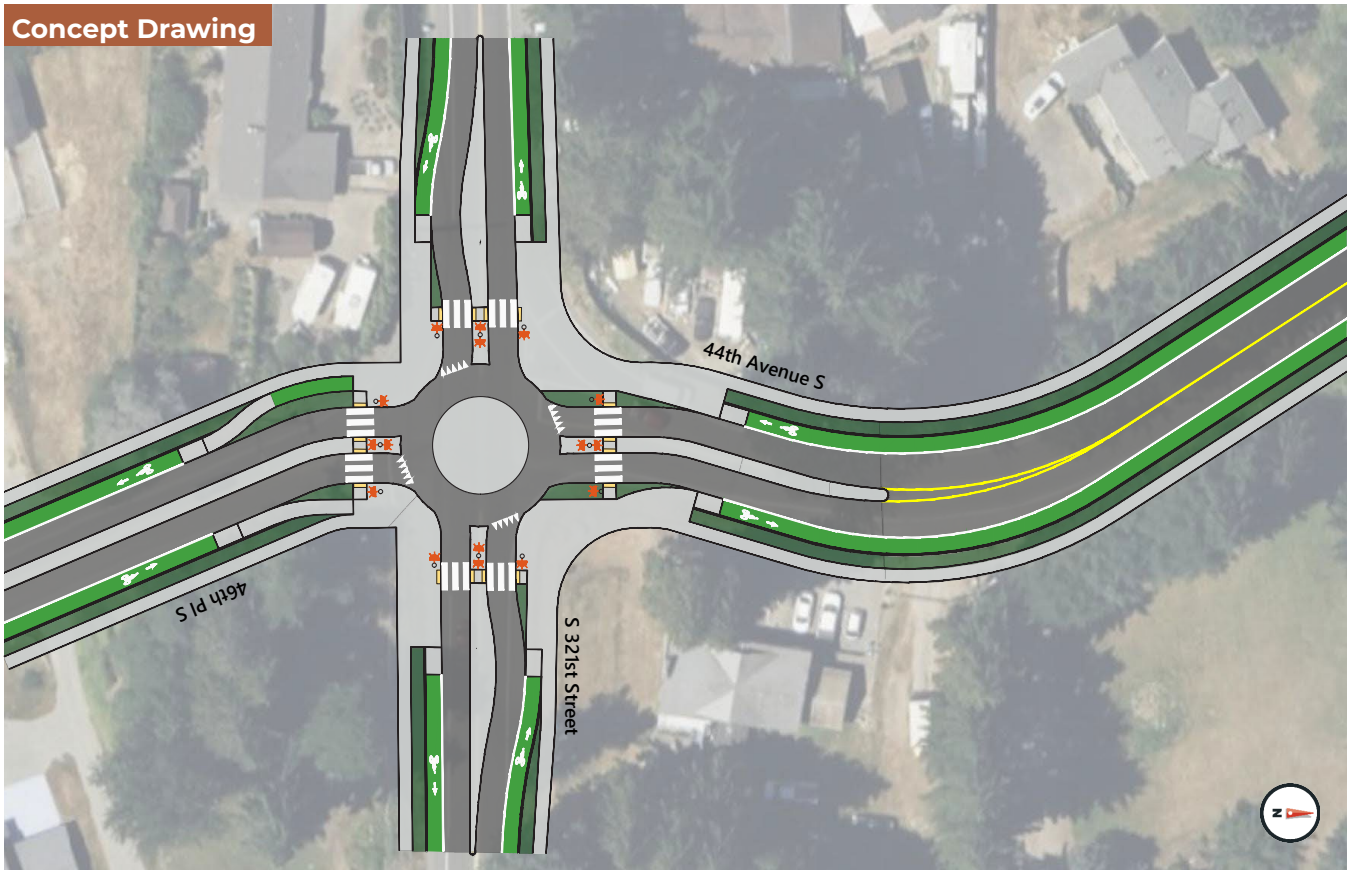
PROJECT PHASE	COST ESTIMATE
Planning & Engineering/ Design	$ 700,000
Right of Way	$ 150,000
Construction	$ 1,300,000
Total	$ 2,150,000

Concept Drawing

COMP-18
S 321ST ST & 44TH AVE S/ 46TH PL S INTERSECTION IMPROVEMENTS

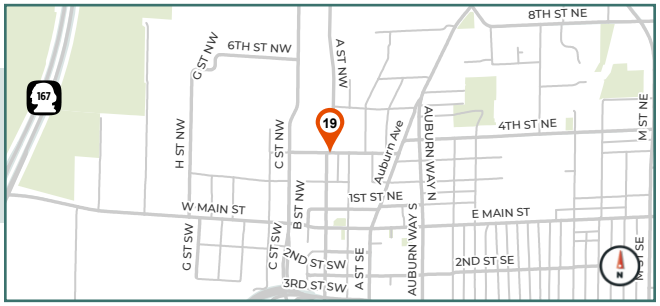
Project Origin: New 2024 CTP Project

Primary Need: Vehicle Capacity



Description:

Intersection delays will be reduced through the construction of a single-lane roundabout. This intersection is outside City limits in King County. Coordination with King County will be required to fund and implement this project.Temporary mitigation measures to address existing LOS deficiency may require a traffic signal or other improvements until permanent project can be funded. Additional analysis is needed to determine if existing and/or future capacity needs can be met by improving the right-of-way east of 46th Place with roadway facilities instead of, or in addition to this roundabout.



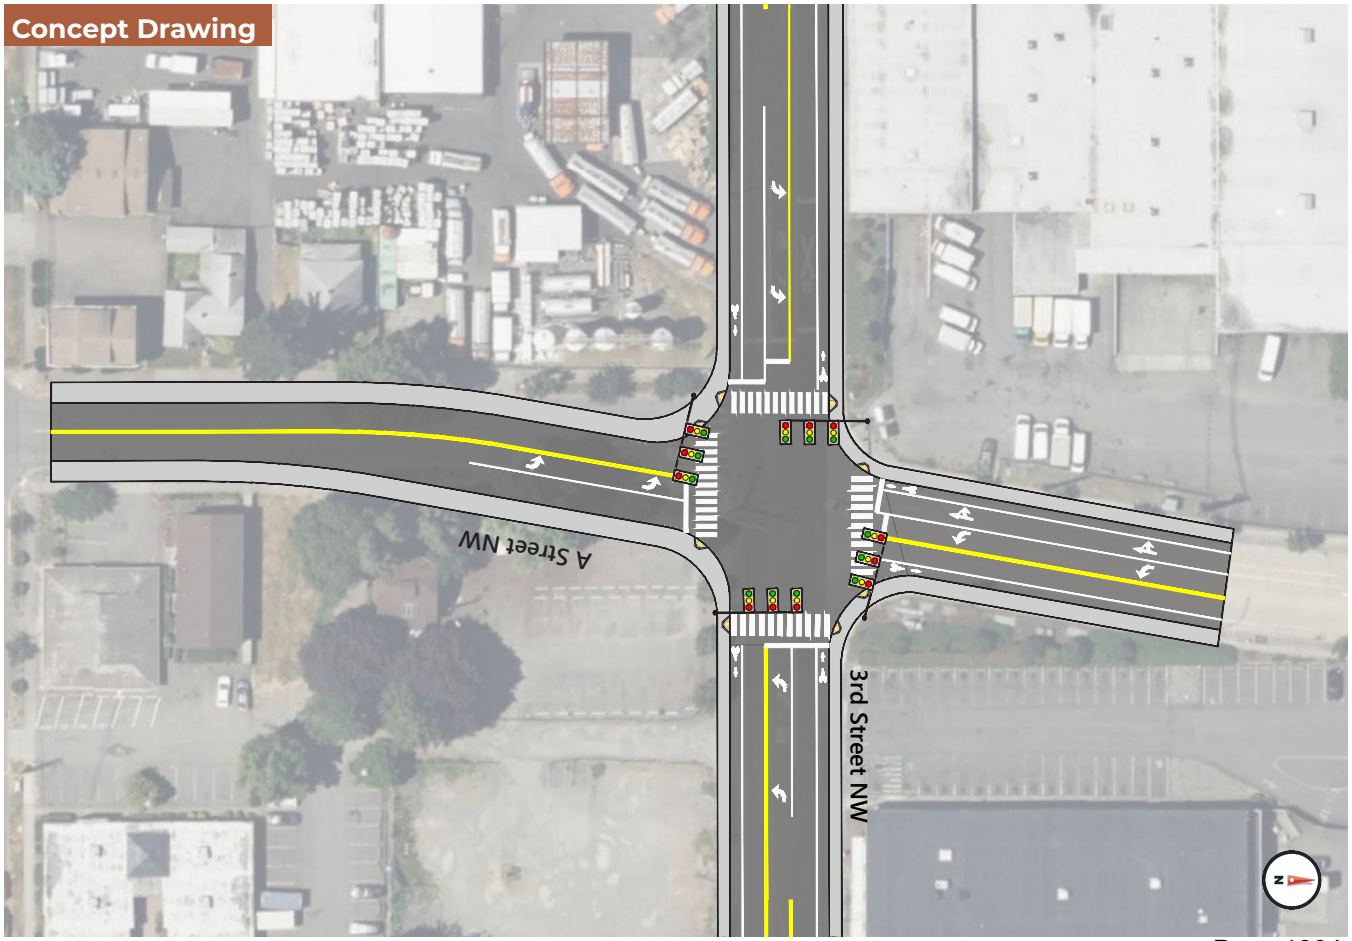
VEHICLE LOS WITHOUT PROJECT	AM	PM
2024 Existing	Meets	Fails
2044 Future	Fails	Fails

PROJECT PHASE	COST ESTIMATE
Planning & Engineering/ Design	$ 1,200,000
Right of Way	$ 350,000
Construction	$ 2,200,000
Total	$ 3,750,000

Concept Drawing

COMP-19
A ST NW & 3RD ST NW IMPROVEMENTS

Project Origin: 2019 Comprehensive Transportation Plan



Primary Needs: Vehicle Capacity

Description:

This project will reduce intersection delays and improve overall vehicle, pedestrian, and bicycle operations through this intersection by re-constructing the south leg of the intersection to be re-aligned such that the split phase operations of the signal can be removed. Modeling indicates that despite this project, the southbound right turn lane queue would have a queue length that exceeds LOS standards. Therefore, additional refinement of this project would be required with, or prior to, implementation.

PROJECT PHASE	COST ESTIMATE
Planning & Engineering/ Design	$ 1,000,000
Right of Way	$ 225,000
Construction	$ 1,800,000
Total	$ 3,025,000

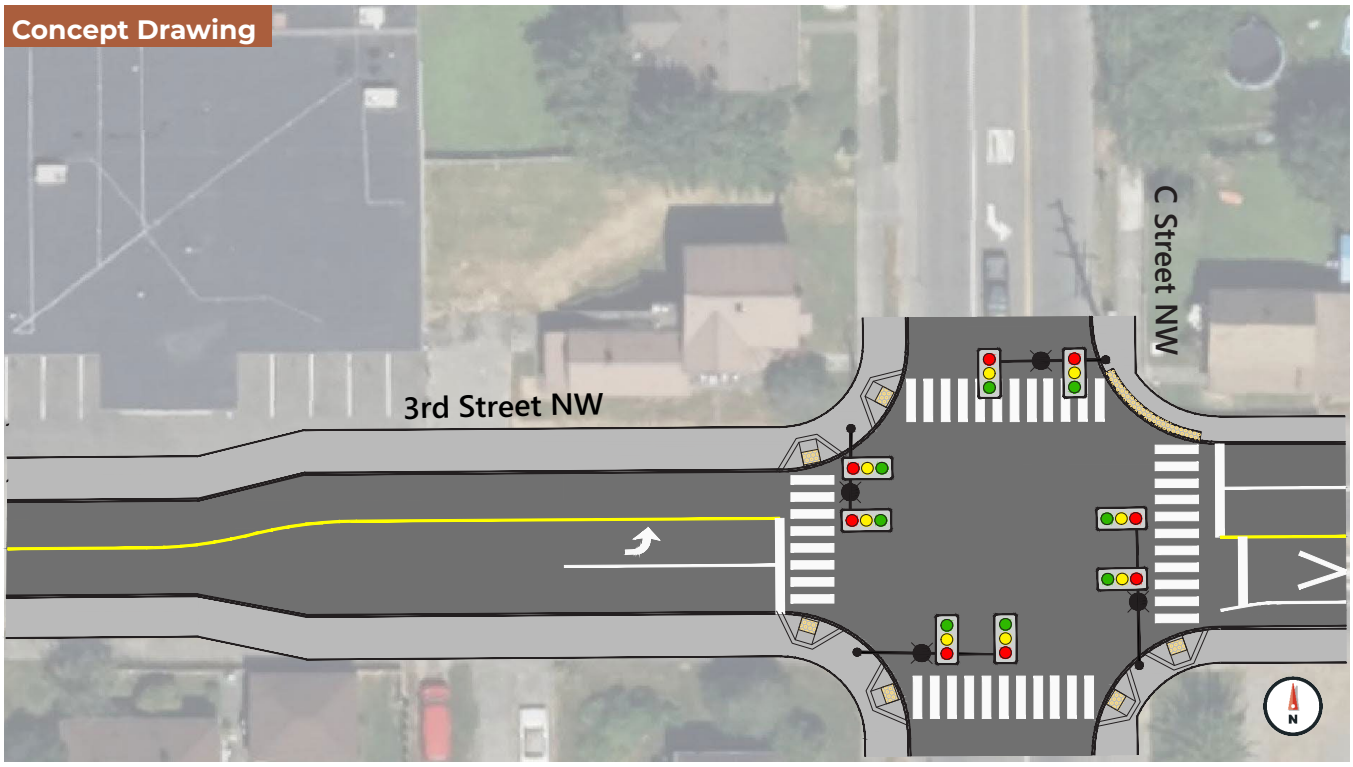
Concept Drawing

COMP-20

C ST NW & 3RD ST NW INTERSECTION IMPROVEMENTS

Project Origin: New 2024 CTP Project

Primary Need: Vehicle Capacity

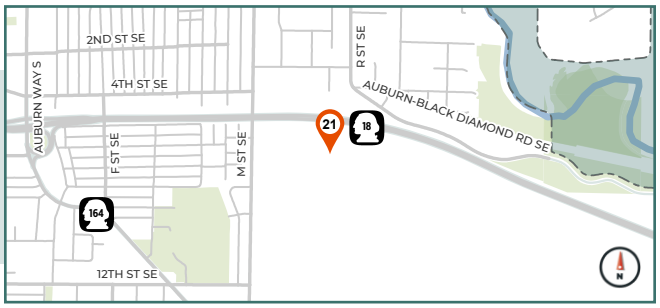


Description:

Intersection delays will be reduced through the addition of a dedicated eastbound left turn lane on 3rd Street NW and modifying the signal operations to allow for protected/ permissive left-turns on all approaches.

VEHICLE LOS WITHOUT PROJECT	AM	PM
2024 Existing	Meets	Fails
2044 Future	Meets	Fails

PROJECT PHASE	COST ESTIMATE
Planning & Engineering/ Design	$ 700,000
Right of Way	$ 0
Construction	$ 1,200,000
Total	$ 1,900,000

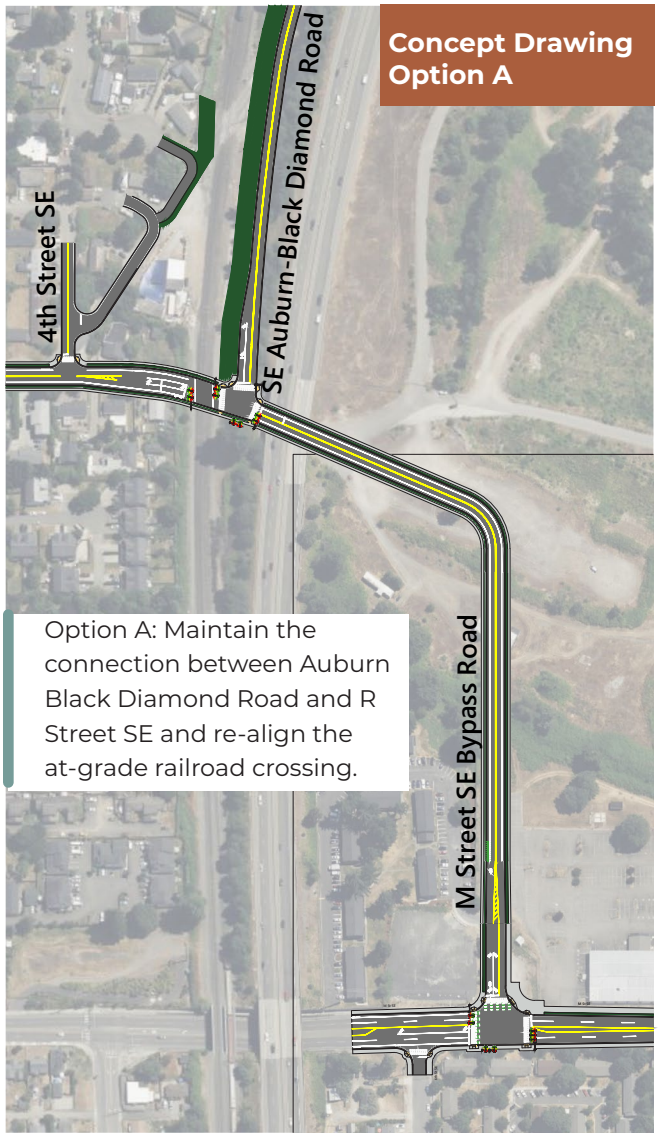


Concept Drawing

COMP-21

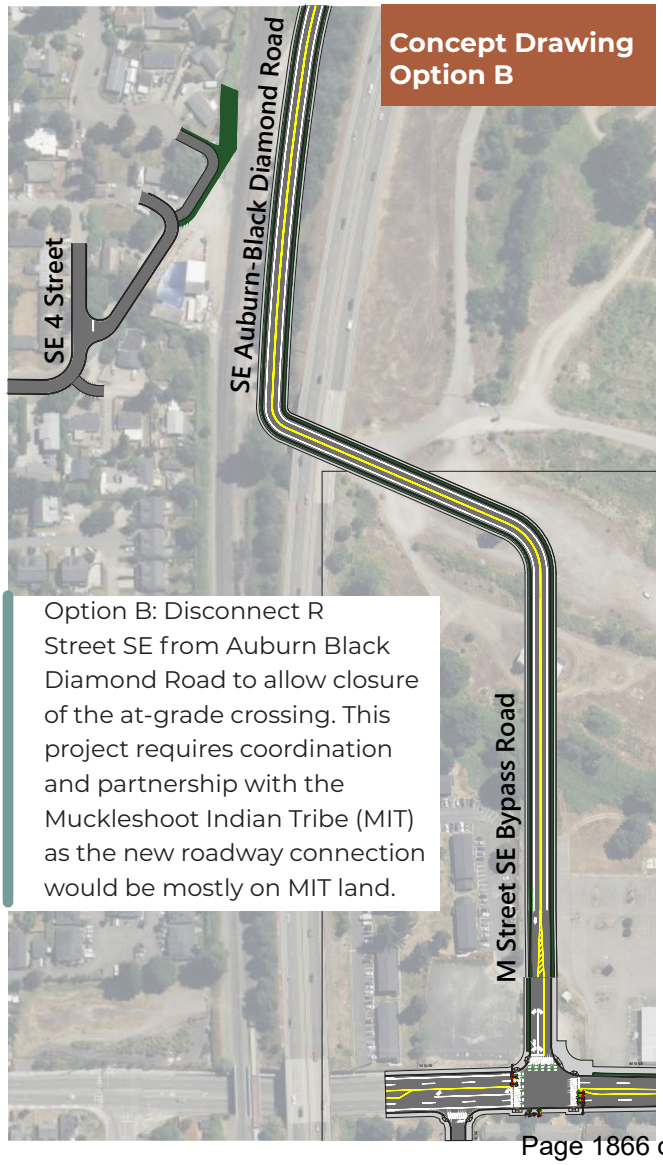
M ST SE BY-PASS RD

(M ST SE BY-PASS RD & SE AUBURN - BLACK DIAMOND RD)



Project Origin: M Street Grade Separation Pre-Design Report (2009)

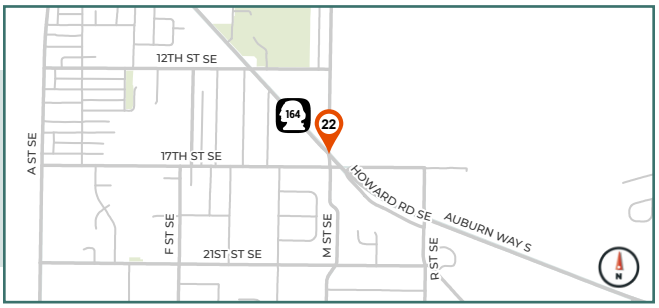
Primary Needs: Active Transportation/Safety/ System Resiliency



PROJECT PHASE	OPTION A	OPTION B
Planning & Engineering/Design	$ 3,500,000	$ 2,400,000
Right of Way	$ 6,250,000	$ 5,000,000
Construction	$ 7,500,000	$ 5,200,000
Total	$ 17,250,000	$ 12,600,000

Description:

This project will provide a new roadway connection between Auburn Black Diamond Road and M Street SE. The new connection will provide pedestrian, bicycle, and vehicle connectivity that allows by-pass of the at-grade railroad crossing at Black Diamond Road/R Street SE to the grade separated crossing at M Street SE. There are two alternatives for this project that will be considered further with preliminary project design:



Option A: Maintain the connection between Auburn Black Diamond Road and R Street SE and re-align the at-grade railroad crossing.

Option B: Disconnect R Street SE from Auburn Black Diamond Road to allow closure of the at-grade crossing. This project requires coordination and partnership with the Muckleshoot Indian Tribe (MIT) as the new roadway connection would be mostly on MIT land.

COMP-22
AUBURN WAY S, M ST SE, 17TH ST SE INTERSECTION IMPROVEMENTS

Project Origin: New 2024 CTP Project

Primary Need: Vehicle Capacity

VEHICLE LOS WITHOUT PROJECT	AM	PM
2024 Existing	Fails	Fails
2044 Future	Fails	Fails

PROJECT PHASE	COST ESTIMATE
Planning & Engineering/ Design	$ 700,000
Right of Way	$ 300,000
Construction	$ 1,300,000
Total	$ 2,300,000

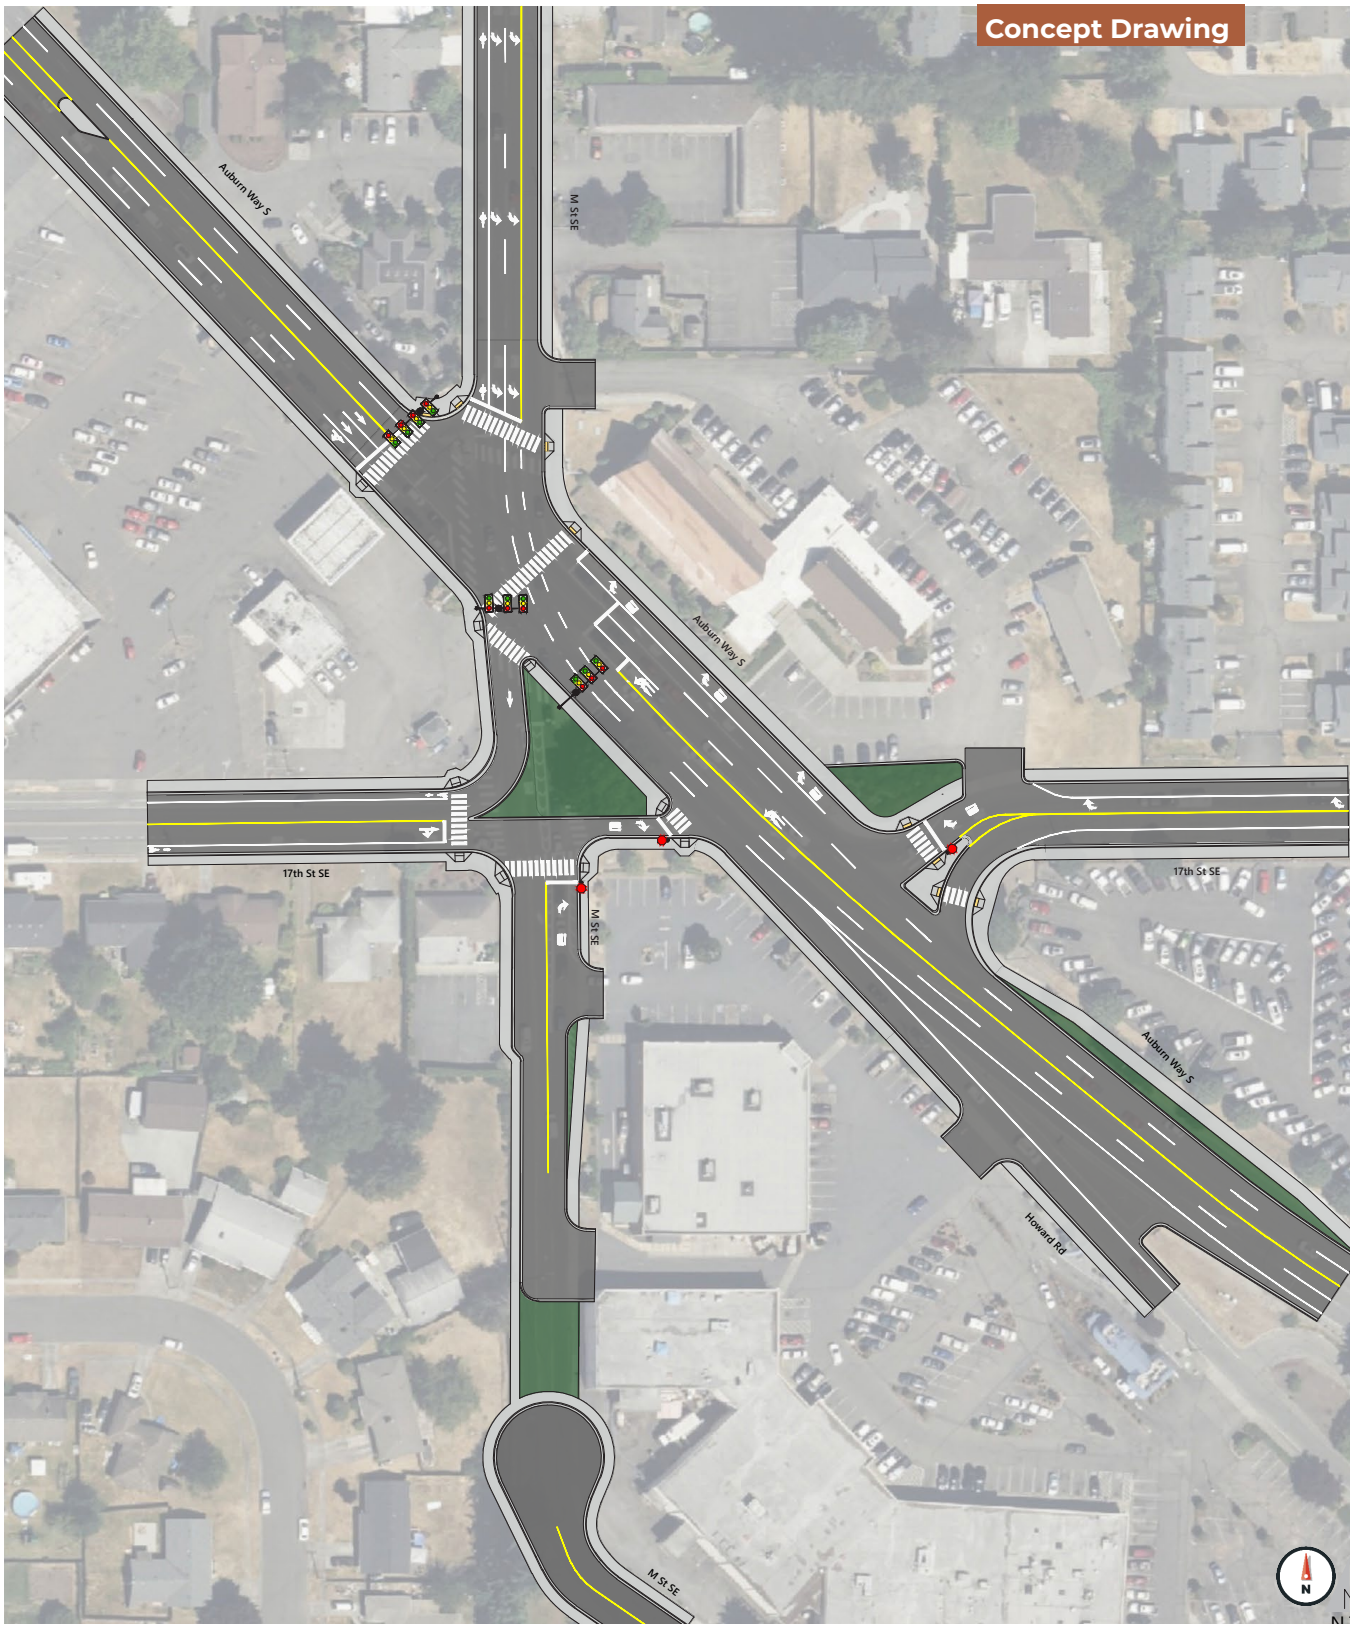
Description:

Intersection delays will be reduced with several improvements including:

Add a third eastbound lane on Auburn Way South through the intersection

Restrict left turns from eastbound Auburn Way South to northbound M Street SE. Vehicles would utilize 12th Street SE for access to M Street SE from eastbound Auburn Way South.

Restrict left turns from westbound Auburn Way South on the west intersection leg with curbing/median. Access to businesses on the south side of Auburn Way South would be made via a u-turn at the signalized intersection of 12th Street SE/Auburn Way South.



Left turns from southbound M Street SE to eastbound Auburn Way South would be allowed from the far west lane, creating three lanes available for this movement.

Eastbound 17th Street SE to eastbound Auburn Way South would be opened where it is currently blocked.

Northbound movements from M Street SE to Auburn Way South would be restricted and M Street SE would not provide connectivity between 21st Street SE and Auburn Way South.

Mark east crossing of Auburn Way South with a new crosswalk

Improvements on Auburn Way South will be subject to WSDOT complete streets requirements and will require coordination and approval from WSDOT.

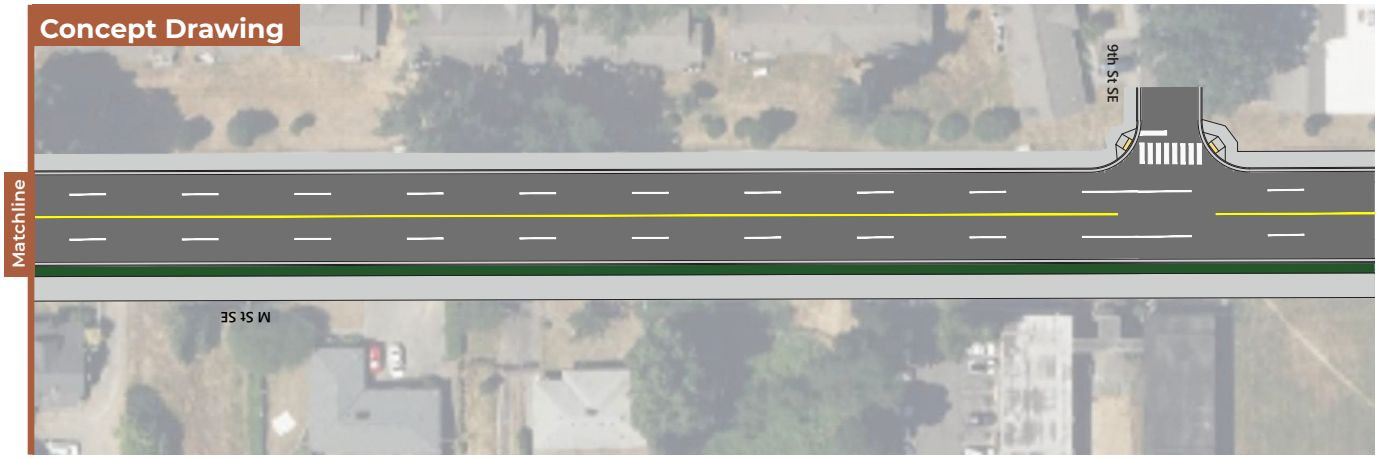
COMP-23

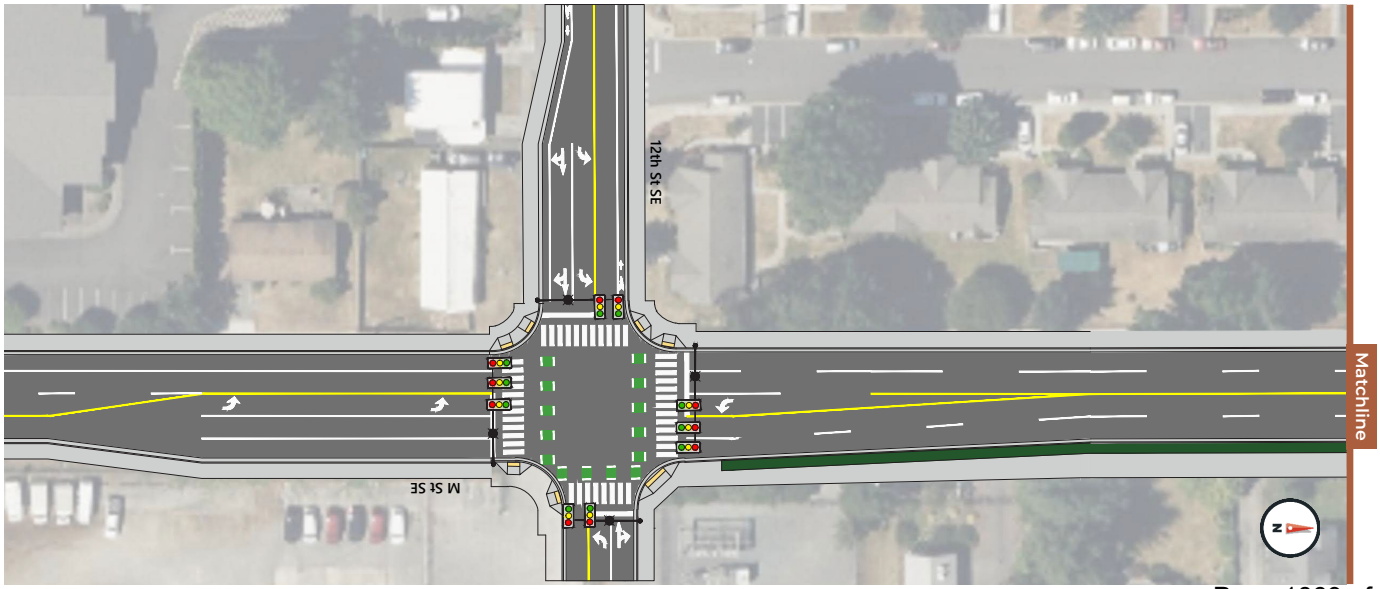
M ST SE & 12TH ST SE INTERSECTION IMPROVEMENTS

Project Origin: 2024 CTP Project (Modified from Previous Comp. Plan)

Primary Need: Vehicle Capacity, Active Transportation



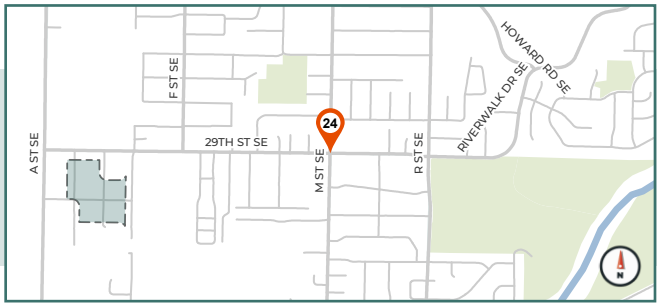
Description:



This project will reduce intersection delays with a new traffic signal. The project will also construct a separated trail along the east side of M Street SE between 12th Street SE and 8th Street SE to address active transportation level of service requirements.

VEHICLE LOS WITHOUT PROJECT	AM	PM
2024 Existing	Fails	Fails
2044 Future	Fails	Fails

PROJECT PHASE	COST ESTIMATE
Planning & Engineering/ Design	$ 1,200,000
Right of Way	$ 1,350,000
Construction	$ 2,100,000
Total	$ 4,650,000

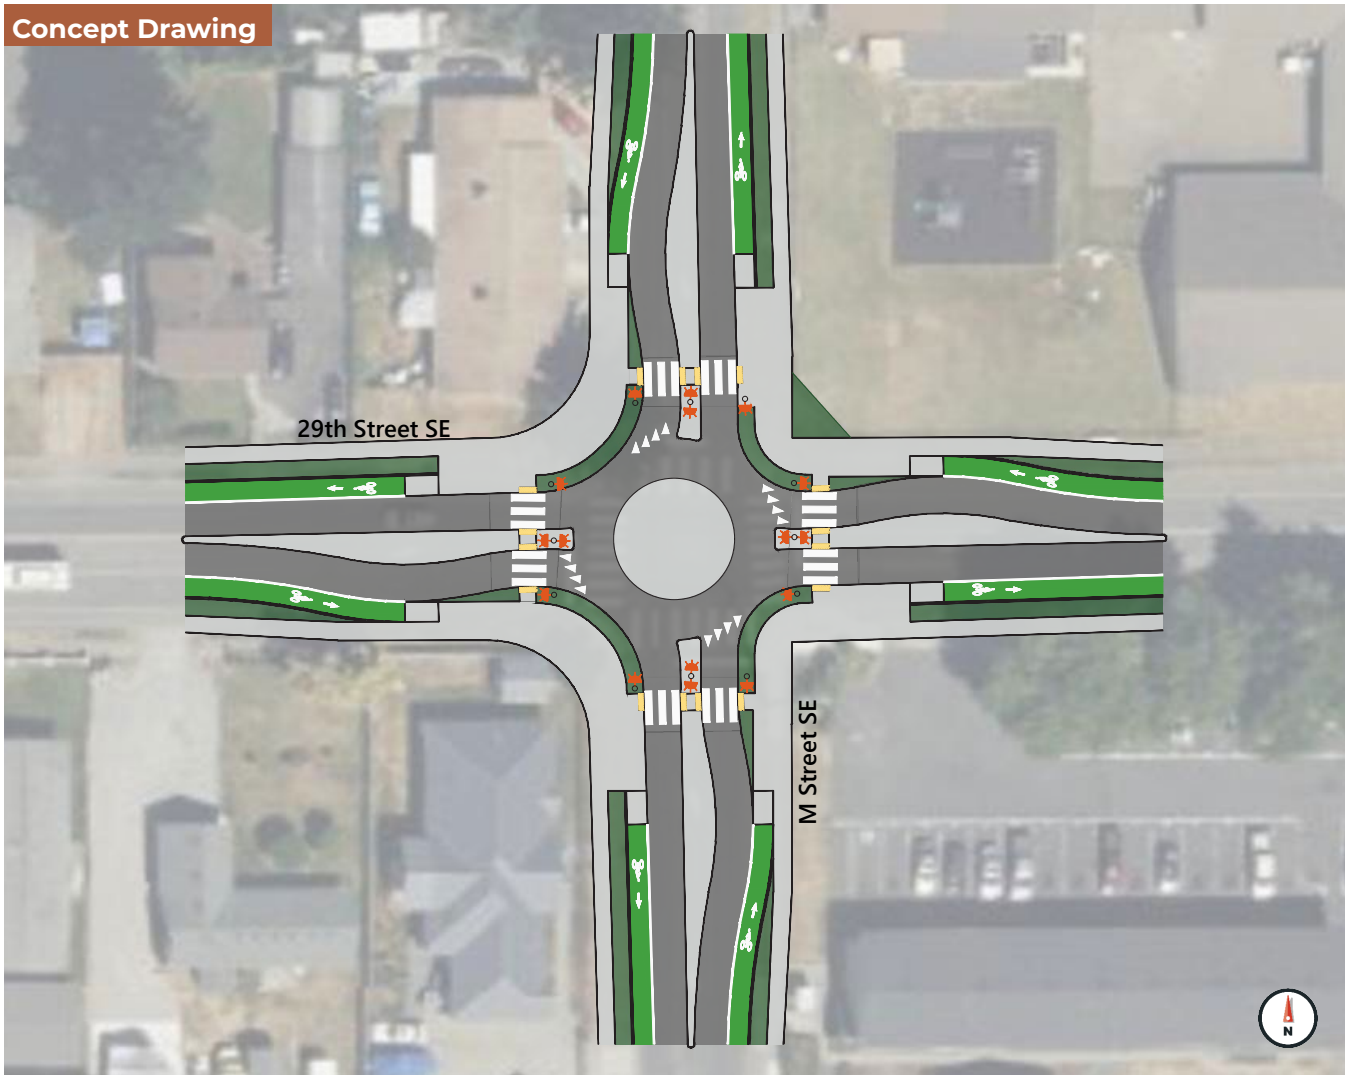


Concept Drawing

COMP-24

M ST SE & 29TH ST SE INTERSECTION IMPROVEMENTS

Project Origin: R St SE Corridor Study (2020)



Primary Needs: Active Transportation/Safety/ Vehicle Capacity

Description:

This project will reduce vehicle delays, improve operations and safety, and provide improved access for bikes and pedestrians through the intersection through construction of a single lane roundabout to replace the current all-way stop control.

PROJECT PHASE	COST ESTIMATE
Planning & Engineering/ Design	$ 900,000
Right of Way	$ 125,000
Construction	$ 1,900,000
Total	$ 2,925,000

Concept Drawing

COMP-25
A ST SE CORRIDOR IMPROVEMENTS
(37TH ST SE - WHITE RIVER BRIDGE)

Project Origin: BNSF Railway and A Street SE Crossing Study (2015), 2024 CTP Project

Primary Needs: Vehicle LOS/Mode Shift/Active Transportation/Safety

	PROJECT PHASE	COST ESTIMATE
Phase 1	Planning & Engineering/Design	$ 2,940,000
	Right of Way	$ 1,750,000
	Construction	$ 15,250,000
	Phase 1 Total	$ 19,940,000
Phase 2	Planning & Engineering/Design	$ 600,000
	Right of Way	$ 225,000
	Construction	$ 1,200,000
	Phase 2 Total	$ 2,025,000
	Project Total	$ 21,965,000

Description:

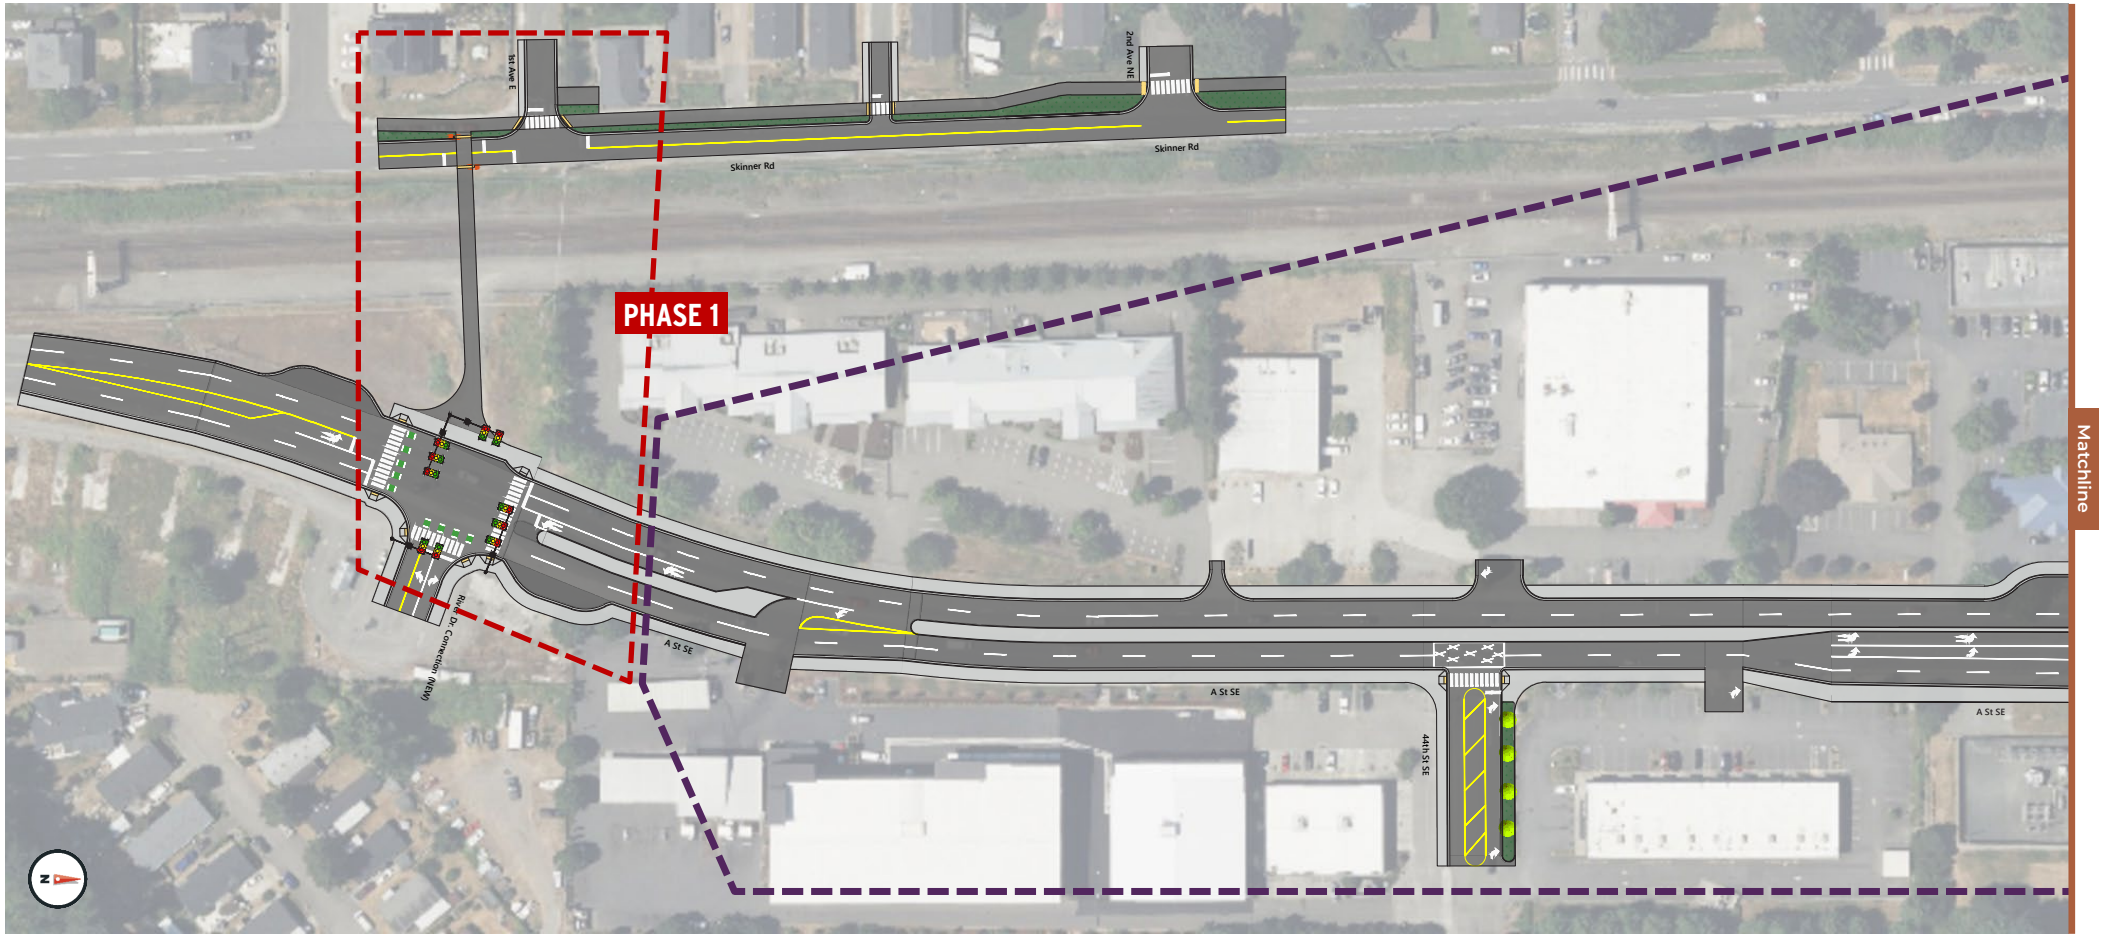
This project will reduce intersection delays at the intersections of C St SW & Ellingson Rd/41st St SE, A St SE & Ellingson Rd/41st St SE, and at SE & 44th St SE (private road). The project will provide active transportation facilities that support mode shift and improved vehicle and active transportation safety. The improvements would likely be implemented with multiple projects implemented over time as funding is available.

Key project improvements and potential sequencing/phasing are:

Phase 1 (BNSF Railway and A Street SE Crossing)

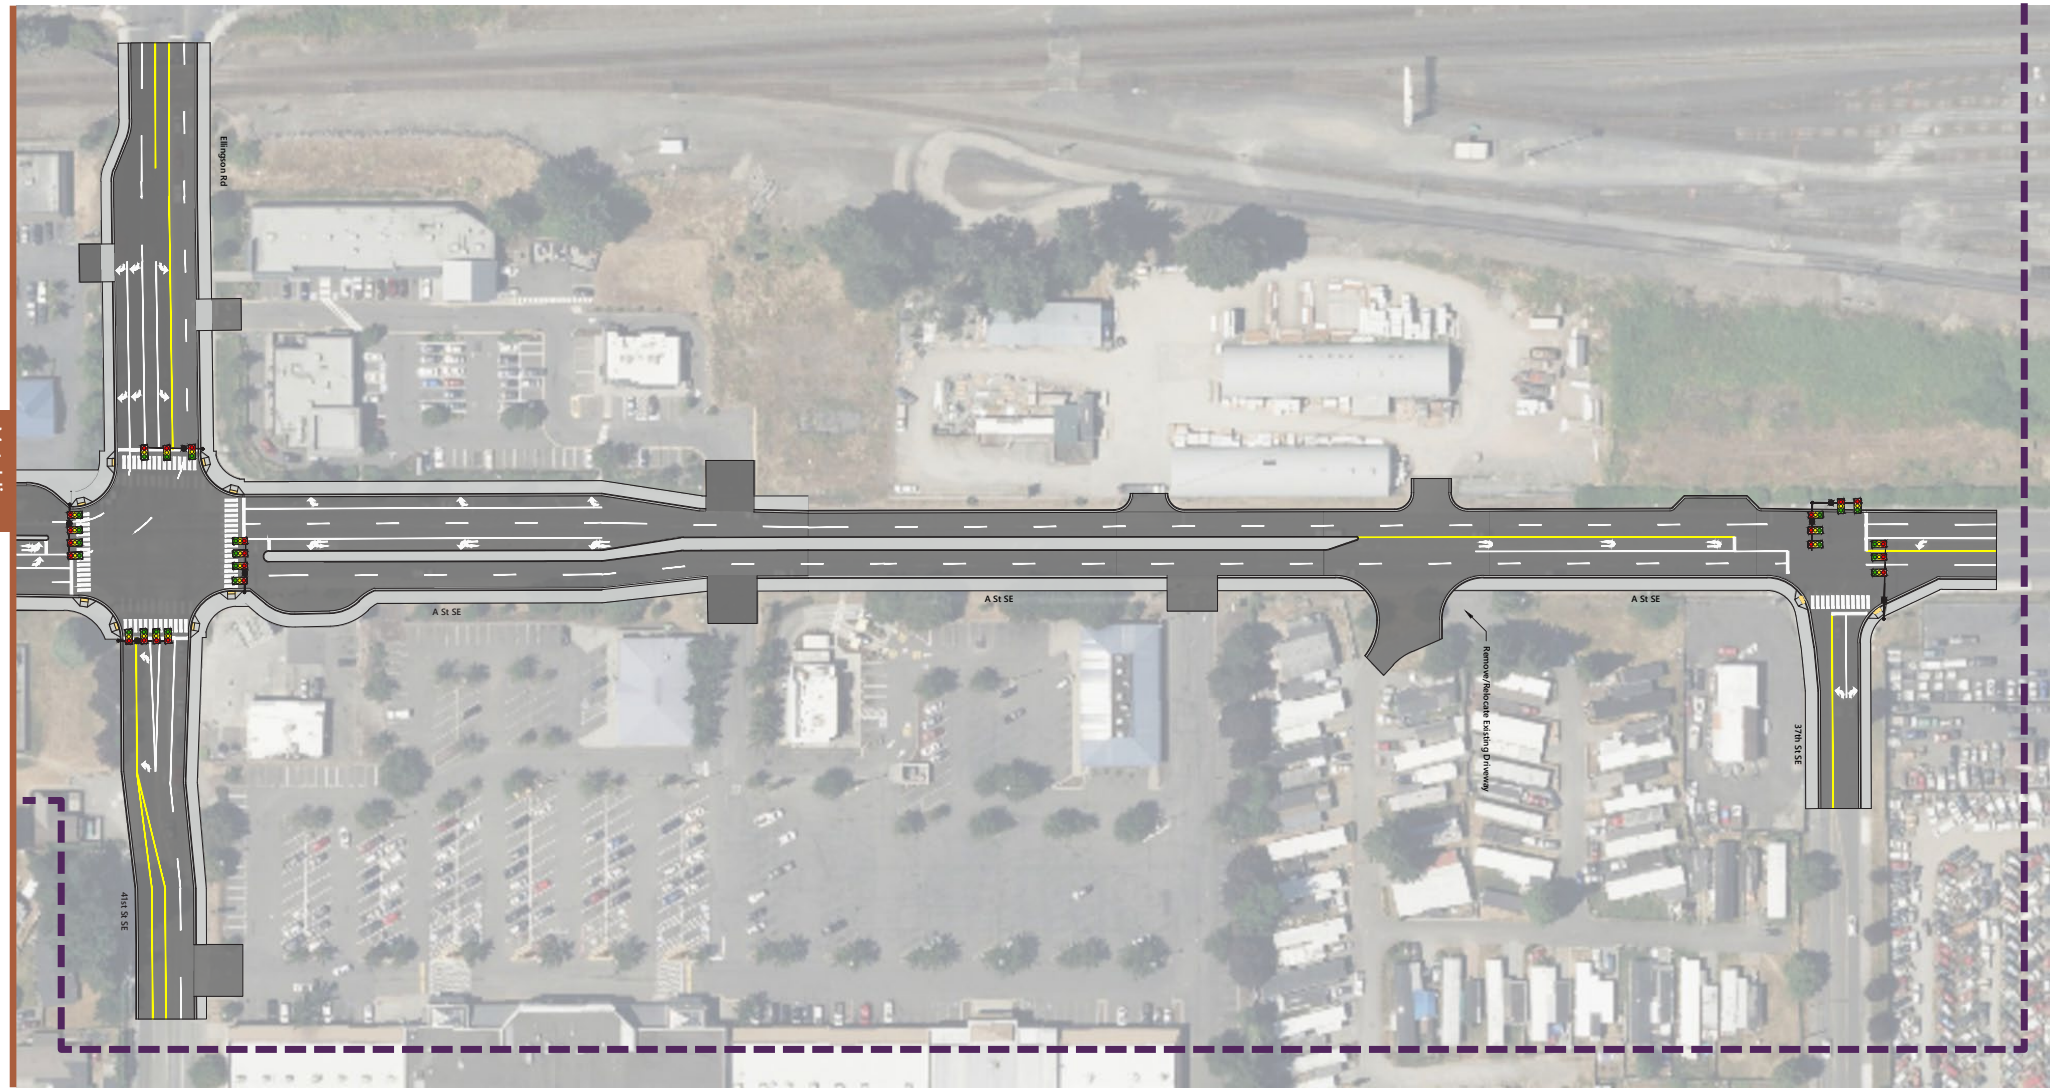
1a New intersection with traffic signal and pedestrian and bike trail crossing on A Street SE just north of White River Bridge. White River Estates, and commercial properties along the east side of A Street SE between 41st Street SE and the new intersection will utilize this intersection for full access.

1b Construction of a pedestrian/bike tunnel under the BNSF Railway tracks that provides connectivity between the west side of A Street SE and Skinner Road. Extension of the separated trail on Skinner Road to connect to the tunnel crossing. Improvements between the White River Trail and the new intersection at the north end of the White River Bridge on the east side of A Street SE to created separated/buffered trail connection.



Phase 2 (Access Management & A Street SE Intersection Improvements at 41st Street SE and 37th Street SE)

2a Space for vehicle u-turns for both directions on A Street SE will be provided at all signalized intersections and medians will be installed to restrict left turns in/out of adjacent driveways and 44th Street SE.



2b A second left turn lane from northbound A Street SE to westbound Ellingson Road/41st Street SE will be added.

2c A second dedicated right turn lane from eastbound Ellingson Road/41st Street SE will be added and there will be a separated dedicated eastbound through lane.

2d Smart signage will be installed on Ellingson Road/41st Street SE to allow two westbound movements through the intersection of C Street SW during some times and one westbound through and one right turn only (to northbound C Street SW) during other times. Re-build sidewalks on Ellingson Road/41st Street SE between C Street SW and A Street SE to provide maximum width possible as constrained by the BNSF bridge and mark the crosswalk/replace curb ramps on south leg of intersection of A Street SE and Ellingson Road/41st Street SE.

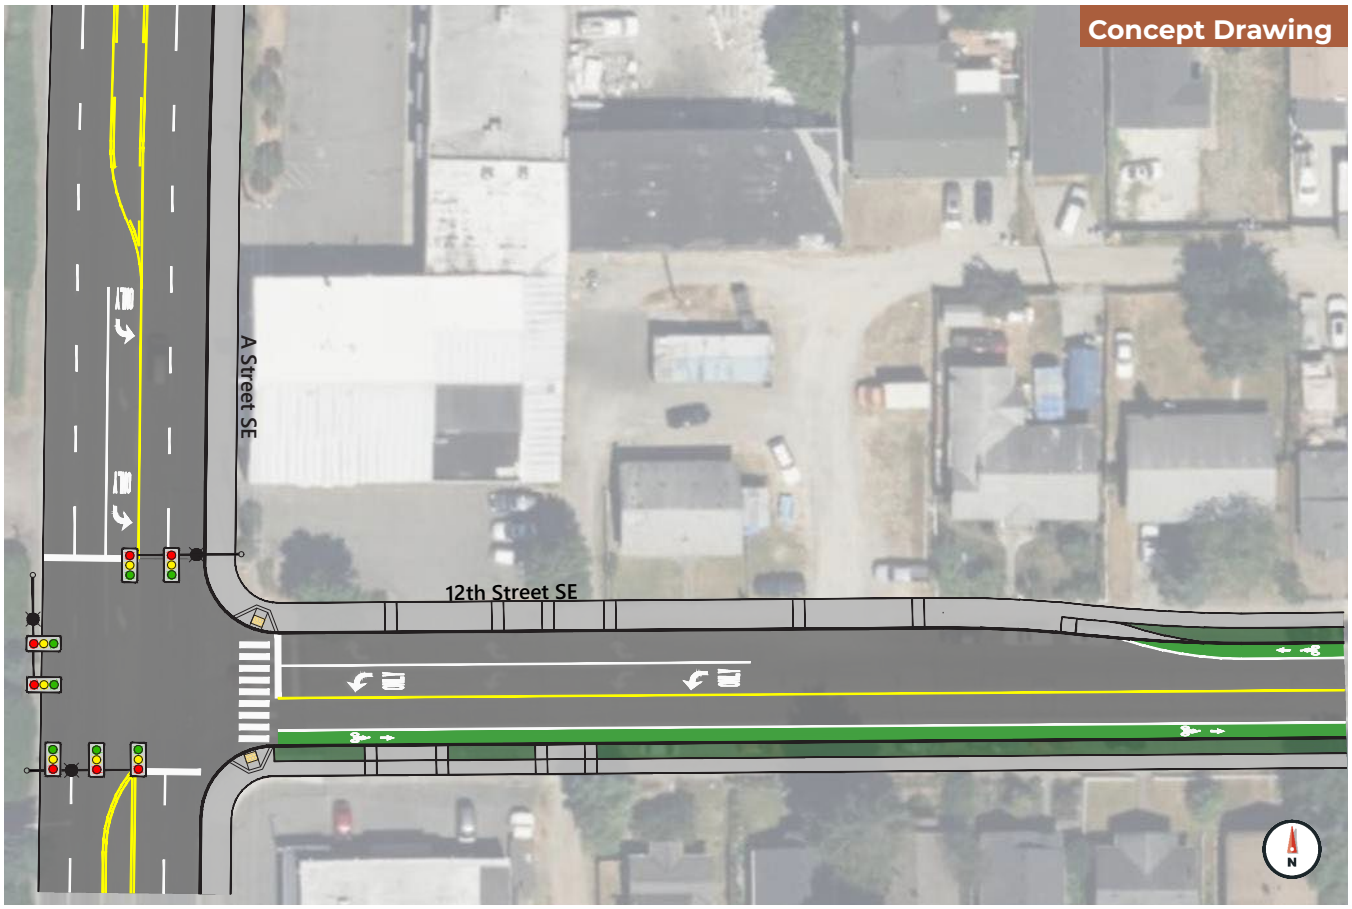
Project Origin: New 2024 CTP Project



Primary Need: Vehicle Capacity

Description:

Intersection delays will be reduced through the replacement of the stop control with construction of a new traffic signal. Improvements may also include widening for a northbound u-turn to support access management along the corridor.

APPENDIX C

Plan Checklists

IN THIS APPENDIX

GMA Requirements Checklist

PSRC Requirements Checklist

GMA REQUIREMENTS CHECKLIST

To comply with the Growth Management Act requirements, the Comprehensive Transportation Plan will include the following elements:

GMA REQUIREMENT	PLAN ELEMENT(S)
1. An inventory of air, water, and ground transportation facilities and services, including transit alignments, state-owned transportation facilities, and general aviation airports.	· Chapter 2 · Appendix A
2. Adopted multimodal levels of service (LOS) standards for all arterials, transit routes and highways.	· Chapter 2
3. Identification of specific actions to bring locally-owned transportation facilities and services to established multimodal LOS.	· Chapter 2 · Appendix B
4. A forecast of traffic for at least 10 years including land use assumptions used in estimating travel.	· Chapter 2
5. A projection of state and local system needs to meet current and future demand.	· Chapter 2 · Appendix B
6. A pedestrian and bicycle component to include collaborative efforts to identify and designate planned improvements for pedestrian and bicycle facilities and corridors that address and encourage enhanced community access and promote healthy lifestyles.	· Chapter 2, Section 2.3
7. A description of any existing and planned transportation demand management (TDM) strategies, such as HOV lanes or subsidy programs, parking policies, etc.	· Chapter 4, Goal 8
8. An analysis of future funding capability to judge needs against probable funding resources.	· Chapter 6, Section 6.1
9. A multi-year financing plan based on needs identified in the comprehensive plan, the appropriate parts of which serve as the basis for the 6-year street, road or transit program.	· Chapter 6, Section 6.1
10. If probable funding falls short of meeting identified needs: a discussion of how additional funds will be raised, or how land use assumptions will be reassessed to ensure that LOS standards will be met.	· Chapter 6, Section 6.4

(Continued on next page)

GMA REQUIREMENT	PLAN ELEMENT(S)
11. A description of intergovernmental coordination efforts, including an assessment of the impacts of the transportation plan and land use assumptions on the transportation systems of adjacent jurisdictions and how it is consistent with the regional transportation plan.	• Chapter 1, Section 1.5
12. A plan for public participation in the comprehensive planning process.	• Chapter 1, Section 1.3 • Appendix D
13. A plan to monitor how well comprehensive plan policies, development regulations, and other implementation techniques are achieving the plan's goals and the goals of the GMA.	• Chapter 7
14. Considerations for preserving property rights with an evaluation of regulatory or administrative actions to ensure they do not result in unconstitutional taking of private property.	• Chapter 4, Goal 9, Policy TR9-3
15. Requirement that local governments permit development only if adequate multimodal transportation facilities exist, or can be guaranteed to be available within six years, to support new development. The GMA requires each local jurisdiction to identify facility and service needs based on LOS standards. Auburn ensures that future development will not cause the system's performance to fall below the adopted LOS standard by doing one or a combination of the following: limiting development, requiring appropriate mitigation, or changing the adopted standard.	• Chapter 4, Goal 7

PSRC REQUIREMENTS CHECKLIST

PSRC requires that the plan promotes a sustainable, equitable, affordable, safe, and efficient multimodal transportation system, with specific emphasis on an integrated regional transit network that supports the Regional Growth Strategy and promotes vitality of the economy, environment, and health.

PSRC REQUIREMENT	PLAN ELEMENT(S)
Implement the Regional Transportation Plan	
1. Promote the development of an efficient, multimodal transportation system that supports the Regional Growth Strategy in collaboration with other jurisdictions and agencies **(MPP-T-7)**	· Chapter 4, Goal 4, Policy TR4-2
2. Work to develop and operate a safe and convenient system for all users and the movement of freight and goods **(MPP-T-11)**	· Chapter 4, Goal 5, Policy TR5-1-4
3. Reduce the need for new capital improvements through investments in operations, pricing programs, demand management strategies, and system management activities that improve the efficiency of the current system **(RCW 36.70A.070(6)(a)(vi), MPP-T-3)**	· Chapter 4, Goal 8, Policy TR8-3
4. Emphasize transportation investments that provide alternatives to single occupancy vehicle travel, increase travel options, especially to and within centers, and support compact, pedestrian- and transit-oriented densities and development **(MPP-T-12-13, T-15)**	· Chapter 4, Goal 8, Policy TR8-4
5. Increase the resilience of the transportation system and support security and emergency management **(MPP-T-31)**	· Chapter 4, Goal 5, Policy TR5-2-15
6. Prepare for changes in transportation technologies and mobility patterns **(MPP-T-33-34)**	· Chapter 4, Goal 10, Policy TR10-15
Support the Regional Growth Strategy	
7. Focus system improvements to connect centers and support existing and planned development as allocated by the Regional Growth Strategy **(MPP-RC-7-9, T-7-8, T-15)**	· Chapter 4, Goal 1, Policy TR1-4
8. Prioritize multimodal investments in centers and high-capacity station areas **(MPP-RC-7-10, T-12-13,T-19)**	· Chapter 2, Section 2.4.1 · Chapter 4, Goal 1, 5, and 6, Policies TR1-3 and TR1-4; TR5-1-1; TR6-3-1 and TR6-3-2

(Continued on next page)

PSRC REQUIREMENT	PLAN ELEMENT(S)
Support the Regional Growth Strategy	
9. Promote the design of transportation facilities that support local and regional growth centers and high-capacity transit station areas and fit the community in which they are located **(MPP-T-19-21)**	· Chapter 2, Section 2.4 · Chapter 4, Goal 5, Multimodal Accessible Network Policies (Transit) · Chapter 4, Goal 6, MMLOS Standards Policies (Transit)
10. Support a safe and welcoming environment for walking and bicycling **(MPP-DP-15)**	· Chapter 4, Goal 5 (page 62-66)
11. Include a pedestrian and bicycle component and collaborative efforts to identify planned improvements for pedestrian and bicycle facilities and corridors **(RCW 36.70A.070(6)(a)(vii))**	· Chapter 2, Section 2.3
12. Improve local street patterns and design to promote walking and biking **(MPP-T-16-17)**	· Chapter 4, Goal 5
13. Support alternatives to driving alone, including walking, biking, and transit use, through design of local streets, land use development tools, and other practices **(MPP-T-16-18)**	· Chapter 4, Goal 8, Policy TR8-4
Support People	
14. Identify racial and social equity as a core objective when planning and implementing transportation improvements, programs, and services **(MPP-T-9)**	· Chapter 4, Goal 2
15. Ensure mobility choices for people with special needs **(MPP-T-10)**	· Chapter 4, Goal 2
Support the Economy	
16. Recognize the critical role of safe, reliable, and efficient movement of people and goods **(MPP-Ec-6,T-1, T-23)**	· Chapter 4, Goal 5, Policy TR5-1-4
17. Identify and support key facilities and improvements that connect the region to major transportation hubs such as ports, airports, and designated freight routes **(MPP-T-24-25)**	· Appendix A
18. Promote coordination with providers of major regional infrastructure, such as freight rail and commercial aviation **(MPP-Ec-4-5, T-27-28)**	· Chapter 4, Goal 5, Multimodal Accessible Network Policies and Supporting Actions (Freight, Air Transportation)

(Continued on next page)

PSRC REQUIREMENT	PLAN ELEMENT(S)
Protect the Environment	
19. Promote clean transportation programs and facilities, including actions to reduce air pollution and greenhouse gas emissions from transportation **(MPP-CC-3, CC-12, T-29-30)**	· Chapter 4, Goal 4, Policy TR4-2
20. Reduce stormwater pollution from transportation facilities and improve fish passage **(MPP-T-32)**	· Chapter 4, Goal 4, Policy TR4-3
21. Incorporate environmental factors into transportation decision-making, including attention to human health and safety **(MPP-DP-44, T-4-5, T-29-32)**	· Chapter 4, Goal 4, Supporting Actions
Provide Facilities inventories and identify Service Needs	
22. Include mapped inventories for each element of the transportation system, including roadways, transit, cycling, walking, freight, airports, and ferries **(RCW 36.70A.070, RCW 36.70A.108, MPP-T-7,T-15-17)**	· Appendix A
23. Include state facilities and reflect related (regional/ state) level-of-service standards **(RCW 36.70A.070, RCW 36.70A.108)**	· Chapter 2, Section 2.2
24. Develop a comprehensive concurrency program that addresses level-of-service standards for multimodal types of transportation and include implementation strategies **(RCW 36.70A.070, RCW 36.70A.108, MPP-DP-52-54)**	· Chapter 4, Goal 7
25. Provide travel demand forecasts and identify state and local system projects, programs, and management necessary to meet current and future demands and to improve safety and human health **(RCW 36.70A.070, MPP-T-4-5)**	· Chapter 2, Section 2.2.8
26. Identify maintenance and system preservation projects and programs necessary to maintain the ability of the transportation system to provide safe, efficient, and reliable movement of people, goods, and services **(RCW 36.70A.070, MPP-T-1-2, T-4)**	· Chapter 4, Goal 10 · Chapter 6

(Continued on next page)

PSRC REQUIREMENT	PLAN ELEMENT(S)
Finance Transportation Investments	
27. Identify stable and predictable funding sources for maintaining and preserving existing transportation facilities and services **(MPP-RC-11-12, T-6)**	· Chapter 6, Section 6.3
28. Pursue alternative transportation financing methods, such as user fees, tolls, and other pricing mechanisms **(MPP-T-6)**	· Chapter 6, Section 6.5
29. Include a 20-year financing plan, as well as an analysis of funding capability for all transportation modes **(RCW 36.70A.070(3), RCW 36.70A.070(6)(a)(iv), WAC 365-196-415, WAC 365-196-430, MPP-RC-11-12, T-6, T-15)**	· Chapter 6, Section 6.1
30. Include a reassessment strategy to address the event of a funding shortfall **(RCW 36.70A.070(3), RCW 36.70A.070(6)(a)(iv), WAC 365-196-415, WAC 365-196-430, MPP-RC-11-12,T-6)**	· Chapter 6, Section 6.4
Address Land Uses Adjacent to Airports	
31. Airport-adjacent communities: Identify and address any airports within or adjacent to the jurisdiction **(RCW 36.70.547, 36.70A.070(6)(a)(iii)(A), MPP-DP-48)**	· Chapter 2, Section 2.5
32. Describe existing and planned uses near the airport, as well as policies and regulations that discourage incompatible uses **(RCW 36.70.547, 36.70A.070(6)(a)(iii)(A), MPP-DP-48)**	· Existing and planned uses are not described. However, Chapter 4, Goal 5, lists an action under Actions to Support Multimodal Accessible Network Goal and Policies (Air Transportation) that calls the agency to do so
33. Promote coordinated planning and effective management to optimize the region's aviation system in a manner that minimizes health, air quality, and noise impacts to communities, including historically marginalized communities **(MPP-T-28)**	· Chapter 4, Goal 5, Multimodal Accessible Network Policies (Air Transportation)

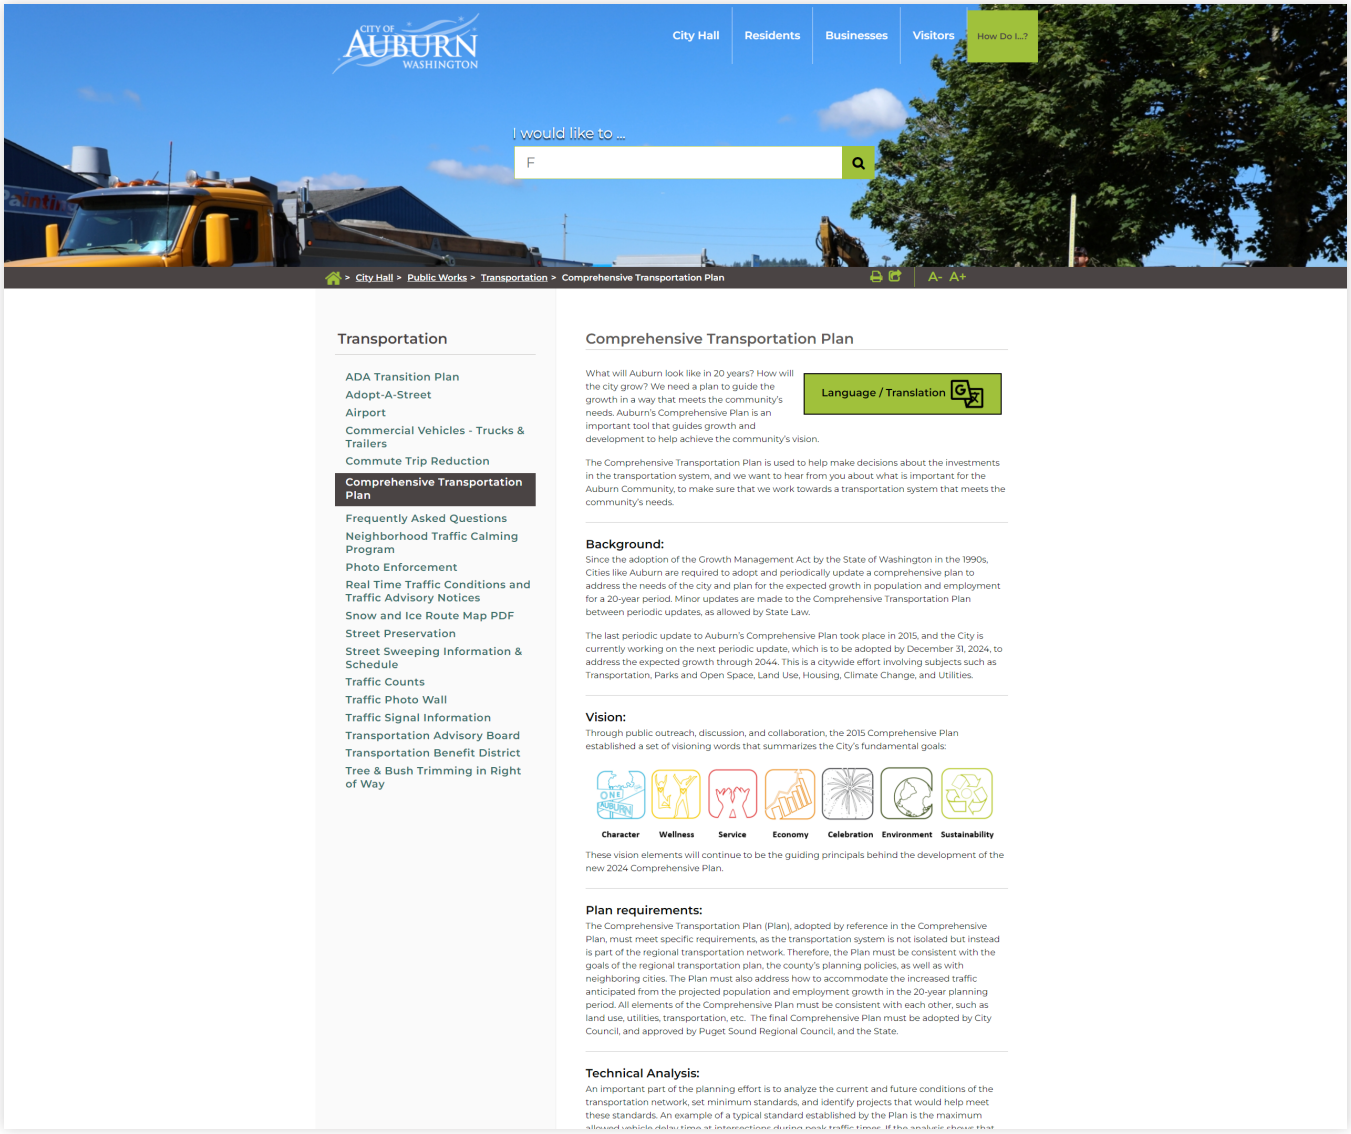
APPENDIX D

Outreach

IN THIS APPENDIX

Public Outreach



PUBLIC OUTREACH

For the 2024 update to the Comprehensive Transportation Plan (Plan), City staff engaged with the public in different ways, with the intent to encourage participation and receive input from the public to ensure that the needs of the community are addressed in the planning process.

Plan Webpage

A webpage was created with key information regarding the plan, and with a location specific survey where people could show on a map the type of concern they have, as well as three questions to help guide our planning process. The survey questions were translated into the four most used languages in Auburn, after English, which are, as of 2023, Spanish, Ukrainian, Russian, and Tagalog.

Figure 15. Plan Website Homepage

Visit the Comprehensive Transportation Plan Website

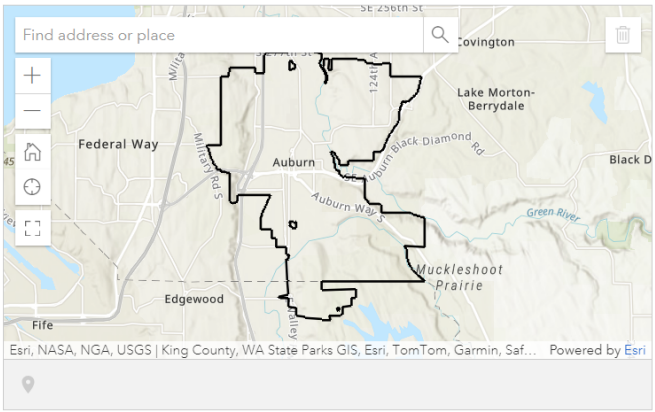
Figure 16. Online Survey - Location Specific Feedback

Public input:

We want to hear from you throughout this process, to understand your needs and ideas for Auburn's transportation systems.

Location Specific Feedback

Click on the map to drop a pin for the comment*



Please only click inside the box showing the Auburn City Limits. Only locations in Auburn will be considered.

Haga clic en el mapa para colocar un marcador para el comentario. Haga clic únicamente en el recuadro que muestra los límites de la ciudad de Auburn. Solo se considerarán las ubicaciones dentro de Auburn.

Клацніть на карті, щоб поставити мітку для коментарю. Клацайте лише в полі, що розташоване в межах міста Auburn City. Ураховуватимуться тільки зони в Auburn.

Щелкните карту, чтобы поставить метку для комментария. Щелкайте только в поле, находящемся в пределах города Auburn City. Будут учитываться только зоны в Auburn.

I-click ang map upang maglagay ng pin para sa mga komento. Pindutin lamang sa loob ng box na nagpapakita ng mga Limitasyon sa Lungsod ng Auburn. Ang mga lugar sa Auburn lamang ang isasaalang-alang.

Which category fits best? ¿Qué categoría se adapta mejor? Яка категорія підходить найкраще? Какая категория подходит лучше всего? Aling kategorya ang pinakaangkop?*

Public Comments from the Website/Online Survey

Comments collected through the plan website/online survey are summarized in the table below:

GENERAL QUESTIONS ABOUT TRANSPORTATION IN AUBURN			
QUESTION	**RESPONDENT #1**	**RESPONDENT #2**	**RESPONDENT #3**
1. Do you have any suggestions on how we can encourage more people to walk, ride a bike, or take a bus instead of driving a car?	*I think the best thing to do is to expand the bicycle route network. The current network of bike lanes and trails do not take people to where they want to go. The best way to get people out of their cars is to make cycling an attractive option, and making dedicated space for them will allow for that. Ideally, bike lanes should be protected bike lanes; cyclists are not going to feel safe if there is nothing physically protecting them from being run over by cars! In terms of walking, many sidewalks are currently too narrow and/or do not provide enough protection from cars. We could also benefit from more protected pedestrian/ bicycle crossings (e.g., HAWK signals). Also consider making some streets (perhaps downtown) pedestrian-only; taking cars off of a street makes it a much more attractive place for people to gather and shop. For buses, increasing service frequencies and expanding service hours (e.g., adding off-peak service to the 497) is a good way to attract more riders.*	*Safety. Safety. Safety. Nonexistent or disconnected infrastructure makes pedestrians and bicyclists feel unsafe. Aggressive inattentive drivers are everywhere and street widths are designed for freeway speeds. My elementary school children are threatened by drivers and nearly run over by right and left turning drivers daily. No amount of victim blaming will fix that. Intersections near schools need pedestrian first design principles like raised crosswalks and intersections and narrow streets to force drivers to slow.*	*You need a mix of advertising options and upkeep for what you have. Moved down here going on 2 years and there are places that are not safe to walk due to crime, etc. Other places like between Les Groves and M tend to have lots of debris piled up. (For example under the overpass there's large piles of dirt and grass growing and it's clear there's very poor drainage and upkeep in the area). Businesses downtown occasionally block sidewalks with signage etc., making it difficult for strollers or mobility issues. Overall need a mix of upkeep so people can utilize/ access them and then making sure you are giving them places to go.*

(Continued on next page)

GENERAL QUESTIONS ABOUT TRANSPORTATION IN AUBURN

QUESTION	RESPONDENT #1	RESPONDENT #2	RESPONDENT #3
2. Do you have any suggestions on how we make sure we are providing transportation facilities in an equitable way and that we are considering the needs of the entire community, including typically underserved and disadvantaged groups?	*Expanding pedestrian, bicycle, and transit infrastructure to serve everyone's destinations is the best way to provide equitable transportation. Cars are expensive to purchase and maintain; living without one should be a feasible option.*	*Expanding pedestrian, bicycle, and transit infrastructure to serve everyone's destinations is the best way to provide equitable transportation. Cars are expensive to purchase and maintain; living without one should be a feasible option.*	*More education on existing options, maybe a more consistent booth at the farmers market and/or articles in the paper and making it clear where to flag needs or provide suggestions. Community Facebook groups in the area (and Nextdoor) seem fairly active so a social media education campaign could help spread the word more than just an add in the Auburn reporter (which by the way was misleading ad. I thought it was for city wide feedback but all these questions are transportation specific).*
3. Do you have suggestions on how we should prioritize limited funding for the wide range of transportation needs throughout the City?	*I think non-motorized projects should be prioritized over most projects that serve private cars. It's cheaper to add new bike lanes than it is to add new car lanes. And if we can get enough people out of their cars, we won't even need to expand road capacity!*	*All road repaving effort must add infrastructure for unrepresented road users like bicycles. Per a comprehensive plan for a connected network. Change zoning to create 15 minute neighborhoods.*	
4. Do you have any other comments about transportation in Auburn?		*All road repaving effort must add infrastructure for unrepresented road users like bicycles. Per a comprehensive plan for a connected network. Change zoning to create 15 minute neighborhoods.*	

This page left intentionally blank

Active Transportation (Non-motorized, Walking or Biking) General Traffic Issues Safety

COMMENTS ON THE INTERACTIVE MAP

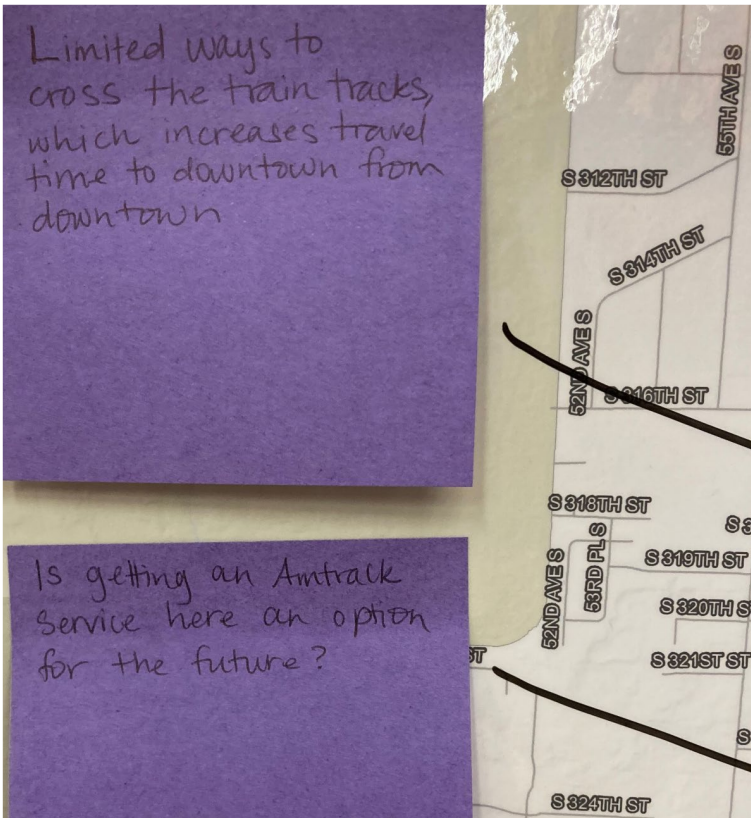
COMMENT	CATEGORY	PIN/LOCATION
Perhaps a traffic light at A St SE & 21st St SE? This seems like a fairly busy intersection and I see a lot of people making somewhat dangerous turns.		A St SE & 21st St SE
Southbound C Street SW can get very congested at Ellingson Road during peak hours. Maybe consider adding an additional southbound left turn lane. Though, due to capacity constraints, this may require careful coordination of the C Street and A Street signals.		C St SE & Ellingson Rd
Consider bike lanes on Evergreen Way SE! The road lanes are too narrow to fit a bike and car simultaneously, and the sidewalk is too narrow to comfortably fit a bike and pedestrian simultaneously. I used to bike on this road frequently as part of my commute to school, and this caused problems for me.		Evergreen Way SE
On Kersey Way SE between Stuck River Dr and 50th St SE, there is a mismatch between the design speed of the road and the posted speed limit. Most of the vehicles on the road travel significantly faster than the posted speed limit of 35 mph, because the geometry and environment of the road puts the comfortable driving speed much higher. This should be fixed by either raising the speed limit to reflect the actual speed of traffic, or by adding traffic calming measures to make drivers slow down.		Kersey Way SE
The portion of Kersey Way SE between 50th St SE and the White River currently lacks non-motorized access. There should be a path for pedestrians and cyclists running parallel to this road on its west side. As someone who lives near 50th St, this would make it much more convenient for me to bike to school or downtown.		Kersey Way SE
The sidewalks are poor quality and in some places overgrown. Makes it difficult for anyone handicapper, strollers etc. to get around. There are several elderly residents on this road so would be nice to see some meaningful repair work done, not some more griding that literally did nothing to improve conditions. The street was skipped over for paving as part of the larger paving project in the area, which made sense but the sidewalks are a big miss for the area and promoting walkability.		L St SE between E Main St & 2nd St SE

 Active Transportation (Non-motorized, Walking or Biking)

 General Traffic Issues

 Safety

COMMENTS ON THE INTERACTIVE MAP



COMMENT	CATEGORY	PIN/LOCATION
Everyday I cross this intersection; everyday drivers fail to yield to pedestrians. Particularly drivers waiting to turn left ignore children AND adults in the crosswalks. Drivers even do this with the crossing guard waiving their flag! Several changes would make this intersection safer. Time the light to treat pedestrians with respect. Give us the time to cross the street without fear of drivers by keeping all lights red and making right turn on red illegal and left turn only on green arrow. For human behavior it seems best to make this 24 hour policy instead of only before and after school hours. That would be a big improvement without much expense. What is really appropriate for a pedestrian area like this is a traffic circle with raised crosswalks to return the right-of-way to pedestrian and bicycle modes.		Lakeland Hills Way SE & Evergreen Way SE
Because of high volumes of vehicular and pedestrian traffic, it may be wise to consider prohibiting right turns on red at the Lake Tapps Pkwy/Lakeland Hills Way intersection to improve safety.		Lakeland Hills Way SE & Lake Tapps Pkway E
The all-way stop at 29th St SE and M St SE can sometimes get congested or confusing. Maybe consider installing a roundabout instead, to improve safety and traffic flow. I'm no traffic engineer, but traffic patterns seem to be well-suited for a roundabout.		M St SE & 29th St SE
Maybe replace the all-way stop at 37th St SE and M St SE with a roundabout. Most people are making the same turn; right onto westbound 37th, or left onto northbound M. A roundabout would allow both of these movements to occur simultaneously without everyone having to stop.		M St SE & 37th St SE
The intersection of Sumner-Tapps Hwy E and 16th St E seems like a good place for a roundabout. From what I can tell, the traffic patterns here are more sporadic, making it a good fit for a roundabout to improve traffic flow and safety. Though, I understand that this intersection probably isn't a high priority for the city.		*Sumner Tapps Hwy E & 16th St E*

Comprehensive Plan Open House

Organized by the Community Development Department, this event was intended to inform the community about the update to the City's Comprehensive Plan, on April 25, 2023 from 4 pm to 7 pm, at Washington Elementary School. Transportation Staff was present to share information and engage with attendees on the Comprehensive Transportation Plan, which is the Transportation Element of the Comprehensive Plan.

Figure 17. Open House Photos

Other Events

Staff hosted a celebration station on **Bike Everywhere Day**, on the Interurban Trail at the West Main Street entrance to encourage cyclist and active transportation in Auburn, as an alternative to driving, as part of the CTR / TDM work. At the same time, staff took advantage of this event to also engage with cyclists on the plan update and the survey.

Staff displayed information at the **Kids' Day** event on June 23, 2023, to let the community know about the plan, and share information about the survey.

Staff reserved a booth and engaged with the community at the **Auburn Farmer's Market** on July 23, 2023, from 10 am to 3 pm.

Staff reserved a booth and engaged with the community at the **Church of Nazarene**, who was hosting a resource fair for families with free backpacks and school supplies in partnership with the Auburn Kiwanis on August 5, 2023, from 11 am to 2 pm.

Public Comments from Outreach Events

Comments collected at all of our public outreach events are summarized in the table below and categorized by type:

Pedestrian Bicycle Transit Safety Parks

COMMENT	CONTEXT/ CLARIFICATION	COMMENT TYPE
Open House (April 5, 2023)		
1. *Dedicated and protected bike lanes needed. It's hard to feel safe if the bike lanes are not protected, as there are A LOT of distracted and bad drivers.*	*Comment was Auburn in general, not related to one specific location.*	Bicycle
2. *Need street lights, especially brighter LED lights as it's hard to see people at night.*	*Comment referring to neighborhood downtown, to the west of the BNSF tracks, south of Main St.*	Safety
3. *Is getting an Amtrak service an option for the future?*		Transit
4. *Limited ways to cross the train tracks, which increases travel time to downtown from downtown*	*Referring the access from the west side of the tracks to the core downtown area.*	Transit
5. *Need to improve safety and the perception of safety downtown.*		Safety
6. *Need to better enforce traffic laws and improve bike and pedestrian visibility at intersections downtown.*		Safety
7. *The 4-way stop by Zola's (Main St /D St) lacks compliance and there is a concern about pedestrian safety when crossing.*		Safety
8. *Bus shelters are not welcoming. We need shelters and seating to encourage riders, and need to address safety at bus stops, such as transient camps and unwanted activity taking place in bus shelters.*		Transit
9. *The interurban trail is not welcoming anymore; there is trash and homeless camps*		Pedestrian Bicycle
10. *There is lots of trash downtown - garbage bins were removed and people don't have places to throw away trash, so it's all over the sidewalks. This makes the sidewalk less appealing and less comfortable to walk downtown.*		Pedestrian
11. *Bathrooms are closed in downtown parks. It is not equitable when other parks out of downtown have access to bathrooms, but not downtown residents and families.*		Parks

Pedestrian Bicycle Transit Safety Parks

COMMENT	CONTEXT/ CLARIFICATION	COMMENT TYPE
Bike Day (May 19, 2023)		
1. *The Interurban trail needs to be repaved.*		Pedestrian, Bicycle
2. *Accessing the Interurban Trail from the grocery Outlet area is difficult.*		Pedestrian, Bicycle
3. *Suggestion to replicate event from Seattle, where 8 miles of Lake Washington Boulevard are closed to traffic on Sundays for bicycles to ride. Something like this would be great in Auburn.*		Bicycle
4. *Corner radius in ADA compliant facilities should also accommodate bike turning radius, as sharp corners are challenging for bikes*		Bicycle
5. *Streets need to be bicycle friendly in general. Bike lanes with RPMs, rumble strips, or delineators would make it much more comfortable for cyclists. Solid curb is not ideal, however, as it presents a challenge to get out of the bike lane.*		Bicycle
6. *Bike lanes need to be cleaned regularly, and also plowed when there is snow.*		Bicycle
7. *Suggestion to extend the Interurban trail to Tacoma.*		Bicycle
8. *Auburn needs more protected bike lanes along large or busy roads.*		Bicycle
9. *Suggestion to look at Denver's bike network - they are a great model with a good bike network that connects Denver to any surrounding suburbs. The network is continuous, comfortable, and safe.*		Bicycle
10. *It would be great to connect the Green River Trail to the Interurban Trail.*		Bicycle

Bike Day

Pedestrian Bicycle Transit Safety Parks

COMMENT	CONTEXT/ CLARIFICATION	COMMENT TYPE
Bike Everywhere Day Celebration Station (May 17, 2024)		
1. *There needs to be a connection between the Interurban Trail and the Sumner Link Trail.*		Pedestrian, Bicycle
2. *The trail condition on the Interurban Trail needs improvements, particularly the southern portion of the Interurban.*	*Comment is not specific to the portion of the Interurban in Auburn, but also pertains to portions of the trail outside of Auburn*	Bicycle
3. *The pavement quality of the Interurban Trail is poor, particularly from W Main St to 15th St SW*		Bicycle
4. *There should be restroom facilities on the Interurban Trail.*		Pedestrian, Bicycle
5. *There needs to be a better bicycle connection between Auburn and Federal Way*		Bicycle
6. *There needs to be better pedestrian facilities on W Valley Hwy*		Pedestrian
7. *There is no bus connection between W Valley Hwy and Auburn Station. People who work along W Valley Hwy have to walk to Auburn Station to get the train.*		Transit
8. *There should be water fountains along the Interurban Trail*		Pedestrian, Bicycle
9. *Make sure there are traffic calming features and RRFBs at trail crossings*		Bicycle
Senior Center Tabling (May 21, 2024)		
1. *There is a safety concern for pedestrians when walking under Hwy 18; there are many homeless people there making it feel unsafe.*		Pedestrian, Safety
2. *During the winter, there is often ice near the bus stop by the downtown Safeway. Please make sure that ice is clear near bus stops.*		Transit, Safety
3. *There is no transit access to Mary Olsen Farm; would like a bus route that goes there.*		Transit
4. *Drivers often don't see pedestrians during blinking yellow left turn signals.*		Pedestrian, Safety
5. *I generally have a good pedestrian experience walking around Auburn in terms of sidewalks and ramps.*		Pedestrian

Pedestrian Bicycle Transit Safety Parks

COMMENT	CONTEXT/ CLARIFICATION	COMMENT TYPE
Farmer's Market (July 23, 2023)		
1. *Need easier / more affordable way to get to airport (SeaTac).*		Transit
2. *Parking garage for Sounder Train gets full early, and it's difficult to find parking to ride the train, unless arriving very early. There is no alternative parking available.*		Safety
Church of Nazarene One Community Kiwanis Event (August 5, 2023)		
1. *It is difficult for elderly residents to get around when they have mobility challenges.*		Safety
2. *Need to improve safety for kids to get to and from schools, parks, and around the neighborhood.*		Pedestrian, Bicycle
3. *The Government should not tell people what to do and let people chose to drive if that is what they want.*	*Comment related to the question "how to encourage people to walk, bike, and use transit."*	Pedestrian, Bicycle
4. *The City needs to install more roundabouts, and replace traffic signals with roundabouts.*		Safety

COMMENT	CONTEXT/ CLARIFICATION	COMMENT TYPE	LOCATION
OMS Requests (Comments are Summarized)			
1. *At the intersection of M St SE & 21st St SE, there are concerns about speeding and stop sign compliance. Multiple residents have complained about crashes resulting in both injuries and property damage. They've also voiced concern about this due to it's proximity to schools.*	*We have received 13 requests for this intersection: R41232, R41186, R39846, R39650, R39529, R39519, R39511, R39398, R39262, R38041, R37045. R36674, R34364*	Safety	M St SE & 21st St SE
2. *At the intersection of 112th Ave SE and SE 284th St, there have been requests about speeding and a request for a roundabout at this location to help with pedestrian safety concerns.*	*R399390*	Safety	112th Ave SE & SE 284th
3. *Stop compliance concern at W St NW & Terrace Dr/S 316th St*	*R39982*	Safety	W St NW & Terrace Dr/S 316th St
4. *Concern about speeding and the left turn at 124th Ave SE & SE 284th St. Requests a street light at this location.*	*R40588*	Safety	124th Ave SE & SE 284th St
5. *Concern about the road condition on 37th St NW between I St NE and the Interurban Trail. Would like the condition of the road improved for bicycles.*	*R41651*	Bicycle	37th St NW
6. *Concern about pedestrian safety at the intersection of SE 304th St and 116th Ave SE.*	*R42770*	Pedestrian, Safety	SE 304th St & 116th Ave SE
7. *Would like sidewalk along SE 304th St between 112th Ave SE and 116th Ave SE.*	*R42772*	Pedestrian, Safety	SE 304th St between 112th Ave SE & 116th Ave SE
8. *Concern about safety on Lea Hill Rd between 104th Ave SE and 112th Ave SE. Requests additional safety features, such as street lights, turtles, warning signs, etc.*	*R42796*	Safety	Lea Hill Rd between 104th Ave SE and 112th Ave SE
9. *Concern about safety at the AWS & SR-18 interchange. Reports that many drivers wait too long to get into the left turn lanes, stopping abruptly in the through lanes and cutting in front of other drivers.*	*R43047*	Safety	AWS & Sr-18 Interchange

AWS, 17th St SE, M St SE Project Ratings

RATING	COMMENT
1	*If you filter southbound M St SE traffic to 17th St SE, it will impact the residential area between 17th St SE and 21st St SE next to the middle school and overflow 21st St SE traffic. The right turn a car has to make from M St SE onto 17th St SE is what slows traffic going through the lights! There needs to be a light at M St SE and 21st St SE. Also, people going north from this end of town, who normally take M St SE will have to take R St SE and you also need a traffic light at R St SE and 21st St SE to handle that. During the evening rush hour, it's very difficult to get on R St going north to wind around, get on Auburn Way S for 1/2 a block and try to turn north onto M St SE. Come up with a better plan to not choke out R St SE, because this one you present will become an instant nightmare in a very wide area of southeast Auburn. A freeway exist running up to the Muckleshoot area of Auburn Way S, from the M St SE area under Hwy 18 would be a good spot for an exit! That would relieve traffic coming down M St SE to get to Auburn Way S and beyond.*
n/a	*The cul-de-sac will promote tent camping as there are no houses like a normal cul-de-sac. Let me just tent behind the Walgreens. And the antique store that already has a lot of theft will become a bigger target.*
n/a	*I have a lot of concerns. Will there be any public meetings or can I come down to see a whole plan? Do not block off and make a cul-de-sac of M St SE between 21st and 17th. All your improvements are pushing speeding traffic down neighborhood streets with no alternatives. If you close off M St SE between 21st and 17th, where is all the traffic supposed to go? Also, people in my area will now be forced into more traffic since there will be fewer options to get to the other side of town. Bad idea!*
5	*I am excited to reduce traffic in the residential area on and around M St SE. We have new schools in the area and a lot of kids walk to school. I live on the corner of M St SE and 21st St SE and I cannot count the number of accidents that have occurred and the number of near misses at this 4-way stop. It is a nonstop flow of traffic.*
5	*I live on the corner of M St SE and 21st St SE. Day and night, I hear cars spinning out and loud music. Oftentimes, people blow through the stop sign and cause accidents, one of which damaged our front fence. I believe the cul-de-sac will be the most beneficial for my family and everyone in this area! Thank you for this proposal, and I hope they all pass!*
1	*How am I supposed to get home when I live further south on M St SE?*
1	*I live on 23rd st SE. It is almost impossible to get out on R St SE to get to Auburn Way S in the morning, so I go to M St SE to get across Auburn Way S to get to work on the north end of town. This is going to force me and countless others to go through the school zones during the start of school and increase our time and fuel costs. Once in a while I will go to A St SE and the amount of inconsiderate parents dropping their kids off in the middle of the road is insane, all so they don't have to pull off the road and fight their way back in. My opinion is this will end in disaster.*
4	*I appreciate the multiple options provided. The lane being utilized for multiple left/right options makes the most sense to me.*
4	*Not a fan of the cul-de-sac on M St SE south of 17th St SE. It would cut off the direct access to Auburn Way S and M St SE from 21st St SE.*

(Continued on next page)

RATING	COMMENT
1	*I know it will make no difference since you will go through with these plans, but not having access to crossing Auburn Way S from M St SE is really an inconvenience to the hundred if not thousands of people that use it now. Change can really stink and this one is not helping.*
1	*Northbound coming from Lakeland, Lake Tapps, and Bonney Lake will only have R St SE/17th St SE to get on Auburn Way S instead of also having the option of M St SE. 17th St SE already backs up for blocks to get onto Auburn Way S. There will need to be a light at the bottom of Auburn Way S at 17th St SE for traffic from 17th St SE to get onto Auburn Way S. Also, how will fire trucks get through from the fire station onto Auburn Way S if 17th St SE is backed up? For southbound traffic, there needs to be a light at Howard Rd onto R St SE, as this already backs up onto Auburn Way S. Additionally, the pedestrian crossing at M St SE (from the church to Starbucks) is very dangerous. Needs to be "no vehicle turn on red" from Auburn Way S onto M St SE. Also, making M St SE a dead end is a horrible idea - there are only 3 north-south roads through Auburn.*
1	*No northbound traffic from M St SE to westbound AWS is a huge mistake. Putting in a cul-de-sac on M St SE is a nightmare waiting to happen. I suggest you put in a light at the intersection just south of the fire station on R St SE for everyone trying to make a left turn. I'd rather not ever shop in that area of Auburn since the access is so limited to go west on AWS. Also, this intersection was remade to its current flow to reduce accidents from cars attempting to cross over AWS at 17th St SE. Dead ending M St SE is a huge mistake. I'd rather see a roundabout for better traffic flow.*
4	*The 12th St SE signal with a u-turn? This isn't clear to me. Will there be a crosswalk at 12th? Will 12th ever go through to this land use that is being discussed at the miles sand pit?*
1	*Auburn Way S traffic up toward Muckleshoot and Enumclaw has gotten out of hand. The amount of incidents, traffic violations, and growing traffic is unbearable. Turning M St SE into a dead end doesn't seem like the correct answer. It seems like a cost effective, short sighted solution to a big problem.*
1	*By stopping northbound traffic from M St SE onto Auburn Way S, you did not provide a safe way for residents to access Auburn Way S from the streets west of Game Farm Park. This forces traffic onto R St SE, which means all those streets must make left turns and then go behind the apartments on Howard Rd to merge onto Auburn Way S without a traffic light. Or they will be forces to make a left turn at the four-way stop on 21st and then back track in order to turn onto 17th St SE. While this plan may move more volume, it totally ignores the current residents who live in this community.*
1	*This is not an improvement for traffic at all. M St SE is a major through road to reach the south end of town for families.*

(Continued on next page)

RATING	COMMENT
1	*This proposal, in my opinion, is not favorable to the citizens of Auburn whatsoever. I am a router for the Auburn School District and design the bus routes that travel these roads. This proposal would add significant costs, delays, and additional traffic to the intersection of Auburn Way S & M St SE. For our buses transporting students between all north end and south end schools, this would add significant delays where we wouldn't be able to make it to schools on time. Our bus fleet travels north and south on M St SE as the quickest way to access schools in north Auburn, mid-town, Lea Hill, and all the schools on the south end of Auburn. Eliminating access on M St SE from Auburn Way S to 21st St SE will cause major delays. Personally, I can't really believe it is being considered. We have bus stops at EJ Square (1210 M St SE) and if the eastbound left hand turn lane on Auburn Way S is eliminated, we will not be able to access this development. This is not even counting all the buses we have doing field trips that use that road to and from all the south and north schools. We have at least 30 routes that turn off Auburn Way S to 17th St SE. We have 23 routes that use R St SE and 17th St SE. We already have 22 buses that go from H St SE to 17th St SE to G St SE to 12th St SE to Auburn Way S. If you close M St SE, that will cause over 100 buses to use the neighborhood streets and we already get complaints when we use some of them.*
1	*This will make traveling north from our home on 25th St SE next to Pioneer Elementary very difficult. K St SE is already crowded in the morning. People park when dropping off kids and it's unsafe. This appears to make K St SE the only way out of our neighborhood. This plan will make traveling out of and in to south Auburn more congested.*
1	*The blocking off of M St SE from 21st St SE to 17th St SE is totally unacceptable! Having to use the neighborhood side streets to reach Olympic Middle School, Pioneer Elementary, or 17th St Plaza Retirement Center is not acceptable for emergency teams or school buses. Has anyone asked the police/fire departments about having to respond when more than one unit has to go there? The traffic on R St SE/17th St SE is already a major back up at the AM rush hour and so is the PM traffic on the road in front of the shopping center (Walgreens) connecting to R St SE. You think their deliver trucks can square the blocks through the 21st St SE neighborhoods? That short expanse of M St SE from 17th St SE to 21st St SE is a relief for the back ups at R St SE in the am/pm and so does the right hand turn of Auburn Way S to 17th St SE. Having them available decreases the response time for additional units coming into the SE Auburn area. This plan is a safety risk for the 21st St SE/R St SE/17th St SE/29th St SE residents.*
1	*The dead-end of M St SE does not make sense. It will cause increased traffic for nearby residential areas and a school zone. I do not understand the rationale. A better solution would involve adjusting the traffic light sequencing. No explanations for the changes have been presented. The communities south of 17th St SE will be negatively impacted. More thought needs to be given to the proposal, with better reasons given.*

A St SE Projects

RATING	COMMENT
5	*I believe that such improvements are needed on A St SE.*
4	*Yes, I think they need to add a road under the railroad tracks. Ellingson Rd is impossible at 3:00pm to 6:00pm in the afternoon. We cannot get in or out of our neighborhood. All of the traffic going to Lakeland Hills blocks us from leaving or coming home. So many people use that intersection. They don't follow the traffic light rules and block the intersection. It is definitely overrun with excessive traffic. There needs to be a separate road to cross over to A St SE.*
4	*I like it but we need serious help with the Skinner Rd and Ellingson Rd intersection. The traffic is backed up at the light going eastbound and it blocks the intersection. We have to drive around cars to continue on Ellingson northbound through the very short green light. It's been dangerous and dreadful whenever I leave my house on 2nd Ave NE during rush hours.*
4	*All around, this is a pretty good plan with sensible safety improvements. A few notes: 1) the illustration does not depict any bike lanes/paths along A St SE. This project should include quality bicycle facilities along the corridor; they would fill a crucial gap in the bike network and would make the proposed tunnel more useful. 2) It's unclear from the illustration if the existing median on Ellingson Rd will remain. If ti will, it may be worth considering allowing u-turns from eastbound Ellingson so eastbound traffic can access the shopping center with the Dominos and Starbucks. 3) For pedestrian safety, I'd recommend keeping the existing no turn on red restriction. 4) The sidewalks don't look particularly safe or pleasant to walk on since they're right up against the travel lanes. Consider adding some extra space between the road and sidewalks; this would have the additional benefit of not detouring pedestrians as much around the u-turn pockets.*

M Street Bypass Project Ratings

OPTION A RATING	OPTION B RATING	PREFERRED OPTION	COMMENT
3	5	B	*I live on 5th St NE and initially gravitated toward option A, but then as I read through the logic of Option B, I was swayed. My biggest complaint about my neighborhood is that it's not very walkable because it is cut off by several busy streets and people speed up and down R St. Not to mention I find the train horns to be a mild nuisance. I would love to live in a quieter, more walkable neighborhood and taking two extra minutes to drive a couple blocks further when I need to use that highway exit is most certainly worth that. Let's make this a more walkable, more connected city!*
n/a	n/a	B	*Option B looks best. It might move some traffic from residential streets to minor arterials. Also removes an at-grade railroad crossing. There are alternative routes to get access to Hwy 18, so no problem there. Please consider a roundabout instead of a new signal at the new M St SE intersection.*
3	5	B	*I live near there and the trains not sounding their horns sounds like a great idea to me.*
5	2	A	*Concern is losing access to Hwy 18 with Option B for us who take this everyday instead of Lea Hill or downtown Auburn. I vote for Option A because it is an additive with less negative due to opening up driving opportunities, improving train safety, and benefiting the community around it. 100% for train safety as we do not want a derailment ever.*
1	5	B	*Currently, the traffic along R St SE to Black Diamond Rd encourages some drivers to rev their engines, speed, and make a lot of noise, all of which is detrimental to the residents and community that neighbors R St SE. Option B would eliminate this nuisance and improve the quality of life for everyone along R St SE and neighboring streets. Currently, it is risky to walk along R St SE as a pedestrian, out for a stroll. Option B would make the walk far more pleasant and also better for bicycles. Bicycle traffic currently is dangerous and hazardous for both cyclists and motorists.*
1	5	B	*I've lived in this neighborhood for almost 30 years and experienced a decline in quality of life due to increased traffic on R St SE due to noise and pollution. The train hons continue to be a nuisance, especially at night. The closing of R St SE (Option B) would be a blessing to the neighborhood, restoring some peace and tranquility, preserving the residential character of the area. I fail to see the practical feasibility of Option A. R St south of E Main St is a narrow two-lane street, no sidewalks, minimal shoulder, lined with homes. The front yards of these homes are shallow. There is no space to widen the road. A further increase in traffic, as projected, would be disastrous for the residents of this area. Traffic delays would still occur at the redesigned railway crossing. I don't know anyone who would feel inconvenienced by driving a few extra blocks to reach Auburn Black Diamond Rd. Funneling traffic to M St SE makes more sense as M St SE is well-established as a major arterial.*
1	4	B	*The statement says we currently enjoy easy access to Hwy 18. It is much easier to go up over Lea Hill and enter the highway there. I would rather do that than to continue to endure the extra load of trucks that Option A would bring to our neighborhood.*
5	n/a	A	*I think it's critical that NE Auburn maintains access through R St.*
n/a	5	B	*We don't need more traffic on R St NE. This would make the 8th St NE and R St NE intersection more of a mess and the 8th St NE road over the bridge to Lea Hill more of a bottle neck.*

(Continued on next page)

OPTION A RATING	OPTION B RATING	PREFERRED OPTION	COMMENT
n/a	n/a	B	*I prefer Option B because Option A would give access to more traffic at high speeds through residential areas. We already have this issue when Hwy 18 is blocked due to accidents.*
5	1	A	*I live outside the city limits on Auburn Black Diamond Rd and use the R St connection to get into Auburn when Hwy 18 is backed up or block and have used it for years! Closing off the R St connection would have a huge negative impact for those of us who live out that way! Having the M St connection in addition to R St would absolutely help give options to easily commute to both north and south Auburn.*
1	3	Neither	*With Option A, it is imaginable traffic flow eventually increasing along R St to make those along it and surrounding areas uncomfortable. The little connector of 4th St SE (from to R) may suffer similarly. Residential streets are not meant as highways. It's better to keep traffic flow on streets already undertaking heavier flow, such as M St. This makes Option B preferable. Yet, Option B's closing older access from 4th to Auburn Black Diamond and train crossing seems overkill. Local access will be lost. Not everyone taking back roads is a distance commuter or looking for shortcuts. It is a mistake to assume so. As for the train horn, Auburn is a railroad town. Train hors are sounding all about. Residing in the very neighborhood of the intersection discussed, it strikes me that spending money on an "inconvenience" that will little effect pervasiveness is wasteful. I prefer a compromised Option B, one with 4th to Auburn Black Diamond and the train crossing remaining open.*
n/a	n/a	A	*My concern is the restriction access to Auburn Black Diamond Rd for neighbors. Being a resident of 4th St SE and T St SE, Auburn Black Diamond provides a quick and necessary route for our children to get to and from school at Lakeview Elementary, especially for emergencies. In addition to accessing recreational areas such as Flaming Geyser Park and community events, family, and friends.*
1	5	B	*I would much prefer to keep our neighborhood quiet and lose the convenient access to 18 than have trucks utilizing R St.*
1	5	B	*I am voting for keeping large volumes of truck traffic out of our neighborhoods. M St is a large street, which is much better suited to such traffic.*
n/a	n/a	Neither	*Option A puts a street in our yard! Option B cuts us off from Hwy 18. Option A, how many drivers are going to run the light? Or speed through our yard? How many more accidents are going to happen in our yard? Option B takes away our road to Hwy 18 or Flaming Geyser State Park. Option B also allows the trains to be longer and idle more next to the houses here. We the home owners have to live with the extra noise, pollution, danger of car crashing our yard, loss of property, and more vibrations. We do not want this! No Option A or B!*
n/a	n/a	Neither	*Neither option benefits the neighborhood. Both options harm the neighborhood that this construction is being planned around.*
1	5	B	*I do not think diverting traffic through a housing neighborhood is a best practices idea. As the old Miles Pit area is developed, this would increase. I dealt with the M St SE underpass project and the traffic that diverted through our neighborhood was obnoxious! Not only did they drive around road closed signs, many of them were speeding while driving through. I would not wish increased traffic through a neighborhood on anyone. We all know that with a new improved road, the speeding would increase and put the residents living in those areas at increased risk.*

(Continued on next page)

OPTION A RATING	OPTION B RATING	PREFERRED OPTION	COMMENT
n/a	n/a	Neither	*I'm not sure what traffic issue is being addressed. Congestion? Rush hour backup? Pollution and accidents? Train horn? Diverting traffic off of M St to push it back onto M St further south doesn't solve much; it only pushes issues further down the line. Adding a traffic signal to M St - this alone will cause more stoppage and congestion. Spending money to eliminate train horns is silly - Auburn is a train hub. Additionally, closing the railroad crossing eliminates local access, potentially increasing incidental traffic on M St. Pollution and accidents will certainly escalate along R St by using it as a diversion thoroughfare. It is easy to speculate, but it would be less so if your purpose was clearer. As it stands, the project seems to be solving a non-existent problem by using Auburn Black Diamond Rd as a catalyst to disregard an entire neighborhood. Dedicated money might be better spent directly connecting Hwy 18 to the top of SR 164 hill at Muckleshoot.*
n/a	n/a	Neither	*Both options hinder the local neighborhood. The planned route saves 2 minutes. Maybe at the cost of a loss of property, more accidents, more noise, and more pollution.*
n/a	1	Neither	*I've lived in this neighborhood for over 15 years. Current traffic volumes and conditions make this a dangerous area to add more vehicles. Current volumes are high enough that a train crossing during peak hours means cars back up and block driveway access all the way down to E Main St. The speed limit is only 25, but folks drive too fast and take out street signs, trees, and last summer even a telephone pole. Most driveways are back in/back out driveways all along R St, which is not great. Option B is not too great either. I can't see why we would want to limit the neighborhood's access to Hwy 18. Aren't the in/off ramps backed up enough during peak hours? I see the intersection at AWS blocked by traffic for the on ramps pretty frequently. Wouldn't decreasing access to 18 make this worse?*
1	5	B	*We do not want more traffic, especially truck traffic, on R St SE.*
1	5	B	*Extending R St to the M St bypass road would negatively impact the quality of life in the neighborhood. The area between M St and the river, and south of 8th St to the railroad tracks is completely residential. R St is a residential street. South of E Main St, it is a narrow two lanes, lined with homes, without sidewalks or shoulders to speak of. There doesn't appear to be much room for widening the street. As such, it is unsuitable for the anticipated increased traffic. The proposed "improvement" to the rail crossing would not eliminate traffic delays as it will remain an at-grade crossing. Current traffic level is a nuisance, as are the frequent train whistles. Most of the traffic is from people outside the neighborhood passing through. This will increase dramatically if R St is extended. The benefits of closing R St - reduced traffic, no train horns - far outweigh the "drawback" of driving a few extra blocks to access Auburn Black Diamond Rd.*
1	5	B	*I am at 19 N St NE in Auburn, and have non-stop traffic down my street all day. My camera records cars every 30 seconds at peak traffic time. I have asked for speed bumps to match the adjacent road for 8 years. We have had two speed studies that show many speeders. I have even offered to pay for the speed bump between myself and the concerned neighbors that have put in many speed concerns on the See-Click-Fix app. Option B seems to be the only one that may lessen people cutting down my road to avoid the light on E Main and M St.*
3	4	B	*We like the reduced cut-through traffic and train whistle elimination of Option B, but a traffic study should be done for westbound E Main St between R St SE and M St first. As it is, we sometimes have difficulty going north and turning left/westbound off of N St SE onto E Main St because of westbound traffic, and Option B would divert more traffic off of R St onto E Main st that would have otherwise continued south on R St to get to Auburn Black Diamond Rd.*

Climate Element Framework

PROJECT OVERVIEW

This Climate Element Framework serves as a foundation for City of Auburn staff to develop a Climate Element and recommends that additional effort be completed to engage key stakeholders and the community as goals and policies are finalized. Ultimately, the Climate Element will provide mitigation and resilience goals and policies to guide City planning efforts that will reduce greenhouse gas (GHG) emissions and build climate resilience for Auburn residents.

THE GROWTH MANAGEMENT ACT (CHAPTER 36.70A RCW) WAS AMENDED IN 2023 UNDER WASHINGTON HOUSE BILL 1181, REQUIRING CITIES AND COUNTIES TO INTEGRATE CLIMATE MITIGATION AND RESILIENCE POLICIES INTO COMPREHENSIVE PLAN UPDATES. TO MEET THE NEW REQUIREMENTS, THE WASHINGTON STATE DEPARTMENT OF COMMERCE RECOMMENDS JURISDICTIONS DEVELOP A CLIMATE ELEMENT THAT CONSISTS OF BOTH RESILIENCE AND GHG EMISSIONS MITIGATION GOALS AND POLICIES. GOALS AND POLICIES MAY BE CONSOLIDATED INTO A SINGLE COMPREHENSIVE PLAN CLIMATE ELEMENT OR INTEGRATED ACROSS MULTIPLE ELEMENTS.

The Climate Element framework includes the following sections:

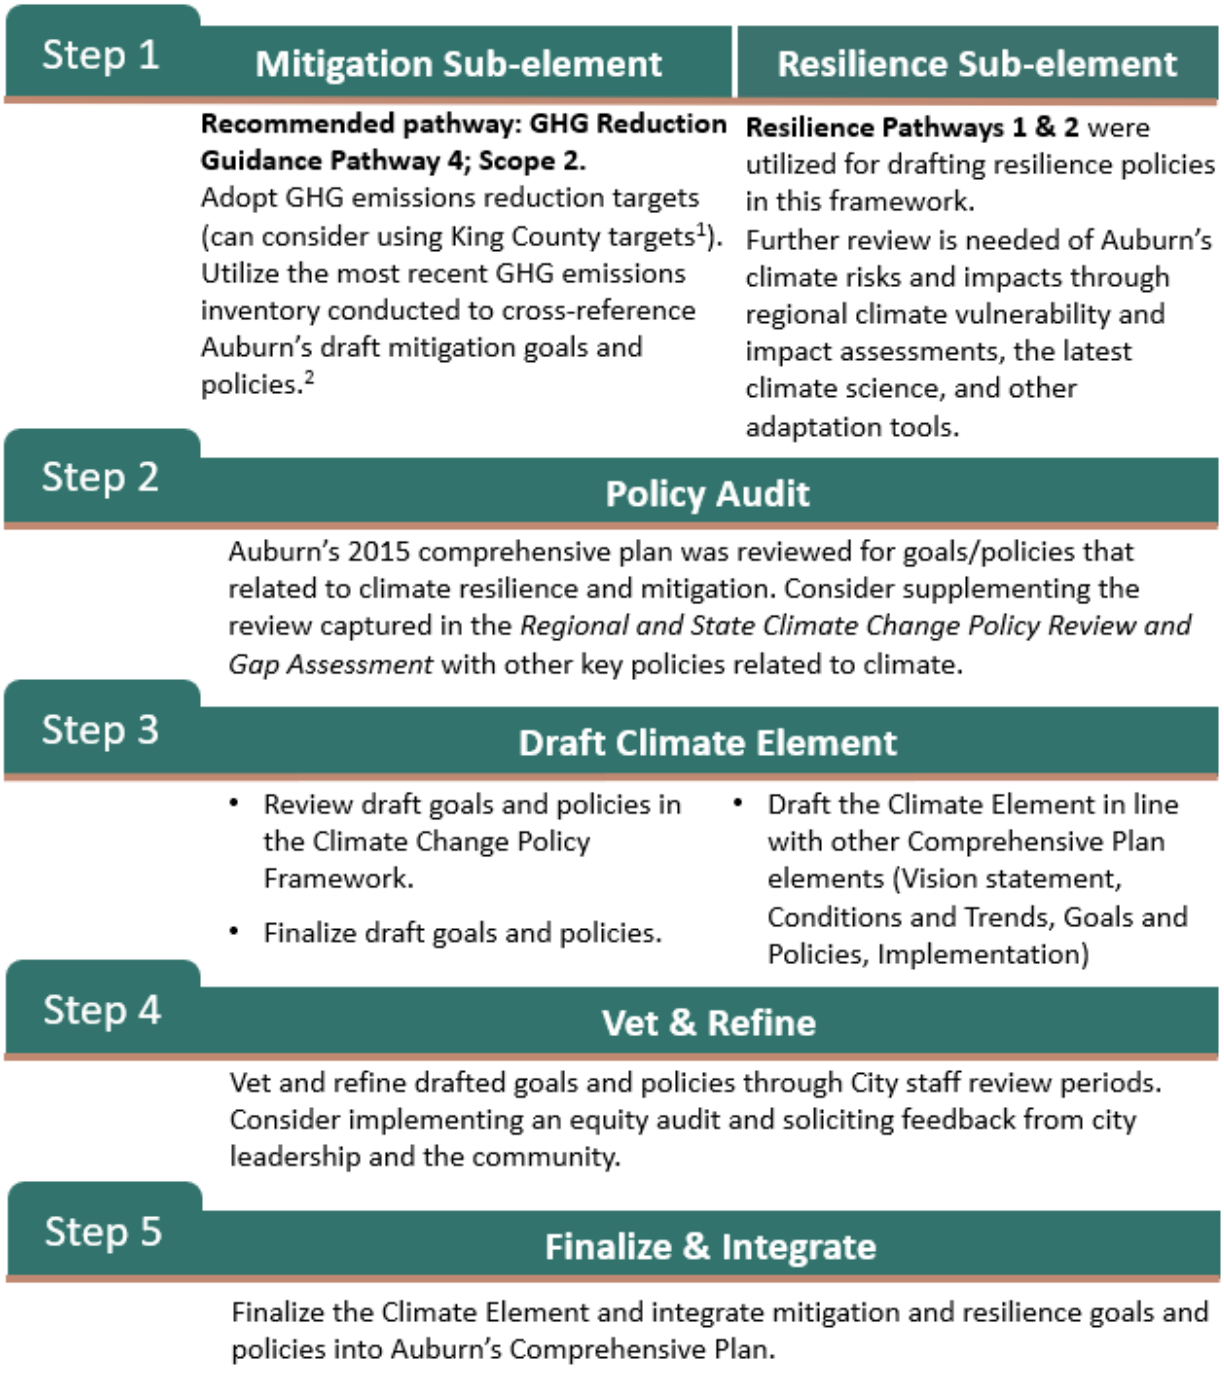
- Implementation Plan: Provides a guidance strategy for developing a final Climate Element and timeline
- Methodology: Reviews steps taken to complete the Regional and State Climate Change Policy Review and Gap Assessment and the Climate Change Policy Framework
- Regional and State Climate Change Policy Review and Gap Assessment: Includes the gap assessment for each key theme that was identified for policies related to climate mitigation, climate resilience, and climate equity to be included in a climate element
- Climate Change Policy Framework: Includes draft mitigation and resilience policies for the climate element

Intended User

City staff responsible for drafting the Climate Element for Auburn's next Comprehensive Plan update can use this framework as a starting point for mitigation and resilience goals and policies to include. Additional review and engagement with the city and community will be required to finalize policies.

IMPLEMENTATION PLAN

Guidance Strategy



The Washington Department of Commerce (Commerce) published an "early version" Climate Element Planning Guidance in June 2023 that provides local governments with resources and detailed steps to complete a Climate Element under the Growth Management Act. This available guidance was incorporated into the Climate Element Framework; however, Commerce intends to publish an "intermediate version" of the guidance in December of 2023. As new guidance and information emerges, Auburn staff should stay informed and incorporate elements of the guidance as needed.

Commerce Guidance and Next Steps

As stated above, the available Commerce guidance was utilized during development of Auburn's Climate Element Framework. As a first phase in developing Auburn's Climate Element, the framework does not represent a complete product, rather it sets the development process in motion by ensuring requirements are understood and met within the policy recommendations included in final framework. See the Methodology section under 1. Evaluate state and regional guidance to identify key themes for compliance requirements.

In the next phase of the Climate Element development process, staff can review the Commerce Guidance and utilize Auburn's framework as a starting point and continue to refine, vet, and engage with the community to ensure compliance is met and city priorities are centered. The following figure outlines the steps Auburn can take to draft the Climate Element (Figure 1). See Commerce's step and pathway figures and descriptions in the guidance for more information.

Figure 1. Auburn's Climate Element development steps.

[1] King County targets: Reduce 2007 emissions 50%, 75%, and 95% by 2030, 2040, and 2050 respectively.
[2] Utilize Auburn draft CAP GHG inventory or the Puget Sound Regional Emissions Analysis Project planning tools

Recommended Timeline

Please note that the recommended timeline will depend on staff availability.

Date Range	Task
2023 July - August	• Review this document: the Climate Element Comprehensive Plan Framework report. • Determine department lead and roles.
2023 August – October	• Determine if additional plans/policies are required for policy audit. Complete supplemental audit if needed. • Finalize draft goals and policies in a language consistent with the Comprehensive Plan. • Engage with Planning Commission to introduce the Climate Element concept, if needed.
2023 - 2024 October – January	• Vet draft goals and policies with additional staff, leadership, and the community. ○ Community engagement could include attending in-person events, hosting a community survey, or publishing draft goals and policies on a platform that allows comments. • Draft the Climate Element to include a vision statement, conditions and trends, goals and policies, and implementation.
2024 February – Onward	• Finalize Climate Element (Planning Commission Recommendation and City Council adoption).

METHODOLOGY

Cascadia used a three-step process to complete the regional and state climate change policy review and gap assessment:

1. Evaluate state and regional guidance to identify key climate resilience and mitigation themes for climate integration in comprehensive plans. The key themes identify groupings for goals and policies to be developed that comply with the GMA and are within the 11 priority sectors identified in Commerce's Model Climate Element Guidance.

2. Identify potential comprehensive plan goals and policies for the Climate Element that relate to the key themes from Step 1. Cascadia reviewed the model climate element policies from the Department of Commerce and King County's K4C Model Policies, Auburn's unadopted Climate Action Plan (CAP), and Auburn's Comprehensive Plan to identify potential goals and policies.

3. Determine degree of alignment of Auburn's existing Comprehensive Plan with potential Climate Element goals and policies. Cascadia compared the

goals and policies currently in Auburn's Comprehensive Plan with potential goals and policies for the Climate Element. We labeled Auburn's existing alignment as either "good," "lacking," or a "policy gap," compared to the model climate goals and policies.

Cascadia then completed two additional steps to develop the Climate Element Framework:

4. Vet and prioritize draft goals and policies with City Staff and project team for inclusion in the Climate Element Framework. Following the completion of Step 3, Cascadia organized a workshop with Auburn City staff and the Comprehensive Plan update team to vet, refine, and prioritize identified policies under each key theme to include in a standalone climate element.
5. Develop Draft Climate Change Policy Framework by creating an implementation plan, guidance strategy, and suite of prioritized mitigation and resilience policies that can be used to develop a climate change element.

Each of these steps is outlined in more detail in the sections below.

1. Evaluate state and regional guidance to identify key themes.

Cascadia reviewed Washington House Bill 1181 that passed the Legislature in 2023 and will require the integration of climate mitigation and resilience policies into county and city comprehensive plans. These required policy changes will address climate emissions and impacts, while considering co-benefits and integration with other planning documents such as housing, transportation, and land use. The requirements outlined in the bill for the "climate change and resiliency element" are as follows:

- GHG emission reduction policies must:
  - Result in reductions in overall GHG emissions generated by transportation and land use within the jurisdiction but without increasing greenhouse gas emissions elsewhere in the state.
  - Result in reductions in per capita vehicle miles traveled within the jurisdiction but without increasing greenhouse gas emissions elsewhere in the state.
  - Prioritize reductions that benefit overburdened communities in order to maximize the co-benefits of reduced air pollution and environmental justice.

- Resilience policies must:
  - Identify, protect, and enhance natural areas to foster resiliency to climate impacts, as well as areas of vital habitat for safe passage and species migration.
  - Identify, protect, and enhance community resiliency to climate change impacts, including social, economic, and built environment factors, that support adaptation to climate impacts consistent with environmental justice; and
  - Address natural hazards created or aggravated by climate change, including landslides, flooding, drought, heat, smoke, wildfire, and other effects of changes to temperature and precipitation patterns.
- The bill also states that for mitigation and resilience policies, complying with any additional requirements from the Department of Commerce (Commerce) Model Climate Element guidelines that are developed in response to the bill would also be required.
  - According to Commerce guidance, the selection of at least one climate resilience goal and supportive policy must be developed within each of the model climate element's 11 sectors (see Table 1).

Table 1. Priority Sectors identified in Commerce's Model Climate Element Guidance

Priority Sector	Includes…
Zoning & Development	Site use, design, and other development facets
Buildings & Energy	Generation, transmission, and consumption
Cultural Resources & Practices	Historic sites and cultural resources and practices
Water Resources	Water quality and quantity
Transportation	Multimodal travel and infrastructure
Economic Development	Business continuity, opportunities
Ecosystems	Land and water species and habitat
Emergency Management	Preparedness, response, and recovery
Human Health	Community well-being and engagement
Waste Management	Materials recycling and disposal
Agriculture	Production and distribution

Cascadia evaluated additional climate change planning guidance documents to identify key themes that would encompass mitigation,[3] resilience,[4] and climate equity[5] goals and policies within the 11 priority sectors identified in Commerce's Model Climate Element Guidance.

The Washington State and regional guidance documents we reviewed included:

- WA Dept of Commerce's Climate Element Guidance and Menu of Measures.
- King County-Cities Climate Collaboration (K4C) Comprehensive Plan Model Climate Policies. *Will be available to the public in Summer 2023.*
- EcoAdapt's Climate Change Adaptation through Local Comprehensive Planning: Guidance for Puget Sound Communities

2. Identify climate element comprehensive plan goals and policies related to key themes.

Once key themes were identified using HB 1181 and climate change planning guidance documents, Cascadia identified goals and policies using Washington state specific model policies,[6] Auburn's Comprehensive Plan, and Auburn's unadopted CAP. Key themes and the goals capture the ways climate change can be integrated in comprehensive plans and cover all 11 Commerce priority sectors. The ten themes we identified are:

Mitigation Key Themes

Theme 1. Transportation and planned development: Reduce greenhouse gas (GHG) emissions by prioritizing accessible multi-modal and low-carbon transportation options; increase the percentage of electric vehicles (EV) and other low-emission transportation modes operating within the City; decrease emissions that stem from fleet & freight

[3] Goals and policies to reduce the rate and extent of climate change caused by greenhouse gas emissions. Mitigation can be achieved through approaches such as higher-density development, reducing vehicle miles traveled, non-motorized transit, green building techniques, reduced consumption and waste, and renewable energy sourcing.

[4] Goals and policies to address the effects of climate change by increasing resilience and/or decreasing vulnerability. Resiliency policies and goals can be achieved though approaches such as low-impact development; climate-certified zoning, permitting & procurement; and climate-savvy hazard mitigation.

[5] Goals and policies to address the disproportionate impacts of climate change on frontline communities due to existing and historic racial, social, environmental, and economic inequities. Climate equity can be achieved through approaches such as community engagement and partnerships with frontline communities, increasing access to healthy local food, and investing in anti-displacement programs. Climate equity policies will be integrated within the resilience and mitigation themes.

[6] Dept. of Commerce's Menu of Measures and King County's K4C Model Policies.

service vehicles and aviation; reduce GHG emissions by promoting densification and efficient land uses in mixed-use urban villages near transit corridors.

Theme 2. Renewable energy and energy efficiency: Reduce GHG emissions by transitioning to renewable energy sources, decarbonizing buildings, and increasing energy efficiency; promote a diverse, clean, efficient grid that increases the grid's reliability as demand increases.

Theme 3. Waste management and circular economy*: Reduce GHG emissions from materials and organic waste by minimizing waste generation and maximizing waste diversion; reduce greenhouse gas emissions from materials by supporting a circular economy.

**Policies within this theme identified with the superscript $^{M+R}$ indicate that the policy falls under both mitigation and resilience categories.*

Theme 4. Natural habitats and urban green space: Protect and enhance land carbon sinks (e.g., trees, urban green space, soil) to mitigate GHG emissions; establish a green belt of parks to develop a non-motorized trail to connect housing, schools, and businesses across a community.

Resilience Key Themes

Theme 5. Public health and community resiliency: Conduct, and periodically update, a climate vulnerability and risk assessment; minimize disproportionate impacts of climate change on vulnerable and frontline communities and focus/maximize associated benefits; prioritize green, affordable housing to meet projected growth and needs of the community.

Theme 6. Infrastructure and emergency preparedness: Protect public health and safety equitably by identifying and planning for risks associated with climate change; protect the community from extreme heat impacts and wildfire smoke; ensure that infrastructure (critical and noncritical) and utilities are resilient to climate change impacts (e.g., precipitation events and stormwater flooding); provide all residents an equitable opportunity to learn about climate impacts, influence policy decisions, and take actions to enhance community resilience.

Theme 7. Cultural resources and practices: Protect and preserve cultural resources and practices to build resilient communities and ecosystems in the face of climate change.

Theme 8. Water conservation and stormwater management: Protect and preserve water quantity and quality from drought, extreme heat, and other hazards exacerbated by climate change consistent with

Auburn's Comprehensive Water Plan; account for climate change impacts in planning, designing, and operating stormwater management approaches consistent with Auburn's Comprehensive Storm Drainage Plan.

Theme 9. Natural habitats and urban green space: Support preservation and access to green and open spaces; protect and enhance the climate resilience of urban forests by implementing climate-smart forest, park, and green space management; ensure the protection and recovery of ecosystems to provide healthy habitat in a changing climate.

Theme 10. Economic development: Increase access to green jobs, with special consideration for increasing access for frontline communities.

3. Determine the degree of alignment of Auburn's existing Comprehensive Plan with climate element policies.

Cascadia then cross walked Auburn's Comprehensive Plan to determine policy alignment with key themes and specific climate policies. With the potential goals and policies now organized by key theme, Cascadia compared the goals and policies currently in Auburn's Comprehensive Plan with each potential goal and policy for the Climate Element. We assessed whether the potential goal or policy was present in Auburn's Comprehensive Plan, the strength and completeness of the goal or policy in relation to what is in Auburn's Comprehensive Plan, and whether the goal or policy made sense to include for Auburn given local context. We labeled Auburn's existing alignment as either "good" alignment, "lacking" in alignment, or a "policy gap" compared to the model climate goals and policies. See Table 2 for how policies were coded.

Table 2. Policy Alignment Cell Coding

Cell Color	Level of Policy Alignment
Green	Good. The green cell color indicates that the current Auburn Comprehensive Plan effectively includes the potential Climate Element goal or policy already; however, additional policies/language could be considered to strengthen existing policy language.
Orange	Lacking. The orange cell color indicates that the current Auburn Comprehensive Plan includes language that is consistent with the potential Climate Element goal or policy but is not effectively integrating the potential climate element goal or policy. Or, it

Cell Color	Level of Policy Alignment
	indicates the potential Climate Element goal or policy was identified in Auburn's unadopted CAP, which is not being used to implement climate action or policies at this time.
Red	Policy Gap. The red cell color indicates a policy gap. The policy is not represented in Auburn's current Comprehensive Plan or unadopted CAP. Policy gaps are taken directly or modified from Commerce's menu or measures or the K4C model policies.

Once we determined the alignment of Auburn's existing Comprehensive Plan with climate element policies, our team drafted the Regional and State Climate Change Policy Review and Gap Assessment memorandum and shared with City staff for review (Step 4).

4. Prioritize Draft Policies with City Staff

Cascadia worked with the project team and City staff to further refine, vet, and prioritize climate goals and policies for inclusion into the Climate Element. A workshop was held on May 17, 2023, with City staff. City staff reviewed the project purpose, outputs, and timeline, then prioritized the draft climate mitigation and resiliency goals and policies for the Climate Element. See Appendix A for a detailed workshop summary.

Staff prioritized policies and provided feedback on goals and policies within the key theme(s) that best aligned with their expertise. City staff prioritized potential policies using these rankings:

- NA: Already represented within the current Comprehensive Plan. (Note element cited).
- Low: Not a priority to include in a Climate Element.
- Medium: Should consider inclusion in the Climate Element, but not a priority.
- High: Recommend inclusion in the Climate Element.

Cascadia revised policies using staff feedback. Policies ranked "Medium" and "High" were included in the Climate Change Policy Framework. We also included policies that did not receive a ranking because they require additional review and prioritization before determining whether they are included in the final Climate Element. See Appendix A for all draft policy rankings.

5. Develop Draft Climate Change Policy Framework

Cascadia then developed a Climate Element Framework that includes a recommended implementation plan, guidance strategy, and suite of prioritized mitigation and resilience policies that can be used to draft and finalize a climate change element. Auburn staff prioritized the preliminary climate goals and policies for inclusion in the Comprehensive Plan's climate element and prioritized policies and included edits based on the feedback we received. Policies were also added when a gap was identified by staff.

Regional and State Climate Change Policy Review and Gap Assessment

This section includes the gap assessment summary for each key theme that was identified for policies related to climate mitigation, climate resilience, and climate equity to be included in a climate element. For a more detailed policy gap and alignment analysis, see the Regional and State Climate Change Policy Review and Gap Assessment (Task 1) Memorandum.

MITIGATION THEMES (1-4)

Theme 1*: Transportation and planned development*

Gap Assessment: The current Auburn Comprehensive Plan captures key policies for long-term planning related to transportation and building infrastructure and development. However, there is a lack of policies that link long-term planning strategies with GHG emissions reduction and climate equity. Additional policies related to electric vehicles (EVs) and EV infrastructure, reducing vehicle miles traveled, and preventing displacement from development should be considered.

Theme 2: Renewable energy and energy efficiency

Gap Assessment: The current Auburn Comprehensive Plan captures key policies for long-term planning related to land use and utility infrastructure, with some broad policies aimed at reducing energy consumption, practicing sustainable development, and reducing the impact of utilities. However, additional polices are needed that relate these strategies with GHG emissions reduction and climate equity. These include policies aimed at transitioning to renewable energy sources, promoting energy conservation and efficiency measures, building grid resilience, and educating homeowners about energy efficiency upgrades should be considered.

Theme 3: Waste management and circular economy

Gap Assessment: The current Auburn Comprehensive Plan captures key policies for long-term planning related to critical facilities (i.e., waste facilities), with some aimed at solid waste management. While the Comprehensive Plan encourages effective solid waste management and increased recycling efforts, additional policies are needed to relate these strategies with GHG emissions reduction and climate equity. Policies including supporting a circular economy, supporting urban agriculture and local food production, encouraging composting, enforcing sustainable construction and demolition (C&D) practices, and implementing environmentally friendly purchasing policies should be considered.

Theme 4: Natural habitats and urban green space

Gap Assessment: The current Auburn Comprehensive Plan captures key policies for long-term planning related to utilizing new development to contribute to new park developments, seeking land to establish a green belt for non-motorized travel, and implementing low-impact development and landscaping in parking lots. However, additional policies are needed that relate these long-term planning strategies with carbon sequestration (i.e., carbon storage). Policies related to managing and planning for carbon storage should be considered.

RESILIENCE THEMES (5-10)

Theme 5: Public health and community resiliency

Gap Assessment: The current Auburn Comprehensive Plan captures key policies for long-term planning related to housing. However, additional policies are needed that relate to climate resilience, public health, and equity. Policies related to identifying climate vulnerable communities, investing in programs and services that reduce vulnerability in vulnerable and frontline communities, and prioritizing green affordable housing should be considered.

Theme 6: Infrastructure and emergency preparedness

Gap Assessment: The current Auburn Comprehensive Plan captures key policies for long-term planning related to housing and infrastructure resiliency. However, additional policies are needed that relate these long-term planning strategies with equity, emergency preparedness, and climate adaptation. Policies related to and offering equitable access to adaptation resources (i.e., resilience hubs), developing strategies to aid community members ability to respond to extreme weather events (i.e., extreme heat, wildfire smoke events), and ensuring critical and non-critical infrastructure is resilient in the face of climate change should be considered.

Theme 7: Cultural resources and practices

Gap Assessment: The current Auburn Comprehensive Plan captures the importance of historic preservation through policies related to developing a Historic Preservation Plan, planning for future development impacts to historic sites, and recognizing that the City should accord the same levels of promotion and protection to Native American sites and artifacts as to those of the more recent past. However, there are not specific policies that recognize the risks climate impacts pose to historic sites. Additional policies related to assessing climate vulnerability of the city's historic resources and establishing and maintaining government-to-government relations with tribes related to preserving sites should be considered.

Theme 8: Water conservation and stormwater management

Gap Assessment: The current Auburn Comprehensive Plan has many policies related to preserving water quality and quantity through conservation efforts and includes policies related to stormwater planning. However, additional policies are needed that provide a connection between climate change impacts and planning for community water needs and stormwater management. Policies that link climate change with water conservation efforts and stormwater management should be considered.

Theme 9: Natural habitats and urban green space

Gap Assessment: The current Auburn Comprehensive Plan includes policies protecting, enhancing, and restoring critical areas and natural resources. However, policies related to forest management and increasing the resilience of natural resources to climate change impacts are lacking. Additional policies that speak to tree management and link the protection of healthy habitats to climate resiliency should be considered.

Theme 10: Economic Development

Gap Assessment: The current Auburn Comprehensive Plan captures the high-level policies related to local economic development. However, additional policies are needed that recognize climate and environmental justice considerations. Policies related to developing a green job strategy, an equitable green workforce (including education and workforce training), and a just transition should be considered.

Climate Change Policy Framework

Policies were revised using staff feedback received at the staff workshop. Policies ranked "Medium" and "High" were included in the Climate Change Policy Framework. Any policy that was not evaluated is also in the Framework so that it can be further evaluated by staff.

Each policy in the Framework has a parenthetical citation. This citation indicates where policy language originated. Language may have been edited to suit Auburn's specific needs.

- Corresponding policies included within Auburn's Comprehensive Plan (e.g., Comp Plan *LU-1*). LU-1 indicates the policy can be found in the 2015 comprehensive plan, Land Use section, Policy 1.
- Corresponding actions included within Auburn's Climate Action Plan (e.g., *CAP E-7*). CAP E-7 indicates the policy can be found in Auburn's CAP, Energy section, action 7.
- Policies sourced from the Department of Commerce's Menu of Measures (Commerce)
- Policies sourced from the K4C Comprehensive Plan Model Climate Policies (K4C Model Policies)

MITIGATION SUB-ELEMENT

Goals and policies included in the mitigation sub-element are focused on reducing GHG emissions.

Theme 1: Transportation and planned development

Draft policies related to electric vehicles (EVs) and EV infrastructure were typically ranked high-medium priority. Draft policies pertaining to reducing VMT were prioritized as "low" or noted as continuing efforts already covered in other elements within the Comprehensive Plan ("NA"). However, as a key compliance requirement, reducing per capita VMT will be important for the Climate Element to address these ongoing strategies and build upon them when appropriate. This includes policies such as:

- Partnering with agencies that support multimodal transportation infrastructure;
- Prioritizing dense, mixed use, transit-oriented development, and affordable housing in high use areas;
- Investigating opportunities to expand and implement multi-modal transportation options, including bicycling, walking, and transit;

- Maximize bicycle and pedestrian infrastructure and other active-transportation systems.

Goal 1	Increase the percentage of EV and other low-emission transportation modes operating within the City.
Policy 1.1	Development incentives should be established that encourage the creation of electric car charging stations (*LU-57*). Work with utility providers and other partners (e.g. developers and EV companies) to ensure that there is access to EV charging where it is needed and expand EV charging readiness for buildings. (K4C Model Policies)
Policy 1.2	Develop and implement an Electric Vehicle Infrastructure Plan that: • Reviews current EV infrastructure in the city to identify gaps in charging locations. This review should be done with an equity lens and consider areas that are historically underserved and where the most benefit would be observed. • Identifies locations for chargers in commercial, multifamily residence areas, and city facilities. • Reviews feasibility of fast charging stations. • Addresses access issues and barriers to EV and charging stations for low-income homeowners, renters, and multifamily residents. • Identifies key stakeholders to EV infrastructure use and development. • Identifies partners in the region who can assist with charging station infrastructure to lower program and construction costs. (K4C Model Policies)
Goal 2	Decrease emissions that stem from fleet & freight service vehicles and aviation.
Policy 2.1	Support state-level policies and actions that incentivize and create requirements for clean fuels and electrification of private and commercial fleet vehicles. (K4C Model Policies)
Policy 2.2	Convert public-owned fleets to zero-emission vehicles (e.g., electric or renewably produced hydrogen) as soon as feasible. (Commerce)

Theme 2: Renewable energy and energy efficiency

Staff noted that some of the draft policies related to energy had limitations to what a city can achieve and when the effort requires action by an industry or other regional partners. Additionally, budget limitations need to be considered when determining what is feasible in the next 20 years under this theme. Draft policies that were ranked “low” were noted to already be covered elsewhere in the Comprehensive Plan.

Goal 3	Reduce greenhouse gas emissions by transitioning to renewable energy sources, decarbonizing buildings, and increasing energy efficiency.
Policy 3.1	Evaluate opportunities to retrofit municipal buildings for energy efficiency. (Commerce)
Policy 3.2	Optimize heating, ventilation, and air-conditioning (HVAC) systems at City facilities by installing more efficient equipment and technology and implementing operational changes to increase energy efficiency. Such efforts may include the following: • Conducting HVAC energy efficiency audits to identify cost-effective upgrades. • Installing building automation systems (BAS). • Installing high-efficiency motors, dampers, and multi-speed motors for air handling. • Phasing out chlorofluorocarbons (CFCs) in air-conditioning and refrigeration equipment. • Educating staff to ensure and maintain peak efficiency and operating conditions. (*CAP E-2*)
Policy 3.3	Adopt performance standards for all City buildings, including renovations on existing buildings and design of new buildings, and establish a tracking system that makes the benchmarking scores of City buildings publicly available. Relevant building performance standards may include the following: • Standards from LEED-EB, the Leadership in Energy and Environmental Design rating system for Existing Buildings. • Building commissioning requirements. • Lighting power densities (LPDs) and controls that go beyond existing energy code requirements. • Wall insulation, window performance, and envelope air tightness standards that go beyond existing energy and building code requirements. • LEED and/or ENERGYSTAR certification for buildings larger than a specified size. (*CAP E-3*)
Policy 3.4	Optimize building envelope energy efficiency at City facilities by installing more efficient materials and technology. Relevant upgrades may include the following: • Conducting audits to identify cost-effective upgrades for weatherization and building envelope components. • Replacing single-pane windows with insulated glazing with low-e film. • Replacing or increasing interior wall insulation and roof insulation during major renovations.

	• Adding additional batt or rigid insulation and thermal barriers during interior renovations. (*CAP E-4*)
Policy 3.5	Implement audits and technical assistance to increase building energy efficiency. Such a program could address single-family, multifamily, and/or commercial buildings. Elements could include weatherization strategies, direct-installation of energy and water conservation materials, appliance trade-in/exchanges, home and business conservation kits, and rooftop solar and solar hot water projects – targeting support in low-income communities. (*CAP E-5*)
Policy 3.6	Adopt performance standards for residential and commercial building codes to increase building energy efficiency. The standards can address single-family, multifamily, and commercial renovations, existing buildings, and new buildings. The City can also require that building performance ratings be publicly available, to help inform prospective tenants and buyers about the energy performance status of buildings. (*CAP E-6*)
Policy 3.7	Pursue and advocate for federal and state funding and incentives to improve energy efficiency in existing commercial and residential buildings. (Commerce)
Policy 3.8	Maximize renewable energy sources for the supply of electricity and heat to new and existing residential and commercial building construction. (Commerce)
Policy 3.9	Retrofit publicly owned buildings with solar panels and electric heat pumps. (Commerce)
Policy 3.10	Support and expand building energy efficiency retrofit programs to reduce building energy use and improve energy resilience, including a focus on affordable housing. (K4C Model Policies)
Policy 3.11	Explore and promote low interest loan options and incentive programs to finance energy efficiency upgrades for commercial and residential buildings, while seeking other finance mechanisms to fill in potential funding gaps. Investments and programs should be prioritized in historically underserved areas. (K4C Model Policies)
Policy 3.12	Develop energy efficiency outreach programs for residents and businesses by partnering with PSE and other local jurisdictions to identify and select appropriate and cost-effective energy improvements. This could involve supporting local schools in integrating climate and sustainability education into curriculum. (K4C Model Policies)
Policy 3.13	Building on proposed WA state policy, strengthen energy efficiency codes to reflect best practices and meet established energy targets (e.g., require energy use disclosure and benchmarking for buildings,

	starting with commercial and multifamily buildings over a size threshold). (K4C Model Policies)
Policy 3.14	Expand local onsite renewable energy production, such as through installation at municipal facilities, support of incentive programs, and coordination of community-based partnership projects and programs. (K4C Model Policies)
Policy 3.15	Support cleaner energy sources. Potential efforts include supporting community-scale renewable energy projects and efficient small-scale on-site power generation, working with local utilities to use cleaner energy sources, and encouraging Auburn businesses and residents to offset their energy use. *(CAP E-7)*
Policy 3.16	Develop low-energy-use requirements and building code compliance for residential buildings. (Commerce)
Policy 3.17	Educate community members about incentives for emerging alternative energy technology, such as tax exemptions for solar installations, and increase community awareness of existing solar arrays and water heating systems in the city. (K4C Model Policies)
Goal 4	Promote a diverse, clean, efficient grid that increases the grids reliability as demand increases.
Policy 4.1	Work with and encourage the utility provider to plan, site, build and maintain an electrical system that meets the needs of existing and future development, and provides highly reliable service for City customers and coordinate with non-city utility providers to ensure planning for system growth consistent with the city's Comprehensive Plan and growth forecasts. (K4C Model Policies)
Policy 4.2	Advocate for increased grid reliability through state and utility regulatory rulemaking and legislation that supports demand response and storage technologies that reduce peak load and provide grid flexibility. (K4C Model Policies)
Policy 4.3	Advocate for energy utilities to adopt efficient practices and explore alternative energy resources, in order to help meet long-term energy needs and reduce environmental impacts associated with traditional energy supplies. (K4C Model Policies)

Theme 3: Waste Management and Circular Economy

Staff feedback received confirmed inclusion of many of the draft policies, however, policies noted as "impractical", not feasible, or already a program that Auburn runs were omitted.

Goal 5	Reduce greenhouse gas emissions from materials and organic waste by minimizing waste generation.

Policy 5.1	Encourage local food production, processing, and distribution through the support of home and community gardens (i.e., P-Patches), farmers' markets, community kitchens, and other collaborative initiatives to provide healthy foods and promote food security. (K4C Model Policies)
Policy 5.2	Update municipal solid waste contract policies and programs to encourage waste prevention and take-back programs, maximize diversion, ensure efficient collection routes, and promote hybrid and electric vehicles to transport and collect waste. (K4C Model Policies)
Policy 5.3	Promote prevention and redistribution of food waste, such as through expanding and encouraging community and school gardens, urban agriculture, and farmers markets; and working with local grocery stores to support a food donation program to send surplus food. (K4C Model Policies)
Policy 5.4	Support extended producer responsibility (EPR) related policies and actions that require companies that make consumer products fund the residential recycling system and that ensure that packaging and paper products actually get recycled. (K4C Model Policies)
Policy 5.5	Implement solid waste management programs and services that provide ample opportunities and incentives to maximize the community's participation in local and regional waste reduction and recycling efforts. (CF-30)
Policy 5.6	Ensure that solid waste management programs shall be developed to make waste reduction and recycling efficient, reliable, cost-effective, and convenient for all residents and businesses. (CF-31)
Policy 5.7	Encourage and promote the use of products manufactured from recycled materials, and the use of materials that can be recycled. City Departments and contractors shall use recycled and recyclable products whenever and wherever feasible. (CF-32)
Policy 5.8	Implement solid waste reduction and recycling programs that have the cumulative effect maintaining the 50 percent waste reduction and recycling goal (recycling tons/total solid waste stream). (CF-33)
Policy 5.9	Promote the recycling of solid waste materials by providing opportunities for convenient recycling and by developing educational materials on recycling, composting and other waste reduction methods. (CF-35)
Goal 6	Reduce greenhouse gas emissions from materials and organic waste by maximizing waste diversion.
Policy 6.1	Expand commercial recycling and organics collection and service, including making recycling and organics disposal as convenient as garbage and adequate to serve the number of tenants. Implement

	compost requirements for food businesses in accordance with HB 1799. Consider the implications of implementing an organics disposal bans and/or requiring services. (K4C Model Policies)
Policy 6.2	Expand recycling and compost service for single-family and multifamily properties and provide technical assistance to help compost successfully. Consider the implications of implementing an organics disposal bans and/or requiring services. (K4C Model Policies)
Policy 6.3^{M+R}	Continue to implement community outreach and education programs around proper waste reduction, recycling, and composting—with a focus on food waste. Provide outreach and program in multiple formats and languages as appropriate. (K4C Model Policies)
Policy 6.4	Adopt standards for City buildings to use best practices for recycling, composting, reuse, and waste reduction. Standards can recommend practices such as placing more recycling bins at workstations, collecting organics more frequently and garbage less frequently, and installing more water bottle filling stations in facilities. (*CAP M-1*)
Policy 6.5^{M+R}	Identify gaps in recycling and composting programs and take steps to expand service. The City can help identify locations, communities, and building types that are underserved by recycling and composting programs, such as multifamily apartment buildings. The City can work with haulers and through policies to improve service and increase recycling and composting. (*CAP M-3*)
Policy 6.6	Incentivize recycling of construction and demolition debris. (Commerce)
Policy 6.7	Use recycled materials in the construction of transportation and other infrastructure facilities. (Commerce)
Policy 6.8	Develop, implement, and enforce construction and demolition (C&D) recycling and deconstruction ordinances. (K4C Model Policies)
Goal 7	Reduce greenhouse gas emissions from materials by supporting a circular economy.
Policy 7.1	Develop and adopt a citywide purchasing policy that includes environmental impacts. Environmentally Preferable Purchasing (EPP) policies can prioritize reusing products and materials, purchasing durable goods, avoiding disposable goods, and reducing energy use, greenhouse gas emissions, and lifecycle costs and impacts. EPP policy may include targets, measures to track impacts, strategies for implementation, and references to existing standards (e.g., EPEAT, ENERGYSTAR, and LEED). (*CAP M-2*)

Policy 7.2[M+R]	Support "collaborative consumption" community projects that encourage shared use and exchanges. Examples projects may include tool libraries or repair cafes, which the City can support through partnerships or grants with nonprofit and community organizations. (*CAP M-4*)

Theme 4: Natural habitats and urban green space

Staff ranked all draft policies "Medium"- "High".

Goal 8	Protect and enhance land carbon sinks (e.g., trees, urban green space) to mitigate GHG emissions.
Policy 8.1	Require open space set-asides (such as parks) for new development. (Commerce) *(PR-2)*
Policy 8.2	Maximize tree canopy coverage in surface parking lots. (Commerce)
Policy 8.3	Improve and expand urban forest management to maximize or conserve carbon storage. (Commerce)
Policy 8.4	Manage natural lands (forests, grasslands, wetlands) to maintain and/or increase their carbon concentrations. Avoid the conversion of carbon-rich ecosystems. Prioritize increasing tree canopy cover and open space in overburdened frontline communities. (Commerce)
Goal 9	Establish a green belt to develop a non-motorized trail to connect housing, schools, and businesses across a community.
Policy 9.1	Actively seek to acquire land along corridors identified for future trail development in the current Comprehensive Transportation Plan and Auburn Parks, Recreation, & Open Space Plan. *(NM-04)*

RESILIENCE SUB-ELEMENT

Goals and policies included in the resilience sub-element are focused on building community resilience and reducing community vulnerability to climate impacts.

Theme 5: Public health and community resiliency

Staff ranked many of the draft policies as "High" but noted they are covered by other plans and programs such as the Hazard Mitigation plan and the Comprehensive Emergency Management Plan.

Goal 10	Conduct, and periodically update, a climate vulnerability and risk assessment.
Policy 10.1	Conduct, and periodically update, a climate vulnerability and risk assessment that includes a focus on the built environment,

	communities, and natural systems. Support enhanced data collection for hazard events to provide a fuller understanding of the community's hazard characteristics—including identifying demographic groups/community members most vulnerable to climate impacts. Use assessment findings to evaluate changes to comprehensive plan goals and policies and enhance resilience. (K4C Model Policies)
Policy 10.2	Promote the use of health impact assessments and other tools to address the potential impacts of health, equity, and climate change on vulnerable communities. (Commerce)
Policy 10.3	Integrate a climate impacts risk assessment and policies into the local hazard mitigation plan. (Commerce)
Policy 10.4	Support enhanced data collection for hazard events of all magnitudes to provide a fuller understanding of the community's hazard characteristics — including those affected by climate change. (Commerce)
Goal 11	Minimize disproportionate impacts of climate change on vulnerable and frontline communities and focus/maximize associated benefits
Policy 11.1	Provide information in multiple languages to Auburn's diverse communities regarding services offered by local and regional governmental, educational, employment, health, and other providers to improve residents' quality of life and to promote resident engagement and household economic independence. (*H-38*)
Policy 11.2	Encourage and support human and health service organizations that offer programs and facilities for people with special needs. Support programs in particular that help people to remain within the community, including those that are veterans, disabled, seniors, single-parent households, and the homeless. (*H-31*)
Policy 11.3	Identify and address the disproportionate impacts of climate change on communities of color and lower-income communities when prioritizing investments, policies, programs, and projects. Prioritize investments, policies, and programs that address existing disparities in the distribution of environmental burdens and benefits. Ensure benefits are accessible to and focused on underserved communities. (K4C Model Policies)
Policy 11.4	Invest in community-driven climate planning processes, share decision-making power, and co-develop and identify climate actions and priorities, particularly with frontline communities. (K4C Model Policies)
Policy 11.5	Improve access to services throughout the community by investing in partnerships with frontline communities to co-identify

	and remove systemic and physical barriers to services that increase climate resilience. (K4C Model Policies)
Policy 11.6	Place special emphasis on extreme weather events that impact programs addressing those who are most vulnerable to homelessness. (K4C Model Policies)
Policy 11.7	Prioritize investments, policies, programs, and projects that equitably reduce climate change impacts on vulnerable communities and increase resilience. This includes actions that address the impacts of extreme weather events on those experiencing homelessness. (K4C Model Policies)
Policy 11.8	Identify communities disproportionately impacted by extreme heat events and prioritize equitable access to emergency preparedness resources for vulnerable populations and areas. Develop and distribute tools and resources for the community to stay safe during extreme heat events. (K4C Model Policies)
Policy 11.9	Identify and expand community-centered anti-displacement strategies and climate-resilient infrastructure to mitigate housing insecurities exacerbated by climate change and/or gentrification. (K4C Model Policies)
Policy 11.10	Link climate adaptation strategies with social equity and public health strategies. (Commerce)
Policy 11.11	Address the social and mental health needs of displaced populations following disasters. (Commerce)
Goal 12	Prioritize green, affordable housing to meet projected growth and needs of the community.
Policy 12.1	Support projects that bring renewable energy to communities of color, low-income populations, and members of limited-English speaking communities, based on evaluation and assessment of barriers and challenges. (K4C Model Policies)
Policy 12.2	Uphold the Growth Management Act to prioritize dense, mixed use, transit-oriented development (TOD) and affordable housing by encouraging integrated site planning and green building, with a focus on early consideration of these in the site development process. Encourage the location of new green, affordable housing units near community amenities and services, such as transit and green space. (K4C Model Policies)
Policy 12.3	Give intentional consideration to a local community response to homelessness with affordable, green housing and supportive services provided. (K4C Model Policies)

Theme 6: Infrastructure and Emergency Preparedness

Staff ranked many of the draft policies as "High" but noted they are covered by other plans and programs such as the Hazard Mitigation plan and the Comprehensive Emergency Management Plan.

Goal 13	Equitably protect public health and safety by identifying and planning for risks associated with climate change.
Policy 13.1	Promote housing improvements by property owners and building managers. Seek available assistance for housing rehabilitation. Assistance will include the development of residential infrastructure and the rehabilitation of individual properties. (HO-20) a. Find public and private sources of capital and offer low-interest loans for rehabilitation. (Public Works, 2012) b. Continue to participate in the Emergency Home Repair Program and consider partnering with nongovernmental organizations to maximize funds. (Public Works, 2012) c. Encourage green lending for improved energy conservation, indoor air quality, and other measures. (Public Works, 2012) d. Help identify professional volunteers at educational or professional associations to plan redesign or architectural upgrades of the properties. (Public Works, 2012) e. Support additional healthy housing and preservation strategies, such as property tax exemptions to preserve affordable housing opportunities and utilizing community health workers to offer property owners and residents the education and resources needed to maintain housing. (*H-21*)
Policy 13.2	Ensure the Comprehensive Emergency Management Plan incorporates considerations of climate change impacts on the Auburn community, including: 1) potential housing insecurities and displacement exacerbated by climate change, 2) chronic and acute heat risk in the community, 3) infrastructure and utility disturbances, and 4) plans and communication tools to help residents plan and practice actions that make responding to emergencies quicker and safer. (Commerce)
Policy 13.4	Develop resilience hubs — community-serving facilities augmented to support residents and coordinate resource distribution and services before, during, and after a hazard event. (Commerce)
Policy 13.5	Work toward a distribution of growth that promotes equitable access for frontline communities and reduces the potential for displacement through program services such as municipal emergency preparedness, affordable energy prices, and accountable utilities with consideration of climate impacts such as

	extreme heat, flooding, wildfire smoke, and drought. (K4C Model Policies)
Policy 13.6	Factor climate impacts into the planning of operations and coordination of preparedness, response, and recovery activities among first responders and partners, including public health, law enforcement, fire, school, and emergency medical services (EMS) personnel. (Commerce)
Goal 14	Protect the community from extreme heat impacts and wildfire smoke
Policy 14.1	Work with partners, such as the Valley Regional Fire Authority, to prioritize at-risk community members for actions that mitigate wildfire smoke, including providing filter fans or incentivizing infrastructure updates that protect against wildfire smoke (e.g., HVAC updates and MERV 13 filters for air intake) for facilities that serve high-risk populations. (Commerce)
Policy 14.2	Develop and implement an urban heat resilience plan or strategy that includes heat mitigation and management actions to prepare for and respond to chronic and acute heat risk in the community. The strategy should be informed by urban heat island mapping and may include coordinated efforts such as cooling centers, early warning systems, development/land use codes, and energy grid resilience. Utilize the King County Extreme Heat Mitigation Strategy to align with county planning efforts. (K4C Model Policies)
Policy 14.3	Review and update land use and development codes to encourage the use of passive cooling approaches to reduce urban heat island effects. Utilizing energy efficient cooling technologies, reflective and/or vegetated roofs, and the integration of trees, landscaping, and green space should be implemented to help reduce the health effects of extreme heat on frontline communities and vulnerable population. (K4C Model Policies)
Policy 14.4	Encourage the use of methods that contribute to improved indoor air quality during wildfire smoke events. (K4C Model Policies)
Policy 14.5	Provide community education and outreach on wildfire mitigation best management practices and expand household-level wildfire mitigation assistance. (K4C Model Policies)
Policy 14.6	Provide community education and outreach on wildfire smoke mitigation best management practices. Ensure outreach is accessible and prioritize frontline communities. (K4C Model Policies)
Policy 14.7	Develop and implement a wildfire smoke resilience strategy in partnership with local residents, emergency management officials, regional clean air agency officials, and other stakeholders. (Commerce)

Policy 14.8	Develop and implement an urban heat resilience strategy that includes land use, urban design, urban greening, and waste heat reduction actions. (Commerce)
Policy 14.9	Ensure that all community members have equitable access to green space within a half-mile. (Commerce)
Policy 14.10	Develop a program to distribute cooling units and install heat pumps, prioritizing households with residents (e.g., low-income seniors) most vulnerable to extreme temperature events. (Commerce)
Policy 14.11	Support Valley Regional Fire Authority in the development of community wildfire protection plans. (Commerce)
Goal 15	Ensure that infrastructure (critical and noncritical) and utilities are resilient to climate change impacts (e.g., precipitation events and stormwater flooding).
Policy 15.1	Integrate local climate impacts risk assessment into hazard mitigation planning. (K4C Model Policies)
Policy 15.2	Account for climate change impacts when planning, siting, designing, and operating capital facility, utility, and infrastructure projects. (K4C Model Policies)
Policy 15.3	Factor climate impacts into the planning of operations and coordination of preparedness, response, and recovery activities. (K4C Model Policies)
Policy 15.4	Coordinate and support public education by utility providers that raises awareness of the need for water and energy conservation and empowers individuals across diverse audience segments to take action. (K4C Model Policies)
Policy 15.5	Identify and reduce flooding through improvements to drainage and reductions in impervious surfaces and runoff, particularly in overburdened communities. (K4C Model Policies)
Policy 15.6	Incorporate post-wildfire debris flow and flooding hazard information into critical area delineation in fire-prone communities. (Commerce)
Goal 16	Provide all residents an equitable opportunity to learn about climate impacts, influence policy decisions, and take actions to enhance community resilience.
Policy 16.1	Create and implement culturally contextualized outreach and education initiatives and materials that will inform the community about near-term and longer-term climate change threats and ways that the community can prepare and build resilience to these changes. (Commerce)
Policy 16.2	Build and support partnerships with community organizations with the capacity and relationships to convene diverse coalitions of

	residents and to educate and empower them to implement climate resilience actions. (Commerce)
Policy 16.3	Cultivate relationships with climate justice coalitions that can help facilitate frontline community learning and engagement that links local issues with regional and statewide issues. (Commerce)

Theme 7: Cultural resources and practices

No feedback was received on theme 7 policies, all were kept for the framework.

Goal 17	Protect and preserve cultural resources and practices to build resilient communities and ecosystems in the face of climate change.
Policy 17.1	Ensure that cultural resources and practices — including historic sites and culturally important traditional foods and natural resources — are resilient to the impacts of extreme weather and other natural hazards worsened by climate change consistent with the Historic Preservation Element. (Commerce) *(HP-1)*
Policy 17.2	Consider climate impact vulnerability (e.g., flooding, landslides, etc.) as a factor in the Historic Preservation Plan to identify and protect City historic resources. *(HP-2)*
Policy 17.3	Establish or work with partners to establish a native plant nursery and seed bank to support long-term restoration and carbon sequestration efforts. (Commerce)
Policy 17.4	Establish and maintain government-to-government relations with Native American tribes for the preservation of archaeological sites and traditional cultural properties that are vulnerable to climate impacts. (Commerce)

Theme 8: Water conservation and stormwater management

Staff ranked most policies “Medium”- “High” and noted there should be more emphasis on preparing for drought as this is an impact that will be exacerbated by climate change. Policy 18.1 was added to address this concern.

Goal 18	Protect and preserve water quantity and quality from drought, extreme heat, and other hazards exacerbated by climate change consistent with the Utilities element.
Policy 18.1	Evaluate the long-term adequacy of water delivery infrastructure to ensure that changes in hydrological patterns (e.g., increases in flooding frequency or reduction of late-summer water availability associated with climate change) can be anticipated and managed effectively.

Policy 18.2	Reduce water consumption annually for the City of Auburn's public water supply by supporting water conservation efforts, such as addressing distribution leakage. *(CAP note; LU-93, CF-20, CF-21)*
Policy 18.3	Promote water efficiency and conserve community water resources. Foster water conservation through incentives, information, and requirements that residents and business adopt water-efficiency practices and technologies. Help ensure that existing codes do not pose any barriers that discourage or prevent the use of water conservation practices on public and private property *(CAP E-8).*
Policy 18.4	Implement automated metering infrastructure (AMI), groundwater monitoring, and other proven measures to conserve water and enhance drought resilience. (Commerce) *(LU-93, CF-20, CF-21)*
Policy 18.5	Utilize water conservation methods and technologies in development of irrigation infrastructure within parks and recreation areas to foster climate resilience. (Commerce) *(LU-93, CF-20, CF-21)*
Policy 18.6	Manage water resources sustainably in the face of climate change through smart irrigation, stormwater management, preventative maintenance, water conservation and wastewater reuse, plant selection, and landscape management. (Commerce) *(LU-93, CF-20, CF-21)*
Goal 19	Account for climate change impacts in planning, designing, and operating stormwater management approaches consistent with the Comprehensive Storm Drainage Plan.
Policy 19.1	Identify opportunities to retrofit undersized stormwater infrastructure and areas with uncontrolled runoff to improve flow control and water quality, with a priority on locations providing the most benefit, are identified to be most vulnerable to extreme precipitation climate impacts, and areas such as overburdened communities. (K4C Model Policies)

Theme 9: Natural habitats and urban green space

Staff ranked the majority of draft policies as "High" and noted they were aligned with Auburn's goals; however, determining leadership and budget to implement some actions were noted as barriers. Policies relevant to forestland were prioritized as a "Low" ranking since they may not be applicable to the City.

Goal 20	Support preservation and access to green and open spaces.
Policy 20.1	Ensure equitable access to parks, green space, and recreational services for all residents consistent with the Land Use Element. (K4C Model Policies) *(LU-96)*

Goal 21	Protect and enhance the climate resilience of urban forests by implementing climate-smart forest management.
Policy 21.1	Review, update, and implement tree protection codes to increase tree retention. Encourage the protection, maintenance, and expansion of tree canopy throughout the community, prioritizing residential and mixed-use areas with the least current tree canopy to equitably distribute benefits. (K4C Model Policies)
Policy 21.2	Adopt an urban forest master plan and implementing ordinances to maintain and expand tree canopy cover, improve tree and watershed health, prioritize carbon sequestration, and build climate resilience. (Commerce)
Policy 21.5	Prioritize urban forestry planning resources and funding for frontline communities that are hurt first and worst by climate change. (Commerce)
Goal 22	Ensure the protection and recovery of ecosystems to provide healthy habitat in a changing climate.
Policy 22.1	Ensure no net loss of ecosystem composition, structure, and functions, especially in Critical Areas, and strive for net ecological gain to enhance climate resilience in accordance with the Land Use Element. (Commerce) *(LU-132, LU-133, LU-134, LU-135)*
Policy 22.2	Identify opportunities to expand habitat protection and improve habitat quality and connectivity to foster climate resilience using conservation area designations, buffers, and open space corridors. (Commerce)
Policy 22.3	Use an integrated approach to prevent the spread and establishment of invasive plant species and enhance the climate resilience of native plant communities. (Commerce)
Policy 22.4	Implement actions identified in restoration and salmon recovery plans to improve climate resilience of streams and watersheds. (Commerce)
Policy 22.5	Protect and restore riparian vegetation to reduce erosion, provide shade, and support other functions that improve the resilience of streams to climate change. (Commerce)
Policy 22.6	Increase resilience to flooding by protecting and, where possible, enhancing, and restoring existing flood storage, conveyance, and ecological functions and values of floodplains, wetlands, and riparian corridors. (K4C Model Policies)

Theme 10: Economic Development

Staff ranked all draft policies “High”.

Goal 23	Increase access of green jobs, with special consideration of increasing access for frontline communities.

Policy 23.1	Support economic development activity through workforce development programs to provide training and employment with private sector, school districts, Downtown Auburn Cooperative, and Green River College. Consideration of the special needs of economically disadvantaged residents and neighborhoods, and people with physical impairments and developmental disabilities, should be included in these programs. (*ED-11*)
Policy 23.2	Develop a green jobs strategy in partnership with community groups, frontline communities, and businesses that (1) supports sustainable practices, green skills development, and the low carbon transition of the City's impacted industries, (2) develops pathways for youth and impacted workers to transition into green jobs; (3) ensures opportunities (e.g., local hiring requirements) for these jobs, and 4) recruits sectors that can bring low-carbon emissions, like clean energy. (K4C Model Policies)
Policy 23.3	Develop an equitable green workforce that is representative of the diversity of the city's communities and reflects the diverse skill sets, knowledge systems, and experiences communities through targeted hiring, workforce development, community agreements, and creating intentional pathways for frontline communities across sectors and seniority levels. (K4C Model Policies)
Policy 23.4	Ensure that the jurisdiction's Comprehensive Emergency Management Plan responds to the impacts of climate change and identifies roles and responsibilities to support a sustainable economic recovery after a disaster. (Commerce)
Policy 23.5	Support local businesses' efforts to generate and store renewable electricity on-site, which can provide back-up power during emergencies and help ensure continuity of operations. (Commerce)
Policy 23.6	Promote local industrial development to support a circular economy that increases demand for recycled materials and reduces demand for new raw materials and their embodied carbon emissions. (Commerce)

Appendix A: Workshop Meeting Summary

Cascadia worked with the project team and City staff to further refine, vet, and prioritize climate goals and policies for inclusion into the Climate Element. A workshop was held on May 17th, 2023 with City staff that focused on reviewing the project purpose, outputs, timeline, and prioritizing the draft climate mitigation and resiliency goals and policies for the Climate Element.

Staff in attendance included representatives from the following departments:

- Community Planning
- Public Works
- Parks & Recreation
- Economic Development

The workshop began with project background, goals, final outputs, and an overview of the timeline. Climate element requirements outlined in HB 1181 and the Department of Commerce Climate Element Guidance was also reviewed.

Once climate element key themes from the Regional and State Climate Change Policy Review and Gap Assessment memo were reviewed, staff were organized amongst four breakout rooms where they were asked to prioritize policies and provide feedback on goals and policies within the key theme(s) that best aligned with their expertise. Prioritization of policies was done using the rankings:

- NA: Already represented within the current Comp Plan. (Note element cited).
- Low: Not a priority to include in a Climate Element.
- Med: Should consider inclusion in the Climate Element, but not a priority.
- High: Recommend inclusion in the Climate Element.

Policy feedback was integrated and rankings that were undetermined or ranked Med - High were to be included in the Climate Change Policy Framework.

BREAKOUT ROOM TAKEAWAYS

Group 1

Group 1 included staff from Community Planning and Public Works and reviewed the following themes:

- Theme 1: Transportation and planned development
- Theme 2: Renewable energy and energy efficiency
- A few policies in Theme 6: Infrastructure and emergency preparedness

Main Takeaways

- Many policies on multimodal transportation, transit-oriented development, and other vehicle miles traveled reduction policies were indicated as being represented elsewhere in the comprehensive plan.
- The Auburn Comprehensive Plan is currently undergoing an update, therefore the gap analysis/crosswalk that was conducted on the 2015 plan is not representative of those updates.
- HB 1110 will address many policies on housing policies in Theme 1.
- There are limitations to what a city is able to achieve on climate and when the effort requires action by an industry or regionally.
- Budget limitation need to be considered when determining what is feasible/achievable in the next 20 years.
- There is conflict/competition between natural areas and open space given demands of housing and employment targets. Space is a commodity and it's hard to achieve all the targets.

Group 2

Group 2 included staff from Public Works and reviewed the following themes:

- A few policies in Theme 6: Infrastructure and emergency preparedness
- Theme 8: Water conservation and stormwater management

Main Takeaways

- Currently, three utility systems (water, sewer, and stormwater) are developing/updating plans. Instead of referring to specific plans within an element, recommend keep policy language more general.
- There should be more emphasis on preparing for drought as this is an impact that will be exacerbated by climate change.

Group 3

Group 3 included staff from Parks & Recreation and reviewed the following themes:

- Theme 4: Natural habitats and urban green space (mitigation)
- Theme 9: Natural habitats and urban green space (resilience)

Main Takeaways

- Many of the policies were ranked "High" and inline with Auburn goals; however, determining leadership and budget to implement some actions were noted as a barrier.
- Policies relevant to forestland were noted as a "Low" ranking since it may not be applicable to the City.

Group 4

Group 4 included staff from Community Planning and Economic Development and reviewed the following themes:

- Theme 5: Public health and community resiliency
- Most of the policies in Theme 6: Infrastructure and emergency preparedness
- Theme 7: Cultural resources and practices
- Theme 10: Economic development

Main Takeaways

- Many of the policies were ranked "High" but are covered by other plans and programs such as the Hazard Mitigation plan and the Comprehensive Emergency Management Plan.
- Identified Valley Regional Fire Authority (VRFA) as a critical partner related to wildfire risks.
- Noted that the City should be recruiting sectors that bring low-carbon emissions, like clean energy.

Theme 3: Waste Management and Circular Economy

During the workshop, Theme 3 was not reviewed as the staff responsible for waste management were not present. Feedback on the goals and policies were collected following the workshop from the Finance Department, who oversees the City's waste management.

Main Takeaways

- It is important to keep policies feasible for the City (i.e., recycling all paper by a certain date is not practical).
- There are ongoing efforts to increase recycling/composting, education, and community gardens in Auburn.

Gap Assessment Findings and Goals & Policies Prioritization

This section includes a gap assessment for each key theme and a suite of accompanying goals and policies related to climate mitigation, climate resilience, and climate equity. Policy alignment per proposed policy also assessed to determine if current Auburn policy alignment is "good," "lacking," or was a "policy gap." See Table 2 for how policies were coded. Finally, each policy is cited to indicate where policy language was taken directly or tailored from, these include:

- Corresponding policies included within Auburn's Comprehensive Plan (e.g., *LU-1*)
- Corresponding actions included within Auburn's Climate Action Plan (e.g., *CAP E-7*)

- Policies sourced from the Department of Commerce's Menu of Measures (Commerce)
- Policies sourced from the K4C Comprehensive Plan Model Climate Policies (K4C Model Policies)

Theme Structure

Under each key theme, the relevant Auburn Comprehensive Plan elements and priority sector will be highlighted if represented by the theme goals and policies. (see Table 3 for figure abbreviations).

Example:

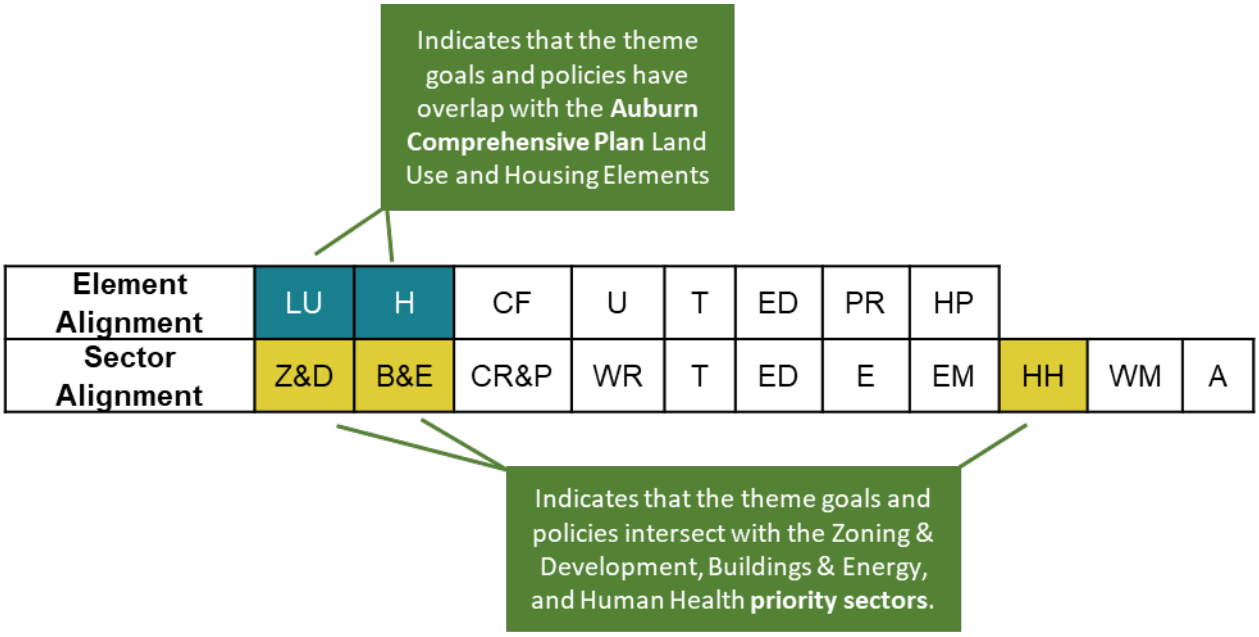


Table 3. Theme alignment abbreviations (abbr.).

Element Abbr.	Element (from Auburn's Comp Plan)	Priority Sector Abbr.	Priority Sector (from Commerce Guidance)
LU	Land Use	Z&D	Zoning & Development
H	Housing	B&E	Buildings & Energy
CF	Capital Facilities	CR&P	Cultural Resources & Practices
U	Utilities	WR	Water Resources
T	Transportation	T	Transportation
ED	Economic Development	ED	Economic Development

PR	Parks and Recreation	E	Ecosystems
HP	Historic Preservation	EM	Emergency Management
		HH	Human Health
		WM	Waste Management
		A	Agriculture

To ensure compliance with Commerce guidance, the resilience themes' priority sector alignment was reviewed to confirm at least one climate resilience goal and/or supportive policy were developed within each of the model climate element's 11 sectors. Table 4 shows the number of resilience themes that aligned within the identified 11 priority sectors.

Table 4. Number of resilience themes that align with Commerce priority sectors.

Priority Sector	Number
Zoning & Development	2
Buildings & Energy	1
Cultural Resources & Practices	1
Water Resources	1
Transportation	1
Economic Development	1
Ecosystems	1
Emergency Management	2
Human Health	3
Waste Management*	1
Agriculture	1

Mitigation

Goals and policies included in the mitigation gap assessment are focused on reducing GHG emissions.

Theme 1: TRANSPORTATION AND PLANNED DEVELOPMENT

Gap Assessment: The current Auburn Comprehensive Plan captures key policies for long-term planning related to transportation and building infrastructure and development. However, there is a lack of policies that link long-term planning strategies with GHG emissions reduction and climate equity. Additional policies related to electric vehicles (EVs) and EV infrastructure, reducing vehicle miles traveled, and preventing displacement from development should be considered.

Element Alignment	LU	H	CF	U	T	ED	PR	HP			
Sector Alignment	Z&D	B&E	CR&P	WR	T	ED	E	EM	HH	WM	A

		Prioritization	Notes
Goal 1	Reduce GHG emissions by prioritizing accessible multi-modal and low-carbon transportation options.		
Policy 1.1	Partner with agencies that support multimodal transportation infrastructure including Puget Sound Regional Council, Sound Transit, King Co. Metro and Pierce Transit. The City should continue to advocate for funding to support transportation improvements, such as better first-last mile access to transit, as an important means of expanding the City's and the region's economic base, consistent with the Economic Development element. *(ED-12)*	NA/Low (see notes)	Already covered in transportation plan.
Policy 1.2	Prioritize dense, mixed use, transit-oriented development, and affordable housing in high use areas in accordance with the Transportation, Land Use *(LU-148),* and Housing *(H-4)* elements.	NA/Low (see notes)	Already doing. Theme throughout: We want the Climate Element to point to other policies and elements that support climate policies (both current plans/policies AND plans/policies in progress or being updated). Important to focus on what's missing, how hard/easy it is, level of importance.

		Prioritization	Notes
			Another component: policies are currently being rewritten (so this crosswalk doesn't address upcoming transportation policies/updates). We want to keep connectivity between elements. Don't want/need to be repeating policies in the Climate Element.
Policy 1.3	Investigate opportunities to expand and implement multi-modal transportation options, including bicycling, walking, and transit. (Commerce; K4C Model Policies)	NA/Low	
Policy 1.4	Create a pedestrian and bicycle master plan to address mobility gaps, improve safety, and increase convenience by improving infrastructure, services, and community development for people walking and biking. Improvements may include: • Bike-sharing programs • Personal motor vehicle-free streets in the downtown area • "Complete Streets" • Infrastructure repairs and upgrades • Incentives for people biking and walking. *(CAP T-6)*	NA/Low	
Policy 1.5	Reduce and prevent displacement of households and businesses from transit-oriented locations, with a focus on low-income households and small businesses. (K4C Model Policies)	NA/Low	Embedded in HB 1110, so it'll find its way into Housing Element (no existing policies but working on it).
Policy 1.6	Consider congestion pricing and tolling or establishing parking maximums to reduce the number of single occupancy vehicles and promote the use of alternative transit (Commerce)	Low (congestion pricing)	Not sure this would be considered, not sure how we'd do this. Maybe adjusting parking maximums.
Goal 2	Increase the percentage of EV and other low-emission transportation modes operating within the City.		
Policy 2.1	Support the transition to plug-in hybrids and electric vehicles within the community by facilitating the installation of EV-charging stations and requiring installation of charging stations in new multifamily housing developments. *(CAP T-5)*	NA/Low	Easy area to embrace with updated building code (higher requirements with EV infrastructure for new buildings). Implementing a building code automatically addresses this. In addition to residential, there's the opportunity for more public charging stations – off street, in parking lots. Complicated, challenges – cannot add

		Prioritization	Notes
			into right-of-way. Narrowing sidewalks takes away from other priorities. Competition within right-of-way for amenities (bike racks, wider ped areas, charging stations, etc.). Especially relevant in downtown. Promote charging within existing parking lots. Take policy a step further to focus on parking lots.
Policy 2.2	Development incentives should be established that encourage the creation of electric car charging stations (*LU-57*). Work with utility providers and other partners (e.g. developers and EV companies) to ensure that there is access to EV charging where it is needed and expand EV charging readiness for buildings. (K4C Model Policies)	High	1.1 and 2.2 blend together – notes above apply to both. Important and will evolve. PSE readiness – support their efforts.
Policy 2.3	Develop and implement an Electric Vehicle Infrastructure Plan that: • Reviews current EV infrastructure in the city to identify gaps in charging locations. This review should be done with an equity lens and consider areas that are historically underserved and where the most benefit would be observed. • Identifies locations for chargers in commercial, multifamily residence areas, and city facilities. • Reviews feasibility of fast charging stations. • Addresses access issues and barriers to EV and charging stations for low-income homeowners, renters, and multifamily residents. • Identifies key stakeholders to EV infrastructure use and development. • Identifies partners in the region who can assist with charging station infrastructure to lower program and construction costs. (K4C Model Policies)	Med	More long-term – needed someday, but not a more immediate priority. Support KC if they are already leading the work. Need to keep an eye on evolving technology.
Goal 3	Decrease emissions that stem from fleet & freight service vehicles and aviation.		
Policy 3.1	Support state-level policies and actions that incentivize and create requirements for clean fuels and electrification of private and commercial fleet vehicles. (K4C Model Policies)	Med	State's requirements don't necessarily meet the needs (can we find clean fuels, electric fleet vehicles, etc.?). Industry needs to be ready before State forces requirements. Depends on how this policy is written.

		Prioritization	Notes
Policy 3.2	Convert public-owned fleets to zero-emission vehicles (e.g., electric or renewably produced hydrogen) by 2040 (or other date). (Commerce)	Med/High	Tech isn't there to meet the needs, not possible. Convert portions of fleet that can be converted. Police fleet does not have time for charging so will not go fully electric. Large vehicles take a lot of energy to function. And it's a significant investment to get charging infrastructure in place. Rewrite 3.2 to be more realistic. Also not recognizing the budget as written. Can we write policy in a way that is optimistic about tech and cost advancements?
Policy 3.3	Partner with local organizations to identify funding sources and opportunities to electrify buses and heavy- duty vehicles. (K4C Model Policies)	Low	3.3 – 3.5 – happy to support efforts.
Policy 3.4	Increase the energy efficiency of city buses and vehicles, through adoption and promotion of innovative technology vehicles and greenhouse gas reducing fuels with a focus on electric vehicles, all electric battery buses and associated infrastructure, where appropriate. (K4C Model Policies)	Low	
Policy 3.5	Support state and regional requirements for electric delivery vehicles and Transportation Network Corporations (TNC's). (K4C Model Policies)	Low	
Policy 3.6	Promote coordinated planning and effective management to optimize the region's aviation system in a manner that minimizes air quality and noise impacts to communities, including historically marginalized communities. (Visions 2050, *Air-03*)	Low/NA	Air travel is in transportation element and airport master plan. Already work on air quality and noise impacts.
Policy 3.7	Support regional and industrial efforts to reduce regional aviation emissions by promoting the use of sustainable aviation fuel and adoption of aviation fuel efficiency measures.	Low	Industry needs to develop the fuels – until then, it's limited in what City can do. Low control.
Goal 4	Reduce greenhouse gas emissions by promoting densification and efficient land uses in mixed-use urban villages near transit corridors.		
Policy 4.1	Focus development within the Urban Growth Area and reduce development pressure on rural and natural resource lands consistent with the Land Use Element. *(LU-92, LU-120)*		Missing from the goal/theme: more explicit or direct VMT reduction policies. 4.1 and 4.4 relate to comments in goal 1 – easy, achievable, supported.

		Prioritization	Notes
			Policy is more about consistency with countywide policies. Potential policy broadly to comply with state regulations. Need more jobs/housing balance so that people can live closer to job locations to reduce travel. Plus expanded/extended transit options.
Policy 4.2	Use innovative zoning provisions to encourage infill development of underutilized parcels in zones that have been identified in the Comprehensive Plan as areas where infill residential development should be encouraged. Certain development requirements for infill development may be relaxed, while requiring adherence to specific design requirements to ensure compatibility with the character of nearby existing residential structures. [HO-27] (*H15*)	Low/NA	Addressed under missing middle housing.
Policy 4.3	Consider greenhouse gas emissions impacts and opportunities to reduce them when updating and implementing transportation and land use plans, codes, and zoning, as well as identifying and carrying out relevant projects (*CAP T-1*)	Low/NA	Building code updates also include energy code updates – which has been ambitious. Support the State's policy – and each energy code update adds significant housing costs (which does not support affordability). Policy is already happening because of State policy.
Policy 4.4	Prioritize dense, mixed use, transit-oriented development, and affordable housing in Auburn and city urban growth areas. (K4C Model Policies)	Low/NA	Downtown Urban Center Plan will further support this policy.
Policy 4.5	Adopt "missing middle" housing policies and codes to allow for broader housing types in single family zones, particularly near transit, while ensuring affordability for current and future residents. (K4C Model Policies)	Low/NA	Easy – HB 1110 will address.

Theme 2: Renewable energy and energy efficiency

Gap Assessment: The current Auburn Comprehensive Plan captures key policies for long-term planning related to land use and utility infrastructure, with some broad policies aimed at reducing energy consumption, practicing sustainable development, and reducing the impact of utilities. However, additional polices are needed that relate these strategies with GHG emissions reduction and climate equity. These include policies aimed at transitioning to

renewable energy sources, promoting energy conservation and efficiency measures, building grid resilience, and educating homeowners about energy efficiency upgrades should be considered.

Element Alignment	LU	H	CF	U	T	ED	PR	HP			
Sector Alignment	Z&D	B&E	CR&P	WR	T	ED	E	EM	HH	WM	A

		Prioritization	Notes
Goal 5	Reduce greenhouse gas emissions by transitioning to renewable energy sources, decarbonizing buildings, and increasing energy efficiency.		
Policy 5.1	Implement measures to promote buildings that conserve energy and water and reduce greenhouse gas emissions. *(LU-9)*	Low/NA (covered elsewhere)	Overarching Q: does the City want/need to do this faster than what the state has established? Overarching note: Main limitations are industry and budget limitations.
Policy 5.2	Public and institutional facilities should incorporate practices that reduce energy consumption, reduce the emission of greenhouse gases, conserve water, and preserve native vegetation. *(CF-62)*	Low/NA (covered elsewhere)	
Policy 5.3	Sustainable development practices will be incorporated into capital facility project design and construction. The City will support and implement efforts to promote climate action objectives by using low impact development techniques, energy and water conservation measures, and reducing greenhouse gas emissions. *(CF-10)*	Low/NA (covered elsewhere)	Some components are already accounted for. Modify to incorporate as appropriate.
Policy 5.4	Identify and implement measures that reduce emissions and conserve energy and water at all park facilities. *(CF-9)*	Low/NA (covered elsewhere)	
Policy 5.5	Support the transition of utility energy fuel mixes to renewable sources, including through coordination with utility Integrated Resource Planning processes and state policy	Low	Not sure this feels relevant to City.

		Prioritization	Notes
	development/implementation. Work with utility provider and other stakeholders to establish a plan to have 100% renewable energy for the community (K4C Model Policies).		
Policy 5.6	Retrofit municipal buildings for energy efficiency (Commerce).	High, but needs wording adjustment/qualifiers – should be aspirational goal for City to pursue.	5.6, 5.8, 5.9, and 5.10 – not sure City can commit to this. Not simple, plus budget impact. Supportive of policy that incorporates more energy efficiency with new buildings, but retrofitting is hard and so unaffordable. And/or policy that looks for/evaluates opportunities for retrofitting.
Policy 5.7	Continue to update and retrofit traffic and street lights to increase energy efficiency. Upgrades may include converting traffic lights and street to light-emitting diode (LED) lighting and installing solar-powered fixtures for signage and lighting where appropriate. (*CAP E-1*)	Low/NA	Already done, so not a priority.
Policy 5.8	Optimize heating, ventilation, and air-conditioning (HVAC) systems at City facilities by installing more efficient equipment and technology and implementing operational changes to increase energy efficiency. Such efforts may include the following: • Conducting HVAC energy efficiency audits to identify cost-effective upgrades. • Installing building automation systems (BAS). • Installing high-efficiency motors, dampers, and multi-speed motors for air handling. • Phasing out chlorofluorocarbons (CFCs) in air-conditioning and refrigeration equipment. • Educating staff to ensure and maintain peak efficiency and operating conditions. (*CAP E-2*)	High	

		Prioritization	Notes
Policy 5.9	Adopt performance standards for all City buildings, including renovations on existing buildings and design of new buildings, and establish a tracking system that makes the benchmarking scores of City buildings publicly available. Relevant building performance standards may include the following: • Standards from LEED-EB, the Leadership in Energy and Environmental Design rating system for Existing Buildings. • Building commissioning requirements. • Lighting power densities (LPDs) and controls that go beyond existing energy code requirements. • Wall insulation, window performance, and envelope air tightness standards that go beyond existing energy and building code requirements. • LEED and/or ENERGYSTAR certification for buildings larger than a specified size. (*CAP E-3*)		(Another department is responsible for this so should be the ones weighing in). Challenge with LEED is annual certification and monitoring that continues after building is built. Staffing would be an issue. Massive budget challenges.
Policy 5.10	Optimize building envelope energy efficiency at City facilities by installing more efficient materials and technology. Relevant upgrades may include the following: • Conducting audits to identify cost-effective upgrades for weatherization and building envelope components. • Replacing single-pane windows with insulated glazing with low-e film. • Replacing or increasing interior wall insulation and roof insulation during major renovations. • Adding additional batt or rigid insulation and thermal barriers during interior renovations. • (*CAP E-4*)		(Another department is responsible for this so should be the ones weighing in).
Policy 5.11	Implement audits and technical assistance to increase building energy efficiency. Such a program could address single-family, multifamily, and/or commercial buildings. Elements could include weatherization strategies, direct-installation of energy and water conservation materials, appliance trade-in/exchanges, home and business conservation kits, and rooftop solar and solar hot water projects. (*CAP E-5*)		Big tradeoff with these policies and affordable housing. Want to be able to support, but all so expensive/require significant staffing.

		Prioritization	Notes
			(Notes apply to a lot of these policies). Policy edit/addition: high priority: Home repair program – importance of weatherization, esp. for low-income households, often mobile homes – so there are elements to this policy that could be incorporated elsewhere (like weatherization, water conservation, energy efficiency).
Policy 5.12	Adopt performance standards for residential and commercial building codes to increase building energy efficiency. The standards can address single-family, multifamily, and commercial renovations, existing buildings, and new buildings. The City can also require that building performance ratings be publicly available, to help inform prospective tenants and buyers about the energy performance status of buildings. (*CAP E-6*)		
Policy 5.13	Provide incentives to improve energy efficiency in existing commercial and residential buildings. (Commerce)		Financial costs here. Could add or focus more on an advocacy policy – to pursue incentives from State/federal.
Policy 5.14	Maximize renewable energy sources for the supply of electricity and heat to new and existing residential and commercial building construction. (Commerce)		
Policy 5.15	Retrofit publicly owned buildings with solar panels and electric heat pumps. (Commerce)		Budget issue, some infrastructure issues.
Policy 5.16	Support and expand building energy efficiency retrofit programs to reduce building energy use and improve energy		

		Prioritization	Notes
	resilience, including a focus on affordable housing. (K4C Model Policies)		
Policy 5.17	Explore and promote low interest loan options and incentive programs to finance energy efficiency upgrades for commercial and residential buildings, while seeking other finance mechanisms to fill in potential funding gaps. Investments and programs should be prioritized in historically underserved areas. (K4C Model Policies)		Could add or focus more on an advocacy policy – to pursue incentives from State/federal.
Policy 5.18	Develop energy efficiency outreach programs for residents and businesses by partnering with PSE and other local jurisdictions with the goals to identify and select appropriate and cost-effective energy improvements. This could involve supporting local schools in integrating climate and sustainability education into curriculum. (K4C Model Policies)		
Policy 5.19	Building on proposed WA state policy, strengthen energy efficiency codes to reflect best practices and meet established energy targets (e.g., require energy use disclosure and benchmarking for buildings, starting with commercial and multifamily buildings over a size threshold). (K4C Model Policies)		
Policy 5.20	Expand local onsite renewable energy production, such as through installation at municipal facilities, support of incentive programs, and coordination of community-based partnership projects and programs. (K4C Model Policies)		
Policy 5.21	Support cleaner energy sources. Potential efforts include supporting community-scale renewable energy projects and efficient small-scale on-site power generation, working with local utilities to use cleaner energy sources, and encouraging Auburn businesses and residents to offset their energy use. *(CAP E-7)*		
Policy 5.22	Require additional net-zero greenhouse gas emission features of all new residential and commercial structures. (Commerce)	Low/NA	Already accounted for in State requirements.
Policy 5.23	Require electric heat pumps and restrict natural gas in new commercial and residential construction. (Commerce)	Low/NA	Already underway.
Policy 5.24	Phase out natural gas use in existing publicly owned facilities by 2040 and retrofit with electric heat pumps. (Commerce)	Low	Not simple. High cost.

		Prioritization	Notes
			Easier to support these actions in new buildings. Not feasible given budget, age of facilities.
Policy 5.25	Require that all publicly owned buildings are powered 100% by renewable energy. (Commerce)	Low	Not simple. High cost.
Policy 5.26	Develop low-energy-use requirements and building code compliance for residential buildings. (Commerce)		
Policy 5.27	Educate community members about incentives for emerging alternative energy technology, such as tax exemptions for solar installations, and increase community awareness of existing solar arrays and water heating systems in the city. (K4C Model Policies)	High	Doable.
Goal 6	Promote a diverse, clean, efficient grid that increases the grids reliability as demand increases.		
Policy 6.1	The City shall consider the environmental impacts of proposed utility facilities as a part of its environmental review process. When requested by the City, the utility provider shall furnish documentation of current research results and/or provide additional information related to determination of the potential environmental impacts, if any, from the proposed facilities. *(PU-7)*	Low/NA	Already do this.
Policy 6.2	Work with and encourage Puget Sound Energy to plan, site, build and maintain an electrical system that meets the needs of existing and future development, and provides highly reliable service for City customers and coordinate with non-city utility providers to ensure planning for system growth consistent with the city's Comprehensive Plan and growth forecasts. (K4C Model Policies)	High	Interesting, but not sure how impactful City would be in this. But happy to support.
Policy 6.3	Advocate for increased grid reliability through state and utility regulatory rulemaking and legislation that supports demand response and storage technologies that reduce peak load and provide grid flexibility. (K4C Model Policies)	High	Interesting, but not sure how impactful City would be in this. But happy to support.

		Prioritization	Notes
Policy 6.4	Advocate for energy utilities to adopt efficient practices and explore alternative energy resources, in order to help meet long-term energy needs and reduce environmental impacts associated with traditional energy supplies. (K4C Model Policies)	High	Interesting, but not sure how impactful City would be in this. But happy to support. Broad note: Conflict/competition between natural areas and open space given demands of housing and employment targets. Space is a commodity and it's hard to achieve all the targets. Housing/jobs come at the expense of natural areas.

Theme 3: Waste management and circular economy (waste management, finance department)

Gap Assessment: The current Auburn Comprehensive Plan captures key policies for long-term planning related to critical facilities (i.e., waste facilities), with some aimed at solid waste management. While the Comp Plan encourages effective solid waste management and increased recycling efforts, additional policies are needed to relate these strategies with GHG emissions reduction and climate equity. These include supporting a circular economy, supporting urban agriculture and local food production, encouraging composting, enforcing sustainable construction and demolition (C&D) practices, and implementing environmentally friendly purchasing policies should be considered.

Element Alignment	LU	H	CF	U	T	ED	PR	HP			
Sector Alignment	Z&D	B&E	CR&P	WR	T	ED	E	EM	HH	WM*	A

**Theme 3 captures both mitigation and resilience policies related to Waste Management.*

		Prioritization	Notes
Goal 7	Reduce greenhouse gas emissions from materials and organic waste by minimizing waste generation.		

		Prioritization	Notes
Policy 7.1	The City shall implement solid waste management programs and services that provide ample opportunities and incentives to maximize the community's participation in local and regional waste reduction and recycling efforts. (*CF-30*)		
Policy 7.2	The City's solid waste management programs shall be developed to make waste reduction and recycling efficient, reliable, cost-effective, and convenient for all residents and businesses. (*CF-31*)		
Policy 7.3	The City encourages and should promote the use of products manufactured from recycled materials, and the use of materials that can be recycled. City Departments and contractors shall use recycled and recyclable products whenever and wherever feasible. (*CF-32*)		
Policy 7.4	The City shall implement solid waste reduction and recycling programs that have the cumulative effect maintaining the 50 percent waste reduction and recycling goal (recycling tons/total solid waste stream). (*CF-33*)		
Policy 7.5	The City shall promote the recycling of solid waste materials by providing opportunities for convenient recycling and by developing educational materials on recycling, composting and other waste reduction methods. (*CF-35*)		
Policy 7.6	The City will coordinate with solid waste providers and King County to ensure the provision of adequate and mandatory waste and recycling service throughout Auburn. The City will continue to create, support, and implement efforts that expand recycling and reuse. (*CF-5*)		
Policy 7.7	Encourage local food production, processing, and distribution through the support of home and community gardens (i.e., P-Patches), farmers' markets, community kitchens, and other collaborative initiatives to provide healthy foods and promote food security. (K4C Model Policies)		This could be added since we have a Community Garden Program (Parks), Farmer's Market (Parks), and Blue Ribbon Committee (Mayor).
Policy 7.8	Update municipal solid waste contract policies and programs to encourage waste prevention and take-back programs, maximize diversion, ensure efficient collection routes, and promote hybrid and electric vehicles to transport and collect waste. (K4C Model Policies)		We do all of this except our hauler has CNG vehicles for collection. King County is piloting an electric transfer truck right now.

		Prioritization	Notes
Policy 7.9	Promote prevention and redistribution of food waste, such as through expanding and encouraging community and school gardens, urban agriculture, and farmers markets and working with local grocery stores to support a food donation program to send surplus food. (K4C Model Policies)		We do this and the Auburn Food Bank has relationships with many of the local grocery stores.
Policy 7.10	Support extended producer responsibility (EPR) related policies and actions that require companies that make consumer products fund the residential recycling system and that ensure that packaging and paper products actually get recycled. (K4C Model Policies)		We are members of the Northwest Product Stewardship Association.
Goal 8	Reduce greenhouse gas emissions from materials and organic waste by maximizing waste diversion.		
Policy 8.1	Reduce municipal solid waste disposed of in landfills by (insert percentage) by (insert target date). (Commerce)		This is not realistic for Auburn at this point. Two-thirds of our tonnage is from our business sector, so it fluctuates with the economy. Also, our city continues to grow in population, and we've had large multifamily developments open recently. Even with waste reduction/recycling efforts, our disposal tonnage has been increasing each year.
Policy 8.2	Recycle all paper, food, textile, and metal waste by (date). (Commerce)		This seems impractical as written. We have recycling available for all those waste types, but we rely on the public to put things where they should go.
Policy 8.3	Expand commercial recycling and organics collection and service, including making recycling and organics disposal as convenient as garbage and adequate to serve the number of tenants. Implement compost requirements for food businesses in accordance with HB 1799. Consider the implications of implementing an organics disposal bans and/or requiring services. (K4C Model Policies)		Yes, we are developing a plan to meet the requirements of HB1799 (Organics Management Law). The disposal ban/service requirement is something that would need to come from King County. Auburn has mandatory garbage service,

		Prioritization	Notes
			recycle is no additional cost and unlimited (not required though), and organics is offered but not required (we only have about a 60% residential subscription rate, so we continue to keep it optional).
Policy 8.4	Expand recycling and compost service for single-family and multifamily properties and provide technical assistance to help compost successfully. Consider the implications of implementing an organics disposal bans and/or requiring services. (K4C Model Policies)		We offer free technical assistance and plan on expanding outreach efforts as we meet the requirements of HB1799. Ban/service requirement would need to come from King County.
Policy 8.5^{M+R}	Build and implement community outreach and education programs around proper waste reduction, recycling, and composting—with a focus on food waste. (K4C Model Policies)		Already do this.
Policy 8.6	Adopt standards for City buildings to use best practices for recycling, composting, reuse, and waste reduction. Standards can recommend practices such as placing more recycling bins at workstations, collecting organics more frequently and garbage less frequently, and installing more water bottle filling stations in facilities. (*CAP M-1*)		We work with our facilities Department to make sure everyone has access to recycle/compost at City buildings where applicable. We have used grant funds for water bottle filling stations in schools, so if that is something the City wanted to do in our buildings, we could help with that.
Policy 8.7^{M+R}	Identify gaps in recycling and composting programs and take steps to expand service. The City can help identify locations, communities, and building types that are underserved by recycling and composting programs, such as multifamily apartment buildings. The City can work with haulers and through policies to improve service and increase recycling and composting. (*CAP M-3*)		We are always looking for ways to improve service/programs. We rotate our focus for projects between residential, multifamily, schools, and business. We will be taking a closer look at composting while implementing the requirements of HB1799. Almost all multifamily housing has recycling (for those that don't we have a recycling station at the WM facility

		Prioritization	Notes
			that is available 24/7). The major limiting factor in multifamily buildings is space for organics collection containers.
Policy 8.8	Incentivize recycling of construction and demolition debris. (Commerce)		What is meant by incentivize? Who would be incentivizing?
Policy 8.9	Create a business technical assistance program to increase recycling and reduce waste. (Commerce)		We already provide free assistance and WM staff visit Auburn businesses every-other-year to offer outreach.
Policy 8.10	Use recycled materials in the construction of transportation and other infrastructure facilities. (Commerce)		Is this something Community Development can require?
Policy 8.11	Develop a program that will enable recycling of all construction and demolition debris (include target date). (Commerce)		King County is leading this. Doesn't seem like a City policy.
Policy 8.12	Develop, implement, and enforce construction and demolition (C&D) recycling and deconstruction ordinances. (K4C Model Policies)		There are cities who have adopted ordinances that we could use for examples.
Policy 8.13	Increase staff and facility capacity for composting programs to achieve (insert percentage) of community waste. (Commerce)		We are told there is plenty of capacity in King County. Doesn't seem like this should be a City policy.
Goal 9	Reduce greenhouse gas emissions from materials by supporting a circular economy.		
Policy 9.1	Adopt a citywide purchasing policy that includes environmental impacts. Environmentally Preferable Purchasing (EPP) policies can prioritize reusing products and materials, purchasing durable goods, avoiding disposable goods, and reducing energy use, greenhouse gas emissions, and lifecycle costs and impacts. EPP policy may include targets, measures to track impacts, strategies for implementation, and references to existing standards (e.g., EPEAT, ENERGYSTAR, and LEED). (*CAP M-2*)		Who would lead this? Would need support/buy-in from City leadership to accomplish.
Policy 9.2^{M+R}	Support "collaborative consumption" community projects that encourage shared use and exchanges. Examples projects may include tool libraries or repair cafes, which the City can support		Kathleen and I are on the steering committee for South King Tool Library's expansion into Auburn.

		Prioritization	Notes
	through partnerships or grants with nonprofit and community organizations. (*CAP M-4*)		

Theme 4: Natural habitats and urban green space

Gap Assessment: The current Auburn Comprehensive Plan captures key policies for long-term planning related to utilizing new development to contribute to new park developments, seeking land to establish a green belt for non-motorized travel, and implementing low-impact development and landscaping in parking lots. However, additional policies are needed that relate these long-term planning strategies with carbon sequestration (i.e., carbon storage). Policies related to managing and planning for carbon storage should be considered.

Element Alignment	LU	H	CF	U	T	ED	PR	HP			
Sector Alignment	Z&D	B&E	CR&P	WR	T	ED	E	EM	HH	WM	A

		Prioritization	Notes
Goal 10	Protect and enhance land carbon sinks (e.g., trees, urban green space) to mitigate GHG emissions.		
Policy 10.1	Require open space set-asides (such as parks) for new development. (Commerce) *(PR-2)*	High	If it's a subdivision and 1 lot is set aside as green space want to ensure the HOA is owning that and not City parks (planning usually does this but just want to make sure) Planning/Zoning code policy
Policy 10.2	Maximize tree canopy coverage in surface parking lots. (Commerce)	High	Parks department doesn't build too many parking lots (maybe not relevant for this department's opinion)
Policy 10.3	Improve and expand urban forest management to maximize or conserve carbon storage. (Commerce)	Med	Unless it's a hazard, trees are not removed
Policy 10.4	Manage natural lands (forests, grasslands, wetlands) to maintain and/or increase their carbon concentrations. Avoid the conversion of carbon-rich ecosystems. Prioritize increasing tree canopy cover and open space in overburdened frontline communities. (Commerce)	High	May not be relevant – if we're talking about street trees that belongs to Transportation. Open spaces are maintained by Parks dept.

Goal 11	Establish a green belt of parks to develop a non-motorized trail to connect housing, schools, and businesses across a community.		Recommend to take “of parks” out of the goal
Policy 11.1	Actively seek to acquire land along corridors identified for future trail development in the current Comprehensive Transportation Plan and Auburn Parks, Recreation, & Open Space Plan. *(NM-04)*	High	No obvious language edits

Resilience

Goals and policies included in the resilience gap assessment are focused on building community resilience and reducing community vulnerability to climate impacts.

Theme 5: Public health and community resiliency

Gap Assessment: The current Auburn Comprehensive Plan captures key policies for long-term planning related to Housing. However, additional policies are needed that relate to climate resilience, public health, and equity. Policies related to identifying climate vulnerable communities, investing in programs and services that reduce vulnerability in vulnerable and frontline communities, and prioritizing green affordable housing should be considered.

Element Alignment	LU	H	CF	U	T	ED	PR	HP			
Sector Alignment	Z&D	B&E	CR&P	WR	T	ED	E	EM	HH	WM	A

		Prioritization	Notes
Goal 12	Conduct, and periodically update, a climate vulnerability and risk assessment.		
Policy 12.1	Conduct, and periodically update, a climate vulnerability and risk assessment that includes a focus on the built environment, communities, and natural systems. Support enhanced data collection for hazard events to provide a fuller understanding of the community's hazard characteristics—including identifying demographic groups/community members most vulnerable to climate impacts. Use assessment findings to evaluate changes to	High	Hazard plan has risk assessment component, but may not address climate vulnerability thoroughly.

		Prioritization	Notes
	comprehensive plan goals and policies and enhance resilience. (K4C Model Policies)		
Policy 12.2	Promote the use of health impact assessments and other tools to address the potential impacts of health, equity, and climate change on vulnerable communities. (Commerce)	High	More Public Health's realm, though there is an Emergency Mgmt. component. Also not reflected in Econ development.
Policy 12.3	Integrate a climate impacts risk assessment and policies into the local hazard mitigation plan. (Commerce)	High	Hazard plan has risk assessment component but may not address climate vulnerability thoroughly.
Policy 12.4	Support enhanced data collection for hazard events of all magnitudes to provide a fuller understanding of the community's hazard characteristics — including those affected by climate change. (Commerce)	High	Don't currently have system in place. Not something the City leads, but do report info to County after storms occasionally (thought inconsistent). Need clarity on what this means and what is entailed but agree it's important.
Policy 12.5	Promote the use of health impact assessments and other tools to address the potential impacts of health, equity, and climate change on vulnerable communities. (Commerce)	See 12.2	Same as 12.2
Goal 13	Minimize disproportionate impacts of climate change on vulnerable and frontline communities and focus/maximize associated benefits		
Policy 13.1	Provide information in multiple languages to Auburn's diverse communities regarding services offered by local and regional governmental, educational, employment, health, and other providers to improve residents' quality of life and to promote resident engagement and household economic independence. (*H-38*)	High	Supportive but note it's covered elsewhere. Joint effort: Housing would distribute and lead; language support comes from Communications; emergency mgmt. and econ development. plan for these communities as well.
Policy 13.2	Encourage and support human and health service organizations that offer programs and facilities for people with special needs. Support programs in particular that help people to remain within the community, including those that are veterans, disabled, seniors, single-parent households, and the homeless. (*H-31*)	High	Supportive but note it's covered elsewhere. Joint effort: Unsure which dept would lead; health, human services, community services, emergency mgmt., parks, and econ development plan for these communities as well.

		Prioritization	Notes
Policy 13.3	Identify and address the disproportionate impacts of climate change on communities of color and lower-income communities when prioritizing investments, policies, programs, and projects. Prioritize investments, policies, and programs that address existing disparities in the distribution of environmental burdens and benefits. Ensure benefits are accessible to and focused on underserved communities. (K4C Model Policies)	High	Should be happening in every project, not just within one group or dept. Public Works lead.
Policy 13.4	Invest in community-driven climate planning processes, share decision-making power, and co-develop and identify climate actions and priorities, particularly with frontline communities. (K4C Model Policies)	High	Should be happening with every planning process.
Policy 13.5	Improve access to services throughout the community by investing in partnerships with frontline communities to co-identify and remove systemic and physical barriers to services that increase climate resilience. (K4C Model Policies)	High	
Policy 13.6	Place special emphasis on extreme weather events that impact programs addressing those who are most vulnerable to homelessness. (K4C Model Policies)	Medium	Also in CEMP but broadened to include all hazards.
Policy 13.7	Prioritize investments, policies, programs, and projects that equitably reduce climate change impacts on vulnerable communities and increase resilience. This includes actions that address the impacts of extreme weather events on those experiencing homelessness. (K4C Model Policies)	Medium	Covered by other policies but should be mentioned here. Include working with Mayor's office, which has an anti-homelessness strategy. Emergency Mgmt. works with Housing Authority (lead), Mayor's office (anti-homeless division), and Public Health to respond to extreme weather events for homeless population.
Policy 13.8	Identify communities disproportionately impacted by extreme heat events and prioritize equitable access to emergency preparedness resources for vulnerable populations and areas. Develop and distribute tools and resources for the community to stay safe during extreme heat events. (K4C Model Policies)	Medium	Also in CEMP, but broadened to include all hazards
Policy 13.9	Identify and expand community-centered anti-displacement strategies and climate-resilient infrastructure to mitigate housing	High	If gentrification is not addressed elsewhere, should be High

		Prioritization	Notes
	insecurities exacerbated by climate change and/or gentrification. (K4C Model Policies)		(emergency mgmt. doesn't address). Similar org structure as Policy 13.7
Policy 13.10	Link climate adaptation strategies with social equity and public health strategies. (Commerce)	High	Should be happening with every planning process.
Policy 13.11	Address the social and mental health needs of displaced populations following disasters. (Commerce)	Medium	Should be happening with every planning process. Main focus of this work should be in emergency mgmt. plans and disaster recovery plans.
Goal 14	Prioritize green, affordable housing to meet projected growth and needs of the community.		
Policy 14.1	Support projects that bring renewable energy to communities of color, low-income populations, and members of limited-English speaking communities, based on evaluation and assessment of barriers and challenges. (K4C Model Policies)		
Policy 14.2	Uphold the Growth Management Act to prioritize dense, mixed use, transit-oriented development (TOD) and affordable housing by encouraging integrated site planning and green building, with a focus on early consideration of these in the site development process. Encourage the location of new green, affordable housing units near community amenities and services, such as transit and green space. (K4C Model Policies)		
Policy 14.3	Give intentional consideration to a local community response to homelessness with affordable, green housing and supportive services provided. (K4C Model Policies)		

Theme 6: Infrastructure and emergency preparedness (P.J., except Goal 17; AF/NG Goal 17)

Gap Assessment: The current Auburn Comprehensive Plan captures key policies for long-term planning related to housing and infrastructure resiliency. However, additional policies are needed that relate these long-term planning strategies with equity, emergency preparedness, and climate adaptation. Policies related to and offering equitable

access to adaptation resources (i.e., resilience hubs), developing strategies to aid community members ability to respond to extreme weather events (i.e., extreme heat, wildfire smoke events), and ensuring critical and non-critical infrastructure is resilient in the face of climate change should be considered.

Element Alignment	LU	H	CF	U	T	ED	PR	HP			
Sector Alignment	Z&D	B&E	CR&P	WR	T	ED	E	EM	HH	WM	A

		Prioritization	Notes
Goal 15	Equitably protect public health and safety by identifying and planning for risks associated with climate change.		
Policy 15.1	Promote housing improvements by property owners and building managers. Seek available assistance for housing rehabilitation. Assistance will include the development of residential infrastructure and the rehabilitation of individual properties. [HO-20] a. Find public and private sources of capital and offer low-interest loans for rehabilitation. [Public Works, 2012] b. Continue to participate in the Emergency Home Repair Program and consider partnering with nongovernmental organizations to maximize funds. [Public Works, 2012] c. Encourage green lending for improved energy conservation, indoor air quality, and other measures. [Public Works, 2012] d. Help identify professional volunteers at educational or professional associations to plan redesign or architectural upgrades of the properties. [Public Works, 2012] e. Support additional healthy housing and preservation strategies, such as property tax exemptions to preserve affordable housing opportunities and utilizing community health workers to offer property owners and residents the education and resources needed to maintain housing. (*H-21*)		
Policy 15.2	Create evacuation plans and outreach materials to help residents plan and practice actions that make evacuation quicker and safer. (Commerce)	High	Already in Comprehensive Emergency Mgmt. Plan (CEMP), so describe briefly in Climate Element

		Prioritization	Notes
			and refer to CEMP for details.
Policy 15.3	Ensure that people, including the community's most vulnerable groups, are resilient to climate and weather-related hazards by better understanding hazard type and impact and equipping people and the community to prepare for and respond to emergency situations. (K4C Model Policies)	High	Already in Comprehensive Emergency Mgmt. Plan (CEMP), so describe briefly in Climate Element and refer to CEMP for details.
Policy 15.4	Develop resilience hubs — community-serving facilities augmented to support residents and coordinate resource distribution and services before, during, and after a hazard event. (Commerce)	Medium	Have other policies that get resources to people; use a trusted partner network.
Policy 15.5	Work toward a distribution of growth that promotes equitable access for frontline communities and reduces the potential for displacement through program services such as municipal emergency preparedness, affordable energy prices, and accountable utilities with consideration of climate impacts such as extreme heat, flooding, wildfire smoke, and drought. (K4C Model Policies)	High	Important to make policies that get out to people and effectively reach them
Policy 15.6	Factor climate impacts into the planning of operations and coordination of preparedness, response, and recovery activities among first responders and partners, including public health, law enforcement, fire, school, and emergency medical services (EMS) personnel. (Commerce)	High	Important to make policies that get out to people and effectively reach them
Goal 16	Protect the community from extreme heat impacts and wildfire smoke		
Policy 16.1	Prioritize at-risk community members for actions that mitigate wildfire smoke, including providing filter fans or incentivizing infrastructure updates that protect against wildfire smoke (e.g., HVAC updates and MERV 13 filters for air intake) for facilities that serve high-risk populations. (Commerce)	High	Should involve Valley Regional Fire Authority (VRFA). Doing a lot of work on smoke and WUI laws.
Policy 16.2	Develop and implement an urban heat resilience plan or strategy that includes heat mitigation and management actions to prepare for and respond to chronic and acute heat risk in the community. The strategy should be informed by urban heat island mapping and may include coordinated efforts such as cooling centers, early warning systems, development/land use codes,	High	Very important – noting KC report that identified Auburn and Kent as heat sinks.

		Prioritization	Notes
	and energy grid resilience. Utilize the King County Extreme Heat Mitigation Strategy to align with county planning efforts. (K4C Model Policies)		
Policy 16.3	Review and update land use and development codes to encourage the use of passive cooling approaches to reduce urban heat island effects. Utilizing energy efficient cooling technologies, reflective and/or vegetated roofs, and the integration of trees, landscaping, and green space should be implemented to help reduce the health effects of extreme heat on frontline communities and vulnerable population. (K4C Model Policies)	High	Outside of emergency mgmt. so curious about what building folks think of this policy
Policy 16.4	Include messages on the impacts of climate change on health and safety, including information to help residents plan and practice actions to protect themselves from these impacts, in outreach efforts. Outreach and materials should be provided in languages representative of community needs. (K4C Model Policies)	Low	Already in outreach planning
Policy 16.5	Work with community partners to establish resilience hubs that can serve as clean air shelters for use by the public during wildfire smoke events, particularly in areas that experience poor air quality due to transportation emissions. (K4C Model Policies)	Low	People don't use clean air shelters as much as you think. Same for cooling centers. More bang for buck to focus on things people can do at home.
Policy 16.6	Encourage the use of methods that contribute to improved indoor air quality during wildfire smoke events. (K4C Model Policies)	High	Helps people at home
Policy 16.7	Develop community wildfire preparedness, response, and recovery plans. (K4C Model Policies)	Medium	Already in Comprehensive Emergency Mgmt. Plan (CEMP), so describe briefly in Climate Element and refer to CEMP for details.
Policy 16.8	Develop and implement notification alerts within the community to reduce the risk of exposure to wildfire smoke and particulate matter. (Commerce)	Medium	Already in Comprehensive Emergency Mgmt. Plan (CEMP), so describe briefly in Climate Element and refer to CEMP for details. Idea to have a

		Prioritization	Notes
			Climate Element statement about "alignment and support with CEMP"
Policy 16.9	Provide community education and outreach on wildfire mitigation best management practices and expand household-level wildfire mitigation assistance. (K4C Model Policies)	Medium	Not Auburn's biggest hazard
Policy 16.10	Provide community education and outreach on wildfire smoke mitigation best management practices. Ensure outreach is accessible and prioritize frontline communities. (K4C Model Policies)	Medium	Indirectly covered in CEMP, but it's not specific to wildfire smoke
Policy 16.11	Develop and implement a wildfire smoke resilience strategy (if absent) in partnership with local residents, emergency management officials, regional clean air agency officials, and other stakeholders. (Commerce)	High	Don't have this yet
Policy 16.12	Develop and implement an urban heat resilience strategy (if absent) that includes land use, urban design, urban greening, and waste heat reduction actions. (Commerce)	High	Don't have this yet
Policy 16.13	Ensure that all community members have equitable access to green space within a half-mile. (Commerce)	High	Would be great!
Policy 16.14	Develop a program to distribute cooling units and install heat pumps, prioritizing households with residents (e.g., low-income seniors) most vulnerable to extreme temperature events. (Commerce)	Medium	Not a high priority for emergency mgmt. cooling response – would do other things first (quicker or more efficient), but not unhelpful. Human Services or Community Resources would distribute these.
Policy 16.15	Support the development of community wildfire protection plans. (Commerce)	High	Valley Regional Fire Authority doing this – new reports.
Goal 17	Ensure that infrastructure (critical and noncritical) and utilities are resilient to climate change impacts (e.g., precipitation events and stormwater flooding).		
Policy 17.1	Integrate local climate impacts risk assessment into hazard mitigation planning. (K4C Model Policies)		KC runs hazard mitigation process for the

		Prioritization	Notes
			whole county. Auburn prepares annex and Emergency Mgmt. leads it. Work detail is covered elsewhere so Karissa recommends Medium.
Policy 17.2	Account for climate change impacts when planning, siting, designing, and operating capital facility, utility, and infrastructure projects. (K4C Model Policies)		
Policy 17.3	Factor climate impacts into the planning of operations and coordination of preparedness, response, and recovery activities. (K4C Model Policies)		
Policy 17.4	Coordinate and support public education by utility providers that raises awareness of the need for water and energy conservation and empowers individuals across diverse audience segments to take action. (K4C Model Policies)		
Policy 17.5	Identify opportunities to retrofit undersized stormwater infrastructure and areas with uncontrolled runoff to improve flow control and water quality, with a priority on locations providing the most benefit, are identified to be most vulnerable to extreme precipitation climate impacts, and areas that are historically under-resourced. (K4C Model Policies)	Same	
Policy 17.6	Review and update development codes and design standards to increase requirements for stormwater facility sizing, low-impact development, adopt nature-based solutions, and minimize impervious surface areas in private development and city capital improvements. (K4C Model Policies)	Theme 8	
Policy 17.7	Account for climate change impacts in planning, designing, and operating stormwater management approaches, including stormwater infrastructure and stormwater best management practices. (K4C Model Policies)	Low	SWIM Plan? Stormwater management plan This is something we could consider once we know what the target is. Would need specific BMPs
Policy 17.8	Identify and reduce flooding through improvements to drainage and wastewater systems and reductions in impervious surfaces and runoff, particularly in traditionally underserved areas. (K4C Model Policies)	High	Remove wastewater systems. Disadvantaged communities

		Prioritization	Notes
			We are doing this. Reductions in impervious surfaces in a stretch
Policy 17.9	To help increase resilience to flooding, protect, and where possible, enhance, and restore existing flood storage, conveyance, and ecological functions and values of floodplains, wetlands, and riparian corridors. (K4C Model Policies)	High	Belong in natural system/greenspace resiliency. Existing protections in place to promote
Policy 17.10	Map transportation infrastructure that is vulnerable to repeated floods, landslides, and other natural hazards, and designate alternative travel routes for critical transportation corridors when roads must be closed. (Commerce)		Already in Comprehensive Emergency Mgmt. Plan and map is updated through that planning process. Karissa recommends Low.
Policy 17.11	Analyze how the municipal water system maintains adequate pressure during a major wildfire event (e.g., multiple structures burning) and how it will look under current and projected drought conditions. (Commerce)	Low	Auburn – not at a high risk for Wildfires Well-worn communities – emergency water systems
Policy 17.12	Incorporate post-wildfire debris flow and flooding hazard information into critical area delineation in fire-prone communities. (Commerce)		
Goal 18	Provide all residents an equitable opportunity to learn about climate impacts, influence policy decisions, and take actions to enhance community resilience.		
Policy 18.1	Create and implement culturally contextualized outreach and education initiatives and materials that will inform the community about near-term and longer-term climate change threats and ways that the community can prepare and build resilience to these changes. (Commerce)	High	High b/c culturally contextualized. Not necessarily an Emergency Mgmt. role but would support. Not sure who would lead.
Policy 18.2	Build and support partnerships with community organizations with the capacity and relationships to convene diverse coalitions of residents and to educate and empower them to implement climate resilience actions. (Commerce)	High	No clear lead dept. Emergency Mgmt. would support. Would likely integrate across departments.

		Prioritization	Notes
Policy 18.3	Cultivate relationships with climate justice coalitions that can help facilitate frontline community learning and engagement that links local issues with regional and statewide issues. (Commerce)	High	No clear lead dept. Emergency Mgmt. would support. Would likely integrate across departments.

Theme 7: Cultural resources and practices

Gap Assessment: The current Auburn Comprehensive Plan captures the importance of historic preservation through policies related to developing a Historic Preservation Plan, planning for future development impacts to historic sites, and recognizing that the City should accord the same levels of promotion and protection to Native American sites and artifacts as to those of the more recent past. However, there are not specific policies that recognize the risks climate impacts pose to historic sites. Additional policies related to assessing climate vulnerability of the city's historic resources and establishing and maintaining government-to-government relations with tribes related to preserving sites should be considered.

Element Alignment	LU	H	CF	U	T	ED	PR	HP			
Sector Alignment	Z&D	B&E	CR&P	WR	T	ED	E	EM	HH	WM	A

		Prioritization	Notes
Goal 19	Protect and preserve cultural resources and practices to build resilient communities and ecosystems in the face of climate change.		
Policy 19.1	Ensure that cultural resources and practices — including historic sites and culturally important traditional foods and natural resources — are resilient to the impacts of extreme weather and other natural hazards worsened by climate change consistent with the Historic Preservation Element. (Commerce) *(HP-1)*		
Policy 19.2	The City should consider climate impact vulnerability (e.g., flooding, landslides, etc.) as a factor in the Historic Preservation Plan to identify and protect City historic resources. *(HP-2)*		

Policy 19.3	Establish or work with partners to establish a native plant nursery and seed bank to support long-term restoration and carbon sequestration efforts. (Commerce)		
Policy 19.4	Establish and maintain government-to-government relations with Native American tribes for the preservation of archaeological sites and traditional cultural properties that are vulnerable to climate impacts. (Commerce)		

Theme 8: Water conservation and stormwater management

Gap Assessment: The current Auburn Comprehensive Plan has many policies related to preserving water quality and quantity through conservation efforts and includes policies related to stormwater planning. However, additional policies are needed that provide a connection between climate change impacts and planning for community water needs and stormwater management. Policies that link climate change with water conservation efforts and stormwater management should be considered.

Element Alignment	LU	H	CF	U	T	ED	PR	HP			
Sector Alignment	Z&D	B&E	CR&P	WR	T	ED	E	EM	HH	WM	A

		Prioritization	Notes
Goal 20	Protect and preserve water quantity and quality from drought, extreme heat, and other hazards exacerbated by climate change consistent with the Utilities element. ~~consistent with the Comprehensive Water Plan~~.	Public Works – water, sewer, storm	Water chapter to the water system plan (what will be reference in the utilities element) All three utilities will have their own system plan
Policy 20.1	Reduce water consumption ~~by 1%~~ annually for the City of Auburn's public water supply by supporting water conservation efforts. *(CAP note; LU-93, CF-20, CF-21)*	High	We are already working to reduce consumption. 172/g/connection – 1% goal Once this is reached, we will reevaluate. Address distribution leakage goal (DSL under 10%)

		Prioritization	Notes
Policy 20.2	Promote water efficiency and conserve community water resources. Transporting and treating drinking water, wastewater, and stormwater requires energy and generates pollution. The City can foster water conservation through incentives, information, and requirements that residents and business adopt water-efficiency practices and technologies, in addition to Low-Impact Development that it already requires. The City can also help ensure that existing codes do not pose any barriers that discourage or prevent the use of water conservation practices on public and private property *(CAP E-8).*	Low – stormwater Med/High – water and sewer	All three utilities are grouped. Reduce the number of pump stations. Development/manage stormwater on the site. Goal is to be efficient as possible. Located in a valley and limited by terrain. Separate incentives from operations - Water = tiered water rate system - Toilet rebate program (low flow) - Auburn does not treat wastewater, but they do transport it
Policy 20.3	Implement automated metering, groundwater monitoring, and other proven measures to conserve water and enhance drought resilience. (Commerce) *(LU-93, CF-20, CF-21)*	High (water)	AMI – implement water metering. Should be covered in water and sewer plans. Cover all three utilities – try not toget too specific
Policy 20.4	Utilize water conservation methods and technologies in development of irrigation infrastructure within parks and recreation areas to foster climate resilience. (Commerce) *(LU-93, CF-20, CF-21)*	Med	AMI School education/programs – water efficiency May be more appropriate somewhere else (some parks use turf, water reuse TBD, water audits – landscape irrigation)
Policy 20.5	Manage water resources sustainably in the face of climate change through smart irrigation, stormwater management, preventative maintenance, water conservation and wastewater reuse, plant selection, and landscape management. (Commerce) *(LU-93, CF-20, CF-21)*	Med	Landscape management – lots of grasses are “useless grass” Stormwater management = uses LID

		Prioritization	Notes
Goal 21	Account for climate change impacts in planning, designing, and operating stormwater management approaches consistent with the Comprehensive Storm Drainage Plan.		
Policy 21.1	The Storm Drainage Utility shall work with other jurisdictions and agencies to address regional water quality issues exacerbated by climate change, consistent with the Capital Facilities Element. *(CF-50, CF-51, CF-52, CF-53)*	NA	Regional water quality issues – what is meant in this policy Not general Utilities Element
Policy 21.2	Require the use of green infrastructure and low-impact development to address increased storm intensities and stormwater runoff. (Commerce) *(CF-38)*	NA	Utilities Element (stormwater comprehensive plan)
Policy 21.3	Review and update development codes and design standards to increase requirements for stormwater facility sizing, low-impact development, adopt nature-based solutions, and minimize impervious surface areas in private development and city capital improvements. (K4C Model Policies) (*CF-39, CF-40, CF-44)*	Low Supportive, but this will be covered by other standards provided by Ecology	Sizing = 100 year storm events There are other regional efforts going on at the state level/county level that will push the direction here
Policy 21.4	Identify opportunities to retrofit undersized stormwater infrastructure and areas with uncontrolled runoff to improve flow control and water quality, with a priority on locations providing the most benefit, are identified to be most vulnerable to extreme precipitation climate impacts, and areas that are historically under-resourced. (K4C Model Policies)	High	Stormwater comp plan Make more broad – still related to stormwater

Theme 9: Natural habitats and urban green space

Gap Assessment: The current Auburn Comprehensive Plan includes policies protecting, enhancing, and restoring critical areas and natural resources. However, policies related to forest management and increasing the resilience of natural resources to climate change impacts are lacking. Additional policies that speak to tree management and link the protection of healthy habitats to climate resiliency should be considered.

Element Alignment	LU	H	CF	U	T	ED	PR	HP

Sector Alignment	Z&D	B&E	CR&P	WR	T	ED	E	EM	HH	WM	A

		Prioritization	Notes
Goal 22	Support preservation and access to green and open spaces.		
Policy 22.1	Ensure equitable access to parks, green space, and recreational services for all residents consistent with the Land Use Element. (K4C Model Policies) *(LU-96)*	High	
Goal 23	Protect and enhance the climate resilience of urban forests by implementing climate-smart forest management.		Be sure to use "urban" before forest when referring to urban forestry.
Policy 23.1	Review, update, and implement tree protection codes to increase tree retention. Encourage the protection, maintenance, and expansion of tree canopy throughout the community, prioritizing residential and mixed-use areas with the least current tree canopy to equitably distribute benefits. (K4C Model Policies)	High	Strong language (good). Planning and public works policy for implementation.
Policy 23.2	Adopt a forest master plan and implementing ordinances to maintain and expand tree canopy cover, improve tree and watershed health, prioritize carbon sequestration, and build climate resilience. (Commerce)	Med	Not sure what a forest master plan would like (who would own this?)
Policy 23.3	Reduce loss of private forestland through forest stewardship education and identify opportunities to expand incentives for forest landowners. (Commerce)	Low	May not be applicable to a city
Policy 23.4	Encourage participation in Washington's small forest landowner assistance cost-share and stewardship programs. (Commerce)	Low	May not be applicable to a city
Policy 23.5	Prioritize urban forestry planning resources and funding for frontline communities that are hurt first and worst by climate change. (Commerce)	High	Prioritize may not be the right word for it. Implementation considerations – would need to hire a consultant for this, consider what this means for budget
Goal 24	Ensure the protection and recovery of ecosystems to provide healthy habitat in a changing climate.		
Policy 24.1	Ensure no net loss of ecosystem composition, structure, and functions, especially in Critical Areas, and strive for net ecological gain to enhance climate resilience in accordance with the Land Use Element. (Commerce) *(LU-132, LU-133, LU-134, LU-135)*	High	Good – strong language

		Prioritization	Notes
Policy 24.2	Identify opportunities to expand habitat protection and improve habitat quality and connectivity to foster climate resilience using conservation area designations, buffers, and open space corridors. (Commerce)	High	Good strong language
Policy 24.3	Use an integrated approach to prevent the spread and establishment of invasive plant species and enhance the climate resilience of native plant communities. (Commerce)	High	Good strong language
Policy 24.4	Implement actions identified in restoration and salmon recovery plans to improve climate resilience of streams and watersheds. (Commerce)	High	Good strong language
Policy 24.5	Protect and restore riparian vegetation to reduce erosion, provide shade, and support other functions that improve the resilience of streams to climate change. (Commerce)	High	Good strong language

Theme 10: Economic Development

Gap Assessment: The current Auburn Comprehensive Plan captures the high-level policies related to local economic development. However, additional policies are needed that recognize the need for climate and environmental justice considerations. Policies related to developing a green job strategy, an equitable green workforce (including education and workforce training), and a just transition should be considered.

Element Alignment	LU	H	CF	U	T	ED	PR	HP			
Sector Alignment	Z&D	B&E	CR&P	WR	T	ED	E	EM	HH	WM	A

		Prioritization	Notes
Goal 25	Increase access of green jobs, with special consideration of increasing access for frontline communities.		
Policy 25.1	The City should support economic development activity through workforce development programs to provide training and employment with private sector, school districts, and Green River College. Consideration of the special needs of economically disadvantaged residents and neighborhoods, and people with physical impairments	High	Add stakeholder: Downtown Auburn Cooperative. Economic development Department is lead; shared with Community development Dept

		Prioritization	Notes
	and developmental disabilities, should be included in these programs. (*ED-11*)		
Policy 25.2	Develop a green jobs strategy in partnership with community groups, frontline communities, and businesses that (1) supports sustainable practices, green skills development, and the low carbon transition of the city's impacted industries, (2) develops pathways for youth and impacted workers to transition into green jobs; and (3) ensures opportunities (e.g., local hiring requirements) for these jobs. (K4C Model Policies)	High	Try to recruit sectors that can bring low-carbon emissions, like clean energy. Economic development Department is lead; shared with Community development Dept
Policy 25.3	Develop an equitable green workforce that is representative of the diversity of the city's communities and reflects the diverse skill sets, knowledge systems, and experiences communities through targeted hiring, workforce development, community agreements, and creating intentional pathways for frontline communities across sectors and seniority levels. (K4C Model Policies)	High	Pair with Policy 25.2 – need the opportunity and environment to work. Next 10-year economic strategic development plan should include Policies 25.2, 25.3, and 25.6 – will start renewal process in 2024; include support for the High policies in Goal 25. Economic development Department is lead; shared with Community development Dept
Policy 25.4	Ensure that the jurisdiction's Comprehensive Emergency Management Plan responds to the impacts of climate change and identifies roles and responsibilities to support a sustainable economic recovery after a disaster. (Commerce)	High	CEMP has boiler plate language on climate change (need to update to be more specific; it's on its own 5-year update cycle).
Policy 25.5	Support local businesses' efforts to generate and store renewable electricity on-site, which can provide back-up power during emergencies and help ensure continuity of operations. (Commerce)	High	City-private grant partnership to share costs? Would need to work with PSE. Encourage for new buildings in particular. Economic development Department is lead; shared with Community development Dept
Policy 25.6	Promote local industrial development to support a circular economy that increases demand for recycled materials and reduces demand for new raw materials and their embodied carbon emissions. (Commerce)	High	Economic development Department is lead; shared with Community development Dept

EXECUTIVE SUMMARY

ES.1 Introduction ES-1
ES.2 System Goals for Long Term ES-2
ES.3 Sewer Utility Evaluation ES-2
ES.4 Capital Improvement and Financial Plan ES-3
ES.5 System Administration Plan ES-3

CHAPTER 1 INTRODUCTION AND BACKGROUND

1.1 Purpose and Objectives 1-1
1.2 Document Organization 1-2
1.3 Background 1-3
1.3.1 Previous Auburn Comprehensive Sewer Plans 1-3
1.3.2 City Comprehensive Plan 1-3
1.3.3 Sanitary Sewer Service Area 1-3
1.3.4 Existing Land Use Plans 1-3
1.3.5 Wastewater Treatment 1-5
1.3.6 City of Auburn Water Resources Protection Report 1-8
1.3.7 City of Auburn Water Conservation 1-8
1.4 Neighboring Sewer Utilities 1-8
1.4.1 Soos Creek Water and Sewer District and City of Kent 1-8
1.4.2 City of Pacific 1-8
1.4.3 Muckleshoot Indian Tribe Reservation 1-9
1.4.4 Lakehaven Water and Sewer District 1-9
1.4.5 City of Algona 1-9
1.4.6 City of Bonney Lake 1-10
1.4.7 King County 1-10

CHAPTER 2 WASTEWATER SYSTEM GOALS AND POLICIES

2.1 City Comprehensive Plan Consistency 2-1
2.2 Business Practices/Asset Management 2-1
2.3 Sewer Comprehensive Plan Policies, Standards, and Guidelines 2-2
2.3.1 Service Area 2-2
2.3.2 System Planning 2-3
2.3.3 Operations and Maintenance 2-4
2.3.4 Environmental Stewardship 2-4
2.3.5 System Performance and Reliability 2-5
2.3.6 Fiscal Responsibility 2-7

CHAPTER 3 PLANNING CONSIDERATIONS

3.1 Planning Area 3-1
3.2 Basis of Planning 3-1
3.3 Land Use 3-2
3.3.1 Description of Land Use Designations 3-4
3.4 Sewer System Flow Components 3-5
3.4.1 Dry Weather Flow Components 3-6
3.4.2 Wet Weather Flow Components 3-6
3.5 Average Dry Weather Flow 3-7
3.5.1 Average Dry Weather Flow Development 3-7
3.6 Wet Weather Flow 3-8

CHAPTER 4 DESCRIPTION OF EXISTING SYSTEM

4.1 Overview 4-1
4.1.1 Valley Sewer Basin 4-1
4.1.2 West Hill Sewer Basin 4-1
4.1.3 Lea Hill Sewer Basin 4-2
4.1.4 Auburn Way South Sewer Basin 4-2
4.1.5 South Hill Sewer Basin 4-2
4.2 Sanitary Sewer Facilities 4-3
4.2.1 Critical Infrastructure 4-6
4.2.2 Pump Stations 4-6
4.2.3 Gravity and Force Main Collection System 4-7
4.2.4 Side Sewer Laterals 4-7
4.2.5 River Crossings 4-7
4.3 King County Conveyance 4-11
4.4 Infiltration and Inflow 4-11
4.5 Odor Control and Corrosion 4-12
4.6 Industrial Waste Discharges 4-12
4.7 Water Reclamation and Reuse 4-14
4.7.1 Regulatory Framework 4-14
4.7.2 Potential Reclaimed Water Sources 4-15
4.7.3 Potential Reclaimed Water Users 4-16
4.7.4 Reclaimed Water Summary 4-16

CHAPTER 5 WASTEWATER SYSTEM ANALYSIS

5.1 Introduction 5-1
5.2 Design and Performance Criteria 5-1
5.2.1 Design Storm 5-2
5.2.2 Climate Risk 5-3
5.2.3 Conveyance System 5-3
5.2.4 Lift Stations and Force Mains 5-4

5.3 Future Conditions Flow Projection 5-5
5.3.1 Future Conditions Average Dry Weather Flow Development 5-5
5.3.2 Future Conditions Wet Weather Flow Assumptions 5-5
5.4 Gravity Collection System Deficiencies 5-9
5.4.1 Key Causes of Deficiencies 5-9
5.4.2 Existing System Potential Deficiencies 5-9
5.4.3 2044 Potential System Deficiencies 5-9
5.5 Lift Station and Force Main Evaluation 5-13
5.6 Inflow and Infiltration Evaluation 5-14
5.7 Remaining Useful Life 5-17
5.8 Recommendations 5-19
5.8.1 Asset Inventory, System Inspections, and Remaining Useful Life 5-19
5.8.2 Capacity Evaluation Recommendations 5-19
5.8.3 Future Population Growth 5-19
5.8.4 Inflow and Infiltration Evaluation Recommendations 5-22

CHAPTER 6 MAINTENANCE AND OPERATIONS

6.1 Utility Responsibility and Authority 6-1
6.1.1 Organizational Structure 6-1
6.1.2 Staffing Level 6-2
6.1.3 Level of Service 6-3
6.1.4 Operator Training and Education 6-3
6.2 Routine Operations 6-3
6.2.1 Pump Station Maintenance 6-3
6.2.2 Collection System Maintenance 6-6
6.2.3 Field Operations 6-7
6.3 Fats, Oils, and Grease Reduction Program 6-7
6.4 Non-Routine and Emergency Operations 6-8
6.4.1 Customer Service Requests 6-8
6.4.2 Emergency Response Program 6-9
6.5 Communications, Data Collection, and Record-Keeping 6-10
6.5.1 Telemetry and Pump Station Controls 6-10
6.5.2 Data Collection and Record-Keeping 6-10
6.6 Existing Staffing Requirements 6-12
6.7 Potential Improvement Opportunities and Capital Needs 6-13

CHAPTER 7 CAPITAL IMPROVEMENT PLAN

7.1 Capital Improvement Plan 7-1
7.1.1 Project Priority 7-2
7.1.2 Project Cost 7-2
7.1.3 Project Summary 7-2

7.2 Capital Improvement Projects 7-2
7.2.1 Summary Table 7-2
7.2.2 Project Descriptions 7-4

CHAPTER 8 FINANCIAL PLAN

8.1 Introduction 8-1
8.2 Past Financial Performance 8-1
8.2.1 Comparative Financial Statements 8-1
8.3 Financial Plan 8-5
8.3.1 Capital Funding Plan 8-6
8.4 Available Funding Assistance and Financing Resources 8-8
8.4.1 City Resources 8-8
8.4.2 Outside Resources 8-9
8.4.3 Capital Financing Strategy 8-10
8.5 Financial Forecast 8-11
8.5.1 Current Financial Structure 8-11
8.6 Current and Projected Rates 8-16
8.6.1 Current Rates 8-16
8.6.2 Projected Rates 8-16
8.7 Affordability 8-18
8.8 Conclusion 8-18

EXECUTIVE SUMMARY

ES.1 Introduction

This *Comprehensive Sewer Plan* (Plan) for the City of Auburn, Washington (City) is an update to the previous Plan, adopted in 2016. This Plan should be considered a General Sewer Plan under the authority of Washington Administrative Code (WAC) Section 173-240-050. This Plan reflects changes in existing and projected land use and population levels, extensions to the public sewer collection system, and completion of sewer capital projects since the completion of the previous Plan.

Additionally, since the adoption of the previous Plan, both the City and King County have performed extensive flow monitoring of the City's collection system that, along with updated asset data, provides valuable information for updating the hydrologic and hydraulic (H&H) model used for system capacity assessment.

This Plan includes estimated periods that are intended to be used as a framework for future workload planning and funding decisions, and within which future actions and decisions are anticipated to occur. The purpose of the Plan is to guide the City with respect to future activities and improvements for the Sanitary Sewer Utility (Utility). To fulfill this stated purpose, the following objectives were achieved:

- Evaluation and updates to sewer policies to better reflect and integrate with overall City Comprehensive Plan policies.
- Plan for updating the comprehensive sanitary sewer system inventory, based on the City's geographic information system (GIS), that incorporates currently available infrastructure data into a digital database that can be directly linked with the hydraulic model used for analyzing the system.
- Hydraulic modeling analysis to evaluate existing system capacity.
- Future population and development projections were used to evaluate future sewer capacity needs.
- The Plan for sewer service extensions was refined, including where extensions will occur and how the City will serve these areas.
- Documentation of the City's existing Maintenance and Operation (M&O) program, and evaluation of existing Utility staffing and standard procedures.
- Completed a financial analysis of the Utility, including a projection of cost to provide sewer service and development of a funding strategy for identified goals.
- Developed a capital improvement program (CIP) by sustainably meeting required customer service needs, effectively managing risks, and minimizing the City's costs of sewer asset ownership.
- Prioritization of capital improvement projects to accommodate both 6- and 20-year funding frameworks.

ES.2 System Goals for Long Term

This Plan presents policies and standards related to system development, maintenance, funding, and general guidelines for Sanitary Sewer Utility operation. These policies define limits and outline how the wastewater collection system should be operated and maintained and are grouped within the following goal statements:

- **Goal 1:** Plan for sewer extensions and capacity upgrades to reflect the planning and growth projections included in the City's Comprehensive Plan, such that the public sewer system, when constructed, will have adequate capacity to support all future planned development.
- **Goal 2:** Plan for future service to all properties in the City within urban density areas.
- **Goal 3:** Manage the extension of the public sewer system to minimize future costs to operate and maintain.
- **Goal 4:** Design, operate, and maintain the public sewer system in a manner that increases reliability and efficiency, and demonstrates environmental stewardship.
- **Goal 5:** Apply asset best management principles to the City's sewer infrastructure.
- **Goal 6:** Manage the sewer utility funds and resources in a professional manner in compliance with applicable laws, regulations, and City financial policies, which requires ongoing monitoring of revenues and expenses in order to make prudent business decisions and report to City officials, as needed, regarding the status of utility operations.

ES.3 Sewer Utility Evaluation

The City customer base continues to increase through system growth by development, redevelopment, and connection of on-site system properties to the system. With the additional customers served, some of the City's sewer infrastructure may reach its conveyance capacity. In addition, the installed sewer infrastructure continues to age:

- Hydraulic Modeling: The City hydraulic model was updated to reflect currently installed infrastructure. Current sanitary loading was developed from flow monitor data collected through recent temporary monitor programs, as well as long term sites. A total of 22 sites were used for modeling to develop land used based flow factors, and dry and wet weather model calibration.
- System Evaluation: The flow factors were used to develop a future flow projection based on a combination of general population projects, anticipated land use changes to address City and State requirements. The hydraulic model was used for evaluating current and figure capacity needs. In addition, installed infrastructure age was evaluated relative to anticipated useful life expectancy.
- Maintenance and operation: The current organization and common procedures associated with the ongoing maintenance and operation of the City sewer utility system are reviewed. The primary purpose being to establish a baseline understanding of the proactive and responsive maintenance procedures performed by City staff. This baseline understanding is used herein to evaluate Sewer Utility (Utility) staffing, data collection and computerized record-keeping needs, and other Utility requirements to continue to meet the Utility's goals.

ES.4 Capital Improvement and Financial Plan

This Plan includes time frames, which represent the intended framework for future funding decisions and within which future actions and decisions are intended to occur. However, these time frames are estimates, and depending on factors involved in the processing of applications and project work, and availability of funding, the timing may change. The framework does not represent actual commitments by the City. Project identification is an ongoing effort requiring periodic evaluation.

The CIP list was developed based on incorporating the City's Capital Facilities Plan (CFP), identification of equipment limitations within the M&O group, and identification of areas of improvement. The CIP focuses on addressing known problems in a manner identifying cost-effective solutions that incorporate the risks associated with substandard facilities and the uncertainty inherent in engineering calculations/model simulations. The CIP places emphasis on projects identified for implementation between 2025 and 2030, which constitutes the 6-year planning period for utility capital funding requirements and staffing needs. This period provides a realistic outer limit for accurately forecasting the annual cycle of utility projects and priorities. This Plan also includes a 20-year CIP that examines long-term capital requirements, such as the replacement of infrastructure as it exceeds its useful life. All projects in the CIP are consistent with the LOS.

For implementing the CIP and sustaining long term operation of the Utility, a financial program is outlined that allows the City sewer utility to remain financially viable during the planning period. This financial viability analysis considers the historical financial condition, current and identified future financial and policy obligations, M&O needs, and the financial impacts of the capital projects identified in this Plan. Furthermore, this chapter provides a review of the sewer utility's current rate structure with respect to rate adequacy and customer affordability. The results of this analysis indicate that at existing rate levels the utility will be deficient beginning in 2028. To keep pace with expenses, the City has adopted a 7.50 percent rate increase in 2025. An annual rate increase is recommended for several years, as well as a regular review and update the key underlying assumptions that compose the multi-year financial plan to ensure that adequate revenues are collected to meet the City's total financial obligations.

ES.5 System Administration Plan

In addition to the projects listed in the CIP, this Plan includes other tasks and activities that should be priorities during this planning period. These include:

- Renewal of the franchise agreement with King County which expires in 2027, and beginning negotiation of an extension to the Sewage Disposal Agreement which expires in 2036.
- The continued implementation of asset management principles including:
  - Completing the inventory of sewer assets
  - Verifying and updating asset data/information as part of normal maintenance activities.
  - Integrating condition assessment information into the City's CMMS as a tool for prioritizing rehabilitation and replacement decisions
  - For assets with poor condition scores, determining the consequences of failure to help assess asset criticality.
  - Use condition assessment studies included in the CIP to make long-term maintenance, upgrade, rehabilitation, and replacement decisions for key assets.

- Proactively discouraging the discharge of substances detrimental to the sanitary sewer and wastewater treatment system by:
  - » Enforcing the requirements to manage fats, oils, and grease (FOG) by restaurants and other businesses likely to discharge FOG into the sewer system.
  - » Educating residents about the negative effects of discharging FOG on both private and public portions of the sanitary sewer system.
  - » Educating residents about the negative effects of discharging cleaning wipes, pharmaceuticals, and other prohibited discharges to the sewer system, and promoting alternative disposal methods.

CHAPTER 1 INTRODUCTION AND BACKGROUND

This *Comprehensive Sewer Plan* (Plan) for the City of Auburn, Washington (City) is an update to the previous Plan, adopted in 2016. This Plan should be considered a General Sewer Plan under the authority of Washington Administrative Code (WAC) Section 173-240-050, and within this document, Comprehensive Sewer Plan and General Sewer Plan should be considered synonymous. This Plan reflects changes in existing and projected land use and population levels, extensions to the public sewer collection system, and completion of sewer capital projects since the completion of the previous Plan.

Additionally, since the adoption of the previous Plan, both the City and King County have performed extensive flow monitoring of the City's collection system that, along with updated asset data, provides valuable information for updating the hydrologic and hydraulic (H&H) model used for system capacity assessment.

This Plan includes estimated periods that are intended to be used as a framework for future workload planning and funding decisions, and within which future actions and decisions are anticipated to occur. These time lines are estimates and depending on factors including staff availability, available resources, coordination with other City departments, and overall development activity, the actual timing of actions described by this Plan may differ. The timing estimates for activities included in this Plan do not represent actual commitments by the City.

This Plan meets the requirements of the Washington State Department of Ecology (Ecology) as set forth in WAC Section 173-240-050. The Plan was submitted to Ecology; the Washington State Department of Health (DOH); King and Pierce counties; the cities of Algona, Bonney Lake, Kent, and Pacific; Lakehaven Water and Sewer District (LWSD); Soos Creek Water and Sewer District (SCWSD); and the Muckleshoot Indian Tribe (MIT).

1.1 Purpose and Objectives

The purpose of the Plan is to guide the City with respect to future activities and improvements for the Sanitary Sewer Utility (Utility). To fulfill this stated purpose, the following objectives were achieved:

- Evaluation and updates to sewer policies to better reflect and integrate with overall City Comprehensive Plan policies.
- Plan for updating the comprehensive sanitary sewer system inventory, based on the City's geographic information system (GIS), that incorporates currently available infrastructure data into a digital database that can be directly linked with the hydraulic model used for analyzing the system.
- Hydraulic modeling analysis to evaluate existing system capacity.
- Future population and development projections were used to evaluate future sewer capacity needs.
- The Plan for sewer service extensions was refined, including where extensions will occur and how the City will serve these areas.
- Documentation of the City's existing Maintenance and Operation (M&O) program, and evaluation of existing Utility staffing and standard procedures.
- Completed a financial analysis of the Utility, including a projection of cost to provide sewer service and development of a funding strategy for identified goals.

- Developed a capital improvement program (CIP) by sustainably meeting required customer service needs, effectively managing risks, and minimizing the City's costs of sewer asset ownership.
- Prioritization of capital improvement projects to accommodate both 6- and 20-year funding frameworks.

1.2 Document Organization

This Plan is organized to focus on the actions that the Utility will take while implementing Plan recommendations. Supporting documentation and background information is included in appendices where appropriate. The Plan is organized into the following chapters:

- **Chapter 1 - Introduction and Background:** Explains the need for updating previous sewer planning documentation and outlines specific objectives of the Comprehensive Sewer Plan Update and provides background information regarding the Utility and Sanitary Sewer Service Area (SSSA).
- **Chapter 2 - Wastewater System Goals and Policies:** Specifies the utility's goals and policies used to develop capital improvements and future M&O activities.
- **Chapter 3 - Planning Considerations**: Describes the factors used to project the future capacity needs of the system.
- **Chapter 4 - Description of Existing System:** Describes the existing conditions of the City's sanitary sewer system.
- **Chapter 5 - Wastewater System Analysis:** Presents methodologies used to evaluate system capacity and future sewer extensions.
- **Chapter 6 - Maintenance and Operations:** Provides an overview of the organization and common procedures associated with the ongoing M&O program and evaluates existing Utility staffing needs based on established Level of Service (LOS) goals.
- **Chapter 7 - Capital Improvement Plan:** Describes recommended capital improvement projects including cost estimates.
- **Chapter 8 - Finance:** Develops a funding plan that optimizes use of rates, systems development charges, and other service fees based on projected Utility spending requirements and a review of funding sources and City financial policies.
- **Appendix A - Inter-local Agreements and Outside Agency Correspondence:** Provides copies of inter-local agreements related to sanitary sewer conveyance and disposal.
- **Appendix B - Agency Comment Letters and Responses:** Provides copies of key agency review, resolution of comments, and final approval.
- **Appendix C - Approval:** Provides a copy of final council adoption ordinance.
- **Appendix D - Hydraulic Model Update, Calibration, and Capacity Analysis:** Provides a detailed review of the hydraulic modeling completed for near- and long-term land use modeling scenarios to identify areas of capacity concern.
- **Appendix E - Pump Station Information:** Provides detailed information related to the pump stations (pump sizes, wet well size, etc.).
- **Appendix F - SEPA Compliance:** Provides a letter documenting the "Determination of Non-Significance."
- **Appendix G –** Reclaimed Water Checklist: A copy of the King County reclaimed water checklist from the 2024 Water System Plan.

1.3 Background

This section includes background information related to the development of the City's current wastewater collection and conveyance system. A description of the City SSSA is also included, along with information on adjacent sewer utilities, which will facilitate an understanding of existing and potential collaboration opportunities with other purveyors to enhance system reliability and/or reduce costs. Changes to land use planning efforts affecting the City SSSA are also discussed.

The City of Auburn vicinity within the greater region is shown in Figure 1.1.

1.3.1 Previous Auburn Comprehensive Sewer Plans

The current wastewater planning effort supersedes previous plans prepared in 1968, 1982, 2001, 2009, and 2016. This Plan builds upon concepts established in the five previous plans modifying, or updating goals, policies, and analyses to account for present conditions.

1.3.2 City Comprehensive Plan

The City most recently revised its City Comprehensive Plan in June 2015. The City Comprehensive Plan incorporates the Comprehensive Sewer Plan by reference. The City is in the process of updating the City Plan for adoption in 2024.

1.3.3 Sanitary Sewer Service Area

The City SSSA has not changed significantly since the 2016 *Comprehensive Sewer Plan*. Service has been extended to a small area of unincorporated King County located west of Algona. The current SSSA is shown on Figure 1.2.

As of September 2023, the City serves 13,417 single-family residential customers within its SSSA. Additionally, commercial customers (including non-single-family customers) equate to 19,980 Residential Customer Equivalents (RCE) based on total water consumption records for commercial connections. The City tracks total RCEs and reports to the County quarterly.

The City coordinates service at the boundary of its SSSA with nearby sewer utilities. When the City's SSSA extends beyond current corporate limits, the City requires a franchise to own, maintain, and manage the wastewater facilities within King and Pierce counties' rights-of-way. This coordination with other utilities and King and Pierce counties is discussed in Section 1.4.

1.3.4 Existing Land Use Plans

Various land use plans govern development with the City SSSA; these plans are described in the following sections.

1.3.4.1 King County Comprehensive Plan

Urban unincorporated areas of the City's SSSA within King County are subject to the King County *Comprehensive Plan*, as most recently updated and adopted in December 2022. This section highlights portions of the King County document affecting policy direction for functional plans, such as this City of Auburn *Comprehensive Sewer Plan*.

In the 2022 King County *Comprehensive Plan*, policy F-255 states:

In the Urban Growth Area, all new development shall be served by public sewers unless:

a. *Application of this policy to a proposal for a single-family residence on an individual lot would deny all reasonable use of the property; or*
b. *Sewer service is not available for a proposed short subdivision of urban property in a timely or reasonable manner as determined by the Utility Technical Review Committee. [1]These on-site systems shall be managed by one of the following entities, in order of preference:*
    i. *The sewer utility whose service area encompasses the proposed short subdivision; or*
    ii. *The provider most likely to serve the area; or;*
    iii. *An Onsite Sewage System Maintainer certified by Public Health - Seattle & King County.*

The onsite system shall meet all state and county approval requirements. The approved short subdivision shall indicate how additional lots to satisfy the minimum density requirement of the zoning will be located on the subject property in case sewers become available in the future. There shall be no further subdivision of lots created under this policy unless served by public sewers.

In conjunction with policy F-255, policy F-256 states:

> *In the Urban Growth Area, King County and sewer utilities should jointly prioritize the replacement of on-site systems that serve existing development with public sewers, based on the risk of potential failure. King County and sewer utilities should analyze public funding options for such conversion and should prepare conversion plans that will enable quick and cost-effective local response to health and pollution problems that may occur when many on-site systems fail in an area.*

Chapter 5 discusses potential sewer extensions within currently unsewered areas. The City's SSSA currently includes three areas of unincorporated King County, as shown on Figure 1.2.

1.3.4.2 Pierce County Comprehensive Plan

Urban unincorporated areas of the City's SSSA within Pierce County are subject to the *Pierce County Comprehensive Plan*, as most recently updated and adopted in July, 2023. Several goals and policies included in the Pierce County document affect policy direction for functional plans, this City of Auburn *Comprehensive Sewer Plan Update* such as:

- GOAL U-2 - Provide urban level facilities and services only within the designated Urban Growth Areas prior to or concurrent with development.
    - U-2.1 - Encourage the provision of urban level services from cities or appropriate regional service providers.
    - U-2.3 - Preserve the rural way of life by not providing urban LOS' within rural areas.
- GOAL U-15 - Provide sanitary sewers within the urban area.
    - U-15.6 - Recognize on-site septic systems within the Urban Growth Area are considered interim facilities.

Chapter 5 discusses potential sewer extensions within currently unsewered areas. The City's SSSA currently includes one area of unincorporated Pierce County, as shown on Figure 1.2.

[1] The Utility Technical Review Committee (UTRC) is a King County Committee that reviews sewer and water plans and makes recommendations to the Council/Executive.

1.3.5 Wastewater Treatment

The City is a component agency of the King County Wastewater Treatment Division. As such, its Sewer Utility operates a collection system that discharges collected wastewater to King County facilities for conveyance to King County's South Plant for treatment, outside of the service area to the North. The South Plant operates under a permit from the Department of Ecology, and the County is required to continually upgrade its treatment processes to ensure its effluent and other treatment byproducts meet the most current environmental standards.

The City's agreements with King County can be found in Appendix A, and are active until 2036. It is expected that negotiations for extending that agreement will occur during this planning period. Under the current agreement, the City is obligated to deliver all of the sewage and industrial wastes collected or received by the City, and Metro (King County) shall accept the sewage and industrial wastes delivered for treatment. There is currently no limit on the quantity of wastewater delivered by the City to Metro (King County).

1.3.5.1 King County Regional Wastewater Services Plan

In 2007, King County adopted a revised *Regional Wastewater Services Plan* (RWSP), which outlined proposed wastewater conveyance improvements. Improvements that impact the City collection and conveyance system included the following:

- Stuck River Trunk: New gravity pipe constructed to convey flow away from the M Street Trunk to the Lakeland Hills Trunk Line and eventually the Auburn West Interceptor.
- Pacific Pump Station discharge: New pipe to convey flow north from the Pacific Pump Station to the Auburn West Interceptor.
- Auburn West Interceptor Parallel: New gravity pipe to replace or parallel an existing portion of the Auburn West Interceptor between 15th Street SW and West Main Street.

The Stuck River Trunk was completed in 2013. The Pacific Pump Station discharge and Auburn West Interceptor Parallel were completed in 2018.

Based on the completion of most of the projects included in the RWSP, King County issued its final report on the RWSP in 2017.

The County has continued to identify projects for its Conveyance System Improvements Program based on decennial flow monitoring data and updated land use and population projections. Those projects include the replacement of the Lakeland Hills Pump Station located along the White River within Roegner Park, which is planned for the year 2031.

In 2019, the County began the planning process for what is to be called the Clean Water Plan. Activities included evaluation of existing assets, analysis of evolving environmental regulations, decennial flow monitoring, future land use projection, and gathering stakeholder input. This planning effort is currently paused pending clarity on future regulations but is expected to resume once that clarity is achieved.

CITY OF AUBURN
2024 COMPREHENSIVE SEWER PLAN

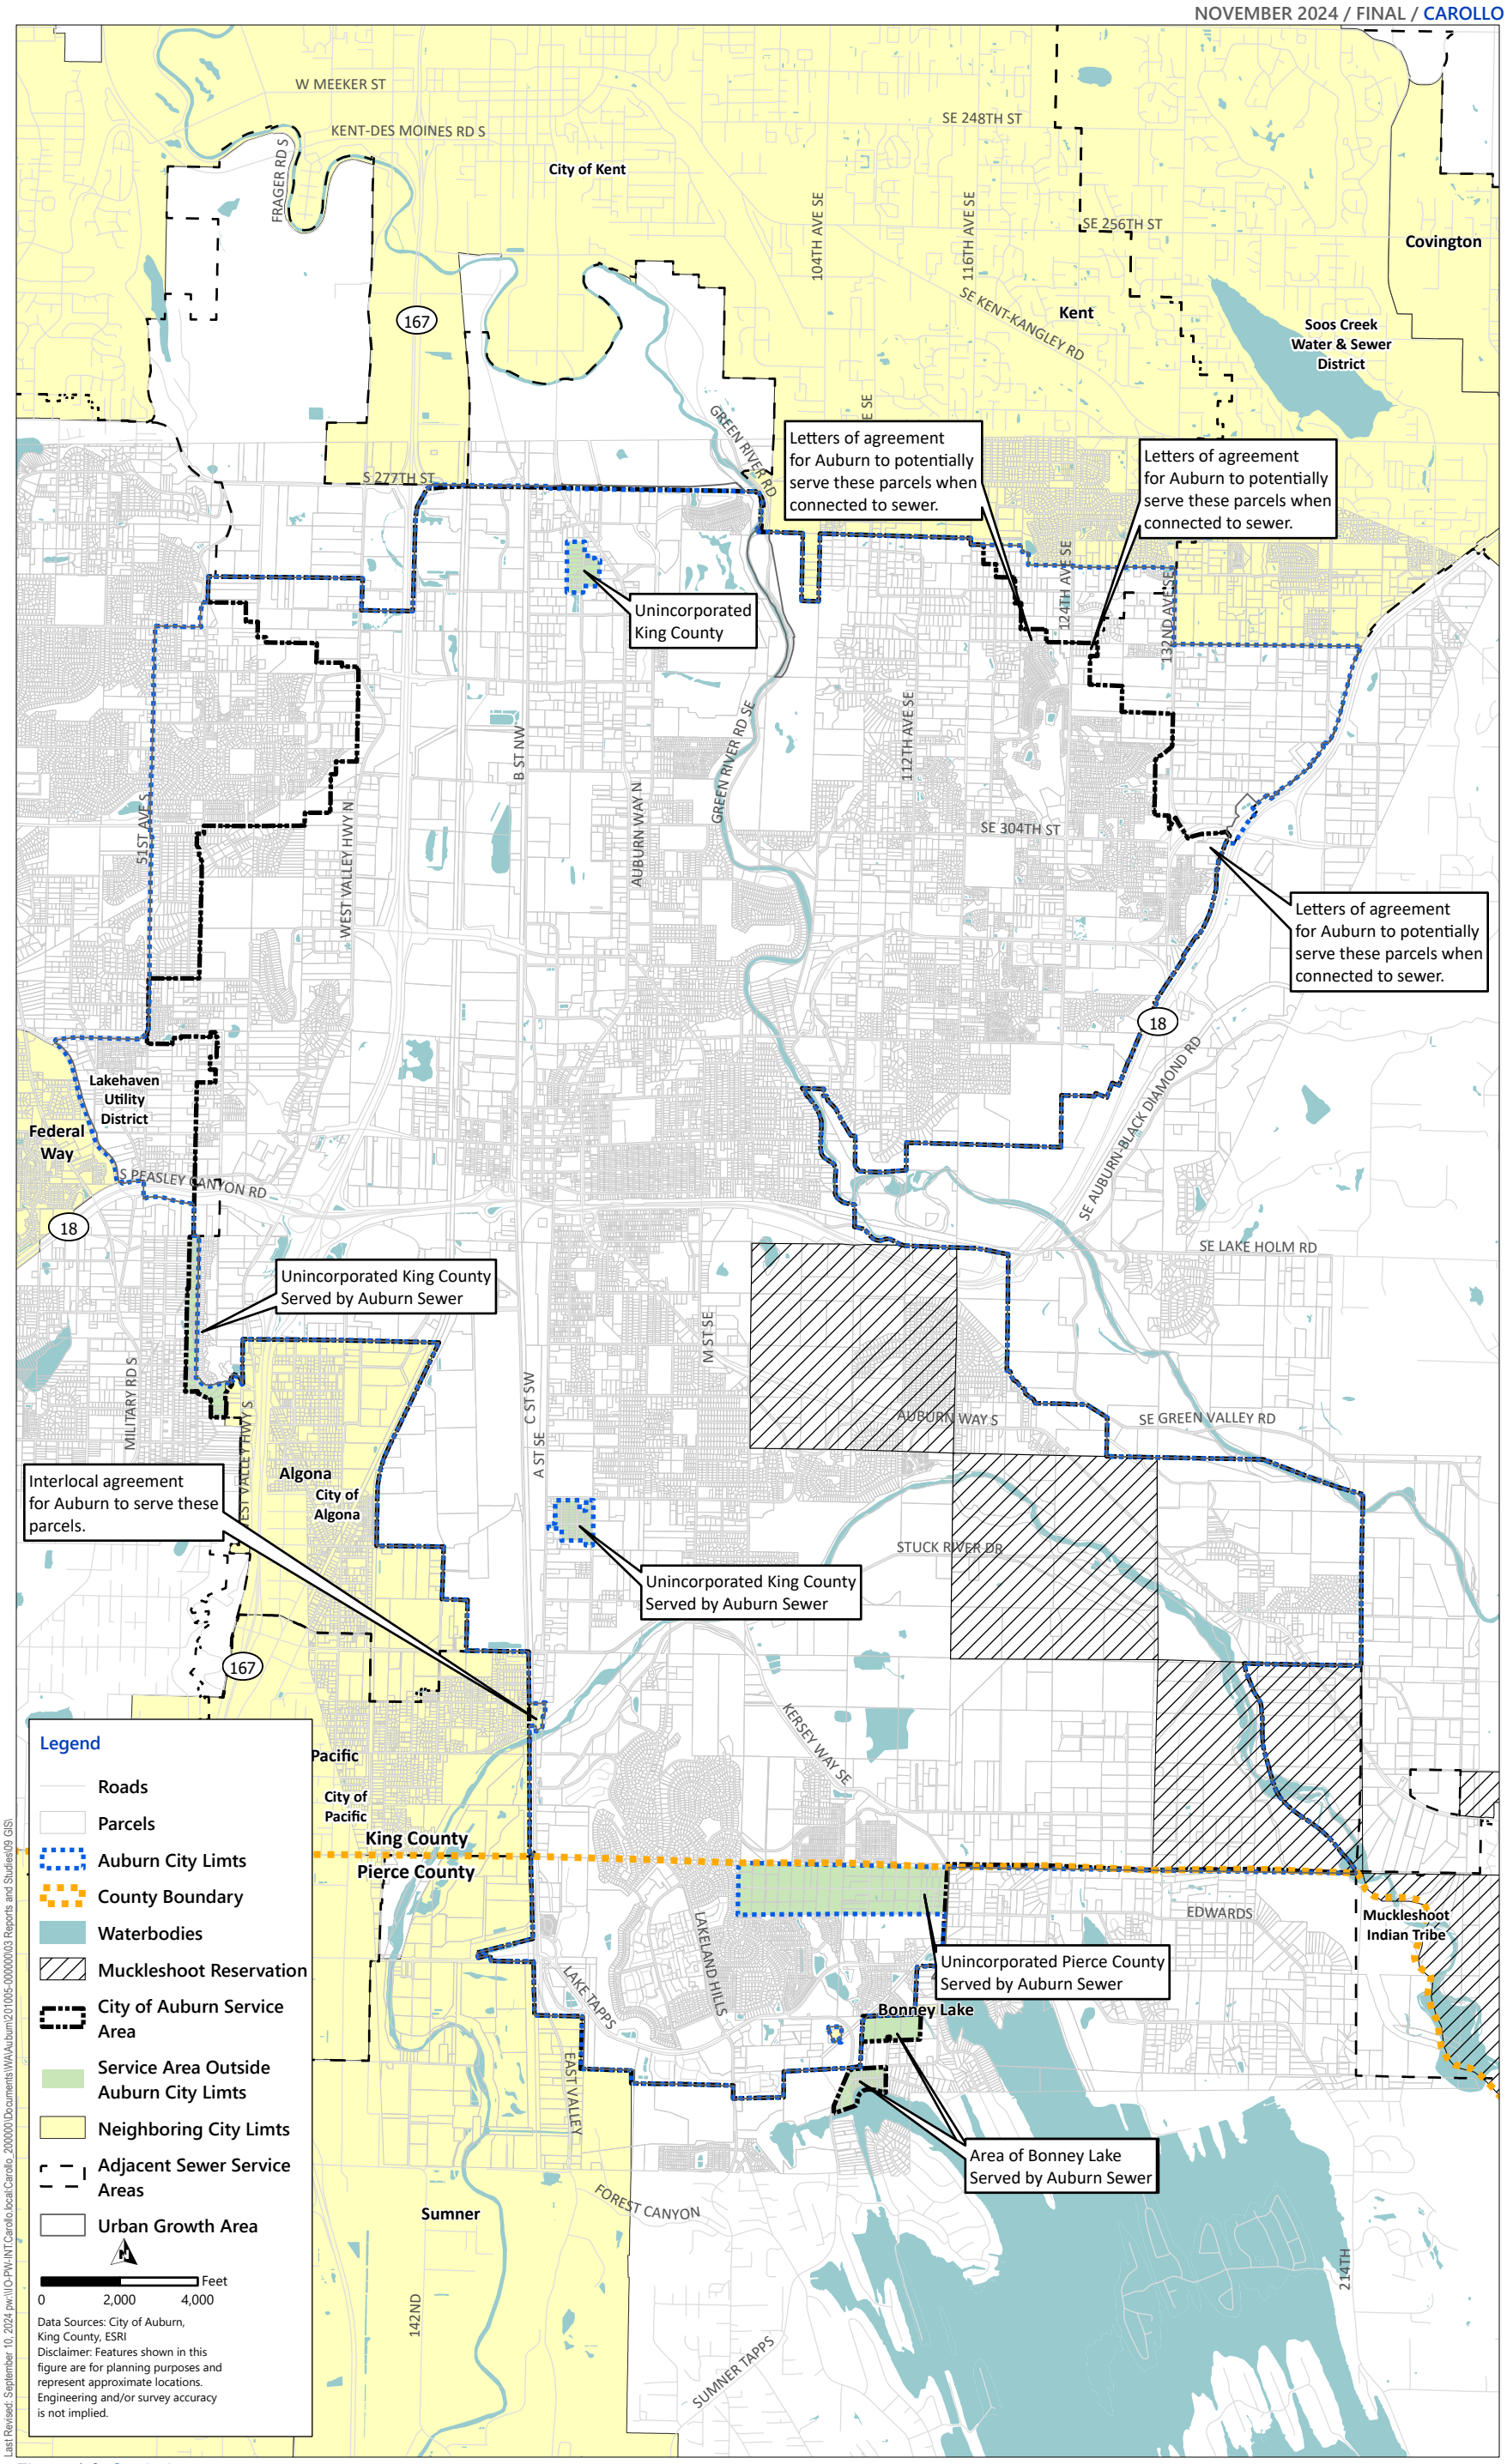

Figure 1.2 Study Area
CITY OF AUBURN
2024 COMPREHENSIVE SEWER PLAN

1.3.6 City of Auburn Water Resources Protection Report

As identified in the City's 2016 *Sewer Plan*, coordination with the Water Utility will be necessary in the future, as many of the City's unsewered areas lie within the Water Resource Protection Areas identified in the *Water Resources Protection Report* completed in 2000. In particular, planning for future wastewater infrastructure could include the importance of removing potential contamination (i.e., onsite sewer systems) from those areas, based on coordination with the Water Utility. Auburn City Code 16.10 (Critical Areas) now refers to the areas as "Aquifer Recharge Areas" and regulates activities within them.

1.3.7 City of Auburn Water Conservation

The City of Auburn's Sanitary Sewer Service Area largely overlaps with its Water Service Area, therefore, water conservation efforts undertaken by the City's Water Utility will, by far, be the most likely to affect sewage flows handled by the City's sewage collection system. The Water Utilities program is described in Section 4.3 of the 2024 Water System Plan. The primary effect of such measures on the sewer system would be to reduce the overall wastewater flow, while potentially increasing wastewater strength. Since the City's sewer hydraulic model calibration was based on actual measured flows, the effects of existing conservation measures have been accounted for. Further increased effectiveness of water conservation efforts could result in capacity improvement projects being eliminated or delayed if anticipated flow increases are not realized.

1.4 Neighboring Sewer Utilities

The communities surrounding the City administer their own wastewater conveyance and collection systems. The following sections describe these systems and discuss interlocal agreements between the City and these communities that establish SSSA boundaries and other conditions of service. Neighboring sewer utilities that serve a portion of Auburn are identified in Figure 1.2.

1.4.1 Soos Creek Water and Sewer District and City of Kent

In the northeast corner of the city, within the Lea Hill sewer basin (as shown on Figure 1.2), there are small areas served by the Soos Creek Water and Sewer District (SCWSD) and the City of Kent. In 2001, prior to annexation of the Lea Hill area by the City, the City executed interlocal agreements with SCWSD and the City of Kent, establishing sanitary sewer service area boundaries in the basin. The agreements enable SCWSD and the City of Kent to provide the most efficient method of sanitary sewer service to this portion of the City while ensuring adherence to the City's development standards. Copies of these agreements are included in Appendix A.

As development in Lea Hill occurs, the City will continue to work with both agencies to refine our respective planning areas as needed.

1.4.2 City of Pacific

An interlocal agreement establishing sanitary sewer service area boundaries between the City and the City of Pacific was executed in 2008. This agreement allows Auburn to provide sanitary sewer service to property located on the eastern portion of Pacific's municipal boundary, which lies in the vicinity of

Auburn's wastewater infrastructure. The agreement recognizes that Auburn has sufficient wastewater conveyance capacity to support the SSSA with maximum efficiency in the use of existing and future facilities, together with orderly and efficient sanitary sewer planning. The cities of Auburn and Pacific are considering allowing the area described in the agreement to be annexed by Auburn. A copy of this agreement is included in Appendix A.

1.4.3 Muckleshoot Indian Tribe Reservation

The MIT reservation is located within and to the southeast of Auburn city limits, as shown in Figures 1.1 and 1.2. In 1997, the MIT, Indian Health Service, and City of Auburn entered into an agreement for the City to provide wastewater service to the MIT property located outside city limits, outside the potential annexation area (PAA), and outside the Urban Growth Area. An additional agreement, signed in 2004, superseded the 1997 agreement, and outlined cost sharing in the replacement and maintenance to the conveyance system from the south end of the City on Auburn Way South to the connection to King County's M Street Trunk. Two outcomes of that agreement were that (1) the MIT become a component agency of the King County Wastewater Treatment Division, which officially occurred in July 2004; and (2) the MIT would own a portion of the capacity within the Auburn Way South sewer line for the conveyance of sewage from a portion of MIT properties located outside the City's service area to King County.

In 2013, Resolution 4902 established a master agreement/provision for City utility services on MIT lands. Lands owned by the MIT within the City SSSA are billed as ordinary ratepayers. Development of lands within the MIT reservation must be in accordance with the master agreement. MIT-related agreements are included in Appendix A.

1.4.4 Lakehaven Water and Sewer District

In 2004, an interlocal agreement was established between LWSD (then known as Lakehaven Utility District) and the City delineating a mutual sewer service area boundary within a portion of the West Hill Service Area within the City.

Amendments to this agreement were made in 2005, and 2018, transferring sewer service from LWSD to the City for portions of the area known as Jovita Heights-West Hill. Copies of both LWSD agreements are included in Appendix A.

1.4.5 City of Algona

The City of Algona borders the City of Auburn to the southwest. In 2003, the cities of Algona and Auburn executed an interlocal agreement establishing sanitary sewer service area boundaries. The agreement allows Algona to provide sewer service to a small area in southwest Auburn, within the city limits and adjacent to Algona. Sewer service by Algona provides efficiency in the use of existing and future facilities. An additional agreement between Auburn and Algona was executed in 2020 to clarify the connection locations and billing responsibilities for several parcels located along the service area boundary. Copies of both Algona agreements are included in Appendix A.

1.4.6 City of Bonney Lake

An addendum to a 1998 interlocal agreement establishing sanitary sewer service area boundaries between the cities of Bonney Lake and Auburn to roughly coincide with Auburn's PAA boundaries was executed in February 2005. The addendum added a single parcel to the City SSSA because the parcel was partially located in both Auburn's and Bonney Lake's service areas as a result of the previous agreement.

In April 2005, an interlocal agreement was established for Auburn to provide sanitary sewer service to a parcel within Bonney Lake's SSSA (and designated within Pierce County's Urban Growth Area). The maximum efficiency in the use of existing and future facilities is achieved by having Auburn provide sewer service to this area within Bonney Lake. A subsequent agreement, executed in August 2005, allows for Bonney Lake to serve the parcel in question once a sewer franchise with Pierce County has been secured for the area of Pierce County in which this parcel is located. Copies of both Bonney Lake agreements are included in Appendix A.

1.4.7 King County

In 2002, the City of Auburn was granted a sanitary sewer franchise from King County to operate, maintain, repair, and construct sewer mains, service lines, and appurtenances in, over, along, and under County roads and rights-of-way in areas that, at that time, were located within unincorporated areas of King County. The legal descriptions of the areas covered by that agreement were updated through an amendment approved in January 2013. Copies of the agreement and amendment (Resolution 5027) are included in Appendix A. That franchise agreement will expire in 2027, so a renewal of the agreement should be sought during this planning period.

CHAPTER 2 WASTEWATER SYSTEM GOALS AND POLICIES

This chapter presents policies and standards that guide the operation and development of the City's wastewater collection and conveyance system.

2.1 City Comprehensive Plan Consistency

The City Comprehensive Plan serves as the City's blueprint for managing growth, encompassing policies aimed at protecting critical areas and preserving natural resource lands. This plan also designates urban growth areas, outlines the preparation of comprehensive utility plans, and an implementation approach through capital investments, and development regulations. The City Comprehensive Plan provides a framework of policies for development, expansion, and maintenance of the Utility reflected in this Plan.

2.2 Business Practices/Asset Management

The City desires to employ recognized best business practices that result in an efficient and cost-effective operation of the Sanitary Sewer Utility. The City shall identify the key business functions within the Sanitary Sewer Utility (e.g., billing, permitting, asset management, and planning) and develop supporting best business practices for each.

The City understands that defining and implementing best business practices is a long-term effort and will require a stepwise approach. Given that the Utility is largely composed of physical assets that have the greatest value and deserve the greatest commitment to operate and maintain, the City shall continue to prioritize asset management.

Asset management is a systematic approach to keep assets in good working order to minimize future maintenance and replacement costs, and especially to avoid costly deferred maintenance. The best practices for asset management involve systematically basing choices on an understanding of asset condition and performance, risks, and costs in the long term. Asset management best practices include:

- Having extensive knowledge about assets and their costs for maintenance and replacement (i.e., detailed inventories).
- Maintaining Levels of Service.
- Taking a life-cycle approach to asset management planning.
- Implementing the planned solutions to provide a reliable, cost-effective service.

Since the adoption of the 2016 Comprehensive Sewer Plan, the Utility has compiled an inventory of assets and their conditions for approximate 70 percent of its current assets. The Utility shall continue implementing the above best practices during the next planning period.

2.3 Sewer Comprehensive Plan Policies, Standards, and Guidelines

This Plan presents policies and standards related to system development, maintenance, funding, and general guidelines for Sanitary Sewer Utility operation. These policies define limits and outline how the wastewater collection system should be operated and maintained and are grouped within goal statements that are headlined under the following categories:

- Service Area.
- System Planning.
- Operations and Maintenance.
- Environmental Stewardship.
- System Performance and Reliability.
- Fiscal Responsibility.

2.3.1 Service Area

Goal 1: Plan for sewer extensions and capacity upgrades to reflect the planning and growth projections included in the City's Comprehensive Plan, such that the public sewer system, when constructed, will have adequate capacity to support all future planned development.

- Policy 1.1 - Incorporate the Comprehensive Sewer Plan as an Element of the City's Comprehensive Plan.
- Policy 1.2 - Sewer Service provided by outside purveyors within City limits are required to obtain a franchise with the City and are required to conform to all federal, state, and local laws and regulations. (ACC 20.02.040 and 20.04).
- Policy 1.3 - Future land use patterns for the SSSA will correspond to existing uses or current designations or as otherwise identified in the City's Comprehensive Plan.
- Policy 1.4 - Require that, if a sewer system extension is needed to serve new development, that it is built prior to or simultaneously with such development, according to the size and configuration identified by the Comprehensive Sewer Plan and the City's Comprehensive Plan, as necessary to serve all planned development. (ACC 13.20.270).
- Policy 1.5 - Require the owner of a property connecting to the public sewer system be responsible for the cost of the sewer line across the frontage of, and within their property (ACC 13.20.270), and for a proportionate share of the costs of pump stations, trunk lines, and other facilities specifically designed to enable service to a larger basin. As such:
  - Property owners connecting to existing sewer facilities may be required to reimburse the installer of those facilities, if the facilities satisfy the responsibility described above. (ACC 3.25).
  - Developers, or the City if it funds the construction, may be eligible to be reimbursed, by property owners connecting to the public sewer system, for the cost of installing those facilities that benefit multiple properties. (ACC 3.25).
  - Required improvements may be deferred for reasons of efficiency, but the property owner will, in the future, be obligated to pay a proportionate share of the construction of that required improvement.

2.3.2 System Planning

Goal 2: Plan for future service to all properties in the City within urban density areas.

- Policy 2.1 - System planning will include a provision for future sewer service to all unsewered properties within the SSSA.
- Policy 2.2 - Identify, through interlocal agreements, a sanitary sewer provider for those properties located within the City, but outside the City's SSSA.
- Policy 2.3 - Consider, but not encourage, providing sanitary sewer service to properties outside the SSSA. Property owners outside the SSSA bear the burden of pursuing adjacent sewer providers for service prior to seeking service from Auburn. Considerations for service include:
  - An analysis of the capacity of existing City of Auburn facilities.
  - Required upgrades to City of Auburn facilities.
  - Operational costs added to the Utility.
  - Potential revenue from the added service area.
  - Concurrence of the existing sanitary sewer service area provider.
  - The temporary or permanent nature of the service.
  - The need to permanently adjust the service area boundary and have it approved by the Boundary Review Board.
  - Potential impacts to public health.
- Policy 2.4 - Consider allowing properties within the SSSA to receive service from an adjacent sewer agency. Considerations for service by an adjacent agency include:
  - Future City of Auburn sewer service plans and the anticipated short and long-term timing of such an extension.
  - The effect of long-term capital costs on other future City of Auburn Customers.
  - The willingness/ability of the adjacent agency to provide service.
  - The temporary or permanent nature of the service change.
  - The need to permanently adjust the service area boundary and have it approved by the Boundary Review Board.
  - The potential impact on public health.
- Policy 2.5 - The Sanitary Sewer Utility does not intend and will not plan to extend sanitary sewer service to or through King or Pierce County rural zoned property. Exceptions will only be considered for reasons of health, safety, or service to a school in accordance with King or Pierce County policies and with the approval of King or Pierce County as appropriate.
- Policy 2.6 - Allow development where public sewer service is not readily available to be served by individual onsite (septic) systems, if the individual lots are suitable for onsite systems, per the requirements and approval of King County or Pierce County Department of Health, and the City's or Counties' development codes as appropriate. The allowance of the use of onsite systems will consider City water resource protection efforts and possible impacts to city drinking water sources. (ACC 13.20.060, 13.20.080, and 13.20.090).

- Policy 2.7 - Require a connection to public sewer if an existing onsite (septic) system fails and a permit to repair that system cannot be issued by the County Health Department that has jurisdiction. (ACC13.20.060 and 13.20.070).
- Policy 2.8 - Maintain an asset database to be used in prioritizing asset maintenance and repair and replacement activities. The database includes asset age and material information, and will be validated and updated through inspections, records review, and other available information.

2.3.3 Operations and Maintenance

Goal 3: Manage the extension of the public sewer system to minimize future costs to operate and maintain.

- Policy 3.1 - Set standards for the design and construction of the sanitary sewer infrastructure primarily based on the technical criteria found in the most recent versions of the Ecology publication Criteria for Sewage Works Design (CSWD) and Washington State Department of Transportation (WSDOT)/ American Public Works Association (APWA) Standard Specifications. (ACC 13.20.270).
- Policy 3.2 - Maintain specific criteria for the design and repair of public and private sewer systems, through the City of Auburn Engineering Design and Construction Standards. (ACC13.20.270 and 13.20.300).
- Policy 3.3 - Require the transport of sewage by gravity whenever feasible in order to increase reliability, sustainability, and long-term cost effectiveness.
- Policy 3.4 - Allow pumped systems when it is not feasible to install a total gravity system. Feasibility criteria include the relative elevations of the property to be served and existing sewer infrastructure and physical conditions, such as the existence and nature of critical areas, which may impact the constructability and maintainability of proposed gravity sewer extensions.
- Policy 3.5 - Allow non-gravity services (e.g., grinder pumps, low-pressure force mains, or other on-site pumping facilities) in extenuating circumstances when service by gravity is infeasible, provided that the cost of installation, operation, and maintenance of a non-gravity system shall be borne by the property owner, community association, developer, etc. The City will evaluate applications for non-gravity services consistent with ACC 13.20.200. The City will not install, own, or maintain (outside of emergencies) any part of a private non-gravity system. (ACC 13.20.500 and 13.20.510).
- Policy 3.6 - Give preference to the construction of fewer large public pump stations over a greater number of smaller public pump stations.
- Policy 3.7 - Allow private sewer conveyance systems, consistent with Washington Administrative Code (WAC) 173-240-104(3)(b), within the SSSA as long as they are designed and operated per City standards and are not part of sewer extensions to other parcels. Multiple connections per parcel are allowed. (ACC13.20.500).

2.3.4 Environmental Stewardship

Goal 4: Design, operate, and maintain the public sewer system in a manner that increases reliability and efficiency, and demonstrates environmental stewardship.

- Policy 4.1 - Comply with all federal, state, and local regulations in operation and maintenance of the City's wastewater collection and conveyance infrastructure.

- Policy 4.2 - Prevent storm drainage from entering the sanitary sewer system and pursue inflow and infiltration (I/I) reduction for the purposes of eliminating or reducing required capacity upgrades and reducing maintenance costs (to include reducing wear and tear on pump stations) when determined to be cost-effective. (ACC13.20.130).
- Policy 4.3 - In order to protect public health and the environment, require a property owner to promptly repair any private sewer system failure. If the property owner fails to do so, the City will take such action, as it deems necessary, to prevent or rectify an overflow, including but not limited to temporarily suspending occupancy of the premises or repairing the system at the property owner's expense. (ACC 13.20.500 and 13.20.510).
- Policy 4.4 - Support the use of reclaimed water technologies where economically feasible. City staff will evaluate opportunities for reclaimed water use and support initiatives where the benefits outweigh costs.
- Policy 4.5 - Size the sewer collection system for peak wet weather flow rates that include I/I flows. Gravity sewers will be sized to convey the once-per-20-year peak hour flow without surcharging.
- Policy 4.6 - Size pump stations and force mains for peak wet weather flow rates that include I/I flows. Pump stations will be sized to convey the once per 5-year flow with one pump out of service and convey the once per 20-year flow with all pumps in service.
- Policy 4.7 - Maintain, operate, and repair public sewers and portions of private side sewers located within public rights-of-way, except when damage is caused by discharges from private property or trees located on private property. (ACC13.20.120 and 13.20.182).
- Policy 4.8 - Review complaints/citizen reports and claims made against the City for damages caused by sanitary sewers to identify and make improvements as required.
- Policy 4.9 - Communicate proactively with the community and stakeholders regarding wastewater service improvements.
- Policy 4.10 - Investigate all customer service calls within 24 hours and record results in the computerized maintenance management system (CMMS).
- Policy 4.11 - In cooperation with King County, seek to eliminate prohibited discharges to the public sanitary sewer system. (ACC 13.20.140, 13.20.156, 13.20.158, and 13.20.160).
- Policy 4.12 - Require that businesses which may introduce fats, oils, and greases (FOG) into the waste stream have a grease interceptor installed and maintained to minimize FOG discharge to the public sewer system. (ACC 13.22.020).

2.3.5 System Performance and Reliability

Goal 5: Apply asset best management principles to the City's sewer infrastructure.

- Policy 5.1 - Develop and implement system improvements, infrastructure renewal (repair, rehabilitation, or replacement), and M&O programs for the wastewater system according to asset management principles that address the triple bottom line (economic, social, and environmental benefits and costs), minimize asset life-cycle costs, and incorporate risk management into decision making.
- Policy 5.2 - Monitor the frequency and causes of any service disruptions and develop programmatic methods for reducing the number of disruptions.

- Policy 5.3 - Perform condition assessments of critical assets, developing and implementing a condition assessment schedule for all critical assets.
- Policy 5.4 - Assign industry standard design lives for sewage assets. The actual physical assessment will be compared to the theoretical design life to determine the optimal economic life. Seek to repair or replace system assets before they exceed their economic life. The number of high-criticality assets beyond their economic life will be minimized.
- Policy 5.5 - Conduct maintenance activities at a level that is consistent with optimizing system reliability, asset economic life, and system performance.
- Policy 5.6 - Maintain a level of reliability for pump stations provided by redundancy of critical mechanical and electrical components. Provide backup power generators or dual power feeds and provide a minimum of two pumps at each pump station.
- Policy 5.7 - Implement the use of the National Association of Sewer Service Companies (NASSCO) Pipeline Assessment and Certification Program (PACP) for inspection of all pipelines.
- Policy 5.8 - Create, update on a routine basis, and use an emergency response plan for critical facilities.
- Policy 5.9 - When necessary, work on private property on private assets when the private asset is negatively impacting the public system. If the condition requiring such work is the responsibility of the owner, the City shall seek to recover the costs for the work. (ACC 13.20.510).
- Policy 5.10 - Replace or repair private side sewers as part of a City initiated project to reduce I/I of extraneous water into the sanitary sewer system where shown to be cost-effective versus capacity improvements. (ACC13.20.130).
- Policy 5.11 - Monitor the frequency, location, and details of all odor-related complaints. At a minimum, respond, research the cause of, and propose control methods once three complaints per month at a site are documented.
- Policy 5.12 - Take adequate measures to ensure system security. At a minimum, maintain security at pump stations by using the SCADA system (motion detection, intrusion alarms) to alert City personnel when unauthorized access is occurring.
- Policy 5.13 - Take appropriate measures to ensure the redundancy and security of data related to the sewer system, including, but not limited to the supervisory control and data acquisition (SCADA), CMMS, GIS, and closed-circuit television (CCTV) systems as well as permitting and other development records.
- Policy 5.14 - Encourage employee participation in workshops, seminars, and other education programs to improve job skills. The City may pay fees and employees' time for the required certification testing, as well as required annual renewal fees if such certification is a job requirement.

2.3.6 Fiscal Responsibility

Goal 6: Manage the sewer utility funds and resources in a professional manner in compliance with applicable laws, regulations, and City financial policies, which requires ongoing monitoring of revenues and expenses in order to make prudent business decisions and report to City officials, as needed, regarding the status of utility operations.

- Policy 6.1 - Implement an adequate system of internal financial controls and adopt a biennial budget.
- Policy 6.2 - Remain a self-supported enterprise fund; however, grants and other alternative financing may be sought and used.
- Policy 6.3 - Assess appropriate rates and system development charges (SDC) to fund the ongoing maintenance, operation, and capital expenditures of the Utility, in accordance with the Comprehensive Sewer Plan. Periodic cost of service studies shall be completed to reassess the monthly service and SDCs.
- Policy 6.4 - Maintain adequate reserves for operation and maintenance, capital improvement, and Sewer revenue bond obligations in order to ensure that the Utility can provide continuous, reliable service and meet its financial obligations under reasonably anticipated circumstances.
- Policy 6.5 - Establish Sewer rates at a level sufficient to pay expenses and maintain adequate reserves.
- Policy 6.6 - Structure Sewer rates to allocate costs fairly and equitably among different customer classes.
- Policy 6.7 - Charge uniform Sewer rates for all Utility customers of the same class throughout the SSSA.
- Policy 6.8 - Consider providing rate assistance programs for qualified specific low-income seniors or totally or permanently disabled citizens.
- Policy 6.9 - Establish fees and charges to recover utility costs related to development.
- Policy 6.10 - Require new customers to substantially pay for the costs of improvements designed to accommodate growth, while the costs to operate, maintain, repair, replace, and improve the existing system capacity are paid by all sewer system customers.
- Policy 6.11 - Sustain funding for the CIP at a level sufficient to maintain system integrity.
- Policy 6.12 - Reinvest in Utility capital assets in order to ensure that the integrity of the existing Utility plant and equipment is maintained. This reinvestment is generally referred to as repair and replacement (R&R).
- Policy 6.13 - In addition to projects designed to maintain and replace existing facilities, seek to invest annually in system improvements designed specifically to upgrade the system in order to meet State regulations and the City's standards and criteria. These improvements may include upgrades to the sanitary sewer SCADA and data management systems, and upgrades to increase safety for both City personnel and the public, bring noncompliant infrastructure into compliance, and reduce environmental impacts.

- Policy 6.14 - Consider replacing or upsizing sewer facilities in the right-of-way whenever a street is to be substantially reconstructed or other significant utility work is to be completed, especially when sewer improvements are specifically identified in the Comprehensive Sewer Plan. In addition, consider street and other utility improvement needs when replacing or upsizing sewer facilities.
- Policy 6.15 - Consider installing public sewer extensions by the formation of Local Improvement Districts whenever a street is to be substantially reconstructed or a new street built where public sewer does not currently exist.
- Policy 6.16 - Consider investing in sewer extensions and the construction of pump stations based on the following considerations:
  - Cost of the infrastructure.
  - Size of the service area as measured by potential customers or customer equivalents.
  - Potential coordination with other City Capital projects that will decrease the overall cost of the proposed extension.
  - The ability to recoup costs from future customers whose connection was facilitated by the investment.

CHAPTER 3 PLANNING CONSIDERATIONS

This chapter includes information related to the projected future development of the City and the resulting needs for capacity improvements to the wastewater collection and conveyance system. Recent needs for changes to land use planning efforts affecting the City SSSA are also discussed.

3.1 Planning Area

The Comprehensive Sewer Plan Study Area is shown in Figure 1.2. It generally encompasses the area within the incorporated city limits of Auburn with the following exceptions (Shown on Figure 1.2):

- Some areas on the West Hill are within the City but are served by the LWSD.
- Some areas of Lea Hill are within the City but are served by the SCWSD or the City of Kent.
- The City currently conveys flows from areas within Bonney Lake's service area that are adjacent to the southernmost boundary of Auburn's service area and for which Bonney Lake does not yet have adequate infrastructure.
- The City currently serves a small area of the City of Pacific just north of the White River.
- The City currently serves an area of Unincorporated King County just west of the city limits.
- There are several areas within the City which are islands of unincorporated King or Pierce County. These areas are within the City's urban growth area and sewer service area.

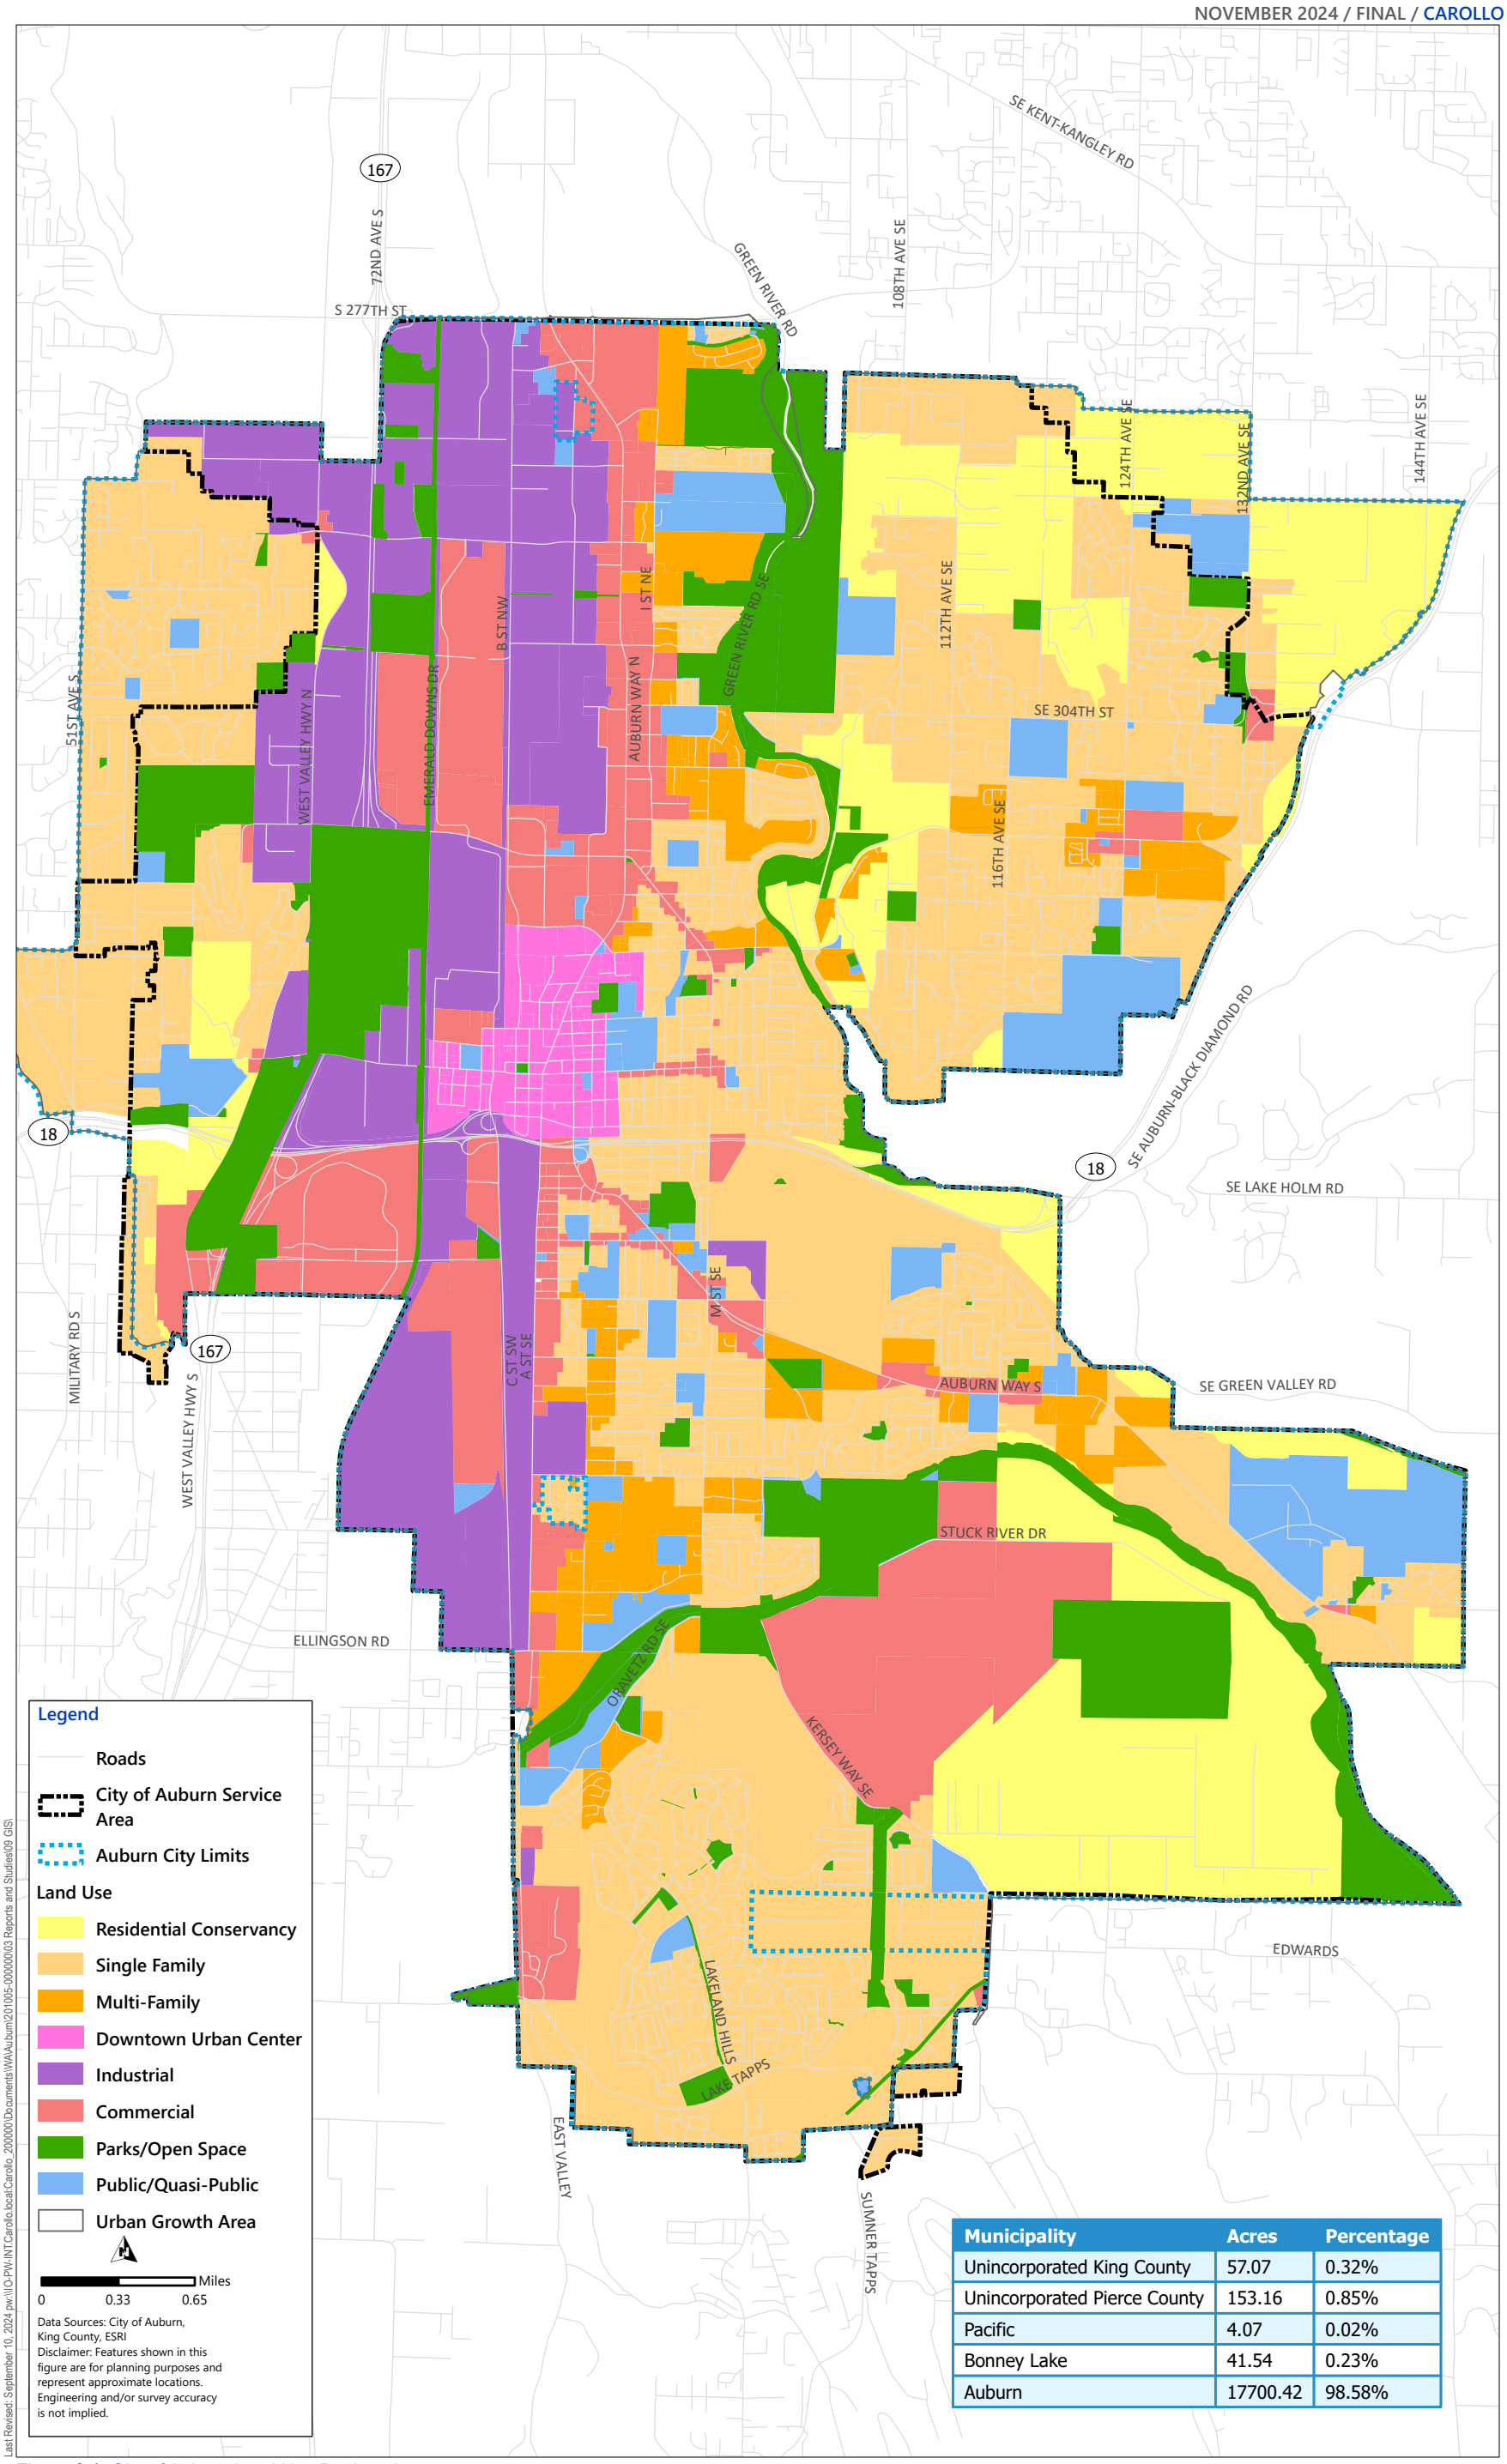
3.2 Basis of Planning

An evaluation was made of the existing system conditions and for the projected flow conditions in 2044.

Hydraulic modeling for the existing flow conditions was developed using measured rainfall, flow data collected from October 2020 to May 2022 and the physical characteristics of the existing collection and conveyance system.

Future flow conditions were projected using estimated growth developed during the current preparation of the City's Comprehensive Plan. Housing Unit and Employment growth projections/goals were distributed to areas of expected growth throughout the City based on the availability, or anticipated availability of necessary infrastructure such as transportation and utilities, as well as the concentration of developable land. The anticipated additional flow from that growth was then incorporated into the hydraulic model to identify areas where increased capacity will be required as that growth occurs.

3.3 Land Use



Land use designations are used to encourage growth in areas where the City's infrastructure, including the sanitary sewer system, is or will be adequate to serve that additional growth. The City currently uses 13 land use designations within four general categories.

Table 3.1 Land Use Categories

General Categories	Designations
Residential	▪ Residential Conservancy ▪ Single Family Residential ▪ Moderate Density Residential ▪ Multiple Family
Commercial	▪ Downtown Urban Center ▪ Neighborhood Commercial ▪ Light Commercial ▪ Heavy Commercial ▪ Mixed Use
Industrial	▪ Light Industrial ▪ Heavy Industrial
Public and Institutional	▪ Open Space ▪ Public/Quasi Public

These designations, along with their accompanying zoning, aim to achieve the growth patterns included in the projections. Any changes to land-use designations during the current planning cycle are expected to support the projected growth, and therefore, expected to maintain the projected wastewater flows.

The current land use designations for the City are shown in Figure 3.1

Municipality	Acres	Percentage
Unincorporated King County	57.07	0.32%
Unincorporated Pierce County	153.16	0.85%
Pacific	4.07	0.02%
Bonney Lake	41.54	0.23%
Auburn	17700.42	98.58%

Figure 3.1 City of Auburn Land Use Designations

3.3.1 Description of Land Use Designations

Below is a description of the characteristics and goals of each of the land use designations. Each of the categories and designations are accompanied by specific policies and associated zoning designed to achieve the described character.

3.3.1.1 Residential

- Residential Conservancy - This designation should consist primarily of low-density residential uses (one dwelling unit per four acres is allowed) and accessory agricultural uses in areas featuring environmental constraints or requiring special protection such as the Coal Creek Springs watershed area, low-lying areas along the Green River, and areas that are isolated from urban services. This designation will serve to both protect environmental features and to hold areas for higher density development until public facilities become available.
- Single Family Residential - This designation is the predominant land-use category in the City. Maintaining and creating a diverse arrangement of interconnected subdivisions, neighborhoods, and communities that have a mix of densities and housing types; linkages with other residential areas and commercial hubs through nonmotorized modes, such as pedestrian and bicycling, and vehicular modes will be encouraged.
- Moderate Density Residential - These designated areas are planned to accommodate a variety of residential dwelling types. Varying densities may be permitted to provide a transition between single-family residential and other more intensive uses or activities (such as arterial streets) based on adjacent density, intensity, and/or character. Appropriate densities in these areas generally range from 7 to 20 dwelling units per acre. Dwelling types generally range from single-family dwelling to multiple-family dwellings, with larger structures allowed (within the density range) where offsetting community benefits can be identified.
- Multiple Family - This category shall be applied to those areas that are either now developed or are reserved for multiple family dwellings. Densities may range from 20 to 24 units per acre. These communities are served by transit, have nonmotorized connections to surrounding amenities and services, or have access to on-site amenities.

3.3.1.2 Commercial

- Downtown Urban Center - This category should be applied exclusively to downtown Auburn. The area should be developed in consistently with and conducive to pedestrian-oriented activities. The ambiance of the downtown area should encourage leisure shopping, provide services to local residents and area employees, and provide amenities that attract regional visitors and shoppers.
- Neighborhood Commercial - Low-intensity, small-scale commercial services that meet the daily needs of and complement the quality of the residential neighborhoods they serve. Commercial uses need to be carefully located, (if located within single-family residential neighborhoods), or should be buffered from single-family residential areas. These areas are characterized by lower traffic, fewer operating hours, smaller-scale buildings, and less signage than light commercial areas.

- Light Commercial - This category represents the prime commercial designation for small- to moderate-scale commercial activities. These commercial areas should be developed in a manner consistent with and attractive to pedestrian-oriented activities. Such areas should encourage walkability, leisure shopping, engaging public space, and should provide other amenities conducive to attracting shoppers.
- Heavy Commercial - This category is intended to accommodate uses that would also facilitate a wide range of heavier commercial uses involving extensive storage or vehicular movement.

3.3.1.3 Industrial

- Light Industrial - This category is intended to accommodate a wide range of industrial and commercial uses. This designation is intended to provide an attractive location for manufacturing, processing and assembling land use activities that contribute to quality surroundings. A wide variety of appropriate commercial uses in this designation benefit from the location, access, physical configuration, and building types of these properties. It is distinguished from heavier industrial uses by means of performance criteria. All significant activities shall take place inside buildings, and the processing or storage of hazardous materials shall be strictly controlled and permitted only as an incidental part of another use.
- Heavy Industrial - This designation allows the full range of industrial uses, as well as certain heavy commercial uses that serve the needs of workers in light industries are also appropriate.

3.3.1.4 Public and Institutional

- Open Space - This category shall be applied to areas that are owned by a public entity and maintained in a largely undeveloped state. It includes parks, watersheds, shoreline areas, significant wildlife habitats, storm drainage ponds, utility corridors with public access, and areas with significant development restrictions.
- Public/Quasi Public - This category covers those areas that are reserved for public or quasi-public uses. It is intended to include those areas of a significant size, and not those smaller public uses that are consistent with and may be included in another designation. These public uses include public schools, developed parks, and uses of quasi-public character such as large churches and private schools. Public uses of an industrial character are included in the industrial designation, and small-scale religious institutions of a residential character are included in the residential designation. Streets, utilities, and other separate uses are not intended to be mapped separately as Public/Quasi-Public.

3.4 Sewer System Flow Components

The City has separate sewer and stormwater collection systems, where only wastewater is conveyed in the sanitary sewer system. However, some groundwater and stormwater inevitably enter the sanitary sewer through defects in pipes and manholes (MH) and illicit storm drain connections. Therefore, sewer flows may vary substantially between dry and wet weather.

The different flow components are described in the section below.

3.4.1 Dry Weather Flow Components

There are two components of dry weather flow:

- Base wastewater flow (BWF).
- Dry weather groundwater infiltration (GWI).

3.4.1.1 Base Wastewater Flow

The BWF is the sanitary flow generated by routine water usage of the City's residential, commercial, and mixed-use customers. The collection system's primary function is conveying this flow. The flow has a diurnal pattern that varies by customer. Typically, a residential diurnal pattern has two peaks with the more pronounced peak following the wake-up hours of the day, and a less pronounced peak occurring in the evening. Commercial and mixed-use patterns, though they vary depending on the type of use, typically have more consistent higher flow patterns during business hours, and lower flows at night. Furthermore, a weekend diurnal flow pattern may vary from the diurnal flow experienced during a typical weekday.

3.4.1.2 Groundwater Infiltration

Dry weather GWI enters the sewer system through defects such as cracks, misaligned joints, MH defects, and broken pipelines. Dry weather GWI only occurs when the relative depth of the groundwater table is higher than the depth of the pipeline and where there is a defect; therefore, it varies throughout the system. Dry weather GWI (or base infiltration) cannot easily be separated from BWF by flow measurement techniques. Therefore, dry weather GWI is typically grouped with BWF.

3.4.1.3 Average Dry Weather Flow

Average dry weather flow (ADWF) is the average flow that occurs on a daily basis during the dry weather season and is representative of routine wastewater discharges into the collection system from customers as well as baseline groundwater infiltration.

3.4.2 Wet Weather Flow Components

Wet weather flow (WWF) includes two components:

- Inflow and Infiltration (I/I).
- Wet weather GWI.

3.4.2.1 Inflow and Infiltration

The stormwater I/I response in the sewer system to rainfall is seen immediately (inflow) or within hours after the storm (infiltration).

Inflow is stormwater that enters the sewer system via a direct connection to the system, such as roof drain and downspout connections, leaky MH covers, and illicit storm drain cross-connections. Infiltration is stormwater that enters the sewer system by percolating through the soil and then through defects in pipelines, MHs, and joints. An adverse effect of I/I entering the sewer system is an increase both the flow

volume and peak flows so that the sewer system could be operating at or above its capacity. If too much I/I enters the sewer system, sanitary sewer overflows (SSO) could occur.

3.4.2.2 Wet Weather Groundwater Infiltration

Wet weather GWI is not specific to a single rainfall event, but rather to the effects on the sewer system over the entire wet weather season. The depth of the groundwater table rising above the pipe invert elevation causes GWI. Sewer pipes within close proximity to a body of water can be greatly influenced by groundwater effects.

Wet weather GWI is associated with extraneous water entering the sewer system through defects in pipes and MHs while the ground is saturated during the wet weather season. Wet weather GWI may occur throughout the year, although rates are typically higher in the late winter and early spring in the Pacific Northwest.

3.4.2.3 Peak Wet Weather Flow

Peak wet weather flow (PWWF) is the highest observed hourly flow that occurs following the selected design storm event. PWWF in a sewer system can be more than ten times the base flow, causing utilities to construct high-capacity infrastructure to convey and treat these flows. For Auburn most of the basins have a peak factor below 5 for the 20-year design storm, with one small basin over 10 as noted in Chapter 5.

3.5 Average Dry Weather Flow

Developing an accurate estimate of the future quantity of wastewater generated at build-out of the collection system is an important step in maintaining and sizing sewer system facilities, for both existing conditions and future scenarios.

Base flow can be estimated for a wastewater system by comparing dry weather flow and wet weather flow at the various flow monitoring locations. To estimate ADWF for more specific areas, such as individual wastewater basins, dry weather flows are typically estimated based on the area contributing to flows and flow coefficients developed for each land use type. This method is developed based on the assumption that areas with similar land uses, such as low-density residential parcels, produce equivalent quantities of wastewater flow. System-wide flows can be compared to measured flows at flow monitor locations. This method of estimating base flows is an industry standard for planning and provides sufficiently accurate data for planning purposes.

3.5.1 Average Dry Weather Flow Development

Existing ADWFs for each basin were estimated using data from the Flow Monitoring Program for each of the flow monitoring basins. ADWF was developed using the driest days from the flow monitoring period based on the following set of minimum criteria:

- Less than 0.1 inch of rain the previous day.
- Less than 0.4 inch of rain in the previous three days.
- Less than 1.0 inch of rain in the previous five days.

- Selected days must exhibit average-day flows within 85 percent to 115 percent of the average-day flows of remaining dry days.
- In addition, those dry days that exhibited unusual flow patterns were not used to generate net dry day flow values for a basin.

Characteristic dry weather 24-hour diurnal flow patterns for each site were developed based on the hourly data. The hourly flow data were also used to calibrate the hydraulic model for the observed dry weather flows during the flow monitoring period. Hourly patterns for weekday and weekend flows vary and were separated to better understand dry weather flow. Additional information on this process is outlined in Appendix D.

3.6 Wet Weather Flow

PWWF in a wastewater collection system are caused by rainfall dependent I/I. Peak hour flows can result in flows more than ten times the base flow, causing utilities to construct high-capacity infrastructure to convey and treat these extraneous flows.

Existing and projected PWWFs are predicted using the hydraulic model and design storm used for this Plan. This analysis uses a 20-year recurrence interval design storm, illustrated in Chapter 5 - Wastewater System Analysis. This storm was identified in the 2012 King County I/I Study and corresponds to the recurrence interval within historical King County rainfall. To represent typical Pacific Northwest winter rainfall conditions, antecedent rainfall was added from historical data. Additionally, climate change risk was evaluated by modifying the design storm to represent possible changes to local rainfall based on the latest available research. Further details on the development of the design storm and climate evaluation can be found in Chapter 5 - Wastewater System Analysis.

CHAPTER 4 DESCRIPTION OF EXISTING SYSTEM

This chapter describes the existing wastewater collection and conveyance system and SSSA. The City provides wastewater collection services to city residences and businesses through multiple facilities including gravity sewers, pump stations, and force mains. The wastewater flow is conveyed to the King County Regional Wastewater System for treatment and disposal. The City's system consists of 17 sewer pump stations, approximately 5,500 MHs, and approximately 210 miles of sewers and force mains. The City's system is intended to collect and convey only sanitary flow, but the flow also includes rainfall-derived I/I. There are no known SSO in the system.

4.1 Overview

For purposes of discussion, the City's wastewater collection system is divided geographically into five major sewer basins. The descriptions of the five major sewer basins (Valley, West Hill, Lea Hill, Auburn Way South, and South Hill) are presented below and shown on Figure 4.1.

4.1.1 Valley Sewer Basin

The Valley Sewer Basin is located on the valley floor and contains the oldest portions of the City's sewer collection system. Four primary King County trunk sewer lines (Stuck River Trunk Sewer, M Street Trunk Sewer, Auburn Interceptor Sewer, and Auburn West Interceptor Sewer) convey flow from south to north along this sewer basin, providing the backbone for service to the City. The Valley Sewer Basin receives flows from the other four sewer basins and conveys these flows to the King County sewer trunk lines. The topography of the valley is very flat with a minor incline, sloping down from the south end of Auburn (elevation 109 feet) to the north end of Auburn (elevation 53 feet). Seven pump stations are located within the Valley Sewer Basin to serve areas which are unable to reach the King County trunk lines by gravity. The City provides service to two small areas of unincorporated King County, located within the sewer basin. The Valley Sewer Basin is bounded by the Lea Hill and Auburn Way South sewer basins to the east, the South Hill Sewer Basin and the Cities of Algona and Pacific to the south, the West Hill Sewer Basin to the west, and the city of Kent to the north.

4.1.2 West Hill Sewer Basin

The West Hill Sewer Basin includes areas located on the West Hill above the valley floor as well as areas of the valley adjacent to the hill. Flows from the West Hill Basin are conveyed to two King County trunk lines—the Auburn West Valley Interceptor and the Auburn Interceptor. Two pump stations serve portions of this basin. The Peasley Ridge Pump Station serves a small area on the westernmost edge of the basin. The Hudson Pump Station serves a flat area on the valley floor in the north end of the basin. The West Hill Sewer Basin is bounded by the Valley Sewer Basin to the east, city of Algona to the south, LWSD to the west, and City of Kent to the north.

The western boundary of the West Hill Sewer Basin, which is also the western boundary of the service area, was established by interlocal agreements with LWSD in 2004, 2005, and 2018 (see Appendix A).

4.1.3 Lea Hill Sewer Basin

The Lea Hill Sewer Basin is the portion of the city located to the east of the Green River. Sewer flows exit this basin into the Valley Sewer Basin by river crossings at the 8th Street Bridge or the Green River Siphon (see Section 4.2.4). Four pump stations serve the Lea Hill Sewer basin. The Rainier Ridge, Verdana, and Promenade Pump Stations are located on the east portion of the Lea Hill Sewer basin and convey sewage to high points on the hill where it can flow via gravity to the river crossings. The Riverside Pump Station serves low areas just east of the Green River and lifts sewage to the gravity sewer main that conveys flows across the 8th Street Bridge. There is a significant unsewered area in the north portion of the Lea Hill Sewer Basin. The area is substantially developed with single-family homes on lots between ¼-acre and 1 acre that use existing on-site septic systems. The northeast area of the sewer basin is served by SCWSD and the City of Kent (see Figure 4.1).

The basin is bounded on the south and west by the Green River. The north and east boundaries of the Lea Hill Sewer Basin were established by a 2001 interlocal agreement with the City of Kent and by a 2006 interlocal agreement with the SCWSD (see Appendix A).

4.1.4 Auburn Way South Sewer Basin

The Auburn Way South Sewer Basin is located east of the Valley Sewer Basin along Auburn Way South on the Enumclaw Plateau. It is geographically bounded by State Route 18 to the north and the White River to the south. The southeast portion of the Auburn Way South Sewer Basin borders the MIT reservation sewer service area. The City and the Muckleshoot Utility District jointly own a major trunk line that discharges to King County's Stuck River Trunk Line and/or the M Street Trunk Line at the northwest edge of the sewer basin.

4.1.5 South Hill Sewer Basin

The South Hill Sewer Basin is bounded by the White River to the north and east, City of Pacific to the west, and City of Sumner and Pierce County to the south. Portions of the Pierce County area lie with the City of Bonney Lake's Sewer Service Area. The western half of the South Hill Sewer Basin has been developed as a residential area. The eastern half (east of Kersey Way) of the sewer basin is currently developed as a low-density residential area and is unsewered. There is a large 300–400-acre gravel pit that is intended to be developed as a residential area within the next several years. Its development will require the installation of a sewer pump station to convey the flow from at least a portion of that project. Three pump stations (Area 19, Terrace View, and North Tapps) serve the southern extent of the sewer basin. All of the flow from the South Hill Sewer Basin is conveyed to King County's Lakeland Hills Pump Station, then pumped to King County's Lakeland Hills Trunk sewer located in the Valley Sewer Basin.

4.2 Sanitary Sewer Facilities

The following sections provide information regarding the City's wastewater facilities. Locations of the pumping facilities, river crossings, King County trunk lines, and other key system elements are shown in Figure 4.2. Ownership of interceptor and collection system pipelines is indicated by line color. Figure 4.2 also shows the City's potable water pumps, wells, and reservoirs. The City draws its potable water from deep aquifer wells located throughout its geographical boundaries. While no sewage treatment facilities are located within the City, portions of the conveyance system are located in the vicinity of some of those wells. Most of the sewer lines are located more than 100 feet from the wellheads as stipulated for new sewer works by Ecology's CSWD (G2-1.5.3), two well sites are close to 100 feet from existing sanitary sewers in the central part of the system. As part of the sewer inspection activities outlined the Chapter 7 CIP, the distance between wellheads and sewers will be definitively measured at these sites. If sanitary sewers are within 100 feet from the wellheads, based on condition and other projects in the vicinity, the sewer distance can be addressed as part of the Sanitary Sewer Repair and Replacement/System Improvements project summarized in Chapter 7, following the outlined priority methodology.

2024 COMPREHENSIVE SEWER PLAN

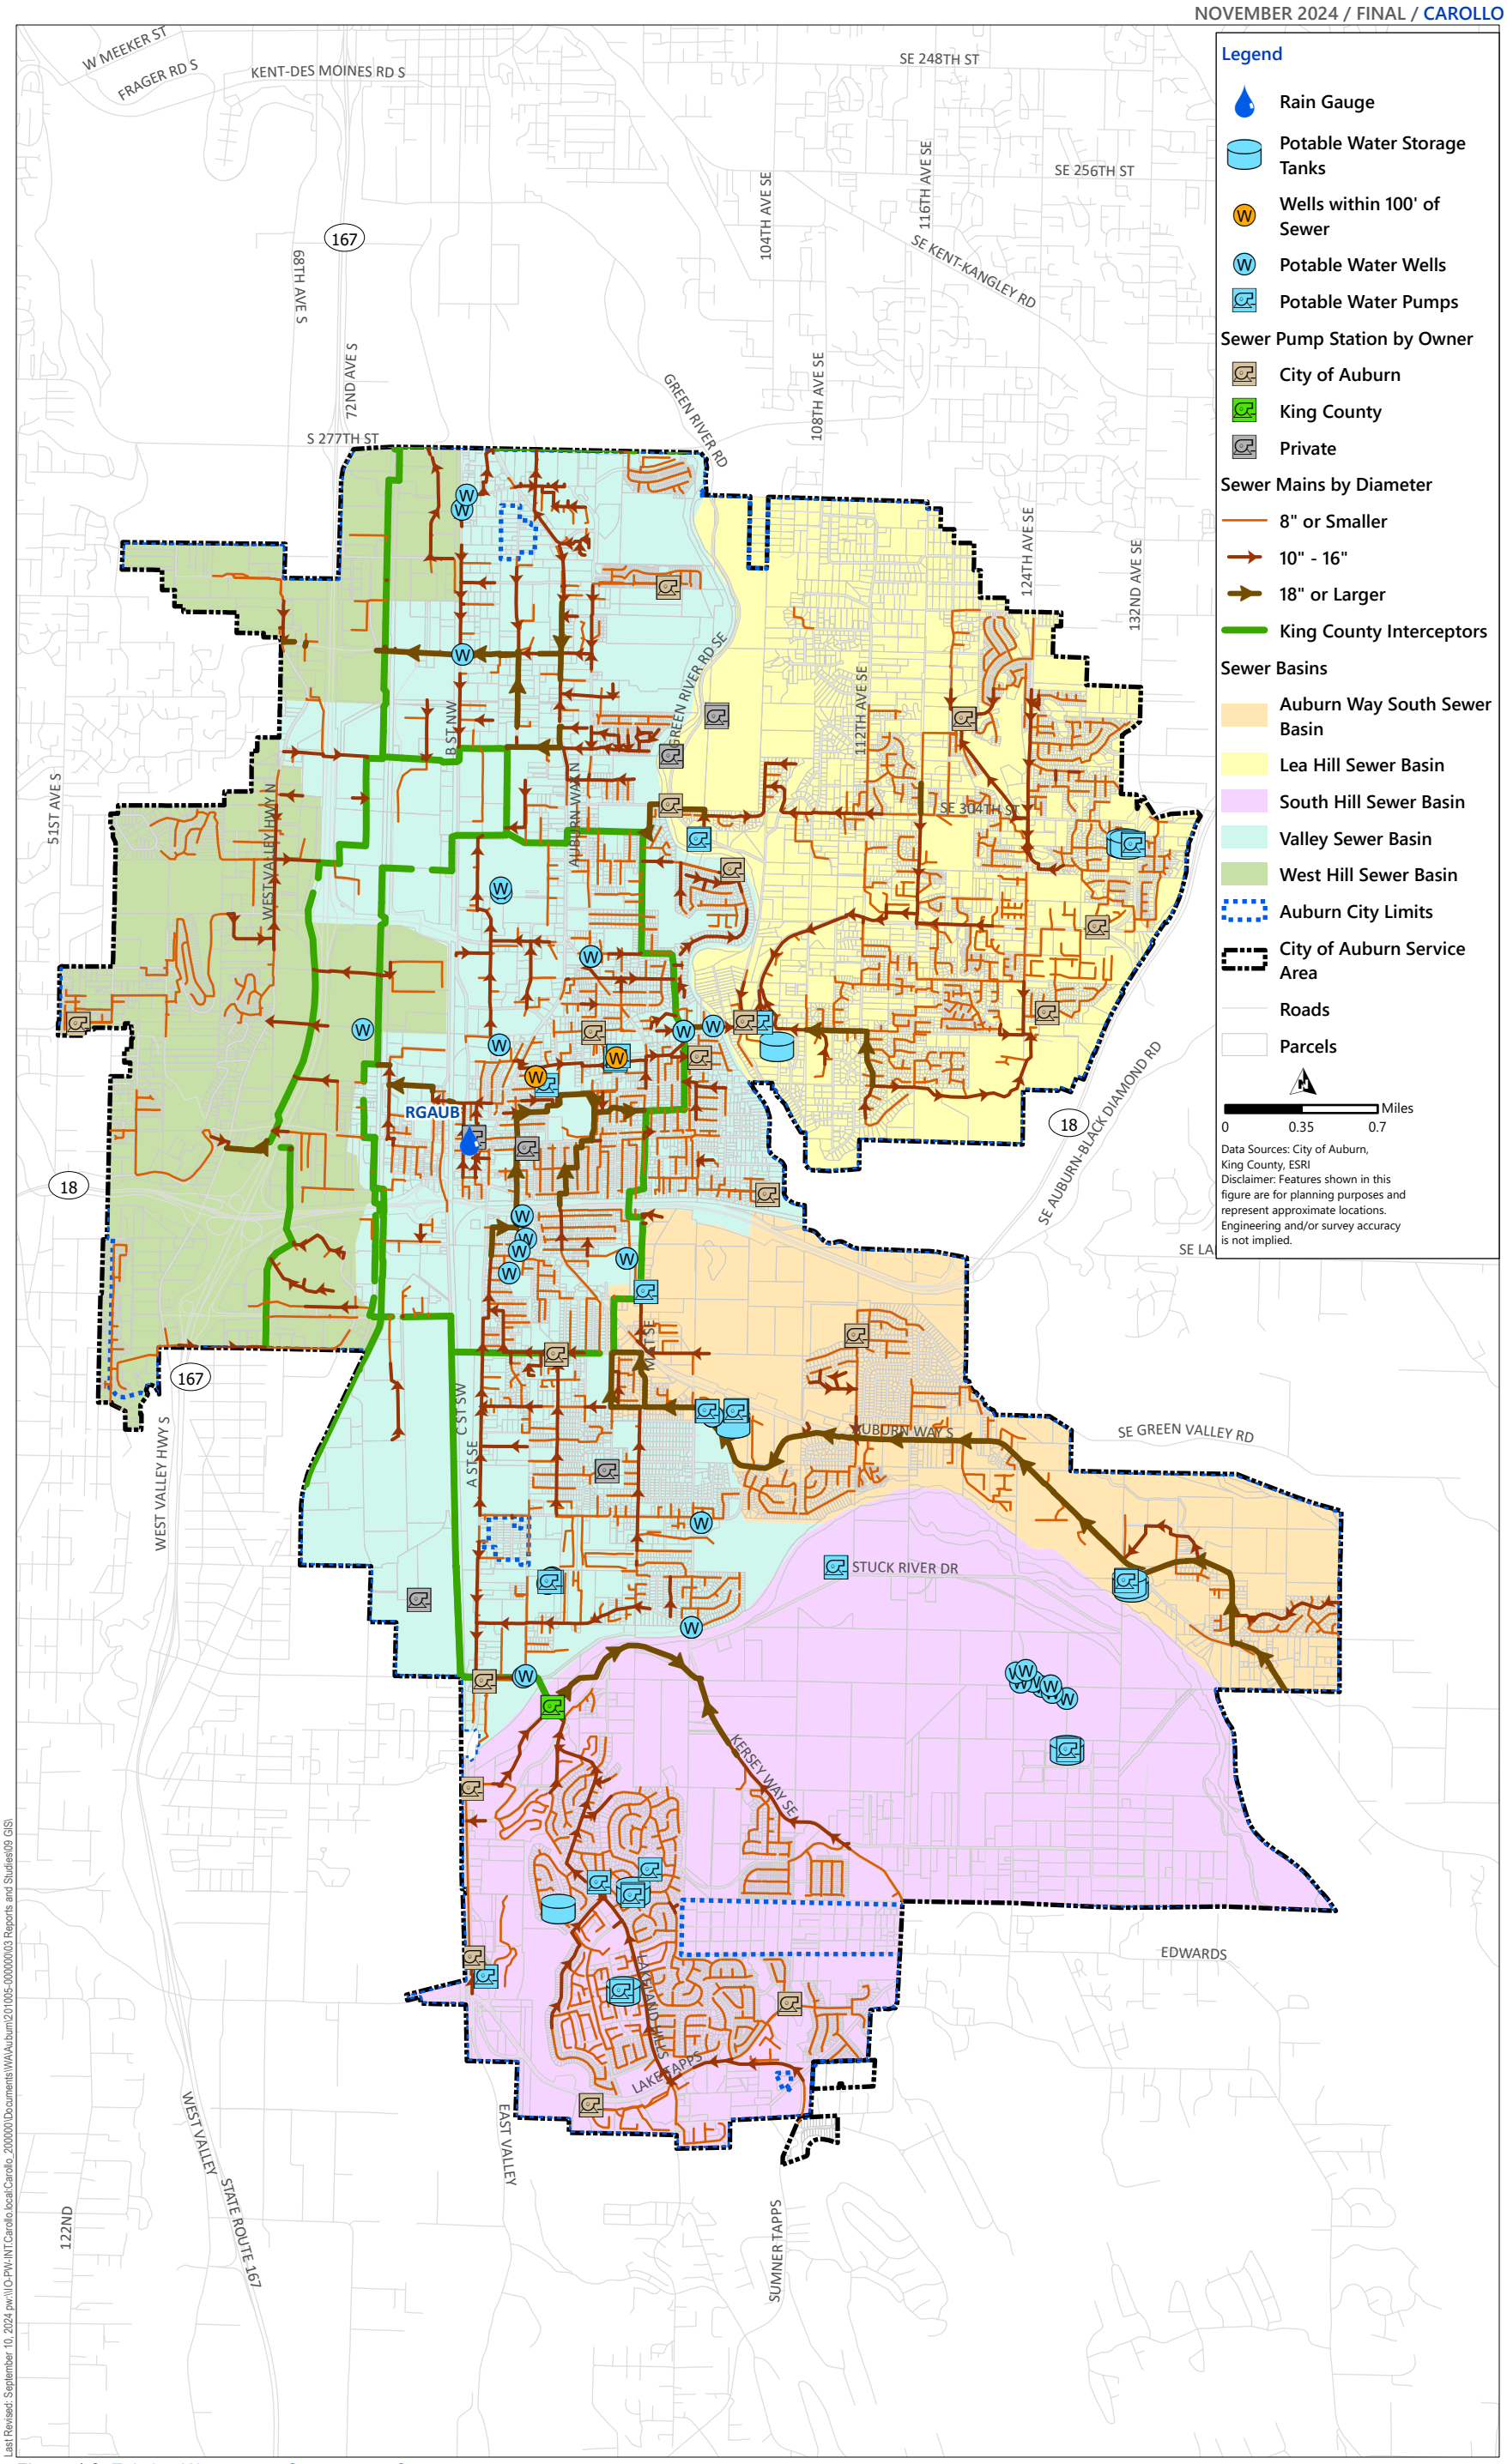

Figure 4.2 Existing Wastewater Conveyance System
CITY OF AUBURN
2024 COMPREHENSIVE SEWER PLAN

4.2.1 Critical Infrastructure

For planning purposes, the City considers all sewer pump stations, force mains, river crossings, and areas downstream of these facilities to be critical infrastructure. The critical infrastructure designation also applies to major trunk lines (pipes greater than or equal to 12 inches in diameter). Also, all gravity sewer lines serving the hospital, city hall, City maintenance facility, Justice Center, and fire stations are considered critical. These critical assets are shown in Figure 4.3.

4.2.2 Pump Stations

Since preparation of the *2016 Comprehensive Sewer Plan*, the City has added two new sewer pump stations associated with new developments, the Hudson, and Promenade Pump Stations.

The City currently has 17 pump stations within its SSSA. The pump stations are listed in Table 4.1 along with their location and year of construction or most recent replacement. More detailed information regarding the pump stations is provided in Appendix E.

Table 4.1 City of Auburn Sewer Pump Station Inventory

Pump Station	Year Constructed/ Replaced	Cross Streets	Approximate Address
South Hill Sewer Basin			
Area 19	2006	Lake Tapps Pkwy. E and west of 72nd St. SE	800 71st Street SE
North Tapps	2007	Lake Tapps Pkwy. SE and west of 176th Ave. E	2610 Lake Tapps Pkwy. SE

Riverside	1981	8th St. NE and 104th Ave. SE	31902 104th Ave. SE
Verdana	2011	118th Ave SE and SE 296th Pl.	11807 SE 296th Place (Kent)

4.2.3 Gravity and Force Main Collection System

The City sewer collection system includes approximately 205 miles of gravity and 5 miles of force main pipe. The collection system is primarily composed of polyvinyl chloride pipe with an 8-inch diameter. Older areas of the collection system consist of concrete or clay pipe, which the City has been replacing with other material when repairs are required or anticipated. The City is continually updating its digital geographic and record-keeping systems to include pipeline information such as material, diameter, installation date, and TV reports. Figure 4.4 provides a visual representation (by overall system percentage) of pipeline characteristics, including unknown and/or unrecorded data. The largest current data gap is the installation date of collection system facilities. The recently formed Public Works GIS group has begun a more detailed inventory and data collection effort that is compiling data from a variety of sources to increase the reliability and usefulness of the system data. As part of the City's asset management efforts, City maintenance staff will verify collection system information during routine inspections.

Additional conveyance facilities, primarily owned by King County, are also located within the Auburn SSSA. King County conveyance facilities are discussed in Section 4.3.

4.2.4 Side Sewer Laterals

Generally, each building has a separate side sewer lateral connecting the building sewer to the public main. The Utility is responsible for the maintenance and repair of the portion of side sewer laterals within the right-of-way.

4.2.5 River Crossings

The City of Auburn collection system contains two crossings of the Green River. The crossings are located at the 8th Street NE bridge and near 26th Street NE, both are shown in Figure 4.2. Detailed descriptions of each river crossing are provided below.

4.2.5.1 Green River Crossing (via 8th Street NE)

The Green River crossing was constructed in 1965. The crossing consisted of a cast-iron pipe mounted on the 8th Street NE bridge. When the bridge was replaced in 1971, that pipe was replaced with a combination of ductile iron pipe and "reinforced plastic mortar pipe cast in concrete." Because the midpoint of the bridge is at a higher elevation than the bank on either side, the pipe does not have a positive downhill slope across the bridge and must rely on upstream pressure developed in the line as it comes down Lea Hill to force the flow across the bridge. The pipe continuing up Lea Hill is approximately 900 linear feet and is constructed of 14-inch-diameter cast-iron pressure pipe. At the bottom of the hill, just upstream of the bridge, a valve chamber once housed a mechanically operated control valve. The valve was originally designed to remain closed until pressure, as caused by the upstream pipe filling, opened the valve, and released the flow across the bridge. Due to significant development on the east side of the river, flow within this sewer segment became sufficiently high to maintain continuous scouring flow along the flatter portion of the pipeline, so the valve has been removed.

4.2.5.2 Green River Crossing (via Inverted Siphon at 26th Street NE)

The inverted siphon across the Green River near 26th Street NE was constructed in 1986 and includes parallel 8- and 12-inch-diameter siphon pipelines. The 8-inch-diameter siphon is typically in use. When increased flows occur, wastewater will be redirected to the 12-inch-diameter siphon. If needed, both siphons are capable of operating together. The siphon facility includes a flushing manhole, located in Isaac Evans Park.

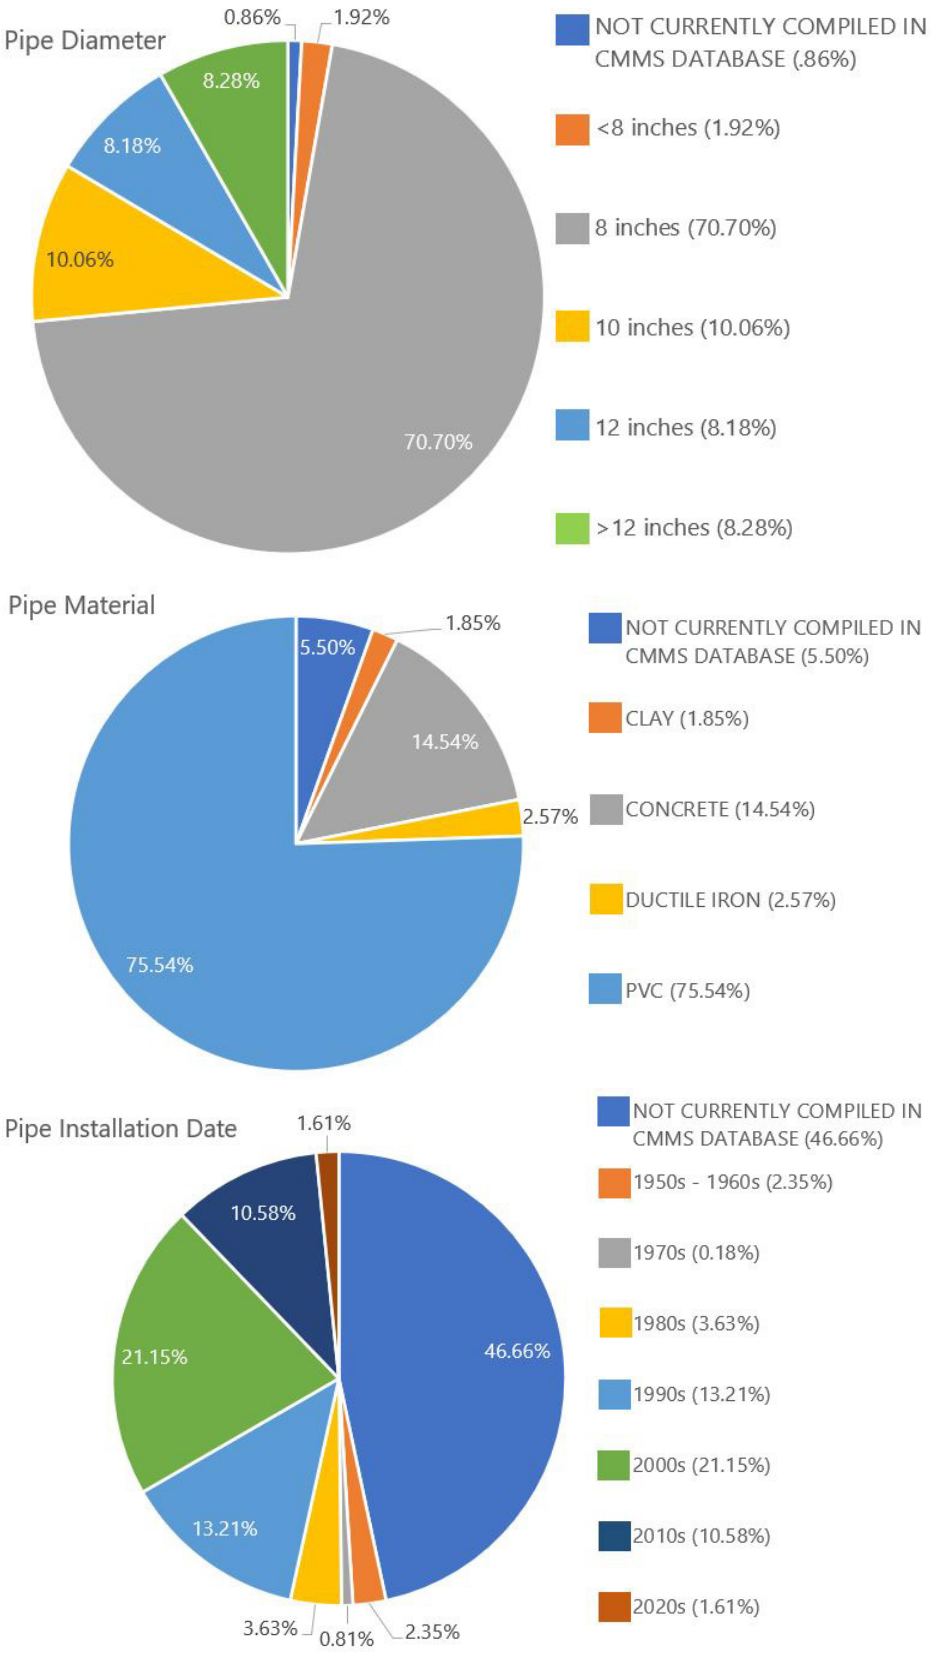

Figure 4.4 City of Auburn Collection System Summary Statistics

4.3 King County Conveyance

The King County wastewater conveyance facilities serving the City include the Auburn Interceptor, Auburn West Valley Interceptor, Auburn West Interceptor, M Street Trunk sewer, the newly constructed Stuck River Trunk sewer, the Lakeland Hills Trunk sewer, and the Lakeland Hills Pump Station. As shown in Figure 4.2, the King County facilities convey wastewater from the south to the north, collecting flow from the Auburn SSSA. The Auburn West Valley Interceptor begins in Algona and flows through the West Hills sewer basin. The Lakeland Hills Trunk sewer and Auburn West Interceptor carry flow from the Lakeland Hills Pump Station north. The M Street Trunk sewer lies mainly on the eastern side of the Valley basin. The Stuck River Trunk sewer extends from the south end of the M Street Trunk sewer in a westerly direction, where it intersects the Lakeland Hills Trunk sewer. All flows are conveyed to the King County South Treatment Plant in Renton, Washington.

King County has initiated a project to replace the Lakeland Hills Pump Station by 2031. The replacement station will serve the same basin as the existing station but will include elements to increase its reliability and maintainability. The capacity of the station will be designed to reflect future growth within its basin.

4.4 Infiltration and Inflow

As part of the analysis of the 2016 Plan, the City used King County Decennial Flow Monitoring (from 2009-2011) and sewer pump station data to identify areas within the service area that may be experiencing high levels of I/I. During this planning period, City staff hired a contractor to install temporary flow meters at specific locations within the potential high I/I areas to locate specific areas of high I/I more precisely. This monitoring corresponded with King County's most recent decennial flow monitoring effort (2020-2022), so that the data from both projects could be shared. The results and conclusions from this effort are included in Chapter 5.

King County, along with the Metropolitan Water Pollution Abatement Advisory Committee (MWPAAC), which is made up of component agencies (Cities and Districts who operate sewer collection systems convey the wastewater to King County for treatment), have worked together since 2000 to measure I/I and have piloted several programs to identify and reduce I/I. Actions included flow monitoring, smoke testing, CCTV inspection, and construction projects designed to reduce I/I to the extent that the required capacity of conveyance and storage facilities could be reduced. While the pilot projects were somewhat successful in reducing I/I, it was not clear that costs of the projects were less than the costs of expanding downstream capacity to convey such flows.

From 2017 until now, King County and MWPAAC have explored concepts to reduce I/I programmatically, focusing on private side sewers and the reduction of I/I over the long term. These efforts included developing or enhancing standards for side sewer construction, encouraging proactive maintenance for side sewers, and identifying and mitigating sources on private property. The strategy with the most potential impact is a proposal to require inspection and repair of side sewers at the point-of-sale of a property. Since this proposal will likely require legislative action and input from a large field of stakeholders, pursuit of that strategy may be included in the upcoming Clean Water Plan planning effort.

4.5 Odor Control and Corrosion

Sewer Policy 5.11 commits the City to monitor frequent odor complaints and to act when three per month are documented. City staff investigate all odor complaints to determine their source, persistence, and potential source if it can be identified. Strategies for mitigating odor include sealing sewer manhole lids, adding bioxide to pump station wet wells to minimize the generation of hydrogen sulfide gas, and filtering wet well ventilation at pump stations. These strategies have been effective, and the City currently has no sites where persistent odor has been detected or reported.

City staff assess corrosion in the system as part of manhole inspections, CCTV inspections of sewer mains, and pump station wet well maintenance activities. The City has not identified any persistent widespread problems with corrosion, but as specific incidents of corrosion are identified those observations are recorded in the City's CMMS. Strategies for managing corrosion include replacing or lining (using Cured-in-Place Pipe) sewer mains, replacing corroded manhole rings and covers, and coating concrete pump station wet wells.

4.6 Industrial Waste Discharges

As part of its conveyance service, the City accepts industrial waste from permitted industrial waste dischargers. King County staff manage the industrial waste program, including permitting, inspection, record-keeping, and enforcement. While that responsibility lies mainly with County staff, City staff help to proactively identify potential dischargers as part of the business license review process. Table 4.2 below identifies the current industrial waste dischargers within the City SSSA. For updated Industrial Waste Discharge Permit information, contact King County's Industrial Waste Program by phone (206.477.5300) or E-mail (Info.KCIW@kingcounty.gov).

King County Industrial Waste staff have indicated that the overall volume of industrial waste flows has generally been consistent and primarily concentrated during working hours during weekdays. While the City does not limit or prescribe the number or types of industrial businesses in the City, it is assumed that collectively, the amount and quality of future industrial wastewater flows from those businesses will be similar to existing flows.

City Engineering staff manage commercial restaurant dischargers in accordance with ACC Chapter 13.22. Maintenance activities related to commercial pretreatment facilities, specifically the City's FOG Reduction Program, are discussed in Chapter 6, Section 6.3.

4.7 Water Reclamation and Reuse

Reclaimed water is wastewater that has been treated to a level at which it can be used safely and effectively for beneficial, non-drinking water purposes. The City does not currently use reclaimed water because there are no nearby sources or transmission pipelines for reclaimed water. While immediate opportunities are not available, the City is in favor of the concept of water reuse, and as technology, economics, and/or the development of infrastructure makes such use feasible, the City would encourage its use. The City participates in the King County reclaimed water program, which completed a Reclaimed Water Comprehensive Plan in 2012, and includes a completed King County Water Reclamation Evaluation Checklist, a copy of which is included as Appendix G, as part of the Water System Plan (WSP).

This section summarizes the regulatory framework surrounding the generation and use of reclaimed water, potential reclaimed water sources and users, and City planning for near-term reclaimed water use within the City SSSA.

4.7.1 Regulatory Framework

The state has identified reclaimed water as an important water resource management strategy that offers benefits related to potable water supply, wastewater management, and environmental enhancement. State law supports the beneficial reuse of reclaimed water for consumptive applications (such as irrigation, commercial and industrial process use, etc.) and non-consumptive purposes (including groundwater recharge via surface percolation or direct injection, wetland enhancement, and stream flow augmentation).

DOH and Ecology have developed standards that guide the planning and development of reclaimed water projects and systems. These standards, summarized in the jointly published *Water Reclamation and Reuse Standards* (September 1997), describe the allowable beneficial uses of reclaimed water and the required levels of treatment appropriate for each use. The Standards establish four classes of reclaimed water; A, B, C, and D. Class A reclaimed water represents the highest level of treatment, referring to water that is oxidized, coagulated, filtered, and disinfected to certain standards. Of all levels of reclaimed water, Class A is acceptable for the widest range of uses. Additional clarification and guidance related to the design of reclaimed water facilities are provided in Ecology's Criteria for Sewage Works Design (Ecology, 2008).

Ecology prepared draft reclaimed water regulations (WAC 173-219) to further define and provide guidance for reclaimed water facilities and uses. The rule-making process began with legislation in 2006 that amended the Reclaimed Water Use Act, Revised Code of Washington (RCW) Chapter 90.46, and directed Ecology to coordinate with DOH, form a stakeholder Rule Advisory Committee, and adopt a comprehensive rule for reclaimed water use by December 2010. The overall goal was to develop a Reclaimed Water Program through rules, guidance, and statutes that runs smoothly and consistently while protecting public health and the environment. Several drafts of the proposed rule were made available for review by stakeholders, and significant comments were submitted, but the rule-making process was suspended by executive order before it could be completed. Ecology reactivated the rulemaking process in June 2014. The revised reclaimed water rule was incorporated into WAC 173-219 in 2018.

4.7.2 Potential Reclaimed Water Sources

This section identifies potential sources of reclaimed water in the vicinity of the City SSSA.

Receiving water from any of the existing treatment plants would involve the construction of long (7-15 mile) pipelines since none of them are located in or immediately adjacent to Auburn. Also, since reclaimed water cannot be mixed with potable water, all of the options listed below would also require the installation of a separate reclaimed water distribution system to convey that water directly to potential users.

4.7.2.1 King County

City of Auburn wastewater is treated at King County's South Treatment Plant, located in Renton, approximately 13 miles north of Auburn. Although South Plant does generate reclaimed water for onsite uses, nearby irrigation, and habitat restoration, there are no existing or planned transmission lines south to the City of Auburn. The status of current King County reclaimed water comprehensive planning is discussed in Section 4.6.3.

4.7.2.2 City of Sumner

The City of Sumner wastewater treatment plant is located approximately 8 miles south of the city of Auburn. Sumner does not currently produce reclaimed water for offsite uses, but the City will continue to monitor Sumner's plans for reclaimed water use to determine if transmission of reclaimed water from Sumner to the City is feasible and cost-effective for potential users within the City SSSA.

4.7.2.3 Lakehaven Water and Sewer District

LWSD owns and operates two wastewater treatment plants, the Lakota and Redondo facilities, located approximately seven miles to the west and northwest of the City. LWSD does not currently produce reclaimed water but has evaluated the feasibility of producing reclaimed water for landscape irrigation and groundwater recharge. Because the Redondo facility site is limited with respect to expansion area, reclaimed water improvements, if implemented, would likely occur at the Lakota facility. The City will continue to monitor LWSD planning efforts with respect to reclaimed water production and reuse.

4.7.2.4 City of Auburn

Although the City does not operate a centralized wastewater treatment plant, a smaller, satellite reclaimed water production facility could feasibly be installed at one of the City's pump stations. A satellite facility could be used to capture wastewater flows from a specific basin, and then generate reclaimed water for uses nearby. While a range of treatment approaches may be employed at a satellite facility, many utilities are implementing membrane bioreactor (MBR) technology in these types of applications, because of the small footprint required relative to other, more conventional forms of wastewater treatment. Solids generated at the satellite facility would be returned to the collection system and conveyed to King County's South Treatment Plant. While currently, the capital investment for such a facility is prohibitive as technology and cost effectiveness improves, such a facility would be considered.

4.7.3 Potential Reclaimed Water Users

Starting in 2009, King County began development of a Reclaimed Water Comprehensive Plan to evaluate expansion of its existing reclaimed water program over a 30-year period. The City of Auburn supported the County's planning process by providing non-potable water use data by specific parcel. City staff and elected officials also participated in reclaimed water workshops held at key points in the County planning process. Although the Reclaimed Water Comprehensive Plan was not completed, some of the concepts evaluated during that process will inform the development of a plan for reclaimed water as part of King County's Clean Water Plan. The most likely reclaimed water customers would be in the irrigation class, as noted in the WSP.

4.7.4 Reclaimed Water Summary

The City of Auburn is not planning any specific capital improvements related to producing and/or conveying reclaimed water for the following reasons:

- King County and other nearby treatment plant sources of reclaimed water are unlikely to be developed for use within the City SSSA in the near term.
- The City currently has adequate water supply in the near term and the need for offsetting potable water demands is low at this time.
- The capital costs related to design, construction, and permitting of a reclaimed water production facility are large relative to the benefit at this time.

The City acknowledges the value that a reclaimed water program might offer in the future, especially if a nearby reclaimed water source with associated conveyance piping is extended to the City's SSSA. The City will continue to monitor reclaimed water planning by nearby purveyors, the adequacy of the City's water rights to meet current and future potable water demand, and the industrial user base, or other significant user to evaluate whether reclaimed water is a feasible and economically viable alternative. City staff will also continue to participate in King County's Clean Water Plan to promote the City's interests in County policies, criteria, and implementation strategies.

CHAPTER 5 WASTEWATER SYSTEM ANALYSIS

5.1 Introduction

The City customer base continues to increase through system growth by development, redevelopment, and connection of on-site system properties that were not previously connected to the system. With the additional customers served, some of the City's sewer infrastructure may reach its conveyance capacity. This chapter presents an evaluation of the available capacity of the existing system to convey current and future projected sewer flows and develops appropriate CIP to address any deficiencies. Using the City's updated and re-calibrated collection system hydraulic model, major pipes and lift stations in the collection system were evaluated using the established capacity criteria. The modeled collection system consists primarily of large gravity sewers which represents a skeletonized version that includes all key components of the system. The modeling focused on the key conveyance infrastructure, neglecting smaller collector pipes which generally have adequate capacity to convey the flow. This approach reduces the modeling computational effort, while providing necessary conveyance information. Additional details on the hydraulic model update and calibration can be found in Technical Memorandum (TM) 1 - Model Calibration Report (Appendix D).

The collection system was evaluated for two planning scenarios:

- Existing - Based on 2020-2021 flow monitor data.
- Future year 2044 - Based on traffic area zone (TAZ) projected population and employment developed from Puget Sound Regional Council projections by Leland Consulting Group.[1][2]

This chapter presents potential deficiencies under both existing and future conditions and includes an I/I analysis.

5.2 Design and Performance Criteria

Defining performance criteria and key conveyance events is a critical step in the master planning process because it sets evaluation metrics for the collection system infrastructure's ability to meet service goals set by the City. It is important to differentiate performance criteria from design criteria when judging the performance of collection system infrastructure:

- Design criteria establish the standards for designing and constructing new sewers and lift stations.
- Performance criteria establish the standards that are used to analyze adequacy of existing facilities and to trigger infrastructure improvements meeting design criteria.

The collection system's function is to convey sanitary flows from residential and commercial customers to King County's trunk system that takes flows to the King County South Treatment Plant. However, additional wet weather flow from rain and groundwater sources may enter the system that also need to

[1] Auburn Comprehensive Plan: Industry Composition, Location, and Work from Home Memo | Draft, 10/6/2023, Leland Consulting Group.
[2] Auburn Comprehensive Plan: TAZ Allocations under No Action and Preferred Land Use Scenarios | Draft, 10/6/2023, Leland Consulting Group.

be conveyed. Wet weather flows vary with storm size, intensity, and timing. For planning purposes, a design storm is simulated in the hydraulic model, which is used as the evaluation point for the modeled infrastructure. The following sections describe the City's established design criteria and performance criteria used in this analysis.

5.2.1 Design Storm

Design storms are simulated rainfall events used to analyze the performance of a collection system under peak flows and have a specific recurrence interval and rainfall duration. The National Oceanic and Atmospheric Administration publishes isopluvial (rainfall contour) maps that can be used to approximate the total rainfall depth for a range of design storms. Additionally, an appropriate hydrograph for the storm is required to distribute the rain through the design period. Finally antecedent conditions should be considered, as Pacific Northwest storms tend to span multiple days which can lead to saturated ground conditions increasing runoff. The best approach to address hydrograph and antecedent conditions is to base analysis on a historical precedent. The City has selected a weather event from 1996 with a recurrence interval of 20 years for the design storm based on an analysis done for the 2016 Comprehensive Sewer Plan. At that time, a long-term simulation was done with rainfall data from January 1, 1949 through December 31,2012 to identify 20-year peak flow frequency. The third largest event appeared to have a 25-year recurrence and fourth largest appeared to have an 18-year recurrence, with both events producing similar peak RDII flows of 27.19 mgd and 27.03 mgd, respectively. Therefore, the third largest event that occurred on February 5, 1996 was selected to represent the 20-year design storm.

Figure 5.1 shows the historical design storm used for the capacity analysis. A period of rain events occurred over five days. The storm peak lasts 24 hours at the end of the event, with a peak rainfall intensity of 0.29 inches per hour and a 24-hour volume of 2.39 inches.

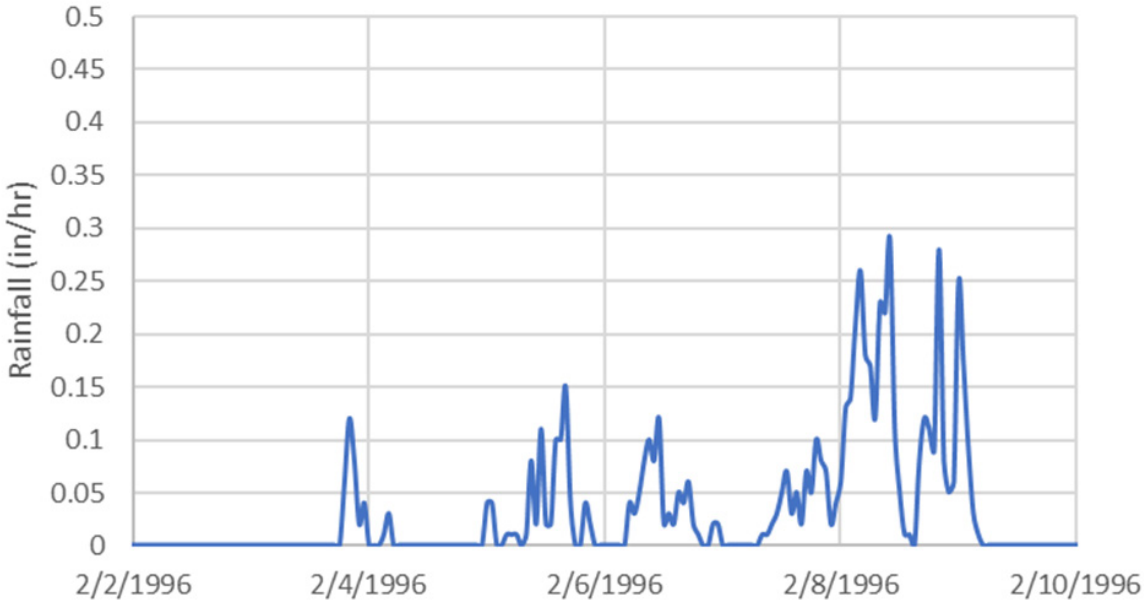

Figure 5.1 20 Year Design Storm

5.2.2 Climate Risk

As described in the previous section, the performance criteria for this master planning effort are evaluated using historical events and by performing statistical analysis to determine the likelihood of recurrence. This is standard practice but does not incorporate expected local and regional climate changes in the future. Over the coming decades, it is expected that the Pacific Northwest will see extreme precipitation events with increasing frequency.

To help plan for this future, this master planning effort evaluated regionally-downscaled climate model results from the University of Washington Climate Impacts Group (CIG). CIG has statistically downscaled an ensemble of global climate models to a 12-km grid and provides expected increases in 1-hour and 24-hour precipitation for various recurrence intervals. These values were used to determine the expected percent change for the 20-year design storm characteristics (peak rainfall intensity of 0.29 inches per hour and a 24-hour volume of 2.39 inches) for the future year being evaluated (2044) as well as the end of the century. Since CIG averages model results over a 30-year period, 2044 is represented by the 2030 - 2059 model ensemble results and the end of the century is represented by 2070 - 2099. Table 5.1 and 5.2 show the ensemble average, maximum and minimum results for both time periods.

Table 5.1 Summary of Potential Future Characteristics for the Design Storm, 2030 - 2059

Parameter	Ensemble Average	Ensemble Maximum	Ensemble Minimum
Peak Intensity (inches per hour)	0.36 (+24%)	0.46 (+58%)	0.26 (-10%)
24-hr Volume (inches)	3.85 (+17%)	5.07 (+54%)	2.89 (-12%)

Table 5.2 Summary of Potential Future Characteristics for the Design Storm, 2079 - 2099

Parameter	Ensemble Average	Ensemble Maximum	Ensemble Minimum
Peak Intensity (inches per hour)	0.42 (+45%)	0.59 (+103%)	0.30 (+2%)
24-hr Volume (inches)	4.24 (+29%)	5.76 (+75%)	3.39 (3%)

These results were used in the existing models to analyze the adequacy of existing facilities and can be used to set future design criteria. Climate change modeling will continue to advance, with new techniques and improved computer processing allowing for more robust projections in the future. In 2021, the Intergovernmental Panel on Climate Change released the most recent major update to the global Coupled Model Intercomparison Project. CIG is currently working to downscale results from those models and compare them to the previous generation used in this study. Following CIG's work, it is recommended that the City review those results to determine if further changes to future design criteria are required.

5.2.3 Conveyance System

It is common practice to use a diameter-based flow depth criteria for pipes both when evaluating exiting sewers and designing new sewers. The depth/diameter (d/D) ratio is defined as the depth (d) of flow in a pipe divided by the pipe's diameter (D). For the conveyance system, the design criteria and performance criteria are outlined below and shown in Figure 5.2:

- Performance Criteria: During PWWF for the design storm, water levels should not surcharge pipes (maximum d/D of 1.0). Pipes that surcharged and exceeded a d/D of 1 and were less than 6 feet from the ground surface in manholes were considered deficient. In Figure 5.2, the hydraulic grade line (HGL) is surcharged and therefore would be considered deficient.

- Design Criteria: Sewers shall be designed to not surcharge or flow at a maximum d/D of 1.0 at peak flow rates for both existing and build-out conditions.

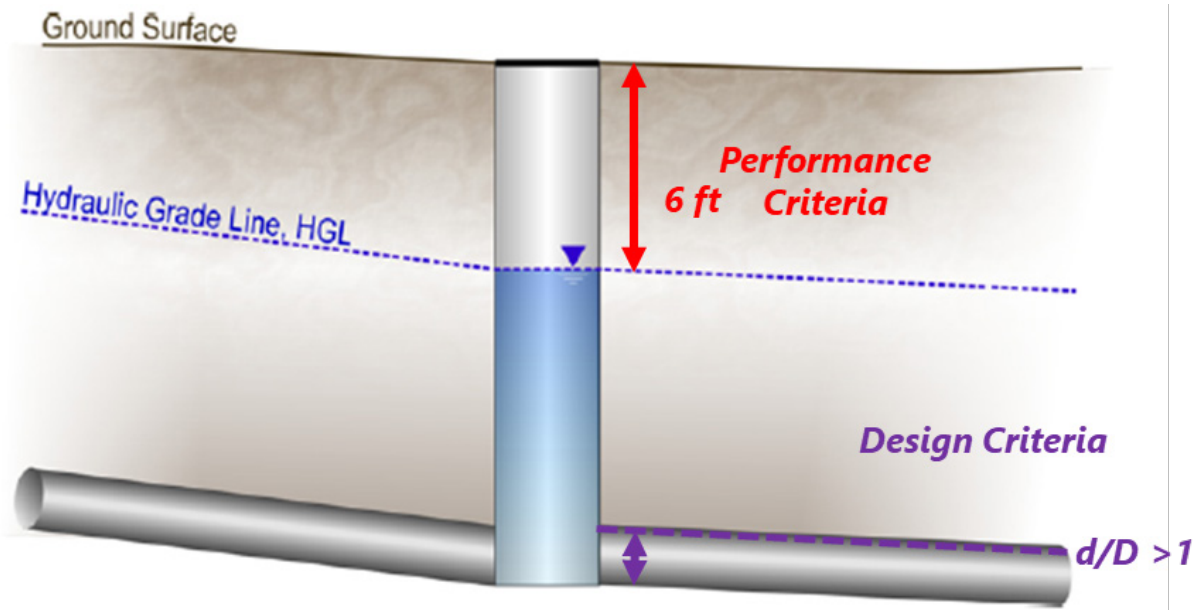

Figure 5.2 Design and Performance HGL Criteria

5.2.4 Lift Stations and Force Mains

Any new lift station recommendations will need to follow Washington State Department of Ecology's Criteria for Sewage Works Design (Orange Book) recommendations for lift stations and force main construction to meet Ecology requirements. Ecology's requirements are outlined below:

- The firm capacity of a pumping station shall be equal to or greater than the peak hourly design flow. Because mechanical and electrical equipment is typically designed for a 20-year life, it is recommended that the peak design flow be based on a 20-year forecast or greater.
- The number of pumps selected shall allow the station to provide the peak design flow with the largest pump out of service.
- The station shall be designed to remain fully operational during the 100-year event.
- Pumps should be designed for pumping sewage and capable of passing solids at least 3 inches in diameter. Pump suction and discharge should be 4 inches or greater.

The City's performance criteria requirements for existing lift stations include firm capacity (i.e., capacity with largest pump out of service) and force main velocities. According to Washington's Orange Book, firm lift capacity shall be provided to manage the design storm peak hour flow, also known as the PWWF, from the lift station's tributary area with the largest pump out of service. Therefore, the City's lift stations should have sufficient firm capacity to pump the PWWF during the design storm.

The evaluation of existing force mains is based on recommendations in the Orange Book for a maximum pipe velocity of 8 feet per second or less during the PWWF for the design storm. The design of new force mains should keep the minimum velocity above 2 feet per second to minimize solids settling.

5.3 Future Conditions Flow Projection

The 2044 scenario flow projection was based on the existing condition flows developed in Appendix D, TM 1 - Model Calibration Report Section 1.6.

5.3.1 Future Conditions Average Dry Weather Flow Development

TAZ blocks provided estimates of existing (2021) and future (2044) units of employment, single family, multi family, housing units, and population. These TAZ blocks were spatially joined to the modeled catchment layer to determine the units in the City's collection system. Figure 5.3 outlines the TAZ blocks within the City's service area.

Table 5.3 outlines the TAZ unit type for 2021 and 2044. The unit type increase was used to calculate a scaling factor, or the unit of increase between the 2021 and 2044 units. The scaling factor was used to project the future ADWF for every catchment in the collection system. The project sanitary flow summary by TAZ type are shown in Table 5.3.

Table 5.3 Flow Projections Summary

TAZ Type	2021 Total Units	2044 Total Units	Scaling Factor	2021 Sanitary Flow (mgd)	2044 Sanitary Flow (mgd)
Single Family	14,841	21,631	1.46	3.03	4.50
Multi-Family	16,985	20,578	1.21	0.90	1.16
Employment	47,738	65,674	1.38	4.49	6.25
Housing Unit	31,457	42,219	-	-	-
Population	86,149	114,056	-	-	-
Total	-	-	-	8.45	11.92

Notes:
mgd - million gallons per day.

5.3.2 Future Conditions Wet Weather Flow Assumptions

Figure 5.4 identifies the portion of the collection system that is currently developed with available sewer in yellow, the portion that likely will not be developed is in red, and the orange section identifies areas that can be developed or are not currently connected to a sewer. The areas shown that likely cannot be developed are due to steep slopes greater than 40 percent grade or large wetlands occupying a large portion of the area. There are likely smaller areas within the system that similarly cannot be developed, but are not easily captured in the larger planning effort. It was assumed that all developable parcels would be developed and connected for the 2044 scenario in the model including those with on-site systems, contributing a WWF I/I component from the contributing area. It was assumed that the I/I of future sewered areas would be 1,500 gallons per acre per day (gpad) during the design storm. This I/I rate is slightly higher than the King County target value of 1,100 gpad, providing a level of conservatism in projecting future peak flows, and closer to the actual level of I/I into the system. The hydrologic model components Model A and rainfall derived infiltration (RDI) were set at 0.65 percent and 2.58 percent respectively, to represent such an I/I rate. Figure 5.5 below shows a detailed map of the City's existing and future sewer system, including future pump stations and mains.

5.4 Gravity Collection System Deficiencies

A capacity analysis of the modeled collection system was performed using the City's calibrated hydraulic model, the design storm, and referring to the above outlined evaluation criteria in Section 5.2. The capacity analysis entailed identifying areas in the sewer system where the performance criteria or the capacity of lift stations was exceeded.

5.4.1 Key Causes of Deficiencies

The calibrated hydraulic model was run with the design storm to determine areas that may be triggering potential capacity deficiencies based on the system performance criteria. The key causes triggering deficiencies in the City's collection system included:

- Adverse slopes and misaligned inverts.
- Pipe restrictions (a single or few smaller diameter pipes between larger diameter pipes).
- Pipe diameter too small or at too flat a slope to convey the PWWF.

5.4.2 Existing System Potential Deficiencies

For the existing planning scenario, the current PWWF was routed through the hydraulic model. The peak HGL in manholes and gravity pipelines were compared to the established performance criteria. In general, the modeled collection system has sufficient capacity to convey existing flows during the design storm. The existing deficiencies are relatively minor; their locations are shown on Figure 5.6 in red and yellow. Figure 5.7 also identifies shallow manholes (manholes with a depth less than 6 feet). A total of 7,428 feet of pipe is surcharged, 1 manhole (MH) may flood, and 47 MHs are within 6 feet of the rim during the design storm.

5.4.3 2044 Potential System Deficiencies

For the 2044 planning scenario, additional contributing areas, and additional dry weather flow (DWF) were added to the model based on the projected growth identified in Section 5.3. In general, system HGL increases with additional flows. A total of 16,842 feet of piping may surcharge during PWWF, 3 MH are potentially flooding and 64 MHs are within 6 feet of the rim. The 2044 deficiencies are identified in red and yellow on Figure 5.7. The 2044 deficiencies with the climate change design storm are shown in red and yellow on Figure 5.8. The climate change design storm leads to 29,538 feet of surcharging pipe, 6 MH potentially flooding and 76 MHs within 6 feet of the rim.

CITY OF AUBURN
2024 COMPREHENSIVE SEWER PLAN

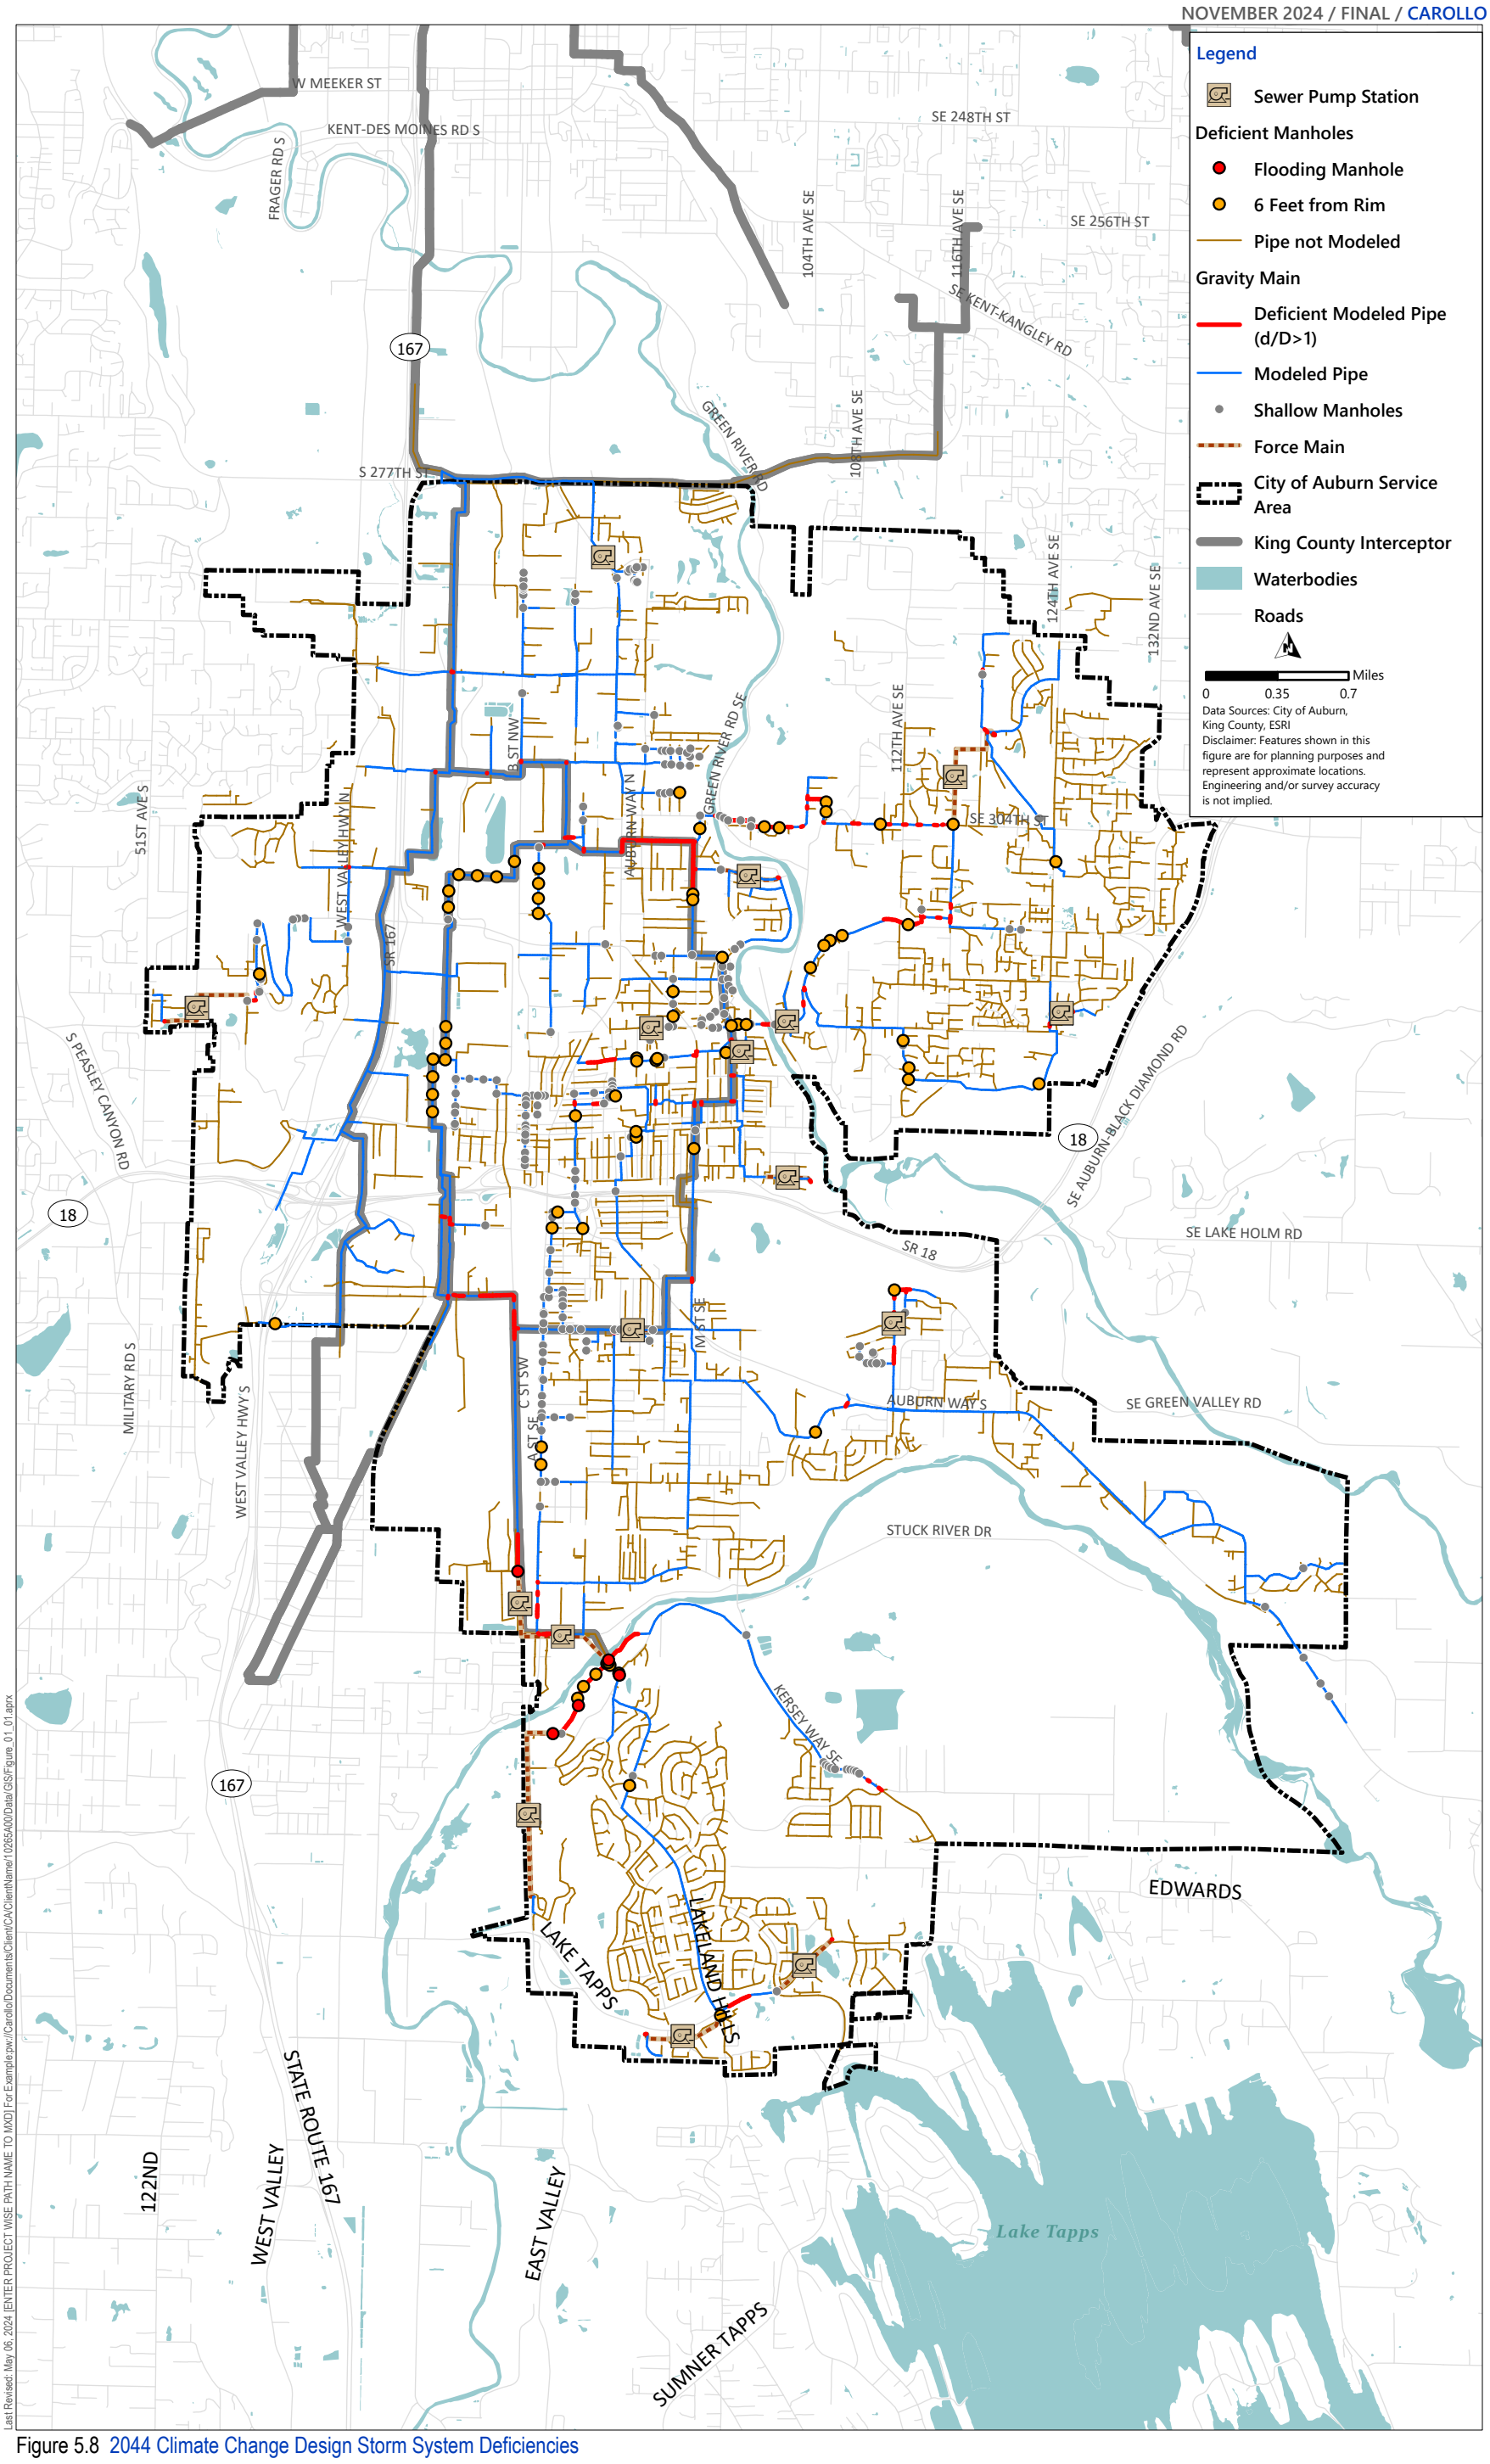

Figure 5.8 2044 Climate Change Design Storm System Deficiencies

5.5 Lift Station and Force Main Evaluation

Ensuring lift stations have adequate capacity to convey PWWFs is important for preventing sewage overflows at or near lift stations. In accordance with the established performance criteria, the City's existing modeled lift stations were evaluated to determine if each one has the available capacity to convey existing and future PWWFs with the largest pump out of service (i.e., its firm capacity). If a lift station has inadequate capacity to pump the PWWFs, the water level in the wet well may rise to the overflow point, spilling sewage.

The City's hydraulic model includes 14 of the 17 City owned lift stations located in the collection system. The estimated current and future PWWFs were compared to the 14 lift stations' firm capacities. Lift stations with an influent PWWF above the existing firm capacity were flagged as deficient. Table 5.4 summarizes the results of the lift station evaluation. Rainier Ridge and Dogwood are shown as deficient under 2044 PWWFs.

Table 5.4 Lift Station Analysis

Lift Station	Number of Pumps	Total Capacity(1) (gpm)	Firm Capacity(1) (gpm)	Existing PWWF (gpm)	2044 PWWF (gpm)
Area 19	2	650	325	120	124
Terrace View	2	1,350	675	114	282
Ellingson Road	2	3,054	1,527	1,355	1,456
Auburn 40	2	880	440	---(2)	---(2)
F Street	2	800	400	265	370
Riverside	2	800	400	126	198
R Street	2	200	100	50	58
Peasley Ridge	2	550	275	47	115
Rainier Ridge	2	400	200	184	**366**
Valley Meadows	2	250	125	20	66
22nd Street	2	1,100	550	90	109
8th Street	2	300	150	94	106
North Tapps	2	1020	510	24	28
Verdana	3	3,000	2,000	975	1,219
Dogwood	2	600	300	239	**395**
Hudson	2	1,200	600	---(2)	---(2)
Promenade	2	348	174	---(2)	---(2)

Notes:
(1) The total and firm capacity of the station is based on the pump design point, assuming the pumps will be able to steadily deliver the flow.
(2) The model is skeletonized, including only larger diameter piping and key connections, these pumps our outside of the modeled portion of the system.
gpm - gallons per minute.

5.6 Inflow and Infiltration Evaluation

I/I occurs in all sanitary sewer systems. Infiltration is defined as water entering the sanitary sewer system through pipes, joint connections, manhole covers, and walls. Inflow is defined as water discharged to the sanitary sewer system through connections to roof drains, yard drains, foundation drains, and cross connections with storm sewers and combined sewers. The combination of I/I may be a major portion of the total wastewater flow which is carried by the sanitary sewer system.

The *City of Auburn 2016 Comprehensive Sewer Plan, Brown and Caldwell* (2016 CSP) provided recommendations to improve the City's collection system. The *Auburn Washington Rainfall Derived Infiltration and Inflow Report 2022, ADS* (2022 RDII Report) provided an initial look at the I/I across the City. The results of both the analyses are summarized below:

- Current levels of I/I were not causing capacity-related issues (2016 CSP).
- Recommended the City to do an initial I/I investigation to support an eventual I/I management program (2016 CSP).
- Sewer extension projects are recommended to serve every parcel within the City limits.
- Two of the larger basins, Y-1 and Y-3 exhibited slightly higher than the moderate threshold level of 10 gallons/linear feet/inch rainfall as RDII (2022 RDII Report). Converting to area based RDII shows that Y-1 is estimated at 2,700 gpad and Y-3 at 4,100 gpad.
- The upper most part of basin A9 (sub basin A9e) is responsible for the large majority of RDII measured from this A9 area. In the basin A8 area, only sub basin A8b stood out as having potentially elevated RDII. Only the southern part of basin A7 (A7e and A7g) area stood out as having potentially elevated RDII (2022 RDII Report). These four basins had greater than 25 gallons/linear feet/inch rainfall, or all greater than 12,000 gpad.

The City's hydraulic model can be used to estimate peak flows for the different flow monitoring basins and areas included in the model during the design storm. The following parameters were calculated to better understand I/I severity in the collection system:

- **Peaking Factor:** Peaking factors are the ratio between peak flow and base sanitary flow and are commonly used for wastewater infrastructure design. These factors are derived by dividing the peak flow by the base sanitary flow for each basin. Due to the prolonged rainy season, wastewater agencies in the Pacific Northwest typically experience peaking factors from 2 to 10, and in some cases more than 10.
  - » Systems with a Peaking Factor of 3 or less are often considered as performing well. High Peaking Factors above 5 are typically signs of direct inflow to the collection system.
- **Peak I/I Rate:** The Peak I/I rate is the peak flow rate of all non-sanitary flows. Peak I/I rates are calculated by subtracting the base sanitary flow from the peak flow for each basin. Peak I/I rates are largely dependent on local hydrology, the condition of the collection system, and drainage connections, with the rate expressed in terms of gpad. The Peak I/I rate is calculated by dividing the Peak I/I flow by the total contributing area of land in acres in each basin. Peak I/I Rates can range from 1,000 gpad to over 20,000 gpad in areas in the Pacific Northwest. High peak I/I rates are usually signs of infiltration.

Table 5.5 summarizes the peaking factor and I/I rate for each flow monitoring basin during the design storm. Figure 5.9 outlines the Peak I/I rate by flow monitoring basin. King County has a target I/I rate of 1,100 gpad during the design storm. Although some basins exceed the County target, the City average I/I rate is 1,446 gpad during the design storm.

Table 5.5 I/I Summary by Flow Monitoring Basin for the Design Storm

Flow Monitoring Basin	Gross ADWF (mgd)	Gross PWWF (mgd)	Net ADWF (mgd)	Net PWWF (mgd)	Contributing Area (acres)	I/I Rate (gpad)	Peaking Factor
A1	0.33	0.78	0.10	0.24	244	627	2.4

AUBRN53	7.81	20.03	1.34	2.95	1,212	1,322	2.2
Average						1,446	

Notes:
(1) PWWF constrictions upstream limit net PWWF calculation, making it difficult to determine accurate I/I values in these basins.

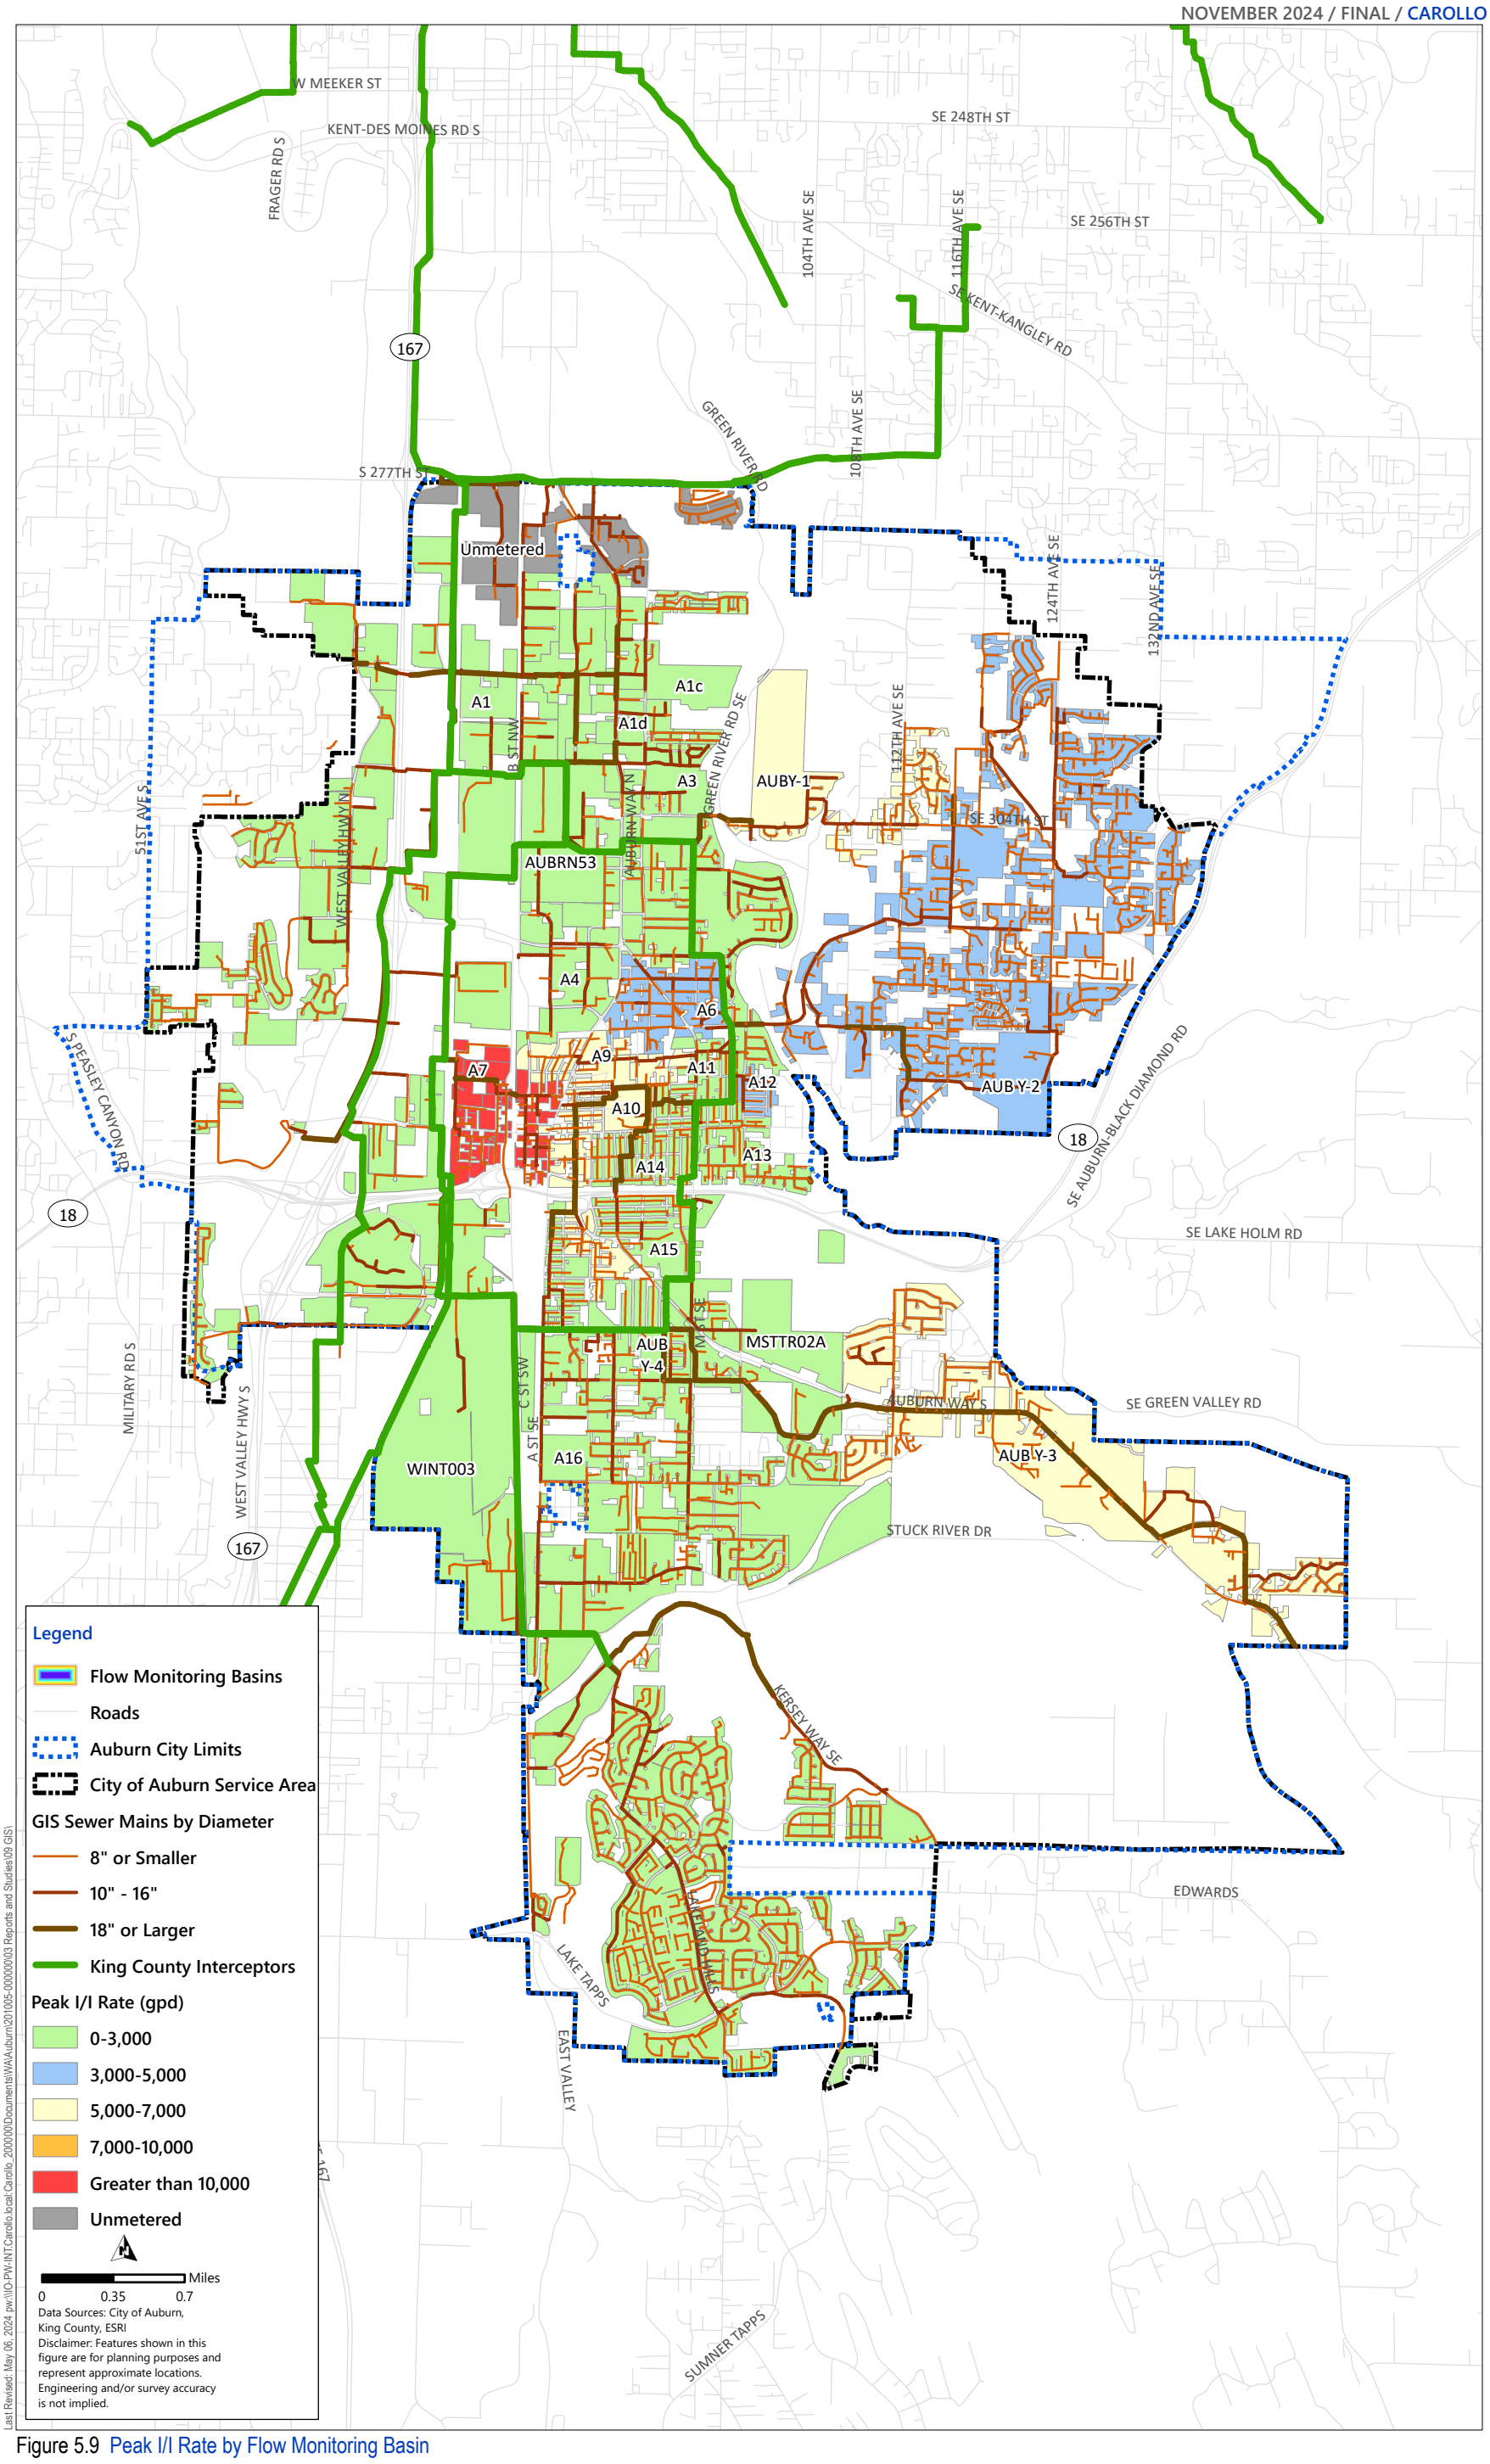

Figure 5.9 Peak I/I Rate by Flow Monitoring Basin

5.7 Remaining Useful Life

One key criteria used for assessing vulnerability and long-term rehabilitation and replacement needs is a remaining useful life (RUL) estimate. This estimate represents how many years a pipe with a certain material has before the likelihood of failure significantly increases.

Pipe age and material type are used to determine the RUL of the collection system pipelines. GIS data and field research were used to determine the type of material and year or decade that pipe segments were installed and identify data gaps. The City is in the process of updating its asset inventory, so the data to conduct a comprehensive analysis of RUL across the system is not complete. Upon substantial completion of the inventory work, the City should analyze the complete set of data to project rehabilitation and replacement needs.

Pipe manufacturers establish a theoretical useful life based on pipe material; however, the actual useful life is also influenced by local soil conditions, aggressive wastewater materials, methods of installation, etc. The original useful life for pipe of known material varies from 75 years for concrete pipe (CP) to 100 years for vitrified clay pipe (VCP). Since the age and material data for some of the pipelines were unavailable, it is assumed that the original useful life for all pipes of unknown age and materials is 75 years. Table 5.6 presents the estimated useful life of pipes of various materials.

Table 5.6 Useful Life of Pipes

Pipe Material	Original Useful Life (years)
Polyvinyl Chloride	100
Unknown	75
Concrete	75
Vitrified Clay	100
Ductile Iron	75
High Density Polyethylene	90
Clay	75
Cured in Place Liner	75

Table 5.7 summarizes the City's gravity sewer system available information by material type and known age into short (less than 10 years), medium (10-20 years), and long-term (greater than 20 years) for replacement needs, as well as unknown where age or material type is not current in the GIS. The cells are color-coded to show the three categories of RUL and unknown; orange is the unknown, red indicates pipe that is expected to reach the end of useful life in the next 10 years or has reached its useful life, yellow represents pipe with a RUL of between 10 and 20 years, and green represents pipe that has a RUL of over 20 years. In total, approximately one percent of the existing collection pipes with a known installation year are expected to reach the end of their useful lives by the year 2034. The table shows that the City GIS database is currently missing information of material type and/or approximate installation year for a large portion of the system.

Table 5.7 Remaining Useful Life

Feet of Pipeline					
Pipe Material	Less than 10 Years	10-20 Years	Greater than 20 Years	Unknown Install Date	Total
Unknown	1,541	2,153	10,855	55,723	70,272
Clay			199	13,226	13,425
Concrete		14,998	8,219	119,443	142,660
Cured in Place Liner			3,408		3,408
Ductile Iron			14,860	9,616	24,475
High Density Polyethylene			18,759	4,555	23,315
Polyvinyl Chloride			443,899	381,190	825,089
Vitrified Clay			3,280(1)	3,280	3,280
Total	1,541	17,150	500,199	587,033	1,105,923

Notes:
(1) Likely greater than 20 years as material use was stopped more than 20 years ago.

As noted earlier, prior to developing any detailed formal replacement and rehabilitation programs based on this information, a thorough assessment of the collection system asset management should be completed to update the age and material information in the GIS system where missing. Material and age of pipelines is critical to understanding when pipeline replacement may be needed. The material type and age will provide a picture of when the asset may need updating. The asset inventory effort should determine the following attributes for all City owned facilities:

- Material.
- Age of installation, or estimate based on material.

As the majority of the system has more than 20-years or unknown remaining useful life, the City should focus on identifying the unknown information prior to the next plan update. Based on a complete picture of material and age, long term costing can then be developed to create an effect renewal and replacement program, thereby ensuring the long term reliability of this key City asset.

While the RUL analysis provides a guide to when pipes may need replacing, short term decisions that prioritize which pipes to rehabilitate or replace must take other factors into account, including:

- Pipe Condition Scores - Based on CCTV inspections and standard scoring criteria.
- Pipe Criticality - The consequences of a pipe failure both for customers affected and environmental concerns.
- Efficiency - Considering replacement or rehabilitation of pipes in conjunction with other City projects save funds.

5.8 Recommendations

5.8.1 Asset Inventory, System Inspections, and Remaining Useful Life

An asset inventory effort is underway that will update the asset database with information available from as-built drawings and inspection records. An inspection program of laterals in City right-of-way (ROW) is being planned by the City to better understand current conditions. This inspection program would provide several key benefits for the City, including better information on pipe material, condition, and age. This program would allow for filling in GIS data gaps on pipe materials to enhance asset management capabilities. When updating GIS records with material, the installation date could also be added to the records to further improve understanding of a pipeline's potential remaining useful life. The inspection program would also provide significant insights on potential sources of I/I within the limited areas having elevated WWFs.

5.8.2 Capacity Evaluation Recommendations

Figure 5.10 outlines the key conveyance deficiencies in the system, where a pipe is both surcharged and 6 feet from the rim. The figure identifies which scenario the deficiency is a part of with existing surcharged pipes shown in red, the 2044 surcharged pipes in green, and the 2044 with climate change pipes in purple. The figure also shows the peak I/I rate to help identify if I/I is a significant contributing factor. I/I investigation is recommended to address capacity deficiencies in basins with an I/I rate above 5,000 gpad. Ideally, the lateral inspection program would start with a high I/I basin.

Table 5.8 outlines six different deficiency areas. These areas are classified by timing, recommendation, and extent of surcharging and deficient manholes. These areas are included withing the CIPs in Chapter 7 with some additional discussion, however not all of them have a specific CIP number associated with them. Area 1 has high I/I and is recommended for continued monitoring with a specific CIP Project 9. Area 4 is a large project with a specific CIP. Areas 2, 3 5 and 6 are all shorter lengths of piping and included within a programmatic CIP.

5.8.3 Future Population Growth

Although this Plan anticipates population and employment growth projected during the development of the City Comprehensive Plan, recent legislation (e.g. HB1110 passed in 2023 and upcoming HB1245) may permit or promote growth in a manner not anticipated by this Plan. As growth occurs, the utility may need to reevaluate pump station or other conveyance systems to ensure adequate capacity exists.

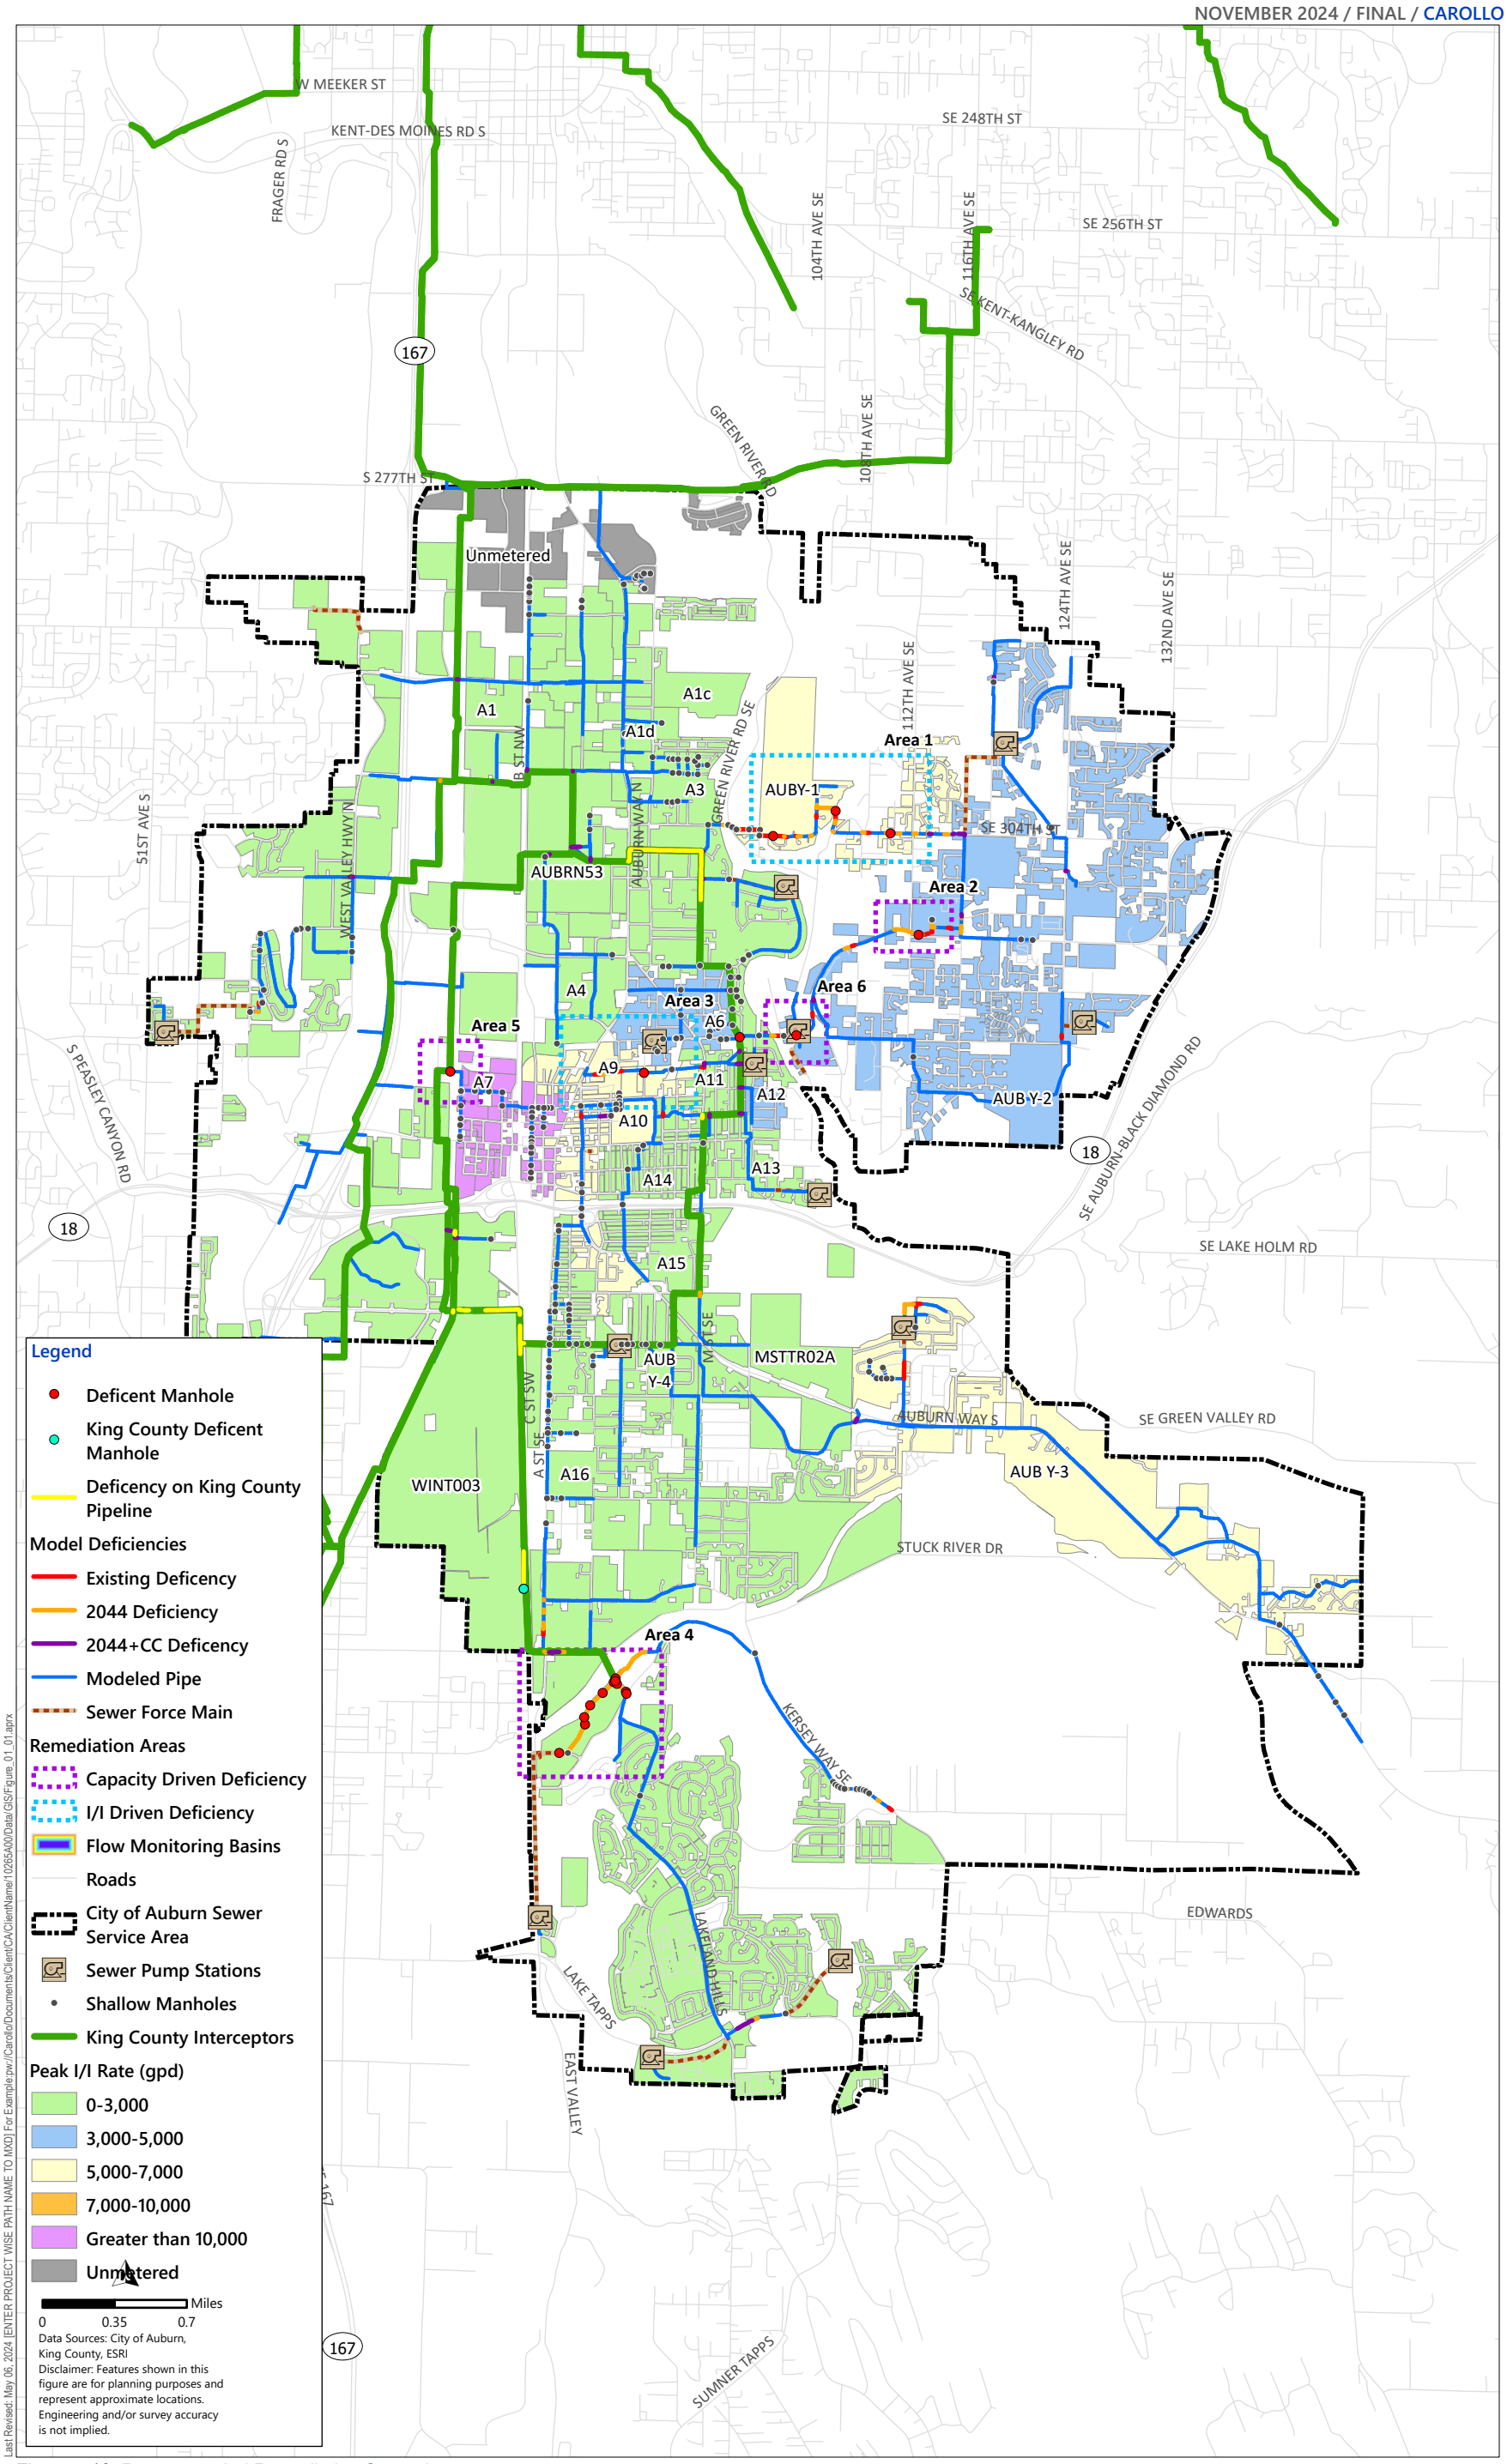

Figure 5.10 Recommended Remediation Strategies
CITY OF AUBURN
2024 COMPREHENSIVE SEWER PLAN

Table 5.8 Capacity Deficiencies

Area Number	Location	Timing	Pipe Diameter	Approximate Depth (feet)	Number of Manholes Impacted	Linear Feet of Surcharged Pipe (feet)	Flow Monitoring Basin I/I Rate (gpad)	Recommendation
Area 1	Along SE 304th Street and 304th Place, between 116th Avenue SE and the Green River crossing	2044	10-inch to 18-inch	9	3	2,666	6,454	Additional I/I Monitoring
Area 2	From Lea Hill Road SE to SE 311 Street	2044	12-inch	10	1	1,243	3,471	Capacity Driven – Recommend Upsizing
Area 3	6th Street NE to H Street NE, through Veterans Memorial Park	2044	10-inch	7	1	836	7,000	I/I Remediation
Area 4	Oravetz Place SE to the Lakeland Hills force main, through Roegner Park	Existing	8-inch to 24-inch	12	11	4,158	314	Capacity Driven – Recommend Upsizing
Area 5	Just south of 6th Street NW near the Interurban Trail	Existing	18-inch	6	1	72	314	Capacity Driven – Recommend Upsizing
Area 6	SE 320th Street and 102nd Avenue SE	Existing	12-inch to 14-inch	10	1	602	3,471	Capacity Driven – Recommend Upsizing

Notes:
NE - northeast; NW - northwest; SE - southeast; SW - southwest.

5.8.4 Inflow and Infiltration Evaluation Recommendations

5.8.4.1 Recommended Strategies for Additional Monitoring or Investigation

The City has few high I/I basins and minimal I/I driven capacity deficiencies. Figure 5.8 outlined the location of three areas that are in high I/I rate basins. Based on previous I/I analyses, and capacity deficiencies identified in the model, the following I/I basins are to be prioritized:

- A10.
- A9.
- A8.
- A7.
- AUB Y-1.
- AUB Y-3.

ADS flow monitoring performed additional micro monitoring for basins A9, A8, and A7 and identified sub-areas of focus, discussed in the next section. Basins AUB Y-1 and AUB Y-3 both have elevated I/I rates that cause some risk of deficiency. It is recommended that additional monitoring at and upstream of meter AUB Y-1 and AUB Y-3 be done and continued periodical monitoring of flows in the high I/I basis to understand if conditions are stable or degrading.

5.8.4.2 Recommended Remediation Strategies

Reduction of I/I in wastewater systems can be a difficult and costly task to undertake. Identifying specific sources, developing metrics for tracking the effectiveness of reduction techniques, and balancing the cost against capacity projects are all major challenges.

Common techniques for reducing I/I include the following:

- Direct Disconnects: This includes disconnecting roof downspouts, yard drains, foundation drains, stormwater catch basins, and/or any connection to the wastewater system causing inflow. Disconnection of these items may require additional provisions for stormwater drainage.
- Repair and replacement of Pipes: This includes replacing or repairing public wastewater pipes, typically due to poor condition, root intrusion, and disconnected joints. Options for pipe replacement include open-cut trench construction or using trenchless technologies, such as pipe bursting or cured in-place pipe. These options need to be assessed for local conditions, such as pipe condition, adjacent utilities, and soil type.
- Repair and replacement of Manholes: Several options exist for sealing manholes and preventing infiltration through faulty joints and cracks. Alternatives include grouting, coating, installing a liner, and/or applying an external sealant.

- Repair and replacement of Laterals and Side Sewers: This includes replacing or repairing laterals and side sewers due to poor condition and the presence of infiltration. Faulty side sewers and laterals are known to be large contributors of I/I. Identifying and repairing multiple faulty laterals and side sewers on private property can be more difficult and expensive than repairing a public wastewater pipe, and replacing or repairing side sewers on private property is the responsibility of property owners. Methods for repairing or replacing laterals and side sewers are similar to those described for public pipes. Trenchless technologies, which are less obtrusive than open-cut trenches are effective for replacing laterals and side sewers while minimizing impacts to landscaping and driveways. The City can repair or replace portions of side sewers within rights-of-way, and should support efforts to encourage property owners to replace portions on private property.

At this point, the City is experiencing relatively low I/I driven issues in concentrated areas. Area 6 is likely deficient due to elevated I/I in the A9e subbasin. It is recommended that the I/I remediation strategies outlined above be investigated further for I/I reduction in subbasin A9e. The lateral inspection program should start with this basin.

CHAPTER 6 MAINTENANCE AND OPERATIONS

This chapter provides an overview of the organization and common procedures associated with the ongoing maintenance and operation of the City sewer utility system, the primary purpose being to establish a baseline understanding of the proactive and responsive maintenance procedures performed by City staff. This baseline understanding is used herein to evaluate Sewer Utility (Utility) staffing, data collection and computerized record-keeping needs, and other Utility requirements to continue to meet the Utility's goals.

The City sewer system, detailed in Chapter 4, consists of approximately 210 miles of collection system piping, approximately 5,500 manholes, 17 sewer utility pump stations, and 3 siphons and serves more than 16,000 Utility customers. Utility staff also maintain 7 stormwater pump stations and 5 sewer pump stations serving individual facilities owned by other City departments.

6.1 Utility Responsibility and Authority

This section provides an overview of the Utility organization and basic information related to Utility staffing, training, and education.

6.1.1 Organizational Structure

The Utility is operated as a utility enterprise under the direction of the Public Works (PW) Department Director. PW is responsible for planning, design, construction, operation, maintenance, quality control, and management of the sewer system. The City has a mayor-council form of government; therefore, the PW Director reports to the Mayor. The Mayor provides direct administration and management of the utility. The City Council provide direction on policies and budget.

The Engineering Services Division (Engineering) within PW is the lead group for comprehensive sewer system planning, development of a CIP, and the design, construction, and inspection of projects related to the sewer system. The Utilities Engineering Manager oversees Utilities Engineering, including the Sewer Utility Engineer, and reports directly to the PW Director.

The M&O Services Division within PW is the lead group for the maintenance, inspection, and operation, of the physical assets of the Sewer Utility. The Storm/Sewer Manager oversees the Utility's 10 employees including the Sewer Field Supervisor and is responsible for the day-to-day maintenance and operation of the system. The Storm/Sewer Manager reports to the M&O Services General Manager, who, in turn, reports to the PW Director.

The location of the Utility within the overall PW organizational structure is shown in Figure 6.1.

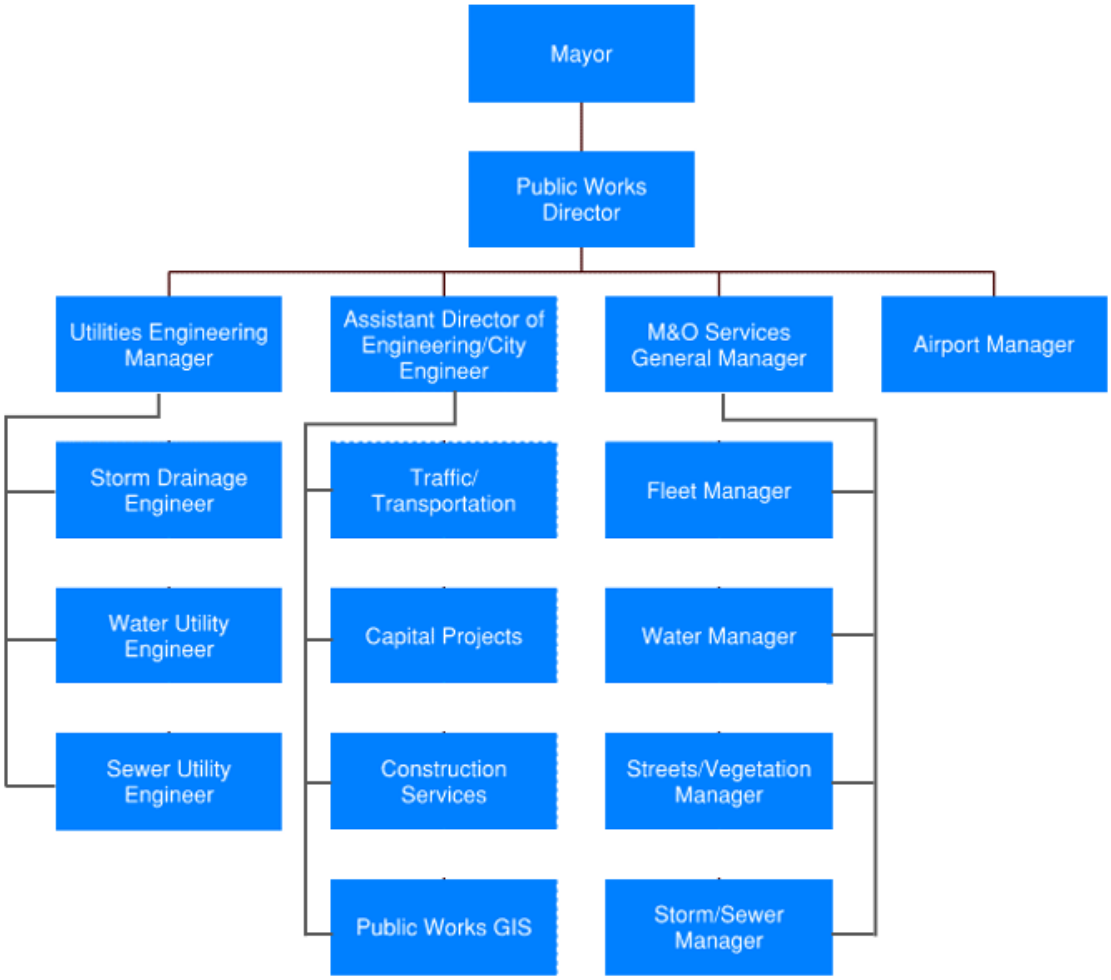

Figure 6.1 City of Auburn Public Works Department Organizational Chart

6.1.2 Staffing Level

The Utility currently employs 10 full-time M&O field staff plus a Storm/Sewer Manager and a Sewer Field Supervisor, who perform administrative duties. This chapter does not include an evaluation of Utility management, including regulatory compliance, planning, and coordination with other City departments. The position titles and primary functions of the full-time M&O field staff working within the Sewer Division are shown in Table 6.1.

Table 6.1 Sewer Utility M&O Field Personnel

Position	Primary Function(s)
Sewer/Storm Manager	Utility administrative duties.
Sewer Field Supervisor	Supervision of field staff.
Sewer Specialist	Two full-time staff dedicated to pump station inspection and maintenance.
Lead Maintenance Worker II	One full-time staff dedicated to operating the CCTV Inspection Program.
Maintenance Worker II	Five full-time staff dedicated to field inspection and maintenance.
Maintenance Worker I	Two full-time staff dedicated to field inspection and maintenance.

6.1.3 Level of Service

The Utility operates in accordance with the policies outlined in Chapter 2, and internally adopted goals integral to policy implementation. These goals are generally based on the current staffing level and tasks deemed most critical to the City and its residents.

6.1.4 Operator Training and Education

The City recognizes the value of having a knowledgeable and well-trained staff operating the Utility and encourages employees to obtain the highest level of training available. At this time, the State of Washington does not require certification for sewer maintenance operators. Seminars, conferences (specifically the annual Washington Wastewater Collection Personnel Association conference), and college coursework have become tools to advance knowledge for maintenance staff with subjects covered including safety, pumps, generators, forklift training, confined space, first aid, CPR, and electric and electronic fundamentals.

Many M&O staff serve in a specialized capacity. This can promote expertise, but also has the potential to limit the ability of the Utility to absorb absences due to vacation, sickness, retirement, and termination. To mitigate this limitation, the City has broadened the scope of the Utility's education system by cross-training staff, primarily staff that will serve in an on-call capacity and will be required to respond to off-duty emergencies.

6.2 Routine Operations

Routine M&O activities for the Utility can be divided into functional groups by facility type, as described in the following sections.

6.2.1 Pump Station Maintenance

Utility staff are responsible for maintenance of 29 pump stations, including 17 sewer utility stations (see Chapter 4), 7 stormwater utility stations, and 5 pump stations serving facilities owned by other City departments, at the Auburn Golf Course, Auburn City Hall, Auburn Justice Center, Isaac Evans Park, and Auburn Valley Humane Society. M&O activities include scheduled weekly and monthly equipment and grounds maintenance as well as emergency generator testing and maintenance. Pump station maintenance is a full-time commitment for two Utility staff teams which each include a maintenance worker and a sewer specialist.

6.2.1.1 Weekly Activities

Weekly pump station inspections are intended as a quick check to ensure proper operation and performance, and to identify potential non-emergency concerns to be addressed during scheduled monthly maintenance. Equipment maintenance schedules are based on manufacturers' recommendations. Depending on the site and time of year, ground maintenance may also be performed weekly or monthly as conditions dictate.

Weekly pump station maintenance activities include the following tasks:

- Perform a general visual inspection of grounds and pump station structure or vault.
- Check equipment for abnormal vibrations.
- Check lubrication of all pumping equipment.
- Check and clean, as needed, seal filters.
- Check ultrasonic level sensor.
- Check pump run times.
- Bleed lines of moisture.
- Inspect/exercise control valves.
- Check wet well for debris.
- Manually run the pump and observe wet well level.
- Security fencing inspection.

Weekly inspection activities are intended to be completed in less than one hour for each pump station.

6.2.1.2 Monthly Activities

Monthly pump station maintenance activities incorporate weekly activities while allowing more time for detailed maintenance and to address any previously identified concerns. Monthly maintenance can be particularly important for older pump stations, where equipment and facilities require more attention.

Monthly pump station maintenance activities include the following tasks:

- Inspect and test engine-generators (see below).
- Inspect pump station mechanical bypass pumping.
- Flush sump pit and manually run sump pump.
- Clean pump station interior and, at a minimum, wipe down control panels and pumps, and wash down/disinfect floor.
- Inspect fall restraint system.
- Spot-check control system and telemetry alarms.
- Inspect cathodic protection.
- Conduct building safety inspection.
- Test automatic transfer switch operation.
- Clean seal filters and vacuum probes.
- Clean check valves.
- Inspect the bioxide system.
- Inspect odor control systems.
- Inspect ventilation systems.
- Inspect chain hoist and crane systems.
- Inspect ladders and stairs.

- Check dehumidifier.
- Inspect electrical panels and variable frequency drive pumps.
- Inspect remote terminal units that connect pump stations to the Supervisory Control and Data Acquisition (SCADA) system.

The duration of monthly inspection activities varies widely depending upon the age/condition of the pump station and observations made during previous weekly inspections. On average, monthly inspections are assumed to be completed within four hours at each pump station.

6.2.1.3 Yearly Activities

Yearly maintenance includes actions that take significantly more time than routine activities and often require coordination/scheduling with additional City staff and/or outside vendors.

Yearly pump station maintenance activities include, but are not limited to, the following tasks:

- Mag meter calibrations.
- Chain hoist and crane load testing.
- Impellers an expeller inspection.
- Volute and motor inspection.

6.2.1.4 Generator Testing and Maintenance

City Utility staff perform limited maintenance on emergency generators serving sewer and stormwater pump stations, primarily to verify the generator's ability to perform in an emergency. Emergency generators are exercised, and fuel levels are evaluated during monthly maintenance activities. Private contracting services are used for detailed generator maintenance. It is recommended that detailed generator maintenance be performed annually, including filter changes and load bank testing.

Permanent generators are located at all 17 Utility-owned sewer pump stations. Four of the stormwater pump stations are equipped with permanent engine-generators. During a power outage, pump stations at City Hall and the Justice Center are run via generators that serve the building. Those two generators are maintained by the Administration Department, Facilities Division. In the event of a generator failure, pump stations can be operated using portable generators owned and maintained by the PW Department.

6.2.1.5 Wet Well Cleaning and Inspection

Wet well cleaning is performed by Utility staff as needed, but on average is necessary twice annually. Some pump stations in service areas with a noted high amount of fat, oils, and grease (FOG) accumulation require cleaning at a higher frequency (see Section 6.3).

During cleaning, wet wells are drained and the inside is cleaned with high-pressure water. Accumulated FOG and sludge/sediments are suctioned from the wet well using the City's vactor truck and transported to a disposal facility. During cleaning, Utility staff inspect all floats, sensors, and other hardware while the wet well is drained, and they also visually inspect the wet well structure for damage.

6.2.2 Collection System Maintenance

Utility staff are responsible for maintenance of approximately 210 miles of collection system piping and approximately 5,500 manholes. M&O activities include pipe cleaning/jetting, closed-circuit television (CCTV) inspection, and manhole inspection and maintenance.

6.2.2.1 Manhole Maintenance

Manhole maintenance includes initial inspection and potential follow-up cleaning and/or repair. Inspection is usually performed in conjunction with CCTV and jetting operations. The inspection includes the following:

- Visual confirmation of proper flow conveyance.
- Assessment of solids buildup in the manhole.
- Evaluation of structural damage or wear and the integrity/condition of manhole covers and ladder rungs.
- Confirmation and/or population of data stored in the computerized maintenance management system (CMMS).

Follow-up cleaning and maintenance work orders are generated based upon the results of initial inspection recorded in the CMMS, and typically require a two-person crew. Based upon recent maintenance history, it is estimated that approximately one in 10 manhole inspections leads to further cleaning. The City estimates that a total of 50 manholes per year require some repair.

6.2.2.2 Sewer Pipeline Cleaning and CCTV Inspection

Cleaning and inspection of the sewer system is performed using City-owned vactor/jet truck and CCTV equipment. Cleaning and CCTV inspection are typically performed in tandem from manhole to manhole by a two- or three-person crew for each task.

Jetting of sewer pipelines and subsequent vactor truck removal is the principal means of removing debris, sludge, FOG, and obstructions from the sewer system. A hose with a special end fitting is inserted into a pipe and high-pressure water (up to 2,500 pounds per square inch) is sent through the hose. The high-pressure water exits the small hole at the tip of the nozzle, breaking down and/or scouring obstructions. Debris is then removed via suction by the vactor truck equipment at each manhole.

Following cleaning, CCTV inspection is performed to identify structural defects and potential pipeline leaks. Routine CCTV inspection of the sewer system is an essential component of the M&O program as it can identify trouble spots before larger failures occur and can provide the City with accurate information about the condition of the sewer collection system. Between 2007 and 2019, inspection reports and digital video captured by the CCTV crews have been stored within the City's computer network using PIPELOGIX software). Since 2020, inspection data has been stored electronically using WinCan software. The PW GIS Group is in the process of inventorying sewer assets and updating data attributes. As part of that effort, Engineering staff is developing a procedure to export condition assessment data from WinCan to the CMMS. The intent of this data sharing is to be able to provide a more accurate planning tool based upon the known condition of wastewater system assets.

The City's goal is to clean and inspect all sewer collection pipes, using the National Association of Sewer Service Companies (NASSCO) Pipeline Assessment Certification Program (PACP), within the system on a seven-year cycle. On average, a three-person crew can clean approximately 3,000 feet of pipe per day or inspect approximately 1,500 feet of pipe per day.

Some of the City's larger, high-flow pipes are challenging for staff to inspect using the current set of equipment. In 2019-2020, the City hired a contractor to perform CCTV inspections on all 18-inch diameter sewer pipes and larger. While no major deficiencies were found, some degradation of older concrete pipe was observed. Staff intends to repeat some of those large diameter pipe inspections during this planning cycle to assess whether additional degradation has occurred and to help project and plan for future repair and replacement needs.

6.2.3 Field Operations

In addition to the M&O activities discussed in Sections 6.2.1 and 6.2.2, the Utility typically maintains a two-person field crew that performs a variety of other ongoing Utility functions. The Utility is also available to assist other PW divisions such as Water, Stormwater, or Transportation during manpower shortages or emergencies. Sewer staff perform liaison functions with Engineering and construction inspections for new projects, repairs, or modification of existing lines.

Currently, services for Utility locates are performed by two designated locators who are under the supervision of the Water Division Manager.

Examples of field operations activities include:

- **Repair:** Sewer staff perform repair of minor pipe breaks/leaks and other system infrastructure.
- **Engineering:** Sewer staff often provide facility inspection services for Engineering projects and support Engineering through visual observation in the field.
- **Vehicle and Equipment Maintenance**: The Utility maintains an extensive inventory of equipment available to respond to problems or emergencies. The fleet is currently equipped with seven trucks, one CCTV van, one sewer vactor/jet truck, and one emergency bypass pump. Each component of this fleet is equipped with valve operators and traffic control equipment.
- **Supply Inventory:** The Utility maintains an inventory of supplies and parts that are available for use in responding to emergency situations as well as normal Utility operations. Supplies and parts are tracked in an inventory control system that allows easy identification of available materials.

It is difficult to quantify the field tasks performed by Utility staff in terms of equivalent staff. Many of these tasks are performed outside of a regular maintenance schedule. The evaluation of existing staffing requirements in Section 6.6 assumes that a two-person field operations crew is maintained for a majority (0.75) of working days, or 1.5 full-time equivalent (FTE).

6.3 Fats, Oils, and Grease Reduction Program

FOG causes many operational challenges in the collection and treatment systems when not properly disposed of at the source. When FOG enters a sewer, it cools, solidifies, and can stick to the interior of pipes. FOG buildup increases over time, reducing the capacity of pipe to convey wastewater, potentially causing backups in the sewer system and operational concerns within pump stations. As of 2024,

Engineering employs two staff members who, among other duties, implement and oversee the City's FOG Reduction Program. The program focuses on regulation of food service establishments (FSE) and FOG generating food processing businesses, as well as public education to minimize the amount of FOG entering the City sewer system. (Note: Each staff member designates 25 percent of their time to the FOG program. Prior to 2024, only one position was available for this effort).

The City currently monitors approximately 174 FSEs within the service area, most of which are required to use grease trap/interceptor pretreatment facilities before discharging to the sewer collection system. FSEs are identified through the business licensing process, during which all FSEs are required to submit a FOG Control Plan per Auburn City Code (ACC) Chapter 13.22. ACC also codifies requirements for installation of pretreatment facilities (typically grease traps and interceptors), cleaning and maintenance, water quality testing, and record-keeping. City policy is to work with FSEs on a cooperative basis through outreach activities; however, refusal to comply with City requirements can result in code enforcement action.

Because of limited staffing for the program, inspection and education efforts have focused primarily on managing requirements for businesses to have a FOG Control Plan and reacting to areas with observed FOG issues. In 2024, an additional staff person was hired to enable a more regular, proactive inspection schedule and more consistent monitoring of grease interceptor cleaning. Regular FOG inspections will also be combined with stormwater source control inspections to use staff resources more efficiently.

Because areas with observed FOG issues are not all downstream from FSEs, staff will continue to monitor those areas and reach out to residents of both single-family and multi-family housing.

In addition to efforts to reduce the amount of FOG in the system, education and outreach efforts include:

1. Discouraging the flushing of cleaning wipes that may be labeled "flushable," but that do not disperse in water. These items can clog sewer lines and get caught in pumps, increasing maintenance efforts within both the City collection and conveyance system, and King County's treatment system.
2. Discouraging the disposal into the sewer system of pharmaceuticals, microplastics, and other prohibited discharges by educating the public on the harmful effects of those substances in the wastewater stream and by promoting alternative disposal methods.
3. Working with the King County Wastewater Treatment Division, Industrial Waste Program, to identify manufacturing and other businesses that discharge substances that may be detrimental to the wastewater treatment process.

6.4 Non-Routine and Emergency Operations

This section discusses unscheduled activities performed by Utility staff and provides a response plan for emergency conditions. The intent of the routine inspection and maintenance activities discussed in Sections 6.2 and 6.3 is to minimize, through proactive management of the sewer facilities, the potential for conditions that could lead to emergencies.

6.4.1 Customer Service Requests

Customer service requests, such as a localized sewer backup complaint, trigger creation of a task to inspect the affected area or sewer facility and identify potential solutions. In some cases, relatively simple solutions can alleviate the issue. However, other cases require coordination with Engineering or

other City departments. On average, Utility staff respond to approximately 50 customer service/complaint-related tasks per year. The effort required to resolve complaints varies considerably.

Good record-keeping can help with complaint resolution by ensuring that all relevant data are gathered and by serving as a reminder to resolve the complaint and notify the complainant. When a complaint is received, the following information should be recorded to the greatest extent possible:

- Name and contact information of the person making the complaint.
- Brief description of the nature of the complaint.
- If sewer overflow, include estimate of volume and duration of overflow.
- Time and date the complaint was received.
- M&O staff assigned to respond.

If any sewage is spilled to the environment or backs up into a building due to problems with the City sewer system, staff will immediately report the spill to the Department of Ecology's ERTS System.

Following the initial response, the complaint record is updated to include the results of inspections and corrective actions taken, if any. If the complaint cannot be resolved internally within the Utility, the complaint record is forwarded to Engineering for further investigation. Notification of any system investigation and/or action is provided to the customer making the complaint.

6.4.2 Emergency Response Program

For specifically sewer related emergencies, the Utility has implemented a standby program whereby one on-call employee is designated to be the first to receive after-hours emergency calls. Most sewer system problems that occur outside normal working hours are reported through the City's 911 emergency response system. An emergency call-out list is provided to the emergency operator in order to contact Utility staff in case of an emergency. Pump station SCADA alarms are also forwarded to the on-call employee. The primary responder to those after-hours calls is the on-call employee. Utility staff have been trained to respond to system emergencies and staff maintains a "Wastewater Standby Manual" with pertinent information helpful in resolving spills, blockages, and other emergencies. The contacted staff assesses the situation, contacts additional staff as necessary, and then responds in accordance with established emergency response procedures.

For citywide emergencies such as severe weather events, flooding, landslides, power outages, or other events with widespread impact across the PW Director or designee will activate the Department Operations Center (DOC) which operates at the M&O facility. By direction of the DOC Operations Chief, Sewer Utility staff will be used for any PW operations and will not necessarily be limited to sewer operations. To help manage staff and operations during such incidents, the PW Department has implemented several standard operating procedures that outline employee responsibilities for availability, work response, etc.

For longer lasting or regional emergencies, City resources, including staff will be managed in accordance with the City's Comprehensive Emergency Management Plan dated October 21, 2019. The primary objectives of the Comprehensive Emergency Management Plan are to ensure public safety, restore essential services as quickly as possible, and provide assistance to other areas as required. That plan outlines responsibilities of City departments related to the mitigation of the emergency situation within

the City, and coordination and support of or from other organizations such as King County, Pierce County, the State of Washington, and neighboring cities.

6.5 Communications, Data Collection, and Record-Keeping

This section describes the electronic communication, data collection, and record-keeping systems used by Utility staff.

6.5.1 Telemetry and Pump Station Controls
